Wilson, John, shipwright (Bridlington)	730
Wilson, Joshua, merchant and shipowner (Sunderland)	447
Winchester, John, shipmaster (Peterhead)	65
Wood, James, fisherman (Whitby)	667
Wood, Nicholas, director of Sunderland Docks (Sunderland)	467
Woodhouse, Thomas, shipowner (Bridlington)	722
Wyrill, Henry, shipmaster (Bridlington)	715
Yeo, Richard, harbour-master of Bideford (Bideford)	299
Yeo, William, shipowner (Bideford)	291
Young, William, shipmaster (Peterhead)	61

MINUTES OF EVIDENCE

TAKEN BEFORE

THE ROYAL COMMISSION

ON

HARBOURS OF REFUGE.

WICK.

Thursday, 26th August 1858.

PRESENT :

Admiral HOPE (Chairman).

Mr. LINDSAY.	Captain VETCH.
Captain WASHINGTON.	Mr. COODE.

Mr. CALVER, Secretary.

Mr. JOHN MACKIE examined.

1. (*Chairman.*) What is your name? — John Mackie.

2. What is your profession?—I am editor of the *Northern Ensign* newspaper.

3. How long have you resided in this part of the country?—For 15 years, or nearly so.

4. Have you any statement to make to the Commissioners bearing on the subject of this inquiry, keeping in view the propriety of abstaining as much as possible from repeating the evidence which has been already laid before the Committee of the House of Commons on the subject in 1857 and 1858?—I am prepared to answer any questions that may be put to me on the subject, as I was under the impression that such would be done.

5. By whose authority did you come by that impression?—Of course I had no official information to that effect, but I believe it is customary in such cases that leading questions are put. However, with the leave of the Commission, I shall make a statement:—I am a native of Peterhead. I was harbour clerk of Fraserburgh from 1838 to 1844, when I came to Wick. I was for six years engaged on the *John o'Groat Journal*, and since 1850 I have been editor of the *Northern Ensign*. I am well acquainted with the trade of the north-east coast of Scotland, and have for many years paid much attention to the fishing and shipping interests. I produce a return of the shipping, foreign and coastwise, in the year 1857, for the ports of Wick and Peterhead. This shows 2,076 vessels, and 240,774 tons for Wick, and 97,177 tons for Peterhead. It has been prepared by me from a Parliamentary return by order of the House of Commons, No. 260. As further evidence of the traffic from Tarbet Ness to the Pentland Frith, I refer to Captain Washington's Summary Report of 1846, from which it appears that in that year the traffic amounted to 4,864 vessels, loaded, of 706,866 tons. I also produce a nominal return of the number of vessels at Wick on Friday last, and the ports to which they belong; the number of vessels being 81, and the tonnage 4,992. I also produce a return of the wrecks which have occurred here since January 1857, obtained by me from the receiver of wrecks appointed by the Board of Trade, so far as regards vessels, the entries as to boats being from my own personal knowledge. I have been unable to obtain any data from which to frame a return of wrecks previous to the date I have mentioned, unless it be a return contained in the Appendix to Captain Washington's Summary Report of 1846, which shows the number of vessels wrecked in Sinclair Bay, one half being engaged in the foreign trade. I have no return of the traffic through the Pentland Frith, nor do I know of any data for such a return, but I refer to Captain Washington's Report of 1846, wherein it is stated that, "according to the official "returns it appears that 4,178 vessels, carrying "cargo of 664,064 tons, passed through the Frith "in the year 1846; this number is exclusive of "vessels in ballast, passenger steamers, ships of war, "revenue cruisers, and all under 15 tons burden." I know that there has been a considerable increase in the Pentland Frith traffic since 1846. For instance, there was not then any steamer to and from Scrabster; there are now four every week. Further, we had no traffic with the Lewis in 1846, and it is now very considerable. Some idea of the vessels passing through the Pentland Firth may be formed from Captain Sulivan's statement before the Committee on Harbours in 1857 (page 57), that from 1,050 to 1,100 vessels found refuge in Scrabster Roads in 1856; and also from the fact that along the Caithness side of the Firth there are 15 pilot boats, with full crews of seven men each, engaged in piloting vessels through the Firth. Since 1846 the coasting trade of Wick has greatly increased. In that year we had only two steamers weekly for eight months in the year, whereas we have now six weekly during the whole year. From the best information I can obtain, I estimate that 10,000 passengers are landed and shipped every year at Wick, almost entirely by means of small boats. The shipping belonging to the port have increased from 39 vessels of 2,063 tons in 1850 to 56 vessels of 3,386 in 1857; while I find, by the Appendix to the Report of the Committee on Harbours of Refuge for 1858, that the tonnage of Peterhead has decreased from 77 ships with a tonnage of 12,616 in 1841 to 54 ships with a tonnage of 10,000 in 1858. The herring fishing at Wick is the greatest in the kingdom. It gathers fishermen from the whole northern counties, Argyle, Ross, Sutherland, Orkney, Shetland, Nairn, Moray, Banff, and Fife, and fish curers from various ports in Ireland,

WICK.

Mr. John Mackie.

26 August 1858.

Chairman.

and from Liverpool, Rothesay, Leith, Dundee, and other places, and vessels from many home and foreign ports. I produce a return showing the number of persons employed in the fisheries at Wick, Lybster, Helmsdale, Peterhead, and Fraserburgh, showing a total of 18,712 on this coast, 4,597 at Peterhead, and 3,865 at Fraserburgh; also a return of the boats and their tonnage, and the quantity and value of fish exported, and the countries to which exported; also a return showing the progress of the Wick fishing in quinquennial periods since 1818, and a return of the herrings exported for the places above mentioned for the last five years. These returns have been collated by me from the Fishery Board's Reports, except in so far as regards the value of the fish exported, which I have calculated according to the prices published weekly in the various newspapers. Attached to the return of the boats and their tonnage, I have given a statement of the boats and men employed at the places named, in the present year; the return for Wick, Lybster, and Helmsdale having been obtained from the fishery officers, and those with regard to Peterhead and Fraserburgh from returns published in the newspapers of these districts. I have given great attention to the subject of harbours for many years, particularly since 1848, and am well acquainted with the creeks in this district, and have had very much intercourse with those who resort to this coast during the fishing season, and have had thus the most ample means of ascertaining their opinions on the subject of the accommodation necessary to enable them to prosecute their trade. Along the whole coast, from Helmsdale to Duncansby Head, there is no harbour of refuge, nor any place to which, with a gale from north-eastward to south, any vessel or boat can run for shelter. In consequence, the fishing and trade are carried at a very serious disadvantage. Steamers and other craft for Wick do not attempt to approach the coast when there is any appearance of a gale from the eastward. The boats are prevented from going to sea from the same cause, not because of any storm at sea, but from having no place of safety to run to in the event of any of those sudden gales which so often visit this coast. The best fishing nights of the season are frequently lost from this cause, and the fishermen are yearly becoming disheartened, the interruption growing yearly with the increase in the number and size of boats. Pulteneytown harbour is exceedingly limited in extent, and has no area to afford accommodation to any thing like the number of boats that prosecute the fishing in the neighbourhood. The other creeks and harbours on the coast, particularly Lybster, are in as bad a condition, and even worse. For want of a harbour the white fishing is not prosecuted to any extent, but there cannot be a doubt that were a sufficient harbour provided, as the Caithness coast has opposite to it the best fishing ground in the kingdom, the white fishing would be very extensively prosecuted. The only effective remedy to meet the necessities of the fishing, and afford shelter to the large number of vessels that pass this coast, is a breakwater across Wick Bay, that would provide sufficient shelter for the whole ships and boats, and would allow the fishing and trade to be carried on with safety. The herring fishing of Caithness is national; most of the persons, and vessels, and boats engaged in it are from a distance. It circulates an immense sum of money amongst the industrious classes in the manufacturing districts; all the materials required in its prosecution, wood, salt, iron, hemp, twine, tar, &c. are imported. It is the best nursery for the navy in the kingdom. When the Royal Naval Coast Volunteers were first enrolled, this district contributed one seventh of the whole force raised in Scotland, although the enrolling did not take place during the fishing season. The fishing on this coast has also proved itself a school of industry, and a large means of support for the Highland population. Ten years ago, not more than 50 boats were owned by Highland fishermen coming to this coast. There are now at least 300, and it is estimated that 1,500 individuals come every year to this coast fishings from the island of Lewis alone. There are good harbours and roadsteads on the Peterhead and Fraserburgh coasts, in proof of which I may state that 14,000 tons of shipping found refuge in Peterhead harbour alone last year, and a quantity not much less at Fraserburgh. Peterhead harbour has been recently very much improved, but that has not tended to increase the tonnage of wind-bound vessels. From a memorial issued by the harbour trustees in 1844, I find that from 1816 to 1824 there was an annual average of 244 vessels using Peterhead harbour windbound; from 1834 to 1844 the average was 237 annually; and although it is stated in that memorial that were certain improvements carried out, a large increase would take place, yet after these improvements have been effected, it appears from the Appendix to the Select Committee's Report, that from 1848 to 1858 the average has decreased to 200 vessels annually. I also find, from the evidence of Mr Stevenson, that the number of vessels observed passing Buchan Ness lighthouse during the day has decreased from 10,186 in 1850 to 5,274 in 1856. A new harbour was recently built at Fraserburgh, at a cost of upwards of 20,000*l.*, and there is first-rate accommodation for boats at both Peterhead and Fraserburgh. I have only to add, that the number of losses on this coast, and the serious inconvenience under which the fishing is prosecuted are yearly destroying the confidence of those engaged in it; and it is the opinion of those best qualified to judge, that unless something effective is immediately done, a calamity more sad than any that has yet occurred will sooner or later appal the country and drive the fishermen from our coast.

6. (*Mr. Lindsay.*) Can you give any reason for the decrease in the tonnage passing Buchan Ness?—I cannot; but one witness stated before the committee that it was probably the effect of railways; but such a cause can never affect the tonnage on this coast. I also observe that the Bell Rock tonnage decreased 3,000 tons in the same period, and that of Kinnaird Head 1,000; and while the tonnage of Noss Head decreased 1,000 in the same period, that of Pentland Skerries rose 500, and Dunnet Head 1,100.

7. You are not aware of any other course being taken by the vessels?—I am not.

8. (*Captain Washington.*) Is it not singular that these returns should show a decrease, while I observe, from the report of the Select Committee, that the traffic of the whole coast has considerably increased?—It is; I am satisfied that the traffic of the county of Caithness has increased 50 per cent. since 1844.

9. Then these returns must be wrong? How are they obtained?—They were handed in by Mr. Stevenson as part of his evidence.

10. (*Chairman.*) There is a portion of your evidence which relates to wind-bound vessels at Peterhead, will you restate it. (Witness here restated the figures with regard to the average number of wind-bound vessels entering Peterhead.)

11. These figures refer to wind-bound vessels?—Yes, they do.

12. Another portion of your evidence has reference to roadsteads?—I have counted 120 vessels at anchor at one time in Peterhead Bay.

13. What was the date?—I think in July 1843.

14. You saw 120 vessels in Peterhead roads?—Yes.

15. Now, what proportion of those vessels do you suppose were vessels that had taken refuge?—All took refuge—not refuge strictly speaking; the wind was moderate—but they were windbound and waiting a change to get south.

16. Then it appears by your statement that while the annual average of wind-bound vessels was 200, you yourself found in one particular day 120 vessels in the roadstead?—The 200 vessels are vessels windbound in the harbour, the others were in the roads.

17. (*Mr. Lindsay.*) You have said that a harbour of refuge is necessary for saving life. I suppose you mean the lives of those engaged in the fishing?—Yes; and I believe that a number of vessels that have been wrecked in Orkney would have been saved had there been a harbour of refuge at Wick.

18. In the list of wrecks which you have handed in, I observe at the top two vessels opposite to which you state, that had there been a harbour of refuge these wrecks would not have occurred?—I did not state so, it was officially reported by the receiver of wrecks.

19. Would the pier proposed according to Mr. Stevenson's plan have saved these vessels?—The wind was blowing in the direction that would have raised a heavy sea in the exact spot. In fact it is the universal opinion here, that Mr. Stevenson's harbour would do more injury than good. It would throw a heavy sea on the north side of the bay, and prevent the fishing from being prosecuted there, as well as cause many wrecks.

20. Would not the same follow under Captain Vetch's plan?—No; it is in deeper water and beyond the breakers. It comprehends a much larger area.

21. During a south-east gale, would small vessels, and especially fishing boats, be equally well sheltered inside Mr. Stevenson's harbour as that of Captain Vetch?—I don't believe they would.

22. Would such vessels enter Mr. Stevenson's harbour with as much facility as Captain Vetch's?—Certainly not; in the one case you have only 2½ fathoms, and in the other 6½. In fact, every one who knows the bay of Wick is aware that the heaviest seas are in that part where Mr. Stevenson proposes to build a harbour.

23. Would a harbour on a plan such as Mr. Stevenson's, but on a different line, be equally effectual?—No; there is not sufficient area or depth of water.

24. But I find that there is sufficient depth of water; inside you will see that there are 4½ fathoms at low water, spring tides?—Yes, inside, but only 2½ at the entrance.

25. No fishing boat would ground with such a depth of water?—They might not ground, but they would founder.

26. Do you mean to say that a fishing boat would run a greater risk of foundering at Mr. Stevenson's than Captain Vetch's harbour entrance?—I have seen them founder at the very place. I saw *thirty boats founder* in one day in Wick Bay.

27. Founder, I presume, from want of protection: but if protection were supplied would they then founder?—Certainly not.

28. What depth of water does a loaded boat draw?—From five to six feet perhaps.

29. Well, then, will not two and a half fathoms be quite enough to admit a boat in safety drawing five or six feet of water?—You are imagining smooth water; I am imagining a storm. I am satisfied there would be more loss were Mr. Stevenson's harbour erected. The sea in the bay would be increased by its erection.

30. Why would not a boat drawing six feet of water be as safe in Mr. Stevenson's harbour as in Captain Vetch's?—First, there is no area sufficient for the accommodation of the boats; secondly, a heavy sea would break over it; thirdly, the commotion in the bay would be greatly increased; and fourthly, I am sure that nothing short of the entire enclosure of the bay will meet the requirements of the place. The area of the present harbour is larger than Mr. Stevenson's, and consequently if Mr. Stevenson's harbour will not accommodate the 600 boats that fish from Pulteney Town alone, how can it afford protection to the 1,700 boats engaged in fishing on the whole coast?

31. Do you mean to say that with the present harbours, and that proposed by Mr. Stevenson, there would not be sufficient accommodation for the whole of the boats?—I do mean to say so; and there is the additional consideration that Mr. Stevenson's harbour would be in danger of silting up.

32. Would Captain Vetch's plan be open to the same objection?—No; the river would not affect it.

33. Would not the sea break over Captain Vetch's breakwater?—No, there is deep water there.

34. Then do I understand the sum and substance of your evidence to be, that for the safety of the fishing boats a harbour on Captain Vetch's plan would be necessary?—That is part of my evidence; but I also state that it is necessary on account of the coasting and foreign trade. A large proportion of the wrecks in Orkney would have been avoided had there been a harbour of refuge in Wick Bay.

35. You allude to vessels passing from the east to the west?—Yes.

36. Are there no harbours in Orkney?—There are, but they are at times very difficult of access.

37. And would a harbour at Wick be preferable?—It certainly would, because there would be no strong tides to contend with. With reference to the wrecks in Orkney, they are generally those of foreign vessels overtaken by easterly gales, and finding they have no chance of safety by running for this coast, they run for Orkney as a last resort, and are lost.

38. Do vessels bound from Hull to the Baltic come near this coast?—No.

39. Then, unless for vessels passing through the Pentland Firth, Wick is not on the great highway to the Baltic?—No; but there is still a large foreign trade going through the Firth, to and from America and the west.

40. Are the pilots, you speak of as being on the Pentland Firth, licenced?—I do not know.

41. Are they all employed in piloting?—They are.

42. And in any other occupation?—Yes, but their livelihood chiefly depends on piloting.

43. Do any vessels call for orders at Wick?—Yes; a great many.

44. Do they call here for orders from their owners in the south?—They do.

45. And this is considered a convenient port of call?—It is.

46. What is the course of post from London?—Thirty-six hours.

47. How soon would a reply reach?—In eighty hours; but you must remember that we have far speedier means of communication by the steamers' mails. I have had a telegraphic despatch in little more than eight hours; besides, orders are generally waiting the vessels before they come. I have known orders sent to Stromness, to which there is now daily communication.

48. (*Captain Washington.*) Have you any notion of the number of vessels that call at Stromness for orders during the course of a year?—I have not.

49. Were there a harbour of refuge at Wick, would many call for orders?—I have no doubt of it.

50. The line of telegraph is now open to Inverness, which is fifteen hours from Wick; do you think there is any probability of its being extended to Wick?—I have no doubt of it; perhaps across the firth, either from Lossiemouth or Fraserburgh. Two years ago I had a communication on the subject with the chairman of one of the leading telegraph companies, and the proposal was very favourably entertained.

51. Have you any doubt, then, that the telegraph would be extended to Wick were there a harbour of refuge made?—None.

52. And in that case Wick would be as well situated as any port in the kingdom?—It would.

53. Would it be possible to obtain a record of the loss of life at Wick for the last 25 years?—Perhaps it might; but I am not aware of any record having been kept.

54. In your opinion, which of the three plans of the proposed line of construction would be the preferable?—The largest, of course.

55. If that were constructed, do you think there

WICK.

Mr. John Mackie.

26 August 1858.

Capt. Washington.

would be sufficient refuge for vessels and boats?—There is no doubt of it.

56. Then it is your belief that if this harbour of refuge were carried out, every accommodation would be afforded?—There would be sufficient for many years, perhaps for ever.

57. And that would greatly tend to save life?—It certainly would.

58. And for the safety of the property?—Yes.

59. And also for the general accommodation and advantage?—Yes.

60. (*Captain Vetch.*) Look at the chart where you see the words "log buoy;" have you ever seen breakers there?—Very frequently heavy breakers.

61. Would vessels have got into harbour while such seas were rolling?—They would not.

62. Are you aware that when bored there were found sixteen feet of sand there?—I am not, of my own knowledge.

63. Would boats enter Mr. Stevenson's harbour with safety while these rollers prevail?—They would not.

64. There has been a good deal said concerning the outline of a harbour proposed by me; are you aware of the fact that Captain Sulivan, without any communication with me, proposed one which is nearly identical with mine?—I find that Captain Sulivan stated so in his evidence before the Committee last year.

65. (*Mr. Coode.*) You have stated your belief that Mr. Stevenson's harbour would silt up, while Captain Vetch's would not?—My conclusions are drawn from what was stated before the Committee last year.

66. Are you aware whether the deposit comes from the river or from the sea?—I am much inclined to believe that it comes partly from the river.

67. Have you ever seen a return of wrecks at Peterhead similar to that given in to-day?—I have not.

68. Are you aware of the chief causes of the wrecks at Peterhead?—I observe from the "North Sea Pilot," published last year by the Admiralty, that most of the wrecks near Peterhead occurred during fogs and calms.

69. (*Chairman.*) In a former part of your evidence you have mentioned that there are 15 pilot boats on the Caithness side of the Pentland Firth. Are you able to name any of the most experienced of those pilots who could afford some information to the Commissioners as to the amount of shipping passing through the firth?—Perhaps Donald Gunn, William Steven, Staxigoe, and William Bruce, Broadhaven. (*The Chairman ordered these pilots to be summoned.*)

70. Are you acquainted with any fishermen of experience who could give the Commissioners any information as to the probable effect of a gale from the south-east on the entrance to the breakwater marked B and C in the plan?—I think John Sutherland and James Bruce might do it.

71. (*Captain Washington.*) What number of vessels have you seen in Sinclair's Bay?—I do not remember. (*The Witness here handed in an additional return as to the rate of labour in Wick.*)

Captain William Campbell examined.

Capt. Wm. Campbell.

72. (*Chairman.*) What is your name?—William Campbell

73. What is your occupation?—I am master of the *Duke of Richmond* steamer.

74. Have you any information to afford relative to the subject of this inquiry?—I have. I know Wick Bay, the Caithness coast, and the Pentland Firth. I have been coming to this coast since 1831 in charge of steamers, and have been weekly in Wick Bay, landing goods and passengers often in great danger and risk; and with regard to Mr. Stevenson's plan, I cannot see how it would enable a vessel to ride in the bay in safety. I have often rode there with a heavy sea under the stern, and in great danger. I am sure that in a gale of wind no boat could enter there with safety, there being only from 2½ to 3 fathoms water. I am satisfied that the outside pier is the only plan that will afford shelter, as the sea will not break at it. There is a fair sea and no breakers, and there is no tide within the heads. I have been in Wick Bay many a time with great risk; and with regard to a wind-bound port, it is much wanted on this coast. There is no shelter, except at Cromarty or the Orkneys, which latter cannot be taken with a south-east gale, except with very great risk, and Cromarty is very difficult to take in such a gale. I was going down on the 13th March 1857 from Ackergill Bay, where I discharged part of the cargo, when the wind blew strong from south-south-east, and there was a strong flood tide. I kept under the land as long as I could with safety, and in the slack of the tide managed to leave for Orkney, close round Duncansby Head, the sea breaking over the head. I never was in such danger. Longhope and Widewall are very good harbours, but the question is how to get there with a south-east wind and a flood tide. In a short winter day, with the wind from the south, and the tide strong, it frequently happens that night comes on before reaching the firth, and then it becomes doubly dangerous, especially when we have no place of refuge on this coast. If there were a good harbour in Wick Bay, there would be no such danger.

75. You see on the plan the breakwater, which is shaded with an opening, marked B C. Suppose such a breakwater made, what is your opinion of the effect of the sea at its opening?—It would afford great shelter for the bay.

76. You mistake me. I do not speak of shelter for the bay; but I want to know what is your opinion as regards an opening in the centre, and one at each end, what style of sea would there be in the opening?—There might be a heavy sea outside, but it would expend itself there, and there would be no drawback.

77. Would there be any cross sea, making it dangerous for boats to run in in heavy weather?—No cross sea, but a fair going sea.

78. Have you any opinion as to the effect of a current running across the mouth of the bay, say from South Head to Proudfoot Rock, on the sea which runs without the bay in heavy weather?—It would have no effect, either good or bad.

79. It was stated to me, not very long ago, that the effect of the tide running through the Pentland Firth from Holborn Head to Dunnet Head acted as a breakwater, and rendered Scrabster Roads a very much safer anchorage than if there had been no tide at all. What is your opinion as to that?—He is quite right in that respect; the tide carries the sea past the bay; it is the same in all places.

80. What is the average strength of the tide which runs across the Bay of Wick?—From 4½ to 5 knots an hour in stream tides.

81. Then will the tide produce a similar effect on the sea which runs into the Bay of Wick, which you say it does in Thurso Bay?—Yes.

82. At what part of the Bay of Wick does the sea begin to break in heavy weather?—It breaks usually where the buoy is placed.

83. Does the sea never break beyond the log buoy?—Oh yes, a long way beyond it.

84. Will you mark in the plan where it does?—(*Witness here marked as far out as the line of the Salmon Rock.*)—But I have never been in the bay with a sea breaking heavily, and it may break further out.

85. (*Mr. Lindsay.*) How long have you been in command of the *Duke of Richmond?*—Since 1838, except four years, when I had the *Queen.*

86. Where does the *Duke of Richmond* trade to and from?—Between Granton, Aberdeen, Wick, and Scrabster.

87. How often do you visit Wick?—Twice a week, winter and summer.

88. Would a south-east wind not be a fair wind for the Pentland Firth?—With a strong wind and a flood tide a very heavy sea is raised rapidly; so much so, that no vessel can enter the firth with safety.

89. Suppose a ship caught with a south-east gale off this coast stood for the firth, and presuming that she were going at the time with an ebb tide, what would follow?—She would be quite safe in that case.

90. Would she find good shelter in Longhope?—Yes.

91. Are there any other harbours in Orkney?—Stromness and Widewall, but Widewall is not so good as Longhope.

92. Presuming the proposed breakwater were erected in Wick Bay, and you were caught with a south-east gale at sea, opposite to Wick, or between Wick and the Pentland Firth, where would you run?—I would not take the firth; I would run to Wick.

93. If it were daylight, would you not take the firth?—If I were going on my voyage I might.

94. But say you were disabled, and found it necessary to take a harbour of refuge?—Then I would take Wick, which I could always reach; whereas it is often very difficult to get to the harbours in the Orkneys.

95. You think that even with an ebb tide you could run with greater safety to Wick?—Yes.

96. Would the breaking sea not throw a considerable surf at the entrance of the harbour, marked B and C?—Yes, but not so heavy as to prevent entrance; it would be only on the surface, and there would be no difficulty in getting in.

97. Would the sea at the entrance be more cross than now?—No, it would not; there would be a fair sea.

98. You said, in answer to a question by the Chairman, that boats could not live within the limits of Mr. Stevenson's pier. Why?—Because there are only 3 to 3½ fathoms, and there would be a heavy drawback inside, so that the boats would be driven against the pier ends.

99. Would a boat be liable to be drifted among the breakers at the log buoy?—Yes, if not very quickly hauled round.

100. Would it alter the condition if the end of the breakwater, instead of turning round to the westward, were carried out more to the northward, beginning at east?—There would be the same danger, and perhaps more sea.

101. If there were a pier from the other side, would it have the same effect?—I do not think so.

102. Suppose a small area of water enclosed, would that be sufficient for the protection of the lives and property connected with the fishing?—It might do for boats, but not for vessels.

103. (*Captain Washington.*) Do you think that a sailing vessel, entering Mr. Stevenson's harbour in a south-east gale, could get in safely?—No.

104. Suppose the other breakwater were erected, could she do so?—I have no doubt of it. There would be sufficient room for her to veer cable.

105. The bay is very liable to heavy gales and seas?—Very liable to sudden gales and heavy seas, and it is not safe for a sailing vessel in a south-east gale to try the firth at flood tide.

106. Then the natural harbours of the Orkneys are of no use; they might as well not exist?—Quite so; we cannot get to them.

107. Where do you think the opening of the breakwater should be?—In the centre.

108. Would you prefer a central entrance, or two entrances, one at each end?—I would prefer one in the centre.

109. Have you ever run for any other harbour in easterly gales?—Yes; Aberdeen for instance.

110. Do you know the width of the entrance?—No.

111. Have you any difficulty in taking it?—Yes, there is great risk at times, arising from the fresh out of the river.

112. Is there any such at Wick?—Very little indeed, compared with Aberdeen. I have passed Aberdeen, and been unable to take it in bad weather.

113. Have you ever been in Peterhead or Fraserburgh?—Not for 12 years.

114. Did you not make use of the expression, that to take the Pentland Firth in a gale of wind and a flood tide would be like going into the jaws of a lion's mouth?—I think it would.

115. (*Captain Vetch.*) In the course of your experience, have you ever been on a lee shore with an upright rock?—Frequently.

116. Does the sea break?—I have seen it break as high as 200 feet.

117. Have you felt any bad effects from the recoil?—No.

118. Suppose the piers of the breakwater in this bay were upright, would the effect be the same?—Yes, the recoil would be the same; I have no doubt of it.

119. Would you be kind enough to show in the chart where the tide runs in front of the bay?—From Proudfoot Rock to the old kiln on the south.

120. Then inside of that line you would not be much affected by the current?—It would be comparatively still water.

121. (*Mr. Coode.*) You prefer a central opening to one in the side. Why?—Because there is better access in the centre.

122. Suppose the wind from south-south-east?—I would still prefer the centre opening.

123. (*Chairman.*) Here is a plan prepared by Mr. Rendel showing a breakwater from south side to Proudfoot.—A very good plan.

124. Comparing it with the others you have seen, which do you prefer?—I prefer Mr. Rendel's.

125. Why?—Because it shows where the sunken rock of Proudfoot lies. It is a dangerous rock. There would be less sea in entering it.

126. Do you consider Rendel's entrance preferable to Captain Vetch's?—I do. The sea would not enter into the bay so much; it would strike on the north shore, and leave the rest of the bay smooth.

127. With reference to vessels of 200 tons and upwards, would you consider Mr. Rendel's entrance preferable?—Their merits would be very much the same.

128. What are the prevailing winds off the bay of Wick in heavy weather?—North-east to south-east.

129. From what quarter have you the heaviest weather?—South-east.

130. How does the heavy weather begin?—It is very uncertain and changeable.

131. Do the heavy south-east gales begin from the south, veering to east, or the reverse?—They generally begin at south-east, veering to west after rain. At times they begin to the north of south-east, and veer round.

132. With reference to open boats, what entrance would you prefer?—Equally the same.

133. (*Captain Washington.*) What is the tonnage of vessels frequenting this coast?—From 1,600 tons to 50 or 60.

134. Are there many vessels of 1,000 tons frequenting this coast?—During the last three months I have seen some as high as 1,200.

135. Have they increased in size lately?—They have.

136. (*Mr. Lindsay.*) Where do vessels of 1,000 and 1,200 tons go from?—From Sunderland, Hull, Shields, Leith, to America and elsewhere, to West Indies and Australia.

137. When it would be unsafe to go through the Pentland Firth, could they not go round the Orkneys?—There is great danger that way.

138. Why so?—Because there are strong tides and heavy seas there, and on account of the low land.

WICK.

Capt. Wm. Campbell.

26 August 1858.

Capt. Vetch.

139. (*Captain Vetch.*) Would not a beacon at Proudfoot answer your difficulty about showing where it is?—Not at night.

140. Would not Mr. Rendel's piers be more apt to be carried away?—Yes, by being nearer the stream.

141. Would there not be some benefit obtained by having the breakwater in smooth water, and at a distance from the run of the tide?—Yes.

142. (*Mr. Coode.*) What change of a south-east gale is the worst?—That which changes to north.

Mr. J. G. T. Sinclair, of Ulbster, examined.

Mr. J. G. T. Sinclair.

143. (*Chairman.*) Have you any evidence to give bearing on the subject of this inquiry?—The evidence which I have to offer is this:—That whereas Mr. Stevenson stated, in his evidence before the House of Commons Harbours Committee, that from the lighthouse returns the vessels passing Buchan Ness were 7,763 as against 3,113 passing the Pentland Skerries, showing a proportion of 5 to 2 against Wick; I can show, on the same authority, that the tonnage which paid for Buchan Ness was 1,112,636 tons as against 713,609 paying for Noss Head, reducing the proportion to 3 to 2. I have further to state, that from evidence which I have collected at Leith I have reason to believe that the Baltic trade which has been reckoned in favour of Buchan Ness should be deducted, because vessels which sail from Leith and ports south of it to the Baltic do not sight Buchanness more than once in six voyages. By another calculation, from the same returns, I have been enabled to estimate that the Baltic traffic so accounted to Buchan Ness is 120,000 tons; consequently the true statistics of Buchan Ness stand as 992,636 against 713,609 already given. The next point is, that vessels are calculated by trips, while boats which are at sea for 36 nights are only accounted for once. Another point is, that the foreign and colonial owned passing vessels may be estimated at a tonnage of half a million on the basis of a trade circular from Elsinore, which shows that, exclusive of British vessels, which are already reckoned, 15,108 vessels of all nations passed Elsinore in 1851, exclusive of vessels passing the firth bound for Christiana and other ports. This return does not distinguish the ports from which the vessels came, excepting the American vessels, which numbered 134, all of which passed through the firth; and assuming each of those vessels to average the same number of tons as the 67 which are enumerated in the list, namely 404 tons, the total of the American tonnage going and returning would be 108,272 tons. Averaging the remaining 14,684 vessels paying sound dues at only 100 tons, or less than one third the average of American vessels, we have, say 2,972,800 tons, exclusive of British and American shipping, passing Elsinore; and supposing only one fifth of that traffic to go to America and Australia, which together make two fifths of the globe, we have 594,560 to add to the Wick or Pentland Firth traffic, which added to the American-owned vessels and 713,609 tons which pay dues for Noss, we have a total of 1,362,305 tons justly in favour of Wick against 1,112,606 reckoned by the lighthouse returns in favour of Peterhead.

144. (*Mr. Lindsay.*) Are you aware where vessels from London, Hull, and Sunderland generally sight the land or take their departure from for the Baltic or Archangel?—In the evidence which I collected at Leith from masters and owners I found that not one sixth ever sight Buchan Ness. They leave St. Abb's Head from Leith, and in no case do they ever sight Buchan Ness unless driven by a storm out of their course; and it was considered to be a hardship to pay for Buchan Ness, and has often been complained of.

145. Do not the vessels which pass through the Pentland Firth pass Buchan Ness?—They do.

146. How did you arrive at these returns?—By my own compiling from the Report of the Lighthouse Commissioners of 1852 and 1853, from which time the lights have not been kept separately. I deducted from the Buchan Ness total traffic that of the local ports on the east coast of Scotland going through the Caledonian Canal and Pentland Firth. The residue I considered to be Baltic traffic; and I may add to my statement that I have ascertained from the Caledonian Canal Commissioners returns, that 1,307 vessels, of 101,000, exclusive of local traffic, passed through the canal. Of these a large number would have passed through the Pentland Firth had there been a harbour of refuge in Wick Bay.

147. (*Chairman.*) Do you feel yourself competent to offer an opinion as to the merits of the different plans of breakwaters before the Commissioners?—In the presence of so many gentlemen who are so well acquainted with such matters I would rather not express an opinion.

Commander John Tudor, R.N., examined.

Commander J. Tudor, R.N.

148. (*To the Chairman.*) I am a commander in Her Majesty's navy. I was sent to Wick by the British Fishery Society in the beginning of March 1854, and had three plans of a harbour by Mr. Rendel with me to place before the Chamber of Commerce and others interested. One was a plan for a small harbour extending from the Salmon Rock, another was on a slightly increased scale, and the third was for a large harbour enclosing the entire bay from the south to the north heads. After being here for nine days, during which I witnessed an easterly gale, I became satisfied that the smaller harbours would be of little or no use to the shipping interests. I found that the rollers in the bay commenced beyond the six-fathom line, and acquired force as they proceeded shorewards, and I could not therefore recommend a harbour in three-fathoms water entrance. On the 14th March 1854 I wrote to the secretary a letter, of which I now hand in a copy, and ere I returned to London I communicated to the chairman of the Chamber of Commerce my intention to warn the directors of the danger of erecting the smaller harbour. I have seen the harbours now during four winters, and am more strongly of opinion that any harbour to be efficient must be outside the line of rollers thus pointed out by me on the map. If it is so it will not only protect the boats, but be a refuge for shipping generally. Wick is the key of the Pentland Firth; vessels leaving it for the firth may clear Cape Wrath in one tide. There are sometimes heavy rollers in the bay even when the wind is blowing out and it is calm outside. I recollect an instance which I pointed out to one of the members of the Refuge Harbours Committee, Lord John Hay, March 1857, when a merchant brig was reaching to the northward with royals set, and the bay was one mass of rollers, so that it would have been impossible for a boat to live within the six-fathom line.

149. From what quarter is the heaviest weather?—From south-east.

150. How do south-east gales commence?—I generally find that with the wind from the west it veers round with a rising barometer; then there is a succession of strong easterly gales, lasting for several days; and with a falling barometer we have strong east-south-east and south-east gales.

151. Do they come from the eastward?—They generally spring up from the eastward. When we get heavy rains it generally veers round to the west.

152. What opening do you prefer in the proposed breakwater ?—Decidedly the central opening.

153. If Mr. Rendel's plan were adopted, would you prefer the opening shown by him to a central opening ?—I should not ; it is well known that with a strong gale from the south silting suspension may be washed in. With a strong gale and an entrance of 500 feet in the centre, very little can be washed in, and that is counteracted by the influence of the stream. In the case of a central opening, no silt can be carried into the harbour, as it will either pass in a south-east gale to the north of Proudfoot, or in a north-east gale it will be carried south, and I consider the back water would be sufficient to counterbalance any attempt of the silt to deposit itself.

154. What is your opinion of the opening as regards fishing boats ?—For all purposes I prefer the central.

155. What do you think of the effects of the outside sea upon the opening ?—Supposing it to be placed on the line of current, it would not enable a vessel to recover her steering way in passing in so easily as if the line of current were a ship's length or two outside the breakwater. In the latter case she would recover her steerage way after passing the line of current.

156. Where is the line of current ?—It reaches from Proudfoot across to the old kiln.

157. Would the position of Mr. Rendel's breakwater be sufficiently inside the line of current ?—To a great extent it would ; it would depend greatly upon the direction and strength of the wind.

158. I see a jetty in Mr. Rendel's plan ; what is your opinion of it ?—I like to see a slight curve, because it takes down the strength of sea by the under-running current below.

159. And you would recommend the jetty ?—With a slight alteration.

160. Is it good or bad ?—If it is to be a straight breakwater it will be of no use, as no vessel could enter in southerly gales with a following sea along the line of breakwater.

161. Do you consider Mr. Rendel's plan would provide sufficient shelter to make it a harbour of refuge in the highest meaning of the term, as well as for local traffic, in which I include the whole of the fishing boats ?—I should regard it as providing ample shelter for the 1,700 boats fishing on this coast, but not for all the trade I have seen here were it to be doubled.

162. What is the largest size of vessel you expect to take refuge in Wick Bay ?—With a harbour of refuge, it would admit the *Diamond*, one of our frigates. The vessels named to-day of from 1,200 to 1,600 tons could find shelter. The boats are laid up during winter, which is the time when refuge for vessels is most needed, and I am certain that, with such a harbour, we should not only compete with other ports, but raise a hardy race of seamen prosecuting the white fishing during every lawful day of the year.

163. What number of vessels are likely to resort to such a harbour of refuge at any one time ?—I have been told that as many as 300 or 400 vessels have been seen to go through the Pentland Firth in one tide, and taking into consideration the frequency of south-east gales, and the danger of going through the Firth during the flood tide, I have no doubt the greater part of such vessels would take refuge in Wick.

164. During what period of the year is the fishing prosecuted ?—It generally commences on the 14th of July, but this year it was a good deal later. It lasts from 7 to 8 weeks, according to the success.

165. Do you think these boats would interfere with wind-bound vessels using the harbour ?—I am satisfied that it would be on a sufficiently large scale to meet all the requirements of both, as well as the local traffic.

166. (*Mr. Lindsay.*) How long have you been harbour master ?—Since March 1854, except 18 to 20 months when I was engaged in the Crimean war.

167. What description of vessels were those 300 to 400 which passed through the Firth in one day ?—Coasting and foreign.

168. What number of boats belong to the bay ?—1,100 ; and on the whole coast from Helmsdale northwards, upwards of 1,700.

169. What loss of life has taken place since 1854 ?—When I was absent some losses took place in the bay, but only one life, so far as I can remember, so long as I have been here ; but on the 9th September last I lost a man out of the life-boat, in rendering assistance to a Hanoverian galliot ; this is the second to my knowledge. That loss was occasioned through negligence during the dipping of the sail. In January two boats belonging to the steamer laden with goods were lost, and six men were drowned.

170. Would a harbour of refuge have prevented that calamity ?—Most certainly.

171. You object to Mr. Stevenson's pier. Why ?—Because it runs along the line of breakers, and is in only 3 fathoms water, while the rollers commence in 6 fathoms, so that a vessel or boat would have to run through a long line of rollers before getting in.

172. Do you think the plan proposed by Captain Vetch is necessary for the protection of the fishing boats and the lives of the fishermen ?—I do.

173. Why ?—Boats frequently return laden with fish to the extent of from 60 to 80 crans, and I do not think it safe for a deeply laden boat to enter the bay unless it were perfectly free from rollers.

174. (*Captain Washington.*) Were not 100 lives lost on this coast in 1848 ?—In this immediate vicinity 37 men were drowned, and many boats were wrecked, and on the other coast a great loss also took place.

175. Would a breakwater have saved those lives ?—Every soul and every boat.

176. Are fishermen deterred from going to sea ?—Very often.

177. Do you think a breakwater would encourage them to go ?—I am sure it would, it is a hard case when there is the slightest chance of getting fish to find them hanging back, when there is no bad weather outside, simply for want of a low water harbour to which they can run.

178. Have you a barometer ?—A very splendid one, erected by the British Fishery Society.

179. A light also ?—Yes ; lighted all night, the whole year round.

180. Does Proudfoot Rock want a beacon ?—I think it does; but it is beyond my jurisdiction.

181. Whose duty is it to provide it ?—The Lighthouse Commissioners.

182. As a sailor will you venture to take refuge in a south-east gale in Mr. Stevenson's harbour ?—No. There are those who can prove that before the present piers were erected there was a depth of from 9 to 10 feet water at low-water spring tides at the end of the south quay. I have seen it dry, and there are not now more than two feet water under the same circumstances, and I am satisfied that Mr. Stevenson's harbour would silt up in the same manner. We have shifting sands which would greatly affect Mr. Stevenson's harbour.

183. Does the silt come from the river or the sea ?—From the river principally.

184. Might the present harbour be deepened were a large harbour erected, and can it be underpinned ?—It cannot, as the walls are built on large loose boulder stones.

185. How many pilots have you ?—Ten.

186. Are they all licensed ?—Yes, by the Society ; in the event of an application, an examination would take place, myself acting as chairman, and assisted by the men of nautical experience at the port.

187. Do you consider the breakwater should be inside the south head ?—To a small extent.

188. And on the north side ?—Within Proudfoot.

WICK.

Commander J. Tudor.

26 August 1858.

Capt. Washington.

189. Would it be more easily taken thus?—It would.

190. What are the advantages of it being inside?—It would prevent the sea running along the breakwater.

191. Is there sand in suspension off Wick Bay?—There may be sand in the tide way.

192. Would it be safer to have an entrance on each side sheltered by the heads, or one entrance in the centre?—The objection to one of the side entrances would be the recoil of the sea; with one entrance there would be no difficulty in taking it, and there would be less chance of silt coming in.

193. Is the trade of Wick chiefly dependent on the fishing?—Chiefly, but not entirely. This is an agricultural county. We import a great quantity of timber for other purposes than that of the fishing. The trade is dependent both on fishing and farming.

194. (*Captain Vetch*). Supposing an entrance according to Mr. Rendel's plan, would it not hamper the fishing boats and destroy much valuable curing ground on the north side?—It certainly would.

195. Would it be possible for boats to lie along the north shore were Mr. Rendel's plan adopted?—The central entrance would give the largest area and line of shore.

196. Would it not be safer for vessels and boats to get clear of the tideway before entering the harbour?—It would.

197. Would the sea break or recoil against an upright wall?—It would recoil when there is a sufficient depth of water.

198. When the boats have been prevented from going to sea has there been fish on the coast?—Frequently; for instance, I have known boats venturing out and returning with 60 or 70 crans.

199. What do you consider to be the amount of the loss through this cause?—Last year we lost, perhaps, about 50 or 60,000*l.*

200. What is the largest quantity you have known to be caught in a single night?—25,000 crans, or 25,000*l.* value.

201. If there were a refuge harbour, would the boats go to sea when they are now prevented?—Often.

202. (*Mr. Coode.*) You speak of rollers off the bay with the wind off the land, do you mean rollers or a ground swell?—These were breaking rollers or bar seas, not ground swell. A ground swell does not break, a roller does.

203. How do you account for it?—The only way I can account for it is that there may have been a gale on the outside, but we have a roll inside at times without any outside roll.

204. Does not the tidal water affect the bay with silt?—Not at all, or very slightly.

205. What effect have the freshes of the river upon the water in the bay?—I have seen along with the fresh the water discoloured to the full extent of the bay.

206. You have said that you prefer a curved to a straight breakwater, give your reasons?—I consider that the sea going along a straight line gains force, and a curved line disarms the sea.

207. What would be the weight of a boat with the fish and nets?—The calculation is 340 lbs. to the cran.

208. How many crans will a boat carry in extreme cases?—From 70 to 80 crans.

209. Then 80 crans would be about 12 tons; what do you consider a proper weight for a boat of 15 tons to carry?—I would consider her overladen with 80 crans, if she had to go through rollers or broken water, except in fine weather.

210. And you say that rollers break in 6 fathom in the bay of Wick?—Yes.

211. How many nights does the want of a harbour prevent the boats from going to sea?—Last year about 10 nights, and that may be called an average.

212. What plan would you propose for the present harbour?—I applied to the society for rebuilding the walls, but that could not be done unless there was a harbour outside.

213. Would not two openings give more motion in the bay than one?—I do think so.

214. What is the cause of silt in the bay?—Merely matter in the tideway driven in by gales.

215. What is the cause of the deposit of silt?—Merely the stillness of the water.

216. I again ask you would not two openings give more circulation in the bay than one, and prevent the deposit of silt?—Yes; but the other objections outweigh that consideration.

217. (*Chairman.*) Outside the line at which rollers commence is there generally a fair sea?—Not a rolling sea.

218. How much of a boat's gunwale is above the water when she is heavily laden?—About 9 or 10 inches.

219. Is that sufficient for her safety?—Certainly not in our bay with the rollers, or when there is any break in the sea.

220. What is sufficient for safety in the bay with the rollers?—I do not consider that there is any safety at present in the bay for a heavily laden boat.

221. Therefore in heavy weather boats must be light?—Yes; rather than attempt the harbour mouth they frequently run to the bays and creeks adjoining.

222. What is the fair load for a fishing boat at so many crans per ton?—A fishing boat of 15 ton would have a fair load with 50 or 60 crans on board; 4 tons is a fair estimate.

223. (*Mr. Lindsay.*) Is it not a matter of suprise to you that only one life was lost during two years, considering the number of boats, the great many lives at stake, and the great depth to which they load their boats?—No; because the fishermen do not risk going out.

224. Where were the 37 lives lost in 1848?—Within the bay of Wick.

225. Would a breakwater have saved them?—Every one of them.

Mr. Patrick May, Shipmaster, examined.

Mr. Patrick May.

226. (*Chairman.*) When did you first go to sea?—1835.

227. At what age?—Thirteen.

228. Have you read the evidence as respects Wick taken before the Harbours of Refuge Committee?—Yes.

229. Will you state for the information of the Committee what you wish to offer on the subject?—In my opinion there is great necessity for a harbour of refuge here. I generally agree with all that Captain Campbell and Captain Tudor have said.

230. Is there any additional statement which you would like to make?—I came by Elsinore in October last, along with 186 sail, two-thirds of which were bound to the north of Scotland, and about 30 to the United States. I often heard in America the great danger of the Pentland Firth, and of the want of a harbour in its neighbourhood, save the Orkneys, which are very difficult of access during stong south-east gales, so much so that so long as we can wear canvass I should never think of running for them with a flood tide in a south-east gale, but would keep off shore.

231. What description of vessel have you been at sea in?—From a fishing boat of 4 tons to 2,500 tons sailing vessel. I have fished in Ireland, and was master of a coasting smack before going to America.

232. How long?—Two years.

233. After you went to America what sized vessel did you command?—I never commanded one in America, I was bound for it.

234. What was the size and description of the vessel?—A brig of 140 tons register.

235. What vessel had you next?—The one I now command, which is a schooner, 85 tons new measurement.

236. How long have you been on board of her?—Two years.

237. Where have you been trading?—Wherever I can get a freight, Newcastle, Hull, Caledonian Canal, Bristol Channel, and the Irish ports.

238. What is the direction of the wind right through the Pentland Firth?—On this side from south-south-east to east-south-east.

239. In a heavy south-east gale and a strong flood tide, how far from the firth does the tide extend an unfavourable influence for a ship?—Three miles off from the Pentland Skerries.

240. In heavy weather, with the wind from south-south-east and the flood tide, where would you heave your vessel to, if you had several hours to wait?—I would go no nearer to the firth than Wick, but a little to the south of it, if the gale were heavy.

241. Why would you heave to or hang off at so great a distance?—Because it would be of the greatest importance for me to keep so far off in case of wanting room to leeward by change of weather.

242. With an ebb tide, is it always safe to pass through the firth?—Not with a strong gale and deeply laden vessel. In such a case there is often the greatest risk.

243. Have you heard of any accidents to vessels in the firth?—None have happened to myself. I saw one brigantine, bound from the Baltic to Dublin, in it, when the gale was so heavy that her topmast went over the bows, and her foreyard in the slings.

244. Were you in any danger?—Not then.

245. But my question referred to serious accidents by which vessels and crews suffered?— Being a stranger here, I cannot name cases, but the losses off the Pentland Firth have been long spoken of.

246. (*Mr. Lindsay.*) What experience as a master mariner have you had on this coast?—I have been backwards and forwards upon it for 9 years.

247. Where have you been trading to during that time?—To the Baltic, the Irish Channel, and other places I have named.

248. What ports have you traded to during the last year?—Rostock, Hull, Drogheda, Newcastle, Portsoy, Wick. I was overtaken on the 1st of May by a heavy gale off the Firth of Forth, when the *Ann Fleming* was wrecked at Duncansby Head with a strong south-east gale which shifted to north-east. We were two days under double-reefed canvass, and were afraid to come to anchor at Wick or Sinclair Bay, lest the wind should change.

249. Let us suppose that you were on your passage from the Baltic to Hull, and suppose, when in the longitude of Greenwich, and the 58th degree of latitude, you were caught by a strong south or south-east gale and got disabled and thought it necessary to run for a harbour of refuge, and suppose there were such a harbour at Peterhead or Fraserburgh, and another at Wick, which of these places would you run to?—To Peterhead, of course.

250. Say you were bound the other way and obliged to run for a harbour of refuge, where would you run?—To the same place.

251. But if you were bound for Ireland or America, where would you put in?—Wick, of course; as I would naturally run to the point nearest my port of destination.

252. You stated that in going through the firth, even with an ebb tide, it would not be safe at times?—It would not, with a small vessel, heavily laden, and a heavy sea.

253. Would you not have Cromarty under you lee?—Yes, with a south-east gale.

254. If you missed Wick, running for it with a south-east gale, could you fetch Cromarty from Wick?—No.

255. Whether, are the headlands of Wick or those of Fraserburgh and Peterhead seen at a greater distance?—The Paps of Caithness are seen much farther off at sea. The land about Wick and Peterhead is equally low.

256. Going back to the first point, would you see the land of Peterhead at an equal distance as the land at Wick?—I think not. I came from the Humber last winter, bound for home, and passed Peterhead without seeing it; nor did I sight any land till between Tarbet Ness and Cove Sea Skerries. The weather was thick.

257. If you had been the same distance from Wick that you were from Peterhead, would you have seen it?—I think not.

258. Suppose you leave Shields for the Baltic, from what point would you take your last departure from the land?—From the nearest headland at the harbour's mouth.

259. Would it be desirable under certain circumstances to sight the high land in the direction of Peterhead, in taking your final departure from the land?—If I did so, I should do the work of a schoolboy.

260. Supposing you were sailing from Archangel or the Baltic to Newcastle, for what land would you make?—I would steer right for Newcastle.

261. Would you hesitate to go through the firth with a flood tide?—I should not like to attempt it.

262. Do you think there is any risk with an ebb tide?—To a stranger there is, with a heavy sea and a deep vessel.

263. Can you say from you own personal knowledge that the passage is dangerous?—I am sure it is.

264. Is there any more danger in going through the firth with an ebb tide in moderate weather, than in any ordinary navigation?—I do not think there is; but, in rough weather, I was never more afraid in my life than in going through the firth.

Mr. James Dunnet examined.

265. (*Chairman.*) What is your name?—James Dunnet.

266. What is your occupation?—Shipmaster.

267. At what age did you go to sea?—Since I left my parents; and at the age of sixteen. I was not indentured, but served a regular apprenticeship of five years. I have been at the fishing and engaged as a mariner for twenty years. I first went to Inverness, and at the close of my apprenticeship remained with my former employer till he sold off; and since then I have been employed in the coasting trade to Ireland, the Baltic, and various home ports. I have been a master mariner 12 years, having charge of vessels from 70 to 100 tons register. I have often had occasion to go through the firth in very coarse weather, and have many times been in danger in it. I cannot say I ever suffered disaster, but many of my companions have been drowned in it, losing their vessels and themselves.

268. Will you state any accidents that have occurred to your own knowledge in the firth?—The *Lady Camilla* of Thurso, Captain Crear, foundered in the chops of the firth, and no trace of her was ever seen, save some small pieces of wreck and the dog. She was laden with guano, and was a fine new schooner of 80 to 84 tons.

269. Any more accidents?—The sloop *Pomona* foundered there; and another vessel, that I remember, lost two of her hands by their being washed overboard in a heavy gale from the south east, in attempting to take the firth to get shelter. Both of

WICK.

Mr. James Dunnet.

26 August 1858.

Chairman.

these vessels I have named as being lost, attempted to take the firth during a south-east storm and flood tide.

270. Did these losses arise from stress of weather or from an error of judgment?—They came under the land, thinking to get to the windward of the tide, and being unable to get through they were overtaken and foundered.

271. (*Mr. Lindsay.*) Where were you employed in the fishing trade?—In Pulteney Harbour.

272. How long ago?—21 years.

273. Were there any losses of life during that time?—There may have been many lost, but I was only a boy and do not recollect.

274. Do you remember any boats being lost?—I do not remember.

275. Say you were outward bound for the Baltic, and there was a harbour at Wick and Peterhead, and you were caught with a south-east gale in Greenwich longitude and 58 latitude, where would you run for?—I would prefer the nearest harbour, if it were a safe one.

276. If you were coming from the Baltic?—The cases would be the same; I prefer the weathermost harbour.

277. As a sailor, would you prefer a refuge harbour on a salient point to windward or one situated in a bay?—In the event of running for a harbour, if the wind is blowing to the land it is no matter where we go.

278. If both were to leeward, which would you prefer?—There is no difference, in my estimation.

279. Suppose in running for Wick harbour you missed it, what then?—If you could not catch a harbour in a bay you would have as bad a chance on a point in thick weather.

280. If you miss Wick harbour would you be able to weather the land and get to the firth?—We might.

281. Say you ran for Peterhead or Fraserburgh and missed them, would you have a better chance than at Wick?—In a south-east gale I would get shelter in the Moray Firth.

282. Suppose an easterly gale?—I would then try to get to Cromarty.

283. Have you no fear of running for a bay when a gale comes on?—Not when I know there is good refuge for me.

284. In the event of your missing Wick in a south-east gale, would there be any chance of your saving your vessel? Would you not also have a bad chance of saving yourselves?—I would not be afraid to try to get to sea during the day, and we have Noss Head under our lee during the night, affording some protection.

285. Would you have more danger in running for Cromarty than Wick?—There is more danger.

286. Is there more danger in running for Cromarty from Peterhead, than running for the Pentland Firth from Wick?—In the first case I would have a long lee shore.

287. Would you rather run for the firth than attempt to make Cromarty?—Cromarty is safer; but we might sooner take a fair wind and a drubbing, so as to make a passage.

288. What then comes of all your evidence as to the dangers of the firth?—It is certain destruction if attempted at certain times.

289. Any more losses?—Yes, the *Sea Sprite* was lost in a south-east gale, with all on board. I saw a ship on her beam ends in the firth lose two of her hands under like circumstances.

290. Was this by the sea breaking on board?—Not in this case.

291. Would it be as likely to take place in the open sea as in the Pentland Firth?—By no means.

292. I want to know the extent of the losses, during your experience, to life and property in the firth during a south-east gale and a flood tide?—Those I have mentioned to you were of that description, and many others I do not now remember. It it very likely that many losses have occurred in the firth without a single individual being left to tell the sad tale. This was the case with the *Sea Sprite* of which there was not a vestige found, although there is no doubt she foundered there. A brig, belonging to Blythe, sailed from the Baltic with grain from Dublin, and was never heard of. I am sure that 10 or 12 such cases have occurred in my knowledge.

293. (*Chairman.*) It is stated in evidence before the Committee of the House of Commons that vessels are afraid to run down to the Moray Firth with a gale on shore, because when they near Cromarty the wind comes off the land, and, getting between two winds, they are not able to reach it. Have you had any experience on that point?—I had twelve years' practice of it, and can verify the statement if the wind is south-west, and I have got many a good drubbing going through it. But if the wind is direct from the sea it will not catch you, but will carry you direct to Cromarty. It is a leading wind.

294. My question referred to cases in which the wind blows from north-east to south-east into the land.—Such a wind is a leading wind all the way to Cromarty, and blows fair home to Cromarty Harbour. If we are at the south side of the firth the wind is shy, but if it blows from north-east to south-east it will take us to Cromarty.

295. Therefore, with a wind from north-east to south-east it is always safe to run to Cromarty as respects carrying the wind close home to the harbour mouth?—Yes.

296. Is there any difficulty in running for Cromarty in heavy easterly gales, or in gales from north-east to south-east, or anything in respect of the weather, character of the land, tides, or currents which makes Cromarty unsafe?—None of any importance.

297. The weather in the bight of the bay is not thicker than at sea?—Not unless with wind and rain.

298. Would it then be more hazy than at sea?—I don't think it would be much.

299. Generally speaking, at what distance can you make the land in thick weather?—5 or 6 miles off.

300. Then the chief disadvantage of Cromarty is the ground you lose by running so far to leeward?—A vessel bound from Inverness to the south would take Wick sooner than Cromarty. If she leaves Inverness she would sooner get to Wick than Cromarty, because, if the wind comes from the north-east, she has a clear coast, but with a north-east wind she would not be able to have a clear coast at Cromarty. If a vessel is bound up the Moray Firth, with wind at south-west, if she catches the Caithness land, she gets a true set of the currents, but on the other side the current perpetually sets down when the wind is down the Firth, and the sea is so strong that a loaded ship cannot work to windward with any advantage.

301. (*Mr. Lindsay.*) You say that in leaving Inverness with a strong south-west wind you would rather run for Wick than Peterhead or Fraserburgh?—That is my opinion if there were a suitable harbour.

302. But suppose there were a suitable harbour at Fraserburgh, would you, if you could reach that harbour, prefer Wick?—If there were a harbour of refuge constructed where I think it ought to be, I would prefer Wick to either Peterhead or Fraserburgh.

303. If they were equally suitable?—If there were the same advantages at both places then I would think that the shorter the distance the better.

304. Then you prefer these to Wick?—Of course, as they would be further in my way.

DONALD GUNN examined.

WICK.

Donald Gunn.

26 August 1858.

305. (*Chairman.*) What is your name?—Donald Gunn.

306. Your occupation?—A pilot and fisherman at Staxigoe, two miles from Wick.

307. Have you been a pilot all your life?—I have.

308. Are you well acquainted with the Pentland Firth?—I have good reason, as I have been a pilot there for 50 years.

309. How many vessels on an average pass annually?—I have no idea, as I never kept any account.

310. How many a week?—Perhaps two or three a week.

311. In a month?—Half a dozen, or eight or nine, perhaps a dozen.

312. What is the general size?—From 100 to 1,200 tons, sometimes 1,500.

313. Are the larger proportion in the coasting trade?—Yes.

314. Have you any idea of the proportion?—No.

315. During a south-east gale with a flood tide what would you do with a vessel of 1,000 tons?—If she were weighty I would take different ways to shun it; I do not think it dangerous.

316. Suppose a 500-ton vessel, what would you do with her?—Take her through, of course.

317. During a south-east gale and flood tide?—Of course. I would go in off Duncansby, cut over, and get into the eddies and pass the flood tide.

318. In the case of a vessel of say 50 tons and upwards, has it ever occurred to you to be obliged to heave to, to wait the tide on account of the heavy sea?—Not a doubt of it.

319. Well, in vessels of 500 tons, would you hold the flood tide of any account?—Not a grain.

320. How low in point of tonnage would you regard a vessel as included in the remark you had made as holding the tide of no account? Could it be safe for a well-found vessel of 300 tons?—Yes. And as fit for a vessel of 1,000 tons, and handier too. A vessel of 150 tons could manage to get through the Pentland Firth so long as a boat could board her.

321. Suppose a south-east gale with a flood tide, would you consider it consistent with your duty, suppose you are pressed by the captain to run through?—No. I would heave to till the tide began to slack.

322. Does that include vessels up to 150 tons?—Yes, the sea takes off when the tide slacks.

323. And a vessel of 250 tons?—I would do the same with her.

324. If 300 tons?—All the same.

325. If 1,000 tons?—All the same.—If I thought the tide too strong, I would heave to and hang off. I would just please myself, and do what I thought was the best.

326. (*Mr. Lindsay.*) You say you would do the same with all sizes of vessels?—Quite the same.

327. Would there be any risk in heaving to in the circumstances you speak of?—Not a grain.

328. Would it be a right thing to heave to?—If the tide was against us it would, and it would be all the same with a vessel of 500, 300, 200, 150, or 100 tons.

329. During your 50 years' experience of the firth you have seen a great number of vessels taking the firth?—Yes.

330. What loss of life and property have you seen?—I have never seen very much.

331. Have you seen many instances of lives being lost?—Yes, when there were no pilot to get on board.

332. Do you think there is a greater loss in taking the Pentland Firth than in taking ordinary channels?—Yes; there is no place of refuge, and you must run the firth.

333. Do you think the danger greater than the risks of ordinary navigation?—It is a dangerous passage for those not acquainted with it, but to those who know it there is no danger.

334. In your long experience on the coast are you aware of any large loss of life among the fishermen?—Yes.

335. Do you recollect any particular occasion besides 1848?—I don't remember any in particular. I have seen many losses about the harbour and mouth of the bay, but none so great as in 1848.

336. Do you remember the spots where these losses took place?—In different parts, but generally close by the harbour among the breakers.

337. Suppose there had been a pier made, would these lives have been saved?—Yes.

338. (*Captain Washington.*) At what rate does the spring tide run in the Pentland Firth?—About 9 knots.

339. Are the ships pretty fast sailers?—They have just enough ado to run over the spring tides.

340. When this tide is running how do you generally manage a vessel?—I would run her into the eddies.

341. Would you try to cross and go down to the Orkneys?—Yes; if I got hold of the eddy.

342. Any difficulty in getting to it?—No doubt a little, but it can be done.

343. I am afraid, Donald, you are thinking we are doubting your knowledge of piloting, but we are not?—I don't care whether you do or not. I rather took a thocht of that.

344. I want to know if you generally advise vessels to pass through the firth. Remember you are a pilot of 50 years' standing, and it may go out to the world that you recommended vessels to go through the firth under dangerous circumstances?—I have done it.

345. Is it your general practice?—Not to a great extent.

346. How many vessels have you seen go through the firth in one day?—I have seen as many as 150 in 24 hours.

347. Had they all pilots? They had not all Donald Gunns on board?—They had not all pilots.

348. Did they know what to do? Would they with a nine-knot flood dare to go through the firth?—They might.

349. What would happen if they did? Would they get their decks swept?—No.

350. Then there is no particular danger in the firth?—Ah!

351. Have you ever been across the North Sea or English Channel?—No.

352. Did you ever hear of such a dangerous race as the Pentland Firth?—I don't know.

353. How many of the 150 vessels you refer to had pilots?—I can't say.

354. Where were they bound?—They were going to America.

355. Was the weather fine?—Yes.

356. Where do they pick up the pilots?—At Noss Head, Sinclair's Bay, and Duncansby Head.

357. Do many vessels anchor in Sinclair's Bay?—A good many, but I cannot state the number.

358. Do you think those vessels would come into Wick if they had the shelter?—Yes.

359. Have you heard of Wick Bay being made a harbour of refuge?—Yes.

360. Suppose it were made, would many vessels go in?—Yes; it is not so convenient to go to the Orkneys with a wind from north-west round to south.

361. In the case of a breakwater being built here, would it be much used?—Oh, yes.

362. (*Mr. Lindsay.*) In the case of a south-east gale do you think they would run for Wick in preference to the Orkneys?—In coarse weather.

363. Is it your opinion that during a strong south-

WICK.

Donald Gunn.

26 August 1858.

Mr. Lindsay.

east gale, with a good harbour, a vessel caught by dirty weather would prefer Wick to going to Longhope?—In coarse weather they would be unable to get a pilot, and would therefore prefer Wick.

364. If it were so strong that a vessel could not get a pilot to take her into Wick, would it be as safe as to go through the Pentland Firth?—There would be no danger in getting into Wick.

365. Is there not much more room in the entrance to the firth?—Yes, of course.

366. If it were clear weather, and if you were caught with a strong south-east gale, would you prefer the firth or Wick?—If the wind were east-north-east I would enter Wick, as I could not get round Duncansby Head. But there is no place of safety at present.

367. (*Captain Washington.*) Then it is your opinion, as a 50 years' pilot, that were a breakwater built at Wick it would be good for ships and boats?—I do think so, and for the preservation of men's lives.

368. If it were brought out as proposed in this plan, would you have one or two entrances?—One is plenty.

369. Where?—In the centre, a little to the northward.

370. Why?—Because it would give more shelter from south-east winds.

371. Which of those two plans would you prefer?—Rendel's, and that to the line of Proudfoot, or a small bit within it.

WILLIAM BRUCE, Pilot and Fisherman, Broadhaven, examined.

William Bruce.

372. (*Chairman.*) How long have you been a pilot?—Since I was 16 years of age. I have been going in and out nearly ever since.

373. For how many years?—37.

374. Can you give us any idea of the proportion which the coasting trade of the Pentland Firth bears to the foreign?—These several years back the foreign trade has not been so brisk as formerly: the coasting trade is the greater part.

375. Were you ever in the Pentland Firth with a vessel with a south-east gale and flood tide?—No common sailing vessel can cut the tide. She must be run from one eddy to another, or dodge in the south side of Duncansby Head before attempting to go through against the height of the spring tides.

376. Would a pilot, thoroughly well acquainted with the firth, by availing himself of the eddies, have any hesitation in heavy weather in attempting to run a vessel through?—None.

377. And that at all times of the tide?—If the wind were sufficient to allow her to enter the inner channel, but not the strength of the channel.

378. If you had a commanding wind while in the eddy tide you would have no difficulty in running?—No.

379. Now are there any particular states of winds in which there is more certainty of a commanding breeze than others?—Yes; a wind from south-south-west to east-north-east and north-east suits going to the westward, and we can keep the eddies also; but if the wind were from the north-west we cannot keep the eddies so well.

380. Is there much difficulty in heavy weather and flood tides with the wind from the eastward in vessels being boarded by pilots?—Yes, very often. It is only in moderate weather that a pilot can be got. Particularly in south-east breezes they cannot get out to the ships.

381. Under such circumstances would you consider it unsafe for the captain, unless he were very well acquainted with the firth, to run through with his vessel?—Yes, unless perfectly well acquainted.

382. To what size of vessels does this refer; because, in point of safety, a vessel of 1,500 to 2,000 tons is differently circumstanced from a smaller one?—A vessel of from 300 to 80 tons is suitable for running. A ship of 300 tons is handy if she has not a large draught of water. One of 80 or 90 tons is also handy. You can go with small coasters where you cannot with larger vessels.

383. This applies to a vessel with a pilot?—Yes.

384. But supposing she has no pilot, would you be disposed to say that in the case of a well-found vessel of 200 tons the captain would act prudently in attempting to run his vessel through with a flood tide?—Not many would attempt it; he might try, but he would likely be driven back, and he would then dodge and wait till the tide turns.

385. In your experience has it occurred to you to notice many vessels run into the firth in heavy weather unacquainted with the locality, and then failing in their object to haul off and heave to?—I have seen many lost in consequence. I have repeatedly known vessels founder between the Pentland Skerries and Duncansby Head. I have seen them do so in daylight. I have known of four foundering between these heads.

386. You are therefore of opinion that a harbour of refuge at Wick would be of great advantage to the passing trade?—It would, no doubt. It would save a great many wrecks in Sinclair's Bay and north of it; but as there is no refuge at present, with a flood tide many vessels are driven ashore.

387. (*Mr. Lindsay.*) Do you think there would be more danger in running for the Pentland Firth than for Wick Harbour?—There would be no danger in running for Wick Bay, and it is very rarely you can run for the firth without danger.

388. Suppose you could get no pilot on board?—I would enter Wick without a pilot.

389. Have you known many vessels to founder, having no pilot on board, between Duncansby Head and the Pentland Skerries?—Perhaps 10 or 12 lost or foundered with all hands in attempting to take the firth with a south-east gale and a flood tide. Four or five of them have occurred to my knowledge not many years back.

390. How many vessels go through the firth annually?—It is greatly diminished since I remember.

391. Foreign and coasting vessels; what is the cause?—I cannot say, unless the trade is diminished.

392. The trade of the country during the last 37 years has very greatly increased, has it not?—It may be so; but foreign ships have diminished on this coast. I remember to have seen 70 or 80 vessels at one time for America and the West Indies, and now not so many will go the whole spring.

393. Do they take a different route?—Many go to the north of the Orkneys; they don't venture there early in spring, to avoid being knocked about and put back.

394. Are you aware of any large losses among the fishermen?—Yes, in 1848.

395. Any other?—There was one not long since, when two of the steamer's boats were lost in the bay with six men.

396. Did the boats swamp?—Yes.

397. Suppose there had been a harbour of refuge in Wick, would that calamity had been prevented?—Not one of these men would have been lost.

398. Did you ever know of any of the boats swamping at sea?—I have heard of one.

399. With regard to 1848, I believe the bulk of the lives were lost in Wick Bay?—Yes; one boat in attempting to take Staxigoe foundered with all on board.

400. Do you recollect the limits of where the 100 lives were lost on that occasion?—Principally between the Ord of Caithness and Duncansby Head, and I believe some on the opposite side.

401. (*Captain Washington.*) Is the land at Wick easy to make?—Yes; it has excellent landmarks, such as Noss Head, where there is an excellent light.

402. Is it serviceable?—Nothing like it. It is a landmark by day and a light by night.

403. There are also very high hills which are easily recognised at sea?—Yes, the Paps of Caithness.

404. They are the most remarkable hills along the north-east coast of Scotland?—They are.

405. Before Noss Head lighthouse was erected were there many wrecks in Sinclair's Bay?—Yes.

406. Have they diminished since?—Very much.

407. Supposing a refuge harbour were made at Wick would vessels come to it?—Certainly, they would prefer a harbour to an open bay such as Sinclair's Bay.

408. Would you prefer a central to a side entrance?—I would like an opening in the centre.

409. Do you think that many vessels would enter Wick if a breakwater were erected?—They would, particularly the North American vessels. I have been eight days between Tarbet Ness and Duncansby Head tossed about in a vessel.

410. At such a time would you have been glad to come to Wick?—Certainly.

411. (*Mr. Coode.*) Can you give any idea of the loss of life between Duncansby Head and the firth?—I remember 4 schooners with from 3 to 5 hands in each. One brig ran ashore at Keiss, and lost one or two hands. She belonged to Montrose.

412. You have some knowledge, you say, of 10 to 12 vessels?—Yes; and they would have an average of not less than 4 hands each.

413. How many vessels have you seen at one time in Sinclair's Bay?—10 to 20 sail. It is no rare sight to see vessels in Sinclair's Bay almost every day with wind from north to south-west.

414. (*Chairman.*) How long is it since you were tossed about for 8 days?—20 years ago.

415. Were you unable to weather Tarbet and get to Cromarty?—We twice ran for Tarbet with heavy snow showers, when the wind veered to south-west and put us back in the direction of the Orkneys. The vessel was bound for Liverpool.

416. During these eight days how was the wind?—From north-north-east, north east by east, veering round by showers of snow.

417. The following question and answer appear in the Harbour of Refuge Committee's Report of this year: "Does it consist with your knowledge that a "ship running for Cromarty, with a north-easterly "gale, frequently meets with a wind at the upper "part of the firth blowing downwards that prevents "her getting into Cromarty at all?—It is a very rare "occurrence to go into Cromarty with a fair wind. "I have done so on some occasions; but when we "get to Brough Head the wind comes down almost "usually out of Cromarty." What is your opinion about that?—There are so many high lands about Cromarty; there is no point from which a contrary wind does not blow after entering the Sutor Head.

418. Do you consider the wind from north-east to south-east blows fair into Cromarty Firth?—About east-north-east right up.

419. And how far does the wind blow so as to rely upon it?—If the wind is east or east by south, Cromarty can be entered perfectly well; but if there is any northing in it, you always meet the wind coming in.

420. Does this apply to south-east and south-south-east?—No; it is always a true wind.

421. Supposing a breakwater is placed according to Mr. Rendel's plan, where would you, as a pilot, put the entrance?—In the centre, with a small bit of an overlap.

422. In regard to fishing boats, is the centre the most suitable for them?—I think so. Rollers always break bodily into the bay. I would not fear any cross sea from the backwater from the heads. The opening would make a clear channel for itself.

WILLIAM STEVEN, Pilot, Staxigoe, examined.

423. (*Chairman.*) What is your name?—William Steven.

424. Your occupation?—Pilot and fisherman for 54 years.

425. Have you been here during the examination of the last witness?—Yes.

426. And you have heard his evidence?—Yes.

427. Can you give any information as to the proportion of foreign and coasting trade passing through the Pentland Firth?—I cannot say. The foreign traffic has fallen off, but the coasting trade has risen, and is in the majority now.

428. To what do you attribute the falling off?—I don't know.

429. Has it ever occurred to you to witness vessels in heavy weather attempting to enter the firth, and, finding themselves unable to cut the tide, stand off?—Very few; if night were coming down they might do it. If daylight, they would endeavour to stem the tide.

JOHN SUTHERLAND, Fisherman, Wick, examined.

430. (*Chairman.*) How long have you been a fisherman?—Since I was about 9 or 10 years of age.

431. Have you ever been placed in great danger by being caught with a south-east gale?—Yes; the running sea on the bar is the principal danger. Always in deep water there is safety. In shoal water there is always great danger.

432. Have you ever had to throw your cargo overboard?—Several times.

433. Were you ever obliged to cut from your nets?—No. We have shaken fish out of them to lighten the boat.

434. Were you ever obliged to run and take shelter anywhere else than Wick, in consequence of the state of the weather?—No; but I have known plenty having to do so.

435. (*Mr. Lindsay.*) Were you fishing in 1848?—Yes.

436. Were you at sea on the 17th August of that year, during the storm?—Yes, we ran for Pulteneytown harbour, where we got in by one o'clock.

437. You remember the loss?—Quite well.

438. Where was the loss?—Principally at the quay head, or a little without it.

439. Among the breakers?—Yes.

440. If there had been a breakwater in the bay would these losses have been prevented?—There is do doubt of that.

441. Is there any other harbour in the neighbourhood?—No safe one.

442. You know Broadhaven?—There is no great safety in it. It is already lumbered with boats.

443. What number of boats would it contain?—From 100 to 150.

444. With safety?—Few boats can be there in safety.

445. Do they prefer Wick?—Yes. I have known the Broadhaven boats run to Wick for safety.

446. How much of the gunwale of the boat is above the water when she is laden with herrings?—About 10 inches to a foot.

447. If the weather were rough?—There would be great danger.

448. (*Mr. Coode.*) You know the bar?—Yes.

WICK.

J. Sutherland.

26 August 1858.

Mr. Coode.

449. In what particular spot is it?—It shifts according to the gales. It is sometimes farther out than at others.

450. Would 100 to 150 boats get shelter in Broadhaven?—No.

451. What number would lie there in safety?—I cannot say. It is no very safe place.

452. If you run into Broadhaven could you beach your boat and draw her up?—Only a few boats could do that.

453. Could boats ride safely there during a heavy easterly gale?—No.

JAMES BRUCE, Fisherman, Pulteney-town, examined.

James Bruce.

454. You are a fisherman?—I have been so all my life, since the age of 9 or 10.

455. Have you ever been in danger of life in prosecuting the fishing in heavy weather?—Very often.

456. Have you ever thrown your cargo of fish overboard?—Sometimes at sea.

457. Why?—In stress of weather, to lighten the boat.

458. Have you ever cut away your nets?—None, except a few old ones, when we had plenty of herrings.

459. Would you prefer an opening in the centre, or at the side, in a breakwater across the bay?—In the centre; it would be smoother water, and it would give a vessel more room to reach out.

460. Where does the line of current run?—From Old Kilns to Proudfoot Rock. I prefer the breakwater outbye, as the sea does not break so heavy there.

461. Have you any opinion as to whether the tide has any effect on the sea which runs into the bay?—Not much; it runs pretty fair across, from one point to the other.

462. Are you quite sure you noticed no change in the sea when there is more or less tide running across the bay?—Very little difference.

463. (*Mr. Lindsay.*) How old are you?—67 years.

464. Have you been a fisherman 55 or 56 years?—Yes.

465. Do you remember the great loss of life in 1848?—I do. There was never any here like it.

466. The gale in 1848?—There were not so many lives lost, but there were more than 100 boats.

467. Where?—About the bay.

468. (*Captain Vetch.*) What is the strength of the stream of tide across the mouth of the bay?—In spring tides about 3 knots close in shore.

469. What is the velocity of the strongest?—I don't know, but at times it runs very fast.

Friday, 27th August 1858.

PRESENT:

Admiral HOPE (Chairman).

Mr. LINDSAY. | Mr. COODE.
Captain VETCH. | Mr. SEWELL, Secretary.

Mr. PATRICK MAY re-examined.

Mr. Patrick May.

27 August 1858.

470. (*Chairman.*) Do you think that it would be a public benefit to have a harbour of refuge as near to the Pentland Firth as possible; and would you in that event prefer Wick to Peterhead as a site?—I would.

471. Is the Pentland Firth in your opinion more dangerous than the Moray Firth, the Firth of Forth, or any other part of the coast?—It is far more dangerous; there is no comparison at all. I should consider it the worst part from Cape Wrath to Flamborough Head.

472. Suppose a vessel on this side of Caithness were overtaken by a gale from the south east, would she be in great danger?—Not unless she were close in shore.

473. If she were a little distance off, say four miles?—She could run for Cromarty; but if it blew strong from the south and she were close in shore, she would be in danger; and if Wick were available she could bear away for it.

474. Would a vessel be in as great danger at Peterhead as at Wick, with a gale blowing on the shore? If not, state why.—Peterhead projects more into the sea than Wick, and is not affected by the dangers of the Pentland Firth. In that case, suppose no harbour were at Peterhead and a vessel before being too close in saw the land, she would bear away for the Moray Firth.

475. Do you think Cromarty is as easily taken by vessels unable to get to Peterhead, or, in other words, is Cromarty as serviceable as a place of shelter to Peterhead as to Wick, or more so?—I should say it is, with the wind on the shore, it is as serviceable to Peterhead as to Wick.

476. (*Mr. Lindsay.*) Why would you prefer Wick to Peterhead as a site for a harbour of refuge?—For no other reason than the dangers attending the Pentland Firth in south-east gales in strong flood tides.

477. Would not Peterhead be more in the track of vessels than Wick?—I should say not. Ships returning from the Baltic to Ireland, America, or any part of the Irish Channel, would not go in the direction of Peterhead to go through the Pentland Firth; and after passing Peterhead, although the weather might be fine, then a vessel in her course from Peterhead to the south might be caught by a heavy gale of south-east wind.

478. Is Peterhead not more in the track of vessels from the east coast and channel ports of England to the Baltic?—In that case a vessel has nothing to do with either Peterhead or Wick.

479. Is not Peterhead more in the track?—It is nearer by about 90 miles.

480. Then, if you are forced to take a harbour of refuge, surely you would prefer Peterhead to Wick, as it would be 90 miles nearer to you?—Yes.

481. Well, is not the proportion of vessels trading between the Baltic and the east coast and English Channel far greater than the vessels trading between the Baltic and Ireland and America?—I am not able to give an opinion, as I do not know the proportion of vessels. I am rather inclined to think there are more vessels going through the firth than to England and Scotland together, I mean the coast trade as well as the Baltic, all these go through the firth.

482. But I am asking you with regard to vessels coming from the Baltic, Archangel, &c., are these not more?—I do not know.

483. Are there other harbours you could take between the Firth of Forth and the Pentland Firth?—Cromarty is one.

484. Can you take Cromarty at all times in safety? —Yes.

485. Have you never found a difficulty with variable winds in getting into the bight of a bay?—I have.

486. Have you run for Cromarty during easterly gales?—Not blowing heavy.

487. Have you found the wind variable in running for Cromarty?—I have found the wind very variable, but the entrance is easy. It is only in light weather I have seen it variable. I think in a heavy gale there would be no danger of contrary winds.

488. Why do you consider the Pentland Firth more dangerous than the Moray Firth, the Firth of Forth, or any other part?—In consequence of the very strong tide in it. It is considered by seamen that the Pentland Firth is the worst part of the sea in the whole kingdom.

489. What is the width of the firth at the narrowest part?—I should say that from Stroma and the Men of May the channel is not above 2 to 2½ miles wide.

490. Is it deep water?—Deep, but very dangerous with a calm; as the tide shoots nearly from one point to another, and in some cases overlaps.

491. Do you consider it as dangerous with calms as with gales?—Nearly as much so. I have the same objection to go through with a light gale as an easterly gale.

492. But you would not hesitate with an ebb tide? —No.

493. (*Chairman.*) Where did you say was the narrowest part?—From the Men of May to Stroma.

494. Are you sufficiently well acquainted with the firth to take a vessel into slack water with a flood tide for the purpose of getting through?—I sometimes do it. I am not a pilot. I never took a pilot through the firth. I would consider it a disgrace for us coasters to take a pilot; but the pilots are best acquainted with the tides.

495. As a general rule, from your knowledge of the generality of coasting vessels, do you think they venture in blowing weather to take advantage of the slack water?—I never saw a vessel get into slack water, I would rather take the channel. Suppose I lost a spar in the slack, what would become of me? I would run the risk of losing the vessel and cargo, I would not do so in a heavy gale.

496. Has it ever occured to you to see a vessel doing it with a pilot on board?—I have never seen it.

497. It has been stated in evidence that Longhope, Widewall, St. Margaret's Hope, and Deer Ness are difficult of access, is that your opinion?—I consider that they are all difficult of access, excepting to such men as are acquainted with the Orkneys. Few strangers would run to the Orkneys in bad tides to look for a harbour. I would not wish to do so.

498. State your reasons for not wishing to do so, taking into view the charts we go by at sea?—To run for the Orkneys by such charts, there are so many islands, and rocks, and sounds that a stranger is apt to mistake the one for the other, and get embayed, when he would not be able to bring up.

499. Have you any other reasons?—That is my chief reason.

500. As a general rule do the coast vessels use larger charts?—They do. They are a little smaller in size than greater-priced charts.

501. Do they use charts of the same scale as the Admiralty charts?—Perhaps about half the size.

502. Is Longhope a safe anchorage in blowing weather?—It is. I consider it safe.

503. Is the holding good?—I consider it is.

504. I was told the other day that gusts of wind are so violent in Longhope that vessels are often forced from their anchorage, and driven to sea?—I never saw any case of the kind, or knew of it; but from my knowledge of the harbour I would not venture to contradict it.

505. What do you say about Widewall Harbour in that respect? on the lee side of the bay do vessels ever drive from their anchorage there, and go on shore?—I never knew of it; but I don't consider Widewall a good harbour. It is a long time since I was in it, and to my knowledge then, the water was very shoal, at least the part where I was in.

506. And in order to get a good shelter you must go into shoal water?—Yes.

507. (*Mr. Lindsay.*) You said you would consider it a disgrace to take a pilot going through the Pentland Firth. Is this the case at all times?—Yes.

508. If it is the case, then the difficulties and dangers of the passage can't be so great as you state them?—I will tell you my reason. Out of 103 vessels belonging to my port not a single master takes a pilot, even when entering the bar of Liverpool; therefore I should take it as a disgrace were I to do it going through the firth.

509. Do you consider there is greater danger and difficulty in entering the firth than Liverpool, to which place you have been accustomed to trade?—All my fear in entering the firth is the sea in a gale, or the tide in a calm; but in entering the bar of Liverpool by night or by day we must know all the banks and marks, otherwise we loose our vessel.

510. The harbours of refuge in the Orkneys are difficult of access?—Yes, to any one not acquainted.

511. Do not a large number of vessels take refuge in them at times?—At Longhope principally.

512. In your experience has there been a large loss of life and property in consequence of this?—I have often heard from other masters of great losses of many vessels and crews; but I do not know of my own knowledge.

Mr. James Dunnet re-examined.

513. (*Chairman.*) Do you think it would be a public benefit to have a harbour of refuge as near the Pentland Firth as possible, and do you in that event prefer Wick to Peterhead as a site?—I would.

514. Is the Pentland Firth in your opinion more dangerous than the Firth of Forth, the Moray Firth, or any other part of the coast?—It is.

515. Suppose a vessel on this side of Clythness overtaken by a gale from south-south-east, would she be in great danger?—I have been caught myself several times, but managed to get to Cromarty.

516. Would a vessel be in as great danger near Peterhead as at Wick, with a gale blowing on the shore?—I do not think there is the same danger in a south-east wind. The distance from Buchan Ness to Rattray Head is short, and you have a clear firth to Cromarty, nor there have you to wait for a pilot or for flood or ebb tides.

517. Do you think Cromarty is as easily taken by vessels unable to get to Peterhead, or, in other words, is Cromarty as serviceable as a place of refuge to Peterhead as to Wick, or more so?—More so to Peterhead than to Wick. A vessel off Peterhead with a south-east wind has the Moray Firth clear. A vessel getting through the firth, and caught with a south-easterly gale must go back again, as she could not be kept to windward, and must go back day or night if caught with a lee-going tide.

518. Would you venture to take a vessel into slack water to avoid the flood tide in the Pentland Firth in heavy weather?—I would not like to make free with it, because the rebound of the sea off shore must cause extra motion in the water, and a vessel under low canvass, coming under these high lands, is apt to get becalmed and find the wind variable, and not blowing in its regular course as in the open sea.

519. Do you consider that the prevalent opinion

WICK.

Mr. James Dunnet.

27 August 1858.

among men in charge of coasting vessels?—I cannot say. I know that every master whom I know will work towards the head, but not in heavy weather, and will prefer keeping off till the tide ebbs.

520. (*Mr. Lindsay.*) Do you take a pilot going through the firth?—No. In fine weather I act as pilot myself, and in rough weather I cannot get one.

521. In what trade are you employed?—Round the British isles to Hull and elsewhere.

522. Are you often through the Pentland Firth?—Many times a year. Sometimes twice a week. I was twice last week.

523. Do many shipmasters as a rule take pilots?—No; none of the coasters do.

Mr. WILLIAM BRUCE re-examined.

Mr. William Bruce.

524. (*Chairman.*) You know what tide and half tide is?—Yes.

525. Is there such a tide in the Pentland Firth?—Yes; but not in the centre.

526. From Dunnet Head to Freswick Bay does the flood and the ebb run for an equal number of hours?—No; the top of the spring runs for 3 hours south-south-west to south-west, but that is the eddy tide; and 9 hours of ebb tide runs about north-east to Dunnet Head.

527. How far from the land does the eddy tide extend?—Not half a mile at first; but in course of 3 hours it extends for 3 or 4 miles off half way between Duncansbay Head and Freswick.

528. From Dunnet Head to St. John's Point do the flood and ebb run an equal number of hours?—Close inshore.

529. There is no difference?—When the ebb commences to run to the west at any point it forms an eddy, and the tide runs the contrary way. This applies to flood and ebb.

530. From St. John's Point to Duncansby Head is there any difference in the ebb and the flood?—The difference is nearly the same except under the headlands.

531. When taking the side from Hoxa Head to Iron Ness are there any eddies which enable you to work with advantage in getting through the firth?—A variety of eddies and several cross tides to encounter.

532. Can you avail yourself of the tide to get through?—Yes.

533. (*Mr. Lindsay.*) In your experience, is there more danger in going through the Pentland Firth during calm weather or light winds than during south-east gales?—Yes, there is.

534. It appears that the wind which masters of vessels most dread is south-east gales and a flood tide?—It is.

535. How long does the flood tide last?—Six hours; in the eddies only 3 hours.

536. Do you know how many vessels have taken refuge in Longhope and the other harbours of the Orkneys?—The largest number I have seen at Longhope at one time is from 200 to 300.

537. Were they lying in perfect safety?—No; Because I have frequently seen them driven out of Longhope on to the island of Flotta.

538. Ships of all sizes?—50 to 1,000 tons, and even 1,200 to 1,400.

539. Have you known of any vessels being wrecked in Longhope?—Yes; with north-west winds I have seen them drag their anchors, and driven on shore. In no other quarters will they drive ashore there.

540. Have you ever known a vessel wrecked in a south-easterly gale in taking Longhope?—No; but I have seen it in calms.

541. What other harbours are there in the Orkneys?—Panhope is a small harbour not much resorted to, and is perfectly safe with the wind off the land. I never saw more than three or four vessels in it

542. Any other harbours?—Widewall Bay. But it gives no safety. It gives good anchorage for small vessels in 7½ fathoms water.

543. Any others?—Stromness, which holds the largest-sized vessels that frequent the coast; but it is difficult of entrance except to those who have been there before. I have seen 30 to 40 Greenland vessels in it at one time.

544. Any other harbours?—There is a variety of places where vessels wait the tides, but none of them are available as harbours of refuge.

545. Have you anything to add to your evidence of yesterday?—I have one statement to make: I omitted to make reference to the great number of pilots that have been drowned off this coast since I came here. There have been no less than 14 boats, with an average of at least five men.

546. Where did they belong?—Stroma, Freswick, Sinclair's Bay, Staxigoe, and one to the River of Wick. All these boats were occupied in piloting and fishing.

547. Where were they lost?—Between Noss Head and Dunnet Head.

548. Would a harbour of refuge have saved them?—It might not; but if it had not been that the ships had no harbours of refuge to run to, and consequently drew the pilots off, they would not have been drowned.

549. How many ships have been lost?—A good many. I hand in a return of a few. There are more, but these are some of them from 1834 to 1844, between the Ord of Caithness and Duncansby Head, during south-east and east gales.

550. In your opinion, would the whole or a part of these wrecks have been prevented had there been a harbour of refuge in the immediate neighbourhood on the coast?—Part at least, I am sure, but I cannot say how many.

551. (*Chairman.*) Suppose a vessel out of her reckoning by bad weather, and making for Mill Head, would Deer Ness Harbour be of any use to her?—Deer Ness is quite out of our district and track.

552. What about Kirkwall?—It is a very good harbour, but there are a great many shoals and tides on both sides of the entrance.

553. (*Mr. Coode.*) Do you know Gills Bay?—I do.

554. Is the holding good?—Very; but vessels never lie more than a tide in it, if they can help it at all.

555. What kind of bottom has it?—Sandy.

556. What is the strength of the tide outside?—7½ to 8 knots an hour. I never saw more than 3 to 5 vessels in it.

557. (*Chairman.*) Is Gills Bay safe in dirty weather?—Well, there is good anchorage in it; but few vessels enter it.

558. (*Mr. Coode.*) You know Brough, east of Dunnet Head?—It is of no use except in calm weather.

559. What harbours are used on the south side of the Firth?—None but Gills Bay.

560. Is Thurso Bay a good roadstead?—Capital; it is a great refuge.

Captain Tudor deposited with the Commissioners a large plan of Wick Bay by Mr. Rendel, the property of the British Fishery Society, with the view of the Commissioners obtaining tracings therefrom.

561. (*Chairman.*) Is there any person present who wishes to tender further evidence with respect to this inquiry?—(No answer.)

Sittings at Wick closed.

FRASERBURGH.

Monday, 30th August 1858.

PRESENT:

Admiral HOPE (Chairman).

Sir FREDERIC SMITH.	Captain VETCH.
Mr. LINDSAY.	Mr. COODE.
Captain WASHINGTON.	Mr. SEWELL, Secretary.

Mr. LEWIS CHALMERS examined.

564. (*Chairman.*) State for the information of the Commissioners anything that you have got to say on the subject of this inquiry. — I may mention at the outset that I am chairman of the Harbour Commissioners of Fraserburgh, and Commissioner for Lord Saltoun, the Superior of the Burgh; and as such, by your permission, I shall give a short account of the statistics of Fraserburgh harbour. Fraserburgh was originally called Faithlie, a Burgh of Barony, conform to a charter from Queen Mary, dated 2nd November 1546; but afterwards by another charter from King James VI., dated 4th April 1601, it was erected into a free port, free Burgh of Barony, and free regality, to be called in all time thereafter,— "The Burgh and Regality of Fraserburgh." It is situated close by the rocky headland called Kinnaird's Head. The Commissioners of the harbour of Fraserburgh act under powers granted by Act of Parliament, 2nd and 3rd Vict., cap. 65, and the Fraserburgh Harbour Amendment Act, 20 and 21 Vict., 1857. The Commissioners have done much since the first-mentioned Act was passed for the improvement of the harbour. As early as 1745 a stone pier was erected in the bay. In 1808 the north pier was built; and if we look to the Government Report on Harbours of Refuge, page 329, we shall find that the middle pier was built in 1830, at a cost of 5,654*l.*; and that there had been laid out in excavations during the last six years, as by that report, which was published in 1849, 2,103*l.* 4*s.* 7½*d.*, making a total of 25,702*l.* 4*s.* 7½*d.* At November 1857 there had been expended, chiefly in the construction of a new north harbour, including the last-mentioned sum, 50,099*l.* 11*s.* 9*d.* I produce a table, showing the imports and exports comparing the year 1837 with the year 1857; and I now lodge a copy of that table with the secretary. A very important traffic has sprung up of late years with the Orkneys and Caithness in cattle. In 1856 I have known about 1,500 head of cattle brought from the Orkneys to this district. The revenue of the harbour last year was 1,999*l.* 2*s.* 0½*d.* In the year 1797 the revenue was only 45*l.* The tonnage of vessels belonging to the port is, I think, mentioned in the table now lodged. The number of wind-bound vessels which entered the harbour during the last ten years was 1,453, representing an aggregate tonnage of 80,302 tons. This is taken from the harbour books. The number of vessels passing Kinnaird's Head in 1846, close to Fraserburgh, according to Captain Washington's "Report on the loss of life and damage to fishing "boats on the east coast of Scotland, in the gale of "19th August 1848," was no less than 7,700 laden vessels, supposed to carry a million of tons. I have no means of knowing the number at a later date. The number of vessels that have entered Fraserburgh harbour during the last ten years was 4,702, representing an aggregate tonnage of 160,895. This also is taken from the harbour books, and will be certified by the clerk and collector if required. There are five seal and whale fishing vessels belonging to Fraserburgh, representing an aggregate tonnage of 1,219 tons. The value of the cargo in 1856 was 12,613*l.* 17*s.* 6*d.* The herring trade is carried on to a considerable extent at Fraserburgh. In 1856, as appears from the fishery board's report, there were cured 44,215 barrels; caught but not cured 3,076 barrels; the number of cod 30,927 cwt., and 512 barrels cured in pickle, besides a considerable quantity of red herrings, whereby employment was given, it is supposed, to about 4,064 persons. As a herring fishing station, Fraserburgh is now second only to Wick. Last year the number of boats fishing in that district was:—at Fraserburgh 248, Pitullie 33, Rosehearty 41, and Pennan 9, making a total of 331. It has been stated that Peterhead is second to Wick, but we find that the number of boats fishing last year was 233, and at Boddam 26, making in all 258. In the present state of the harbour, and until the outer breakwater is prolonged, these boats can only make it in a gale with safety at two hours flood. A great many wrecks occur at Fraserburgh and in the neighbourhood. There was no loss of life, however, at Fraserburgh in the gale on the 19th August 1848, when 31 lives were lost, and property to the extent of 3,820*l.* at Peterhead. On that occasion the gale was from the south-east. The prevailing gales on this coast are from the south or south-east. The direction of the wind is taken every night at Kinnaird Head lighthouse, and I obtained my information on this point from that source. These books show that out of the 365 days in the year 1857, on 165 the winds were southerly, while only on 53 days were they from the north, while in the gale column 41 gales were from the south, and only 23 from the north. The number of wrecks which have occurred at Fraserburgh since 1848 was 26, and the supposed value, including cargo, 21,156*l.* This is taken from the lighthouse record. Mr. Stevenson, in his evidence given before the Select Committee of the House of Commons on Harbours of Refuge, says, that between Girdle Ness and Kinnaird's Head thirty-five wrecks had occurred in ten years in all that line of coast; so that Fraserburgh would appear to have had its due proportion, twenty-six of those wrecks having happened in its immediate neighbourhood. The position of Fraserburg would appear to me to be particularly favourable for a great national harbour of refuge. In support of this, if allowed, I would quote from government documents a few passages. First, from Captain Washington: "Report on the loss of "life and damage to fishing boats on the east coast "of Scotland, in the gale of 19th August 1848," at page 13 we find the following: "Fraserburgh is in "an admirable position close to the promontory of "Kinnaird's Head, the turning point of the shore, and "directly in the track of all the trade from the southward to the Moray Firth and the Caledonian Canal. "It is the head quarters of a fishing district, 22 miles "in extent, employing 428 boats, and 923 men and "boys." Turning to page 47 of same report we find the following observations:— "The situation of "Fraserburgh harbour is generally known, throughout "all the maritime towns in Great Britain, to be the "most north-east point in Scotland, and situated at "the mouth of the Moray Firth, consequently a place "much resorted to, and well suited for the accommodation of wind-bound vessels, fishing boats, and "others. It is 12 miles north of the latitude of "Peterhead, and about 8 miles to the westward of "its parallel of longitude; it lies in a bay which is "formed by Kinnaird's Head on the west and Cairnbulg Head on the east; the distance between these "heads in a straight line is about 2 miles, and the "depth of the bay inland within said line is somewhat better than a mile; its exposure is nearly

FRASERBURGH.

Mr. L. Chalmers.

30 August 1858.

Chairman.

" north-east. The shore from the interior part of " Cairnbulg Head to within half a mile of the town " is flat and sandy, and there is generally good " anchoring ground throughout the whole of the " bay." " A refuge harbour at Fraserburgh seems to " be absolutely necessary, being a station where " vessels bound either north or south about night " find shelter in storms." I would also quote, from Appendix C to the second Report of the Commissioners appointed to inquire into Tidal Harbours," Mr. Robert Stevenson's opinion of Fraserburgh, page 325, and Mr. Walker's opinion, page 327. Perhaps it is needless, having noted the pages, to read them over. The date of Captain Washington's report is 28th July 1849. I shall just quote Mr. Robert Stevenson's remark. The report is dated 1847. The date of Mr. Stevenson's report is 1818. He says: "From information received accidentally " by the reporter regarding the origin and progress " of the harbour of Fraserburgh, it appears that this " town is of very considerable antiquity, but till a " comparatively modern date its harbour was merely " an open bay, like that of most of the early harbours " of Scotland, having no piers for the shelter or " berthage of decked vessels. At that time it was " consequently resorted to only by fishing boats and " small craft, which could be easily drawn upon the " sea-beach out of the reach of the waves. From the " naturally convenient position of the bay of Fraser- " burgh for the shipping of the North Sea, the " Moray and Cromarty Firths, and also the coasting " trade of the north of Scotland, Fraserburgh, even " prior to the erection of piers, was at certain " times considered a place of refuge for small " craft in the stormy and tempestuous weather with " which the shipping of the coast is but too often " visited." And a little farther on, he says: "It " has also been considered so excellent a situation " for wind-bound vessels that about twelve or fifteen " years ago, a very general desire was expressed by " the shipping and mercantile interests of the numer- " ous ports of the Moray Firth and Firth of Forth, " and also on the English coast as far as Newcastle " and Sunderland, for the enlargement and improve- " ment of the harbour." Again at page 328, the same gentleman writes as follows:—"By the slightest " inspection of a map or chart of the German Ocean " or North Sea, it will be observed that vessels " overtaken by a gale of wind from the north, east, " or south-east have only the Firth of Forth and " Moray and Cromarty Firths to resort to in a storm, " all other ports and inlets of the sea upon the " British side being respectively shut up and ren- " dered inaccessible with these winds. It may " further be observed, that the land between Bu- " chan Ness and Peterhead to the south and Kin- " naird's Head or Fraserburgh towards the north " forms a prominent shore between the great estuary " of the Firths of Forth and Moray, and becomes a " turning point in the navigation of this port, and is " also the land most generally made by ships south- " ward-bound from the Baltic and higher latitudes." Further on he states:—"When a vessel has got to " the northward of Fraserburgh and meets with an " adverse wind, it is of importance to her safety to " get into that harbour, instead of again passing these " foul grounds in bearing away for the Firth of " Forth, *as Peterhead cannot be entered when Fraser- " burgh would be perfectly accessible.*" If allowed, I would also quote from Chambers' "Repository of Instructive and Amusing Tracts," where the following occurs:—"In 1736 an Act was passed authorising " the formation of a Board for the erection of four " lighthouses on the Scottish coast, Kinnaird Head, " Mull of Kintyre, the Orkneys, and the Isle of " Harris. The Board, however, was not appointed " till 1786. They entered on their duties with " spirit, and in December 1787 the Kinnaird Head " light was first shown." The limited works shown on the plan, which was laid before the Committee on Harbours of Refuge, as will be pointed out by Mr. Abernethy, are not meant to exhibit the works which will be required for a great naval station or maritime harbour of refuge; but the simple extension of the outer breakwater in water not too deep for its construction, but deep enough for any sized vessel (being an average of six or seven fathoms water at any rate), would provide a refuge harbour, such as it seems is so much desired on the north-east coast. In regard to the facilities for the erection of the harbour, I may mention that there is a first-rate quarry about 450 yards from the present breakwater connected with it by railway, which quarry is inexhaustible, and from which stones of any dimensions may be produced. This quarry the Commissioners are allowed, by the kind permission of the proprietor Lord Saltoun, to work gratis. The new north harbour is now well on to completion, although it will cost a very large sum of money to deepen, extend, and clean it. It affords a water area of 11½ acres, and additional quay room when the retaining wall along the shore is built of 3,020 feet; but it will never be a good harbour till the outer breakwater be continued to the outer Bush. I shall conclude by stating that in olden times there used to be, where the baths now stand, a battery, which was removed to make room for their erection.

565. Mr. Chalmers, you hesitated once or twice in the course of your statement as to whether you should read more at length, or not; I wish to ask you, before you sit down, if you are quite satisfied that you have put us in possession of all the information you wished?—Perfectly satisfied, because what I have not read I have referred to as at such and such a page of such and such a government document.

566. As I understand, Mr. Chalmers, you had arranged with Captain Washington, who came here previous to our arrival, that you were to put questions to the witnesses; is it so?—It is the wish of the parties themselves.

567. It is not in exact consonance with the mode of procedure which we have adopted hitherto, but our desire being to elicit the truth and all the information we can, we will follow that which you, from your local knowledge, are of opinion will be the most efficient way of obtaining it. Who is your first witness?—Mr. Abernethy, but I do not wish to examine him. I shall examine only the seamen and pilots, whose evidence will, I think, be best brought out by this mode of procedure.

568. (*Sir Frederic Smith.*) You stated that there were a certain number of wrecks within a certain period; can you, Mr. Chalmers, give the Commissioners any information as to the cause of the wrecks at those several periods?—I have a document at hand which will do so. That is, a list of the wrecks that have occurred at Fraserburgh during the last ten years, which I extracted from the record kept at Kinnaird Head lighthouse. In that list the date of the wreck is placed in one column, the name of the vessel in another, to whom belonging in a third, the name of the master in a fourth, the number of tons in a fifth, the value of cargo in a sixth, when wrecked in a seventh, and the cause of a wreck in an eighth, when the cause of wreck is known.

569. And the points to which they were destined and where they came from?—It does not show where they were bound to; but I will examine a witness by-and-by who will speak to that. The documents will be put in in evidence by Mr. Reid, the keeper of the lighthouse and of the register itself.

570. (*Mr. Coode.*) You stated, Mr. Chalmers, that Buchan Ness was the land generally made by vessels from the Baltic bo und south; is that so?—I stated Kinnaird's Head.

571. What course did these vessels take?—In a south-east gale they make Kinnaird's Head rather than Buchan Ness, whether they were bound north or south, in order to keep the Moray Firth open.

572. Can you state the proportion of vessels bound south for the Thames that make Buchan Ness?—All

vessels bound south desire to keep the Moray Firth open in a south-east gale, and all those vessels bound north and west of Fraserburgh invariably make Kinnaird's Head and Mormond Hill, and not Buchan Ness.

FRASERBURGH.

Mr. L. Chalmers.

30 August 1858.

Mr. ABERNETHY examined.

Mr. Abernethy.

573. (*Chairman.*) What is your name?—James Abernethy.

574. What is your occupation?—I am a civil engineer

575. State the information which you wish to offer relative to the subject of the present inquiry, observing that it will be desirable, so far as may be in your power, not to repeat that which is already before the Commission in an official shape, in the published evidence taken before the Committees of the House of Commons in the years 1857 and 1858?—That being the case, my evidence on this occasion must necessarily be very short. I need not again repeat the opinion which I gave before the Committee of the House of Commons, that I do not consider it necessary to treat Fraserburgh as an important point for a harbour of refuge for an extensive district of coast, because I am of opinion that, with the exception of Wick as an important fishing station, no harbour on the east coast of Scotland ought to be so treated. Therefore, I have confined the suggestions which I have offered to the Commissioners of Fraserburgh for the improvement of the harbour, by treating it entirely as a local harbour—a harbour of refuge for a limited extent of coast.

576. (*Mr. Lindsay.*) Then you are going to give your evidence holding the opinion you do that a great national harbour of refuge is not necessary on the north-east coast of Scotland?—I think it is not necessary. I think there is no one point that you can select on the north east coast of Scotland that would serve the purposes of a great harbour of refuge.

577. Then is it because you think there is no site on the north-east coast of Scotland well adapted for a great national harbour of refuge that you give that opinion?—No; I think there are sites on which you might construct a great harbour of refuge, but that harbour of refuge, if constructed, would be available only to a very limited number of shipping as compared with the shipping of the whole coast. That such an extensive work would therefore not answer the purposes of a national or general harbour of refuge; and if the Commissioners think fit I will briefly give them my reasons for holding this opinion. In doing so it may be necessary for me to advert to the claims of Peterhead. I would have much preferred to have made any statement regarding that port in the presence of the authorities at Peterhead, and more especially as I do not think the engineer to the Commissioners for that place is present; but if the Commissioners see fit I will now give my general reasons for the opinion I hold.

(*Chairman.*) Certainly, proceed with your statement.—The Commissioners will probably have before them the wreck charts for 1852, 1853, 1854, 1855, 1856. In dealing with the subject, I would divide the portion of the coast to be dealt with as between Fifeness and Buchness, and between Buchan Ness and the Moray and Cromarty Firths. As regards the first of these sections of the coast, because the easterly gales are exceedingly sudden in their occurrence, and that coasting vessels especially hug the shore in seeking their ports, I think it is manifest that in an easterly gale, there is but very little chance of vessels under ordinary circumstances, bound northward, weathering Buchan Ness point. I have myself, during my experience for ten years as an engineer at Aberdeen, often seen vessels fail to weather the Buchan Ness in easterly gales. As regards this first section of coast, a harbour of refuge at Peterhead would not be available. And if vessels, bound perhaps foreign, have sufficient offing off that coast to weather Buchan Ness Point, I think it is manifest that they would attempt to run into the Moray or Cromarty Firths, as they do at present. Between the Buchan Ness Point and the mouth of the Moray Firth, during on-shore northerly gales there, the same thing takes place. Vessels are caught between the various headlands between Buchan Ness Point and Kinnaird's Head, between Kinnaird's Head and Banff, and between Banff and Lossiemouth; and you will observe that at Lossiemouth there are a very considerable number of wrecks immediately to the westward. None of these vessels caught on this coast by an on-shore gale could by any chance reach a harbour of refuge at Buchan Ness. They would all be caught between these various headlands, and must go on shore if there is no port under their lee. At Lossiemouth there is a reef of rocks which extends immediately westward, called the Skars; and vessels in north-easterly gales generally go ashore there if they miss Lossiemouth. I think, therefore, that if a harbour of refuge were carried out at Peterhead to-morrow, it would be available for only perhaps one or two solitary vessels that managed in easterly gales to struggle round the Buchan Ness Point, and that it is more advisable, for the safety of the shipping generally, to improve and enlarge the existing harbours within the bights of the bays, and adapt these as much as possible for refuge purposes, than to construct a great harbour of refuge which could not be accessible to the great majority of the shipping in gales on this coast. Entertaining these views, in advising the Commissioners of Fraserburgh harbour, I pointed out to them that it ought to be treated, like all the others, as a mere local harbour of refuge for a given district of coast. But supposing that the question of a general harbour of refuge was entertained, setting aside my own views altogether, I say that the port of Fraserburgh offers much greater facilities in every point of view for the construction of such a work than Peterhead, and that with a much smaller sum of money a greater extent of anchorage can be secured. I find, from the evidence given by Mr. Stevenson before the Committee of the House of Commons, that for a sum of 300,000*l.* he proposed to provide 200 acres of deep water. I expressed my doubts before that Committee, as to the possibility of affording any such extent of sheltered anchorage for such a sum of money; and on examining the plan now appended to the report of the Committee of the House of Commons, I find that there are only 96 acres of what you might call deep water anchorage, that is, of three-fathom depth and upwards, instead of 200 acres; and I believe it will be proved to the Commissioners, that a considerable portion of that is foul ground. Therefore, setting aside my own opinions altogether, as to the advisability of having one harbour of refuge on this coast, I have caused a plan to be prepared of an extended harbour at Fraserburgh, by prolonging the pier 1,500 feet, as I originally proposed, to the extent of 1,500 yards; and I find by doing so, that a much larger area of water space, with clean ground for anchorage, is secured than can possibly be obtained at Peterhead. For by extending the pier this distance, there will be included within the two-fathom line and upwards, 195 acres of anchorage, within the three-fathom line 151 acres, in round numbers, and within the four fathom line 97 acres—a much greater extent than can be provided at Peterhead by the construction of the breakwaters shown in the plan appended to the Committee's report. And I believe it will be proved that the anchorage here is composed of blue clay, with a slight stratum of sand above it, entirely free from rocks. I will put this map in evidence. Perhaps it is unnecessary to point out to the Commissioners, that during

FRASERBURGH.

Mr. Abernethy.

30 August 1858.

the east and south-east gales the harbour of Fraserburgh is sheltered by Cairnbulg Point. Therefore it is only open to the north-east seas, and provided it were sheltered from them it could be entered by vessels at all times and under any circumstances.

578. (*Sir Frederic Smith.*) Have you made an estimate of the extension of the pier at Fraserburgh?—I have not, but I have no doubt that that extension could be executed for a much smaller sum than a similar length of pier at Peterhead, inasmuch as the situation is much less exposed, and the site altogether more favourable.

579. (*Chairman.*) Then you are of opinion that the best system for the protection of the passing trade along the north-east coast of Scotland, is an improvement of the several harbours along the coast, in preference to the construction of any one single large harbour of refuge?—I am; all the present harbours on this coast are high-water harbours. Great number of wrecks occur at the period of low water, when vessels cannot enter them; and if by extending the existing works you could provide deep water at that period, I am of opinion that few wrecks would occur.

580. From what quarter is the heaviest weather on this part of the coast?—At Fraserburgh, the north-east sea is the heaviest sea; at Aberdeen, from east and south-east.

581. From what quarter does the wind blow hardest?—We find the eastern and south-eastern gales the hardest.

582. From what quarter do the south-east gales generally commence, and by what weather are they generally preceded?—The weather is generally murky and cloudy; and the gale, commencing from the south-east, generally travels round to the east, and gets round to the north-east. I have noticed that at Aberdeen the easterly gale is more southerly than at Fraserburgh. A vessel caught off Aberdeen in an easterly gale would find, when she gets round to Fraserburgh, that it is northerly. I have noticed at Aberdeen very fine weather, and after a lapse of four or five hours a strong gale blowing; so sudden are easterly gales in their occurrence.

583. How long, as a general rule, do these gales last?—I have known them last from two to three days, but as a general rule a shorter period of time.

584. Would you say then, that the gale commences one day, blows hard the next, and breaks the third?—The gale lasting three days would probably increase in strength the second day, and gradually die away. But at times it blows hard almost at the commencement of the gale and continues so. Vessels after leaving Aberdeen, and but a short distance out of the bay, have been caught in these gales and wrecked.

585. When the wind gets round to the north-east, do they generally break?—They generally die away.

586. How do the heavy north-easterly gales commence on this coast?—Not having resided at Fraserburgh, I am not prepared to speak decidedly on that point.

587. But on the coast from the Firth of Forth to the Pentland Firth generally? If you can give me any information on the subject, tell me what you know from your own knowledge?—In many cases they are extremely sudden, commencing within a few hours to blow a strong gale. As a general rule all the gales from the east are sudden in their occurrence on this coast. I might give one instance which is exceedingly well known in Aberdeen. A whaling vessel called the *Oscar* left the port, went out into the bay, and in a few hours was in pieces on the rocks.

588. (*Sir Frederic Smith.*) Mr. Abernethy, in giving an adverse opinion to the formation of any one great harbour of refuge, you seem to base that opinion upon the effect of north-easterly gales; but I shall be glad to know what your opinion would be of a harbour of refuge at Peterhead or at Fraserburgh, with regard to vessels bound southward in a south-easterly gale and being south of Peterhead. Would a harbour of refuge then not be valuable either at Peterhead or Fraserburg?—In a south-easterly gale of course the vessel would not as a general rule proceed to the south. For instance, if in the Cromarty Firth, she would remain there.

589. Would not that be 100 miles out of her way?—If caught by south-easterly winds south of Buchan Ness, the probability is vessels would run back, as they do now, to the Cromarty Firth.

590. Is not that an evil?—If they had a fair wind they would go round by Kinnaird's Head, in a south-easterly gale; running into Peterhead would be attended with extreme risk, even if a harbour of refuge were constructed there. All vessels would prefer running before the wind in a south-east gale to passing into Peterhead, because the sea would run so high and irregularly between the heads of the proposed piers that there would be great danger in taking it even with a much wider opening.

591. That is, with reference to Peterhead, but I am talking of Peterhead and Fraserburgh; would you say that in these circumstances no harbour of refuge would be necessary or desirable?—In a south-east wind a vessel could enter Fraserburgh harbour.

592. But you recommend going into Moray Firth, where they might be caught in an easterly wind?—Under existing circumstances, but if a harbour of refuge was provided at Fraserburgh, vessels in south-easterly gales would enter that harbour, and so obviate the necessity of proceeding to the Cromarty Firth.

593. (*Mr. Lindsay.*) I think you said, Mr. Abernethy, that you proposed to carry out your original plan from 1,500 feet to 1,500 yards?—Yes.

594. What was your estimate for the 1,500 feet?—I think 80,000*l.* with contingencies.

595. You said that you had not had sufficient time to calculate an estimate of the pier extended for 1,500 yards?—That is the case, because it was only this morning that I turned my attention to this extension.

596. Well but, if 1,500 feet in comparatively shallow water cost 80,000*l.*, three times that length of pier in much deeper water would cost a great deal more than three times that sum?—It would. I am calculating, of course, only roughly, but I would not put down the estimate for that extension under 400,000*l.*

597. You would not put it down under 400,000*l.*?—I would not; and I think the estimate of 300,000*l.* for the breakwaters at Peterhead very low.

598. Would you state to the Commissioners how you would construct so great a length of pier as 1,500 yards?—I may at this point state that probably I shall on a future occasion have to bring before the Commissioners my views on the subject of the construction of breakwaters. I am at present preparing detailed plans and drawings for this purpose. They are not in a state now to be produced, but I may state that I do not propose to follow the mode of construction that has hitherto been adopted. The class of material, as a general rule, is much too small. Stone of a great size, in any quantity, is difficult to be procured. I shall be quite prepared on a future occasion to give my views on this subject at length.

599. But could you not give the Commissioners at present an outline of your views as to the mode of constructing such a pier as this, say that the Commissioners had agreed to recommend such a pier?—If time is granted, I shall furnish the Commissioners with detailed drawings, showing the mode by which I propose to construct the pier. At present I am not prepared to do so.

600. Do you propose to construct the whole of such a pier as this of stone?—Generally of stone.

601. Do you mean that the outer end of the pier would be wood?—No; of stone.

602. On what part of the pier would you put your wood?—In the case of this pier I shall not apply

wood except as staging and as a protection to some extent to the work during its progress.

603. What other materials besides stone would you use in the construction of the pier?—I may state that I am just now making experiments, the results of which I shall be very happy to bring before the Commissioners. They relate to the building of large masses of rubble masonry in a peculiar way. The machinery for lifting these masses is the question that I have still under consideration.

604. When would it be convenient to furnish the Commissioners with your views on that point?—Probably the Commissioners will have to visit the Bristol Channel, where I will endeavour to furnish them with all the information they require.

605. If this great pier is carried out, to what winds would the bay be open?—It would be sheltered then from all points. Cairnbulg Point bearing true east from the present pier head, the north-east seas would be the only seas to which the harbour is exposed, and the area within the breakwater would be sheltered from that wind.

606. But I understood you to say that the north-east winds brought the heaviest seas. If, then, a breakwater were exposed to the heaviest seas, would not the area or any portion of it be exposed to those heavy seas?—No; it would not. No portion of the anchorage ground would be exposed to the north-east seas.

607. You offered your opinion on some nautical points; I think it advisable not to trouble you with these. They are rather for seafaring men?—I gave them, having been for twenty years a harbour engineer.

608. Are you agreeable that I should ask perhaps one question or so upon this?—Perhaps it would be as well to ask some nautical man. I gave the reasons for my opinion that one harbour of refuge would not benefit this coast generally.

609. I would just ask you one question on that point. Did I understand you to say that if a great national harbour of refuge were to be formed, you would prefer Fraserburgh as the site to Peterhead?—I do.

610. Then did I understand that you prefer Fraserburgh to Peterhead because ships from the north bound to Aberdeen and the southern ports hug the shore?—I begin at Fife Ness travelling northward, and speak of vessels bound to the north from Aberdeen and various ports, such as Dundee and Montrose, and meeting with easterly gales.

611. But do vessels bound north hug the shore during easterly gales here?—Yes. Seeking the ports they do, the moment they round the Buchan Ness they can run into Cromarty.

612. Do vessels during easterly gales keep as much to windward as possible until they get opposite their port?—As a general rule they do; but we generally find as regards vessels bound from the south to Aberdeen that if a severe easterly gale comes on, very few get round the Buchan Ness, for want of sufficient offing.

613. If they could not weather Buchan Ness in an easterly gale of wind so as to reach Peterhead, for what reason do you suppose they could reach Fraserburgh?—I do not understand the question put to me, but think that if a vessel in a south-easterly gale could round the Buchan Ness Point she could reach Fraserburgh or the Cromarty Firth, as a harbour of refuge.

614. But if a vessel bound for the north from Aberdeen could weather Buchan Ness Point, could she not get into Peterhead?—She could not get into Peterhead in a south-easterly gale from the violent confluence of the tides; and from the fact that the mouth of the projected harbour of refuge is open to the south-east seas, there would be manifest risk to any vessel entering the harbour in such circumstances.

615. She would get in, but you say there would be great risk on account of the construction of the proposed harbour?—Yes; whereas in Fraserburgh there is not the same risk, because Cairnbulg Point shelters it from the action of the south-east seas.

616. (*Captain Vetch.*) Mr. Abernethy has two designs, I think, for a harbour at Fraserburgh, one pier consisting of 1,500 feet, and another pier consisting of 1,500 yards. I understood that the latter one was to be abandoned, and the shorter one preferred. I want to know if that is the case or not?—I have merely produced that plan to contrast it with the projected harbour of refuge at Peterhead, and to show that for a smaller outlay an additional length of pier and greater extent of anchorage could be provided—not that I recommend that plan to the Commissioners.

617. I want to know whether in a south-easterly gale a vessel being opposite either to Peterhead or Fraserburgh would find the one or other most easily entered?—Of course, Buchan Ness Point being the most easterly headland of Scotland, in a south-easterly gale there would be a very heavy sea between the heads of the projected harbour of refuge at Peterhead, but Fraserburgh being protected by Cairnbulg Point the entrance of the projected harbour would be comparatively smooth, and there would be no risk in entering it and passing the pier-head.

618. Then, in missing the entrance to either harbour, you think the vessel would be more safe at Fraserburgh?—Yes, because there would be much less sea.

619. (*Mr. Coode.*) In your evidence before the Committee of the Harbours of Refuge in April 1858, you said the south-easterly was the prevailing gale on this coast. In the table which you handed in I see that the south-east gales were 41, while the south-west were 68.—What I meant to state was, that the south-east gales were the prevailing on-shore wind, and the south-west the off-shore wind.

620. Does this table refer to winds for any one year, or is it an average for any number of years?—This table, I may mention, was handed to me by Mr. Chalmers to put in, and I think I stated it was his table and not my own.

621. Do you know whether it is for one or two years?—I do not.

622. You stated in answer to the Chairman that south-east gales blow hardest on this coast. What gales raise the heaviest seas in the North Sea?—If you take the coast from Buchan Ness, the north-east sea, of course, has the longest stretch. At Aberdeen it is from east to south-east, because Aberdeen is protected from the north-east by the Buchan Ness Point.

623. In this particular part of the North Sea, which wind makes the heaviest sea?—The north-easterly.

624. By referring to the large chart of Fraserburgh, can you state the number of acres sheltered from the easterly and north-easterly gales?—I have not calculated because Cairnbulg Point effectually shelters Fraserburgh.

625. Well, taking the gale east by north have you the number of acres shut in from that?—No.

626. What is the nature of the material with which you purpose to construct this new harbour?—I have already stated generally that the foundation of the work is to be made of large concrete blocks of rubble.

627. I mean the character of the rock which you propose to use?—I should use the whinstone and limestone of the country.

628. What is the kind of limestone? To what formation does it belong?—It is a black limestone, exceedingly coarse and cannot be burned; the rest is whinstone. Granite is in the immediate neighbourhood also.

629. Can you get blocks of a large size of the whinstone, or should you propose to use granite?—You can get large irregular masses of whinstone, but as a general rule you cannot procure large blocks for dressing, except from the Firth of Forth, where large masses can be procured.

FRASERBURGH.

Mr. Abernethy.

30 August 1858.

Mr. Coode.

630. You speak of the confluence of the tides at Peterhead, does that refer to the tide within the horns of the bay?—Immediately off the headland.

631. Do you happen to know the greatest strength of tide off Fraserburgh?—I do not.

632. (*Chairman.*) Do you know that plan of Wick Bay?—Yes, I have seen it before.

633. You see the central opening marked BC?—I do.

634. With reference to the opinion given in your evidence as to the effect of the sea upon the projecting pier heads, give me your opinion of an entrance of that description, as to whether there will be an unfair sea?—That, of course, will depend on the way the land trends north and south of that entrance.

635. Give me your opinion as to the effect in a locality similar to that shown by the plan?—Without a better knowledge of the locality and the rate of the tides, and the action of the sea, I should perhaps be wrong in giving an opinion.

636. I am not talking of Peterhead at all. I am talking as to whether there would be an uniform sea at such an opening as you see in the chart, if an opening of that description has come within your experience as an engineer?—Without a further knowledge of the position of Wick (for I have never been at Wick), I might give an opinion that would be wrong.

637. Have you been much in the society of seafaring men?—A great deal.

638. Have you ever been at sea?—Oh yes, frequently.

639. For what period, would you say?—For the last twenty years, I have been round the greatest portion of the coast, from one point to another.

640. Have you heard questions such as those which arise out of our present inquiry frequently discussed amongst seafaring men?—I have.

641. From the nature of your profession, have these questions been of any interest to you?—They have necessarily been so, inasmuch as, considering my position, these questions necessarily formed an element in guiding me in my conclusions; and I have been in the habit of consulting nautical men previously to making harbour designs. I may mention that my profession is entirely that of a harbour engineer.

642. For how many years have you been an engineer?—I have been twenty years an engineer of harbour works. I commenced my first important work, the large dock at Aberdeen, in 1842. Previous to that I had been engaged as assistant engineer and resident engineer on harbour works.

643. Would you state how long you were an assistant?—Four or five years.

644. And therefore, though not a nautical man by profession, you are disposed to attach some weight to your opinion on nautical subjects?—I speak with all deference to the opinions of nautical men, but I have been obliged as a matter of course to consider nautical points during my professional career, constantly.

Mr. JOHN DALRYMPLE examined.

Mr. J. Dalrymple.

645. (*Chairman.*) What is your name?—John Dalrymple.

646. What is your occupation?—A retired master mariner.

647. (*Bailie Chalmers.*) You are a native of Fraserburgh?—Yes.

648. And you now reside there?—Yes.

649. How long have you been at the sea?—Thirty years.

650. Chiefly in the foreign trade?—Yes.

651. Do you know the Bays of Wick, Peterhead, and Fraserburgh?—I do. I have been at Wick, and I know from seafaring men the nature of the coast.

652. Have you studied the subject of harbours of refuge?—Yes.

653. And you prepared some remarks which you wish to read to the Commissioners?—I have noted some particulars which I consider peculiar to the Bay of Fraserburgh, and which, with the permission of the Commissioners, I would read to them.

Permission having been granted, witness read as follows:—

"To the Honourable the Commissioners on Harbours of Refuge.—John Dalrymple, residing in "Fraserburgh, of which place I am a native, and "now retired from seafaring life of thirty years experience, upwards of twenty of which I was in the "command of vessels trading to different parts of the "world. The following points I consider from personal experience peculiar to the Bay at Fraserburgh: First, with the heavy south-west gales "which prevail in winter, vessels coming from the "south and bound to the north and west, bring with "them to Kinnaird's Head a leading wind. But "there their passage is stopped, for as they attempt to "go further to the north and west, the wind heads "them. It therefore follows that vessels from the "Moray and Pentland Firths, bound south, also "bring a leading wind with them to this place; but "here, as in the other case, they get no further; so "that in winter it is a very common occurrence to "see off this bay large fleets of vessels, bound both "to the north and to the south, struggling for days "to keep hold of the land; and it frequently happens "that in our present limited harbour may be seen "vessels lying windbound alongside of one another, "and bound to opposite points. Such a circumstance "does not, I think, occur at any other place on this "coast. Second, that here no new harbour has to be "commenced, but that an extension of the present "breakwater will afford refuge to vessels from all "winds, and at all times of tide; and it is only a "matter of the extent of the extension of said breakwater to give any amount of shelter to vessels of "the largest class. Third, another peculiar feature "in the direction of the winter storms on this coast "is, that (so far as my observation goes) I have never "known a heavy westerly storm blowing into the "bay. It appears to me that the heavy easterly "gales in the north sea and south coast become a "north-east storm here; that if our present breakwater were carried out into deep water, vessels "with such a gale could at all times of tide, day or "night, run out and get shelter in smooth water "under it. From south-east gales the bay is sufficiently protected by Cairnbulg point, and the reef "of rocks running out from that point. Lastly, "Fraserburgh has a smooth and gradually sloping "sandy beach of some miles in extent. I need not "enlarge on the fact that vessels in stormy weather "will make bolder and run with more confidence for "shelter under such circumstances than they would "do when nothing but a rocky iron-bound coast presets itself. I may also add that here the tides run "less rapid, and more direct, and the sea more regular "and less dangerous, than on the coast without this."

654. (*Chairman.*) At what time of the year is the worst weather?—Perhaps in December. In the winter months generally.

655. From what point of the compass have you the hardest gales?—North-east.

656. How do the north-east gales begin?—South-east and south, veering from the south-east and round, but it does not come to blow till it reaches to the north-east here. Our north-east gales are east gales to the south of us.

657. How do these north-east gales terminate?—They die away generally.

658. The wind still blowing from the north-east?—Yes.

659. In a north-east gale is Cromarty Firth easy of access?—That depends upon the position of the vessel requiring to reach it.

660. Supposing a vessel to be off the entrance to Cromarty Firth with a north-east gale, would it be easy of access?—With good winds on shore.

661. Then approaching Cromarty with a scant wind, are you ever liable to the wind leading you off the high land, and making access difficult?—With south-west gales, the wind invariably blows off the high land from the west. In that quarter the wind is right out of Cromarty.

662. But with the wind from the north-east and south-east, however hard it blows, it blows fair home into the entrance of the firth?—Yes.

663. In what trade have you generally commanded vessels?—I could scarcely particularise. I have been in all parts of the world.

664. How long were you master of a vessel?—Twenty years.

665. Have you traded to the Baltic?—In the early part of my time I was at the Baltic.

666. Have you been at Archangel?—Never.

667. Have you traded to America, going north about?—No; I have been in Norway.

668. Are you of opinion that harbours of refuge are wanted on this coast?—Very much.

669. What land do you generally first make when coming from the Baltic, bound to Leith?—In the autumn we generally made Kinnaird's Head and Mormond Hill, in the immediate vicinity of this, and one of the best landmarks we could have.

670. Do you consider Mormond Hill the best mark to make in dirty weather?—No master of a vessel can mistake it.

671. When you traded to the Baltic, from what port did you sail?—Particularly from Liverpool.

672. Did you come north about?—Yes.

673. Are you acquainted with the Pentland Firth?—Yes.

674. How often have you gone through it?—Seven or eight times.

675. Have you ever been in it in bad weather?—In a favourable breeze and in a strong gale.

676. Which way?—Going west.

677. Do you know the harbours of Longhope, Widewall, and St. Margaret's Hope?—No; I have only been at Stromness.

678. (*Sir Frederic Smith.*) How long is it since you left the sea?—Six years.

679. (*Mr. Lindsay.*) In the statement which you read, you stated that during south-west gales you had seen large fleets of vessels off Kinnaird's Head?—Yes.

680. Were these vessels bound both north and south?—Yes.

681. Are the south-west winds safe?—Yes, but blow very hard. Vessels run great risk of being disabled, and of being driven into the North Sea. Vessels in a south-west point hug the land; and it is as much as they can do. They have often a very severe task to keep the land.

682. Are not these vessels found in great numbers in south-west gales off Peterhead?—I think not. If they are bound for the Pentland Firth, they are so much farther on their voyage at Fraserburgh. They can pass Peterhead with a fair wind, but here they are stopped.

683. Then is it because that during south-west gales more are under shelter off Fraserburgh than off Peterhead?—I would conceive they would proceed on their voyage as far as they could come past Peterhead with a fair wind, but stop here.

684. But vessels bound from the south to the Baltic and Archangel would not be found in Fraserburgh Bay?—No.

685. Then you refer only to homeward-bound vessels?—Vessels from the ports bound to the south are found here.

686. From your experience as a shipmaster, say one great national harbour was to be made on the north-east coast of Scotland, whether would you prefer it at Wick, Peterhead, or Fraserburgh?—At this place.

687. Why?—Because of the number of vessels that congregate here.

688. But you say in south-west winds?—Yes.

689. But I need not say that during south-west gales vessels would not take a harbour of refuge?—Yes, and very glad to get it, because it blows very hard.

690. You would then prefer Fraserburgh to the other two points?—Most undoubtedly.

691. Any other reason for doing so?—Because it has a sandy beach, on which we would seek shelter sooner than on a rocky-bound coast; and also the tides run more equal here.

692. (*Mr. Coode.*) Suppose vessels bound from the Baltic to the Humber, what land do they generally make?—Flamborough Head, I should suppose.

693. (*Captain Washington.*) But with vessels returning from Baltic?—Not further north than Kinnaird's Head, unless disabled.

694. Were you ever driven to the Orkneys?—No, unless disabled.

695. Do you remember of eight vessels being wrecked within ten years in the Orkneys, returning from the Baltic?—No.

696. Were they not bound to the Pentland Firth?—I don't know.

697. (*Mr. Coode.*) Tell us the direction of the ebb and flood streams, from Cairnbulg Point to Kinnaird's Head, do they run fair across?—I think they do.

698. Do you know the rate?—Five to six miles off Kinnaird's Head; only this is merely an opinion.

699. (*Captain Washington.*) Is the beacon on Cairnbulg Head sufficiently conspicuous?—It might have been further out and higher. It is, however, only six weeks since it was fixed.

700. Have any wrecks taken place upon the rocks there?—Frequently.

701. (*Chairman.*) Have you seen that chart before?—No; I am not aware.

702. Are the charts that you have been in the habit of using on the same scale as that?—No.

703. With a chart of that description, would you, as an experienced seaman, have any difficulty in running for the anchorage of Longhope, never having been there before?—I should think not in clear weather.

704. If with thick, dirty weather, and you were very desirous to get into the anchorage, would you then have much hesitation in running for it?—I certainly should hesitate, unless circumstances obliged me to seek a place of refuge, from having a leaky vessel, or being disabled, or anything of that sort. I would not voluntarily run down in thick weather.

705. In running through the Pentland Firth, have you ever taken a pilot?—I have had a pilot, and I have gone without one.

706. When you have gone without a pilot, was it because the weather was such that you could not get one on board, or by preference?—I did not look for one. I think I could do the thing quite as well myself without a pilot.

707. In running for the Pentland Firth, with a strong south-easterly gale, would you have any apprehensions about the flood tide which meets you there?—I should wait till the slack tide before I attempted, with a gale of wind, to run through with a loaded vessel.

708. But still, knowing the time of high water, you would have no difficulty in heaving your vessel to for a sufficient time, and then running through on the ebb?—No.

709. You have stated in your evidence that you have only been through the Pentland Firth five or six times?—Yes.

710. Does that arise from the circumstance of your only having occasion to make that voyage five or six times, or that you preferred going north-about round the Orkneys?—Solely from the latter circumstance.

711. Should you say, from your acquaintance—

FRASERBURGH.

Mr. J. Dalrymple.

30 August 1858.

Chairman.

which must be pretty extensive amongst your brother seamen, that the opinions you entertain relative to the Pentland Firth and Long Hope, are such as generally prevail amongst them?—I think they must do so; it is not from conversation amongst them that I judge so, but because I think that these views which I have expressed are the opinions which, I imagine, generally prevail.

712. You are not prepared to say so from your own knowledge?—No.

713. (*Mr. Lindsay.*) I understood you to say that you did not take a pilot in some cases when going through the Pentland Firth?—No.

714. Then, I understood you to say that should you have found it necessary you would have had no hesitation in running for Long Hope in clear weather?—None.

715. And further, that you would have great hesitation in running for Long Hope in thick weather?—Yes.

716. Would you not have great hesitation in running for almost any harbour in thick weather?—I should make a comparison between one state of thickness and another. I should run for many a place in preference to Long Hope in thicker weather than I would do to day. I would not run for any harbour in a dense fog, but I would hesitate to run for Long Hope with a moderate haziness.

717. Now, you have looked at Long Hope, this is the question on which I would ask your opinion as a nautical man of great experience; say that you were off the Caithness coast, and that you were caught with a southerly gale in thick weather, whether would you prefer running through the Pentland Firth for Long Hope, or running for a harbour of refuge at Wick, as laid down in the plan?—I think I should prefer running for Long Hope. I have much greater scope in running for it than I have in running for Wick.

718. Well, suppose these piers were carried out much further than they are, so as to afford even greater shelter than now appears, would you still prefer running for Long Hope in thick weather to running for that harbour?—I should still prefer running for Long Hope, and my reason would be that in running for Wick Bay, which, I suppose, is not above a mile and a half across, I have to run, as it were, into a needle's eye. In the other case I have several miles to veer and haul upon, even in thick weather.

719. (*Captain Washington.*) In the same thick weather should you run for a harbour at Fraserburgh?—Yes.

720. Is the entrance of the proposed harbour at Fraserburgh a mile and a half wide?—I don't know how far they propose to carry the breakwater out, but I should, as I have said before, prefer running a risk for a port at Fraserburgh, when I would not do so at Wick. I should consider that the lives of my crew, taking the very worst view of the thing, were safer in running for Fraserburgh than in running down upon a coast like Wick. I should be very nervous in doing so.

721. (*Captain Washington.*) Mr. Abernethy, perhaps, can state to us the width of the proposed opening between Cairnbulg Biggs and the ends of the pier?

(*Mr. Abernethy.*) A mile and a quarter.

722. Have you ever been at Wick?—I have.

723. Have you ever sailed into the harbour of Wick?—Never.

724. Have you ever sailed into Long Hope?—Never.

725. Then I understand you to say, that to run for Wick Bay, which is a mile and a half wide, would be like running for the eye of a needle, while to run for Fraserburgh Harbour, which is only a mile and a half wide, would be better?—Being a projecting point I would run the same risk of losing the vessel; but supposing I missed the harbour I would have a chance of saving the vessel at Fraserburgh, by making one or two tacks; whereas at Wick, if I am down there and find I have no hope of entrance, there is no hope for me. At Fraserburgh I would be very likely to save the vessel at least.

726. How are you supposing the wind?—I am supposing a favourable wind into both places.

727. Do you mean south-east or north-east?—You must take the wind differently. I am supposing your question to refer to my running down on a lee shore, and looking for a harbour. Of course the wind seems to be different here for a lee shore. In an easterly wind here I should fear the land; but if I were in an easterly wind in Wick, I am ruined.

728. Have you been a good many years cruising in the North Sea?—No, but merely sailing to the Baltic. I judge from my observations in regard to scenes that took place on the coast of England, and judging from what it is in winter there must be very tremendous gales there which we never have.

729. Why do you think so?—From the casualties which take place at Sunderland and Shields, and which are generally easterly gales.

730. You have run through the Pentland Firth in an easterly gale?—Yes.

731. With or against the tide?—With the tide.

732. Would you venture to run against the tide in an eastern gale?—I should not make chances of doing so.

733. What size of vessels did you command?—At that time I had a small vessel of 150 tons.

734. At what rate does the flood tide run after the springs in the Pentland Firth?—I should think eight or nine miles. From seven to eight, and perhaps sometimes nine.

735. And sometimes ten?—Well, it may.

736. We know this by actual measurement. In a damaged vessel would you venture to cross the Pentland Firth in a flood tide, and to run to Long Hope?—No, I should think not.

737. Would any sailor in his senses attempt to do so?—He would not make choice of doing so.

738. Would he dare to do so?—He could no more dare than fly. There are vessels built now-a-days that perhaps you could do anything in.

Very well, when you go to sea again, perhaps you would try the experiment.

739. (*Mr. Lindsay.*) You stated that you would, in a vessel of 150 tons, not consider it advisable to run for the Pentland Firth with a south-east gale in a flood tide?—No.

740. What would you do?—I would get on to the land after the eddy.

741. That is, in fact, to dodge until the tide turned?—Yes.

742. Then would you consider that you were running a great risk, during a south-east gale, in getting under the land to dodge, until the tide turned?—That is, if a heavy south-east gale came on, I should consider there was considerable risk.

743. (*Bailie Chalmers.*) Would you not make more bold to reach a harbour with an entrance of a mile and a half and a sandy beach than a harbour with an entrance of 500 feet and a rocky coast?—Most decidedly.

744. (*Mr. Lindsay.*) Say that you were caught with a south-east or easterly gale off this coast, and that you were at an equal distance from Peterhead and Fraserburgh, presuming it to be thick weather, whether would you take Fraserburgh, with the harbour constructed as proposed by Mr. Abernethy, or run for Long Hope and the Pentland Firth?—I should not hesitate for a moment to run into Fraserburgh with the harbour as has been represented to me as being proposed by Mr. Abernethy.

745. Then would you run for it in preference to running for the Pentland Firth and Long Hope?—Most assuredly.

746. (*Bailie Chalmers.*) Do you consider that Fraserburgh would be a good look-out in time of war?—

think that was a feature which was introduced into the Harbours of Refuge Report; and I think the Commissioners will see that if you are placed on Kinnaird's Head you have a longer extent of sea horizon from that point than from any other point on this coast.

747. Do you often see the Caithness coast from Kinnaird's Head?—Yes.

Mr. JOHN STEPHEN examined.

748. (*Chairman.*) What is your name?—John Stephen.

749. What is your occupation?—That of a master mariner.

750. (*Bailie Chalmers.*) How long have you been at sea?—Twenty-eight years.

751. You have commanded vessels in the coasting as well as in the foreign trade?—Yes.

752. For how long have you commanded vessels?—Nineteen years.

753. What vessel do you command at present?—The *Melinka*.

754. What trade is she engaged in?—The seal and whale trade.

755. How long have you been in the *Melinka?*—About seven years.

756. You know the harbours and bays of Wick, Peterhead, and Fraserburgh?—Yes.

757. Have you been in Wick?—Yes.

758. Do you remember the quay there being knocked down during the storm some time ago?—Yes.

759. (*Captain Washington.*) What storm was this?—I forget the year when it happened. The pier wall broke down.

760. Tell us when it occurred, as near as you can?—I think it must have been about seventeen years ago.

761. That is, two years after you got the command of a vessel?—Yes, about that.

762. (*Bailie Chalmers.*) If a harbour of refuge is to be erected on the north-east coast of Scotland, at which of the three places would you say it should be erected?—I should say it ought to be erected in Fraserburgh Bay.

763. Can you tell me why?—Because, providing that I were in the North Sea, and caught with a gale of wind from the south-east, which is the most prevalent wind on the coast south-west or south-east. I should never think of running down upon any dead land when I had a headland of this kind to run under. I don't mean to run under, but to keep off, knowing that I can come to a harbour, if there was a harbour erected in this bay, because it is a clean bay, and I have the lighthouse here. If I were to run down upon a dead land at any other place, and were to miss, I know that it is certain destruction.

764. Do you find here almost every winter, a great many ships of considerable tonnage congregated about the bay?—Yes.

765. Are many of them driven from the coast of England?—I have known a great many from off the coast of England, as well as from off the coast of Holland, and off the mouth of the Sleeve.

766. Do you find that they congregate here, bound both north and south, with a south-east gale?—Yes, the south-east gales, south-south-east, and south gales prevail most.

767. Do you find them congregate here going both ways?—Yes.

768. And two went down?—Yes, ships of 400 tons upwards, are often off here, and would have entered the harbour if they had got water.

769. Many of them in a disabled state?—Yes.

770. How long have you been going about here, between this and Cromarty?—I have known vessels knocked about here for two or three weeks.

771. And some of that traffic from the coast of Norway?—Yes.

772. Do you consider easterly gales the most dangerous on this coast?—Yes.

773. Do you consider that during easterly gales Fraserburgh harbour would be safe as compared with others?—I think it would be much safer.

774. Would you give me your reason for stating that?—The shallowness of the water before it reached where the extended harbour would be would moderate the sea.

775. An easterly gale is of quite rare occurrence, is it not?—Yes.

776. Do you find vessels bound to Peterhead, driven round to Fraserburgh during a south-east gale?—Occasionally in winter we have such vessels.

777. Why?—The reason we have heard was, that the sea was too heavy at Peterhead, and they could not approach it for that reason.

778. Would the position of matters be altered by the erection of such a breakwater as you see in the report of the Committee, at Peterhead?—To a small extent, but a very small extent, from the dangerous state of the sea.

779. I mean, the plan of the breakwater proposed by Mr. Stevenson, which you have seen in the report of the Committee?—I do not think the position of matters would be altered in that case.

780. Suppose a vessel were once in the harbour in the prevailing gales you have mentioned, could she leave it?—No; by no means. The best ship that belongs to the navy could not. The sea is extraordinarily heavy, and the water is tremendously deep.

781. Would a vessel bound from the coast of England northward or west, think of running down to the land and leave the Moray Firth, which is open in these gales?—No seaman would do that.

782. Would vessels from the Baltic bound to the Moray Firth, and the west, come to the Caledonian Canal by Kinnaird's Head?—They would.

783. Is an inducement now held out on the Continent to masters and owners to go to the Moray Firth and the west coast by the Caledonian Canal, since it has been improved, and steam introduced on the canal?—Yes, the insurance is cheaper. I have always found, from what I have had to do with merchant ships of late, that since the improvement in the Caledonian Canal, it has been the request of the merchants of the Continent to go through the Caledonian Canal to the west coast.

784. Would ships in a disabled state from the North Sea reach with safety the harbour of Fraserburgh in almost any gale, if the breakwater were carried out?—They could do so as long as they can live in the sea, because they come in upon a sandy bay. Every mariner knows that if he can come in upon a sandy bay he has more chance of saving his life than on an open rocky coast.

785. Would there be a necessity for a harbour of refuge at Wick for the fishing boats?—I am at a loss to find any argument for a great harbour at Wick.

786. I spoke of a smaller harbour?—I have been a good deal at Wick, and I have always seen a great necessity for improvement at that harbour.

787. Have you seen the plan of the proposed harbour at Wick?—Yes.

788. With a gale from the south-east, would you like to run down upon that harbour?—I would rather run to the Pentland Firth.

789. Do you say the same about Peterhead?—I should say the same thing. There is no alternative but certain destruction if you miss the harbour mouth.

790. What is the principal anchorage ground at Peterhead?—It is about seven-fathom water.

BIBLIOTECA DEL C.O.A.M.

FRASERBURGH.

Mr. John Stephen.

30 August 1858.

Baillie Chalmers.

791. In what direction?—It is just in the mouth of the harbour, where the place is most exposed.

792. Do you know any other good anchorage ground on that enclosure?—The best ground is there. There is no other anchorage ground, the other places being rocky.

793. (*Being shown chart No.* 2181, *the Chairman put the following question to the witness:*—) Are the charts which you are in the habit of using on the same scale as that chart, I mean as large?—The chart which we use for the Orkney and Shetland Islands is on a much larger scale than this.

794. By "larger scale than this" do you mean that the whole chart is larger, or that the proportion of the degrees of latitude is greater?—I mean the scale.

795. You see Long Hope on that chart?—Yes.

796. Do you know Long Hope?—Yes, I have been in it often.

797. Supposing that you had never been in Long Hope, and were in possession of a chart of that description, would you, as a seaman, have any hesitation in running your vessel for it?—None whatever, if it were clear weather.

798. Are you acquainted with the Pentland Firth?—Yes, I have been often there.

799. How often?—Ten times, at least.

800. Have you ever run through the Pentland Firth in heavy weather?—Yes.

801. How was the wind?—I have been there with heavy gales from the northward.

802. Have you ever run through with a southerly gale?—I have run through with very heavy winds from the southward.

803. Do you recollect if, on approaching the Pentland Firth, you had to dodge your vessel for the purpose of waiting for the tide?—Yes, I have had to tack in, not to be down too quickly upon Duncansby Head and the mouth of the Pentland Firth.

804. And with the knowledge you possess of the Pentland Firth, do you consider that there is any risk whatever in running through it when a southerly gale blows, provided you do so with due attention to the tides?—None, if the weather is clear, and if you can keep your ship to windward till the tide turns.

805. You say that you know Long Hope well; what style of anchorage is it, good or bad?—It is very good anchorage; very good holding ground.

806. Did you ever know vessels driven to sea from Long Hope by strong gusts of wind from the westward?—Never; I have been there in gales from the westward as hard as ever it was known to blow, with two anchors down, and 100 fathoms on each chain.

807. Do you know Widewall?—I have been in Widewall and St. Margaret's Hope.

808. What kind of anchorage is Widewall with a strong westerly wind?—It was in St. Margaret's Hope that I was; I never was in Widewall—I don't know anything about it.

809. What kind of anchorage is it in St. Margaret's Hope in blowing weather from the westward?—It is very good if you go in, but it is a very small place.

810. Is it easy of access?—I don't know it well; I have been at different places thereabout. It is said to be rocky.

811. What is the heaviest wind on this part of the coast?—The easterly gales are the worst we have.

812. By easterly gales you mean from north-east to south-east?—From north-east to east; the most prevalent winds are from the south-east.

813. By this coast do you include the coast from the Forth to the Pentland Firth?—Yes.

814. Have you traded to the Baltic?—Yes.

815. How many voyages have you made to the Baltic?—I don't recollect exactly—perhaps 12 or 13, or more.

816. Have you often come home in the fall of the year?—Mostly every year. Perhaps ten winters I have had to come from the Baltic, and to go from this side as late as the 20th October.

817. Should you say that there is any prevailing wind at that time of the year in the North Sea?—The winds prevail most from the south-west and south-east.

818. And what generally is your land-fall?—It depends on where we are bound to from the Baltic.

819. Where have you traded from to the Baltic?—From all places on the east coast of England, and the Continent too—at least, I have been from Antwerp to the Baltic, from Guernsey, Jersey, London, Hull, the Firth of Forth, and other places.

820. If bound for the Firth of Forth, where would be your landfall?—If the wind was for the Firth of Forth I should make for it, if I could.

821. With reference to your former answer relative to the prevailing winds, are they such as generally enable you to make the land as far south as the Firth of Forth?—I have had to heave to through a heavy gale while bound to the Firth of Forth till it had cleared. It was very often foggy in some of those gales.

822. (*Mr. Lindsay.*) You would prefer a harbour of refuge at Fraserburgh to Wick?—Yes.

823. Is your reason why you prefer the harbour of refuge at Fraserburgh to Wick on account of its being in a more prominent position?—Yes; the most trade is in the southern part of the North Sea and down; in the northern part there is no trade. Besides, all the ships are brought here. No man, supposing the harbour of refuge was at Wick, would ever think of running down on the coast of Wick. That would be a most preposterous idea, as long as he has a headland here to run under, and the Moray Firth open with Cromarty at the top of it, and the Pentland Firth on the north side of it. He would never think of running down upon a dead land like Wick, although a harbour of refuge was erected there, because if he were missing that harbour mouth, with snow in the dead of winter, there is nothing but certain destruction for him.

824. Then you object to harbours of refuge on dead lands?—Unless there is sufficient room for an entrance.

825. Then, as a general rule, you would prefer a harbour of refuge upon a promontory, or close to a headland, to a harbour of refuge which was in a bay?—Yes, if it could be approached in all weathers and with safety, so that you can save your life if you run down upon it.

826. I believe there was another reason why you preferred Fraserburgh, and that was, there would be more chance of saving life, on account of there being a sandy beach at Fraserburgh?—Yes, a sandy, clean, and open beach.

827. Is it all a clean bay?—Yes, it is a clean bay.

828. Are there no rocks which intervene?—There are no rocks at all. On the only rocky shore there is four fathoms at low water, about east or east-south-east from our breakwater, which would protect our breakwater from more than what people think about. The face of the sea is broken upon that before it comes to the harbour.

829. I have a plan of Fraserburgh harbour, No. 1439; look at that plan, and see if there are any rocks along the sandy beach?—There are no rocks. It is a clean bay until you come to the vicinity of Cairnbulg Briggs, from the Buss, or Burnett's Buss.

830. But in an easterly gale of wind, would there not be a danger of your ship running right on to those rocks, instead of running on to the sandy beach, where you say that there would be a greater chance of saving life?—If the breakwater was extended, there would be smooth water with the easterly gales at the place where the beach is lined with rocks.

831. Are there no rocks along the beach to the eastward of Kinnaird's Head?—Yes, to the southward of the Busses.

832. Are there no rocks along the beach to the eastward?—None, till you come to the vicinity of Cairnbulg Head.

833. Then, between Cairnbulg Head and the

place to which you have referred, is the beach entirely clean and clear?—It is.

834. Such a beach that a ship might run for it with a chance of saving life?—Yes; we have had many instances here of such cases.

835. (*Sir Frederic Smith.*) Are you of opinion that a harbour of refuge for this coast is at all necessary anywhere?—I am quite of that opinion. I have had experience of it, having been off here many days, and could get neither north nor south, after having put out into the North Sea.

836. (*Captain Vetch.*) Suppose you were sailing from Fraserburgh to go through the Pentland Firth, and then on reaching Sinclair Bay you found the wind was against you, and you could not fetch to Duncansby Head, what would you do?—If the wind is from the north, of course I must beat through the Pentland Firth.

837. But if the wind were so far from the east that you were in danger of getting on the shore?—Then I would go to Cromarty.

838. From Sinclair Bay?—Yes.

839. Would you not rather take a port under your lee, or one being near at hand?—In the winter it is very seldom that we can see to the very north, which is always the thicker. I find that in the trade I am employed in, if I take a port I lose a passage; I cannot get out again.

840. (*Mr. Lindsay.*) Then even in thick weather you would prefer with such winds as these to take the Pentland Firth and Long Hope rather than to run for Wick Bay, even if there was a harbour there?—By all means; because I have more room, and if I miss even Long Hope I have an open sea before me.

JOHN REID examined.

841. (*Chairman.*) What is your name?—John Reid.

842. What is your occupation?—I am keeper of the lighthouse at Kinnaird Head.

843. (*Bailie Chalmers.*) How long have you been at Kinnaird Head lighthouse?—Sixteen years; and I was two years, in 1816 and 1817, learning the profession.

844. You have been in the employment of the Commissioners of the Northern Lights since 1817?—Yes.

845. You are contractor for repairs at the Kinnaird Head lighthouse?—Yes.

846. And for any other lighthouses?—Yes; for Samborough in Shetland. I am also inspector at Buchan Ness, Cape Wrath, Dunnet Head, and Burrow Head lighthouses.

847. Do you keep at this lighthouse a register of the wrecks that occurred in the vicinity?—Yes.

848. Is that a correct copy of the register?—Yes; and I now enter it as evidence.

849. While at these places you had frequent opportunities of knowing the force of the waves on curving shores and perpendicular rocks?—Frequently.

850. And the effects of currents and tidal waves?—Yes; I have made it a study.

851. Can you tell me the force of the current between Kinnaird Head and Cairnbulg?—I cannot.

852. Have you any idea what it is?—I have an extract that I prepared about it some time ago, but it is not here.

853. Have you found that the strong reach of the tide that occurs at Great Ness to and round the headland, formed in storms a barrier, and cut-off the undulation of the waves, and reduced the surface inside to ripple only by the wind?—Yes.

854. Is the cause of that the tidal current passing through the breakwater?—Yes.

855. I have asked these questions because I wish to compare this place with Fraserburgh. Have you seen something of the same sort affect Fraserburgh?—I have noticed it from the lighthouse frequently, and I have always seen that the current coming down the Moray Firth took the point, as it were, at an end, and was driven over to the south side of the bay. And again, the tide after sweeping the bay turns out and almost forces the wave and sends it down, making thereby a smoother part for a considerable portion of the sea before the harbour mouth.

856. Have you been requested by any one to make these observations for a certain number of years?—Mr. Robert Stevenson requested me many times to make my observations on the waves at different places where I was, in order to give him satisfaction about it; and I did so also for my own satisfaction, and from time to time was much satisfied to see the effects of the waves, reporting occasionally to Mr. Stevenson.

857. Do you know Peterhead?—Well.

858. You have been at the Buchan Ness lighthouse?—I was once superintendent there.

859. You have been there as long as you have been at Kinnaird's Head?—Yes, longer.

860. Can you tell us if the sea is as heavy in Fraserburgh Bay as it is in Peterhead Bay?—It is much heavier in Peterhead Bay.

861. Did ever you see so heavy a sea in Fraserburgh Bay as you have seen in Peterhead Bay?—No.

862. Could a vessel with the wind blowing strong from the south-east or north-east take the harbour of Peterhead with any safety?—Not if there was a heavy sea. No man could attempt to take the harbour in any of these winds with a gale. I have often seen them put into the bay at Peterhead, and turn out again.

863. From what direction was the wind blowing then?—From the south-east or east, and even with easterly winds. I have seen them making a reach out there, but they could not take the harbour.

864. Can this occur at Fraserburgh?—No; because here we have the shelter of the point of Cairnbulg Head, causing the water to be smooth, the sea at the mouth of Peterhead throws them across to the back of the next pier.

865. What do you consider the best quarter to blow from to get into Fraserburgh harbour?—The north-west wind.

866. Even off the land?—Yes, because the water is smooth, even during a heavy gale.

867. Suppose the present north pier head to be extended outwards, would that be remedied?—That would just be the safety round the pier, and then down anchor.

868. You have often seen a number of vessels wind-bound here?—Yes.

869. And bound different ways?—Yes.

870. Have you seen the abstract of the register of winds published by the Committee in the Appendix to their Report?—Yes, it is a correct abstract or very nearly so. The wrecks from the south quarter are 41, and from the north quarter 23, but I have made it out to be 22. This applies to 1857.

871. Are you prepared to say how the gales were from 1853 to 1856 inclusive?—The gales were double from the south what they were from the north quarter.

872. Do you find also in west-south-west gales that vessels cannot get either south or west?—That is too often the case.

873. Of course you would say that this is only the result of your observation during the day?—That is all, and in clear weather.

874. Taking an average of four years, how many ships have you seen?—I have seen 4,400 in the daytime passing and repassing.

FRASERBURGH.

John Reid.

30 August 1858.

Bailie Chalmers.

875. You have taken this from your register?—Yes.

876. What do you put down those passing at night for?—I suppose there would be just as many at night and in foggy weather as during the day, that makes 8,800 vessels at Kinnaird's Head, on an average of four years, yearly.

877. Have you observed how they pass, west and north?—Yes, there are about 460. As many go west as go north.

878. You know Peterhead Bay?—Very well.

879. From your experience as an inspector of works, do you consider it to be very difficult to erect a pier at Peterhead to stand?—I would think so; it is very deep water, and they would require a very, very strong pier to stand there.

880. Do you know anything about Wick?—Wick has much need of a harbour to protect the boats, but I should feel rather suspicious as to its being filled up with sand.

881. Are you so well acquainted with the place as to say so?—Yes, I have been frequently in it, when I was at Dunnet Head.

882. (*Chairman.*) Of the vessels which have passed your lighthouse, can you give me any notion of the proportion which vessels apparently belonging to the coasting trade bear to those which belong to the foreign trade?—I could not do that, because we cannot know what they are. Only we keep a note of whether they are sloops, brigs, steamers, or barques.

883. Are there any considerable number of large ships?—No; there are not so many of them as of the other coasting vessels. Generally schooners, brigs, and sloops are the most prevailing.

884. Can you give me any idea of the proportion of the large vessels to that of the smaller vessels that you have named?—In general, the proportion would perhaps be that of six large vessels to 120 or 200 schooners in a month.

885. (*Mr. Lindsay.*) You say that on an average of four years 4,400 vessels pass Kinnaird Head every year during daytime?—Yes.

886. And you presume an equal number pass at night?—I would suppose so, taking foggy weather also into account.

887. Well then, that being the case, in the course of ten years there will have passed somewhere close upon 100,000 vessels?—Yes, there would be that.

888. You have given a return of the number of wrecks at Fraserburgh and the immediate neighbourhood, which return shows a loss of 26 vessels; are these all the vessels which have been lost during the last ten years?—Yes, that is all which have been lost, to my knowledge.

889. Then there is only a loss of 26 vessels out of 100,000 vessels that passed Kinnaird Head?—Yes.

890. Now look to this return, and let me know how many vessels in your opinion would have been saved if there had been a harbour of refuge at Fraserburgh?—There would have been twelve, as far as I can see.

891. That return was made up by you?—Yes.

892. From the information which you received at the time?—Yes.

893. Would a harbour of refuge at Fraserburgh be of any value in westerly or south-west gales?—Oh yes, very much; because there is many a vessel endeavouring to keep out of Moray Firth, that would take into harbour here rather than be driven about.

894. Well, but could Fraserburgh Bay be made of any more value during westerly and south-westerly gales, by the construction of such a harbour as that which is proposed by Mr. Abernethy, than it is now?—It would be so.

895. But do not the south-westerly gales blow off the land?—Yes.

896. Then, when the wind is off the land, what benefit would such a pier as this proposed by Mr. Abernethy be to vessels with the wind blowing off the land?—It would prevent them from being blown into the sea.

897. Then you think a breakwater ought to be erected at Fraserburgh to prevent vessels from being blown to sea. That is your opinion of the use of a breakwater?—Yes, to keep the vessels in safety.

898. Were not eighteen of these twenty-six vessels lost when the wind was south-west and westerly?—There were.

899. Were not four more of these vessels lost during easterly winds, from the loss of their bowsprit, the loss of their sails, and other causes besides the gales?—Yes.

900. Then, in fact, it would appear by this return, and by the analysis of the winds and the causes of loss, that out of 100,000 vessels which have passed Kinnaird Head during the course of these ten years, there are only three which would have been saved had there been a harbour of refuge at Fraserburgh; is it so?—That is not my opinion.

901. Is your opinion still, after the answers you have given me, that there would have been more than three saved, and that there would have been twelve saved?—I am still of opinion that there would have been twelve saved, if there had been a harbour which they could have taken.

902. (*Captain Washington.*) How many vessels of those which have been wrecked have been lost off Cairnbulg Briggs?—Eight out of twenty-six.

903. Is there no buoy or beacon, or anything else, to mark the extent of the Cairnbulg Briggs?—There was none until about two months ago.

904. I believe the design for the north breakwater was drawn by you, was it not?—I gave a sketch of it.

905. I think I saw you ten years ago, and you then brought that design under my notice; I am very glad to see that that design has been carried out; I hope it will be carried still further. It has made a very good harbour; about six or seven acres?—It is more than eleven acres.

906. (*Bailie Chalmers.*) Might not a harbour of refuge at Fraserburgh have prevented part of those wrecks that you see on the wreck-chart as having occurred at Lossiemouth and up the Firth?—Yes.

907. So that Fraserburgh ought to be credited for more than the wrecks that simply occur in the immediate vicinity?—Yes.

908. Would not a harbour of refuge at Fraserburgh have saved many of the vessels bound south from the north, in a south gale, wrecked at Peterhead, and between Rattrayhead and Peterhead?—Yes, they might have got in here.

909. In south-west gales, have you not known of ships having been blown off the land here and never heard of again?—Yes, I have heard of them.

910. Then would you not say that a harbour of refuge would be useful even in those gales?—Yes.

911. (*Mr. Lindsay.*) But could vessels fetch into Fraserburgh during a strong south-western gale?—Yes, if they come into smooth water.

912. Does not a south-westerly wind blow right out to sea?—Yes.

913. Then how could a vessel be saved by a harbour of refuge at Fraserburgh?—By beating into the harbour.

914. But can a ship beat against such a south-westerly gale as that to which I have alluded?—When the water is smooth off the land.

915. The question was put to you, would not a harbour of refuge during a south-westerly gale have saved ships from being blown to the north? you said yes. Well, then, I ask you how could a vessel beat into Fraserburgh Bay in such a gale as would blow her to the northward?—If she were coming from the southward, and came round there in a south-west gale, she would be able to make Fraserburgh, rather than be knocking about.

916. But could she get into Fraserburgh Bay during a south-west wind by any other means than beating?—No.

917. She would be obliged to make a tack before she could get in?—Yes, that is a clear matter.

918. (*Bailie Chalmers.*) Can a vessel, to your knowledge, get in here with a south-west wind?—I have seen them come in just by taking one tack. I have seen it done frequently, and even in a gale.

(*Mr. Lindsay.*)—I would rather give Fraserburgh the benefit of that last answer than occupy more of the time of the Commissioners.

WILLIAM STEPHEN examined.

919. (*Chairman.*) What is your name?—William Stephen.

920. What is your occupation?—Fisherman and seaman.

921. (*Bailie Chalmers.*) You are seventy-one years of age?—And above.

922. You are a native of Fraserburgh?—Yes.

923. You have been engaged in seafaring pursuits the greater part of your life?—Yes.

924. How long were you a pilot in Fraserburgh?—About ten years.

925. You are well acquainted with the harbours of Wick, Peterhead, and Fraserburgh?—Yes.

926. From what quarter do the gales prevail most upon this coast?—They occur mostly from south-east and south-west.

927. Are these also the prevailing winds?—The prevailing winds occur generally in the fall of the year when vessels are coming from the Baltic.

928. With a gale from the south-east or south, would you consider that a harbour of refuge at Peterhead would be of much use on this coast?—No.

929. Why?—When I am bound from the coast of England, or from the Firth of Forth, with blowing weather from the south-east, heavy gales, the sea running very high, and an iron-bound coast, I am afraid to go to look for it, but keep the sea till I am certain I am round the Buchan Ness. Then the coast varies two points, which makes me more free. Until I have the Moray Firth quite open, my mind cannot be easy.

930. In a south-east or south gale, do you consider Fraserburgh quite accessible with a good harbour?—I do.

931. In a south-westerly gale could you easily make Fraserburgh?—Yes, if I have clear weather and can carry canvass.

932. Have you done it?—Yes.

933. Suppose a gale from the north-east, would you consider Fraserburgh a good refuge?—Yes.

934. And sufficiently protected?—Yes.

935. What sort of anchorage ground have you got in this bay?—We have good anchorage. We have sand above, when a vessel comes to the right end, and we have blue clay below.

936. How do you know?—When we heaved the anchor up, we got the blue clay sticking on the peak of the anchor.

937. Is there any rocky ground whatever in Fraserburgh Bay?—There is rocky ground on both sides of the anchorage, but when you come up to the bay it is all clear. There are no rocks to be met with until you come to Cairnbulg Briggs.

938. How far may Cairnbulg Point be from the breakwater?—It is considered to be about two miles.

939. If the breakwater were carried out a quarter of a mile, would that form a good refuge?—Yes.

940. Would that afford ground to accommodate even Her Majesty's ships of war?—They have been much oftener in "shoaler" water than that.

941. Do you know anything about Wick?—Yes.

942. Have you been there?—Yes; I have fished two seasons there at the herring fishing.

943. Will you give me your opinion about the capabilities of Wick as a harbour of refuge? Do you consider it a good place for a harbour of refuge?—There might be a harbour of refuge made, but I don't think any man would attempt it in bad weather.

944. Why?—From Clythness to Duncansby Head there is nothing but iron-bound rock. The general winds are from the south-east, and we have also foggy weather on that coast. A stranger might try to run into such a harbour, but any man acquainted with the coast would never do so. He has got the Pentland Firth to go to, if the wind is blowing from the south-east, and if the tides are not suited to take it he must keep the ship off, in order to keep the Moray Firth open. If he would not take the Pentland Firth with bad tides in thick weather, he must reach to the southward, and keep the shore open, that he may have a chance of Cromarty.

945. Have you taken Cromarty with vessels of 17 feet water?—Yes, as a pilot.

946. You were not a pilot at Wick, were you?—No, but I was a pilot at Fraserburgh; and when in that situation I went to Cromarty with vessels drawing that draught of water.

947. Have you seen fleets of vessels wind-bound in this bay, bound both north and south?—Yes.

948. Have you seen it frequently?—I have seen eighty-four vessels harboured here at one time.

949. If the harbour was larger, would you have seen more of them?—Yes; I have seen eighteen smacks riding in the bay at the same time.

950. Can you tell me were these vessels bound for the west?—They were generally bound south at that time.

951. But you have seen them wind-bound here, both north and south?—Yes, from west to south-east-by-south.

952. Do you remember the great storm from the south-east on this coast some years ago when the accident at Peterhead happened?—Yes, I was caught in the gale.

953. Where were you?—I was fishing from this quarter.

954. Were many of those who attempted to make Peterhead after the gale came on saved?—I think there were about 30 boats lost.

955. Were they all the while trying to make for Peterhead?—I believe they all intended to make for it during that gale, but they were all lost.

956. Do you know if any attempted to make Fraserburgh?—Yes, there were a few of the Peterhead boats carried round Rattray, and all got safe into Fraserburgh, and the Fraserburgh boats which attempted the port were all quite safe.

957. During westerly gales, is it common to see Buckie boats here for refuge?—Yes.

958. Do you remember a few years ago that a number of English vessels were driven on this coast?—Yes.

959. Did they make Fraserburgh?—All that could did.

960. Do you remember where the gale was from?—South, south-east, and south.

961. Would Cromarty be easily made in westerly gales?—Yes, when you can carry canvass.

962. What wind drives the Baltic vessels to this coast?—From south-east to south-west.

963. Suppose that there were a harbour of refuge at Peterhead, in this case could these vessels take advantage of it?—I don't think there would be any wisdom in that.

964. Would you do it?—No.

965. As a pilot, would you take down a ship to Peterhead in those gales?—No.

966. Have you seen Mr. Stevenson's plan?—No. No man in his judgment would run for Peterhead Bay in a gale from the south-east, when the west was free to him.

967. Why?—Because if I miss the harbour mouth I run a great risk of losing my ship.

968. Can you say that any man in his senses would

FRASER-BURGH.

Wm. Stephen.

30 August 1858.

Bailie Chalmers.

run to Peterhead in such a sea ?—No ; he has nothing but hard rocks on both sides.

969. Do you consider, from the depth of the water, that there would be a considerable swell on at the entrance ?—I always found that there was a most heavy sea there. Our minds are always unquiet till we get round the heads.

970. Do you know the anchorage ground at Peterhead Bay ?—Generally they bring vessels to close up. It is generally opposite a certain street.

971. What is the name of the street ?—I do not recollect.

972. You cannot see the plan at all ?—No ; my sight is nearly gone.

973. You cannot tell me, then, that the principal anchorage is exactly opposite the opening of the harbour ?—I understand that from the south point, where it comes up, there is much shallow water. Along the breakwater there is a great deal of shallow water. The most deep water is nigh the harbour mouth.

974. Do you know that the principal anchorage is near the harbour mouth ?—Yes.

975. Do you remember a small battery being where the baths now stand ?—Yes.

976. It was removed when the baths were erected ?—Yes.

977. The baths of Fraserburgh, I mean ?—Yes.

978. Is there anything else you might want to say ?—I suppose I recollect as long as any old man in Fraserburgh. I was at work here before the foundation of any of these quays was built. Then we had only a very small place, and some ten or twelve small vessels. Our harbour revenue at that time was only 60*l.* ; and I think, in less than half a century, we have advanced in numbers above any small place that I know "'twixt John o'Groat's and the pier of Leith."

979. (*Chairman.*) You stated in the former part of your evidence that you had been a pilot for ten years, did you not ?—Yes, in Fraserburgh.

980. When you were pilot at Fraserburgh, whereabouts did you generally pick up the vessels ?—From about the Castle, round the bay, and round Cairnbulg, when we saw the signals for the places where we were detained.

981. What size of vessel have you generally been piloting ?—In that place we could not take large vessels. They were vessels of perhaps 40, 50, 60, or 100 tons we took in them.

982. (*Sir Frederic Smith.*) You say that you are 71 years of age ?—Yes, I exceed that.

983. How long have you left the sea ?—Well, I have been about 60 years at sea.

954. And you are at sea still ?—I still persist a little at it.

985. You are still a pilot, are you ?—No, I was about 30 years or more upon the register after I had given up the piloting.

986. You say, sail along the coast round here till you have got the Moray Firth open ; how do you know when you have got the Moray Firth open ?—We must keep our reckoning.

987. Then if you know by your reckoning when you get the Moray Firth open, surely you must know by your reckoning when you have got Peterhead open ?—Yes, but I am not certain in making for a round promontory.

988. Are you not wrong in your reckoning sometimes ?—Oh yes.

989. Well, it must be rather awkward then to find by your reckoning that you had reason to believe you had got the Moray Firth open when it is not ?—Then we take soundings.

990. But these soundings would enable you to know that you were at Peterhead ?—Yes.

991. Under all circumstances you have no doubt whatever that Fraserburgh would be the best place for a harbour of refuge as compared with Peterhead ?—If my canvass is good, the ship in a workable way, I could take it as long as I could live in the sea.

992. (*Mr. Lindsay.*) What is the course from Buchan Ness to Cairnbulg Point ?—North-north-east to Rattray, and then north by west.

993. Well, that would be a fair wind during south-east gales ?—Yes.

994. If that is a fair wind during south-east gales, would the Moray Firth not be as much open to you as far as a fair wind is concerned, off Peterhead, as it would be if you were off Cairnbulg Point ?—The sea is so bad there that it would almost catch our ships. We must drive round and get smooth water, and the further we get round, we get sheltered by the point, and get fine smooth water, whereas we could not live off Buchan Ness.

995. But, so far as a fair wind is concerned, would not the Moray Firth be as open to you at Peterhead as at Cairnbulg Point ?—The wind might be good to take us forward to the Moray Firth ; but there we round the point, and get shelter.

996. However, it would be as much open to you, as far as the wind is concerned ?—Yes.

697. Well, you have the soundings as far off from the land to the eastward of Peterhead as to the eastward of Cairnbulg point ?—Yes.

998. Then you can depend as much upon the soundings at the one place as at the other ?—We can, but we must be certain we are round.

999. You said that you have made Fraserburgh in a south-westerly gale, and also in a gale from the west ; where were you coming from then ?—I would be coming from the south. I can come from the south and south-west.

1000. Then you have made Fraserburgh, you say, in a south-west gale coming from the south ?—Yes.

1001. Before you get into the best anchorage bay at Fraserburgh, could you bring up by making a tack or two ?—Yes.

1002. That is to say, you must beat to windward to some extent ?—Yes.

1003. You say you have also made the bay of Fraserburgh with a gale from the westward ?—Yes, as long as I can carry canvass, and the ship will work.

1004. How many tacks would you require to make with a gale from the westward from Cairnbulg Point to the best anchorage in Fraserburgh Bay ?—The great point is, whether we have the flood tide, or an ebb tide with us. When we have the tide on the flood it keeps us back ; we need far more tacks. When we have the ebb tide, we do it quickly.

1005. Then with an ebb tide and a good smart ship well found, how many tacks do you think you would require to make from Cairnbulg Point during a westerly gale ?—Three tacks will do it fast enough.

1006. That is, with the tide in your favour ?—Yes.

1007. But with the tide against you, how many tacks do you think you would need ?—We might be tacking for six hours.

1008. Now you have had great experience, do you think a ship is in any danger when she can beat to windward and make way to windward ?—Yes, I have known ships blown northward from Fraserburgh Bay. When they returned from Norway Fraserburgh was the first point which they made.

1009. Then, do I understand that a ship, in your opinion, is in great danger at sea when she is in a position, or so well found, as to be able to beat to windward ?—For instance, if a master sees he has little chance of gaining any ground, he would run to a shelter, to shelter him from the long course of the stormy night coming on.

1010. Then he makes for a harbour of refuge in such gales as these, more to ease his own mind than for any imminent danger to the ship ?—To preserve the ship and property as well.

1011. You said that if a pier or a breakwater were carried out for about a quarter of a mile as originally proposed it would afford good accommodation for Her Majesty's ships of war ?—That is, not to say that we should take the largest, but these are

amongst them. There would be plenty of water to take them in.

1012. If a pier were extended for a quarter of a mile what area of water, in acres of four fathoms depth, would that pier afford?—I cannot answer the question.

1013. (*Captain Washington.*) In coming from the Baltic, is the land about Fraserburgh a good landfall?—It is generally considered so.

1014. What makes it?—It reaches on the point here, and here is the Moray Firth open.

1015. Is there anything in the appearance of the ground?—There is Mormond Hill.

1016. How far off would that be seen?—We can see it 20 miles off.

1017. Then it is a very good landfall?—Yes, we know by the shape of it.

1018. (*Captain Vetch.*) You know the bay of Wick very well?—I fished there two herring seasons, and I have been there with my vessel different times.

1019. You are aware that in the fishing season 1,000 or 1,500 boats are there?—I know there are far more now than when I was there.

1020. And that there are sometimes 40 vessels besides, all at the same time in the bay?—I believe so.

1021. I wanted simply to ask you whether you did not think some protection was desirable for these boats and ships, particularly as the place is well situated in other respects?—I believe there is great necessity for something being done for the preservation of such a number of boats, but there is no trade to support.

1022. Are you aware of any other place near Wick which would serve to protect, so well as the bay of Wick, the boats and vessels?—There is no place but Sinclair Bay sheltered a little from south-south-east and westerly gales.

1023. But from your knowledge of that part of the coast and the large number of boats that are fishing there and vessels attending them, you would think that some work of safety was desirable to be made there?—There is great necessity for safety. They have got a new breakwater there, and when it was built it was thought that it would be a great accommodation, but the last time that I was there I found that the sand had run into it nearly as much as the old harbour.

1024. Then you think it wants something still to make it all right?—That is quite plain.

1025. (*Captain Washington.*) Are you aware that great loss of life took place at Wick ten years ago?—I am aware of that.

1026. A loss of some 37 fishermen?—Yes.

1027. Is the life of a fisherman as valuable as that of any other sailor?—I consider it just the same.

1028. Then, don't you think that a very large harbour of refuge for ships generally, and for the fishermen and small coasting vessels there, is very desirable?—It would be very desirable indeed.

1029. Do you think it is worth while to give them some protection?—Yes.

1030. (*Mr. Lindsay.*) Considering the number of boats that fish at Wick, and the number of lives which are placed in jeopardy, do you know of your own knowledge, that the proportion of life is greater from those boats at Wick than it is from the boats fishing at any other place along the north-east coast?—There is not such a liability elsewhere.

1031. That is to say, you are not aware that the proportion is greater there from those boats sailing from Wick than the boats from any other port?—There must be some risk, because there is a great body of people there.

1032. Quite so; but the loss of life is not greater in proportion to the number of people employed, is it?—When the wind comes dead on, accidents occur at Wick, as well as at other places, but here we have Kinnaird's Head, and we may enter the harbour with a risk.

1033. Then you think the fishermen going out of Fraserburgh risk their lives as much even as the fishermen at Wick?—When the wind is south-east there is a greater risk.

1034. (*Captain Washington.*) In all your recollection as a fisherman, did you ever hear anything like the calamity that occurred at Wick on the 19th August 1848?—It was most severe, certainly.

1035. Did you ever hear anything like it, before or since?—Well, I was liable to the same the same night; but there has been nothing like it. I heard, however, an old story about a storm at Dunbar that was worse, some 200 or 300 boats being lost.

1036. Does anybody else know anything about that old story about Dunbar?—I have read about it.

1037. (*Mr. Lindsay.*) Do you know about the number of lives lost over the fishing portion of the north-east coast during that fearful gale of 1848?—I did see it in print, but I don't remember the number.

1038. Was it somewhere about 100, do you recollect?—I don't recollect, but it was very heavy on the coast of Caithness.

(The Secretary here read the official list, which stated that 124 boats were wrecked, value 7,011*l.*, and 100 men drowned.)

1039. (*Captain Washington.*) Did you ever hear of a calamity like that, I ask you still?—Never.

1040. (*Chairman.*) I think I have gathered from your evidence, that you consider the bay of Fraserburgh more favourably circumstanced for the fishermen than the bay of Wick; do you understand the question?—Yes; that is my view concerning it.

1041. How many fishing boats are at Fraserburgh just now?—I could not say.

1042. Make a guess?—I cannot exactly say the number; about 230, I believe.

1043. Can you give me any idea of the number of fishing boats at Wick?—There are places round the coast, about eighteen miles, included in Wick; I could not specify the number of boats, on account of its being so long since I fished there.

1044. I find that there are 1,200 boats at Wick, and some 330 at Fraserburgh: can you explain to me why there are 1,200 at Wick and only 330 here, since you have told me that this is a more favourable locality for the fishing boats?—Perhaps they can't find merchants to lead them to this quarter. When I went to Wick I could not get a merchant there.

1045. Is Wick nearer to the good fishing ground than Fraserburgh?—I cannot say; it is just owing to what way the shoals go. Sometimes the shoals come from the east, sometimes from the north; sometimes they may set in by the coast of Wick and not come here, and sometimes they set in here and don't go there.

1046. I distinctly understand that you attribute the greater number of fishing boats which resort to Wick to the greater assistance and encouragement they receive from the merchants?—Yes.

1047. (*Sir Frederic Smith.*) I presume that the merchants generally select those places that give them the greater profit?—It has been thought that they do so.

1048. Well then, how can you account for the merchants selecting Wick for their trade rather than Fraserburgh?—It has been longer in standing favour.

1049. But don't merchants change their ground for profit?—I have seen them do so.

1050. Is it not likely that they would do so?—Merchants from many quarters go to Wick. They see it to their advantage to go farther than Fraserburgh.

1051. Have you any knowledge of the proportion of fish caught per boat here and caught at Wick in the season?—We have often beat them, and they have often beat us.

FRASER-BURGH.

Wm. Stephen.

30 August 1858.

1052. That seems to be a very strong reason for the merchants changing their ground. It must appear to you singular that with a superior harbour here for fishing there should be the smaller number of boats with an equally likely chance of getting fish. There must be some reason that you have not given us to account for this?—Well, I could not say the reason; but there is one thing, they generally have to pay as much for their fish there as here.

1053. What are the chief markets for the fish caught at Wick or here?—They go to many different markets.

1054. What is the general market?—The Baltic, Stettin, and other places.

1055. Well then, according to your own view, it is easier for the Baltic vessels to find this harbour than Wick harbour; and the fish being equal in quantity at both places, they should give this the preference?—Merchants making Wick their home don't like to leave it.

Mr. William Burnett examined.

Mr. Wm. Burnett.

1056. (*Chairman.*) What is your name?—William Burnett.

1057. What is your occupation?—Seaman.

1058. (*Bailie Chalmers.*) How long have you been at sea?—Twenty-one years.

1059. And how long a master?—Eight years.

1060. In what trade have you been engaged?—Both foreign and coasting.

1061. In what trade are you now engaged?—In seal and whale fishing.

1062. What is the size of your vessel?—349 tons.

1063. You know the bays of Wick, Peterhead, and Fraserburgh?—Particularly the last two.

1064. The bay of Wick you don't know quite so well?—No.

1065. If a harbour of refuge is to be erected at one of these points, where would you prefer it?—At Fraserburgh.

1066. How do the winds on this coast prevail?—From south-west and south-east.

1067. Would a man of prudence attempt to run down to Peterhead even if the harbour of refuge be erected there in these circumstances?—Never, if he could clear Rattray Head or the Buchan Ness.

1068. You have seen this plan of Mr. Stevenson's?—Yes.

1069. Suppose that plan were carried out, do you think it would afford shelter for vessels in gales from the south?—Not from the south-east.

1070. How is the sea near Peterhead Bay?—The sea is always very heavy from the south-east.

1071. And the tides?—The tides run pretty strong.

1072. Are they so heavy and so strong that vessels trying to make that harbour would be sent round to Fraserburgh?—I think so.

1073. Do you know the anchorage ground at Peterhead?—Yes; it is in a line with Maiden Street.

1074. Is it the principal anchorage in the bay of Peterhead?—Yes.

1075. Is the opening to the south-east?—Yes.

1076. Is there any other good anchorage in the bay?—Not that I am aware of.

1077. Do you very often see fleets of vessels lying here wind-bound, going both north and south?—Yes.

1078. Can you explain how that occurs?—When the wind is from the south-west.

1079. Are vessels coming from the north-west stopped at Peterhead?—Yes.

1080. As they attempt to go west of that, they are met by a wind?—Yes.

1081. This is the leading wind for vessels through Moray Firth?—Yes.

1082. And they in their turn are stopped by the wind that brought the vessels up from the south?—Yes.

1083. Do you know any other point on the north-east coast, where such a thing can happen?—No.

1084. Do you consider that a harbour of refuge ought to be erected on this coast at the place which can be made with the greatest safety in the most prevailing gales?—Yes.

1085. And these gales are?—South-east and south-west.

1086. Do you consider that, if a harbour according to this plan, or any harbour, were erected at Peterhead, it would be of any use to a mariner in these gales?—Not if he wish to save himself and property.

1087. Supposing that one pier was carried out, say one third of a mile across the bay, would that afford a good refuge?—Yes.

1088. In any gale?—Yes.

1089. With regard to Wick, do you consider that there would be great use for accommodation for the craft there?—Yes, for the boats and small ships.

1090. You don't consider that a large harbour of refuge at Wick would be of any use for the regular trade of the country?—I don't think it would.

1091. You have been at the Baltic trade?—Yes; and ships bound to the west coast make for Mormond Hill or Kinnaird Head.

1092. And in gales from the south-east, how do these vessels do?—They attempt to keep the Moray Firth open.

1093. And in that case they would make for Kinnaird Head in preference to Buchan Ness, would they not?—Yes.

1094. Is Mormond Hill a good landmark?—Yes, very good.

1095. Have you occasionally seen English colliers and other vessels driven down from the coast of England to Fraserburgh?—Yes, from London, Newcastle, &c., some of them loaded and some light.

1096. You are aware that a great many wrecks occur in the neighbourhood of this bay?—Yes.

1097. And away up about Lossiemouth and down about Peterhead?—Yes.

1098. Would a harbour of refuge here have been the means of saving many of those who have been wrecked here and at Lossiemouth and Peterhead?—That is owing to the position of the wind.

1099. But it would have saved some of them?—Yes.

1100. Do you know how it is that 1,200 boats, fish at Wick and only 300 here?—Because there are more curers there.

1101. Is it only lately that we have been able to accommodate a larger number of curers than we did?—It is only within a few years.

1102. And they have not had sufficient trial of the new harbour to change from Wick to Fraserburgh?—Yes.

1103. (*Chairman.*) How long had you been a mate prior to being master?—Eight years.

1104. Prior to that were you apprenticed?—Yes.

1105. You heard the evidence given by the former witness, and you must have seen at once the drift of my later questions to him with respect to the fishery?—I cannot say much about the fishery.

1106. Are you of the same opinion with him that the harbour of Fraserburgh is in itself a more favourable harbour and better locality for the fishermen than the harbour of Wick?—There is more accommodation in it just now than there was formerly.

1107. Do you think that the fishermen can make the harbour in bad weather here more easily and with more safety than at Wick?—That is owing to the way the winds are.

1108. But supposing the wind to be in the most dangerous direction at either place?—I should say there is not much difference.

1109. You see and understand that plan of Wick Bay, do you?—Yes.

1110. Do you see the breakwater marked with the opening in the centre?—Yes.

1111. Now, supposing that breakwater to be made, would you consider it a superior harbour for the fishermen to the harbour at Fraserburgh as it now exists?—No.

1112. So that even supposing that breakwater was placed where you see it, you would still consider Fraserburgh a better harbour for the fishermen?—Yes, in bad weather.

1113. Will you state to me your reasons for doing so?—There is a deal of sand to run to here, for one thing, which can save a vessel and property, whereas it is all rock about Wick. If they pass the entrance they pass all.

1114. Nothing else?—No.

1115. As the advantages of the harbour at Fraserburgh are in your opinion superior to those at Wick, and as you will probably soon have railways to Fraserburgh, and therefore your access to the markets will be very much better and cheaper than that which there is at Wick, do you anticipate a great increase of the fishing trade here?—Yes, but we want a better harbour.

1116. Not if you had a better harbour, but with the harbour as it is at present, do you anticipate a great increase in the fishing trade?—Oh yes.

1117. And *à fortiori*, if the harbour was made better you would expect a still greater increase?—Yes.

1118. Do you consider that at Wick the fishermen are nearer to the good fishing ground than they are at Fraserburgh?—I could not say.

1119. That you have no experience of?—No.

1120. (*Sir Frederic Smith.*) Are there any instances of fishermen having missed the harbour and run for the sands?—Yes.

1121. Many?—I have seen a few.

1122. Lately?—I could not say how long it is—some years ago.

1123. Then, although you have the sands here, they have not been of much avail to you?—They have been made use of frequently.

1124. And saved life in consequence?—Yes.

1125. You say you have navigated to the Baltic?—Yes.

1126. Have you ever had occasion to go into Cromarty in coming from the Baltic?—I never was driven there.

1127. You have always made safe voyages and got into your port here?—I always got in when I came.

1128. But you have never been driven out of your course?—Oh yes, many a time. I make my way sometimes into Moray Firth.

1129. Do you think if you had a harbour of refuge at Fraserburgh you would come here instead?—Yes.

1130. In fact, nothing but the want of a harbour would take you there?—Yes.

1131. You have no water capable of taking in a vessel of 300 tons at low water?—No.

1132. What is the largest vessel that can come in at low water with safety?—No ship of any size could come in at low water. It is a dry harbour.

1133. (*Mr. Lindsay.*) I think you said that no man of prudence would run for the harbour of Peterhead in a south-east gale if the breakwater was carried out as laid down there so as to make it a harbour of refuge?—Yes.

1134. If the breakwater was carried out as proposed at Fraserburgh, would you have any hesitation in running for it in an easterly gale?—No, none.

1135. Can you tell the Commissioners from your experience why any man of prudence would not run for Peterhead during a south-east gale?—Because you have only got one chance; that is, the entrance, and if the ship does not steer well, down they are. There is no alternative for ship nor man; whereas here, if we miss the entrance at Fraserburgh we have got the sand. If we don't get inside the breakwater we can take the Moray Firth.

1136. Then when you spoke of Peterhead you referred to a ship not steering properly, or any accident having happened to her, just at the time she was about to enter the purposed harbour?—I say I would never run unless the ship was disabled.

1137. Then the sum and substance of your answer is, that even if there were a harbour of refuge at Peterhead, you would never run for it during a south-east gale?—Yes.

1138. I have not clearly understood from you the reasons why you would not run for it, would you repeat them?—Because the entrance is narrow, and if you miss the entrance you have got nothing to run to.

1139. You would also have a narrow entrance to Fraserburgh if these piers were carried out?—We have something to run to here.

1140. You have the sands to run to?—Yes.

1141. And therefore on that account you consider a harbour of refuge more desirable at Fraserburgh than at Peterhead; is that your reason?—Yes.

1142. Is that your only reason?—We can save our lives here, which we cannot do at Peterhead, on account of the sand at the head of the bay at Fraserburgh.

1143. Have you any other reason?—It would be a more easily-taken harbour in a south-east gale.

1144. You mean that you could take Fraserburgh in a south-east gale, when you could not take Peterhead?—Yes.

1145. (*Captain Vetch.*) I think we heard that there are 330 fishing boats at Fraserburgh, are you aware of that fact?—Yes.

1146. Do you know how many of these fish here, and how many of them go to Wick to fish there?—I am not aware that any go in the meantime.

1147. Are you aware that the herrings generally select known haunts, and that they are found there in great quantities, and not found anywhere else? Do you know that at Peel, in the Isle of Man, they appear in large numbers, and that fishing boats come from the island, from Scotland, from England, and from Ireland, to fish in that island at a particular time?—I have heard so, but I cannot speak upon it.

1148. But you do not expect that you can change the haunts of the herring; if the boats resort to the fishery they must go to the haunts of the fish?—I cannot speak anything about the fishing.

1149. Well, then, you can speak as to the protection required for the herring fishery boats?—Oh yes.

1150. Where would you place the protection? Near the haunts, or far from them?—Near them.

1151. Very well, then, I suppose that is a very good reason why the protection to the boats should be given at Wick and not at Fraserburgh. I think Fraserburgh has a very good harbour for many purposes, but it would hardly suit for the protection of the fishing boats. Is not that, too, your conclusion? But Fraserburgh would do for the fishing boats as well as for any other?—Perfectly, if you could get the first to come here.

1152. (*Mr. Coode.*) You said there was a very heavy sea off Peterhead in a south-east gale, do you consider that it is heavier at Peterhead in a south-east gale than at Fraserburgh in a north-east gale?—Yes.

1153. Why so?—Because the tides run stronger.

1154. I do not say in the bay, but off Peterhead and off Fraserburgh?—Yes.

1155. Do you know the difference in the rate of tide?—No, I cannot state it.

1156. Do you think it runs much stronger off Peterhead?—Yes, but I don't know the exact time.

1157. (*Bailie Chalmers.*) Do you happen to know that the entrance to the proposed harbour to be erected at Fraserburgh would be more than a mile wide.—Yes.

1158. And that the entrance to the proposed harbour at Peterhead is only four hundred feet?—Yes.

FRASER-BURGH.

Wm. Burnett.

50 August 1858.

Bailie Chalmers.

1159. Would not that be another inducement for you to run to Fraserburgh in preference to Peterhead ?—Yes.

1160. As well as what you have said about the rocky nature of the coast at Peterhead ?—Yes.

1161. (*Sir Frederic Smith.*) If the opening be a mile in width, does not that expose your harbour much more than an opening of only four hundred feet ?—If we get to the mouth of the breakwater, we are in smoother water.

Mr. Alexander Stephen examined.

Mr. Alex. Stephen.

1162. (*Chairman.*) What is your name ?—Alexander Stephen.

1163. What is your occupation ?—Mariner.

1164. (*Bailie Chalmers.*) How long have you been at sea ?—Twenty years.

1165. How long have you been a master ?—Twelve years.

1166. Have you been employed in the foreign and coasting trades ?—Yes.

1167. Are you at present engaged in the seal and whale fishery ?—Yes.

1168. You command the *Alexander Harvey* ?—Yes.

1169. Do you know the bays of Wick, Peterhead, and Fraserburgh ?—Well; but I am more intimate with the two latter bays.

1170. But you know something of Wick Bay ?—I have been once in it.

1171. Which of those places would you prefer as the site for a great national harbour of refuge, if such is to be ?—I would prefer Fraserburgh.

1172. Would you give me any reasons for preferring Fraserburgh ; about the winds, for instance ?—It is naturally protected from south-east and south-south-east winds.

1173. Are these the winds which prevail, to your knowledge, upon this coast?—Yes, and south-west winds.

1174. What is your experience about the sea near Buchan Ness ?—In going from the coast of England, which I have often done, I find the sea as I approach the Ness to run very heavily, and my vessel almost foundering till I can get to the north of Peterhead, where I find the sea less dangerous and more favourable for the ship to pass through.

1175. Do you know of any place on the north-east coast, where the tide runs so strong as between the Skerry Rock and the north and south heads of Peterhead, with the exception of the Pentland Firth ?—No.

1176. Have you seen Mr. Stevenson's plan of the proposed harbour at Peterhead ?—Yes.

1177. Can you point out upon the plan, the principal anchorage ground in Peterhead Bay at present ?—Yes.

1178. Where is it ?—I can point it out on the plan from the information I got when I had first the charge of a vessel, the first time I was in the bay, by some of the pilots, I was informed by some of the pilots that the figure 8 is in the line of the best anchorage in the bay.

1179. Do you know what street it is opposite ?—I think it is Merchant Street, but I am not sure.

1180. But you have been there ?—Yes, and I know that the best anchorage lies where I have indicated.

1181. Do you know if there is any anchorage as good as within this enclosure ?—I don't know that there is any so good.

1182. Do you believe that there is any as good ?—There might be for small vessels, but there is none except this for larger vessels.

1183. Then this anchorage ground is left open to the sea, especially in the prevailing gales ?—Yes.

1184. What land do vessels from the Baltic, bound north and west, make ?—I should prefer Kinnaird's Head and the Hill of Mormond.

1185. And even when bound south in a south-east gale, which land would you make ?—I should prefer making Mormond Hill too, if possible, and keep the firth open.

1186. You would do that rather than take the chance of running down two miles in a south-west direction to seek for shelter ?—Yes.

1187. What sort of coast is it all along there ?—There are some sandy bays, but generally speaking it is a rocky coast.

1188. Would you make Peterhead Bay with any confidence in a south-west gale ?—No.

1189. Why ?—Because I have so often experienced in running down on that bay, even a mile and a half off, that the sea runs so high as to put me in danger of our private property being lost.

1190. Is the face of the sea considerably modified by the water being shallower a considerable distance outside ?—Yes, from certain winds.

1191. But even in an east or a north-east gale ?—In that case the force of the sea is broken by the water being shallower.

1192. Suppose a breakwater was carried out according to the plan which you have seen, do you suppose that the harbour of Fraserburgh could be made in any gale ?—Oh yes, I have no hesitation in saying so.

1193. And obtain safe anchorage inside ?—Certainly, to the best of my judgment.

1194. Have you seen frequently vessels wind-bound out in the bay both north and south ?—Yes.

1195. Is this a thing that occurs in any other point of the coast?—I have not experienced it ; I do not think it is.

1196. Would you consider this one cause for preferring Fraserburgh Bay to Peterhead Bay and Wick Bay as a harbour of refuge on a great scale ?—Yes, for sheltering vessels that are often wind-bound here, bound north and south.

Bailie Chalmers then said :—This is a paper I got sent to me by Mr. Calver, filled up. I now beg to lodge it in the hands of the Secretary, and I expected to have been able to examine Commander Croker, but his absence in London has prevented my doing so.

(*Chairman.*) Is he resident in London ?—Yes.

(*Bailie Chalmers.*) I have here Commander Croker's precognition, as well as those of Captain Aldridge and Captain Rohb.

(*Chairman.*) Is it your wish to put these papers in evidence ?—It is.

(*Chairman.*) The Commissioners have decided that these papers cannot be received in evidence.

(*Bailie Chalmers.*) I request that the evidence of these gentlemen may be taken in London, in order to complete my case.

(*Chairman.*) Your request will be duly considered by the Commissioners.

Mr. Abernethy recalled.

Mr. Abernethy.

1197. (*Bailie Chalmers.*) Laying aside your own views, Mr. Abernethy, as to small grants to various harbours, if the Government determine on the erection of a great national harbour, do you consider Fraserburgh the best site on the north-east coast for that harbour ?—I do, for the interests of the shipping generally. At the same time I must say, that I am strongly impressed with the necessity of a harbour of refuge for the vessels connected with the fishing trade being provided at Wick.

1198. (*Mr. Lindsay.*) There is a portion of your evidence so important, that as we have to examine

witnesses at Peterhead before it can be printed, I wish just to see that I have taken it down correctly. Did I understand you to say, that the pier, as proposed by you, extending 1,500 yards and costing somewhere about 400,000*l.*, would enclose an area of 195 acres within the two-fathom line ?—I think that is on the plan.

1199. That is to say, two fathoms and under ?—Yes.

1200. And further, within the three-fathom line down to two fathoms, 150 acres ?—Yes.

1201. And further, you would have, four fathoms down to three fathoms, ninety-seven acres ?—Yes.

1202. Do you mean that you would have 195 acres of depth between two fathoms and three fathoms ?—Two fathoms upwards.

1203. That is to say, your whole area within two fathoms would be 195 acres ?—Quite so.

1204. And your whole area within three fathoms would be 151 acres ?—Quite so.

1205. And your whole area within four fathoms would be 95 acres ?—Quite so.

1206. Then, I think I understood you also to express a doubt of a harbour at Peterhead, such as is proposed, being constructed for the sum which Mr. Stevenson has stated ?—Yes ; I think the estimate is low.

1207. Do you think, from your past experience, it would cost considerably more than 330,000*l.* ?—I do.

1208. Have you formed any idea of how much more it would cost ?—I have not. I gave an estimate of 400,000*l.* as a probable estimate, without having time to go into details ; but in proportion as regards this pier I have put a much larger price upon it than on the pier at Peterhead. I think, seeing the situation, a harbour at Peterhead would be much more difficult to make, and much more expensive, than a harbour here.

1209. Do I understand you to say that there would not be a greater area than 97 acres at Peterhead ?—There would be within the three-fathoms line 95 acres ; within the two-fathoms line there would be 116 acres.

1210. Did I understand you to express an opinion that the holding ground at Fraserburgh is better than what it is at Peterhead ?—From all the information I have received, and inquiries I have made, the holding ground, is clean ground, and better ground at Fraserburgh than at Peterhead.

1211. (*Mr. Coode.*) By the replies which you gave to Mr. Lindsay, I believe the areas had reference to the portion enclosed within the north-east line ?—Yes.

FRASERBURGH.

Mr. Abernethy.

30 August 1858.

1212. Will you tell us nearly in what proportion that area would be reduced if a line were drawn from the outer end of the breakwater, east by north ?—This might reduce the depth of the water anchorage within the four-fathom line about one-fourth.

1213. Do you not think that a line drawn east by north would reduce that in a greater proportion than one-fourth ?—Yes ; but as the Cairnbulg Point and the rocks beyond this point trend so far to the eastward, I don't think the harbour would be exposed in that direction. In fact, I believe that, with an east wind in the direction you mention, at present there is smooth water in the bay.

1214. Do you not think that a line drawn east by north from the outer head of the breakwater would reduce the sheltered area to a greater extent than one-fourth ?—Within the three-fathom line ; and within the two-fathom line, considerably more than one-fourth.

1215. You have no memorandum of the relative numbers of acres, have you ?—I have not. I don't think so, for this reason : that, with the wind in that direction, I find at present that the water is smoother in the bay at that point. You will observe that, although a beacon is shown on Cairnbulg Point, the reef extends beyond that, and at present the beacon is within 400 feet of the rocks.

1216. (*Chairman.*) Will you put in a plan on a reduced scale, when corrected ?—I will.

1217. I understand you to say that you are not prepared to go into the question of construction whatever till a later period ?—Yes ; I am at present preparing detailed plans for the purpose of laying them before the Commission at a future period, on the question of construction.

(*Bailie Chalmers.*) I request leave to examine Mr. Abernethy on a future day in regard to the construction of the harbour.

1217*a*. (*Chairman to Bailie Chalmers.*) Before you sit down, allow me to ask you what is your profession ?—An advocate.

(*Chairman.*) Is there any person present who wishes to tender further evidence with respect to this inquiry ?

No answer.

Sittings at Fraserburgh closed.

PETERHEAD.

Tuesday, 31st August 1858.

PRESENT :

Admiral HOPE (Chairman).

Sir FREDERIC SMITH.
Mr. LINDSAY.
Captain WASHINGTON.
Captain VETCH.
Mr. COODE.
Mr. SEWELL, Secretary.

Mr. ALEXANDER ANDERSON examined.

1218. (*Chairman.*) What is your name ?—Alexander Anderson.

1219. What is your occupation ?—I am Preses of the Harbour Trustees, and Provost of Peterhead.

1220. State for the information of the Commissioners any information which you may wish to offer relative to the subject of the present inquiry, observing that it will be desirable, so far as may be in your power, not to repeat that which has already been given before the Select Committee of the House of Commons on Harbours of Refuge, in the years 1857 and 1858.—If permitted, I shall read the following statement :—

PETERHEAD.

Mr. A. Anderson.

31 August 1858.

With the view of facilitating the inquiry which the Royal Commissioners are about to make at Peterhead, to enable them to report on the best site for a harbour of refuge on the east coast of Scotland, and thereby lessening the labours of the Commissioners, Provost Anderson begs,

PETERHEAD.

Mr. A. Anderson.

31 August 1858.

with their permission, to make a short statement of some of the leading points on which he thinks that good grounds exist for the selection of Peterhead for such a harbour.

It will not, he hopes, be considered out of place to state how important the harbours of Peterhead have been viewed by the country for a long series of years. So early as 1661, in the first Parliament of King Charles the Second, an Act was passed "for a Contribution for repairing the "Harbours of Peterhead." In 1705, an Act of the Scottish Privy Council was obtained "for a Voluntary Contribution "within all the Parish Churches of the three Lothians and "bewest the Forth" for building and repairing these harbours; and in 1729, and again in 1739, the Convention of Royal Burghs authorized a voluntary contribution throughout all the royal burghs in Scotland for the same purpose. In 1807, and again in 1827, Acts of Parliament were obtained for their farther improvement; and since 1797 upwards of 105,000*l.* have been expended on these improvements. The harbours are managed by a rotatory Board of Trustees, a certain number of which are elected annually. The revenue can be applied only to the maintenance of the harbours, the payment of the interest of the debt, and the liquidation of the principal. No individual or body of persons have any pecuniary interest in them whatever. Within the last ten years extensive improvements have taken place, which have been duly appreciated by the public, upwards of 50,000*l.* having been expended within that period on those improvements. By the present Act of Parliament the trustees are authorized to borrow 60,000*l.*; they have under that authority borrowed 57,517*l.* 19*s.* on the security of the annual revenue, which for the year ending at March last amounted to 4,391*l.* 19*s.* 7*d.*

Between 1806 and the present time many eminent engineers and others, by reports and other ways, have borne the strongest testimony in their favour. These reports will be found in the memorials and other documents which will be tendered to the Commissioners.

Before entering upon the few details he is about to submit, he may be farther allowed to state that he is himself practically acquainted with nautical affairs. He went to sea at an early age, and was eight years in the navy, and 24 in command of a ship in the merchant service, and he has himself had experience of the necessity for a refuge harbour upon the east coast of Scotland.

He would, in the first place, respectfully refer the Commissioners to the following documents, which have not been printed in either of the reports on harbours of refuge which were made by the Select Committee of the House of Commons in 1857 and 1858; he does so because they contain much valuable information respecting the fitness of Peterhead for a refuge harbour; evidence of the loss of many valuable lives, and much property, which, had there been a refuge harbour at Peterhead, would have been prevented; and a strong expression of preference which a vast number of shipmasters and mariners trading along the coast referred to have given in favour of Peterhead.

The documents now alluded to, and which he requests to be allowed to hand to the Commissioners, are the following:

Copy of memorial by the trustees of the harbours of Peterhead to the House of Commons, 1858.

Copy of petition by shipmasters and mariners at many of the ports in Scotland, 1858.

Copy of a petition by shipmasters and mariners at many ports in England, in 1858.

Copy of a report by Messrs. Stevenson, civil engineers, Edinburgh, in 1858.

Copy of a report by Mr. James Leslie, civil engineer, Edinburgh, 1858.

Return of wrecks which have occurred in the vicinity of Peterhead at different intervals since 1816, there being no means of procuring a continuous return.

Besides these, there are other returns which he will take leave to lay before the Commissioners, and which he will afterwards notice.

The geographical position of the harbours of Peterhead, as will have been shown, has for many years secured for them much public attention, and the spacious south bay has long been looked to by many mariners as the most fitting place on the east coast of Scotland for affording them necessary protection, should means be taken for that purpose.

It will be shown in evidence to the Commissioners by witnesses of respectability, intelligence, and practical nautical knowledge now present,—

That the south bay is the most generally frequented anchorage on the east coast between the Pentland Firth and the Firth of Forth:

That it has good holding ground:

That the Buchan Ness light on its south boundary; and the adjoining high land, so mark its position that it is easily got hold of; and these objects, forming, as they do, landmarks for vessels passing in either direction, naturally draw them thither, so that shelter and refuge are often sought for in it, and would always be obtained were breakwaters erected for the necessary protection from certain winds:

That all vessels from Archangel to the east coast of Britain endeavour to make the land of Buchanness, and most of them do so:

That vessels from the Baltic to the east coast of Scotland, more especially as the season advances, seek first for the Buchan Ness:

That many vessels from the Baltic bound to the west coast or to America also endeavour to make the Buchan Ness land; and that all vessels bound south or north of Peterhead, from whatever quarter, invariably endeavour to make it:

That in its present unprotected state large fleets of ships bound northward or westward obtain shelter in the south bay in the spring, summer, and autumn months:

That the average of such vessels is not less than 600 of 80 to 90 tons average; many of them are of too large tonnage to be enabled to enter the harbours:

That so many as 96 ships have taken shelter in the south bay at one time:

That large numbers of vessels also take refuge in the present harbours of Peterhead, so many as 86 having been there at one time: on one occasion 78 ships bound northward and westward were in the harbours together; and that during the last five years the number which took refuge in the harbours was 1,149, and the tonnage 69,703: a return to this effect will also be presented to the Commissioners:

That adding these to the tonnage entered at the Custom House for purposes of trade, and those decked vessels which, though entering the harbours for purposes of trade, are not included in the Custom House Returns because of the nature of their employment, such as the carrying of fish coastwise, lime, &c., the total number, taking the average of the last three years, was 1,323 sail of ships of 106,964 tons annually: an amended Return to that which was laid before the Select Committee will also be presented to the Commissioners:

That the trade of the Moray Firth especially is greatly dependant on the harbours and bays of Peterhead for the refuge afforded to it there, when its vessels are overtaken by gales or contrary winds:

That many vessels from Archangel, the Baltic, and North America, call at Peterhead for orders, the average number being not less than 150:

That were the south bay protected, many vessels would take shelter there that cannot do so at present:

That the number of vessels lost and stranded, as enumerated in the return referred to, was 134, and that since 1847 the number has been 64, causing the loss of 87 lives, as nearly as can be ascertained, exclusive of the loss of life which has taken place in the herring and white fisheries, the amount of which has not been ascertained with certainty, although the fact is of itself sufficiently notorious. From a return which will be submitted to the Commissioners it will be shown that since 1847 the number of lives so lost amount to 15. Reference is not now made to the great loss which occurred in 1848 farther than to state, that upon that occasion 59 boats were driven on shore; 35 of these were totally lost, in most cases with all their nets and other materials; the damage was estimated at upwards of 3,000*l.*, and, melancholy to add, no fewer than 19 fishermen perished in that storm:

That Peterhead is a station for the herring fishery second in importance in Scotland, the number of boats engaged annually being from 230 to 400; and within a range of 14 miles south and north, the white fishing is largely carried on, more particularly in the winter months:

That were a harbour of refuge erected at Peterhead, it would possess all the advantages which the trade of the North Sea passing or nearing the east coast of Scotland could require.

Provost Anderson, in conclusion, would beg to inform the Commissioners that he is prepared with a list of the witnesses to whom he has referred, and who will be prepared to answer any questions which the Commission may think proper to put to them in evidence of the points which he has taken the liberty of submitting to their consideration, or any others having reference to the important national object which has been committed to them.

1221. (*Mr. Lindsay.*) You stated that 105,000*l.* had been expended since 1797. In what way has that sum been expended?—In the deepening and enlarging of the harbours.

1222. The tidal harbours?—The tidal harbours.

1223. Was there any part of that sum expended so as to make more safe the anchorage in the bay?—None.

1224. By the powers granted to you in your Act you can borrow 60,000*l.*, of which I understood you to say you had already expended 57,000*l.* ?—Yes.

1225. How has this sum been expended ?—In cutting a communication between the two harbours, in deepening the North harbour, &c.

1226. The money has been expended solely upon the tidal harbours and the docks ?—Yes.

1227. I think you stated in your evidence that you had been for four years in the command of a ship ?—twenty-four.

1228. During that time you traded to where ?—The West Indies.

1229. Where from ?—London.

1230. Have you had any experience in the navigation of the North Sea ?—Not a great deal. In my earlier days I was cruising in a ship of war. During that time we were through every part of the Orkneys, Shetlands, and the Pentland Frith, and all about. The first voyage I made in the merchant service was to America, and in coming home I came through the Pentland Frith, with a gale of wind to the west. Since then I have merely had opportunities as a passenger for observing these places.

1231. You have had some experience in the Orkney Islands in your younger days ?—Yes ; but the period is so far back that I would not venture to give an opinion regarding them. I may merely state the fact that I found no difficulty in coming through the Pentland Frith ; there was a good deal of sea, but nothing to hurt a good ship.

1232. Are you acquainted with the natural harbours of Longhope, Kirkwall, and Stromness ?—It is so long ago since I have been there that it would be with difficulty I could remember the formation of them.

1233. Don't you feel satisfied in offering an opinion on the several harbours ?—I feel competent to say that Longhope and Kirkwall are safe in all winds.

1234. One other question. You say that during that fearful gale in 1848, 59 fishing boats belonging to Peterhead were wrecked, and that 15 fishermen lost their lives. Did all these belong to Peterhead ?—Not all ; some frequenting it, and others fishing at it.

1235. Did I understand you to say that, independent of the loss of life in 1848, there were 15 fishermen who lost their lives at different periods ?—Yes.

1236. Do you know sufficient of the details to answer my questions ?—One boat capsized off the heads and one or two other boats were lost in a similar way.

1237. But would a harbour of refuge at Peterhead have saved those lives ?—I should think not, under the circumstances.

Mr. David Stevenson examined.

1238. (*Chairman.*) What is your name ?—David Stevenson.

1239. What is your profession ?—A civil engineer.

1240–1. State, for the information of the Commissioners, what you wish to offer relative to the subject of the present inquiry, observing that it will be desirable, so far as may be in your power, not to repeat that which has been already before the Commissioners in a published shape in the reports of the Select Committee on Harbours of Refuge, in the years 1857 and 1858.—I do not know any additional evidence that I have to lay before the Commissioners. I think all that I have to say in the shape of evidence has been laid before the Committee ; but I am desirous of offering explanation on a few points. The first is with reference to the tables of traffic which I was asked by the Select Committee to lodge ; and since these tables were made public I have been told that in some quarters they are considered to be inaccurate, I am therefore desirous of explaining as fully as possible to the Commissioners the manner in which these tables were made up ; and I think I shall be able to satisfy the Commissioners that they are correct in so far as they go, not as presenting *absolutely*, but at least *relatively*, the amount of traffic at different parts of the coast. In page 4 of the Report of the Committee on Harbours of Refuge for 1858 I have given a table. That table contains the average numbers of vessels seen to pass certain lighthouses during the day, and extending over a period of seven years. I shall now state the manner in which these observations were made. At each of the lighthouses the light keepers, in their printed instructions, were ordered to note the number of vessels seen to pass each lighthouse during the day, noting the kind of vessels, whether three-masted, two-masted, one-masted, or steamers, and also the direction in which they were seen to be sailing ; and this was as much a part of the lightkeeper's duty as lighting the lamps, or any other service connected with the station. These observations were all entered in a book containing printed forms ruled for every day, and regular returns made up from that book were transmitted to the office in Edinburgh. From these forms the tables which I have produced were made up. The observations were made not by any one set of persons at each lighthouse station, but, as the light keepers are shifted from station to station, it very often happens that the observations at some of the places were made by many different people. For example, during the period over which the observations extend, I find that there were two principal light keepers and eight assistants at the Bell Rock ; at Buchan Ness there were two principal light keepers and two assistants ; at Pentland Skerries, two principal light keepers and five assistants ; and so on, varying according to the changes made. So that these observations really come from independent people, acting under definite and stringent instructions, and with all the care with which it was possible to make observations of such a nature. I think, indeed, that the table bears upon the face of it its accuracy, from its wonderful consistency from year to year at the different stations. I was also asked by the Select Committee, not only as to the numbers of these vessels, but also as to their tonnage, in order to furnish them with a comparative view of the tonnage of the vessels passing Buchan Ness and through the Pentland Frith. The return which I gave to answer that requirement is found in page 210 of the Appendix, which gives the amount of light dues at Buchan Ness and Dunnethead lighthouses from 1846 to 1853 inclusive. These returns, obtained from entirely different sources, shew the same general result, and appear to me to be absolutely conclusive as to the statement which I made, that the traffic on the Buchan Ness coast is very considerably greater than that through the Pentland Frith. I have here, in addition to these tables, a note of the different kinds of vessels which were seen to pass each station during the seven years in question. That is the only explanation with reference to these tables which I have to offer.

1242. Have you anything further to state on the subject ?—I may also mention that the plan I have produced is simply a preliminary plan, made on the understanding that 200 acres was what was necessary ; and showing how these 200 acres could be enclosed in the Bay of Peterhead. But it does not indicate the full resources of the locality, should it be desirable to enclose a larger space, and expend a greater sum of money.

1243. With reference to your last observation, could you point out to us the most eligible mode of constructing a large national harbour of refuge at Peterhead ; I mean, viewing your chart, where would you run the breakwaters ?—The present design might be extended by shifting the piers as laid down [*pointing to the chart*] further seaward ; that is, the area might be extended by removing the piers in a direction somewhat parallel to their present lines

PETERHEAD.

Mr. D. Stevenson.

31 August 1858.

Chairman.

of direction further seaward; and by this means the whole of the south bay of Peterhead would be enclosed, and somewhere about 70 acres additional harbour room obtained.

1244. Putting considerations of expense out of view, as an engineering question, would there be any difficulty in including Invernetty Bay, following the course of the Skerry rocks?—There is, I believe, no engineering difficulty; but it would be an enormous work, involving a very large amount of time and of expense. It would enclose from 1,200 to 1,500 acres of anchorage ground, I suppose.

1245. (*Sir Frederic Smith.*) Why do you draw any comparison between the number of vessels that pass Buchan Ness and Dunnethead? What is the object of that comparison?—The object of that comparison was in answer to a question from the Committee as to the comparative amount of traffic on the Aberdeen coast and the Pentland Firth.

1246. Have you any estimate of the cost of enclosing the 200 acres?—335,000*l.*

1247. For 300 acres?—None.

1248. Any approximate sum?—It might cost 100,000*l.* more. Probably it might be more.

1249. What are the soundings here?—6 to 7 fathoms low water at the south part of the bay, and 7 to 8 at the north part.

1250. Would there be any great difficulty for a vessel to take your harbour in a south-east gale of wind?—Certainly not; I cannot see any difficulty.

1251. This is so far a nautical question; but would you be prepared to say whether there is any state of the wind in which a vessel could not take the harbour of refuge proposed?—I cannot see any difficulty whatever with south-easterly winds.

1252. Was it at all under your consideration whether it would not be better, instead of having a central opening, to have a breakwater detached from both sides of the bay, with an entrance at either end?—I did carefully consider that; and my reason for suggesting one entrance is that it gives a greater amount of shelter. It does not open up the bay so much, and keeps the entrance more from the rocky shores both to the north and south. If again a single entrance were adopted, but placed close to the north side, it would be dangerous for vessels in rounding too closely the projecting rocks, round which the north-east seas break with great violence. If on the other hand the entrance were placed close to the south end, it would be a very dangerous harbour, as vessels would be brought too close to the Salter point. In my opinion there is too little space between the points for the adoption of a double entrance in this situation, however desirable it might be. Before you could allow a sufficiently commodious entrance with a sufficient berthage from the rocky shore at either extremity, you would shorten the breakwater so much that its utility as a shelter would be destroyed.

1253. Look at the plan of the proposed harbour, and give me your opinion whether a breakwater made with a curved line, shown in pencil, would not give more anchorage ground at somewhat less cost than what you propose?—The plan which you have shown me represents a pier going from Salter Rock to meet the proposed north pier. It would give a greater area; but I have found, so far as my experience goes, that the piers of a harbour, in order to have a smooth water entrance, should recede as much as possible from the entrance. In accordance with this view I threw the landward extremity of the south pier within the bay. In short, the entrance to a harbour should never, if possible, be a gap, as it were, in a straight line formed by the piers on either side, but should rather be projected forwards, the piers receding from the entrance on either side towards the shore. This gives relief to the sea, prevents recoil, and stilts the entrance. This is one reason why I said, in answer to the Chairman, that if the harbour were extended, the extended piers should, as far as possible, be made parallel to the lines shown on the plan. These views represent generally the principle by which I was guided in laying out the harbour shown on the plan.

1254. Do you not think that the curved form which I have given to the south breakwater would in some degree produce the effect you desire, of breaking the force of the wave?—No, I am afraid it would not, because I see in the sketch shown me that there is a large portion of the pier—1,500 feet or more—at the mouth of the harbour which is very nearly straight; and I should be afraid that the very nearly straight portion would throw the seas during the south-east winds too much into the entrance to the harbour. I should prefer very much a direction somewhat parallel to that shown on the plan.

1255. Are the two harbours on the same level?—The north harbour is of considerably greater depth than the south harbour. The basin in the north harbour has a depth of four feet at low water; the south basin is dry at low water.

1256. In your evidence before the House of Commons you spoke very favourably of Wick as a fishing harbour?—Yes, I did.

1257. Do you still adhere to your statement in favour of Wick made at that time?—Yes; I have seen no reason to alter my opinion.

1258. Do you think that Wick is the best harbour on this coast for fishing?—I am not exactly sure my evidence was to that effect. It is a very bad harbour just now.

1259. But as to the locality?—As it is, there is no single harbour where there is the same amount of boats collected during the herring fishing.

1260. But are you of opinion that it would be a national object to improve Wick harbour, looking at it as a nursery of seamen and a place of trade, deserving protection?—There cannot be a doubt that the improvement of Wick harbour would be of very great importance to the fishings there, and to that district. And if improved upon a sufficiently large scale, my opinion is, that it would also to some extent be useful as a harbour of refuge.

1261. Do you imagine that if Peterhead harbour were improved it would tend to increase the herring fishing at this port?—I should think it would.

1262. (*Mr. Lindsay.*) I understand that the south-east winds are the heaviest and most dangerous on this part of the coast?—No; I should say the north-east gales sent in heavier sea than the south-east at Peterhead; that is, the sea in the north bay with a north-east wind is much heavier than the sea in any state of the wind in the south bay. The south bay is considerably sheltered by the Buchan Ness and Skerry rocks, and the run of the tide outside of it, which may in part account for this; but my own impression is, that the north-east wind raises a higher sea off these coasts than a south-east wind.

1263. The south bay of Peterhead is somewhat protected in the north-east gales?—To a very considerable extent; and that is one of its great qualifications for the construction of works.

1264. But the south bay is in nowise protected in south-east gales. Is that so?—Yes; it is quite open to the south-east gales; but the sea in it, as stated before, is not so heavy as might be expected.

1265. Now, instead of those piers you propose, as shown on the plan (*pointing to the chart*), if a breakwater was formed, say on the eight-fathom line, leaving a passage for ships to the north, and another to the south, would ships anchored within the bay be then protected against south-east and east gales?—Yes, they would.

1266. They would be protected from both south-east and east gales?—Yes, they would; but in order to have that amount of protection, it would be necessary, as already stated, to carry a breakwater too close to the rocks, both at the north and south-east side, which is a decided objection to the double opening.

1267. You think then that you would not be able to give a breakwater along the eight-fathom line, or thereabouts, which would sufficiently protect ships

during south-east and east gales, and at the same time give a sufficiently wide passage for ships to enter with safety ?—I should much prefer, in this particular case, to accomplish it by having one entrance in some such position as that shown on the plan.

1268. Suppose further, the breakwater were along this eight-fathom line, do you think—for you can only answer the question roughly—do you think such a breakwater would cost more money than those piers laid down upon the plan ?—No, I am not sure it would.

1269. What greater extent of anchorage would it give ?—It would enclose about 40 acres more space.

1270. Not more ?—Not if placed near the eight-fathom line. If placed where I see it, it would cost little more.

1271. The Chairman asked you a question in regard to a very great undertaking ; that is to say, carrying out a breakwater from the Skerry rocks on the one side, and somewhere between the south head and the proposed line of the north pier on the other, so as to form a great harbour of refuge somewhere within these limits ; you said if it were so carried out it would give an area of 1,500 acres. Do I understand you to mean an area of 1,500 acres at low water of one fathom and upwards ?—No, at low-water line. But the bay, especially the south bay, is pretty steep, and there is not a material difference in the area at low water and the one-fathom line.

1272. What description of shore is it generally ? Is there any place within the south bay where a ship could be beached ?—Not at present with safety, I think.

1273. There is one point I want to ask you about which has sorely puzzled me. In the evidence before the Committee of the House of Commons, I observe that Mr. E. R. Calver, when under examination (page 119, question 1996, Report for 1857), was asked the question—"Do you know Peterhead ?" To which he answers "I do." He is then asked, "Do you recommend anything being done at Peterhead ?" He answers, "Not at all." "Confining your attention entirely to public purposes, it does not present any facility for an external harbour of refuge ?" He replies, "Except one of a very limited character, which, of course, could only be partially available. There is a bay to the northward of the present harbour, but I think it is very contracted in space ; the water is deep, and there would be a considerable outlay required." Now, considering that Mr. Calver has been long employed in the survey of harbours, these answers must have weight with me ; but on turning to a book called "The North Sea Pilot," which is printed for the Hydrographic Office at the Admiralty, and would seem to be a book which is published for the guidance of mariners frequenting the North Sea, I find, at page 110, referring to Peterhead Bay, the following statement :—"This bay has "been often pointed out as a site for a harbour of "refuge. Its advantageous position, under the shelter "of the easternmost headlands of the coast of Scot- "land, the long list of wrecks that have taken place "in its immediate neighbourhood, and the number of "windward vessels seeking shelter, the vicinity of "granite rocks, and other reasons adduced by eminent "engineers who have reported upon it, recommend it "for adoption as a national undertaking." The writer of this book and Mr. Calver are both official or semi-official, and as both express opinions diametrically opposite to each other, and as I am bound to value the opinions of both ; if you can do anything by way of explaining this great difference of opinion, do so ?—I may observe that this question attracted my attention the first time I read the evidence, and I immediately concluded that there must be some mistake in the report of Mr. Calver's evidence before the Committee. At the same time I was struck with it, and had prepared for my own information this small sketch here, showing the relative areas of the bays of Wick and Peterhead, drawn from the Admiralty survey, which I found to confirm my own convictions on the subject that Peterhead Bay is of very considerable dimensions. One circumstance may have probably misled Mr. Calver, and that is, a report of mine in 1847, where a harbour of refuge in Peterhead on a small scale, for a limited number of vessels, is proposed, but that plan does not in any shape embrace the resources of Peterhead Bay as a harbour of refuge. It is just possible that there may have been some mistake at the moment with reference to that plan.

1274. (*Chairman.*) Do you give in this plan ?—Yes, if you desire it. It was not prepared for being produced, but merely for my own information ; but I believe it represents the matter pretty accurately.

1275. (*Mr. Lindsay*). From your knowledge of the coast, do you agree with what is stated in the paragraph I have read to you from "The North Sea Pilot ?"—Most certainly I do.

1276. Considering your high position as an engineer, would you answer me one question, and I wish you calmly to consider it. Do you think the south bay of Peterhead, all points considered—the preservation of life and property on the coast, the expense of construction, and the area of anchorage—is the best point on the north-east coast of Scotland to construct a harbour of refuge ?—I shall answer this with certain explanations. With reference to the combined consideration of the general trade on the coast, the amount of traffic, and the facilities afforded for making a harbour, I have no hesitation in saying that the harbour of refuge at Peterhead for shipping would be more useful generally than on any other part of the east coast of Scotland.

1277. Are you well acquainted with Fraserburgh ? —Yes : I have been there often.

1278. Have you looked at it as an engineer, I mean with the eye of an engineer ?—Yes, I have.

1279. What is your opinion of a harbour of refuge at Fraserburgh. I speak of a national harbour ?—I have no hesitation in saying that Peterhead is a far better place for a national harbour.

1280. Do you mean better as a place affording greater facilities for ships to enter during the gales which are most frequent on this coast, or as affording greater facility for the construction of a harbour of refuge ?—In both points of view, Peterhead is not so open as Fraserburgh, and is in a great measure sheltered from our most severe wind, the north-east, to which the bay of Fraserburgh is completely open. It is also a far more useful part of the coast, being more in the track of shipping, and having a far better loose. It is also to the south of a very dangerous sea opposite Rattray Head.

1281. Do you know the Bay of Fraserburgh sufficiently to say whether, for the same expenditure, you could obtain a larger area of good anchorage ground at Peterhead than at Fraserburgh ?—I know Fraserburgh very well, but I could not answer that question off hand ; I could not, without some actual data, give an opinion which I could venture to lay before the Commissioners ; but I can say generally that works in the Bay of Fraserburgh, if carried to any great extent, must be greatly exposed to the north-east sea, from which those in Peterhead Bay are, for the reasons already mentioned, much sheltered. There is also a very great want of material for the construction of such works at Fraserburgh ; at least, what I mean is, that it does not exist to the extent at all compared with Peterhead ; and these are very important elements connected with engineering constructions.

1282. You know Fraserburgh ?—Yes.

1283. Are you not aware that within 200 yards of the town there are large whinstone quarries ?—There are quarries, but they don't produce for sea work anything compared to what the quarries at Peterhead do.

1284. Would you obtain equally good stone at as low a cost at Fraserburgh as you would do at Peterhead ?—I don't think that the same quality of stone can be got at Fraserburgh at all. Peterhead granite has been largely exported and extensively used.

PETERHEAD.

Mr. D. Stevenson.

31 August 1858.

Mr. Lindsay.

1285. As an engineer, have you inquired into the relative qualities of the holding ground at Fraserburgh and Peterhead ?—No, I have not.

1286. (*Capt. Washington.*) As you have called attention to the table of the number of vessels observed passing lighthouses, in page 4 of the report of the Select Committee on Harbours of Refuge for 1858. I should wish to refer you to it for a minute If I understand aright, it is only a return of vessels that have passed during daylight ?—It is.

1287. Therefore all passing during the night and in foggy weather are not included ?—No ; and therefore I have stated that the results are not *absolute*, but *comparative*.

1288. Then I would call your attention to the column in your table for the year 1852, in which year 2,700 vessels passed the Pentland Skerries, whereas there were 3,788 at Dunnethead. This is a discrepancy of 1,000 odds between two lighthouses about 20 miles apart. Perhaps you could throw a little light upon that point ?—It is impossible for me to explain the variation in that very year which you have pointed out, excepting that it is in point of fact true that the Dunnethead return should perhaps be higher than the other returns given, inasmuch as it is within the Pentland Firth, to which narrow passage the vessels converge ; and vessels passing near it can be more easily seen, but I cannot give any definite or decided explanation to you upon what you point out.

1289. Should you not be rather disposed to think that the preponderance would be in favour of Pentland Skerries, inasmuch as vessels bound to the east coast would probably sight the Skerries and not Dunnethead ?—Well, one would suppose, from that circumstance, that the preponderance would be in favour of the Pentland Skerries ; but what I have stated leads rather to the supposition that it may be in the other direction. It is a point on which it seems to me no explanation can be given.

1290. Of course you are aware that I have not the slightest doubt that the table was prepared by you in the belief that it was thoroughly correct, but it carries condemnation on its face. As a good deal of stress has been laid upon it, I think it better to bring out the valueless nature of that table?—In reply to that I have only to say that it was made with all care, and that I still believe it to be correct ; and it does appear in my view, on the whole, to be consistent, inasmuch as the whole of these observations prove a gradual falling off of the amount of traffic from the Bell Rock northwards, and particularly in the upper part of the Moray Firth, and that for a series of seven years.

1291. Well, let us carry it one step further—1854. In it again occurs a difference of 1,000 vessels between Pentland Skerries and Dunnethead ?—Yes, and it is in the opposite direction this time.

1292. Exactly so. I purposely cited it to show that I don't want to draw any unfair deduction from it, and only wish to show that too great stress must not be laid upon it.—In that particular case, I admit, the consistency is not so fully borne out. I cannot pretend to explain how, but it does not materially affect the general averages and results.

1293. I have only further to say in reference to it, that I only wish to be understood as referring to these inaccuracies of the table to show that it may be valuable to a certain extent, in which you will probably agree with me. Do you think that as these returns have only reference to the vessels passing during daylight, that those passing during night or in fog, being out of sight, would probably be double ?—Safely double, and probably 2½ times.

1294. At present you are aware that these returns are very much less than those we get from other sources of the general traffic along the coast?—I am not aware what has been laid before the Commissioners. The only estimate I have seen is one by Mr. Sinclair, published in the newspapers, which is not based on observations at all.

1295. But to return to the harbour proposed at Peterhead. You have placed an admirable plan before us ; may I ask if it is from your own survey ?—Not altogether ; it is partly enlarged from the Admiralty survey.

1296. Well, then, take in your hand the Admiralty survey, No. 1430, of Peterhead, in which observe that the whole of the shore out to low water, marked, is rocky, which you have stated is hard. Nests of rocks occur within two cables' lengths of the low-water mark around the whole margin of the bay ?—Yes, I see.

1297. Have you any reason to doubt the Admiralty chart ?—None in the least. No rocks are shown on it beyond the one-fathom line, nor do I think there are any.

1298. Can you tell the width of the entrance ?—400 feet.

1299. In deciding upon this, did you consult any pilots or nautical men ?—No ; I went upon my own knowledge of such matters ; but the plan has long been before the harbour trustees, many of whom are nautical men, and with whom I have had many meetings on the subject. But the entrance, its width, and exact directions of the piers, I do not hold to be determined in the same exact manner as I should do if making out the working drawings for the actual execution of the work.

1300. I think you have been employed on a good many harbours ?—Yes.

1301. Could you mention some of these ?—Sunderland, Hartlepool, Seaham, the Tyne, &c., and almost every harbour on this coast, and many in Ireland.

1302. Several of these are pier harbours ?—Yes.

1303. These harbours are taken by vessels ?—Yes.

1304. What is the breadth of the pier harbour at Sunderland ?—350 feet.

1305. There is a very large traffic in and out of Sunderland ?—I am not aware of its extent.

1306. May it not be about 25,000 vessels a year ?—I could not say exactly, but it is very great.

1307. It is that number. No very great difficulty has arisen in taking that entrance in a gale of wind ?—Occasionally they are wrecked in taking it, because the piers there are nearly parallel, and that for a considerable distance within the entrance ; and that causes a very unsteady sea within the entrance, and from the limited depth of water on the bar vessels are apt to lose steerage, and are sometimes lost in making the harbour of Sunderland.

1308. Do you think it is the width of the entrance that causes the wrecks ?—No, but mainly the shallow water and defective form of entrance.

1309. What would be the breadth of pier harbours at Fraserburgh, or any other ports along the coast in the event of their being constructed there ?—400 to 500 feet is quite sufficient.

1310. (*Capt. Vetch*). Will you tell me what is the amount of the low-water area, and at one fathom and upwards ?—I could not.

1311. Of three fathoms and upwards ?—195 acres.

1312. Four and upwards ?—I have not these measurements by me, but it is not materially less.

1313. What is the greatest depth of water you have under the line of piers ?—Eight fathoms.

1314. What is the rise and fall of the tide ?—11 feet spring tides and 6 neaps.

1315. Could you form an opinion as to the number of vessels from 200 to 500 tons that would find anchorage inside ?—I never calculated.

1316. Which is the wind that brings in the heaviest seas upon the site of the harbour ?—The north-east, from which the works are greatly sheltered.

1317. Is there any strong run of tide across the mouth of the bay ?—There is round the north head but not in the bay.

1318. Do you know its rate ?—Not exactly; in particular circumstances, it may run nearly 5 knots just at the north head and close in shore.

1319. Suppose the tide was running, and the strength of the stream beyond the bay under a heavy sea on from the eastward, would a vessel be able to

take that entrance easily ?—Yes, I think so. The strong tide which I mention does not apply to the entrance to the bay at all, but to the north head. The tide opposite the bay is not so strong.

1320. How much, outside of the proposed harbour, would the stream of the tide run ?—The strength of the tide is at the outside, in the line from the north head to the outside of the Skerries. There is only a modified current that comes into the bay.

1321. This would in some degree cross the harbour's mouth ?—Yes, but it is very gentle.

1322. In heavy weather, under these circumstances, would there not be some difficulty in getting in ?—There is no doubt that in heavy weather vessels would encounter heavy seas, but I cannot see any difficulty in vessels during south-east gales making the harbour. This is more a nautical question, which nautical witnesses may speak upon.

1323. With respect to the bottom, you say there are 95 acres of 3 fathoms and upwards of good anchorage ground. Are these 95 acres of clear ground for anchorage ?—The best anchorage for large vessels is towards the north ; but there is a large amount within the area covered by the harbour where vessels might take their anchorage.

1324. Would there be any danger of vessels driving from their anchorage in heavy sea ?—Possibly they might if anchored too far in; but there is plenty of room for good anchorage in the bay.

1325. I think you already mentioned that there was no beaching ground on the harbour ?—No ; I think there is not any ground where vessels can safely beach at present, in the unprotected state of the bay.

1326. (*Mr. Coode.*) In making your estimate of the cost of this harbour, what kind of construction—what form of section—would you adopt ; how would you arrange your materials ?—It would be composed of rubble brought up to somewhere about 12 feet below the low water, with a superstructure raised to the height of about eight feet above high water.

1327. What proportion of that section would be raised by cranes, and what thrown in ?—All below 12 feet low water would be thrown in, and all above that set.

1328. Do you propose to use mortar or cement ?—Neither, above nor below.

1329. I think you gave evidence as to the height above high water ?—Eight feet.

1330. Have you revised your estimate ?—Yes.

1331. State the nature of the material ?—It is of granite rock, to be found in the neighbourhood from two localities. The one is Stirling Hill, about two miles from the town ; the other is Black Hill, about the same distance. The material is equally suitable in either case, but perhaps Stirling Hill granite is the best.

1332. What is the size of the blocks you propose to employ there ?—For the under-water works we take the blocks as we find them.

1333. With what height of face do you contemplate working the quarry ?—A face of 50 to 100 feet could be very easily obtained.

1334. Would you have any difficulty in getting faces from 50 to 100 feet ?—Not the least.

1335. As to the nature of the holding ground, was your information obtained from pilots and others ?—Yes.

1336. You made no personal observations yourself ?—No; but I have several times been at anchor in the bay.

1337. Have you made any observations on the strength of the tides ?—No ; they are given on the Admiralty chart.

1338. Have you any idea of the strength of the tide from the south head to Salter's Point ?—It is slack water nearly between the south head and Salter's Head. The main stream outside, from the north head to the Skerries, is, I think, three or four knots.

1339. You said that the north-east wind was the worst in the German Ocean, and that the north-east gales raised the heaviest seas ?—Yes.

1340. Is there a pretty general concurrence of opinion in this ?—Yes.

1341. Could you give us the soundings in Invernetty Bay ?—They are shown on the small plan.

1342. What would be the height of the top of your proposed work above the level of high water at spring tides ?—Eight feet.

1343. Do you propose to have any parapet upon it ?—No.

1344. You spoke of the material at Fraserburgh. Have you an intimate knowledge of the quarries there ?—I know them very well. I don't consider it very well adapted for the construction of a harbour, except for the underwater rubble. It will be next to impossible to get large well-shaped stones there in any quantity.

1345. This is not a complete plan, but subject to investigation ?—No doubt of it.

1346. (*Capt. Washington.*) As attention has again been called to the table at page 4 of the Report for 1858, I again desire your attention to it. Between Kinnaird's Head and Buchan Ness is a distance of twenty-two miles ; then it would be fair to suppose that any great change which would pass at the one lighthouse would also be shown at the other ?—No, not at all. I conceive that many vessels pass Buchan Ness and are not seen at Kinnaird's Head, Buchan Ness being upon a point of the coast, and Kinnaird's Head off this course.

1347. I mean the comparative number passing the one would likely be the comparative number passing the other ?—No.

1348. We shall deal with facts. Will you run your eye along the line of Kinnaird Head, and you will see that a fair average is maintained during the whole seven years. Now, will you refer to the column marked Buchan Ness, and you will see that while 10,186 vessels passed in 1850, only 5,225 vessels passed in 1855. Can you explain that extraordinary discrepancy ?—A gentleman has suggested that it may be accounted for by the Russian war in 1855–56, when the Baltic ports were closed. I shall inquire into this, and explain it to-morrow. It is obviously due to a variation in some part of the traffic which is not common to both stations.

1349. Would a vessel sailing from Peterhead, going north, be reckoned as passing Buchan Ness lighthouse ?—No.

1350. She would not pay shore dues, but would she not be reckoned ?—No.

I have only further to say, that it tends to show the reliance which may be placed on this table.

1351. (*Chairman.*) Would the secretary read at page 21, paragraph 22 of the Report of the Select Committee on Harbours of Refuge for 1858, beginning "In conclusion," and ending at "in severe storms." With reference to one expression in the paragraph of the Committee's Report now read to you, which indicates the probability of the continued extension of our passing trade, do you consider that the second bay—Invernetty Bay—will afford any facility for constructing a national harbour of refuge at Peterhead ; that the protection for the passing trade at present required may be obtained by a work constructed in the south bay in such a manner that hereafter, if required, Invernetty may be included ?—I am afraid that could hardly be done without to some extent constructing a work which would be afterwards superseded. But although I know the place very intimately, I am not prepared to advise the Commissioners at this moment.

1352. You have never considered it in all points of view ?—Not very closely ; and there is no subject on which I should be more cautious to offer an opinion without due consideration than the construction of sea works, where exposure, currents, and many other things have to be taken into account.

1353. Would you have any objections to consider it, and to send in the result to the Commissioners

PETERHEAD.

Mr. D. Stevenson.

31 Aug. 1858.

Chairman.

at a later period?—I shall certainly be most ready to do so.

1354. What time would you take to consider it?—A week or two.

1355. (*Sir Frederic Smith.*) Would it be inconvenient for you to give the Commissioners a rough section of your proposed breakwater?—I shall do so.

1356. Do you attach any importance to the dressing of stones for the harbour; that is, the fair outside dressing?—None whatever to the outside dressing.

1357. (*Mr. Lindsay.*) I have one question to put to you by way of explanation. Did you suppose, by the way I put the question, I asked you who was the author of the paragraph I read from "The North Sea Pilot"?—Yes, I so understood it.

I think it right to say a word by way of explanation. I myself was not aware that Mr. Calver was the author of the paragraph when I read it. I supposed he had nothing to do with it. I wished merely, as the opinion offered in that book was so very different from that offered by a very competent and impartial authority in the evidence before the Select Committee, to draw your attention to the two paragraphs, and obtain from you an explanation of them, not supposing that Mr. Calver had anything to do with the paragraph in "The North Sea Pilot."

(*Capt. Washington.*) I am responsible for this publication, and, in the absence of Mr. Calver from indisposition, I think it right to exonerate him from any apparent contradiction. The paragraph in question, with the exception of the last two words, is entirely a quotation from the Report of the Tidal Harbours Commission, which was written by myself. You hold that report in your hand. Mr. Calver says, "to recommend it (Peterhead Bay) for adoption as a national undertaking." For "adoption" "consideration" should have been written, and most probably was the idea in the mind of the writer. I think you will admit that by this alteration the statement does not sound so strongly. I believe it was Mr. Calver's wish to say everything he could for a refuge harbour on the east coast of Scotland, and that it has been the aim of his life for the last twenty years to get refuge harbours on the coast of Great Britain.

Wednesday, 1st September 1858.

PRESENT:

Admiral Hope, Chairman.

Sir Frederic Smith.
Mr. Lindsay.
Captain Washington.
Captain Vetch.
Mr. Coode.

Mr. Sewell, Secretary.

Mr. D. Stevenson.

1 Sept. 1858.

Mr. David Stevenson.

1358. I was asked yesterday to put upon this plan the two-fathoms and three-fathoms line, and also to insert the soundings in Invernetty Bay. This plan which has been lodged contains that information; and having no means of doing it here, I understood the Commissioners to say that they would be satisfied with this, and that it was not necessary to transfer it to the large plan. I may state, that the rocks to which the Royal Commissioners alluded do not extend beyond the one-fathom line. The only other point that I have to mention with reference to the evidence of yesterday is with regard to the currents. There appears to be some slight mistake as to what was said regarding the directions of the tidal currents. The statement made was, that the strength of the flood tide runs in a line between what is called the north head and the second head on the map to the south Skerry. I mentioned that at one point the tide under certain circumstances ran with a velocity which I thought might be about five knots an hour; that is between the south head and the north head. Off the bay of Peterhead the velocity is about three knots an hour, and the tides in the bay are eddy tides, so that the main stream tide runs without the bay of Peterhead. I am not sure that that was quite understood in the evidence yesterday, and before the nautical witnesses came I wished just to explain what was intended.

1359. (*Chairman.*) Have you any other statement that you wish to make?—There are a few statements which I should wish to offer with reference to the statistics at a future period of the sederunt, when I shall be prepared to do so, if the Commissioners can give me a few minutes.

(*Chairman.*) Very well.

Capt. P. Burnett.

Captain Peter Burnett examined.

1360. (*Mr. Boyd.*) You were a shipmaster in Liverpool?—Yes.

1361. The last ship you commanded belonged to Malabar?—Yes.

1362. You left that ship a few months ago?—Yes.

1363. How long have you had command of a ship?—Since 1839.

1364. Have you had much experience along this coast?—I never traded regularly along the coast, but I have made many voyages on the coast at different periods.

1365. You were a good many years in the Greenland trade?—I commanded ships in the Greenland trade from this port from 1845 to 1852.

1366. You have, I presume, thought about and considered the question of the desirableness of a harbour of refuge upon the east coast of Scotland, and the most eligible site for such a harbour?—I have.

1367. Would you state to the Commissioners the opinion which you have formed, and the grounds on which that opinion has been formed?—I will. In giving my opinion regarding harbours of refuge, I think there is a fact which all seamen would agree with me in when speaking with regard to all harbours of refuge, with the exception of those in some peculiar situations to which I will afterwards refer, namely, that nine tenths of the vessels entering these harbours of refuge do so, not from stress of weather, or with the wind blowing in currents on the land, but as wind-bound ships taking shelter in unsettled states of the weather when the wind is against them. Granting these views to be correct, I would then glance at this chart of the coast, from the Firth of Forth to the Pentland Firth and I see that the eastern promontory of Scotland is where the greatest number of vessels passes, or would have to pass, in the coasting trade, and where, from certain peculiarities in the direction of the wind, the greatest number of vessels meets, coming from both south and north. It is a well-known fact, I believe, to every coasting seaman trading to the Moray Firth,

that in coming along the land and approaching Peterhead from either direction, they will have the wind from west-south-west south of Buchan Ness, west off Peterhead, and west-north-west as soon as they have opened out round Rattray Head. I have myself frequently seen vessels bound both south and north, as many as 60 and 70, at anchor in Peterhead Bay during strong westerly gales, which vessels could get neither south nor north, in consequence of the wind blowing the line in the manner I speak of. That, taken along with the fact that all ships for the coast of England, as far south as Flamborough Head, passing to the northward, either through the Pentland Firth, or steering bound to Archangel, if they steer for the Shetland Isles, do it almost passing or in sight of or near Peterhead, very few ships shaping a direct course for the North Cape. It is my opinion that there is no other point of the coast where so many vessels will be found to have congregated together at one time ; and, as I remarked before taking the meaning of the harbour of refuge, not merely in its limited sense for vessels taking shelter, by having it just under their lee at that very point where they may be caught in a gale from the land, and obliged to run for it, I think it is a very small number of ships that can be able to take advantage of the harbour of refuge under these circumstances ; that the purpose will be better served from the fact that these vessels taking shelter in an unsettled state of the weather or foul winds, would diminish the risk of loss of property and life along the adjacent coast in case of a gale coming on. Holding these views to be correct, I would then point out some inducements that would lead to shipmasters. I, as a seaman, consider that others would be actuated by the same reasons, one of which, and I suppose the greatest, would be to prefer a harbour where the facilities granted would be of easy access, and easy to get out of it when the fair wind should happen. I will carry that plan of the harbour on to this map here, and place it in the position of Peterhead. With those present harbours the entrance through to the north and the contemplated harbour of refuge with the entrance to the south-east, I maintain that there is no other position on the coast, from the Firth of Forth to Duncansby Head, where you could have the same chances of getting to sea with the winds from so many points to the compass as you could out of Peterhead Bay as it at present exists. I also hold that when the winds as such and of such a strength that you could not get out of those harbours in consequence of the sea that would be running in, I, as a shipmaster, would consider it imprudent to attempt to get out, even if I could, because I think that the danger would be very great in proceeding along the coast, particularly to the southward. To the north of Peterhead there is no one place where a harbour of refuge could be built where ships taking advantage of it bound to the southward would be able to get out when it came a fair wind between north-north-west, and east-north-east, which winds invariably shift constantly round from south-west to north-west-west and east-north-east. Again, south of Peterhead, if a harbour of refuge was constructed anywhere between the Firth of Forth and Buchan Ness, with the winds any way from south-south-east to east, or even east-north-east, which, providing a vessel cleared Rattray Head bound up the Moray Firth or Pentland Firth, would be a fair wind for them, I hold that vessels having taken shelter in any harbour so placed would not be able to avail themselves of these winds, they would not get out ; if they do get out of the harbour they will be close on the lee shore. I think the line of coast there of itself bears sufficient evidence on both sides to corroborate what I state. It is not so with Peterhead ; a ship bound for the southward will be able to get out of that harbour, so long as the wind is not to the southward of east, unless blowing a very heavy gale of wind, when, as I said before, it would be imprudent under any circumstances to come out and risk the coast. With the wind at any point of the compass, from east round to south-south-west, she could come out of that entrance ; and between south-south-west and east a vessel could get, on the other hand, out of the north entrance as it at present stands, such vessels whose draught of water would not be too great for the depth of the cut through. These are my principal reasons for maintaining that a harbour of refuge would be of greater benefit, taking it in the most extensive view, here than at any other part of the coast. I might remark, that farther south, on the coast of England, which I said has some peculiar situations, a harbour of refuge would be perhaps better on the bight than on the promontory. I see, between Flamborough Head and North Sunderland or thereabout, there is a class of coal ports, where I suppose a greater amount of traffic is carried on by far than at any other port of Great Britain on the same extent of coast. These ports being in the bight, naturally lead the ships down to them into the bight. Very often at low water, sometimes during the night, and sometimes even during the day, a gale springs up, and they afterwards find that they cannot or dare not attempt those ports that they now run down for. I think that therefore any harbour of refuge on that part of the coast would be of the greatest service in the bight in reference to coal ports.

1368. (*Chairman.*) What coal ports are you speaking about?—I am speaking of the coal ports about Whitby, &c.

We always feel the greatest disinclination to interfere with any witness when he is giving his evidence, because we are perfectly aware when any gentleman comes here to speak before us, and prepared to give his evidence, it discomposes him, but in this case it would be better if you would confine your remarks to the particular locality at present under our notice.

(*The witness continued.*) With regard to the probability of taking such a harbour as that in a gale of wind, I have been residing here at different periods for a number of years, and have seen some very heavy gales of wind blowing here, and have seen also a good many disasters, and much loss of life and property ; at the same time I am of opinion that in the bay of Peterhead there is much less sea strikes in than there is either north or south of it, from the fact that the strong band of tide running across the bay runs the sea down before it enters it. I myself came from London in December 1849, during very heavy gales from the eastward ; and when I was off Aberdeen during the gale, I saw two Aberdeen steamers, one bound north and the other south, both having to call at Aberdeen to land goods and passengers, but neither of which dared attempt the harbour, and one was obliged to pass south, and the other north. That evening, just before dark, my ship took Peterhead harbour as it is with perfect safety, when there was such a sea running at Aberdeen, rendering it impossible for these steamers to enter the harbour ; and I think there is a gentleman present who was aboard one of the steamers, and was landed at Portsoy instead of Aberdeen. I think that of itself is good evidence that there is not so much sea runs into Peterhead Bay as many parties allege ; and it is to be accounted for in the way that I spoke of, namely, that the tide runs the sea down before it enters the bay. My opinion is as a seaman, and my experience, that that harbour, as it is proposed to be made, is adapted for a harbour of refuge, and I would have no hesitation in running for that entrance, so long as my ship would run under a close fore-topsail ; and the larger the ship the better, because she would steer better. There is no tide runs across that entrance ; the band of tide runs direct from the south head to the Skerry Rocks, and there is rather a back tide from Salter Head to the south head from the flood, but it is very irregular, and does not run the same during all the periods of the flood, and it is so weak that it is not of the slightest consequence, and would be of no danger to a ship under any circum-

PETERHEAD.

Capt. P. Burnett.

1 Sept. 1858.

stances, because we always find that the direction of the tide running there is with gales of wind running the tide has about half the velocity that it has with westward when a gale on the eastward, so that I think in a gale of wind from the eastward there would be no back tide at all there. I may remark, that during the year 1848, when the loss of those herring boats occurred, I was perhaps the only man who in Peterhead saw the whole of it. I was upon the rocks at the harbour mouth from the time the first boat came on shore till daylight, and would have been able to give perhaps the best information of any one here on that question. Unfortunately I had to sail before the investigation took place, and the consequence was that I was not present. I have not the slightest hesitation in saying that had there been any such harbour of refuge as that which is proposed, not one boat of those 59 would have been lost, except the two which foundered outside, of which we had no account. However, the accident occurred; but had that harbour existed, with a leading light there, all that I say is that not one boat would have been lost. I could explain to you, perhaps, that the reason that there were so many boats lost at the harbour's mouth was, that, steering in sight of Buchan Ness light, with a wind from the eastward, they bore down upon the harbours. When they found themselves close to the rocks, west to the harbour pier, they could see no harbour lights to guide them; they had to suddenly change their course, and found the sail on the wrong side of the land, which was the consequence of at least 30 boats being wrecked that otherwise would not have been. I believe there are many here in Peterhead, fishermen, who could bear me out in what I say, that I witnessed the whole of it, and saved many of their lives.

1369. (*Mr. Boyd.*) In speaking of the harbour of Peterhead, in its present state, do you mean as it is on the plan?—I mean the old harbours as they stand.

1370. Do you speak of them as being sufficient for the refuge harbour? the harbour as it is, or merely that it is the most suitable site for the necessary harbour of refuge?—Merely that it is the most suitable site for the necessary harbour.

1371. You have made, I understand, a sketch of the line of coast or a chart?—I have.

1372. Do ships going to or coming from Archangel pass through the Pentland Firth from the east coast?—Never.

1373. Is Peterhead where vessels from Archangel and the Baltic endeavour to make the land?—Yes; the Archangel vessels have invariably orders to call at Peterhead for orders.

1374. Do you know that many vessels call at Peterhead for orders?—Yes; I hold in my hand papers which will testify to that effect.

1375. Have you made some inquiry as to the number of letters to be called for?—I have. I found 43 letters. I hold in my hand the *Shipping Gazette* of yesterday, wherein it is stated that 8 vessels cleared out at Archangel to call at Peterhead for orders; and I hold in my hand another paper, showing 21 vessels ordered to call at Peterhead from Archangel.

1376. In short, it is a general place of call to vessels from Archangel?—It is. I can remember the time when no vessels called at Peterhead for Archangel, but of late years the order is now given that they shall call there for orders; there are also a great number of vessels from the Baltic. I think perhaps during 8 or 9 months of the year, the prevailing winds in the North Sea are between west and south or south-south-west. These winds generally prevail during the time that the Baltic is open, and also the south-south-east. The first land that vessels from the Baltic make is about Peterhead, or even to the north of Peterhead, for the purpose of getting into smooth water. That is the reason why a great many of the Baltic ships homeward bound pass Peterhead. No outward-bound vessels do so.

1377. Are you acquainted with the soundings off the coast compared with those off the coast of Caithness?—No, I cannot say I am.

1378. I think you have explained to us the tides in the harbour; what is the rate of the tide between the south head tide and the north head?—There is little or no tide. What tide there is, is a back tide. Vessels riding there in the position of those piers at present will very frequently during the flood tide be met with a stream to the north-east, but it does not continue so during the whole flood of the tide.

1379. Are you acquainted with the South Bay of Peterhead as holding ground?—Yes. I have seen many vessels riding in Peterhead Bay. I occupied a house for several years founded on the rocks at the south harbour mouth, where I had a view of the whole harbour and all the ships that came into it during summer and winter, and I may state that I never saw a ship driving into Peterhead Bay. I have seen 60 or 70 vessels lying there, and I never saw two vessels foul of each other; and I think it will be very difficult for any one in Peterhead to say that there has ever been any fouling in Peterhead Bay, although ships lay out double anchors. I have ridden in it myself at various times, and always found it good holding ground.

1380. (*Chairman.*) How many years have you been at sea?—Since 1831.

1381. How many years as master?—19 years.

1382. Generally of what sized vessels?—From 150 tons up to 1,200 tons.

1383. And of the larger description of vessels, say from 500 to 1,200, how many years?—Since 1853.

1384. How many years were you a mate?—About two years. I had also the command of a transport during the Chinese war. I was about 18 months there. My last ship was in the transport service in the Persian war.

1385. Do you wish to put this chart, with the tracks laid down on it, in evidence?—Yes.

1386. Will you be good enough to lay these tracks down on a smaller chart, or to make a chart for us on a small scale, with the tracts in question?—I will.

1387. I want to ask you, with reference to an opening of that description: has it ever occurred to you, during your experience as a seaman, to run a large ship into a harbour of that kind?—No, I have not. The largest ship I have ever run into Peterhead harbour is a ship of 450 tons. The entrance is 100 feet wide.

1388. I understood from your evidence that it is a great advantage, as respects the sea, which you would expect at the entrance of a harbour of that kind, that it should be out of the run of the tide?—Unquestionably.

1389. And your reason, I presume is, that the sea in the opening would be a fair sea; that is, without tide?—It would; and also that it requires no calculation in steering for it, but just simply steer for it, where, if there is any tide running across it, every stranger would be astray.

1390. (*Sir Frederic Smith.*) Although you never entered a harbour with so narrow an entrance, would you be at all apprehensive in taking vessels of large tonnage with a strong south-east wind into a harbour with such an opening?—Not the slightest. I would have more hesitation in running into it with a very small vessel under a heavy gale of wind than a very large one, from the fact the large ship would steer much better.

1391. Do you know the width of the proposed entrance?—I have heard it stated 400 feet.

1392. Would you be under any apprehension in taking that entrance with a small vessel?—No, I would not; but I merely made the remark to say that as a harbour of refuge for large ships the danger is less to a large vessel than a small, because the large ship will always steer more under command than the small one.

1393. Would a vessel be able to get out of Peterhead harbour with a strong gale blowing to the east of the proposed entrance?—A powerful ship would

be able, but I do not think a small would; but I do not think it would be prudent for a vessel to go out with a gale blowing hard.

1394. What are the winds that would lock a vessel in that harbour?—A vessel could scarcely be locked into it with any wind, unless it was blowing a very heavy gale; because, if you could not get out of the one end you could get out of the other.

1395. But, supposing the vessel of so large a tonnage that it could not get out of the canal, what would you do?—In that case, the wind would be between east-south-east and south-east, not more; because, if you look at the entrance and the magnetic lines there, you will find that with the wind at south, she could lay out at that tack, and clear the south head.

1396. Have you looked at that proposed plan with any degree of attention, or is it new to you?—It is quite new to me. I only saw it some three or four days ago, and that for a short time, till I saw it yesterday in this room.

1397. You have reflected on that plan; can you suggest any alteration in it that would improve it?—Irrespective of cost, I should decidedly say that it is too small.

1398. What number of vessels would be able to take refuge in that harbour?—I do not think more than ten. I think ten would. I do not think that ten could perhaps be placed in a position to execution as men-of-war; but I mean to say that ten could lie very well in that harbour.

1399. What increase of size would you suggest?—A harbour of national benefit should be made from the Skerry rocks; that is to say, it should be such a thing as would be sufficient for a fleet to rendezvous in, and also at the same time to give accommodation to the increasing trade in the merchant marine; but at the same time, a pier run parallel to that from the south side of Salter Head, and another still out upon the south head, would give more than double the present area, as near as I could judge.

1400. Are you of opinion that no vessel could get out, with a strong wind from north-east to east, from the harbour?—Decidedly not, with the wind between north-north-east and east-north-east. The same thing applies to the other side; because, with the wind any way almost, between east and south-east, it is a dead lee sea.

1401. Are you of opinion that if the funds were unlimited, both for Peterhead and Fraserburgh, you would give the preference to a harbour made here, over a harbour made at Fraserburgh?—I would. I may state my reasons for doing so: first, that I think a harbour of refuge is not simply a harbour for ships to run to in a gale of wind that may happen to be near the neighbourhood, but one holding out inducements for vessels to take shelter in it in foul winds; these, by keeping these ships off the coast, I think there would be more lives saved, and less property lost that way, than if the harbour was placed at any point where protection cannot be given for ships driving in a gale of wind.

1402. Then you think a harbour for storms is not so essential as a harbour for vessels with a foul wind?—I think not; I have always found that nine-tenths of the ships in harbours of refuge take shelter in unsettled states of the weather and foul winds.

1403. What would be the opinion of shipowners if their masters ran into this harbour merely to wait for fair winds? Do you think they would approve generally of that course?—I do not think that owners would be profited by harbours of refuge for ships to take shelter in; at the same time I think that the underwriters ought to have as good a claim on the public as the owners have, but the lives of the seamen have still a greater claim.

1404. (*Mr. Lindsay.*) Do you know the holding ground at Fraserburgh?—I do not; I have never been in the anchorage.

1405. You know the anchorage ground well in Peterhead Bay?—I do.

1406. Without the three-fathom line is it good holding ground?—It is. Perhaps it may be satisfactory to the Commissioners to know that at one time I spent nearly a week in Peterhead Bay, looking for anchors with a long tin tube and glass in the foot of it, and went over more than the space within those piers; and without that line of two fathoms, as near as I can judge, there was no such thing as a patch of rocks. Within the one-fathom line there are several places in the bay where a ship could beach. Without that line there are no rocks.

1407. Then, with your knowledge of the bay, are you decidedly of opinion that there are no rocks without the one-fathom line?—Without the one or one-and-a-half fathom line. There are no rocks except at the south head, where the two-fathom line is very near the rocks.

1408. I think you said just now that there were parts of the bay where vessels could beach with safety; what part of the bay is that?—I remember, as far back as 1825, a little vessel in a gale from south-east, and a very heavy sea running into the bay, so much so, that she was afraid of entering the harbour. She ran up to the present breakwater, and reached the beach quite safe. Then again, in January 1849, during one of the heaviest gales of wind and one of the heaviest seas that ever rolled in upon this coast, there were two schooners disabled came into the bay in an almost unmanageable state, notwithstanding which, they were beached a little to the westward of the baths. Manby's apparatus was got, and a stout warp got on board, and the captain nearly reached the shore, when the warp broke. It was very evident that nothing could be done to get the men out. I, being present, managed with a speaking trumpet and signs for them to go down into the forecastle, and remain until low water, which they did, and afterwards came on shore on the dry beach. That was during the heaviest gale of wind that I have ever seen on this coast, and the heaviest sea; which shows that there are points on that bay where ships can be beached.

1409. Are those points sandy points, without any rocks intervening?—The first that I pointed out is sand and small pebbles.

1410. But no rocks intervene between the sand and deep water?—None.

1411. What length of the beach consists of sand?—I should say about 500 or 600 feet, I cannot speak positively upon that. The other point that I pointed out has a rocky bottom, but the rock is not high—quite flat.

1412. I do not suppose that you understand by that that ships could beach with safety on that particular part?—The ship could beach to save the crew on that part, because if you will look at the chart there is a point of rocks runs out westward from the baths, which protects that part of the sea.

1413. You said there were eight vessels, in the *Gazette* received to-day, cleared out at Archangel for Peterhead for orders. Would you look to the *Gazette* and see how many vessels have cleared out from Archangel altogether on that particular day?—Forty-five; 8 of which have cleared for Peterhead, and 37 for other ports. A number of them, I see, are foreign vessels, some to the west coast of England and St. George's Channel, which, of course, would have received their orders here. I have not examined what proportion the ships cleared out for Peterhead bear to those bound to the east coast of England and Scotland.

1414. Would you look to see what proportion they bear to those bound for the east coast of England and Scotland?—Eight for Peterhead, and 14 for the other ports. I may remark upon that point, that it does not always show the number of vessels that will call at Peterhead for orders, because every shipmaster does not clear out his ship. He knows his destination pretty nearly, and very often loads for a port; at the same time he will proceed to call at Peterhead for orders, but he clears out for the port he is going to.

PETERHEAD.

Capt. P. Burnett.

1 Sept. 1858.

Mr. Lindsay.

1415. You expressed an opinion that shipowners were not benefited by harbours of refuge ?—I think that shipowners will be benefited to a certain extent by harbours of refuge. I should say that many men would be in the harbour of refuge when they should have been making the passage, but at the same time I do not think that that would counterbalance the great loss of property and life that accrue in consequence of there not being a good harbour of refuge. I would not give that opinion positively ; it is merely an impression, and might be an erroneous one.

1416. And whether do you think the owner of a ship is more benefited by that ship being anchored in the Downs during strong westerly gales of wind, or attempting to beat to windward ?—More benefited decidedly by lying in the Downs. I have experienced the same thing myself.

1417. That is to say, you think the loss of time to the owner is of less consideration than the wear and tear of the ship, in attempting to beat down the Channel in a strong south-west wind ?—My answer to that question is more the view that many of the owners would take on the question, not exactly my own decided opinion on the matter. I have known ships in the Downs for two months or ten weeks, where they would be a great loss to the owner.

1418. Then you would think that a master of a ship would be very incompetent for his duty, if he lay in a harbour of refuge when there was a chance of making his passage, tear and wear and the safety of the ship always considered ?—I would.

1419. (*Captain Washington.*) I think you stated you had been 20 years at sea ?—I have been 27 years at sea.

1420. Of that time about 18 years in command of a ship ?—Yes, about that.

1421. I think you said that, looking at the proposed width of the entrance of the contemplated refuge harbour in Peterhead South Bay, you think that width of 400 feet is ample to enable you to take it in a gale of wind ?—I think so.

1422. And I think you said the larger the ship the better, as being more under command ?—Yes.

1423. And you, as a seaman, would not hesitate to run down upon that harbour and take it in an easterly gale ?—Not the least.

1424. You had occasion to survey in the bay in searching for anchors ; how long ago was that ?—At least 20 years ago.

1425. How was it that there were anchors in the bay then ?—We lost an anchor not far from the harbour mouth, a warping-out anchor, and it was while searching for it that we saw the bottom so distinctly. The kedge anchor was not buoyed, and it was lost in consequence, just at the entrance of the present harbour mouth.

1426. Then it was not a number of anchors strewed over the bay ?—The search commenced with that anchor, but we got such a beautiful view of the bottom that curiosity led us to examine the whole of the bay. Sometimes in that bay the water is very clear, and you can see the bottom very distinctly.

1427. Did it occupy you a long time to search for this anchor ?—No ; we got the anchor very conveniently.

1428. But then you extended your search ?—We did.

1429. How many days did that occupy you ?—I think we were nearly a week altogether.

1430. Examining the bottom of Peterhead Bay with a glass ?—Yes.

1431. You have a distinct recollection of that ?—I have.

1432. Who was with you at the time ?—I cannot remember. I could tell you, however, who was with me one or two days, a gentleman residing in Peterhead, Mr. Robert Hutchinson, of Cairngall. It was that gentleman who constructed the instrument, and he was with us at least the first day.

1433. When you speak of having examined the whole extent of the South Bay, can you state that you examined it sufficiently accurately to say there were no rocks within the one or two fathom line ?—I can say that I never saw any ; and during all the time I anchored in that bay I can assert that I never found any rocks in it.

1434. Have you often anchored in the bay ?—Frequently.

1435. Which is the best anchorage ?—The best anchorage is a little broken up now, in consequence of being so much used. It is nearly opposite Merchant Street, and there are about six or seven fathoms.

1436. You say that it is broken up by vessels anchoring there ?—Yes, and I think in course of time all anchorages in the same way will be broken up.

1437. How many vessels have you seen in the south bay at one time ?—60 or 70.

1438. But 60 or 70 could not all anchor in that anchorage ?—I do not mean to imply that ; but what I state will be perfectly borne out, that where they will find the way clear they will anchor there.

1439. Pray understand me. I do not wish to doubt in the least what you say, I only wish to get further evidence of the clearness of the bay, because if 80 vessels have been anchored over Peterhead South Bay, they must have been anchored over a large extent, and it is fair to presume that they did not come upon rocky ground ?—There is a larger extent than these piers, because ships will not confine themselves to the pier in an exposed bay.

1440. And 80 ships you say, extended over a greater space than would be enclosed within these piers ?—Oh yes, certainly.

1441. In what winds did that happen ?—A long series of westerly winds, about west-north west, down the Moray Firth to west-south west, along the southward.

1442. Then, if the common demands of the coasting trade at present require more than that space, do you think it would be sufficient to build what is called a refuge harbour of any greater extent ?—I should decidedly say, from my experience, that I have seen, even in the present harbour, a little of that ; where a great expense had to be incurred, which might have been very much lessened, had it been done more extensively when you could go about it ; and I think the same thing will apply to this harbour.

1443. Then you are of opinion, that if a harbour of refuge is to be made there, it should be very much larger in extent ?—I think so ; that is, looking at it in a national point of view, because we find the trade increasing very much, and we must look to it increasing still more.

1444. The trade is increasing, is it ?—Yes.

1445. And you contemplate that it will increase ?—I do.

1446. And therefore it is fair to suppose that a much larger number of ships will come to seek harbour in that bay ?—I think so.

1447. I think you said it was a favourble port of departure for the Baltic ?—No ; not for the Baltic. I said, that ships from the Baltic make it as a landfall, in consequence of the prevailing south-west winds during the whole months the Baltic is open.

1448. And could a vessel, leaving the Baltic with a south-west wind, make a lee so as to fetch Buchan Ness ?—She could not do quite that, but as soon as she left the Naze of Norway, she would keep her reach across the North Sea to the westward till she fetched the land.

1449. I think you said she could make the west across the North sea ?—She could cross with the wind south-west.

1450. Look again ; what will the ship's course be across the water with a south-west wind ?—It would be about west-north-west, and she would make that course good within half a point in an ordinary sailing vessel, at least with winds like what we are getting now.

But I do not mean to say that the wind is blowing steady at south-west; it will take a range of about four points, and the prevailing winds are from south to about west-south-west. It would be rather difficult for me to say that the winds were constantly at one point.

1451. We will take the wind at any point you like to say, but only state it as one?—Well, I say, when the wind is south-west, that ships after they get round the Naze of Norway, will keep their reach under, till they reach somewhere about Peterhead, till they get hold of the weather shore, that is the way I would do myself, and that is the way that the Baltic vessels do also. Vessels along the shore would take more tide than they would do out of the North Sea.

1452. You are speaking, I think, of moderate weather?—Yes.

1453. Well, suppose the south-west breeze increased to a fresh gale, what land would she make then?—I fancy that if she were to keep right on, with a fresh gale of wind, she would, making two or three points of lee way, have quite enough to do to fetch any part of the Moray Firth. I should attempt to tack the ship.

1454. You would, if you could, make Buchan Ness?—I would; that is to say, with a fair wind, and if it was practicable.

1455. And therefore, a great many vessels do pass in sight of Buchan Ness?—If they will fetch at any port on the coast of Scotland, they will reach it and fetch it.

1456. You have laid down some tracks on this chart of the North Sea?—I have.

1457. Are they laid down from memory or from a log book?—Simply from headland to headland, as I would measure off my course if I were shaping my course off the chart.

1458. Independently of winds?—That is supposing fair winds, and an approximation to true magnetic course to which I referred.

1459. I think you have drawn the track from Flamborough Head ships, bound to Archangel, at north-east $\frac{3}{4}$ north?—I thought it was there; I had no other chart to show me.

1460. That is with a fair wind?—It is.

1461. And suppose a ship coming home for Archangel bound to Hull, would she take about the same course?—I think she would rather prefer, in consequence of the chance of west winds, making the land on the coast as soon as she could.

1462. Let us take a vessel bound across to Archangel, as you have laid it down, at what distance from Buchan Ness would she pass?—I did not measure that.

1463. I will measure it for you. It is 95 miles; do you suppose that is about right?—Yes.

1464. Well, take the next course, from the mark of the ships leaving the coal ports bound to Archangel, with a fair wind about north east, do you know the distance they will pass from Buchanness?—I did not measure it.

1465. I will measure it for you. It is 45 miles. Would ships, bound to the Baltic, from the same ports steer more to the eastward?—They would steer direct for the Naze, and therefore would not come near Buchan Ness.

1466. Is there much trade from America to the Baltic?—Not from our colonies, but from the United States there is a great deal of trade, particularly with Russia.

1467. How does that trade pass?—It passes by the Pentland Firth or between the Orkneys and the Shetlands if the weather is very boisterous. In blowy weather, with the wind from the eastward, they generally endeavour to steer about the Faroe islands. In moderate weather, they will generally pass the Moray and Pentland Firths.

1468. And I suppose, make the Skerries off Duncansby Head?—Yes.

1469. Do you think you could obtain log books by which to lay down the actual course of any ships to Archangel at your leisure?—I think it would be a very difficult thing, because the ships going to Archangel don't care very much for the log books; they do keep logs, but the logs are very little cared for after the passage is over. I am sorry to say they are generally torn up for waste paper.

1470. They might be very useful?—I hope when Peterhead is a harbour of refuge, that the captains of ships sailing from or taking refuge in this port, will consider it their duty to keep accurate log books. I think it would be well if instructions were given to all the custom houses in the country to demand a look of the books of every ship that arrives, and take notes from them, for the benefit of science.

We all agree with you.

1471. (*Mr. Boyd.*) You have said that the largest fleet of ships which you have seen riding at anchor in the Bay of Peterhead extended beyond the line of the proposed piers; if the piers had been built would not a much less space than that sufficed to have kept these ships?—Undoubtedly. Ships could moor in tiers within that, just the same as they do in the Mediterranean.

1472. You have just now spoken of the courses laid down upon the chart, do you refer to the course of vessels from the coast of Great Britain or to the coast of Great Britain?—That is from the coast of Great Britain; but I do not mean to say that it is the course adopted, because I think that many vessels endeavour to take their departure from every headland they can get. They have no chronometers, and they are entirely out of reckoning. I merely laid those courses down as showing the distance, with ships steering in a direct line, that the shortest route would be from the different ports.

1473. I wish to know, taking the line from any of those ports on the east coast of Great Britain to Archangel, whether vessels pass the Buchan Ness nearer than they pass the coast of Caithness?—Very much nearer. The nearest point on the coast of Caithness would be 141 miles. From the same point to the Buchan Ness is only 100 miles; but that is not the nearest point. It is 90 miles.

1474. Would you look at the list of the Archangel vessels, and see whether the number 45 which you gave does not include 5 vessels arrived, and whether the proportion named for Peterhead was 8 to 40 in place of 8 to 45?—Yes, it was so.

1475. (*Chairman.*) With reference to the tracks upon the chart handed in, I was under the impression that they were tracks of voyages made by yourself; is that so?—It is not so.

1476. Could you place on a chart for me any tracks of voyages made by yourself across the North Sea?—I am afraid I could not, because in all the vessels I commanded the log books were left on board the ship, and I do not know what has become of them.

1477. I understand you to say in making a voyage across the North Sea, with the wind say from south-south-west to south-west, it would be your endeavour to get across to the weather shore in order to make your passage?—Yes.

1478. Now, as to keeping the sea in bad weather, what is the feeling amongst men who command ships such as you have commanded? Would it not rather be a point of honour to keep the sea, and not to take a harbour of refuge?—In very large vessels it is very seldom that they do take a harbour of refuge. We always endeavour to make our passage.

1479. For what class of vessels then would you say that these harbours of refuge which are proposed along the coast would be most useful?—Vessels from 350 or 400 tons downwards.

1480. Would such vessels be chiefly employed in the coasting trade?—No; I think not. The smaller class of vessels would be employed in the coasting trade.

1481. Then you would include American vessels, Archangel vessels, Baltic vessels, and vessels from St. George's Channel, coming round this way?—Yes.

PETERHEAD.

Capt. P. Burnett.

1 Sept. 1858.

Chairman.

1482. Do you know the Pentland Firth ?—I do.

1483. What is the feeling amongst men who command ships such as you command about the difficulties of the Pentland Firth in running through it ?—None whatever.

1484. Look at the Orkney Islands on that chart (*being shown Admiralty Chart No.* 2181) would you, putting on one side the local difficulties of the Pentland Firth, as respects tides, have any hesitation in running for a harbour like that of Long Hope, shown on that chart, never having been there before ?—Not the slightest.

The witness then said,—You will perhaps permit me to make a remark before I leave. Although I am a resident and native of Peterhead, still I have not the slightest local interest there. The probability is that I will leave it in a few days, perhaps never to return again; therefore the evidence I have given will be taken as purely with a wish to be of service to the shipping interest, and to promote, so far as my judgment will lead, to that which will be the best for the protection of property and the lives of seamen.

(*Chairman.*) We have the power, as you are aware, of swearing witnesses, but do not do so, in the full confidence that every man who comes before us to give us evidence, whether he belongs to Peterhead, or whatever his feelings may be about Peterhead, or otherwise, will tell us the truth, the whole truth, and nothing but the truth; and therefore, whether you have any interest in Peterhead or not, to my mind, has nothing to do with the matter.

Capt. D. Gray.

Captain DAVID GRAY examined.

1485. (*Chairman.*) What is your name ?—David Gray.

1486. What is your occupation ?—A shipmaster.

1487. (*Mr. Boyd.*) How long have you been a shipmaster ?—Ten years.

1488. You have heard the evidence given by Captain Burnett ?—I have.

1489. Do you concur in it generally ?—I do.

1490. In what class of vessels have you been a shipmaster ?—Vessels from 300 to 700 tons.

1491. How long were you at sea before that ?—I served four years as an apprentice and two as a mate.

1492. Are you acquainted with the anchorages in the south bay of Peterhead ?—Yes, I am.

1493. Did you ride out one or two heavy gales of wind there with the wind from south-south-east ?—I have ridden out a heavy gale with the wind from east-south-east.

1494. What was the size of vessel and the draught of water ?—Three hundred tons, and fourteen feet.

1495. Was the sea very heavy ?—Yes, we were showing our fore-foot out of the water sometimes.

1496. Did your anchors hold during that gale ?—Oh, yes : never started an inch.

1497. Have you seen other vessels in different gales of wind in the bay ?—I have.

1498. What ships ?—I could not mention their names; they were vessels of considerable tonnage. Since I remember, I have seen the *Union*, 250 tons.

1499. Did she ride steadily ?—Yes.

1500. And did not drive at all ?—No.

1501. (*Chairman.*) Have you considered the question of a harbour of refuge at all ?—I have.

1502. And I understand you view it in the same light as the former witness—more as a harbour for vessels to run to, being windbound, or expecting heavy weather, than absolutely running for it in distress from stress of weather ?—I agree with what the former witness said on that point.

1503. Tell me, where have your voyages principally been to ?—I have been going all my life to the Greenland whale fishery.

1504. Do you feel competent to offer an opinion as to the navigation across the North Sea from intercourse with men in your own class of life, or from actual experience ?—I would rather not give an opinion on that point.

1505. Have you ever been through the Pentland Firth ?—I have.

1506. How many times ?—Once.

1507. (*Being shown Admiralty Chart No.* 2181,) Do you know what character the Pentland Firth bears as respects tides and other difficulties ?—I do.

1508. Have you any difficulty in passing through the Pentland Firth ?—Not if there is plenty of wind.

1509. But knowing the difficulties to be encountered in running through the Pentland Firth, you would provide for all contingencies by heaving to or otherwise ?—I should let it be till daylight if I had to run through the Pentland Firth. I should contrive to be ready to go through in the morning.

1510. You see the harbour of Long Hope on that chart ?—I do.

1511. If I put a chart of that kind into your hand, and told you to run for a harbour like Long Hope, such as you see it there, would you have any difficulty in doing so, if you had never been there before ?—Not the slightest.

1512. Are you acquainted with the Orkney harbours as respects vessels navigating in the coasting trade ?—I am not.

1513. Should you, if taken in bad weather, have any feeling as to not taking a harbour of refuge unless you are absolutely forced to do so ?—I would never take a harbour of refuge if I could avoid it. In fair weather I would take a harbour of refuge at once, but in foggy weather I would keep the sea as long as I could.

1514. My question related more to the point of honour in keeping the sea and making the passage, instead of running for a harbour of refuge.—I would never take a refuge if I could keep the sea.

1515. As a point of credit as a seaman ?—That is my feeling.

1516. (*Capt. Washington.*) Do south-west gales prevail much on this coast ?—Generally all the winter.

1517. Have ships ever been blown away from the coast off into the North Sea ?—Often.

1518. At such a time would it not be a great advantage to have a harbour of refuge where they could take shelter ?—It would be an immense advantage.

1519. In looking at the plan on the wall, and at the width of entrance bteween the proposed piers of 400 feet, would you have any hesitation in taking it ?—Not the slightest.

1520. I mean in a south-east gale, and the weather sufficiently clear to make out the entrance ?—No, I would take the entrance in the heaviest gale of wind I ever saw on the coast.

1521. You do not think the width of 400 feet too limited ?—Not a bit; plenty of room.

1522. Have ever you been in any of the pier harbours on the coast of England or Scotland ?—Never.

1523. I think you said that the holding ground within the south bay is extremely good ?—There is no better in the world.

1524. You have ridden out an east-south-east gale there without any breakwater ?—I have.

1525. Do you know what the bottom is ?—Blue clay; and it is exceedingly clean throughout the greater part without the two-fathom line.

1526. Where did you anchor ?—We were up till we had Uphill Lane open, and the sea was breaking about.

1527. In what depth of water were you riding ?—We brought up about seven fathoms.

1528. You payed out a whole cable ?—Yes.

1529. Only one anchor down?—We had broken both our anchors before we got them up, they were so hard in the ground.

1530. That says a great deal for the holding ground, does it not?—I rather think so.

1531. Did you hold on to the third anchor?—We got a new anchor from the shore, and after that we got several warps bent on, one being on the larboard bow, and then on to the shore; and got almost all Peterhead down upon those rocks, and hauled the ship out of the bay.

1532. I think you said in the Davis' Straits trade?—In the Greenland trade. I have been in Davis' Straits, but I have been engaged in the Greenland whale fishing.

1533. What is your course generally to your fishing ground?—We steer north-north-east from Rattray Head for Sambrough Head, then a little westerly; and we generally steer a little westerly after we set out from the Pentland Firth, and from the Roost.

1534. Then you have only been once through the Pentland Firth?—Only once, and that was in coming home from Davis' Straits, in the month of November.

1535. (*Chairman.*) Taking into consideration your duty to your owner as to the wear and tear of your vessel on the one hand, and the feeling which you would have as a seaman on the other, I now ask you whether you think that a harbour of refuge would be of great service?—I do think so.

1536. (*Capt. Washington.*) Captain Burnett stated that it was a great advantage to have a north outlet, which we all know and concur in; but we do not know the depth of water in the canal?—In the north side of the bridge it is, I should say, sometimes 17 feet water in high spring tides, and in the south harbour it is not more than 19. I think that is near about the mark.

1537. Would it not be of very great advantage to deepen either the channel or wall of the south harbour?—That is just what we want to complete our harbours.

1538. Would that be attended with great expense?—I am not sufficiently acquainted with the subject to say.

1539. Don't you think that it would require a great deal of money to do so?—It would.

1540. Has great benefit arisen from the communication between the north and south harbours?—Owing to there being so little water in the south harbour, there has not such a great benefit arisen from the canal as was expected.

1541. Why was not the whole of the work carried out?—It is not convenient.

1542. (*Mr. Lindsay.*)—What is the reason of its not being convenient?—We want the funds.

1543. (*Chairman.*) Are you able to place on a track chart a considerable number of your tracks, I mean outward bound, from Peterhead to 50 miles north of the Shetland Isles?—I can give you a number of them.

1544. Will you lodge with Mr. Boyd, for the use of the Commissioners, a track chart showing the tracks I have named?—I shall.

Captain Joseph Scott examined.

1545. (*Chairman.*) What is your name?—Joseph Scott.

1546. What is your occupation?—Master mariner.

1547. (*Mr. Boyd.*) You have been in the room during the examination of Captains Burnett and Gray?—I have.

1548. Do you generally concur in what you have heard them state with respect to the eligibility of this place, and the preference to be given to it, as a site for a national harbour of refuge?—I do, in a general point of view.

1549. How long have you been at sea?—38 years.

1550. How long have you been a shipmaster?—27 years.

1551. Can you give us a general account of the class of vessels you have commanded, and the trades in which you have been engaged?—From 100 tons to 270 tons, and the coasting and foreign trades for 10 years; the foreign trade exclusively for 11 years, and six years in the Greenland whale fishery trade.

1552. You are in the Greenland whale fishery trade at the present moment?—Yes.

1553. What is the general course of vessels from Peterhead to Greenland? Do they pass through the Pentland Firth or not?—No, they pass to the eastward of the Orkney Isles.

1554. Universally?—Yes, as far as I know they do.

1555. Do you concur with what has been said by Captain Gray as well as Captain Burnett?—Yes.

1556. What is your opinion as to the most eligible site on the east coast of Scotland for a national harbour of refuge?—My opinion is that Peterhead is the most eligible site. I wish to make a few remarks to the Commissioners, which I have committed to paper with a twofold object; namely, not to waste their time in wandering from the point, and to assist my own memory, as I am not much in the habit of speaking in public, and I wish to confine myself merely to nautical points on this subject.

(*The witness then read the following statement:*—)

"I think Peterhead is the most suitable site for a harbour of refuge on the north-east of Scotland, its situation being about halfway between the Firth of Forth and Cromarty, and between those two places (which are about 180 miles apart) there is not a harbour at present that a vessel could run for with a strong gale from south-east, and have the least prospect of saving either life or property.

"Peterhead being the north-east point of the mainland of Scotland, vessels bound south and north make for it; and many vessels from the Baltic make Peterhead, although bound to a port south of it. In the fall of the year, when strong southerly winds prevail, vessels keep their reach across the North Sea, and have no fear of making the land about Peterhead, for they have Mormond Hill a little to the north, and Stirling Hill a little to the south, with Mill Hill and its town right at the head of the bay, all which are striking or conspicuous landmarks; and with Buchan Ness light at the south interim of the bay, which can be seen in clear weather from a vessel's rigging a distance of 25 to 30 miles.

"And in foggy weather the sounding of Peterhead will indicate a vessel's approach to the land, as the depth of water decreases gradually from off the shore.

"The South Bay of Peterhead has good anchorage, and were a harbour of refuge constructed there, vessels taking shelter in it from stormy weather, bound either south or north, would have no difficulty in leaving it again when the weather moderated, as it is a salient point. In its present state it affords shelter to many vessels bound south and north: I myself have counted 100 vessels riding in the bay at one time; some of my nautical friends say they have seen more.

"Vessels bound to Fraserburgh, and all ports in the Murray Firth, take shelter in Peterhead Bay, with strong winds from north-east to north-north-west. These are some of its recommendations as a proper site for a harbour of refuge, in a nautical point of view, according to the best of my judgment."

1557. (*Mr. Boyd.*) You were at Fraserburgh on Monday, I understand?—Yes.

1558. Did you hear there some expression of opinion by shipmasters belonging to Fraserburgh with reference to the anchorage at Peterhead Bay?—Yes.

1559. Have you seen these shipmasters taking refuge in Peterhead bay or harbour?—I have.

1560. Did you hear the shipmasters state that

PETERHEAD.

Capt. J. Scott.

1 Sept. 1858.

Mr. Boyd.

Peterhead is not a place where refuge could be obtained, or something to that effect; or that there was any refuge to be got in the South Bay?—I think the sum and substance of their evidence was that the anchorage was very limited, and that very few vessels took refuge there.

1561. At the time that one of these ships, the *Melinka*, took refuge in the South Bay, was there a considerable number of vessels in the south bay?—I was not here at that time.

1562. (*Chairman.*) Where have your voyages in the foreign trade principally been made to?—To almost all parts of the world, China and Australia excepted.

1563. How many times have you crossed the North Sea to the Baltic?—I am not prepared to say the number.

1564. Have you crossed half a dozen times?—More.

1565. Have you crossed a dozen times?—I think, more.

1566. How many times have you been through the Pentland Firth?—About 12 or 15 times, more or less.

1567. Have you any difficulties in running through the Pentland Firth, choosing yourself the time for doing so?—No, not if I can choose my own time for doing so.

(*Admiralty Chart No.* 2181 *was shown to the witness.*)

1568. You see the harbour of Long Hope on that chart?—Yes.

1569. Suppose I give you a chart with a harbour of that description, into which you have never been, would you have any difficulty in running for it?—I should say none whatever. I see nothing lying off the mainland or the islands. If I keep off what I see, I think my vessel will be safe.

1570. Would you be able to place upon a chart for us the tracks of any of your voyages outward from Peterhead, or homeward to Peterhead?—I think I can.

1571. About how many?—I think I could give you about ten.

1572. Will you do so, and lodge them with Mr. Boyd for the Commissioners?—I will, with pleasure.

1573. (*Mr. Lindsay.*) In approaching the land from the eastward, do you consider that the soundings decrease more gradually off Peterhead than off any other part of the north-east coast of Scotland?—I think they decrease more gradually here than they do at any part of the coast to the northward of Peterhead.

1574. Will you get soundings at a greater distance from the land off Peterhead than you will at any part northward of it?—You will get soundings all the way across the North Sea.

1575. Yes, but I speak of soundings of 50 or 60 fathoms?—I think we will have about 60 fathoms of water off Peterhead when we are from 25 to 30 miles off.

1576. What soundings would you have at the same distance, say from Wick?—I think we would have about 45 or 50.

1577. You say you have been through the Pentland Firth some 12 or 15 times?—I have.

1578. Would you consider there was any danger in running through the Pentland Firth for the harbour of Long Hope during a south-east gale and with a flood tide?—That depends entirely upon what kind of a vessel I had and the severity of the gale.

1579. Well, say the gale was so strong that you as a prudent master considered it advisable to run for a place of safety, would you then consider it safe to take the Pentland Firth in such a gale during a flood tide?—Such a gale would not commence all at once; and if such a gale were coming on, I could shorten sail and keep my vessel off until I had an ebb tide, and then I would have no fear in running for it with the heaviest gale from the south-east.

1580. (*Capt. Washington.*) How often have you been in Long Hope?—Three or four times.

1581. On what occasions did you go there?—We were windbound to the westward.

1582. Was it blowing hard from the westward?—Yes.

1583. How was the wind?—From west to north-west.

1584. What time of the year?—In the winter time.

1585. Where were you bound to?—To Liverpool.

1586. Is it a common practice to take shelter in Long Hope in westerly winds?—A great many vessels do.

1587. Were you ever caught at the entrance of the Pentland Firth in a south-easterly gale?—I never was with a very severe gale. I have run through the Pentland Firth from the westward with a heavy gale and an ebb tide. I remember one night I ran through it during the night. I got hold of the Island of Stroma, and kept my vessel there, I think, for four hours, and it was so dark that I could not see the Pentland Skerry line. I remember very well making a log to see what rate she was going at, and I found she was going eight knots; and we hung, I think, for about four hours abreast of Stroma. Then when the tide began to ease I was through in no time, and into Peterhead next forenoon tide.

1588. Do you think it is quite certain the ship was going eight knots?—I do.

1589. Were the spring tides running?—Yes.

1590. Then the spring ebbs run as much as eight knots?—I think they do fully nine.

1591. Do I understand you were hanging under Stroma?—Yes, in sight of Stroma.

1592. Were you hove to?—I had all the sail set that I could carry.

1593. What was the sail?—I think the topsail; there was a reef in it, and it was not very large. I do not remember if the mainsail was set or not. The vessel was a schooner.

1594. Was it a very heavy sea?—There was a good deal of sea.

1595. Did it ever wash your decks?—No; my vessel was in good trim and not very deep.

1596. What was her tonnage?—93 tons.

1597. Did you carry a whole topsail?—There was a single reef in it.

1598. How was the wind?—From the west.

1599. South-west or north-west?—Perhaps west-north-west. I could not say the exact point, but it was a fair wind.

1600. How close were you to Stroma, do you think, at that time?—I think I must have been sometimes within half a mile of it.

1601. Then, in fact, Stroma was acting as a natural breakwater against the ebb tide for you?—Yes, I got out of the face of the eddy at first. It brings a rush of the tide both east and west, and then I had to steer out into the current lest I should run into Stroma.

1602. In fact, you got under Stroma, and dodged the tide?—No, I ran up to Stroma, under the lee of it, but if I had kept the same course I would have run right on to it. Then I steered my vessel to the middle of the stream, and she kept there for about four hours, and never altered the position. The tide was come to the westward, and she hung in the stream till the tide slacked.

1603. Then the wind and the tide were opposed to each other?—Yes.

1604. But there was no such great sea as to sweep your decks?—No.

1605. How often do you say you have gone through the Pentland Firth?—I think I have gone through 15 times.

1606. And you never had such a bad sea as to sweep your decks?—No; I never had. I have gone through between Stroma and the main often.

1607. You said, I think, that from the land you got 60 fathoms, at what distance?—Off Peterhead, from 25 to 30 miles.

1608. And the depths gradually decrease as you approach Peterhead?—Yes, pretty gradually.

1609. Would you venture to approach Peterhead in a fog by your soundings?—Yes, I did it just now, coming in from Greenland.

1610. Very good; very useful knowledge. And you did steer straight for Buchan Ness as long as you saw the light?—I did not see anything at all from the time I left the Shetlands till I was within a mile and a half or two miles of the bay here. I reckoned myself to be right for the Buchan Ness, and I steered on west-north-west and sounded every now and again, and by my soundings I knew that I was close to the land.

1611. Very good and very seamanlike. Have you a chronometer on board?—Yes, but she was of no use, as I could not see the sun.

1612. I think you read some notes?—I did.

1613. Were those notes drawn up by yourself, or were they suggested to you?—They were drawn up by myself from my own experience.

Quite so; I had no doubt of it, but I wished to put it on record as a fact.

1614. (*Chairman.*) I understand from your evidence that you consider the land about Peterhead to be the most easy land on this part of the coast to make by means of soundings in thick weather?—I think it is easier to make than the land north of this.

1615. From Peterhead south to the Firth of Forth do you consider it the easiest land to make?—I think it is.

1616. Tell me why is the land about Kinnaird's Head, for instance, not so easy to make as the land about Buchan Ness by means of soundings?—I think the soundings for Kinnaird's Head will be much the same as for Peterhead; but then if I am a little to the northward I may reach a considerable way up the Moray Firth before my soundings will indicate my approach to the land.

1617. Taking the land about Duncansby Head and Noss Head what is the reason that the land about Peterhead is easier to make by soundings than there?—I think for a considerable distance in a south-easterly direction, that it is all a flat. I will get the same soundings for 20 miles off Noss Head in a south-east direction.

1618. And off Duncansby Head?—I think, taking Duncansby Head in a north-north-west direction, the depth of water decreases very rapidly.

1619. What sized vessels have you commanded chiefly?—I have been commanding a vessel of 270 tons for the last 15 or 16 years.

1620. You have described an occasion on which you hung your vessel off Stroma?—Yes.

1621. Tell me, from the knowledge which you possess of the masters of the coasting trade, whether many of them would be disposed to try the same thing?—I could not say, for I have not been in communication with many of them for several years past.

1622. Amongst the masters of vessels with whom you are acquainted, do you thing there are many who would be disposed to try the same thing?—I do.

1623. (*Mr. Lindsay.*) I see there is a bank here called the "Dutch Bank," on the chart, about 60 miles to the eastward of Buchan Ness?—Yes.

1624. I see there is 53 fathom water inside, and about the same depth of water outside, of that bank; but I see over the whole bank the soundings range from 25 to 35. Would that bank be of any assistance to you in running for Peterhead during thick, foggy weather?—I do not think it would; I do not think that the north end of that bank would be of much service. But the south end is of great service. I have taken advantage of the south and of it.

1625. That is to say, in ascertaining your position you have steered a course so as to hit this bank?—No; but I have crossed it, and thinking I was about that position have tried soundings.

1626. You are aware of such a bank as the Dutch Bank about 60 miles to the eastward?—I have found shallower water on the south end of it; but I have never found it 25 as marked there.

1627. What soundings have you found there?—The least that I have found on it is about 35 fathoms.

1628. Is it much shallower than the water contiguous to it?—It is a little shallower; I could not say how much, but having the bank on my chart I have often tried the soundings when I was there.

1629. (*Capt. Washington.*) In speaking of soundings, do you speak of soundings made by yourself or from the chart?—I speak of soundings made by myself.

1630. That's right. I think you said that this part was easy to make on account of being conspicuous; is it so?—Yes.

1631. How far is it between Mormond Hill and Peterhead?—About 8 or 9 miles. Perhaps a little more.

1632. My reason for asking is, that at Fraserburgh the other day the vicinity of Mormond Hill was made a great point in favour of Fraserburgh as a landfall?—They make it the same here.

1633. Then, in fact, you pass by it?—We generally see it before we see the low land between it and the shore.

1634. Do you see the plan of the proposed harbour; are you aware of the width of the entrance?—I have heard it stated at 400 feet.

1635. Supposing it to be 400 feet, would you have any hesitation in running for it in a south-east gale?—I think none whatever.

1636. You think the limited width would not prevent you taking it?—I think not. I was considering it since yesterday. I think as the entrance is about where the deepest water is, the sea has less chance to break there than it would at each end, although I am not an advocate for breakwaters of that description.

1637. What sort of breakwater would you wish, as far as a nautical man would have an opinion on that subject?—If it could be accomplished, I would like such a breakwater as the one at Plymouth, a detached breakwater.

1638. May I ask if you or any other nautical man in Peterhead were consulted about the design for these breakwaters?—I was not.

1639. Has it ever been the subject of conversation between the masters of ships here?—I do not know that.

1640. Has it with you? Was your opinion ever asked as to the position of the piers?—No, it was not. I only saw the plan yesterday for the first time. I have been considering it ever since, and I was thinking that it perhaps might be the best plan, but if it could be accomplished I think that an opening at each end is the best, because in the bays that I have generally frequented the best anchorage is generally in the middle of the bay, and if a detached breakwater crosses the middle of the bay, it shelters the best part of the anchorage, whereas the best part of the anchorage is exposed in that manner.

1641. In a refuge harbour that you would run for in a gale of wind, you do not care much about still water, do you? It is the sheltered roadstead that you should look for?—I certainly should look for a sheltered roadstead.

1642. Do you wish the water to be very still, or would a sheltered roadstead, such as you would find under the lee of a breakwater be sufficient for you?—Yes.

1643. Supposing the same width of entrance to be at the north and south end of the bay, would you have any fear in taking it?—I am not prepared to answer that question.

1644. There is a spring tide, is there not, off the South Head?—Yes, to the best of my knowledge it runs from 4 to 4½ miles per hour in the direction of the Skerry rocks, and there is a smooth generally between it and the land occurring at the mouth of the bay. The tidal wave forms a kind of breakwater, if I may so express it, and there is generally a calm or a smooth inside of that tidal wave. They are placed where I have observed a rapid tide running across the bay.

1645. And therefore you would recommend the

PETERHEAD.

Capt. J. Scott.

1 Sept. 1858.

Capt. Washington.

piers to be placed just within the cushion of that tide?—Sufficiently within, so as a vessel could pass out of the stream and enter the harbour safely, because there would be a danger in steering, passing from a rapid stream into still water.

1646. Now, then, supposing the entrance were at the north end, would the stream that passes the South Head prevent your taking it?—I do not think so.

1647. Would there be anything in the tide off Salter Point?—There is very little tide between the South Head and Salter Point. I think about, perhaps, a knot.

1648. Then you think a south-west entrance could be taken as easily as that central entrance?—I do.

Captain DONALD MANSON examined.

Capt. D. Manson.

1649. (*Chairman.*) What is your name?—Donald Manson.

1650. What is your occupation?—Seafaring.

1651. (*Mr. Boyd.*) You are harbour-master and captain pilot at Peterhead?—Yes.

1652. How long have you been at sea?—54 years.

1653. You have had the command of a ship?—Several ships.

1654. How long have you been ship-master?—Upwards of 38 years.

1655. Were you the ice-master in the Arctic expedition—the *Isabel* and *Phœnix*?—I was.

1656. What class of vessels had you under your charge as ship-master?—From 300 to 350 tons.

1657. And what trades were you generally engaged in?—In the North American trade, the whaling trade, the Mediterranean trade, and the Baltic trade.

1658. Then you have had a great deal of experience upon this coast in the North Sea?—I have.

1659. Were you present when Captain Burnett was examined?—I was.

1660. Do you concur generally in the opinions which he gave?—I may state that I did not hear him distinctly, I was so far back.

1661. Have you considered the question of a harbour of refuge upon the east coast of Scotland; first, whether it was really called for, and next what was the best place for it?—Yes, of course, I have been passing my views with my neighbours; and if I am to understand the Commissioners distinctly, it is simply to give my opinion as to whether this is a proper site for a harbour of refuge or not, and whether a harbour of refuge is necessary in my opinion. In the first place it is necessary in my opinion; and Peterhead, so far as my judgment leads me, is distinctly the best place.

1662. You know the South Bay anchorage, I suppose?—I am not competent to pass an opinion upon it. I have very seldom come to anchor in the South Bay; and I have only been harbour-master here for two years.

1663. Is it any part of your duty to be acquainted with the anchorage of the South Bay?—If it is my duty I have never acted upon it yet.

1664. Is there an assistant harbour-master who has held that situation for upwards of 20 years?—Yes.

1665. You were present when a question was put to Captain Burnett, and an answer given by him with respect to the length of the heads at the South Bay where a vessel might be beached. Have you measured that?—Yes, since the question was put.

1666. And what is the length of it?—It is 540 feet.

1667. (*Sir Frederic Smith.*) You have been harbour-master here for two years?—Yes.

1668. Can you tell the Commissioners what were the depths of water in the two harbours?—I think about 12 feet at spring tides, and about 8, as near as I can judge, at neap.

1669. Are both harbours the same?—The rise and fall of both harbours are the same. At spring tides there cannot be less than 16 feet in the north harbour, and in the south harbour perhaps about 11 or 11½ feet.

1670. Would it be any great advantage to have the levels the same?—Very much indeed.

1671. What would be the practical advantage?—We could get a great number of ships in, drawing a great draught of water, that are afraid to enter our harbours just now, in consequence of not having it in their power to do so.

1672. Do you think that would be more useful to you than a harbour of refuge?—In my opinion, I should like a harbour of refuge first.

1673. But you would like to have the other also?—Perhaps in the course of time we would be enabled to do it.

1674. So as to make a canal passage for vessels of large draught of water?—Yes.

1675. (*Mr. Lindsay.*) As captain of the pilots, do you not consider it your duty to make yourself conversant with the anchorage in the South Bay;—I am so far conversant with it that I know where the ships generally endeavour to bring up; but I never have been sounding the bay myself.

1676. Then can you say of your own knowledge whether it is good holding ground or not?—Yes, I can say that it is good holding ground, but perhaps not over the whole bay.

1677. Did you ever see a ship drive from her anchors?—Never.

1678. Did you ever know a ship to drag her anchor in the bay?—Not, to the best of my recollection; particularly with the wind from the southward, I think they never do so. With the exception of one year, I think it was one of Her Majesty's ships that had been hung too short, and I believed she dragged her anchors off here, and came ashore at Peterhead That was the *Pleiades*.

1679. When was that?—It was a good number of years ago.

1680. You have had great experience, you say, as the master of a ship?—I did not say that I had great experience; I only said I should have had experience.

1681. You have been thirty-eight years master of a ship?—Yes, and I have been thirty-two years in one ship commanding.

1682. You know the North Sea?—Yes, I know it pretty well, that is, passing and repassing.

1683. Have you ever gone through the Pentland Frith?—Many a time.

1684. Have you ever gone through the Frith in a heavy gale from the south-east?—Yes, I may say I have gone through it in all weathers.

1685. In what sized ship?—A ship of above 300 tons.

1686. Have you ever attempted to go through the Pentland Firth during a strong south-east gale with a flood tide?—Yes, I did attempt it, but I do not think I would be very much inclined to try it again.

1687. Do you consider the danger was great?—The danger, perhaps, was not so very great, but we were likely to get a good deal of our things taken off our deck.

1688. You were afraid, then, on account of the high sea which prevails during a south-east gale and a flood tide, that you would have your deck swept?—Yes, we certainly had that risk at the time, but it was only momentary, just near Duncansby?

1689. Were you not in a position to heave to or dodge your ship till there was a change of tide?—Certainly we had that in our power; but perhaps I was rather too anxious to get home.

1690. Have you been often in Long Hope?—Often.

1691. How many times do you remember?—I could hardly state that very correctly, but I will be bound I have been perhaps fifteen times.

PETERHEAD

Capt. D. Manson.

1 Sept. 1858.

1692. Do you consider it a good harbour of refuge during south-east gales?—I do not know that there could be a better harbour than Long Hope.

1693. Have you known, during your long experience, many ships lost in going through the Pentland Firth, or in attempting to enter the various harbours of refuge amongst the Orkney Isles?—I am not aware of any.

1694. You do not know of your own knowledge?—No, not of my own knowledge.

1695. (*Capt. Washington.*) I think you said you are captain of the pilots?— Yes, I get that designation.

1696. How many pilots are there here?—Sometimes 47.

1697. But it is not your duty to examine the pilots as to their qualifications?—No. I have never done it, at any rate.

1698. Who is that done by?—I believe the harbour trustees take a great interest in examining them.

1699. But you are not concerned in it?—Of course I am concerned in it to a certain extent; but I do not consider it my duty to examine them exclusive of the harbour trustees.

1700. You do not consider yourself responsible whether a pilot is a good pilot or a bad one?—Of course we must endeavour to get them good, if it is in our power. I must consider that I certainly have an interest so far as that goes.

1701. And you have 47 pilots. Are they simply harbour pilots, or do they go along the coast?—Simply for the harbour.

1702. And not to carry a ship through the Pentland Firth?—I do not mean to say that they remain constantly on the piloting, because there would not be sufficient to support such a number of pilots. They occupy themselves in other ways.

1703. Do Peterhead pilots ever take ships to the Pentland Firth?—Not that I am aware of; but I have no doubt there are some of them competent enough to do so.

1704. I think you were ice-master in the *Phœnix* Captain Singlefield?—Yes.

(*Capt. Washington.*) And a right good one you were too, I remember.

Alexander Souter examined.

A. Souter.

1705. (*Chairman.*) What is your name?—Alexander Souter.

1706. What is your occupation?—Pilot.

1707. (*Mr. Boyd.*) How long have you been at sea?—Forty-eight years.

1708. You have been a shipmaster?—Yes.

1709. For many years?—Eight years.

1710. In the coasting and foreign trades?—Yes.

1711. You were a good many years harbour-master and pilot-master at Peterhead?—Twenty-three years.

1712. And within the last two years Mr. Manson has taken your place?—Yes.

1713. You are still a pilot?—Yes.

1714. You are, I presume, well acquainted with the anchorage in the South Bay?—I am.

1715. What sort of anchorage is it?—Good.

1716. You are thoroughly acquainted with it all?—Yes, round and round.

1717. Have you been present during the examination of the witnesses Captains Burnett and Gray, and so on?—Yes.

1718. Have you heard what they have said about Peterhead?—Yes.

1719. Do you concur in what they have said?—I do.

1720. They have said nothing at all in which you would be inclined to disagree with them?—Nothing.

1721. (*Capt. Washington.*) Did you hear Captain Gray's or Captain Burnett's evidence respecting having seen the Buchan Ness light 30 miles off?—I have seen it 25 miles off myself, just going away from it.

1722. Is it a good, distinct, flashing light at that distance?—It is.

1723. And therefore a very good point to make for?—Capital.

Captain Alexander Hepburn, of Inverness, examined.

Capt. A. Hepburn.

1724. (*Chairman.*) What is your name?—Alexander Hepburn.

1725. What is your occupation?—Seafaring.

1726. (*Mr. Boyd.*) You are a shipowner in Inverness?—Yes.

1727. Have you been many years at sea?—About 40.

1728. How long have you been a shipmaster during that time?—About 26 years.

1729. What class of vessels did you command?—From 60 to 150 tons.

1730. In what trade were you chiefly engaged?—In the coasting trade and Baltic trade.

1731. Have you heard the witnesses who have been examined to-day?—Yes.

1732. Do you generally concur in what has been said by them about Peterhead?—I do.

1733. Have you often taken refuge in the South Bay of Peterhead yourself?—Frequently.

1734. Have you found it a place containing good anchorage ground?—Yes, I always found it safe.

1735. Have you been there when it was blowing hard?—Yes; with gales from the west.

1736. Have ever you known ships driving from their anchors in Peterhead South Bay?—No, except the *Pleiades*.

1737. Were you here at that time?—Yes.

1738. In what year was that?—I think it was 1811 or 1812.

1739. Do you know the cause of her drifting?—No.

1740. In the same gale, do you remember some large foreign vessels having been beached in the South Bay?—Yes, I do.

1741. Was it a very heavy gale at that time?—It was.

1742. Where was the wind from?—I think it was east-south-east.

1743. There was great loss in the North Sea?—Yes.

1744. Do you remember the time of the year?—I think it was in November.

1745. Were the crews of these vessels saved by their being beached?—They were.

1746. Was one of them up in the head of the South Bay?—There were two there.

1747. And the crews in both cases were saved?—Yes; they were quite exhausted, and the ships were waterlogged.

1748. I presume you are thoroughly acquainted with the trade of the Moray Firth?—I am.

1749. Is the refuge found in the South Bay of Peterhead held to be of great importance to that trade?—Very great.

1750. Is the trade of the Moray Firth very much dependant on that refuge?—With strong westerly gales the vessels are generally driven down the firth, and take shelter in Peterhead Bay.

1751. Suppose a harbour to be on the Caithness coast, and a vessel taken in a south-east gale, would you consider it safe for her to run down on that coast?—No, I would not.

1752. What would you do?—I would keep the south side, if possible; except, if the wind was westerly, I would try to get to Peterhead Bay.

1753. But supposing the wind was south-easterly?—I would try to get to Cromarty.

1754. You would not run down upon the Caithness coast?—By no means.

PETERHEAD.

Capt. A. Hepburn.

1 Sept. 1858.

Mr. Boyd.

1755. Why?—Because I would be on a lee shore, and there is no harbour.

1756. What is your opinion with respect to the necessity of a harbour of refuge on this coast; do you think it necessary?—I do.

1757. Have you considered the subject of the best place for such a harbour?—Yes, I have thought over it frequently.

1758. What is your opinion as to the locality?—My opinion is, that Peterhead is the best place on the east coast.

1759. In the course of your experience has it happened that you have been driven backwards for a very considerable period between the Gridleven and Somemouth?—I have been so sometimes for three weeks on a stretch, and I could not get hold of any place except Peterhead Bay.

1760. (*Chairman.*) On the occasion in question, where were you from, and where were you bound to?—From London, bound to Inverness.

1761. In what sized vessel?—About 110 tons.

1762. Where do you belong to?—Inverness.

1763. Supposing there were a harbour, say at Wick, would that alter your opinion about running down on the Caithness coast?—Yes, it would, with the south-east wind.

1764. Therefore, having in view the heavy south-east currents, would you, as an Inverness man, prefer Wick to Peterhead, for a harbour of refuge?—No, I would not.

1765. State your reasons why.—With the south-east wind it is a lee shore on the coast of Caithness, but I would prefer trying to get Cromarty.

1766. And with a south-east wind there is never any difficulty in getting into Cromarty in heavy weather?—No.

1767. With the wind from north-east, round to east-south-east, blowing hard, is there ever any difficulty in getting into Cromarty from the wind baffling you when you arrive off the port?—With a north-east wind it sometimes baffles between the Souters.

1768. From what point to what point would the wind blow fair home? With the wind south-east, does it blow fair home?—Not quite.

1769. Does an east-south-east wind blow fair home?—No.

1770. (*Sir Frederic Smith.*) You had only been two years at sea when that man-of-war got on shore here?—About that time.

1771. That is a long time ago; do you remember the circumstances perfectly?—Yes.

1772. How was the wind blowing then?—I think the wind was blowing south-south-east when we came on shore.

1773. Was it blowing a gale?—Not a heavy gale; a strong breeze.

1774. Would a good harbour of refuge, if made at Fraserburgh, be of much or little use to the traders of Moray Frith?—A good harbour would be very useful, but I think Peterhead could be made useful.

1775. If a good harbour were made at Fraserburgh it would be useful?—For windbound vessels.

1776. In what quarter?—The present quarter.

1777. Suppose you got both harbours, which would be the more suitable?—Peterhead, I think, would be the most suitable place.

1778. But in stress of wind, should you make the other in preference to this?—I should say, with a strong northerly wind or north-east wind, a vessel could not take Fraserburgh so well as this place; and in fact, going to or coming from any place or with any wind, Peterhead would be a better place for us than Fraserburgh.

1779. (*Mr. Lindsay.*) Is it your opinion that in a national point of view, all things considered, Peterhead is a more desirable place to have a harbour of refuge than Fraserburgh?—I cannot answer that question.

1780. You said you remembered two or three foreign ships being beached here?—Yes.

1781. The crews were saved?—Yes.

1782. Did these ships become total wrecks?—I do not remember if they broke up here, but I think that they either broke up or their cargoes were landed in the bay.

1783. Were they got off to be repaired?—I do not know; I did not remain long enough to know.

1784. You do not remember whether the ships were got off or not?—No, I do not.

1785. (*Capt. Washington.*) What year did that occur?—1811 or 1812.

1786. You must have been very young at that time.—I was between 11 and 12.

1787. I have no doubt it would make a great impression. Have you ever had occasion to go through the Pentland Firth?—Frequently.

1788. Trading from where?—From Liverpool, Ireland, and different places.

1789. Have you ever run through it blowing hard?—Yes.

1790. And found no difficulty?—No, I always managed to delay till a proper time of tide, if possible, and ran through it with a fair wind.

1791. Did it ever occur to you coming from Inverness with a south-west wind, when you came down from Duncansby Head, you found the wind blowing west-north-west?—Yes.

1792. In that case where did you go to?—I went to Long Hope.

1793. Did you ever stop in Sinclair Bay?—Never.

1794. It is not a good stopping place?—I do not know; I never used it myself.

1795. You crossed to Long Hope?—Yes.

1796. But you would not hesitate to cross the Pentland Firth, blowing hard from the west-north-west?—Not with a tide suitable to get hold of Long Hope.

1797. You would be obliged to wait for the tide?—Yes.

1798. In that case, supposing a harbour of refuge, as has been mentioned, at Wick, would that be of no advantage to you?—No, I would never attempt Wick.

1799. What would be your objection?—There would be no possibility of getting out with a fair wind, and the south-west or south wind raises a heavy sea upon the coast.

1800. You trade also, I think, from Inverness to London?—I did do so.

1801. Did you ever find with a south-west wind, that as you turned the point of the Moray Firth, the wind passed to west?—Yes.

1802. Then you would require a stopping place?—No, we keep on unless it blows very hard. We often get round into the firth with double sails, and we make it.

1803. You see the proposed plan of piers upon the wall; have you seen it before?—No, not till to-day.

1804. Do you know the width of entrance?—I have heard that is 400 feet.

1805. Would you hesitate to take it with a gale from the south-east?—No.

1806. Did you hear what a witness said about a north and south entrance instead of a central entrance?—I did.

1807. Do you agree with that?—I would not like to speak on that point.

1808. (*Capt. Vetch.*) You have traded a great deal between Inverness and London?—Yes.

1809. Did it ever happen to you in passing Fraserburgh that you saw in an adverse wind vessels waiting for a wind to go south?—Yes, frequently.

1810. How many have you seen at a time?—Forty sail.

1811. Then, returning to Inverness on your voyage from London, and reaching Kinnaird's Head with a foul wind, and going down Moray Firth, did you ever see vessels waiting there to go westward?—Yes, I have sometimes seen small vessels at anchor off Kinnaird's Head.

1812. How many have you seen at a time?—Probably eight or ten, not more.

1813. That frequently happens, does it not?—Not frequently.

Mr. JAMES LESLIE, C.E., examined.

1814. (*Chairman.*) What is your name?—James Leslie.

1815. What is your profession?—Civil engineer.

1816. (*Mr. Boyd.*) Were you applied to last year by the harbour trustees to report on the eligibility of the site of the bay of Peterhead for a harbour of refuge, having had submitted to you a plan which Mr. Stevenson had prepared?—I was.

1817. Have you the report which you made?—Yes, it is dated February 1858.

1818. (*Chairman*). Do you wish to put this in evidence?—If you please.

REPORT to the TRUSTEES of the Harbours of PETERHEAD, by JAMES LESLIE, C.E., as to the eligibility of the South Bay of Peterhead as a site for a Harbour of Refuge.

Agreeably to instructions from Mr. Boyd, Clerk to the Trustees, I visited Peterhead in the end of December last, accompanied by Mr. David Stevenson, C.E., and then carefully examined the harbour, the bay, and the adjoining coast. I also visited the neighbouring quarries, so as to be able to judge of the quality and cost of building materials.

It appears to me that the Bay of Peterhead, which is nearly a statute mile in width, and fully three quarters of a mile in depth, is particularly well adapted for the site of an asylum harbour, having great depth of water, good holding ground, and shelter from at least three-fifths of the compass.

I have examined and fully considered the plans of a harbour prepared by Messrs. Stevenson.

The larger one, enclosing the greater part of the bay, and having a low-water area of 190 acres, and an area of 116 acres below 12 feet at low water of spring tides, witha maximum depth of seven fathoms, would be very accessible at all states of the tide, and in all weathers, and it would afford accommodation and perfect shelter to a very large fleet of vessels, a considerable number of which might be of the greatest draught afloat.

This plan is decidedly the one which I should prefer, if funds can be provided for its construction. The expense, however, would be great, viz., according to Messrs. Stevenson's estimate, the data for which I have examined and think correct, 335,000*l.*, which could only be hoped to be raised by the work being made a national measure.

I am of opinion that the smaller plan shown, though possessing fewer advantages than the larger one, would still be highly beneficial, and would afford shelter in deep water to a considerable number of vessels, and would be able to accommodate all the trade of Peterhead, and the vessels trading to the neighbouring coasts. It has a low-water area of 86 acres, and an area of 44 acres, with a minimum depth of 12 feet, and a maximum depth of seven fathoms at low water of spring tides. It has a great extent of beach, viz., three quarters of a mile, enclosed within its piers, where quays, jetties, &c., may be erected at any time, as required, at a moderate expense, no great degree of strength being necessary, as they would be quite sheltered from the sea.

The piers of this plan are much longer in proportion to the area enclosed than those of the larger plan, but the south or west pier being in comparatively shallow water, and not being so much exposed as one facing the sea, could be constructed with less risk and at much less expense.

Messrs. Stevenson's estimate of this plan is 210,000*l.*, and I think that sum sufficient.

With regard to the general suitableness of the locality for a harbour of refuge, I am of opinion that the Bay of Peterhead, being situated on the most easterly point of Scotland, affords great and peculiar advantages.

The number of vessels passing is shown from returns to be very great, and the number of wrecks on the neighbouring coast is also large.

There is no harbour sheltered in easterly gales, and accessible in all weathers, nearer on the south than the upper part of the Firth of Forth, distant 110 miles, and on the north or west than the Cromarty Firth, distant 90 miles. To all vessels out at sea, and overtaken by a violent gale, it is a great object to find shelter within the shortest possible distance, and it is much better for them to find it on a projecting headland, which they can get easily away from again, than in a deep bay, which they may find a difficulty in getting out of, from the state of the wind, even after the weather has moderated.

It has been objected, and doubtless with some reason, that a headland ought not to be selected as the site of an asylum harbour, because vessels can in most of winds run from it—such as in the case of Peterhead in a north-easterly gale, to the Firth of Forth, and in a south-easterly gale to the Moray Firth, and within it, if necessary, to the more perfect shelter of Cromarty Firth, and that, consequently, a refuge harbour in such a situation is a mere convenience, not by any means a necessity. But many dangers beset vessels before they can reach either of those distant destinations, and many a vessel, if off Peterhead, might get into a harbour there during daylight or clear weather, which would require to make a long voyage during the night, or perhaps in thick weather, round the bold rocky coasts, either to the south or the north, and might not be able to stand the sea to be encountered in either direction—that on the north, on rounding Rattray Head, especially, being particularly heavy and dangerous.

It is notorious how reluctant shipmasters are to run far out of their course, if it can be avoided, and that rather than do so they will often run very great risks; and the same reasons that might be urged against forming a harbour of refuge on a headland, would apply with equal force to lighting or otherwise improving the navigation through any strait or channel, used for making a short cut, when vessels might be saved from all risk of running on rocks or shoals and similar dangers, by making a longer voyage, and keeping far enough out to sea. They might also be brought forward as objections to such a work as the Caledonian Canal, made for shortening a voyage, and saving sea risk; but such an idea is seldom mooted, and large sums have been, and are constantly being expended, most judiciously in my opinion, in lessening the dangers which vessels would be exposed to in taking the shortest possible course.

If a vessel be close to a lee shore in a gale, it is doubtless more a matter of necessity for that vessel to have a harbour of refuge close at hand, if in a deep bay than if off a headland, as she might run from the latter, while she might not be able to escape from the former; but as regards the most accessible bays or firths nearest to Peterhead, vessels if once there, can find shelter already by running far enough in.

In my opinion, a harbour of refuge at Peterhead would be of great advantage to all vessels sailing to the northward of the Firth of Forth, and to those sailing between any port of Great Britain and the Baltic, or any port in the north of Europe. That opinion does not affect the question as to the desirableness of having asylum harbours, if possible, elsewhere along the coast; but it seems to me that, taking into account the number of vessels passing, or likely to make the land at Peterhead, and its distance from any place of shelter, its claims to an asylum harbour are very strong and well founded.

I do not consider it necessary to go into the details of the plans of the harbour proposed, further than to say that, generally and essentially, I quite approve of them.

(Signed) JAMES LESLIE.

Edinburgh, 12th February 1858.

1819. (*Mr. Boyd.*) Do you still adhere to that report?—I do.

1820. (*Sir Frederic Smith.*) You say there is a great extent of beach at the bottom of the South Bay?—The extent of beach was great in proportion to the size of harbour in the smaller plan. I do not mean sandy beach. I just mean that the extent of shore was such that they might make building yards on it. Extent of coast, I mean.

1821. (*Capt. Washington.*) Do you concur in opinion with Mr. Stevenson that the entrance of 400 feet is sufficiently wide?—I think it is, but I would not say exactly; something between 400, 500, and 600 feet. I do not think Mr. Stevenson means to say that 400 feet is the precise width he would make.

1822. Would you prefer one entrance or two?—I think under the circumstances one entrance is better. I think it is too narrow a bay for two entrances. Some one of the witnesses formerly stated that it should have a detached breakwater like that of Plymouth Sound, but the length of breakwater there is much larger than the one proposed here.

1823. Do these piers cover the best anchorage?—I believe they do.

1824. If you had a larger sum of money to build farther out, would you have a greater amount of accommodation?—Yes. It was stated by some of the

PETERHEAD.

Mr. J. Leslie.

1 Sept. 1858.

Capt. Washington.

witnesses the other day at Fraserburgh that the very best anchorage is exactly opposite the entrance.

1825. Do you know of your own knowledge?—I do not know from my own knowledge whether it is exactly so.

1826. (*Capt. Vetch.*) Did you look over the estimates?—Yes.

1827. And you were satisfied that they were sufficient?—I am satisfied that they are very liberal.

1828. In what period of years do you think it would be completed?—It depends on the rate at which the money is given for making it. You can begin at both ends or only one.

1829. Supposing the money was forthcoming?—I do not know. In ten years or less it could be done.

1830. There is a larger line and a smaller line; can you describe where the smaller line runs?—A plan will be given in showing that.

1831. Will you state what you found to be the condition of the shore of the proposed larger harbour? How much of it is rocky, and how much otherwise?—It is mostly rocky.

1832. Entirely rocky?—Almost entirely.

1833. How far does that extend into the interior from the high-water mark?—By the Admiralty chart there are no rocks within the one-fathom line.

1834. Will you tell us the nature of the structure which is proposed to be built for that sum of money? What the highest platform will be above high-water mark?—I think it is eight feet.

1835. Is it proposed that these piers should be furnished with a parapet?—No; that does not come within the estimate.

1836. What would be the effect of gales of wind upon such a pier? Would they run over the piers?—Oh certainly.

1837. Then in the case of any vessel in distress or wreck, difficulty or danger, outside the piers, in stormy weather, you would have no means of giving immediate assistance and aid from the piers to those vessels so found?—No persons could go upon those piers in a gale of wind, not at high water at any rate.

1838. (*Mr. Coode.*) Do I understand rightly that you adopted the same form of section at Mr. Stevenson's?—I did not make a plan at all.

1839. You took his section?—Yes.

1840. And upon that section you founded your estimate?—Precisely.

1841. Can you tell us at what rate per cubic yard you calculated the cost of the rough rubble on which the masonry is proposed to be founded?—Three shillings the cubic yard, including carriage.

1842. Do you remember the distance from the quarries to the commencement of the work?—It is a little more than two miles, I think, from the west end of the breakwater.

1843. Is the whole material proposed to be taken from one quarry or from more?—I think from one quarry, because there is plenty of it there.

1844. The name of that quarry?—It is the quarry close to Buchan Ness. It is a large hill of granite.

1845. Did you examine that quarry personally?—Yes, I did.

1846. Did you satisfy yourself that there would be no difficulty in obtaining blocks of sufficient size for the construction of such a work?—I am quite satisfied there could be plenty of it got there of all sizes.

1847. You spoke of the extent of coast, when you made reference to the *smaller* plan, as being adapted for the construction of wharves or building yards, that has reference more to the commercial extent than the refuge extent?—It is entirely as a commercial harbour.

1848. Not as a refuge harbour?—Partially a refuge harbour for the local trade.

1849. (*Mr. Boyd.*) You have said, with reference to the breakwater proposed to be built, which you say you understand to be 8 feet above high water, that the seas will run over it, and that access could not be had from the top to render assistance; do you know any breakwater that has been built at Plymouth where the same exception does not arise,—a breakwater requiring such buildings as would be protection for a harbour of refuge?—No, I do not. I know that you could not walk on the top of the parapets at Peterhead, hardly even the highest of them, in a gale of wind.

1850. (*Sir Frederic Smith.*) Have you been examining the quarries near Fraserburgh?—No; I saw a crane standing in a quarry near Fraserburgh, but I did not examine the quarry.

1851. Do you know anything of the capabilities of the neighbourhood as regards stones?—No, except what I heard Mr. Abernethy explain the other day. He said there was whinstone in small pieces, and limestone, and freestone, and that whinstone in large pieces could be got from the Firth of Forth.

1852. From what you have heard in evidence, and from what you know of your own knowledge, or have acquired from other sources, are you of opinion that the materials found here are more likely to form a good harbour of refuge than the stone to be got in the immediate neighbourhood of Fraserburgh?—I cannot speak as to the neighbourhood of Fraserburgh beyond what I have heard, but I know they would not talk of getting stones from the Firth of Forth if they had good stones there.

1853. You are of opinion that better material than that you quarry here could not be obtained for the purpose?—I do not think it could.

1854. Are you satisfied with the section proposed by Mr. Stevenson?—Quite, as a breakwater.

1855. There would be no external face-work in this section?—No, except at the pier head which is proposed, which will require a rough dressing.

1856. Does it require dressing?—The stones must be cut in such a way that they will lie together.

1857. But you require no outlay for the external surface, I presume?—No, the rougher the better.

1858. With regard to the pier head itself, what is the intention of Mr. Stevenson, as far as you know it?—The pier head itself must be brought up as regular masonry.

1859. Will there be any increase of the thickness of the general line?—No; it is the same breadth.

1860. In fact, to terminate abruptly, but smoothly?—Yes.

1861. There is no advantage in increasing the thickness and rounding the ends of the pier, that you are aware of?—No, I do not think there is in such a case as this.

1862. It only adds to the expense?—Yes.

1863. (*Mr. Lindsay.*) Is there any part of the south bay a sandy beach free of rocks?—I am not aware that there is, except what I heard in evidence to-day, that there was part of it sandy. I think, generally speaking, it is a rocky shore.

1864. You have not examined it yourself sufficiently to be able to answer that question?—Not so minutely as that; but I can say that generally speaking it is not a sandy or gravel beach.

1865. (*Capt. Vetch.*) I wish to follow up where we stopped last. You mentioned that you had not seen the use of any refuge breakwaters that were supplied with parapets; are you not aware that Dover has a breakwater of that description?—No, I have not been to Dover since the commencement of the breakwater.

1866. Or that Cherbourg has, and Holyhead is intended to have, and that the Newcastle piers, which are very extensive, are also to have parapets?—I do not know.

1867. Do not you think, considering the advantage that such piers would have in the saving of wrecks, that they should build such a protection by means of parapet, as would allow of passage along the piers?—The height the parapet would require to make it accessible in a gale of wind would be so enormous, that I do not think it would be advisable.

1868. Do not you think that a parapet rising fifteen feet above the platform would be a great means of saving vessels from the effects of stormy

gales?—I do not think fifteen feet would have much effect. If you call it 25 or 30 feet, it would have a different effect.

1869. Yes; but you do not think it would have much?—It would be an advantage if it were so high as that, but the cost would be very great.

1870. Have you formed any estimate of what would be the additional expense of such a parapet? No; I have not. I think if you had the money to make it, you had much better enlarge the harbour.

1871. Do you think it is better to have a large harbour without parapets, than a small one with parapets?—Yes; for the breakwater.

1872. (*Mr. Coode.*) With reference to the dressing of the outer portions of the work, do I understand you that there was no dressing upon the upper portion, but some upon the lower?—No; it was the outer face, I think, which Sir Frederic Smith referred to specially.

1873. Your answer had no reference to the copestone, simply to the face?—Yes.

1874. Do you propose, or did Mr. Stevenson propose, to make any difference whatever in the character of work at the termination of the piers?—The termination is to be brought up with diving-bell work.

1875. Is it in any respect different from the general run of breakwater?—The lower part is different.

1876. In what way is it different?—It is to be brought up from the foundation instead of being built upon the rubble stones.

1877. Do you remember the additional cost for the additional building?—Part of it was taken at 70*s.* a yard.

1878. What portion was that?—Under low water.

1879. Was the whole under low water taken at 70*s.* per yard?—The backing of that was taken at 50*s.*

1880. Then your answer is: face stones 70*s.* per cubic yard, and backing stones 50*s.* per cubic yard?—Yes.

1881. Was it proposed to use any mortar or cement in their ends?—No; I think not.

1882. (*Mr. Boyd.*) You have just now spoken of a smaller harbour, and produced a sketch; some time hereafter I may refer to this as showing both places?—That is to be put in evidence.

1883. That is the plan referred to?—Yes.

1884. I should like Mr. Leslie to state to the Commissioners his experience in harbour building?—I have been pretty extensively engaged at Leith, Dundee, Montrose, Arbroath, Kirkcaldy, Methel, Burghead, Inverness, Ayr, Dumbarton, and a great many other harbours along the coast and the Firth of Forth.

Mr. Alexander Stuart examined.

1885. (*Chairman.*) What is your name?—Alexander Stuart.

1886. What is your occupation?—Builder and harbour contractor.

1887. (*Mr Boyd.*) You have had some experience in harbour building, Mr. Stuart?—Yes.

1888. You built the harbour at Buckie?—Yes.

1889. You made the breakwater at Nairn?—Yes.

1890. You made extensive improvements in the harbour of Peterhead, building piers, &c.?—Yes.

1891. At Lossiemouth?—Yes; I did some work there, and at some other places.

1892. I put into your hand the other day a printed schedule, that I told you had been issued by the Commissioners with regard to the materials and prices for a refuge harbour; have you made up that schedule?—Yes.

1893. Will you produce it?—Yes.

1894. Was that schedule made up without any communication with Mr. Stevenson, and without your knowledge of his rate of prices?—I had not seen it.

1895. Has he since showed it to you?—I saw it yesterday.

1896. Was his rate higher or lower than yours?—I made up mine on the same data as he did, but after I had made up mine, I found I was 2½*d.* per yard lower than Mr. Stevenson.

1897. And that was the schedule on which Mr. Stevenson based his?—Yes.

1898. Do you see this plan?—Yes.

1899. You know the bays of Peterhead?—Quite well.

1900. As a harbour contractor, would you have any difficulty in executing that plan?—Not if I got plenty of cash.

1901. Do you think it could be built for Mr. Stevenson's estimate?—I will take in hand to do it for that money.

1902. (*Sir Frederic Smith.*) Are you aware of Mr. Stevenson's section?—Yes; I only examined it yesterday, I had never seen a proper section of the piers till yesterday.

1903. But you are aware of the soundings over which it is intended to form the piers?—Yes.

1904. How would you get to the formation of the northern pier? By what mode of traction for the materials?—I would adopt a similar plan to that of Mr. Rendel, at Holyhead. I think it is only that which would do in this bay.

1905. What sort of blocks of stone would you use?—I would use as large blocks as I could get, and mix with small blocks.

1906. How would you quarry these blocks?—We have never attempted the mining system, as at Holyhead. Our system of quarrying has been to put in large perpendicular bores, shake the rock a little by a shot, then fill the crevice with powder, and blow as much out as you possibly can.

1907. Can you describe the various layers of material proposed to be used in that section?—They would just be put in a promiscuous state, as they came from the quarry.

1908. Up to what level would they be?—They would be tipped over the top of the platform, as they come from the quarry to the level of low water spring tide. Then select the largest and best blocks, to put on the top of the section; then I would take the largest blocks, and place them on the top section.

1909. What would be the form of the section you would give to the pier?—I would allow the sea to be her own mason for three or four years, and allow her to make what breadth of base she thought proper.

1910. That is a very suitable arrangement, to allow the sea to be her own artificer; but as you are a contractor, in making your calculation I presume you had some idea of what the size would be?—That would be required to make the calculation, but the sea would form itself a regular beach or slope.

1911. In making a calculation which would enable you to take the contract at the sum specified by Mr. Stevenson, you must have formed an idea of the actual mass you would put into the water?—I had some notion of the number of cubic yards, but I have not exactly the measurement of the base. I did not take that particularly; and the only way that I think Mr. Stevenson's sum to be large enough is that I have merely calculated upon the measure which he has given, and seeing my own prices so much lower than his, I had no hesitation in saying that sum was large enough.

1912. Then, in point of fact, you would not allow the sea to be her own artificer; you would be the artificer on Mr. Stevenson's section?—It was only in making the calculation.

1913. It would be to a certain degree a speculation, without a certainty of profit?—We would require, in making a calculation, a sufficient sum to make it, as much as would include contingencies in the account.

PETERHEAD.

Mr. Alex. Stuart.

1 Sept. 1858.

Sir Frederick Smith.

1914. (*Mr. Lindsay.*) Do you think that a breakwater could be constructed just within the eight-fathom line, which would give a greater area of anchorage, with entrance north and south, for about the same sum of money as the piers?—The same amount per cubic yard would do the work, but the quantity would be so much greater, that the increased cost would be very considerable.

1915. Would the quantity in the breakwater then be very much greater than the quantity in the proposed piers?—I am certain the sea would have more tendency to spread it before you got up to high water and formed your upper works.

1916. Have you formed any idea of the extra cost it would be?—No. There would be another thing; the risk would be greater for carrying away staging and plant, and in working there would be so much more risk.

1917. You could not say whether it would cost twenty, sixty, or a hundred thousand pounds more? —It would require some calculation.

1918. You have not made any calculation?—I never have done so.

1919. (*Mr. Coode.*) In making your estimate, then, you took Mr. Stevenson's quantities and your own prices ?—Yes.

1920. What is the greatest depth of water below low water in which you have had any experience of building piers or breakwater works ? — Seven feet.

1921. That is the deepest?—Yes.

1922. For what length have you built such piers ? —Only about a distance of forty-five feet or fifty feet out in seven feet water at spring tide.

1923. That is all your experience in building under low water?—Yes.

1924. Can you tell us at what rate per ton or per cubic yard you estimated the square blocks which Mr. Stevenson proposes to use in the masonry of his work, taking the price at the quarry?—My schedule furnishes that.

Mr. Boyd then said, Mr. Stevenson requests leave to make an explanation with reference to the evidence which has now been laid as to the plans, and his estimates.

(*Chairman.*) Certainly.

1925. (*Mr. Stevenson.*) The plan, as explained yesterday, but probably not fully, consists of these breakwaters with an understructure of rubble, and a superstructure of systematic but rough and strong masonry. The pier heads themselves are to be brought up from the bottom, but with a gangway elevated on some of the staging piles, and are to be built with a diving-bell, and the whole is to be a simple breakwater without any parapet. The estimates which have been spoken to by Mr. Leslie and Mr. Stuart were made up from calculations of the amount of material in the work, which I furnished to these gentlemen, and Mr. Stuart's prices are his own. The measurements are mine. I can give the Commissioners all the information as to the cost which I have allowed for bringing up the pier itself, or any other part of the work, now; or, if they prefer it, I can furnish them with a detailed statement of the different prices which I have taken, which may probably save time. With reference to the question of the parapet, which has been raised, my own opinion is, that no parapet, however high, speaking within reasonable limits, which could be put upon that north pier, could ever make it a pier along which you could pass in safety in bad weather. Under the circumstances, it seems to me to be very questionable indeed how far it is expedient to spend money in putting a parapet in that situation, seeing that the object in view is simply to afford shelter. No doubt communication could at the same time be had along the pier, by building the parapet very high; but I do not see in what way, without an enormous expenditure of money, such communication could be had by means of a parapet. Therefore the piers are laid out without a parapet, and simply as sheltering piers, with an elevated gangway. I think that is all that I wish to say with reference to the subject of the estimates. I wish also to make some statements with reference to the traffic returns of which we spoke yesterday, if this is the proper time for doing so.

I think this is the time to make that explanation.

1926. In reply to a question which was put yesterday, with reference to the sudden and great diminution of traffic in the Buchan Ness returns, I stated at the time that I was not able to account for in any way, not having lookod into those returns in a critical way, comparing year after year, but simply having laid them before the Committee of the House of Commons as they were obtained by me, being the returns made, as I stated before, by what I conceived to be trustworthy and competent observers. But afterwards it was suggested to me that probably that great diminution in the trade might be accounted for from the fact that in the year 1855-56 the ports of Russia were shut, in consequence of the war. This is more a mercantile question than an engineering one, certainly; but at the same time I have little doubt that the diminution referred to is attributable to that particular cause; and if so, it seems to me to be an additional fact in support of the trustworthiness of the returns. I stated that, in my opinion, the returns, as a whole, bore out the fact that there was greater traffic at Buchan Ness than in the Pentland Firth; in fact, that they were, I believed, a true exponent of the relative amount of traffic at different parts of the coast; and this is a diagram (*showing diagram*) I have made up, which probably you will allow me to put in, and on which the lines for the different years are drawn; and I think it will be seen that with the exception of Buchan Ness, which I think has been satisfactorily explained, there is really no very material difference over the whole table. I may state, in conclusion, that it was in consequence of a desire having been expressed by the Committee of 1857, for such returns being prepared, that that return was made out, with the sanction of the Commissioners of Northern Lights, and was laid before the Committee of 1858.

1927. Is that all you wish to remark in further explanation of your former evidence?—That is all.

1928. (*Capt. Vetch.*) Could you furnish the Commissioners with the cost of the parapet wall upon such a structure as you propose for Peterhead? —Certainly; I will be happy to do so.

1929. From what depth do you bring up your perpendicular wall?—It varies from twelve feet to four or five feet, according to the exposure, exclusive of the pier heads.

1930. And you imagine that with an upright wall presented to the sea, and twelve feet perpendicularly below low water mark, and no parapet wall, that there would be no difficulty in walking along the platform?—I have not the least doubt of it. It will be elevated on the piles a sufficient height above the pier. The seas will pass under it.

1931. Have you ever visited Dover ?—Dover I have not seen since the works were commenced.

1932. You are aware that they proceed upon that plan there, and have every appearance of complete success ?—I am quite aware of this, that I know of no place, whether in low or deep water, where exposed to such a sea as we have here, there will not be a very great rise of sea, indeed ; certainly much greater than any parapet can protect.

1933. Do you not conceive that the upright wall and parapet would act very differently from a sloping wall, such as that generally found in this country ?— That is a very vexed question among engineers, and I am one of those who certainly hold very strongly the opinion that we have no evidence at all in proof of what you say ; because I happen to know several upright faces of rock exposed to the sea, which are nearly perpendicular, and on which the sea rises cer-

tainly in one case higher than I know it to do in any part of the coast. One of these is Barrahead in the Hebrides, another is North Unst in the Shetlands.

1934. Would you give in any sample nearer at hand?—I cannot give you any sample nearer at hand, because, excepting Dover, I know no artificial work which presents the same perpendicular face; and excepting those places I have mentioned, I do not know any nearly perpendicular face.

1935. Do you know Cherbourg?—I do; but I am not aware that Cherbourg is particularly protected from the sea coming over; but it may be.

1936. Then you think, from all your experience, that a parapet wall upon that pier would be useless?—I do, in bad weather, most unquestionably. What I mean to say is, that it would be useless, because, although in ordinary weather it might be convenient, yet in bad weather, when it is most required, I have no hesitation in saying that I believe whatever height of parapet you make, I mean within ordinary limits, during certain states of the weather, when it is most required, it will be unsafe to pass along that pier.

1937. And with all the application of modern practice you think it could not stand?—What I mean to say is, that it would be unsafe to pass along the pier. I state this from my experience of other places.

1938. Do you know, from your own knowledge, that there is any difficulty in passing along the pier at Dover or Cherbourg?—I do not know from my own knowledge; but still I do not know from my own knowledge the contrary; and in the other cases to which I have referred I certainly do know, from my own knowledge that the result is as I have stated it.

1939. In those cases which you know, are the sea walls perpendicular?—The sea faces are nearly perpendicular.

1940. In what depth?—I do not know how many fathoms, but I believe them to be nearly perpendicular. My opinion is, that unless it can be proved that the waves of the sea are purely waves of oscillation, and have no percussive force, they must rise against a plumb wall, and certainly I think no one will doubt that a wave of translation will rise, whether the wall be sloping or upright. In fact, we know that a wave of translation will actually rise higher on an upright wall than on a sloping wall. I have no doubt in the world that during heavy weather you will have against the pier waves of translation as well as oscillation, and I think no man can doubt that if we have waves of translation they will go over it.

1941. That is with a depth of three fathoms from the wall?—Yes.

1942. (*Sir Frederic Smith.*) I do not wish to prolong a discussion upon a point on which engineers differed as far back as the projection of the first harbour of refuge, but I will ask you one question. Whether you will not be much more exposed here than the Dover pier can by possibility be, from the great sweep of tide you have?—I could hardly be prepared to answer that from my own knowledge. I should certainly think we must, in certain circumstances, have heavier seas than they can have at Dover; still it is quite notorious that there are very bad seas there, but whether they may be inferior to the seas we shall have here I really could hardly give an opinion.

1943. Have you seen the pier at Alderney?—No.

1944. Perhaps you have never heard that stones, several tons in weight, are thrown right over the pier there?—I am quite aware of that. The most extraordinary instance of such action of the sea we have, are those in the Shetlands, where I know that stones of six tons weight have been raised to a place that is seventy feet above the level of the sea.

1945. (*Mr. Coode.*) Are you aware to what gales the works at Portland are exposed?—No.

1946. The worst gales at Portland, I believe, are south-east?—North-east.

1947. Do you think there may be as many north-east gales in this latitude as there are south-west gales?—Well, I should think not, I cannot say. I have not made observations sufficient to enable me to give an answer that is worth a great deal.

1948. What is your belief on that subject? Do you know that the frequency of gales from the north-east is greater than the gales from south-west?—On the contrary, I should say that so far as this coast is concerned they are pretty much alike.

1949. Do you know from what quarter the wind blows heaviest on this coast?—I believe the prevailing wind is west.

1950. I am speaking now of the number of gales that the works at Dover would be exposed to as compared with the works at Peterhead; do you believe that the works at Dover, exposed to the south-west, would be subject to as many gales in the winter as the works in Peterhead, exposed to the north-east?—That I cannot answer.

1951. Are you aware of the action of the sea upon a vertical wall when founded at a depth of as many as twenty feet below low water? Have you never seen such a case in your experience?—No; I just mentioned that the only case I am acquainted with is that of Dover, and that I have not seen, neither am I aware of the action of the waves there.

1952. You spoke of Barrahead, I think; have you any means of ascertaining whether the cliffs at Barrahead are strictly vertical?—I have had the cliffs at Barrahead and at North Unst, to which I also alluded, examined as closely as it was possible, and my belief is that for a great depth they are nearly vertical. One of them overhangs a little, and I have no doubt that for a great depth they are nearly or practically vertical.

1953. That overhanging which you speak of is above the water?—Yes, slightly overhanging.

1954. And you have no means of telling us exactly what is the rate of inclination of those rocks under low water?—It is quite deep close up to the rocks, but to what depth I cannot tell, of course.

1955. You cannot tell us, in fact, in what degree they may vary from the perpendicular under low water?—According to my information, and so far as I have been able to observe them, I believe they are to a considerable extent vertical, but how far I am not prepared to say; that is, that after they go down a considerable extent, they may assume another form.

1956. (*Mr. Lindsay.*) Do you consider that Wick as a harbour, has claims upon government for a grant of money?—I do.

1957. Upon what ground?—On the ground of the fishing, mainly.

1958. Do you think there are any other fishing stations along the coast which have equal claims upon the Government in proportion to the number of boats frequenting them, and the number of lives at risk?—I cannot answer as to the number of boats; but I have no hesitation in saying that there are other stations which have very strong claims indeed upon Government, and one of these is the Moray Firth; I state that, in consequence of a reputed loss of life in the Moray Firth; and last year, in that particular locality, there was a loss of forty-five lives. The number of boats I am sorry I cannot give, but I am engaged at present in making a survey for a refuge boat harbour to obviate the calamities that have occurred; and the Hon. Mr. Bruce, who is now present, has taken a great interest in it. He has taken charge of collecting all the statistics connected with that particular part of the coast, and if you desire it he could give you the explanations you require better than I can, for he knows the circumstances better, but I have no doubt whatever as to the very great necessity for a boat harbour on that coast.

1959. Are you prepared to give an answer as to the proportionate loss of life of fishermen frequenting Wick, with the fishermen frequenting the other ports along the north-east coast of Scotland, or do I understand that the Hon. Mr. Bruce is

PETERHEAD.

Mr. Alex. Stuart.

1 Sept. 1858.

better prepared to give an answer to that question?—He has obtained or is in the course of preparing the returns which you desire with reference to the particular question to which I have adverted; namely, the erection of that harbour at some place between Port Gordon and Banff.

1960. Then, of your own knowledge you cannot state to the Commissioners the proportion?—Not further than that the loss of life last year was 45, and I know of my own knowledge that there have been boats lost very often on that particular coast.

1961. (*Capt. Vetch.*) I wish to ask you what are the other fishing harbours which you said are equally entitled to the assistance of Government as that of Wick?—I have all along placed Wick first as regards the herring fishery, but there is one question connected with the fisheries, which is a very important one, and that is the winter fishery—what is called the white fishing. Along that Banffshire coast, to which I have alluded, it is carried on to a very great extent.

1962. Admitting all that, you must have some harbours in your mind, I want to know what they are?—That is one, the harbour in that district of the coast of the Moray Firth, namely, somewhere between Port Gordon and Banff.

1963. You have no particular place in view, then?—No; I am at present engaged in making a survey of that coast, with the view of making a report on what seems to be the most eligible site for making a harbour there.

1964. But you do not actually know at this moment any place that is equally entitled as Wick to the assistance of Government?—I have stated my belief that that place, from the reason of the very great loss of life that has been there, is certainly. I do not say that I should put it first. I should put Wick first, as it has been long spoken about.

1965. What is that place?—It is on the coast between, as I have mentioned before, Banff and Port Gordon, and of which I am engaged in making a survey.

1966. What length of shore is that?—It is somewhere about 15 miles.

1967. Then you do not know at this moment any particular point or harbour thereabouts, which is equally entitled to the assistance of Government as Wick?—There are in that line of coast a certain number of harbours, Port Gordon, Buckie, Banff, Cullen, and several others. It is a very important fishing district, and my statement is that that fishing district, in consequence of the numerous losses, and the very heavy calamities, such as that of last year, when I forget how many boats were lost, but I know there were 45 lives lost, that district has in my mind a very strong claim for Government aid.

1968. Admitting all this, I ask if there is any harbour that you are aware of which is more entitled to the assistance of Government than that of Wick?—I have already stated that there is no harbour. We propose to make this harbour to serve for those harbours which I mentioned, and I may mention that I do not know any other harbour which, if made, could have prevented this extraordinary loss of boats, either to the north or east of it. What I mean to say is this: that that is a most exposed and dangerous district of coast, frequented by a very large number of boats engaged in both summer and winter fishing, and on which very serious accidents and calamities have occurred; and I do not know in what way these calamities could be prevented, except by building a harbour on that line of coast. And in answer to Captain Vetch,—Do I know any place where the money of Government ought to be laid out, or might be judiciously laid out,—I have no hesitation in saying that it is quite as much in want of a harbour as any place I know for fishing purposes.

1969. My question is, will you state the fishing harbours which you conceive equally entitled to the assistance of Government as Wick?—I have already said there is no such existing fishing harbour.

1970. (*Mr. Lindsay.*) Did I understand you to say that it is in contemplation to build a harbour along that particular line of coast so as to suit the various fishing stations in that district?—Yes.

1971. And do the parties intend to build such a harbour at their own cost, or do they intend to apply to the public treasury for a grant of money for the construction of that harbour?—I think you had better allow Mr. Bruce to answer that question.

1972. You cannot answer the question?—My understanding is, that there is to be an effort made—certainly an effort to some extent—to do it out of their own funds.

The Hon. Mr. Bruce examined.

The Hon. Mr. Bruce.

1974. What is your name?—Thomas Charles Bruce.

1975. Where is your residence?—Cullen House, Banffshire.

1976. State, for the information of the Commissioners, any evidence which you may wish to offer relative to the subject of their present inquiry which may more particularly bear on the question of construction, reserving for the statement to be sent into the Commissioners in writing at a later period, should you prefer to adopt that method, the additional information relative to the fisheries, which you wish to offer?—I think I must offer one word or two of explanation as to the reason for which I have tendered myself at all to give any evidence to-day. It is in consequence of some questions which were put to the last witness, and about which he professes himself to be insufficiently informed. I do not know that anything I can say will bear directly upon the subject of your present investigation. It will naturally bear upon the subject on which Mr. Stevenson was questioned, namely, upon the loss of life and the condition of the fisheries in other parts of the coast, particularly on the north coast of Banffshire; and I will not detain the Commissioners above a minute in explaining. Last year, as Mr. Stevenson stated, there was a great loss of life amongst the fishermen on the Banffshire coast, chiefly amongst those who reside within five or six miles of the village of Buckie. There were about 42 men drowned on one occasion, and I think there were about 10 a month or two previously. The subject, of course, excited a great deal of attention throughout the country, and a meeting was held of the county of Banff, at which a committee was appointed to inquire into the state of those fishermen and into the causes of this loss of life, and the means which might possibly be taken to prevent it. I was appointed convener of that committee, and in that capacity I had occasion to obtain several returns, both as to the loss of life on that part of the coast amongst the fishermen, and as to the number of boats that are employed, and other things about the condition of the fisheries. I am very sorry to say that I have not got those returns with me, and I cannot lay them before the Commissioners; in fact, I did not understand that an inquiry such as that would have been included amongst the subjects to be brought before the Commissioners, because, in the view, at all events of the committee of which I am a member, the subject was not one which we could bring under your notice and form the basis of an inquiry such as that in which you are engaged, and which we understand to refer principally to a national harbour of refuge for ships of all classes. But if the Commissioners would think that it would at all conduce to their information that I should forward to them such returns as I have described, which may give some further insight into the condition and the habits of

the fishing population in this part of Scotland, I should be very glad to do everything in my power to forward to them, at the earliest possible time, these returns. The steps that we have taken were alluded to by Mr. Stevenson ; and I may also state that we found, on inquiry, that the inhabitants of the fishing villages, of whom a very large proportion are in the habit of going to Wick during the summer, return to their own villages during the winter time, and that in consequence there are a considerable number of boats, I cannot state how many—there are several hundreds—which sail from the villages in what is called the white fishing, and stay during six or seven months of the year. As these are principally the winter months, these men, of course, are exposed to very considerable danger ; and I regret to say, that it appears that considerable loss of life takes place amongst them. I would not wish to state any number at present, because I have not a very good memory in these matters, and I have not got the returns with me, and I should not like to make a mistake ; but if the Commissioners think it a subject of sufficient interest, I shall be glad to send them these returns. I may add, that the committee of which I am a member have entered into communication with the Board of Fisheries here, and we have taken steps to obtain plans for such a harbour as would afford shelter for the boats on that particular part of the coast. We have not brought the subject before the Commissioners, because, as I have said, we consider it primarily a local, and not strictly a national subject. Our intention is, if we obtain the assistance of the Board of Fisheries, to obtain a plan for a harbour for the place which is considered most suited along that part of the coast, and then we shall endeavour to raise amongst those persons who are interested in the fisheries such a sum as shall meet at all events a considerable part of the expenses. If we cannot raise it all we shall then find it necessary to apply to Government ; but I wish it to be understood that I do not bring the matter forward with any such view—even with the view of bringing before the Commissioners any returns or details which I have procured with reference to this matter, but I shall be very glad to forward such returns to them if they can be of any interest.

(*Chairman.*) The Commissioners will be happy to receive the statements to which you allude.

(*Mr. Boyd.*) I beg to put in as evidence a letter to me of this date, by Captain Penny.

My dear Sir, Peterhead, 1st September 1858.

I regret exceedingly that my continued indisposition will entirely preclude me from the honour of meeting with the Royal Commission in the Town Hall to-day, to give evidence regarding a site for a harbour of refuge on the east coast of Scotland.

Although in these circumstances I am prevented from giving evidence personally, I have great pleasure in bearing testimony to the fact of Peterhead being pre-eminently adapted for such a purpose, from the natural advantages it possesses, and its position on the coast.

Viewing the subject entirely as a national question, after a nautical experience of upwards of thirty-six years, I have no hesitation in pronouncing my decided opinion in favour of Peterhead, conscientiously believing it to be the best locality on the coast for the construction of such a work.

I am, &c.

Andrew Boyd, Esq. (Signed) Wm. Penny.

(*Chairman.*) The Commissioners will be glad to receive from Captain Penny a more detailed statement relative to the subject of their inquiry, to be forwarded to them at his own convenience. Mr. Boyd, will you be good enough to acquaint Captain Penny with this ?

(*Mr. Boyd.*) I will.

Captain Young examined.

1977. (*Chairman.*) What is your name ?—William Young.

1978. What is your occupation ?—A shipmaster.

1979. (*Mr. Boyd.*) How long have you been in the capacity of shipmaster in this town ?—Upwards of 20 years.

1980. In what trade chiefly ?—Commanding in the Orkney, Shetland, Caithness, and Iceland trades.

1981. You have made many voyages to the Orkneys, I believe, in a single year ; can you tell us how many in one year ?—I have made more than 20 from Peterhead and Fraserburgh to the Orkneys in one year.

1982. Have you ever, in coming with a northerly wind, been prevented from getting into Fraserburgh ; Yes, at different times ; but when I was unable to get there, I got into Peterhead instead.

1983. During all the time you have mentioned, was there ever an occasion on which you intended to come into Peterhead and did not get in ?—Never but once.

1984. What was the cause of that ?—It was dark at night and we lost some of our sails, and the wind was north-north-east.

1985. In the many times that you have thus passed through the Pentland Firth had you ever a pilot ?—No, never.

1986. How many times within the last six weeks have you passed through the Pentland Firth ?—Four times.

1987. Have you never passed when it was bad weather and blowing hard ?—Yes, I have passed it in a gale of wind.

1988. Have you ever taken Long Hope, Widewall, and other places for shelter, when it was blowing hard ?—Many a time Long Hope.

1989. When was that ?—That was when I was going westward.

1990. Have you taken either of these places with the wind blowing hard from the southward and coming south ?—Yes, many a time.

1991. Have you been in Wick Bay when it was blowing hard from the southward ?—Yes.

1992. And what were you doing there ?—I would not stop a night in it if I could get out.

1993. Were you engaged in the carrying of cattle ?—Yes.

1994. Was it in order to get provender for these cattle that you ran into Wick ?—I have gone in different times, mostly to get meat for the cattle.

1995. But without having that purpose in view, would you have taken the Bay of Wick ?—If I could not get to the Moray Firth, I would have gone to the Orkneys rather.

1996. Do you know that vessels touch at Sumburgh Bay at times ?—Very often.

1997. Do they stop there generally for refuge ?—Oh, no, only to wait the tide.

1998. Have you known of vessels being wrecked in that bay ?—I have seen a report of 14 or 15 vessels being wrecked there. Two-thirds of them ran there instead of going into the firth. It was not bad weather.

1999. Do you know of other vessels being lost in a mistake, taking the bay for the firth in thick weather ?—Yes.

2000. Can vessels more readily get hold of Peterhead than they can of Wick ?—Yes.

2001. Is Peterhead more in the general track of shipping than Wick is ?—A great deal more.

2002. Did you pass through the Pentland Firth within a week or ten days with a cargo of horses ?—Last week.

2003. How many horses had you on board ?—80.

2004. Was it blowing hard ?—No ; a good strong breeze. We had a reef in our topsail, but we took it with a bad tide.

2005. Did you require to batten down your hatches ?—No ; the hatches were put off.

PETERHEAD.

Capt. Young.

1 Sept. 1858.

Mr. Boyd.

2006. Have you ever been in the Baltic?—Yes, many a time.

2007. Do you know that vessels from the Baltic try, especially in the winter months, to make for Buchan Ness light?—Very often they do, if the wind is at all in their way.

2008. Are you speaking entirely from your own experience?—Yes; and from hearing other masters say the same.

2009. Vessels coming from Archangel mostly all make for Buchan Ness. I mean those which are coming to the south-east coast of Scotland?—Yes.

2010. Do they not pass through the Pentland Firth either going or coming?—No.

2011. Do you think does Peterhead possess any advantages beyond a place on the coast of Caithness or elsewhere on the east coast, for the site of a harbour of refuge?—For a general shipping place it has.

2012. What are the advantages that you think chiefly belong to it? Is it a place that vessels can get easily into or leave?—It is easier than any other place that I know.

2013. Supposing vessels are coming from the Pentland Firth, and it comes blowing from the northward, what would be their best place of refuge?—They might get up to the South Firth or get to Peterhead, or they could to Long Hope, if they were acquainted with it.

2014. Would they go to Wick?—No, because they would not get out again if the wind came fair.

2015. Do you consider generally the navigation of the Pentland Firth to be dangerous?—Dangerous with a bad tide, but it is not dangerous with a good tide and a breeze of wind. It is a very bad place going to it with a bad tide.

2016. Do you know that vessels are sometimes driven from the coast of England to our own coast?—Very often.

2017. Where do they seek refuge?—Somewhere about the Orkneys.

2018. Do they sometimes take refuge in the harbours here?—I have seen them in Peterhead.

2019. What would you think of the coast of Caithness as a place for the ships to run down to?—I would not run down upon it if I could keep off it.

2020. You would rather go to the Orkneys, perhaps?—Yes, or the Moray Firth.

2021. You have passed along that coast very often, and along the east coast of Scotland. Do you know any place that possesses the like advantages with Peterhead for a harbour of refuge?—I do not.

2022. (*Chairman.*) How long have you been master of a merchant ship?—Upwards of 20 years.

2023. Do you hold the Pentland Firth to be no real difficulty in the way of navigating round the coast?—No. It is a very good place, going to it with a right tide. It can do no harm if you go into it with a calm. Go where she likes, you cannot shove your vessel ashore. I have gone through it three or four days in calm weather. We clewed the sails up and let her go. In a gale of wind there is no fear if you go through it with a right tide. I have gone through it many a time against the tide, with a foul wind and a fair.

2024. You know the harbour of Long Hope, I think?—Yes, I have been many a time in it—fifty times.

2025. Have you ever known vessels drive from their anchors at Long Hope in strong westerly winds?—Yes, and drive ashore on an island named Flotta and different other places.

2026. To what do you attribute that?—To strong winds and bad anchorage, I suppose. They did not break their chains. They drove always. The anchor did not hold. There is good holding ground in the right place.

2027. Do you consider it easy of access?—Yes. It is better than it was since they got the lighthouse there.

2028. Supposing that you had never been at Long Hope before, would you have any difficuty in running for it, with the Admiralty chart in your hand?—No, I do not think I would. I know of many a one who has run to it who never knew it before, and I have seen people who have been at it at one time for the first time. I have seen 50 or 60 vessels lying there which never were there before, and plenty of ships have run for it whose masters were never there before.

2029. (*Mr. Lindsay.*) You say you have gone through the Pentland Firth many a time against the tide with a foul wind?—Yes, beating through.

2030. Against the tide?—Yes.

2031. And beat through the Pentland Firth?—Yes.

(*Capt. Washington.*) It is quite capable of explanation, but as it stands now it is nonsense.

2032. (*Sir Frederic Smith.*) At what rate was the tide running?—Four or five knots.

2033 (*Capt. Washington.*) How did you get through?—We got inside in the eddies.

2034. You do not mean to say you actually opposed the tide?—I have gone to the eastward when the tide was coming from the westward with a foul wind.

2035. That is, by working in the eddies?—Yes.

2036. You know Peterhead South Bay well?—Yes.

2037. You have anchored there?—Many a time. I belong to Peterhead.

2038. In what sized vessels?—Small vessels, from 50 to 100 tons.

2039. Have you anchored in different parts of the bay?—No.

2040. Have you generally kept to the general anchorage?—Yes.

Mr. Boyd then said:—I beg to state to the Commissioners that since we have sat to-day I have discovered that there are four foreign shipmasters, one of whom has just called from Archangel for orders. They are in the room, and if the Commissioners desire it will be examined. Their names are not in the list of witnesses, but perhaps it would be interesting to the Commissioners to hear some questions put to them. I will just put one or two questions to one of them, and the others can concur.

CAPTAIN JOPP was examined.

Capt. Jopp.

2041. (*Chairman.*) What is your name?—J. F. Jopp.

2042. What is your occupation?—Shipmaster.

2043. (*Mr. Boyd.*) You are master of a British vessel called the *Karl* of Stettin?—Yes.

2044. You have come from Stettin to Peterhead?—Yes.

2045. How long have you been at sea?—Twenty-one years.

2046. How long have you been in command of a ship?—Eleven years.

2047. You will often have traded to the east coast of Britain?—Yes.

2048. That is where your trade chiefly was?—Yes.

2049. Are there any particular places upon that coast where you call for orders, where you know that vessels from the Baltic and the east country call for orders?—Yes, the places are, Peterhead, Leith, and Grimsby.

2050. At which of these three places do vessels most frequently call?—At Peterhead first, when they can get to it.

2051. Would you explain the reason for preferring Peterhead to the other two places?—Yes, when ships come from the north, if they come from Archangel,

then Peterhead is the first place, and there is this Buchan Ness light, the surest place where they can make the land for. Secondly, when they have to go to Leith, there is the pilotage; and another thing is, when the wind is from the northward or north-eastward, they can make their passage to it from the continent, London, &c., but they cannot get their foot out again. There is just the same reason for Grimsby. With that wind they cannot get out of the Humber. They could make their passage from here before they can get out there.

2052. Then the vessels from the north of the continent of Europe, as a rule, endeavour to make the land in Buchan Ness?—Yes.

2053. (*Chairman.*) Where have you traded to chiefly?—I have traded to England and the West Indies, but chiefly to England and France.

2054. Have you ever gone through the Pentland Firth?—No; I have gone through between the Orkney and Shetland Islands, but never through the Pentland Firth.

Shew the witness the Admiralty Chart.

This having been done,—

Point out to him, Mr. Secretary, the anchorage of Long Hope.

This also having been done,—

2055. Do you see that anchorage on the chart?—Yes.

2056. Look at it well, and tell me if you would have any difficulty in going into that anchorage by that chart?—No, I would not think I should, because I would be sure to land somewhere about Duncansby Head. I would not have any difficulty in running for it if the tide would favour me.

2057. (*Sir Frederic Smith.*) What is the tonnage of your vessel?—102.

2058. Have you ever anchored in the south bay of Peterhead?—No, I have not.

2059. Are you not at anchor now?—I am, in the harbour.

2060. (*Mr. Lindsay.*) Have you ever called at Fraserburgh or Wick for orders?—I have been at Wick, but never at Fraserburgh.

2061. How often have you been at Wick?—Twice.

2062. For orders?—No, I have been there loading a cargo.

2063. Do you know any Prussian ships that call at Wick or Fraserburgh for orders?—I do not.

2064. Do you know of any of your ships which have called at Wick or Fraserburgh for shelter?—No, except the wind is off the land. But I know many a ship calls for orders here at Peterhead. There is just one captain here. There are about ten or twelve letters lying at the post office for foreign ships to call for.

2065. (*Capt. Washington.*) How often have you been at Wick?—Twice.

2066. You were there for a cargo of herrings?—Yes.

2067. Had you any difficulty in getting in?—Oh yes, there is difficulty. I have been lying off the bay for three or four days, and could not get in, while the boats were in the harbour.

2068. There is no accommodation for shipping on account of the herring boats?—No.

2069. Do you think it would be a good thing if there were accommodation for shipping there?—Of course it would be a good thing, but for general shipping it would be better at Peterhead.

2070. But for the ships that are bound for Wick it would be a good thing to have accommodation for shipping there?—Yes.

2071. In short, a good harbour at both places would be a very good thing?—Oh yes.

(*Mr. Boyd.*) I may be allowed to state to the Commissioners that the three other witnesses to whom I alluded, are Captain Meyer, of the *Leonidas*, of Rostock, at present lying off Peterhead for orders, and who has been waiting there for the last two days. The second is Captain C. Joheneson, of Sandieford. now in the harbour, and the last is Captain Scehwz of the *Hermoter*, from Christiansand, which vessel is also lying at Peterhead, and these gentlemen are here. I am unwilling to take up the valuable time of the Commissioners by examining these witnesses now, but perhaps the Commissioners would not object to have it minuted that they were offered, and I shall examine them or not as the Commissioners may think fit.

(*Chairman.*) Proceed with the witnesses.

Captain MEYER examined.

2072. (*Chairman.*) What is your name?—C. Meyer.

2073. What is your occupation?—Shipmaster.

2074. (*Mr. Boyd.*) How long have you been at sea?—Twenty-two years.

2075. And how long have you been a shipmaster?—Four years.

2076. Have you called at Peterhead for orders?—Yes, twice.

2077. Do you know that there are eight or ten ships on their way from Archangel to call for orders just now?—Yes.

2078. Did you hear the evidence given by Captain Jopp?—Yes.

2079. Do you agree with what he said?—Oh yes.

2080. (*Chairman to Mr. Boyd.*) Is that all you wish to ask?—That is sufficient; he agrees with the last witness.

Captain JOHENESON examined.

2081. (*Chairman.*) What is your name?—Captain Joheneson.

2082. And your occupation?—Shipmaster.

2083. (*Mr. Boyd.*) How long have you been at sea?—12 days.

2084. How many years have you been at sea?—19 years.

2085. (*Chairman.*) Is Captain Jopp present?—Yes.

2086. Will he be good enough to act as interpreter to the witness?—Yes.

2087. (*Mr. Boyd.*) How many years have you been master of a ship?—10 years.

2088. Have you heard what was asked at Captain Jopp, and the answers he gave?—Yes.

2089. Would you have said the same thing?—All the same.

Mr. COLIN MACKENZIE examined.

2090. (*Chairman.*) What is your name?—Colin Mackenzie.

2091. What is your occupation?—Merchant and shipowner.

2092. (*Mr. Boyd.*) Have you been at sea?—I have.

2093. How long were you there?—10 years.

2094. Had you the command of a ship during part of that time?—I had.

PETERHEAD.

Mr. C. Mackenzie.

1 Sept. 1858.

Mr. Boyd.

2095. For how long?—About three years.

2096. In what trade were you employed before and after you became a shipmaster?—Before I became a shipmaster I was employed in the coasting trade betwixt Newcastle and London, and in the Mediterranean, Baltic, and American trades; and since I became a shipmaster, I have been principally in the coasting trade.

2097. Are you well acquainted with the trade of the Moray Firth?—I am pretty well acquainted with it.

2098. You are a shipowner in the Moray Firth in Elgin?—Yes.

2099. Do you know the bays and harbours of Peterhead?—I do.

2100. Have you been at anchor in the bays?—I have taken refuge there.

2101. In the south or north bay?—In the south bay.

2102. Were you once there, in a gale of wind blowing from the north, blown out of the harbour?—I was.

2103. What was that owing to?—It was owing to the warp which we had breaking. We were blown out to sea.

2104. Where you able to get back?—We were with great difficulty. After rounding the Skerry, we came in betwixt the Skerry and the land.

2105. The tide did prevent you from reaching the harbour?—No; it did not.

2106. Which harbour did you take?—The south harbour.

2107. If you had been to the southward of Peterhead and driven back to the northward?—On that occasion I was driven back from the north as far south as Stonehaven.

2108. And could you get hold of Peterhead?—I did.

2109. Were you ever driven so far back as Cromarty, after being to the southward of Peterhead?—No; I cannot say I have.

2110. Do you know the harbour of Wick?— I am not very well acquainted with it.

2111. You know its position?—I do.

2112. Have you been down at Wick Bay?—I have.

2113. Did you say that a vessel could leave Wick with the wind coming on from the east-south or south-east?—No; I should say not.

2114. Would a harbour there be generally useful for the shipping upon the coast?—There is no doubt it would.

2115. Would it suffice all that is required for the shipping upon the coast?—No; I do not think so.

2116. Where should a harbour be?—In my humble opinion, the best place for a harbour of refuge is the Bay of Peterhead, from its natural position and the natural advantages it has, and being the most easterly point, where most vessels call at from foreign ports.

2117. Would a harbour there be taken more easily and more frequently than a harbour, if constructed at any other part of the coast, and leave it more frequently?—Yes; I think so.

2118. You know the Pentland Firth?—I do.

2119. How many times have you been through it?—Four times.

2120. Do you attach any difficulty to the navigation through the Pentland Firth, and if so, state what the difficulty is?—I do not attach any particular difficulty to the navigation, excepting that there is a very heavy sea runs there, with a strong flood tide and south-east wind; but vessels coming down from the southward, if it is blowing a gale of wind, can shorten sail and take up till such time as they can make it with a slack tide, when they have no difficulty whatever in passing through.

1121. Do you know Long Hope?—I have never been in Long Hope, but I know the harbour of Long Hope by chart, and the position of it very well.

Show Long Hope to the witness on the Admiralty chart.

This having been done,—

2122. Do you see Long Hope on that chart?—I do.

2123. Should you have any difficulty in running for Long Hope in bad weather by that chart?—I should think not, none whatever.

Captain SHAND, of Lossiemouth, examined.

Capt. Shand.

2124. (*Chairman.*) What is your name?—George Shand.

2125. And what is your occupation?—Seaman.

3126. (*Mr. Boyd.*) Are you harbour-master of Lossiemouth?—Yes.

2127. Have you been at sea?—Yes, for upwards of 30 years.

2128. During that time have you had command of a vessel?—I have, for 25 years.

2129. And what trade were you in?—Baltic and coastwise, and a good deal in the Mediterranean trade.

2130. Are you intimately acquainted with the requirements of the Moray Firth?—Yes, I think I know it pretty well.

2131. Have the harbours and south bay of Peterhead been always looked to as places of great service for the purposes of that trade?—Yes.

2132. Have you been in Peterhead frequently?—I have been a good many times, and riding in Peterhead Bay with my vessel.

2133. Did you find good anchorage ground in the bay?—Yes.

2134. Did ever you drive in it?—No.

2135. Have you been there in bad weather?—I have been there in heavy gales of wind from north-west and north-north-west.

2136. And you were in perfect safety?—Yes.

2137. Have you considered the question respecting a harbour of refuge for the trade in the east coast of Scotland specially?—I have.

2138. Both with regard to the necessity for such a harbour and the best situation for it?—Yes.

2139. Would you be so good as to state to the Commissioners shortly whether you think that such a harbour is required, and what place ought to be selected for it?—I think there is great necessity for a harbour of refuge; and there is no place that I know equal to Peterhead south bay, to the best of my knowledge.

2140. Have you been in the Pentland Firth?—Yes, I have.

2141. Have you been in Longhope?—Yes.

2142. Supposing that you were to meet with contrary winds in passing to the northward, where would you go for shelter?—If I were bound to the northward I would very likely, if I were not far across, come back to Peterhead Bay.

2143. If you were bound anywhere else, what would you do?—If I were bound through the Firth and across to the Caithness coast, I would very likely try to get into the Orkneys.

2144. Do you consider the Pentland Firth a dangerous place for navigation to men who know the tides in it?—I do not consider it a dangerous place to a mariner who understands the tides, and waits the proper time to take the Firth.

2145. You say that you have been engaged in the Baltic trade?—Yes.

2146. What land would vessels coming to the east coast endeavour to make?—Generally, when they wish to make any port here, or to go through the Firth, they always steer for Peterhead. Vessels if they are only coming this way, cannot pass that. I have come myself a good many times, and always steered for Buchan Ness.

2147. (*Chairman.*) You observe that this is a plan of Peterhead and the bay?—Yes, I do.

2148. Do you know Mr. Volume's house above the ropery?—Yes.

2149. Suppose a line drawn from Mr. Volume's house seawards over the ropery to the proposed breakwater, what is the nature of the holding ground so indicated?—Good ground.

2150. Does the witness know Mr. Anderson's house, called Mile-End, above the brickwork?—Yes.

2151. Is there any good anchorage ground south of a line drawn from Mile-End, a little from the north of the brickwork, seaward to the proposed breakwater?—Yes.

2152. Will the witness define on the plan the amount of good anchorage ground?

Witness having made some marks on the plan,—

2153. Has he got it down, Mr. Secretary?—He has marked three places, and he says he has no more to mark.

2154. Are you sure that you have distinctly understood the questions which I have put to you?—I think I have.

2155. (*Mr. Boyd.*) With reference to this plan, can you easily point out, upon a plan of this bay drawn to such a small scale as that, the holding ground with sufficient distinctness, especially seeing that you have not been there for some time?—No.

2156. Is not the best anchorage where the figure 8 is shown on Mr. Stevenson's plan, in the direct line of Merchant Street?—Yes.

2157. Are you aware that vessels have driven often from the best anchorage ground?—Yes. PETERHEAD.

2158. Did ever you know a ship drive on shore in the bay from any anchorage ground?—I saw a vessel drive ashore. *Capt. Shand.* 1 Sept. 1858.

2159. Is that the only case?—That is the only case during the time I was here.

2160. (*Mr. Lindsay.*) When was it that the vessel drove on shore?—About 14 years since, as near as I can guess.

2161. How was the wind blowing?—From south-east and east-south-east; she was riding, and the wind came round from north-north east to south-east and east-south-east. It came on to blow, and she drove ashore.

2162. Did she drag her anchors?—Yes.

2163. Had she two anchors down or one?—I cannot be certain. The vessel was laden with wheat, bound from the westward. The *Sarah* of Liverpool.

(*Capt. Washington.*) I have no question to ask. I have only to suggest whether it would be desirable to enable the Peterhead authorities entirely to disprove the truth of the statements made, that they should call their assistant harbour master, and allow him to contradict them if not true.

(*Chairman.*) The assistant harbour-master will, in pursuance of the course of procedure adopted by the Commissioners, have the opportunity of tendering his evidence if he thinks proper to do so.

Captain WINCHESTER, of Yarmouth, examined.

2164. (*Chairman.*) What is your name?—John Winchester.

2165. What is your occupation?—Shipowner.

2166. (*Mr. Boyd.*) Are you a shipmaster in Yarmouth?—Yes.

2167. How long have you been at sea?—36 years.

2168. How long were you a shipmaster?—21 years.

2169. What are you at present?—A shipowner and surveyor of shipping at Yarmouth.

2170. In what trade were you employed?—The Baltic and coasting trades.

2171. In coming from the Baltic to the east coast of Scotland, what land did you endeavour to make?—If the wind was from the southward, I endeavoured to sight Peterhead.

2172. And otherwise, if the wind was from the northward?—In that case, if I was bound for the Firth of Forth, I would endeavour to sight the Buchan Ness coast.

2173. Do you know if it is the practice of shipmasters to do so?—I think it is in general.

2174. Do you know the trade of the Moray Firth?—Yes, I have been for 10 years in that trade.

2175. During that time, or at any other time, have you been often in the South Bay of Peterhead?—Yes, I have been different times there. *Capt. Winchester.*

2176. Did you find good anchorage?—Very good.

2177. The ground holds well?—Yes.

2178. Is it of great importance to vessels trading in the Moray Firth?—It is of very great importance.

2179. Would a harbour at Wick be of much importance?—Not for the Moray Firth.

2180. What trade would it benefit?—I do not see it would benefit any trade except for itself.

2181. Have you considered fully the question of the necessity for a harbour of refuge upon the east coast of Scotland, and the place that ought to be selected for it; have you thought of that seriously?—Yes.

2182. Do you think, is a harbour of refuge necessary?—I do; and in my opinion, the Peterhead Bay is the best place for a harbour of refuge.

2183. You have heard the evidence given by Captain Shand and other witnesses who have preceded respecting the Bay of Peterhead; do you agree with that evidence?—Yes.

2184. Is there any part of it with which you disagree?—No.

Captain MACLEAN, of Portsoy, examined.

2186. (*Chairman.*) What is your name?—James Maclean.

2187. What is your occupation?—Seafaring.

2188. Where do you belong to?—Portsoy.

2189. (*Mr. Boyd.*) Have you been many years at sea?—42 years.

2190. Of these, how many a shipmaster?—37.

2191. You have heard a great deal of evidence here to-day by a number of witnesses?—Yes.

2192. Do you concur in their testimony or not?—I quite concur with it. *Capt. Maclean.*

2193. Is there any part of it which is contrary to your opinion in any way?—No, nothing material.

2194. You have been often in the bay of Peterhead?—Yes.

2195. And what trades have you been in?—The Baltic, American, Mediterranean, and coasting trades

Captain MATHIESON examined.

2196. (*Chairman.*) What is your name?—James Mathieson.

2197. What is your occupation?—Master mariner.

2198. Where are you a native of?—Banff.

2199. (*Mr. Boyd.*) How long have you been at sea?—Nearly 40 years.

2200. And of these how long a shipmaster?—Nearly 30. *Capt. Mathieson.*

2201. Are you well acquainted with this coast, and the Moray Firth, and the trade in their way?—Yes.

2202. You have been here to-day, I presume?—Yes.

PETERHEAD.

Capt. Mathieson.

1 Sept. 1858.

Mr. Boyd.

2203. Have you heard the questions that have been put to the different nautical witnesses, and the answers which they have given ?—Yes.

2204. Do you concur in these answers ?—Generally I do.

2205. Is there anything in particular occurs to you that is inconsistent with the opinions you hold ?—No.

2206. Were you many years trading betwixt Wick and London ?—Yes.

2207. How many ?—Two years.

2208. Were you master of a vessel at that time ?—Yes.

2209. Then I presume you are well acquainted with the localities about Wick, Fraserburgh, and Peterhead ?—Yes.

2210. Generally with the ports of the north-east coast of Scotland ?—Yes.

2211. Have you taken shelter often in the Bay of Peterhead ?—Yes.

2212. A great many times ?—A good many times.

2213. Could you enumerate them ?—Well, I suppose nearly 50 times.

2214. You have been in both harbours of Peterhead ?—Yes.

2215. For shelter ?—Yes.

2216. You were master of a vessel out of Fraserburgh for a time, were you not ?—Yes.

2217. For many years ?—About 10 years.

2218. Have you been in gales of wind often driven out of the Moray Firth ?—Yes.

2219. And on these occasions where did you find shelter ?—Peterhead Bay.

2220. Did you do that when you could not look at Fraserburgh ?—Yes.

2221. Supposing a vessel driven out of the Moray Firth in similar circumstances to what you have mentioned ; could that vessel find shelter at Wick ?—No, they could not.

2222. When you were in the Wick trade betwixt Wick and London, have you been under the necessity of finding refuge not far from Wick, when you could not run for that place ?—Yes ; I have run for Longhope when I could not take Wick. I once went to Cromarty, because I could not come near Wick.

2223. If you were in the circumstances which lead you to take refuge in Cromarty, did you do it in a gale of wind, or how ?—I was rather to the westward, and the wind was blowing hard about east-south-east, and I thought I would manage better by going to Cromarty.

2224. But I am speaking of the occasion when you took refuge at Long Hope ; were you able at once to enter the harbour, or had you to lie off for a while ?—Sometimes I put on as much canvass as I could, and sometimes, in fact, I have been running without any canvass at all, to pass it in the flood tide.

2225. That was in running for Longhope ?—Yes.

2226. Supposing there was a harbour built at Wick, under a south-east gale would it be safe to run for that harbour, in your opinion ?—I should not like to do it.

2227. Because of what ?—Because there is too much sea. The sea runs very high there, and there is a dead lee shore. There is no remedy after, if you happen to miss the harbour.

2228. Do you know the Pentland Firth ?—Yes.

2229. Is that a very dangerous place ?—Well, it is not so dangerous. It looks dangerous to a stranger when he is in it, but there is not much danger in it.

2230. Have you ever run for Longhope with a deeply laden ship ?—Yes.

2231. Did ever any accident occur to you ? Did you ever sustain any damage on such an occasion ?—Sometimes may be a few boards of my bulwarks may be lost. I have lost nothing else.

2232. With the wind at east-south-east, or south-east, is there a very heavy sea off Rattray Head ?—Yes, a very heavy sea.

2233. Would if be of great importance to a vessel in the circumstances to find refuge before she got as far north as Rattray Head ?—Yes, it would, if she sights Peterhead.

2234. (*Mr. Lindsay.*) With the wind dead upon the land, whether do you find more sea running into the south bay at Peterhead, or into Wick Bay ?—Much more sea into Wick Bay.

Captain BROCK examined.

Capt. Brock.

2235. (*Chairman.*) What is your name ?—George Brock.

2236. And your occupation ?—Shipping master at Aberdeen.

2237. (*Mr. Boyd.*) How many years have you been at sea ?—Thirty-six years.

2238. And of these, how many a shipmaster ?—Twenty-eight.

2239. You are well acquainted with the east coast of Scotland ?—I have a general knowledge of it.

2240. You have heard all the evidence that has been led to-day ?—I have.

2241. Generally do you concur in the opinions expressed by the different witnesses ?—Not by some of the first witnesses ; but I agree with the latter witnesses.

2242. Explain the difference.—I cannot go over the whole minutiæ, but it is about the easy access of the Pentland Firth. I cannot concur in that part of it.

2243. Any other thing ?—That is the only thing I remember at present.

2244. With reference to the three localities which have been mentioned—Peterhead, Fraserburgh, and Wick—as a site for a national harbour of refuge, which of these places would you say is the most eligible for such an erection ?—Peterhead, most distinctly.

2245. (*Chairman.*) State to me as briefly as you can the difficulties of the navigation of the Pentland Firth ?—The Pentland Firth cannot be taken at all times, even with a flood tide. In a gale of south-east wind there is a heavy sea at the entrance. Vessels often having a sufficient offing would rather take the Roost and I myself, in taking the Pentland Firth from the westward, after having run half through the gale of wind from the westward in double reefs, and carrying the main-top-gallant sail with double reefs and great risk, the wind fell light, and the ship came out of the Firth again, and we were like to have our decks swept.

2246. Nothing further ?—Nothing.

2247. State to me your opinion of Longhope as a harbour to run for in bad weather ?—It is a harbour of easy access, tide suiting.

2248. (*Capt. Washington.*) How long have you been at sea ?—Thirty-six years.

2249. You have often run through the Pentland Firth ?—About 12 times.

2250. You have given your own opinion of running through the Pentland Firth. Did you ever happen to have had an opportunity, as shipping master, to hear other captains express their opinion of it, talking about it quietly ?—I have.

2251. Did their opinion concur with yours ?—Pretty much.

2252. You have heard the evidence given in this room this day on the subject of running through the Pentland Firth ?—I have.

2253. Do you, as a seamen of 36 years' experience, concur with it ?—No.

2254. (*Mr. Lindsay.*) Do you consider the Pen-

land Firth dangerous to take at all times of tide, with a south-east gale of wind ?—Not at all.

2255. With an ebb tide and a south-east gale would you consider the Pentland Firth dangerous to take ?—No.

2256. Have you ever heard any of the masters who came before you express a fear of running through the Pentland Firth with a south-east gale and an ebb tide ?—Never.

2257. (*Chairman.*) Then, does your opinion of the difficulty of running through the Pentland Firth apply merely to the unfavourable circumstance of a weather tide and a strong gale ?—At all times, I should say, there is considerable risk in navigating the Pentland Firth. Winds are variable and subject to shift, particularly when a vessel is nearly through with a fair tide, and an adverse tide coming on.

2258. Therefore you would consider that to a man who was not tolerably well acquainted with the locality, it might be better, except in favourable circumstances, to go round the Orkneys?—Yes.

2259. (*Mr. Boyd.*) Did ever you take a pilot in passing through the Pentland Firth?—Once.

Captain Cargill, of Aberdeen, examined.

2260. (*Chairman.*) What is your name?—John Cargill.

2261. And what is your occupation?—I have been a shipmaster, but I have retired the last few years.

2262. Are you a native of Peterhead?—No, of Aberdeen.

2263. (*Mr. Boyd.*) How long have you been at sea?—Thirty-nine years.

2264. And how long in command of a ship during that time?—Twenty-nine years.

2265. Did you command the steam-ship *City of Aberdeen* during the time of the Russian war?—No; the *City of London.*

2266. During the time you were a shipmaster were you a good deal in the North American trade with this coast ?—Yes.

2267. Are you intimately acquainted with the coast, the tides, and the geographical position, and all that ?—I cannot say that I am perfectly acquainted here. I was never in the way of coming into this harbour.

2268. You have been present to-day, and heard the evidence that has been laid ?—Yes.

2269. Do you concur with that evidence generally ?—Generally I do, but there are several points on which I could not agree with them.

2270. Would you point out these things ?—There was one witness examined who considered a harbour of refuge as merely a harbour of shelter that ships would take in any wind. I have always been impressed with the idea that a harbour of refuge was, when a sailor was caught upon a lee shore and could not extricate himself, to get in there.

2271. What more ?—I do not know of anything else. Some spoke about the Pentland Firth—running through in a heavy gale of wind from the south-east with a flood tide—a thing that I could hardly do with a heavy gale of wind. I have run through it in the circumstances when the ship would overcome the tide by getting inside of Stroma, through Gill's Bay.

2272. (*Chairman*). What does the witness wish to state?—Am I to understand that the thing is decided between Wick, Fraserburgh, and Peterhead as a natural harbour of refuge ?

(*Chairman.*) The Commissioners think it unnecessary to give you any answer on that point.

(*Witness.*) The reason that I asked it is, it has been asked several times—On the north-east coast of Scotland which would be the best site for a harbour of refuge ?

(*Chairman.*) Observe, that it is the custom for witnesses to answer questions, not to ask them. Will you now, Mr. Boyd, proceed with your evidence ?

2273. (*Mr. Boyd.*) Is there any other point on which you disagree with the evidence ?—No, nothing else.

2274. Then I would ask you, with reference to the three places that you have named—Wick, Fraserburgh, and Peterhead—which of these places, in your opinion, do you think the most eligible site for a harbour of refuge ?—Peterhead, decidedly.

2275. (*Capt. Washington.*) Was it not you who piloted the royal yacht to Aberdeen two years ago?—I had the honour of so doing ; and I have a very handsome letter from the Lords of the Admiralty, thanking me.

(*Capt. Washington.*) I can certify to that, for I happen to know that the Queen expressed her opinion of the manner in which you piloted the yacht with great satisfaction.

Captain Buick, of Arbroath, examined.

2276. (*Chairman.*) What is your name ?—John Buick.

2277. What is your occupation ?—At present I hold a pilot licence from the Trinity House at Leith. I have retired from sea, and I am now acting as a licensed pilot.

2278. (*Mr. Boyd.*) How long have you been at sea ?—Since 1813.

2279. Have you been a shipmaster ?—For twenty-seven years.

2280. On what part of the coast have you traded ?—Right round the Baltic, and generally the coasting trade.

2281. You have been here all day ?—Yes.

2282. And have heard, I suppose, all the evidence which has been given ; I refer to the evidence of the nautical witnesses ?—Yes.

2283. Do you concur in that evidence ?—Oh yes ; it is as near as I could calculate, in every respect I think.

2284. Have you anything that you can name that you disagree with it in ?—Nothing particular, because of course it all comes to the same thing.

2285. What do you mean by that ?—Our opinions, I suppose, are similar.

2286. You are quite agreed ?—Oh yes.

2287. You are intimately acquainted with Peterhead, as well as Arbroath ?—Oh yes.

2288. (*Chairman.*) Where do you belong to ?—Arbroath.

Thomas Bain examined.

2289. (*Chairman.*) What is your name ?—Thomas Bain.

2290. Your occupation ?—Seaman. I have been at sea since I was ten years old.

2291. Do you reside in Burntisland ?—Yes.

2292. Do you hold a licence from the Trinity House as a pilot ?—Yes.

2293. You say you have been at sea since you were ten years old ; how long is that ago ?—I have been at sea 59 years.

PETERHEAD.

Thomas Bain.

1 Sept. 1858.

Chairman.

2294. Have you during that time been on board of a cruiser ?—Yes, for eighteen years and a half.

2295. What vessel was it ?—*The Regent.* I have sailed on this coast, round the Shetland and Orkney Islands, and all along the east coast.

2296. You held the office of second mate ?—Yes.

2297. (*Chairman.*) Is there anything more to be added to that answer ?—No.

2298. (*Mr. Boyd.*) Do you consider yourself well acquainted with all the coast, the Orkneys, Pentland Firth, and all the east coast ?—I do so.

2299. Have you been here during this day, and heard all the evidence that has been led by seafaring people ?—Yes.

2300. Do you concur in the evidence you have heard ?—Yes, I do.

2301. Is there any part of it that you disagree with ?—No, I could not say anything of that sort.

2302. It coincides with your own opinion, does it ?—Yes, it does so.

Captain Scehwz examined.

Capt. Scehwtz,

2303. (*Chairman.*) What is your name ?—Captain Scehwz.

2304. What is your occupation ?—A shipmaster.

2305. Do you understand English ?—Very little.

2306. Captain Jopp, will you be good enough to interpret ?—Certainly.

2307. (*Mr. Boyd.*) Do you trade generally with the east coast of Scotland ?—No, not always.

2308. How long have you been a shipmaster ?—Four years.

2309. Have you been often on the east coast ?—Five or six times.

2310. Do you know the place upon the coast of Great Britain where shipmasters from Norway generally call for orders ?—It is always here at Peterhead.

(*Mr. Boyd.*) In consequence of the remark which fell from Captain Washington, I have brought here the Assistant Pilot Master and Berthing Master, Mr. Alexander Souter, to explain the loss of the vessel which was driven on shore in the bay, and I think he will give a satisfactory explanation of it.

Mr. Alexander Souter examined.

Mr. A. Souter.

2311. (*Mr. Boyd.*) Do you remember a vessel called the *Sarah*, of Liverpool, having been driven on shore on the head of the South Bay ?—Yes.

2312. Do you remember how long ago it is ?—I have not the date exactly.

2313. But about the date ?—It might be some fifteen or sixteen years ago.

2314. Do you remember the cargo ?—Wheat. She was bound from Liverpool.

2315. Will you explain the cause of her driving ?—She did not drive. The vessel lost her fore yard and some of her canvas. The dark came on. She wanted to get into the north harbour, but the pilots could not get her there. We got her up into the south bay in good anchorage, in the centre of the bay, and it was about three quarters flood, I think, when the boat came in from the ship. I asked the pilots how they had brought the ship there. The wind was about south, and the night looking very dirty. I asked the pilots, "Why didn't you bring her into the south harbour ?" "The master wouldn't come." "Well, I'll go off with you, and I'll consult with the master." I went into the boat, and went off to the ship. I think it must have been from half-past ten to eleven o'clock at night; no moon, but very dark. It was blowing hard. I went aboard the vessel, and communicated with the master. Says I, "Captain, you should slip your cable, and I will run you into the south harbour. The ship is drawing ten feet water." I ascertained the draught of water. "You will save the ship there, but I would not care much about your quarters for the night where you are." Well, he consulted a while. The wind was always blowing. "Will you come below till I speak to you ?" I went down into the cabin with the captain, and he looks at his weather glass. Then he says, "It's standing." "But," says I, "I don't care *that* for your weather glass." The pilots were calling upon me that they would leave me if I wouldn't come; so of course I bade the captain good night, and told him to take care of himself, and I went on shore. About three o'clock in the morning I heard it blowing very hard, and running. I turned out, knowing that the vessel was riding there, and I met with some people about the shore, and could see about the spot where I left the vessel riding, but I could not see the vessel herself. I think it must have been nearly about five o'clock that we discerned her bold upon the bay there. She was lying then broadside on, but fortunately she was drawing about two feet of difference of water aft, and when the tide rose she slued with her head right in, and her stern to the sea. She fayed right up to the beach.

2317. Did the vessel part from her anchors, or did she drag ?—She parted.

Mr. George Gibson examined.

Mr. G. Gibson.

2318. (*Chairman.*) What is your name ?—George Gibson.

2319. And your occupation ?—Joint collector of shore dues.

2320. (*Mr. Boyd.*) Have you been many years connected with the collection of the shore dues at Peterhead ?—I have.

2321. During much of that time have you reported, so far as you could get information, to the *Shipping Gazette* the vessels that have called here for orders ?—I have.

2322. Is there any register kept ?—No.

2323. Were you asked to consider and endeavour to remember about the number that have called at Peterhead on an average annually for orders ?—I have reported from 100 upwards.

2324. Do you know that there are many vessels get orders that you don't get the reports of ?—A great many.

2325. When you have just reported upwards of 100, might the average be fairly stated at not less than 150 in one year ?—Not less than 150, or more than that.

2326. You have, no doubt, observed the number of vessels that have taken refuge in the harbours. You know that many take refuge there ?—Oh yes.

2327. Could you tell us the largest number that you have seen at refuge there at one time ?—86.

2328. Do you remember taking a note of any vessels that had taken refuge in the harbour of Peterhead at one time bound for the north as far round as Liverpool ?—As far as I could remember 78 at one time bound from the north and west.

2329. Do you know that a great many vessels take refuge in the south bay of Peterhead ?—I do.

2330. Is there any register kept of these ships ?—None.

2331. Could you tell us the largest number that you have seen at refuge there at one time ?—I have counted 96.

2332. Riding at anchor at one time ?—Yes.

2333. Could you form any idea of the number that on an average in a year take refuge in the south bay ?—I should say upwards of 600 annually.

Mr. Boyd then said: I beg to mention to the Commissioners that the evidence which I have had the honour to bring before them is now nearly closed ; but before I do so I wish to advert to various returns that were made by Provost Anderson yesterday. Among these especially I shall advert to three returns. The first is a return of wrecks in the vicinity of Peterhead since 1816, and I wish, so far as I am able, to verify these returns. In doing so I would beg to remark that a large portion of it, from 1816 to 1822 inclusive, was made up by myself in 1823 from files of the *Aberdeen Journal*, and the purpose of making it up at that time was that there was a contest between the people of Peterhead and those of Aberdeen respecting the erection of the Buchan Ness lighthouse. The return again from 1826 to 1846 was made up by my direction and under my immediate inspection. The return from 1847 to 1856 was obtained at the Buchan Ness lighthouse from a proper list, as we were informed at the time, of wrecks there. In order to be prepared as correctly as possible for this meeting, I had these lists revised. In the first place I had the advantage of having had a register book kept by the agent of Lloyd's at Peterhead, and therewith a large list was made up of the vessels that were not included in the preceding, and that brought us down to August 1855. And during the period from November 1856 to June 1858 we are indebted for the information contained in that last to the Receiver of Wrecks at Peterhead. I may mention that the information was obtained for the information of the Commissioners, and that I believe it has been made up with the greatest care that could be bestowed upon it, that it really has been so made up, and that I believe it is accurate. The next document to which I would—

Mr. Boyd was here interrupted ; and the Commissioners having retired for consultation for several minutes, on their return.

The Chairman said. We are very happy to receive the statement which accompanied the report, which appears to have been drawn up with great labour, but we are disposed to recommend that in giving in your other papers, you should confine yourself to as brief a statement as possible of their character.

(*Mr. Boyd.*) The other paper to which I was going to request the attention of the Commissioners is an abstract of returns of vessels that have entered the harbour and south bay of Peterhead. It is necessary that I should explain there was a return made before the Select Committee, but in the returns from the Custom House were not inserted vessels which entered the harbours, loaded and unloaded cargoes, and paid harbour dues, because they were vessels employed in the export of herrings coastwise, vessels with lime cargoes, and some others, which are not required to be entered at the Custom House. There is just one other return which has been made up. An account of the loss of life at Peterhead from boats, and account of the loss of life from ships, not included in the account of wrecks. It has just occurred to me to explain, with reference to what I spoke about the wreck list, that in making up this list we discovered that information should have been obtained at Kinnard's Head as well as Buchan Ness. These are the documents which the Provost has given in, and which I presume are to be received as evidence. I believe I have nothing further to say. I presume that these returns which I have produced will be received as part of the Provost's evidence.

(*Chairman.*) Are these distinct from the documents that were tendered by the Provost ?—No ; they were all tendered by the Provost.

Then, perhaps, the more regular way will be, that they form part of the Provost's evidence ?—I only do so for the purpose of bringing them before the Commissioners in a regular and legitimate form. As to the last return of boats, I am not quite certain that that was among the Provost's papers or not.

(*Chairman.*) Recall Captains Burnett, Scott, Young, and Gray.

(*Mr. Boyd.*) Captain Young has sailed.

Captain BURNETT re-examined.

Capt. Burnett.

2334. (*Chairman.*) Did I ask you any question with reference to Longhope ?—Yes.

2335. Have you anything further to add to your evidence on that subject ?—Nothing further.

Captain SCOTT re-examined.

Capt. Scott.

2336. (*Chairman.*) Did I put any question to you with reference to Longhope ?—You did.

2337. Have you anything further that you wish to add to your evidence on that point ?—Nothing whatever.

Captain GRAY re-examined.

Capt Gray.

2338. (*Chairman.*) Did I ask you any question with reference to Longhope ?—You did.

2339. Have you anything further which you would wish to add to your evidence on that point ?—Nothing.

(*Chairman.*) If there is any witness present whom I questioned with reference to Longhope, let him stand up.

Captain BROCK re-examined.

Capt. Brock.

2340. (*Chairman.*) Is there anything further which you wish to add to your evidence with respect to Longhope ?—Nothing.

Mr. BOYD examined.

Mr. Boyd.

2341. (*Chairman*). What is your name ?—Andrew Boyd.

2342. Your occupation ?—I am a solicitor in Peterhead.

2343. You have taken charge of the case of Peterhead to-day ?—I have.

2344. Are you entirely satisfied that you have had

PETERHEAD.

Mr. Boyd.

1 Sept. 1858.

Chairman.

the opportunity afforded you of bringing forward all the evidence which you wish?—I am perfectly satisfied. I may say so, as having taken charge of the case, and as being myself one of the trustees of the harbours of Peterhead.

(*Chairman.*) Is there any other person present who wishes to tender any evidence with reference to the subject of our present inquiry?

No answer.

(*Chairman.*) The Commissioners will now close the evidence with reference to Peterhead. I believe there is a deputation from Elgin present; will you be kind enough to come forward?

Provost GRANT examined.

Provost Grant.

2345. (*Chairman.*) What is your name?—James Grant.

2346. What is your occupation?—Banker. I am also Provost of the city.

2347. What course is it you wish to pursue in tendering your evidence to the Commissioners?—The course which we wish to pursue is with a view to obtain a grant from Government to enable us to carry out the improvements which we intend making at Lossiemouth.

2348. Before you proceed to make your statement, you must permit me to remind you that the primary objects of our inquiry are national harbours of refuge; and, therefore, though we do not wish to decline to receive any evidence which may be tendered to us, as respects the eligibility of minor ports, which do not supply sites for harbours of refuge, for improvement, yet we have no reason to hold out any hopes that our recommendations on that subject will be attended to. And I have further to request that you will abstain, in any statement which you may make, from repeating any information of which we are already in possession in an official shape, in the Reports of the Committees of the House of Commons of 1857 and 1858. Will you now proceed with your statement?—The statement which I wish to make will be very short. The harbour of Lossiemouth was erected a good many years ago, principally by means of funds raised in the immediate locality from the public generally as well as from the proprietors of the surrounding district. Since its first erection, additions have been made to it from time to time; and the improvements which we now contemplate consist of a breakwater, 600 feet in length, projecting into the sea, and which, if carried out, will afford us fourteen feet at low water for a distance of several hundred feet. We have already laid out upwards of 30,000*l.* in the formation of this harbour, and we require from 20,000*l.* to 25,000*l.* additional, to complete this contemplated breakwater. We have prepared plans and estimates of the work, but we have difficulty in raising the means for carrying out the objects we have in view. We think that the contemplated improvements would be most advantageous in a local point of view, for the surrounding district and for the city of Elgin. We also believe that it would afford material accommodation and convenience to a large district of coast in that neighbourhood. From its local position, and in particular from the way in which the contemplated improvements we proposed to be carried out, we believe that fishermen or coasters overtaken by gales, coming from the north-north-east or east, could easily take the harbour; in short, that they would be running before the wind in approaching it, and from the extent of sea-room between the breakwater and the shore, they could easily enter it almost in any weather; I mean, in weather blowing severely from the north-north-east or east; that if it were erected, the lives of many who are now jeopardised would be in perfect safety, and had it been in existence for some years past, we believe that many lives which have been sacrificed, might have been saved by its means. We therefore trust that in a public point of view it is deserving of encouragement; and as we are unable ourselves to raise the means, in addition to what we have already subscribed, to complete this breakwater, we hope that it may come within the province of the duty of this Commission to recommend that a grant may be given from Government; not as a gift, but that a recommendation may emanate from this Commission, by which we may procure money at a reasonable rate of interest, and for which we are ready to pledge the existing revenue, and to pay up the principal within a reasonable time. I believe it will be unnecessary for me to say anything additional, because the subject, I think, has been treated at greater length and with more precision than I can do verbally, in written documents already lodged, and perhaps before the Commissioners.

2349. (*Capt. Washington.*) Who is engineer of the works?—Mr. Abernethy, of London. He has prepared the plans and the estimate.

2350. Are the plans deposited?—They were lodged. We believe they are in Aberdeen just now. There were plans lodged when we got the Act of Parliament for these contemplated recent improvements. You can have ready access to them in London.

Mr. GATHERER examined.

Mr. Gatherer.

2351. (*Chairman.*) What is your name?—George Gatherer.

2352. What is your occupation?—Writer or solicitor.

2353. You heard the remarks I made to the preceding witness?—Yes, and I quite concur.

2354. Will you now proceed with any statement you may wish to make, bearing in mind the remarks which I made?—I am a trustee of Lossiemouth harbour and breakwater, and have been since the present harbour was erected, about 20 years ago. I am also very intimately acquainted with this particular locality, being factor for the district, and although not a nautical man, I have taken every opportunity of examining shipmasters and seafaring men connected with the subject, and the expediency of extending the Lossiemouth harbour. I can state that the harbour is a harbour for the town of Elgin and a large and fertile district; and there is now a railway in connection with it going into the interior of the country, and is the means of developing the resources of the district very much. The harbour has proved a very profitable investment, having yielded for many years a dividend of 5 per cent. to the shareholders. Then, as to the contemplated improvements, we believe that if a breakwater was erected there, in the course of not many years—say six or ten—it would remunerate the expense of any reasonable sum, 20,000*l.* or 25,000*l.*, and that it would prove an immense advantage likewise to the fishing population, which is greatly increasing in the district. I have heard parties who are possessed of experience as seamen, and local knowledge, say that if this breakwater was made at Lossiemouth, it would be available to a district perhaps of 20 miles, from Nairn on the one hand to as far as or nearly Banff on the other. I have also heard from shipmasters, with reference to the calamity that happened last year, that if this breakwater had been erected at Lossiemouth, they believed that many of the lives then lost would have been saved. The fishing is increasing very rapidly, particularly what is called the white fishing. During the winter months, when of course severe weather more prevails, fishermen

are prevented often from going to sea, under the apprehension that during low water and a gale their lives are in danger. But were this breakwater made, which in a great measure comprehends a large portion of the bay, they could reach it under, I may say, almost any circumstances, having at low water 14 feet. With reference to the Report of the Committee of the House of Commons, and I think the 21st paragraph of that report, if it were carried out, it would supply our demands, and we would cheerfully give the per-centage there named (3 per cent.) I am not aware of any other points that I might allude to. I would refer to the evidence of Mr. Abernethy; also I should refer, with deference, to Mr. Stevenson's reports, which we have in our possession, but perhaps amongst his many employments he does not recollect us so well as those immediately interested—his reports saying that the extension of the harbour would be most advantageous at Lossiemouth, not only as a general local harbour, but as a fishing station. There is another feature, and I think a very important one. Betwixt Peterhead and Cromarty, it has been stated, there is no harbour at present. Lossiemouth is exactly midway between these two points, and at a headland well known as the Hulleman's Skerry. Vessels during easterly and north-easterly gales find a difficulty in rounding that head, and are obliged to go down and take Peterhead; they then dodge about may be for days. They have to return up the firth before they can get to Cromarty and lose as much time, whereas if they had been in Lossiemouth they could have availed themselves of the moderate weather, and saved a vast of time. There is another fact, I think, I may allude to, and I think I will be corroborated; the coasters frequenting the south side of Moray Firth, rounding Peterhead and Kinnaird's Head, and keeping the south side of the Moray Firth, are ten to one of the vessels coming from Wick to Cromarty, so that a harbour at Wick would be of no avail to us at Lossiemouth as it would be at Peterhead. We think if there were one at Lossiemouth, midway between that and Cromarty, it would subserve the interests of the district very much. I do not wish to speak of other localities, or say anything against them.

2355. (*Mr. Lindsay.*) If that harbour has proved a very profitable investment, and if, as you state, your extended harbour is likely to prove equally profitable, why do you not get the money for the completion of it in the usual channels?—For this very reason, that money is very difficult to be got just now. We made inquiry about money, and we find that money cannot be got for any harbour improvements under 10 per cent.

2356. You have told the Commissioners that you derive a dividend of 5 per cent. from the harbour?—Yes.

2357. And you want to borrow money from the Government at 3 per cent.?—Yes.

2358. That is to say, you would be receiving 5 per cent. for your money and you would be borrowing from the public purse at 3 per cent.?—No, begging your pardon. If we could get money at 3 per cent., we would save so much of our dividend. We do not say that we will have 5 per cent. of a dividend and pay the Government 3 per cent. We do hope that in the course of 10 or 15 years, with the facilities of trade, the developing of the country, and facilities afforded to the fishing, there might be 5 per cent. or 3 per cent., there might be 10 over the period, and we would be able to repay the Government, but just now we are positively retarded in our improvements from the want of money.

2359. You mean to say that you would enter into an agreement with the Government, provided they meet you on the terms you name, to the effect that individual proprietors were to derive no benefit, to the public loss, by any loan at 3 per cent. which the Government may make to you?—Certainly not. For instance, a dividend of 5 per cent. is yielded on the present expenditure of 30,000*l.* If 20,000*l.* additional were expended on the breakwater, we conceive it would partake more of a harbour of refuge for the whole district than a mere source of profit to the shareholders.

2360. Say that this new harbour also pays 5 per cent. as well as the present harbour, what would you do with the 2 per cent.?—We would propose to wipe off our debt as fast as possible with it.

2361. Yes; but you would enter into an agreement to wipe off your debt under any circumstances, and give security upon your harbour?—Decidedly.

2362. But what would you do with the 2 per cent., say that your new harbour paid you 5 per cent. as well as the old harbour, and you had borrowed money from the Government at 3 per cent?—We would necessarily out of our revenue pay the loan the sooner.

2363. Then you would pay back the money which you borrowed from the Government out of the extra 2 per cent. gained?—Oh yes; it is out of the revenue, as I understand the 21st section of that report, that the 3 per cent. is to be taken, to extend over a period of 50 years, but we would be able to pay it sooner.

2364. Then all you would consider that you were in duty bound to pay to the Government would be 20,000*l.*, with the interest upon it of 3 per cent. per annum during the time that you were in debt to the Government; is that your answer?—We would take it on any such terms, but it would depend on the details of agreement. I think that is the construction to be put on the 21st paragraph, to say that money should be lent by Government on the same as the drainage principle.

2365. That is not the question. I merely wanted to know from you if I put a right construction on the proposal you make for a loan from Government?—I wish it to be distinctly understood that it is not the object of this application to remunerate the present shareholders of the harbour. I may mention the fact that the shareholders, instead of paying money out of capital, paid no dividend; we added it to the improvements of the harbour. Our real object is to carry out this improvement, and satisfy the necessity of a very important district.

2366. Then, I suppose, if the shareholders were not getting it in the shape of interest, you would be getting it in the shape of increased stock?—It might have that effect.

2367. (*Chairman.*) Have you anything further to add to your statement?—No. There were two witnesses in the room, Mr. Mackenzie and Captain Shand, harbour-master at Lossiemouth, whom we intended, if agreeable to the Commissioners, to adduce in support of the statements we have already made, and the petition to the House of Commons from the town of Elgin, but I think from the statements now given it may be rendered unnecessary.

(*Chairman.*) As you have been good enough to attend here as a deputation to state your views on the subject of a harbour at Lossiemouth, and as we naturally feel that at this late hour of the evening you may be indisposed to produce evidence at any great length, we wish you to understand that we shall be happy to receive any written statements or plans with reference to the plans for a harbour at Lossiemouth which you may think proper to forward to our secretary.

(*Provost Grant.*) I am much obliged to you.

2367a. (*Chairman.*) Is there any person present who wishes to tender further evidence with respect to this inquiry?

No answer.

Sittings at Peterhead closed.

ABERDEEN.

Thursday, 2d September 1858.

PRESENT :

Admiral HOPE (Chairman).

Sir FREDERIC SMITH.
Mr. LINDSAY.
Captain WASHINGTON.
Captain VETCH.
Mr. COODE.
Mr. SEWELL, Secretary.

ABERDEEN. 2 Sept. 1858.

(*Sir John Stuart Forbes, of Fettercairn.*) I addressed a memorial to Mr. Calver, enclosing certain documents, at Peterhead; but as, from Mr. Calver's indisposition, they have not been received, I now lay them before the Commissioners. The memorial is addressed to the Commissioners by the landowners of Kincardine.

(*Chairman.*) The case of Stonehaven will be taken up subsequently to that of Aberdeen, and in the meantime it will be sufficient to lodge the memorial in the hands of the secretary.

(*Mr. Burnett*, Secretary to the Trustees of the Harbour of Montrose.) I put in extracts from the reports of Sir John Rennie, Mr. Robert Stevenson, and Mr. James Walker, relative to Montrose harbour.

Do you wish to follow up that memorial by any statement at a later stage of the proceedings?—We do.

(*Lord Provost.*) I have to make a very short statement in my own behalf in respect of the Commission. It would have been my desire, or it would have been in ordinary circumstances my duty, from respect to the Commission and to the importance of its objects, to have attended upon your deliberations during the whole course of your sitting. I believe, however, the Commissioners are already aware that any more unfortunate day could not have been selected than what they have thought proper to fix upon in the case of Aberdeen, where the great national meeting of the Highland Society takes place to-day, which entirely engrosses almost every one, and where, from the great numbers assembled, and the possibility at least of any misadventure happening, I find that my own attendance is required, in particular with reference to some of the arrangements for the evening. And I have been the more confirmed in my conviction that the interests of the proposed inquiry will not in the least suffer from my necessary absence, because the Harbour Board and the Town Council had a meeting on Thursday, and appointed a committee of their members, with Mr. Nicol as chairman, to conduct the case on behalf of Aberdeen. Mr. Nicol will be prepared to furnish a list of the witnesses who are proposed to be examined, and state generally the case of Aberdeen, which is in brief that there is no one point upon the north-east coast of Scotland where it would be a judicious expenditure of public money to lay it out in making one great national harbour of refuge, but that if any public money is to be expended on this coast, it would be better done by giving it in the way of relief and aid or otherwise to the existing harbours for their improvement. I hope, in these circumstances, the Commissioners will not think it any disrespect if I am reluctantly obliged to leave the meeting, which I would have otherwise such a pleasure in joining.

Before we came here we were perfectly aware of the circumstances in which you are placed, and we have to express our obligation to you for having given us the advantage of your presence at the commencement of our proceedings.

Mr. NICOL examined.

Mr. Nicol.

2368. (*Chairman.*) What is your name?—Alexander Nicol.

2369. What is your occupation?—Merchant, shipowner, and underwriter.

2370. Do you wish to make any statement on the subject of the present inquiry?—I wish to make a short statement. Simply a statement in some measure of what the Provost has now mentioned.

2371. Proceed with your statement.—I have in the first place to express regret that so many of our shipowners and shipmasters are just now from home, and otherwise engaged to-day, otherwise several of them would have been present who cannot be, and especially a shipmaster whose evidence I consider to be of great importance in determining as to the site of the harbour of refuge at all. We have very few of them here in Aberdeen at present. What there are I have endeavoured to get to be present here, to give their evidence on the subject, so as to corroborate what the Provost has now stated, that the shipowners here generally do not think that a very large harbour of refuge on this coast is absolutely necessary, or that it is the best way for Government to provide a remedy for the losses of vessels and losses of boats on this coast. I have endeavoured to glance at the evidence laid before the Committee of the House of Commons, with regard to Wick, Peterhead, and Fraserburgh. In regard to a harbour of refuge at Wick, it occurs to me that it would be more suited and more necessary for the fishing boats belonging to that coast than to the trade in such a port as Aberdeen, and I would wish, in making this remark, and bringing evidence before the Commissioners, that it might be looked to more as the trade of the country generally in large sailing vessels than as to anything connected with the fishing boats of this coast. There are three different localities where ships proceed to from this place that might be benefitted by harbours of refuge if we thought them necessary, that is, our American ships, our Archangel vessels, and the Baltic vessels. Now, we find that these vessels in coming to or going from the port of Aberdeen, if they are taken with an easterly gale when off any of these points, such as Wick or Peterhead, have the Cromarty Firth open to them on the one hand and the Firth of Forth on the other; that if they cannot go to a harbour of refuge at Peterhead if the wind is south-east, they might be driven out of the Moray Firth and reach Cromarty, and on the other hand they can go to the Firth of Forth. That seems to be the general evidence of the shipmasters and the general feeling amongst the practical shipping men belonging to this place. Therefore they come to the conclusion that a large harbour of refuge at either of these places indicated is not the best way for Government to lay out its money. But if Government is to make one large harbour of refuge it should be more to the south of Peterhead than any other place, somewhere between the Firth of Forth and Peterhead. It is there generally where vessels are taken at a disadvantage in a south-east gale, because if they reach Peterhead they are quite safe with the Firth on the one hand, and if they cannot reach it, they must necessarily either go ashore or go to the South Firth. Then with regard to Aberdeen as a port of itself, as to the

engineering part, we have Mr. Abernethy here, who has finished our large docks, and he will give evidence with regard to its capabilities, providing it was to be enlarged, which we are of opinion it should be, although from the large sum of money we have already laid out upon it and the high dues that we have necessarily placed upon the shipping, the trade of the place will not stand higher rates. I think I will now place before you the number of vessels that have taken shelter here during the last 10 years. This is a statement of the number and registered tonnage of vessels entering the harbour for safety from 1848 to 1857 inclusive, and I beg to give it in as evidence. This next document is a statement of the revenue of the harbour and of the debt at present, which I also beg to lodge, as well as the following documents. An abstract of the number and tonnage of arrivals at the port of Aberdeen for the years 1839, 1849, and 1857; an abstract of the number and tonnage of vessels belonging to the port of Aberdeen for the years 1839, 1849, and 1857; and a statement of the number of vessels wrecked at or near the entrance to the harbour in each year from 1846 to 1858. I think that is chiefly what I have to say.

2372. You have nothing further that you wish to say?—No.

2373. How long have you been connected with the port of Aberdeen?—I have been in business as a merchant here for 25 years.

2374. I think you are mentioned as an underwriter and shipowner?—Yes.

2375. Will you describe to me generally the character of the ships which leave the port of Aberdeen, and which are engaged in the foreign trade?—We have in the first instance a class of large vessels belonging to Aberdeen, built here, and what we consider a fine description of ships. These chiefly are engaged in trades from London, Liverpool, and other large places, and after being built here, and leaving the port, it is seldom that they return. And, in the second place, we have a class of very fine clipper brigs and schooners engaged in the Baltic trade, Archangel trade, and general and coasting trades. These vessels are constantly going from and coming to Aberdeen, and we consider them a very fine class of ships,—such ships as we shipowners cannot be disappointed with,—for they require to run almost to no harbour of refuge. I may state that I managed for three or four years four of the first clippers that ever were built at Aberdeen, and which are called now the Aberdeen clippers. They traded to London during these four years, and I do not think these vessels ever sought any harbour of refuge between London and Aberdeen above three or four times.

2376. Will you describe to me the character of the coasting trade which sails out of the port of Aberdeen?—Generally they are getting into that same class of ships as the old ones are lost. The coasters generally are a very good class of ships. There are some of them indifferent ships, and not of such a good build as those now built in the port, but they are now getting very few in number, as the clippers I have described to you carry our coals now, in a great measure, and lime and stones, and other goods of that description.

2377. You have stated that there are ships which sail in the American trade from the port of Aberdeen?—Yes.

2378. Do such ships take the passage north about?—Yes, always.

2379-81. Amongst the list of witnesses before me are there any captains who have commanded vessels in that particular trade?—There is one, and he is present.

2382. Amongst these witnesses are there any captains who have sailed in the Baltic trade?—Unfortunately, no; I have endeavoured to find them, but they are not in the harbour at present. They were chief masters in that trade.

2383. Could you procure the evidence of two or three captains who have sailed in the Baltic trade, and who having retired, may perhaps be resident at Aberdeen?—Yes, I can give you three.

2384. Will you be good enough to send for them?—Yes.

2385. (*Mr. Lindsay.*) You have expressed an opinion, that if there is to be a great national harbour of refuge on the north-east of Scotland, it ought to be somewhere between Peterhead and the Firth of Forth. Now, considering your experience, I would like to know from you if there is any particular part of the coast where you think such a harbour could be made?—I have had my attention directed to Aberdeen. We have had the idea that a harbour of refuge could be made here suitable for this locality. I cannot say that I have studied the subject so much as to go from home to know about the places in any part, particularly in the south. I can only speak as to Aberdeen.

2386. Has any gentleman made examinations so as to be able to speak as to the suitability of Aberdeen for a national harbour of refuge?—Yes, Mr. Abernethy.

2387. (*Capt. Vetch.*) Has it ever occurred to your views of the subject in connection with the proposed Government aid for the improvement of harbours, that it should be better to grant some of the money to various harbours, and give them local improvement, rather than to construct a new and a large harbour?—Yes, I am certainly of that opinion.

Mr. George Thompson examined.

2388. (*Chairman.*) What is your name?—George Thompson, junior.

2389. What is your occupation?—Shipowner and merchant.

2390. How long have you been connected with the port of Aberdeen?—40 years.

2391. To what parts of the world have the vessels traded in which you have been chiefly interested?—To all parts of the world.

2392. Have you at present any vessels trading to the Baltic?—None at present. I have interests indirectly. Some of our local companies have their vessels in the Baltic. This class of vessels now are larger than those which go to that particular quarter of the world.

2393. Have you any in the American trade?—Yes.

2394. And these vessels go north about?—Yes.

2395. Have you as a shipowner any desire for a harbour of refuge to the north of Aberdeen, with a view to the safety of your vessels which trade to America?—I am of opinion that a large harbour of refuge as contemplated by the Select Committee is not necessary upon this coast, in the district indicated between the Pentland Firth and the Firth of Forth. I feel diffidence in expressing this opinion, seeing it is so very opposite to a great mass of evidence which I find in the reports recently published; but still, having the opinion strongly, I wish fairly to give it before the Commissioners. And the reasons I should give are these: If a vessel or vessels are caught with a gale of wind on the east coast, she has, if the wind is from the south, the Moray Firth to run to. If it is a gale from the north, she has the Firth of Forth to run to, both natural and excellent harbours of refuge. And there is therefore really no necessity for expending a large sum of public money for a harbour of refuge in the district to which your inquiry presently extends. That appears to me very palpable from my own observation and experience over a long period of years; and also, I think, by glancing at the wreck chart which is at the end of one of these reports, you will find how very few wrecks there are in this district, the numbers being exceedingly few in com-

ABERDEEN.

Mr. G. Thompson.

2 Sept. 1858.

Chairman.

parison to those other districts of coast in the United Kingdom, for which undoubtedly harbours of refuge are in many places very necessary. I may go on further to state, that if a large sum of public money is to be expended it would, in my opinion, be much more profitably expended and realize more entirely the views of the Legislature, which are to save life and property—it would, I say, tend more effectually to secure this desirable end if it were expended in improving the existing harbours within the district, which is now under our notice. I may further state that if other views prevail, as in all probability they will, that a harbour of refuge of an imperial kind should be placed in this district, then I should hold decidedly that Aberdeen is better entitled, from its local position, from the amount of its trade, from the great facilities which it would afford for repairing vessels coming in in distress, and from a variety of other circumstances, that it is imperatively more necessary that the harbour should be placed in one locality, although I think again, as I said, that I see no occasion whatever; but in the event of its being determined that public money is to be expended, assuredly Aberdeen should be the spot.

2396. You have stated to the Commissioners very clearly your opinion on the subject of harbours of refuge, viewing them in the light of the means of saving life and property, as I understand, from stress of weather?—Yes.

2397. Will you state to the Commissioners how you view the question, if you have ever considered it, of harbours of refuge as ports into which vessels may go for the purpose of saving themselves from the wear and tear which their thrashing about at sea with a foul wind, in bad weather, entails upon them?—I should think the Government of this country would never contemplate the idea of placing or constructing a harbour of refuge upon any coast for the mere purpose of saving the wear and tear which a vessel under canvas would have to sustain, by having to run back 50 or 60 miles where she would have a national harbour of refuge. It would be a preposterous expenditure of public money. It would only be a very trifling saving of the small distance the vessel had to run.

2398. What importance are you disposed to attach to the loss of time which would be entailed by a vessel running back, as you have stated, some 50 or 60 miles to leeward?—In a voyage to America it is not of very great importance, or a voyage to Archangel, or even a voyage to the Baltic, because we do not expect a vessel to arrive at her time as a steam-boat does, or at any specific hour of the day; and I state generally that a slight detention of a day or two upon an American voyage, or even a week or two, is not reckoned of any great importance.

2399. How should you be disposed to view the question of those harbours of refuge as bearing upon that feeling of honour which a captain in the command of a large ship would naturally feel in keeping the sea, and endeavouring to make his passage good in bad weather?—Perhaps the question is not altogether clear.

2400. I imagine that if one of your captains came to you and said that he had put into a harbour of refuge, having encountered a very strong foul wind, you would hardly be disposed to hold him in the same estimation as a seaman and as the commander of a ship, as one who came to you and stated that he had kept the sea with the view of endeavouring to make his passage?—That, of course, would depend upon my estimate of the captain's judgment. I should say that it would be much better to put into a harbour of refuge than to encounter the loss of the vessel. But assuredly, if he was a man of judgment, as he ought to be, he would know whether he could go on his voyage or not, and therefore if he had gone into a harbour of refuge when he should have gone on his voyage, I should have censured him, unless it had been a matter of absolute necessity that he should have done so. I should rather have my vessel in a harbour of refuge than be lost for a want of judgment in a master not taking it when it was essentially necessary to do so.

2401. (*Mr. Lindsay.*) I have a very great respect for your opinion upon all shipping questions, and I would like to have your ideas as to what constitutes a national harbour of refuge. Do you understand a national harbour of refuge to mean a harbour, which ships of all sizes can take at any time of the tide, and there anchor in safety from the prevailing winds which blow upon that particular coast?—Certainly.

2402. Well then, if that is your opinion, from your own knowledge of Aberdeen, do you think that Aberdeen could be converted into such an harbour?—I have been told by eminent men, engineers, that it could. Of course this engineering question is not one that I feel competent to answer, but I think that Mr. Abernethy, who was resident engineer at Aberdeen for many years, can give his evidence on that point, and, if I mistake not, but I may mistake, I think that Captain Washington, a member of the present Commission, was of that opinion, but I may be mistaken. I am referring to a period of eight or ten years ago, when some inquiry was instituted here.

2043. You are a large underwriter, Mr. Thompson? Yes.

2404. Do you make any difference in the premium of insurance for ships bound to America going through the Pentland Firth?—None whatever.

2405. Do you, as an underwriter, and as one deeply interested in shipping, as a shipowner, consider the passage of the Pentland Firth a dangerous passage for ships to take?—Dangerous, assuredly, to those not acquainted with it, but by our men on this coast, and those who are acquainted with it, it is not deemed extremely dangerous.

2406. Do you remember having had to pay, as an underwriter, any losses upon ships which suffered damage or were lost in going through the Pentland Firth, or in entering any of the natural harbours of refuge amongst the Orkney Islands?—I have once or twice, over a period of 30 or 40 years.

2407. And now, say that the Government considered it advisable to have one national harbour of refuge to the north of Aberdeen, which point would you consider—Peterhead, Wick, or Fraserburgh—best for the construction of a national harbour of refuge?—I should give my opinion again with great submission, that I consider no harbour of refuge necessary, for the reasons I have already given, and that if a large sum of money is to be expended, a harbour of refuge could be made at Aberdeen, which would be better fitted for the east coast generally than at either ports you mention. Peterhead is a salient point of the coast. When a vessel is caught in a gale of wind there she has no difficulty whatever; she has either to run to the right hand or to the left. But caught opposite Aberdeen, with a gale from the north, it is rather different. I hold that Aberdeen, as equidistant between the Pentland Firth and the Firth of Forth, is a better point for a sum of money to be expended, in my view, as a shipowner, than either Wick, Peterhead, or Fraserburgh.

2408. But though exceedingly glad to have your opinion on these general points—for it is an opinion which I, for one, very much respect—yet at the same time, should the Government arrive at the conclusion that it is advisable to have a harbour of refuge to the northward of Aberdeen, which of these three points that I have named would you consider the best?—It would appear to have a double object in regard to Wick, to protect the herring fishery, which I think is essentially necessary. The Board of Fisheries are prepared to lay out 40,000*l.* or 50,000*l.* for the improvement of Wick harbour, specially for the protection of the herring fishery, which is a most desirable object, and I believe that is only kept in abeyance till they know what course of action the Government is to take, if I mistake not.

2409. Do you know much of Wick; that is to say, the bay of Wick?—I know very little of it.

2410. Then I will not trouble you upon that ques-

tion, as to whether you think Wick is suitable for a great harbour of refuge or not; but I may ask you one thing. You say that vessels caught with a gale of wind near to Peterhead, bound north, have the Moray Firth to run for?—Bound south, if they were caught in a gale from the east, they have the Moray Firth to run for.

2411. But it is somewhere about 95 miles from the Pentland Firth to Cromarty?—But it does not follow that the vessel will be exactly on the point of the Pentland Firth. There is a great deal of intervening distance, and, as I have already remarked, it is nothing for a vessel to run back a matter of 50 or 60 miles. To run for a national harbour it is not sufficient for the sake of doing this to save a sailing vessel running back a few miles to a safe harbour, when the erection of such a harbour would undoubtedly entail an additional taxation on shipping.

2412. But the distance from the point of Peterhead to Cromarty Firth is 95 miles, consequently the distance a ship would have to run could not be less than that, and it might be a great deal more if she was caught with a south-east gale 30 miles off the coast. She would then have 125 miles to run. Besides, Cromarty Firth has been described to us as an awkward place for a ship to run for, on account of the variable winds which prevail in the bight of the bay, and the difficulty of ships getting out of it. Have you from your experience felt that?—Quite the reverse. It is a well known fact that all our vessels do run for it. You will see 50, 60, or 100 vessels wind bound at Cromarty at any time. They get to it quite easily and leave it quite easily. I have never heard of any difficulty. I may just mention the fact that at last fall, one of our largest Aberdeen vessels, called the *City of Quebec*, was obliged to take refuge in the Cromarty Firth, when she came back to the south, and had to be there till she came to Aberdeen. The *City of Quebec* is a vessel of 600 tons.

2413. You said you were decidedly of opinion that though a great harbour of refuge was not necessary on the north-east coast of Scotland, there were other places where national harbours of refuge ought to be made; could you name the places?—For instance there is the Tees harbour, Hartlepool, in the direction where I should think it very necessary, because the amount of traffic on this district of coast from the Pentland Firth to the Firth of Forth, is very little in comparison with the great traffic that there is round the coast of England and the west coast; and I again refer to the wreck chart as evidence on these points; and I say again, my opinion is that the estimate for Peterhead, which is 335,000*l*., —very likely to end in double that sum, or perhaps a million, if it is gone into with proper spirit—I say that that money would be infinitely better expended by the Government, because it would more effectually realise the great object in view, namely, the saving of lives and property, if it were expended in the improvement of the existing harbours, so as to put them in a position that vessels could run to them at all states of the tide.

2414. Then it is your opinion that life and property would be better protected if the sum you named, 330,000*l*. for the north-east coast of Scotland, were spread over the various harbours along that line of coast, so as to improve those harbours and make them accessible to the vessels generally frequenting that particular part of the coast, at all times of the tide and in all gales of wind?—Decidedly; because I look on this district of coast from the Pentland Firth to the Firth of Forth to be exceptional to the state of the other parts of this country, having really excellent natural harbours of its own—the Moray Firth and the South Firth, and having such a comparatively small number of vessels upon these shores that it is rather exceptional to the general question of harbours of refuge in the other parts of the country which are much more frequented by vessels, and where the trade is to a much larger extent.

2415. (*Capt. Vetch.*) I think you mentioned that a good many vessels have traded to America?—Yes, a few.

2416. Will you tell me what part of the voyage between this and America you consider most difficult and dangerous?—There are two places, the Gulf of St. Lawrence and the Pentland Firth. Perhaps some shipmasters who may be brought upon evidence may be better qualified to answer that question; but still that is my opinion of the matter.

2417. (*Chairman.*) I think you stated in a former part of your evidence, that though of opinion that a national harbour of refuge is not required on the north-east coast of Scotland, you are of opinion that it is required on the east coast of England?—Yes.

2418. Have you formed any decided opinion as to the exact locality which would be desirable for such a harbour of refuge?—I should not like to speak with confidence on that point, although I think the neighbourhood of the Tees, or something in that direction, might be a proper place, but not having directed my attention strictly to the subject, I should be very unwilling to express anything like a very confident opinion. Parties in the locality will be much better able than I could possibly be to offer an opinion of value upon that subject.

2419. It is perfectly true that in one sense parties residing in that part of the coast may be able to afford an opinion of greater value; but I should be disposed to attach very great value to your opinion on that subject, who must naturally be totally free from all bias arising from being resident in that part of the country. And therefore, if on reconsideration you feel disposed to offer an opinion on the subject, I shall consider it of value to the Commissioners.—I should not wish to give a very emphatic opinion as to any precise locality, but that a harbour of refuge of a national kind would be desirable on the east coast of England between the Fern Isles and Flamborough Head, there can be no doubt.

2420. Have you read the Report of the Committee of the House of Commons on that subject?—I have glanced at the Report, but more particularly to that part of it relative to our own locality.

2421. It will probably be in your recollection that the Committee have divided their report into several sections, in which they discuss the question as it relates to different districts on the coast of Great Britain and Ireland?—Yes, I have observed that the report is so divided.

2422. Would you give the Commissioners the advantage of your opinion as to the necessity of national harbours of refuge in any other districts besides that to which you have already alluded on the east coast of England?—I feel great diffidence in offering an opinion upon that point, but from the immense amount of property and life invariably exposed to danger upon the east coast of England, and the west coast, and all in that direction, I should think it extremely desirable to have such harbours where they would be favourably situated for refuge to vessels in distress.

2423. (*Mr. Coode.*) Were you residing in Aberdeen in 1852?—Partly in Aberdeen, partly in London.

2424. Do you remember a number of vessels being driven here from the east coast of England in the month of December 1852 in a gale?—I have a faint recollection of that being the case.

2425. Is your recollection pretty distinct?—Not pretty distinct; but I have some recollection of the circumstance you refer to.

2426. Do you think there were as many as 60 vessels being driven?—Yes, I recollect our harbour being pretty full of vessels windbound at that period.

2427. Do you know what point they had reached when they were driven back?—I cannot exactly say; some point, in all probability, between Newcastle and London. It was a great fleet of colliers, I think, chiefly which were driven on our shore at that time.

ABERDEEN.

Mr. W. Hogarth.

2 Sept. 1858.

Mr. WILLIAM HOGARTH examined.

2428. (*Chairman.*) What is your name ?—William Hogarth.

2429. What is your occupation ?—Merchant and salmon fisher.

2430. How long have you been connected with the port of Aberdeen ?—I have been in business since 1821.

2431. In what trades are the vessels chiefly employed in which you are interested ?—In carrying salmon from all the north ports of Scotland to London till within the last four or five years, when the railways and steamers have taken the place of sailing vessels.

2432. Then at present you have no pecuniary interest in shipping ?—Yes, I have vessels trading from the west coast of Scotland just now to Aberdeen.

2433. And these vessels necessarily go north about ?—Always.

2434. What sized vessels, generally speaking ?—Cutters of 20 to 70 tons.

2435. Are you desirous of a harbour of refuge to the north of Aberdeen for your vessels ?—No ; for the reason that perishable cargo is strictly forbidden to go into any port on the voyage. The master would be dismissed for doing so. He is obliged to keep the sea.

2436. Have you formed any opinion with respect to the necessity of such a harbour for vessels which are not engaged like yours in carrying perishable cargo ?—It depends on what part of the coast you mean to apply it to.

2437. To the coast between Aberdeen and the entrance to the Pentland Firth ?—I know the coast intimately, and I do not see any necessity for a harbour of refuge. Cromarty is a sufficient harbour of refuge.

2438. Do the masters of your vessels entertain any apprehension of navigating the Pentland Firth in bad weather ?—I can speak for myself only. I am an old yachtsman, and have been at the sea for the last fourteen years. I have been twice round the island. I entertain no apprehension, and would not put myself out of the way of it.

2439. You are aware of the strong tides which exist in the Pentland Firth ?—Perfectly.

2440. Do you consider them to be any difficulty in navigating the Pentland Firth ?—Yes ; if they are against you.

2441. And as respects endangering the safety of your vessels in heavy weather from the south-east, how do you view them then ?—I would not come through the firth then, I would go into Longhope or Widewall, or some of the other fine anchorages in the Orkneys.

2442. But with a heavy gale from the south-east, and a flood tide, how could you reach Longhope ?—I am presuming that I am to the westward of the Firth when I answer the question. I would lay the vessel to if I were on the east side, and wait till the tide turned.

2443. You have been in the anchorage of Longhope ?—I have been in it many a time.

2444. What is your opinion of its facility of access ?—It is much improved now by the lighthouse which is placed upon it. A vessel can take it now with more ease.

2445. You stated you were considerably experienced as a yachtsman ; what would be your opinion of the captain of any merchant ship who, having a chart of that description (*showing the Admiralty Chart, No.* 2581, *of Longhope*), told you that never having been previously at the anchorage of Longhope he was afraid to run into it by that chart ?—He has no occasion to be afraid of it if he has his chart. It is the easiest taken port I know. The ground is clean on both sides, and there is no risk at all.

2446. Have you ever known ships in strong north-west gales to drive out of the anchorage of Longhope ?—I have known of ships' anchors fouling by the quantity of weed in it. They did not give them chain enough when they dropped the anchor. It depended on the carelessness of the master if he dragged. If he gave chain enough there would be no fear of the ship driving.

2447. Is it of frequent occurrence, vessels driving out of the anchorage of Longhope in bad weather, to the best of your knowledge ?—To the best of my knowledge it is not of frequent occurrence.

2448. Do you consider that the anchorage of Longhope and the others in the Orkney Islands supersede the necessity of any harbour of refuge at Wick for the passing trade ?—I do. Ackergill Bay is the finest anchorage near to Wick. No vessel would think of coming near Wick unless the wind is only one point of the compass. That is the nearest anchorage to Wick. Then we have the Pentland Firth, a fair wind if they are going to the westward. Ackergill Bay is a beautiful anchorage.

2449. Have you ever been at Wick during the fishing season ?—Oh yes. I fish the bay of Wick for salmon as a business, so that I know it very well.

2450. What is your opinion as to the necessity of a harbour of refuge for the very large number of herring boats which resort to the bay of Wick during the fishing season ?—It would be of great advantage to the herring fishing ; there is no question about that.

2451. (*Capt. Vetch.*) I think your trade is at present in vessels from the West of Scotland to Aberdeen ?—Yes.

2452. Do you find that the Orkney Islands are rather peculiarly stormy at certain seasons of the year ?—I think the Orkney Islands are an excellent place for ships to take shelter.

2453. I speak not of the islands but of the weather in that part ?—No ; I do not think it is a bad climate.

2454. Not worse than other parts ?—No.

2455. Then would you tell me what, in your voyages from the west coast through the Pentland Firth to Aberdeen, did you consider the most dangerous part of the navigation in stormy weather ?—I did not like Cape Wrath very much. We are a long way from any roadstead on both sides of the Cape. There are very strong tides on the Heads, and no anchorage near it on both sides.

2456. You are aware that there are tides from nine to ten knots an hour running through Pentland Firth ?—I know it for a fact.

2457. You do not consider that circumstance would be any difficulty in stormy weather ?—No, because a vessel need not go through the Firth unless she please. They may go into any of the roadsteads in the Orkneys if they do not choose to go to the westward.

2458. But still they would be prevented going through ?—Oh yes.

2459. They could not always take it ?—If it were blowing heavy from the westward, that moment you get to the Island of Stroma you meet a very heavy sea from the westward. The vessel could not proceed westward, of course, from the wind. Therefore she would take the shelter of Longhope till the wind changed.

2460. Still, the circumstance of the tide running at that rate is a difficulty, and under these circumstances might create great danger ?—If the weather was bad the vessel does not pass to the windward among the islands, but passes to the leeward and into Longhope.

2461. It would require a person well acquainted with the navigation to avoid these rocks ?—If the master does not know the rocks there the tides of the Pentland Firth will carry him clear of everything. No man that has been once through the Pentland Firth requires to take a pilot again. His tide table is a sufficient guide for him.

Mr. HENRY ADAMSON examined.

2462. (*Chairman.*) What is your name?—Henry Adamson.

2463. And your occupation?—Shipowner and underwriter.

2464. How long have you been connected in these capacities with the port of Aberdeen?—As a shipowner I have been for the last 30 years, and as an underwriter for the last 18 years.

2465. In what trades are the vessels chiefly engaged in which you are at present interested?—In India, Australia, and South America.

2466. Do any of the vessels in which you are interested take the passage north about?—My vessels invariably go south about.

2467. Do they sail out of the port of Aberdeen?—The vessels that I built here, in Aberdeen, generally go from this to London or Liverpool, and very seldom return again, except when they require repairs, when they are brought back to Aberdeen for that purpose.

2468. Have you ever had an interest in vessels trading to the Baltic or to North America?—I had, in the early period, when I commenced ship-owning, vessels in the Baltic, but never any in the North American trade.

2469. Have you turned your attention to the subject of the present inquiry?—Yes, I have given it a little consideration.

2470. Will you state to the Commissioners what your opinions are with respect to a national harbour of refuge on the north-east coast of Scotland?—I am very much of the same opinion as has been stated before the Commissioners on this occasion, that we do not stand in want of a national harbour of refuge here very much, in so far as now we have a very different class of vessels from what we had formerly. Vessels that are able to keep off the shore when overtaken by a heavy gale of wind; and in the second place, our coast is so much better lighted up now, whereby I think, to a certain extent, a national harbour of refuge on the east coast of Scotland might be considered superseded, keeping in view that we have a very safe roadstead in Cromarty, where our vessels, in very bad weather, can run to, and also the Firth of Forth, and they are both perfectly safe.

2471. Do you attach any importance to the difficulties of navigation attendant on the tides in the Pentland Firth?—I am not certainly so very conversant with that. I never had my shipping sailing in that direction, but I am led to understand that the tides run through rapidly and that there is a danger to a certain extent, more particularly to shipmasters who are not so very well acquainted with the navigation of it. They consider it rather a difficult passage to make, although at the same time it is not the opinion of our nautical men, masters of vessels here, that the passage is by any means difficult. They would take it, in my opinion, sooner than they would go south about and down the English Channel.

2472. Have you ever underwritten vessels going north about?—Yes, to America frequently, from round to Ireland and Liverpool—all directions.

2473. Have you been in the habit of requiring any extra premium on ships that you have underwritten which pass through the Pentland Firth?—No, never.

2474. Have you ever had to pay upon losses incurred by wrecks or other accidents to vessels which you have insured passing through the Pentland Firth?—I have not; but my memory does not serve me to remember, never having paid a single loss of vessel passing through the Pentland Firth.

2475. Are you acquainted with Wick?—I know a little of it, having gone down by the steamer.

2476. (*Sir Frederic Smith.*) As an underwriter, would you be disposed to diminish the premium on vessels going north about, if a harbour of refuge were made either at Peterhead, Fraserburgh, or Wick?—I certainly would not.

2477. Would you be disposed to diminish the premium, if a harbour of refuge were made on the north-east coast of Scotland, to vessels coming south about?—No.

2478. In neither case?—In neither case.

2479. Do you know enough of Peterhead and Fraserburgh to be able to give an opinion as to the relative merits of those two places for a large harbour?—I do not think either of them, in my opinion, are suitable for a harbour of refuge at all.

2480. Neither the one nor the other?—Neither the one nor the other.

2481. (*Mr. Lindsay.*) As a large underwriter, would you reduce your premium in any way on vessels trading between London and Aberdeen, or on vessels from London going to the Baltic ports, or going to Archangel, if there were a harbour of refuge situated somewhere between Flamborough Head and the Fern Islands?—If it was the winter season of the year, I would make a little difference certainly.

2482. (*Chairman.*) Have you formed any opinion as to the proper site for a harbour of refuge on the east coast of England?—No, my attention was more directed to the east coast of Scotland, between the Firth of Forth and the Pentland Firth; and I think, if it should be resolved upon to have a harbour of refuge, I consider that Aberdeen is the most centrical point between the two, and it is here where it ought to be.

2483. I think you have stated, in a former part of your evidence, that you consider Peterhead and Fraserburgh to be both unfit sites for a national harbour of refuge?—Yes.

2484. Will you be good enough to state you reasons why for each place?—The distance, in the first place, between Peterhead and Fraserburgh is very little, and in the second place, when a vessel once gets as far as the Buchan Ness, she must be a very bad found ship indeed if she cannot reach the Moray Firth so as to take her up to Cromarty. And then, again, if the vessels are taken so as they come lee around, they can then reach the Firth of Forth upon the other hand. These are my views and opinions with regard to both these harbours.

Captain LESLIE examined.

2485. (*Chairman.*) What is your name?—George Leslie.

2486. What is your occupation?—Shipowner now, but lately shipmaster.

2487. How long have you been a shipowner?—About 40 years.

2488. How long were you at sea as a captain of a vessel?—I commanded a vessel for upwards of 20 years.

2489. When you commanded a vessel, in what trade were your vessels chiefly employed?—Sometimes in the Baltic, Mediterranean, but coasting particularly.

2490. Where were your coasting voyages chiefly to?—On the east coast betwixt this and London. *Capt. Leslie.*

2491. And on the north coast, from Aberdeen to where?—Through the Pentland Firth to Inverness, Cromarty, and so on.

2492. State your opinion as to the difficulties of the navigation of the Pentland Firth or otherwise?—I think Mr. Hogarth described that pretty clearly, perhaps fully better than I could do, because I have not passed through these 40 years. I think what he said is evident, and it is pretty clear that I could not say anything to give more light upon it.

2493. When you commanded a ship to the Baltic,

ABERDEEN.

Capt. Leslie.

2 Sept. 1858.

Chairman.

did you ever return home late in the year?—Sometimes.

2494. About what time of the year?—In October and November.

2495. What are the prevalent winds in the North Sea at that period of the year?—They prevail principally from the north and north-east.

2496. A fair wind, I presume, across from the Naze to Aberdeen?—Yes.

2497. Would you therefore be disposed to say that ships returning from the Baltic in the fall of the year generally bring a fair wind across with them?—They generally do. The gales are in the fall of the year, when they prevail from the west, and are such that the vessels cannot leave the Sound, and they must wait for a fair wind in the fall of the year. They cannot go with a westerly wind.

2498. In coming across from the Baltic, is there any particular part of the coast which you prefer making in preference to the rest?—It would entirely depend upon the state of the wind. If the wind were hanging from the north, I should try to make the Buchan Ness, and from the south, as near Aberdeen as possible, having such a good light as at the Girdleness Lighthouse—a light that we can see in a clear night 30 miles off.

2499. What is your opinion as to a harbour of refuge on the north-east coast of Scotland?—I am decidedly of opinion with the parties that have already been examined. I do not see the necessity of it. It would be of great benefit to the fishing vessels which frequent the east coast; but my opinion is, that it would not be of general utility to the shipping going along the coast.

2500. Supposing it should be decided to construct a harbour of refuge on this district of the coast, which of the three places—Wick, Fraserburgh, or Peterhead—would you be disposed to recommend for the purpose?—I have no hesitation in saying that if it were to be erected, Peterhead has decidedly the advantage of the others.

2501. Will you state your reasons?—I do not think there is space in Wick for a harbour of refuge. I know it very well. I do not think it would hold a sufficient number of vessels in a gale of wind, were they to take it, and the place is very narrow. Then I consider it to be of very little use at Fraserburgh, because it is just the entrance to the Moray Firth; it would be of very little use there. If vessels were off Fraserburgh, and taken with an easterly gale of wind, they would decidedly run for Cromarty. It is one of the finest harbours to take on the east coast. It has two prominent hills on each side of the entrance.

2502. (*Capt. Vetch.*) I think you said you were well acquainted with Wick?—Yes.

2503. You are aware, I presume, that it is the resort of a very large number of fishing boats?—Yes.

2504. Which do not belong to the place itself?—Yes, I am aware it is a plentiful fishing station, and if anything could be done to save the lives of the fishermen it would be certainly a very good accomplishment indeed.

2505. Should it be decided to expend a certain amount of money on the north-east coast of Scotland, with the more specific purpose of saving life and property, how would you be disposed to view the claims of Wick for selection, bearing in mind the large number of fishermen who, during the fishing season, resort to it?—Well, that is more an engineer's question; but if anything could be done to make it more safe for the fishing boats, and not at a heavy expense, I certainly do approve of something being done.

2506. You have mistaken entirely the purport of my question; it is not at all an engineering one. There are a very large number of fishermen who, during the fishing season leave the Bay of Wick every evening; and as you must be aware, have little or no shelter at that place in the event of a heavy easterly gale coming on. Now, supposing that it is decided to spend a considerable sum for the purpose of saving life, where would you be disposed, to spend it of the three ports—Wick, Fraserburgh, and Peterhead?—I should say Wick for that purpose.

2507. My last question referred to life solely; how would you view the question further as relates to property?—I should say that when property can be saved, there is little risk of the lives being lost. If means could be adopted to save the property, there would be very little risk of losing the lives. If the harbour could be made in such a way that the boats could come in at all times of the tide and wind, it would be the means, I dare say, of saving many lives.

2508. (*Sir Frederic Smith.*) As a shipowner, would you consider it a great hardship to be obliged to pay a passing toll for the maintenance of any of the harbours proposed?—I should consider it a hardship to pay a toll for any harbour of refuge north of this.

2509. (*Mr. Lindsay.*) Would you consider it just to pay a passing toll if the Government decided on voting a sum of money to make Aberdeen a harbour of refuge?—Oh no.

2510. Would you not consider it unjust to the shipping interest as a whole to ask them to subscribe towards a harbour of refuge at this particular spot?—I do not think it, because there is no other harbour on the north-east coast equal to Aberdeen harbour. If you look at the amount of water we have got, and the docks which we have for the accommodation of shipping, I think it is the only place in the north of Scotland for a harbour of refuge.

2511. But if another place on the east coast of Scotland could be found where a better harbour of refuge could be made for the same sum of money than could be made at Aberdeen, would you in such a case as that consider it unjust for the shipowners to be called upon to pay passing tolls?—Not at all, but reasonable.

2512. I want your opinion, from your experience, on one point. Say that Government decided to spend 300,000*l.*, with the object in view of saving life and property, and affording greater facilities to commerce, whether do you think that 300,000*l.* would be better spent at one particular spot between the Firth of Forth and Duncansby Head, which includes Aberdeen, than divided amongst the various harbours within the limits I have named?—My opinion is that it would be much better divided. It would improve other ports to divide the money, and you would have a benefit to it, as well as to any other port.

2513–14. Then you think that the expenditure of 300,000*l.* by such means as these would tend more to save life and property, and afford greater facilities to commerce, than the spending of that one sum on any one particular spot?—I am decidedly of that opinion.

Mr. THOMPSON re-examined.

Mr. Thompson.

2515. (*Chairman.*) You are acquainted with the large number of fishermen who resort from different parts of the coast to fish at Wick?—I am not acquainted with it, but I am aware of the fact.

2516. Now, supposing that the Government determined to spend a certain sum of money for the purpose of saving life, taking into account the large number of fishermen who resort to Wick for a period of about twelve weeks, with the great risk to which they are exposed, in a heavy easterly gale, from the insufficient refuge which that harbour affords to them, of the three places, Wick, Fraserburgh, and Peterhead, where would you recommend that sum to be spent?—I should recommend it decidedly to be spent at Wick. I think that the Government would be doing a very good thing, and with the Fishery

Board's 50,000*l.*, together with their own 50,000*l.*, they would make a complete harbour at Wick for the accommodation and protection of the fishermen who assemble there from many quarters of the island.

2517–19. (*Mr. Lindsay.*) Say that it is decided to make harbours of refuge along the whole coast, both the north-east coast of Scotland and east coast of England, and other parts, do you consider that that sum ought to be taken from the Consolidated Fund, or raised by means of a tax in the shape of a passing toll or otherwise, upon the shipping interest? — Decidedly taken from the Consolidated Fund; but I trust that a large sum of money will not be expended by the Government in regard to a great harbour of refuge on the east coast of Scotland, because it is not required.

Mr. Adamson re-examined.

2520. (*Chairman.*) You have heard the last question I put to Mr. Thompson?—I have.

2521. Will you give the Commissioners your opinion on that special point? — I am decidedly of the same opinion as Mr. Thompson. With regard to Wick, if there is a sum of money to be expended there, it ought to be purely from the large number of boats during the fishing season that are congregated there; and I know that there is scarcely a season passes but what there is a great deal of loss of life and property at the same time, in consequence of not having sufficient accommodation.

2522. (*Capt. Vetch.*) I suppose you are aware of the fact, that at present the fishing boats at Wick are often prevented from going out to sea, from the apprehension of being driven on shore and being incapable of finding refuge?—Yes; I have heard that stated.

2523. As the consequence of that circumstance, they were very often deprived of a good night's fishing, when if they had had a place to run to, they might have gone out. Would that be an additional motive for providing security there?—Most assuredly.

Mr. Walter Hood examined.

2524. (*Chairman.*) What is your name?—Walter Hood.

2525. What is your occupation?—Shipbuilder.

2526. How long have you been connected with the port of Aberdeen?—Altogether I have been about 40 years.

2527. Have you considered the Report of the Committee of the House of Commons relative to the subject of our present inquiry?—No; I have not.

2528. Have you considered the question of a national harbour of refuge on this district of coast?—I do not consider that there is any great necessity for a harbour of refuge here, such as we are to have.

2529. Will you state your reasons for that opinion?—I think it would be much better to improve the present harbours so as to deepen them, that a vessel could get in at low water.

2530. (*Sir Frederic Smith.*) Are you at all aware of what the cost would be of deepening the existing harbours so as to take in vessels at all times of tide?—I am not.

Captain A. Somers examined.

2531. (*Chairman.*) What is your name?—Andrew Somers.

2532. What is your occupation? — Shipowner, formerly shipmaster.

2533. How long have you been at sea?—19 years.

2534. For what period a shipmaster?—12 years.

2535. In what trade were the vessels employed which you commanded?—The North American trade.

2536. Did you pass North about through the Pentland Firth?—Yes; in coming to Aberdeen or the Firth of Forth.

2537. State to me your opinion of the difficulties or otherwise of the navigation of the Pentland Firth.—I cannot say but what at some periods of the tide there is a difficulty in the Pentland Firth, but generally speaking, the difficulties of the Pentland Firth were not considered great by the masters of vessels in the North American trade. We generally did not take pilots either going through or coming. Of course, in a very heavy gale of wind, with the tide against the sea, it would not be prudent to go through the Firth, but on the whole, the navigation is perfectly safe with a good chart; at any rate, in my day, and that is about 16 years ago, and I suppose there are better charts now.

2538. State to the Commissioners your opinion of the harbour of Longhope in the Orkneys.—I consider the harbour of Longhope a very good harbour. I have been in it often, and that was when there was no light. Mr. Hogarth observed that there was a light upon it. I am not aware of that, not having been there recently, but during my time there was no light. But we found that there was no difficulty in getting into Longhope, with the exception, I would say, of a south-east gale of wind perhaps, and a strong flood tide, but then the vessel should be kept to west-north-west, with the flood particularly, till the tide eased, but she could come round eastward to the Orkney Islands for the Rostock. There are many good harbours in the Orkneys.

2539. You see that chart of the Pentland Firth and the Orkneys (*showing Admiralty Chart No.* 2180)?—Yes.

2540. Supposing you had never been in the anchorage of Longhope, and you were in possession of a chart of that description, would you have any difficulty in running for it?—I should say not by attending to the tide.

2541. Can you give me any opinion as to what would be the feeling of your brother captains on the same subject?—I think the feeling of my brother captains on the same subject out of Aberdeen is the same as mine generally. I do not know, though; perhaps not. Their feeling as to its being a safe harbour, I think, would be the same as mine. I should say so. A very good anchorage. No one particular part off Longhope. That is, perhaps the east end is choked up with weed, as was observed before, but if you go far enough up Longhope, you may lie there with one anchor down, blowing hard, and with plenty of scour cable. I have been there over and over again. We might have let go a second anchor, but very seldom.

2542. You have mistaken the purport of my question?—Suppose that I placed that chart in the hands of a captain who had never been at Longhope before, do you think, so far as you are acquainted with the opinions of your brother captains, that generally speaking they would be indisposed to run for Longhope with the assistance of that chart?—I do not think it, if the weather was so clear that they could see land.

2543. (*Capt. Vetch.*) I think you stated you have been frequently through the Pentland Firth?—Yes.

ABERDEEN.

Capt. A. Somers.

2 Sept. 1858.

Capt. Vetch.

2544. And you stated you have been frequently in the harbour of Longhope?—Yes.

2545. Will you tell me the object of your going into that harbour?—The object in going into it was, coming from North America in the fall of the year falling in with a south-south-east and a south gale, with a timber-laden vessel. I am bound out to Quebec sometimes with a very heavy westerly gale. We generally go into it as seldom as possible, because we wish to keep out, and try to make our passage, which we consider better. Still we consider it a very good harbour.

2546. If there were any peculiar tides in the Pentland Firth more than elsewhere, would you have been in the same necessity of so frequently putting into Longhope?—But then I did not have adverse tides. It was more with gales from the westward or eastward, with clear tides, that we were obliged to go in there; our vessels not being able to beat for the westward or south-eastward. It was not in consequence of the tides at all that we had to go into Longhope, certainly not.

2547. Then vessels do not go into Longhope on account of the particular run of the tide at the time?—I do not think that there is any necessity for that. It was merely as a wind-bound harbour that we went into Longhope.

2548. (*Chairman.*) State your opinion as to the necessity of a harbour of refuge to the north of Aberdeen up to the Pentland Firth.—I object to the three large harbours of refuge that are proposed; and my reasons are, that Wick is so near the Pentland Firth and the harbour of Longhope, that there is no necessity for it as a general harbour of refuge. The Pentland Firth itself is an outlet independent of Longhope at that quarter. It is at the northern extremity of the north-east coast, and could be got through supposing that we were not to get into Longhope. Then there is also Cromarty, which is a very safe harbour, although a little to the westward, and of very easy access, so that I think Wick is perfectly objectionable. Then Fraserburgh and Peterhead are objectionable also from the part of the coast that they are situated in; as in a gale of wind from east-south-east or east in that quarter, which are the most serious gales that we have, they do the most damage on this coast, a vessel can either go to the Firth of Forth from Peterhead with the wind that way, or she can go up the Moray Firth. The extent of coast there, from Buchan Ness to Kinnaird Head, is perhaps about 25 or 30 miles, but I may be wrong in that, for the coast, in going to the north, goes a little west, then goes to the west out of Fraserburgh. I consider the most dangerous part of the north-east coast of Scotland to be between the Buchan Ness and Fife Ness, that is the north side, I think, of the Firth of Forth. That is the most dangerous part, and with a south-east-and-by-south gale, about midway on that coast, it is very difficult, and sometimes impossible, for a vessel to get either north or south. Now Aberdeen is not far from midway; it is to the north of that perhaps about 15 or 20 miles, and is a very important harbour. Could it be made much more accessible than it is, although not bad as present, still it might be made accessible for vessels at low water, that presently have to come at high water, I should suppose; but I do not think, on the whole, that a general harbour of refuge is necessary, but about that point of the coast I should say that it is very important to have a good harbour.

2549. Have you commanded a ship from the Baltic?—Never.

2550. To Archangel?—Never.

2551. Now, suppose the Government determined to spend a certain sum on a harbour in this district of coast, taking into account the life and property exposed to risk in the fishery at Wick, at which of the three places, Wick, Peterhead, and Fraserburgh, do you think it most desirable that it should be spent?—I should say Wick for that purpose. Although I am not exactly acquainted with the harbour of Wick, I have been often past it, and am aware that there are a great number of boats exposed there very much.

2552. (*Mr. Lindsay.*) Were you supposing the case of a vote of money to make a harbour at Wick sufficient for the fishing boats, or a national harbour of refuge?—Merely for the fishing boats.

Captain MORGAN examined.

Capt. Morgan.

2553. (*Chairman.*) What is your name?—John Morgan.

2554. What is your occupation?—An old worn-out shipmaster for nearly the last fifty years.

2555. In what trade did the vessels sail chiefly which you have commanded?—I have sailed in vessels in the coasting, Baltic, Archangel, and American trades.

2556. Have you ever felt the necessity of a harbour of refuge to run for in bad weather on the district of coast from Fife Ness to the Pentland Firth?—Many a time.

2557. And where would you be disposed to name as the best site for such a harbour of refuge?—I would mention, if you thought I was not speaking partially, about Aberdeen, because it is in the centre.

2558. And in the district of coast north of Aberdeen, where would you be disposed, from Aberdeen to the Pentland Firth, to consider the best site for a harbour of refuge?—If it were going to the north of Aberdeen, I should say Peterhead, and that would give the ships that came along the coast some chance after they have got round there.

2559. State your reasons for preferring Peterhead to Fraserburgh.—I would say that a ship might get the length of Peterhead, and not get round Rattray Head.

2560. What are the prevailing winds in the North Sea in the fall of the year?—They are sometimes south and south-east winds.

2561. And from what quarter do the heaviest gales blow?—I think from east-south-east and south-east. These are the most dangerous upon this coast.

2562. Leaving the Naze of Norway with southerly winds, what land would you endeavour to make?—It would depend entirely on where I was bound, but if I was bound any way betwixt the Carr and the Buchan Ness, I would, with south-easterly gales steer for the entrance of the South Firth, because the coast is dangerous.

2563. Supposing that the wind were hanging from the southward when you take your departure from the Naze of Norway, how would you endeavour to make your passage?—Why, I would stretch along to the land as hard as I could to catch hold of the coast, and if it were coming to blow then I would try for shelter if I did not get a fair wind to make my voyage.

2564. And where do you think that shelter would be of most service to you?—Just here and hereabout upon this iron-bound coast, where there have been many people lost since 1800.

2565. Are you acquainted with the Cromarty Firth?—Yes, perfectly well.

2566. Give me your opinion of the Cromarty Firth as a harbour of refuge?—It is one of the finest harbours in the world. There are Cromarty, Milford, and Malta. I would consider these the three best ports in the world—although I am going past my story. If I could not get any other way, I have gone round Fort George on a coarse night, farther up still. But I beg your pardon, I am perhaps speaking more than is asked me.

2567. No; I am glad to hear everything you have to say. The Cromarty Firth is easy of access in winds from east-north-east and east-south-east?—Yes.

Mr. ABERNETHY examined.

2568. (*Chairman.*) What is your name?—James Abernethy.

2569. And your profession?—A civil engineer.

2570. Will you state for the information of the Commissioners what are the facilities which the port and bay of Aberdeen present either for a national harbour of refuge, or for a subsidiary harbour of refuge, supposing one great national harbour is not adopted on this coast?—I may state to the Commissioners that I have never considered Aberdeen, in common with the other ports on the north-east coast of Scotland, as fitted for a great national harbour of refuge. But I am of opinion that the entrance to Aberdeen harbour can be so much improved that it may be taken by vessels under any circumstances at any period of the tide with safety. And, therefore, undoubtedly it could be made an exceedingly valuable harbour of refuge for a certain section of coast. I have prepared the plan I now produce within the last day to show the Commissioners the present state of the harbour. These soundings which you see show the depth of water at the entrance between the pier heads at low water of a low spring tide. I may state that probably there are few harbours on the whole coast of Great Britain that have been so much improved as the harbour of Aberdeen. It had the services of the most eminent engineers, such as Smeaton, Rennie, and Telford; and at the entrance there is now a depth of water at medium tides of 21 feet, where formerly there was a bar, with a depth over it at low water of the same tides of 2 feet 6 inches, or 13 feet at high water. You will observe upon the south of the entrance a receding breakwater. That breakwater was originally designed as a mere protective work during the extension of the north pier, and it was placed there for no other purpose; for it is obvious that, being within or on a line with the point of the north pier, it cannot in any degree protect the harbour entrance from the south-east gales. On the contrary, by cooping up the current, particularly during floods down the river, between the pier heads in easterly gales, it causes a very heavy and dangerous sea at that point, so dangerous that even steamers within the last few years have lost steerage way when between the pier heads, and have been lost upon the North Pier point. The latest and most distressing instance of that being in the case of the *Duke of Sutherland* steamer, a powerful vessel of 800 tons burden, she was lost at the point of the North Pier in attempting to enter the harbour.

2571. Have you any chart which shows the coast about the immediate vicinity of Aberdeen?—There is a chart which shows the coast from the Fife Ness Head to the north part of Scotland separate and distinct, but I do not think there is one on a large scale.

2572. Proceed.—Years ago I brought before the harbour trustees the advisability of removing what is termed the breakwater from its present site much farther seaward, as indicated by these red lines, from Shortness Point; because I am of opinion that if a breakwater was constructed, as shown by the red lines, projecting from the Shortness Point, the receding harbour entrance would be effectually protected from the action of the east and south-east seas, and deep water also would be provided for the ordinary class of shipping at the period of low water. As a general rule, vessels that have been wrecked at the entrance of the harbour have been wrecked about the period of low water, when they were unable to enter. Therefore I think that the entrance to the harbour would be improved by the erection of such a work, shelter would be afforded from the east and south-east gales, and depth of water would be provided at the period of low water for the admission of vessels. With regard to the first part of the Commissioners' question as to a great national harbour of refuge, I have never said that Aberdeen, or any of the other northern ports, is a proper point for such a purpose, because I am decidedly of opinion, as I have before stated, that the best way to secure the safety of the shipping on this coast is to improve and extend the existing harbours—convert them from high-water harbours into what I should term low-water harbours. And I think, in addition to the safety of vessels generally, by adopting such a course a very great commercial advantage would be obtained, because it is manifest that if you extend and improve the existing harbours you will extend the shipping and commerce of the various ports; whereas if you provide one harbour of refuge, in a commercial point of view, you effect no object further than the protection of the shipping on the coast. I think that by improving the existing harbours you can not only provide for the safety of the shipping, but you can also obtain advantages which the other course will not attain.

2573. (*Sir Frederic Smith.*) Am I to understand you to say that the only change, or alteration, or improvement you propose here is the removal of this short pier or breakwater, and the construction of this larger breakwater?—That is one improvement. Another improvement is at present in progress, and has been for a considerable length of time, namely, the removal of the large boulder stones from the entrance, for which purpose the dredging has been carried out to a very great extent. In fact, during the last ten years upwards of a million tons have been taken from the entrance to Aberdeen harbour. I think the erection of such a work as that breakwater, with the aid which will be obtained from dredging, would improve and extend the harbour of Aberdeen so as to fit it for the admission of vessels at all periods of the tide and under any circumstances.

2574. Is this entirely an idea of your own, or have you consulted any experienced engineers of the day on this question?—It was an idea which occurred to me some years ago, and at that time Sir William Cubitt was consulted by the Harbour Commissioners of Aberdeen on the subject, and with him I inspected what is called the Bay of Nigg, round the Girdleness point, and the adjoining coast. I submitted to Sir William Cubitt at that time a design similar to that which you have before you, and it was his opinion that it was the best method of providing a deep-water harbour at Aberdeen.

2575. Is there any silting taking place in this harbour?—There is not at the entrance. Between the south pier head and the breakwater there is a small bay. The original intention of Mr. Smeaton was to continue that south pier parallel with the north pier, because it was apprehended that silting would take place at that part. During the last six or ten years the depth of water in that bay has not decreased; it is entirely free, and clear of deposit.

2576. I do not very clearly make out how any danger is occasioned by this shorter pier; would you tell me how that is effected?—By cooping up the current at the point between the north pier head and the head of that breakwater, particularly during an ebb tide and heavy easterly gales, a heavy irregular sea is caused immediately between the pier-heads, and during floods also there is a very powerful current running out there, so that vessels, when they reach that point, find themselves unable to enter the harbour, and are driven to leeward on the point of the north pier in easterly gales, or on the beach to the north of it.

2577. Have you any back water in this harbour?—There is a very large tidal reservoir.

2578. Is that used for scouring out?—That of course is discharged from that entrance, and there is also the additional current of the river Dee, which, in time of floods, is exceedingly powerful.

2579. Is it not to be apprehended that the removal of the shorter pier would retain and cause a deposit

ABERDEEN.

Mr. Abernethy.

2 Sept. 1858.

Sir Frederic Smith.

of what, with the backwater, is now scoured away? —I think not; because, by leaving a sufficient opening between the high-water mark and the proposed extended pier, so as to allow of the current along the shore to run round the Girdleness, the deposit would be removed as it is at present. There is no bar now at Aberdeen harbour, and has not been for many years.

2580. The increased depth of water to be attained is to be obtained by dredging?—By dredging, aided by the scouring current of the river.

2581. That will be a constant expense?—I apprehend not. After we have dredged, as I have mentioned, we do not find any tendency to deposit again.

2582. Is not that from the constant dredging, leaving no time for accumulating?—It is caused chiefly by the removal of the huge boulder-stones from the bed of the channel.

2583. How far do you dredge from the north pier? —We have never dredged beyond the north pier, for the removal of those stones takes place within it or along the channel.

2584. What is the shallowest part of this channel? —Seven feet nine at low water spring tides.

2585. What do you suppose it will be at the pier? —About ten feet, I suppose. The object of this pier is chiefly to prevent the heavy swell of sea in the north gales at the entrance; and it would also, at the period of low water, enable a vessel to take shelter, if there was not sufficient water for her to enter between the present piers, behind that breakwater. In fact, vessels have ridden at anchor there.

2586. You have not made up the estimate?—I have prepared a probable estimate, using the material of the existing breakwater, in so far as it would be available,—about the sum of 70,000*l.*

2587. Will you be so kind as to put this plan in evidence?—I will.

2588. You have no estimate to give in? I suppose this is merely a rough estimate?—It is a rough estimate merely.

2589. (*Mr. Lindsay.*) Say that this south pier was removed to where you propose, would that increase the depth of water?—The mere removal of the pier, of course, would not increase the depth of water, except to this extent, that it would do away with the present heavy sea between the pier-heads, and by that alone you would gain some four or five feet during on-shore gales.

2590. I ask the question because I understood you to say, that with these alterations which you propose you would make the harbour of Aberdeen suitable for vessels at all times of the tide?—Yes.

2591. That is to say, vessels drawing under eight feet of water?—In this way, that vessels making the harbour of Aberdeen at the period of low water, and drawing a greater depth than ten feet, could anchor under the shelter of the projected breakwater there, wait for the period of high water, and pass into the harbour, protected from the dangerous cross sea which exists at the period of high water during easterly gales between our present piers.

2592. Then what depth of water would you have at low water spring tides within the proposed pier? —25 feet. At low water at an equinoctial tide I think it would be less.

2593. Do you consider it safe for vessels to run in there and anchor even for a tide?—I think that vessels of the ordinary class frequenting the coast, if obliged to run for Aberdeen harbour at the period of low water, could take shelter under the lee of that breakwater. But the great material benefit which would arise from the construction of that work would be the doing away with the dangerous sea which exists at present at the period of high water between the pier-heads, and which has been the cause of the majority of our wrecks, and even of our powerful steamers.

2594. You say the depth of water between the present piers has been increased from two feet up to eight feet, and even to ten feet in some places; what greater depth of water do you think you would obtain in the channel by carrying out the plan which you propose in the water channel?— If the depth of water in the channel was increased by ten or twelve feet it would involve the necessity of securing the foundation of the present north pier, which could be easily done, and being continuously dredged a depth of fifteen feet at low water might be obtained.

2595. What does the bed of the river consist of between the north and south piers?—Gravel and boulder-stones.

2596. (*Capt. Vetch.*) You have now eight feet additional?—That depth of water has been obtained by dredging.

2597. Will you have any difficulty in removing the great boulders?—We are at present removing them steadily. Since I ceased to take an active part in the management of the harbour in 1846, upwards of two feet additional depth of water has been obtained.

2598. And if you wish to acquire other three feet? —That is a question simply of dredging.

2599. (*Mr. Coode.*) What do you estimate would be the cost of obtaining that additional three feet of depth?—I have not estimated the cost.

2600. Can you tell us nearly?—We go on dredging from year to year, and that is generally at a very low rate, I think for 5¼*d.* a ton, including the deposit on the adjoining sand beach.

2601. You will probably be able to give us some rough notion of the cost attendant upon these additional three feet?—I could, I dare say, make up an estimate, no doubt roughly.

2602. Will you send it to the Commissioners?—Yes.

2603. Do you imagine that, with that additional depth of three feet, there would be any difficulty in vessels making this harbour at all times?—At the period of high water there would be no difficulty whatever, unless in the dangerous cross sea which prevails now between the pier-heads. The most dangerous gale is from the south-east. The sea in those gales impinges directly upon the point of the north pier. That, combined with the outgoing current, causes a heavy, irregular sea at that point, and vessels at the period of high water generally come with safety until within a short distance of the harbour entrance, and it is only there that the danger takes place. I have repeatedly seen them come through heavy seas until they were cast upon the pier, and wrecked.

2604. At what period of the tide does that dangerous sea exist?—Probably from the period of half tide at high water. It gradually decreases with the tide.

2605. Is that cross sea worse at the period of high water?—At or about the period of high water.

2606. What is the greatest rate of tide past the mouth of the harbour?—About one and three-quarters or two knots an hour.

2607. That is on flood?—On floods.

2608. Do you find any inconvenience at ebb?— Vessels, as a general rule, do not pass into the harbour after the period of high water. The danger of not being able to enter the harbour is increased by the ebbing current.

2609. You spoke of vessels sailing up under the shelter of this proposed breakwater. Do you not apprehend there would be considerable sea when the wind was about north, or north-north-east?— Buchan Ness Point trending so far to the east, we find the north and north-east seas are not so heavy as our east and south-east seas. And again, the north-east gales are not the prevailing gales at Aberdeen. The prevailing gales are from east and south-east.

2610. (*Chairman.*) What is the compass direction of this north pier?—About east-north-east.

2611. Supposing that your proposed improvements are made, to what number of vessels would the harbour—I mean by the harbour as distinct from the wet dock—give refuge in heavy easterly gales?—A

hundred sail might be accommodated within the pier-heads.

2612. Will you mark on the plan the part of the harbour where they would anchor?—All along at the harbour in every direction; on both sides, in fact. Vessels in easterly gales sometimes come here, and in order to avoid the reefs they run upon the beach on the south side.

2613. I understand, then, that the part of the harbour which you describe as fit for refuge purposes is that which I have marked from A to B?—Yes, and also a very considerable extent along the portion of the harbour out of the fair-way channel or line of leading lights. This dotted line shows the line of the leading lights or centre of fair-way channel.

2614. From A to C how many additional vessels would obtain refuge?—When I speak of 100 sail I mean the whole. It is my opinion that 100 of the ordinary class of vessels, coasters and otherwise, could find shelter within the whole of the tidal area under the lee of the north pier. Therefore I would include the space of A—C with the space A—B. And I might add, that the additional space on the Torry side is also available in the spill-water channel, which extends about half a mile up.

2615. Between A and B how many vessels will find refuge? How long do you think these calculations would occupy you?—They would not occupy me above two minutes. I could furnish you with the details. Nearly 2,000 feet is the length at the point you speak of, by 450 feet in width.

2616. Will you furnish to the Commissioners at your leisure a plan of the harbour, showing the number of vessels which, in heavy gales blowing right in, can find safe refuge between the points which I marked A and B, between the points which I have marked A and C, and also between the points which I have marked C and D, on the plans now before me? Also, will you be good enough to supply a plan showing the still water, on which plan will be noted the number of vessels to which it will afford refuge?—I will do so. Would you allow me to add, that by dredging the spill-water channel a very considerable addition would be afforded to the amount of shelter I have stated.

2617. I wish these plans to show the soundings, and to afford every other information which will enable the Commissioners to form an opinion as to the facilities of refuge afforded by the harbour of Aberdeen?—I will notice that.

2618. In a heavy easterly gale, between the points D and C is it a perfectly secure anchorage for vessels, supposing you remove the breakwater at present existing, and construct the breakwater proposed?—Yes, I am of opinion that in a heavy easterly gale vessels would be in shelter between the points C and D.

2619. From what direction must the wind blow to make the worst sea in that portion of the harbour?—The sea from north to north-east would then be the only sea to which the harbour would be exposed, and that only to a limited extent; inasmuch, as I have before stated, that these seas are not heavy, and they are not the prevailing winds.

2620. And in that portion of the harbour which I have marked from D to C, do you consider that there would be safe refuge for vessels in a heavy gale right in?—I do not. I think that small vessels in heavy gales would be in comparative safety if obliged to run for the harbour at the period of low water—vessels of a size that could be admitted between the pier-heads, that is, 10 feet draught of water. But the great advantage which would accrue from the construction of that work is the doing away with the dangerous cross sea, at the period of high water, between the present pier-heads. I think also, to a limited extent, that even at the period of low water vessels could be sheltered behind the proposed breakwater. I can recollect an instance of a clipper schooner from London riding at that point till she sank at her anchors.

2621. (*Sir Frederic Smith.*) Is it intended that these vessels are to swing at their anchors, or to be packed up contiguously to each other along the pier?—This is a tidal harbour. Of course, at low water the majority of them would take the ground, as they do at present. All our wind-bound vessels take the ground.

2622. But they would be hanging at their anchors, would they not?—They would be moored to fixed moorings, and contiguous to each other.

2623. So that they could not swing?—They could not swing; that is to say, in the way they lie at present.

2624. (*Capt. Washington.*) Supposing the dredging you contemplate carried out, is there ample harbour accommodation within the flowing basin for any number of vessels that might be expected to resort here?—It is one of the largest single docks in the kingdom, and has an area of 37 acres.

2625. And the width of the entrance?—The lock is 60 feet in, and the entrance is 70 feet.

2626. I believe it is as large as any in the kingdom?—With the exception of the lock of the Victoria Dock at London, which is, I think, 80 feet in width.

2627. But it is ample for all purposes on this coast of Scotland?—It is.

2628. Is there, further, facility for repairing vessels in cases of damage, and for supplying them with machinery?—There are very extensive engineering works in the immediate vicinity of the harbour, and there are three patent slips.

2629. Then every requisite for repairing ships and furnishing them with supplies could be found at Aberdeen?—It could.

2630. (*Mr. Coode.*) I believe that the width between the north and south piers would be somewhere about 350 feet?—I think it is about that.

2631. Do you apprehend that that would be wide enough for a vessel to run in during a gale of wind in a dark night?—We find it is not wide enough at present. In south-east gales, unless they go well to windward, or close to the point of the breakwater. They perhaps go to leeward upon the point of the north pier.

2632. Is the area of the water space within the harbour so great that shelter could be afforded so that 100 vessels would not inconvenience the trade of the port?—I think it is so.

2633. Will you be good to put on your plan the bearing of the Girdleness from the extremity of your proposed breakwater?—I will.

2634. (*Chairman.*) Do you wish to lodge these plans?—No.

Mr. HOGARTH re-examined.

2635. (*Chairman.*) You are well acquainted with Wick and the extensive fishery which prevails there in the fishing season?—I am.

2636. Now supposing that the Government are determined to spend a certain sum on the north-east coast of Scotland, with the view of saving life, in which of the three places, Wick, Fraserburgh, or Peterhead, do you think their object would be promoted?—Taking the number of the inhabitants, or rather the fishermen, at these various places, I should say Wick.

2637. But confining your view not simply to the fishermen, but to the exigencies of the passing trade, where would you be disposed to place a harbour of refuge?—If I must name one of the three, I should say Peterhead for the shipping.

2638. My question is put with the view of ascertaining, considering the exigencies of the passing trade and the fisheries conjointly, with the view of saving life, where then you would place the harbour of refuge of the three places?—I do not think that Wick suits the passing trade, but for saving life it is the best.

ABERDEEN.

Mr. Hogarth.

2 Sept. 1858.

Chairman.

2639. Taking into view the property at risk, without respect to the life, where, for the purpose of saving property, would you be most disposed to spend this money,—at Wick, at Fraserburgh, or at Peterhead?—Certainly not Fraserburgh, and Wick requires it more than Peterhead. Peterhead is a weatherly point on the coast. A vessel might save herself there at any time. A vessel being caught with the wind on at Peterhead might go either north or south. It may be convenient for ships windbound to go up the Firth and take shelter in a roadstead, where she can let go her anchor; but for refuge Peterhead is not necessary.

2640. Are you well acquainted with the habits of the fishermen at Wick?—I do not know what you mean exactly.

2641. My meaning is as respects the mode in which they conduct their fishery?—I know very well how the herrings are caught on both sides of the Firth.

2642. Are you able to offer any opinion as to whether any considerable amount of fish are lost from the circumstance of the fishermen being unwilling to put out to sea in doubtful weather?—I could form no opinion as to the quantity, but if they had a better harbour they would go oftener to sea.

2643. And you can offer no real estimate of the value of the fish so lost?—No; I would not like to make an estimate.

(*Mr. Nicol.*) I do not think that we have anything more to say.

2644. (*Chairman.*) Are you entirely satisfied that you have had the opportunity afforded you of offering all the evidence which you wish to tender to the Commissioners on the subject of this inquiry?—There are one or two of the shipmasters of the more intelligent men trading to the Baltic and Archangel that I should have been glad, if they had been in the port, to have brought forward to give evidence generally upon the navigation of the North Sea, but otherwise I am not aware that there is anything further that can be said.

2645. Will you state the names of the captains in question?—There is Captain Allan.

2646. Any other?—Captain Howley.

2647. Anybody else?—No.

2648. Of course it will be in the power of the Commissioners, at a later period, to call upon the gentlemen you have named to give their evidence in London, if they think proper to summon them. Is there any other person present who may wish to tender any evidence with respect to the subject of an inquiry as relates to Aberdeen?

(*William Talbot.*) Yes, I will be most happy to give my evidence.

Mr. William Talbot examined.

Mr. W. Talbot.

2649. (*Chairman.*) What is your name?—William Talbot.

2650. What is your occupation?—Shipmaster.

2651. For what purpose do you wish to give your evidence?—I am very glad to see the present deputation come down to Scotland on the cause they have come,—to assist the seafaring population in saving life and property. I think you are working in a right direction.

2652. Have you any evidence to offer which has not been already tendered to the Commissioners?—Not particularly.

Then in that case we will dispense with any further evidence on your part.

2653-4. (*Mr. Lindsay.*) Have you any information to give to the Commissioners connected either with the port of Aberdeen or harbours of refuge on the north-east coast of Scotland, which the Commissioners have not already received?—I will be most happy to anwer any question which the Commissioners can put to me as a practical man.

(*Chairman.*) I may state on the part of the Commissioners that of course they are perfectly willing to enter into any evidence which may be tendered, but when a witness states, as in the present instance, that he has nothing new to offer, they think it unnecessary to occupy their own time, or that of others, with any further examination, as they have perfectly satisfied themselves on the points in question. Had you come at an earlier period of the inquiry, I have no doubt we should have been as happy to have taken your evidence as that of the others.

(*Witness.*) I should have been very happy to have given any evidence that I could.

(*Chairman.*) Thank you.

(*Mr. George Thompson.*) May I be allowed to make a remark with regard to the evidence which it is permitted to be taken in London? My reason for making this observation is this, that I feel assured there are many intelligent shipowners, shipmasters, and others connected with the port of Aberdeen, who are not present here to-day, this happening to be the chief day of this great Highland agricultural show. So, I think, if evidence is to be subsequently taken at London for Aberdeen, it is of great importance that we should send three or four shipmasters and leading shipowners, men who are not here to-day, to advocate the case of Aberdeen, which has scarcely been brought out so fully as I think it might have been, had circumstances been more favourable.

(*Chairman.*) I may state on the part of the Commissioners, that they were perfectly sensible that it might very probably happen at Aberdeen that you might not be able to produce some of the evidence which you might wish to offer them, on account of the absence of the parties in the Baltic and American trades. They were also perfectly aware of the other circumstance which you have mentioned, and they will be careful on their arrival in London, and on taking the evidence into their consideration, to give due attention to the request which I understand you to have made.

Deputation from Montrose.

Mr. A. Burns.

(*Mr. Burns.*) I am unwilling to occupy the time of the Commissioners at any great length, and I shall shortly state the views of the Harbour Trustees of Montrose. I lodge, first, an abstract of the harbour accounts for last year; secondly, a note of the number of vessels entering the harbour, and tonnage, for the same period; thirdly, the Admiralty report, or the last Montrose Harbour Act, 1850; fourthly, a printed copy of a petition lately presented to the Treasury by the trustees; and, fifthly, extracts from the reports of Sir John Rennie, Mr. Robert Stevenson, and Mr. James Walker, on the neglect of the harbour. Referring to these productions, it is the decided conviction of the trustees of the harbour of Montrose that it would be much more judicious to expend a sum of money in improving the existing harbours on the coast rather than to construct a harbour of refuge at a great distance from the coasting and foreign trade. The defects of these harbours have been alluded to by various engineers who from time to time have examined the harbours, not with any view of Government assistance, but to ascertain the capabilities of the harbours. These capabilities have been pointed out, and their defects, but from want of funds the local trustees have never been able to adopt the recommendations which these engineers have made. Their funds have been exhausted in internal improvements of the harbour, to

accommodate the trade under ordinary circumstances. Sir J. Rennie, in his report dated 1805, says—"From "this description it is evident that the entrance is "completely sheltered from all winds that blow from "the westward or south, but there is no protection "from the north, nor indeed any winds that blow from "points between thence and east beyond the Sands "End Ness, except what is afforded by the Annat, "which, from its being a low sand, is not very great. "A fine opportunity, therefore, presents itself for "the improvement of this harbour by a pier on "the Annat, which, if judiciously constructed, would "render the entrance to Montrose harbour one of the "best in Scotland; but the expense would be very "considerable, probably more than any reasonable "dues that could be laid on the shipping would "afford." Mr. Robert Stevenson, in his report dated 1816, says—"The reporter cannot conclude without "taking another view of the use that at some future "period may be made of the valuable depth of water, "say at least from 18 to 25 feet, together with the "advantageous position of such a harbour on this "coast." He observes that "Montrose being near "the entrance of the Firth of Forth, is well calcu-"lated as a shipping station in time of war for the "protection of the British trade in the German Ocean, "at least as a rendezvous for two or three of the "smaller classes of His Majesty's ships. The accom-"modation of such vessels would indeed require "the expenditure of a considerable sum on both sides "of the entrance of the harbour or channel, parti-"cularly on the northern side, to render its entrance "more safe and commodious. But were this done, it "were easy to show that there is not, perhaps, another "situation as the north-eastern coast of Great Bri-"tain which so particularly holds out and lays claim "to the assistance of Government than the harbour "or channel of Montrose." Mr. James Walker, in his report dated 1839, says—"I have already referred "to the principal features of the entrance and the "river up to the Stact. The harbour is considered "by you, and probably with reason, as the best "between the Firth and the Moray Firth. It is, "therefore, very important in a public view." I refer to the Admiralty report on the Montrose Harbour Act, and particularly a passage marked 9 on the report I gave in, regarding the capabilities of the harbour, in admitting the *Stromboli* at a time when no other port could admit it. I have to repeat that the Montrose harbour trustees consider that a judicious expenditure of money in improving the existing harbours, and particularly such a harbour as Montrose, would be much preferable to laying out a large sum on a harbour of refuge which is at a great distance from the coasting trade. The coasting trade, it is well known, and the foreign trade, are very trifling, comparatively speaking, north of Aberdeen; and certainly it is like placing a medical man, if I might use the expression, in a place where there is no people, instead of a place where there is a dense population. The Montrose harbour has a depth at the bar of 18 feet. Accumulation there is entirely prevented by the scour of the passing of slate, which counteracts any tendency of the bar to increase. Vessels can therefore enter the river almost at all states of the tide. A little farther up, at a place called the Cross Dykes, the depth diminishes to nine feet. Were this channel deepened, the harbour would be accessible at all times of the tide. This is a rough plan on a small scale showing the locality of the harbour, and another plan of the harbour.

2655. (*Chairman.*) Do you wish to lodge these plans?—The second plan is accessible to all who may wish to inspect it, but the other I can leave.

Witness resumed: There is one mode of improving the harbour that the trustees consider would be very desirable. There is a large bank called the Scalp, which, if removed, would give about 60 or 80 acres of ground within the harbour. I believe that the Commissioners have before them, in the shape of the Admiralty reports and surveys, and reports of the Tidal Harbour Commission, very full information in regard to this harbour, which I will be sorry to trouble the Commissioners with repeating. Captains Washington and Vetch conducted the inquiry before, and, of course, are well aware of the capabilities of the harbour at present, and if improved. I may mention also that the harbour trustees hold the view that the central situation of Montrose, being nearly midway between the Moray Firth and the Firth of Forth, renders the harbour worthy of improvement. The trustees have laid out about 50,000*l.* in the construction of a dock, and otherwise improving the harbour. I am prepared now to answer any question that you may ask. I may add that Arbroath is not very accessible in stormy weather in certain states of tides, and Arbroath vessels enter Montrose and lie there till they can enter conveniently the harbour of Arbroath.

2656. I understand you distinctly to state that you consider the improvement of the smaller ports along the coast to be preferable to the establishment of one large national harbour of refuge?—Most decidedly.

2657. (*Mr. Lindsay.*) You say the depth of water in one part of the entrance is nine feet?—It is in the channel referred to about 1,800 yards up the river. You are fairly within the channel before you come to that diminished depth.

2658. Is that at low water spring tides?—Yes; at a place called Cross Dykes, at the entrance of the river. This harbour is taken by vessels taking the bay lights in line. The depth is marked on the one side by a buoy, and on the other side there is what is called the Stone; and the vessel takes the harbour by the one light covering the other, and they get in up to this point before the diminished depth to which I referred takes place.

2659. What is your rise and fall of tide there?—About 16 or 18 feet.

2660. Then at the shallowest part of the river, do I understand you to say, that you have a depth of 24 feet at high water spring tides?—Most certainly.

2661. And do I understand you to say that at the entrance you have 18 feet at low water spring tides?—Yes; the depth varies slightly, according to prevailing winds and storms, but it is counteracted by the scour of the passing spate, as I have mentioned, which rushes down and counteracts the tendency to increase.

2662. And at high water spring tides at the entrance you have 42 feet?—We have 40 feet at least, but we have a nautical witness who will be able to satisfy you on that point.

2663. (*Capt. Washington.*) There must be some mistake about it?—I observe it stated in Mr. Stevenson's report at 18 feet, and the extract is produced.

2664. I thought you spoke about 40 feet?—I observe that Captain Washington submitted about 100 queries to the harbour trustees, and one of the questions was, "Depth of water at entrance at "low water at spring tides." The answer given at that time was 16 feet at the entrance of the river.

2665. (*Mr. Lindsay.*) He says he has a nautical witness here. I would prefer examining the nautical witness on one or two of these points.

2666. (*Capt. Washington.*) Is there a floating basin at Montrose?—Yes, a wet dock.

2667. What is its area?—3¼ acres. It is 55 feet wide in the clear, and admitted the *Stromboli*. But the excavation of the Scalp would give 60 or 80 acres of berthage within the river.

2668. Have you any estimate for the excavation of the Scalp?—We have no estimate.

2669. Are there facilities for repairing vessels?—Yes, there are three or four places.

2670. And repairs to steam-engines?—Yes.

2671. (*Chairman.*) Mr. Burns, I omitted to place your name on evidence. What is your name?—Adam Burns.

2672. And your occupation?—Solicitor.

ABERDEEN.

Captain BURN examined.

Capt. Burn.

2 Sept. 1858.

2673. (*Chairman.*) What is your name?—John Burn.

2674. What is your occupation?—A shipmaster.

2675. What number of years have you been at sea?—40 years.

2676. For how many years master of a vessel?—33.

2677. And where chiefly employed?—In the Baltic, and round to Archangel.

2678. Is it your opinion that a large national harbour of refuge is required on the north-east coast of Scotland?—It is my opinion that to deepen such harbours as this would be of more benefit to the shipping interest along the coast than one refuge harbour.

2679. (*Mr. Lindsay.*) Are you well acquainted with the harbour of Montrose, and the entrance to it?—Yes, I have been a long time going backwards and forwards.

2680. What depth of water is there at the bar?—We always reckon 18 feet at the lowest spring tides.

2681. But what is the shallowest part of the river?—Ships do not run in at low water.

2682. But what is the shallowest part of the river?—It is what we call the Cross Dykes, half way down from the lower light to that point.

2683. What depth of water is there at low water?—From 8 to 9 feet.

2684. (*Capt. Washington.*) Cross Dyke, I may mention, is the name of a rocky ledge?—Yes.

2685. (*Mr. Lindsay.*) Is the bed of the river sand?—No, it is generally boulders.

2686. Could the depth of water in the navigable part of the river be increased to the same depth as at the bar?—There is no doubt of it.

2687. By dredging?—Yes, and running the quay from the lower light out towards the Annat.

2688. Why would that quay, in your opinion, be necessary?—It would direct the water more low down by that means, and take away the sand from the eastward.

2689. Then are you of opinion that there might be obtained a depth of 36 feet of water in the navigable part of the channel at high water spring tides, with a comparatively moderate outlay of money?—As to outlay of money, I cannot say what it would cost; but I have no doubt it might be made.

2690. But in regard to the cost, what it would cost you cannot say?—No, I have no idea of the cost.

Provost NAPIER examined.

Provost Napier.

2691. (*Chairman.*) What is your name?—Thomas Napier.

2692. And your occupation?—Shipowner and fisherman. I am also Provost of Montrose.

2693. Is it your opinion that any large harbour of refuge is required on this district of coast, the north-east coast of Scotland?—It is not.

2694. (*Mr. Lindsay.*) Have you heard what the previous witness stated?—I have.

2695. Did you ever take in any estimate as to the cost of deepening the river to the extent he named, and build the pier which he referred to?—We have never taken any estimate of what has been referred to by the last witness. With regard to the Cross Dykes, it is but a narrow stripe, perhaps not more than 50 or 60 feet, and the cost of removing it would be very trifling. But the north pier, to keep the scour bay in the channel, would be very considerable, because it is sand to a very considerable distance. It has to be turned from the lower light to the Annat.

2696. Providing you removed this dyke, it would still be necessary for you to have a pier so as to maintain the depth of water in the river?—Yes.

2697. And what length of pier would you require?—I could not state the exact number of feet, but it might be 600 to 800 feet.

2698. (*Capt. Washington.*) Do you say that the expense of removing the Cross Dyke would be trifling?—Yes.

2699. Do you know about what?—I could not estimate the amount, but I know it is trifling.

2700. Of what material is it?—It is gravel and stone.

2701. If the expense would be so trifling, why do not the harbour trustees remove it?—We do not suffer from any want of energy; it is only our small funds that are not sufficient for that.

2702. I see by the chart there is a depth of 6 feet there; to what depth do you propose to remove it?—Were we to improve the Montrose harbour, we would make it 18 feet, the same as the bar.

2703. You are pleased to speak of the bar of Montrose harbour, but in the general acceptation of the term there is no bar?—We always mean the entrance.

2704. It appears that Montrose is in a very peculiar position, having no bar. It appears that you would remove this Cross Dyke at a very trifling expense, when you please?—The reason why we have not been able to remove it is this: our expenditure till within the last year or two was such that we were not in a situation to get it done.

2705. (*Chairman.*) You have stated that you are of opinion that no large harbour of refuge is required upon the north-east coast of Scotland; would you be disposed to say that that is the general opinion held by the parties interested at Montrose?—I would, and for reasons which I will shortly give.

2706. Will you do so?—Yes; we have had this subject thoroughly looked into and investigated, as to the three harbours which have been repeatedly named here this afternoon. Shipowners in the present times do not like harbours of refuge. I speak of the mercantile navy, and inasmuch as we do not want them to go to harbours, if possible. We are well aware of the situation of Wick, and the claims they have been setting up for it. I know the mode, and am well acquainted with all its important fishing operations. But to speak of a harbour of refuge for Wick is quite uncalled for. I consider a harbour of refuge a harbour to give accommodation to vessels with heavy draughts of water, perhaps ten or fifteen of Her Majesty's Navy, if necessary, to get in. Wick wants accommodation for the fishing, which lasts about two months; and it cannot be denied there is great necessity for giving some accommodation to Wick. For that purpose only, but beyond that shipowners do not consider it to be of any importance to them, having, as formerly has been stated, Longhope and Cromarty Firth quite available for any parties that wish to keep the sea; and 10,000*l.*, 15,000*l.*, or 20,000*l.* would be sufficient to give for an ample harbour for their fishing purposes. Well, I think that disposes of that. I come now to Fraserburgh. It is not suitable for a harbour of refuge; it is not worth the name of that; it cannot be done. But they no doubt want some little assistance to complete the harbour which they have commenced, and, like other harbours, would require a little money. That is our position too; the same as we want some money too, to deepen our harbour. Then we come to Peterhead. If the Government decides for a national harbour of refuge to take in 150 to 200 acres; a harbour, another of what some of the gentlemen present were looking at in France lately, then make it at Peterhead; but really it would be a question of money, that I could not recommend the Government to give for that purpose, because we have the Cromarty Firth and the Firth of Forth;

and if you improve some of the existing harbours, you can have vessels of an ordinary draught of water. I speak of Montrose. Give us 60,000*l.*, 70,000*l.*, or 80,000*l.*, and we will give you ample accommodation for half a dozen second-class vessels; and if it was necessary, we could have an harbour studded with men-of-war.

2707. For the purposes of the mercantile marine you are quite of opinion that a large harbour of refuge is not required at Peterhead?—Yes, inasmuch as every shipowner knows perfectly in these times, not only to get our vessels well made, and with good canvas, but to keep them at it, and not allow them to to be at harbours of refuge.

Mr. David Mackie examined.

2708. (*Chairman.*) What is your name?—David Mackie.

2709. What is your occupation?—Shipowner.

2710. In what way are you connected with the harbour of Montrose?—I am one of the trustees.

2711. For what period have you known the harbour of Montrose?—For thirty or forty years.

2712. Do you concur in the statement which has just been made by Provost Napier?—Quite.

Mr. David Walker examined.

2713. (*Chairman.*) What is your name?—David Walker.

2714. What is your occupation?—Shipowner.

2715. In what way are you connected with the harbour of Montrose?—As a trustee.

2716. For what period have you known the harbour of Montrose?—All my life, but I have been connected with it as a shipowner for the last twenty-five years.

2717. Do you concur in the statement of Provost Napier?—Generally, I do.

2718. Are there any points which you would wish to state in which you differ from him?—No, I do not think there is any point of importance.

2719. (*Mr. Lindsay.*) Are there no other points which you would wish to bring under the notice of the Commissioners with regard to Montrose harbour?—No, I coincide in the general opinion of the Provost. I think the main point is the great depth of water, and such a depth of water as naturally requires no dredging. It would be permanently a good harbour, once we got the water up.

2720. You have no further remarks to add than what the other gentlemen stated?—No.

2721. (*Capt. Vetch.*) Why have you not removed the Cross Dykes?—The reason is, that for our local trade the harbour is indifferently good, but if it were to be made a harbour for general purposes it would be highly expedient that they should be removed.

2722. If they were so removed would your trade not increase, and larger ships be accommodated?—The trade that we have at Montrose does not require larger ships.

2723. It would not be navigable for large ships?—Oh yes, it would be navigable; still I think, if it were to be made anything like a harbour for the general trade of the country, it would be expedient to deepen it, and to let in larger vessels than we had occasion for.

2724. Are you speaking of Aberdeen or Montrose?—Montrose.

2725. Then the present state of your harbour is quite ample for your trade?—It would be certainly too much to have Cross Dykes deepened.

2726. Not for the purposes of your trade?—Well, it would be a large increase for that, but the present state of the river is sufficient.

Mr. Burns examined.

2727. (*Chairman.*) In what relation do you stand to the harbour trustees of Montrose?—I am secretary. I would just wish to state in reference to the answer given by the last witness, that it would make it advantageous as a subsidiary harbour of refuge. If any further evidence is wanted in London the harbour trustees would be glad to send any nautical man.

2728. Your request will be duly considered.

2729. (*Capt. Washington.*) Perhaps Mr. Burns would furnish an estimate of the deepening of Cross Dykes, and removing the Scalp?—I will.

Deputation from Stonehaven.

Mr. James Tindall examined.

2730. (*Chairman.*) What is your name?—James Tindall.

2731. And your occupation?—Collector in Stonehaven, and clerk to the Harbour Trustees of Stonehaven.

2732. Is there any statement which you wish to make with reference to the harbour of Stonehaven?—Yes.

2733. Considered first as a fit site for a national harbour of refuge?—I am not capable of giving an opinion upon that point myself; but we were not aware until last night that the Commissioners were to be here to-day, and I happened to be here on other matters altogether; therefore I am not quite prepared to say so, but I know it is the opinion, and has been considered so for some time past, that it is a fit place for a harbour of refuge; if not a national harbour on a great scale, still as a small and subordinary harbour. Perhaps I may state that Sir John Forbes, who was here to-day, and who had a statement to make, was prevented from making it by being officially connected with the great cattle-show here. He lodged three or four documents, and there were two memorials sent to Parliament last session in reference to this subject, and the situation of the harbour of Stonehaven is fully stated in those documents. Perhaps it would be better to refer to them than make a separate statement at any length; but there are one or two things that I would like to state in addition.

2734. (*Chairman.*) Will you proceed with your statement?—The town of Stonehaven and harbour of Stonehaven, as the Commissioners know, is situated to the south of Aberdeen, about 15 miles—about half way between Aberdeen and Montrose; it is the county town—a small town, containing between 3,000 and 4,000 inhabitants, and has very little trade; but these are matters that perhaps do not apply to making a proper harbour of refuge. The harbour was a very small harbour; it was made by the proprietor of the ground, and was forfeited immediately after the rebelion in '45. It fell into the hands of different parties, and was kept up as a sort of private

ABERDEEN.

Mr. J. Tindall.

2 Sept. 1858.

Chairman.

harbour, without having harbour dues. It was kept up in that way till about 30 years, when there being a great desire to improve it, an Act of Parliament was applied for and obtained, and trustees were named for having a new harbour made—the safe harbour. There is a south and a north harbour ; and the money for making it was borrowed from a bank to the amount of about 8,000*l.* That sum of 8,000*l.* still remains unpaid. The shore dues we received at the harbour, and for a considerable time they amounted to perhaps 500*l.* or 600*l.* a year ; but since the establishment of a railway running past Stonehaven, the trade of the harbour has been very much interfered with, and now the yearly harbour dues amount only to about 200*l.* This is applied in keeping the harbour in repair, which does not require very much, and paying the expenses of officers. The expenses and repairs amount to some 60*l.* or 70*l.* a year, and the remainder goes to pay the interest, as far as it is capable, of the money borrowed from the bank, so that the funds of the harbour are in a bad situation, and the trustees are not capable of doing more than they have been doing, and if anything is to be done it must be done otherwise. The ships belonging to the port are some 9 or 10 vessels of small tonnage—80, 90, or 100 tons ; they are chiefly employed in the importation of coal, lime, and other heavy articles ; and during the herring fishing season the harbour has been, for the last 20 years, overflowed by boats from other places to the number of 50, 60, or 70. The number during the present fishing, I think, is 70, all from other places, with the exception of one or two ; and from their having been successful this year it is believed, and I heard it from various quarters, that the number of boats next year, and perhaps in future years, will be very much increased. Before the Act of Parliament was obtained, Mr. Robert Stevenson, the engineer of the Bell Rock Lighthouse, was applied to to inspect the harbour, and make a report. He did so. The idea was merely to have a harbour suitable for the particular class which traded here ; but it struck him as being a place for a much larger harbour, and therefore he added to his report, that he conceived it would be a very suitable place for a large harbour—a harbour something of the nature of a harbour of refuge, in which even vessels of the navy might take refuge ; and he made a report to the same effect, and made a plan of it, and also a sort of plan of the proposed extended harbour. That plan and that report I have not with me to-day, as I was here accidentally on other matters ; but I shall be glad to send it to the Commissioners to-morrow to Dundee or elsewhere, or give it to the steamer in passing Stonehaven to-morrow.

2735. (*Chairman.*) Will you forward the plan in question at your convenience ?—Yes. (*The witness proceeded*) :—

The principal advantages of Stonehaven, as appears to those who have looked at the place, and who have thought of this matter for some time, are :—first, that it is situated exactly midway between the Firth of Forth and the Moray Firth. You will see, from what has taken place here, that this is correct, because the town of Aberdeen on one side of Stonehaven, and the town of Montrose on the other side—that those two places were central places between the two firths. Now, if that be so, of course Stonehaven being between them, must be made so. It is exactly midway between Buchan Ness and Fife Ness. Stonehaven is situated in an extensive bay, protected by headlands on both sides—particularly protected on the south and south-east by a high headland ; and the harbour is just immediately without that ; at present it is only a tide harbour, and as at low water there is almost no water, it is at high water that the vessels enter and leave the harbour. According to Mr. Stevenson, it appears from his report that the harbour could be so far carried out as to have a harbour capable of admitting vessels even at low water. I believe there would be considerable expense in doing that, but the material is just at hand. It is a place very favourable for the material necessary for building piers and breakwaters, there being a quarry, a very extensive one, close to the harbour, out of which the present harbour was built, and out of which harbours of a much greater extent could be built.

2736. (*Chairman.*) State, supposing the improvements you contemplate are carried into effect, to what number of ships it would be capable of giving shelter as a harbour of refuge in a heavy easterly gale.—It could be carried out so as to give shelter to 100 vessels, I should think, but it might be so carried out as to give shelter to 50. At present, I think, some 30 or 40 vessels in the harbour in an easterly wind run in for shelter. It is in some measure a harbour of refuge at present. In easterly storms vessels run into it very frequently.

2737. Would vessels be able to run into it at all times of tide if the improvements which you contemplate are carried into effect?—I think so. If the breakwater be carried far enough out they could come into it at all times of the tide, but that was not referred to by Mr. Stevenson, and not having his report, I would not like to say anything positive about that, but refer to his report and the plan which I shall send to the Commissioners.

2738. (*Mr. Lindsay.*) You say that if the improvements were made which Mr. Stevenson recommends vessels could enter at all times of the tide ; what sized vessels ?—He said the smaller vessels of the Royal Navy might enter.

2739. Do you remember what Mr. Stevenson's estimate of the cost of making such a harbour would be ?—The cost of the larger harbour, I think, that he lays down upon his plan, was something more than 40,000*l.*

2740. What depth of water have you in the bay? —By going a very short way out the depth increases rapidly.

2741. What kind of shore have you along the bay? —Sandy sort of beach along the bay. There were some rocks where the harbour is, but they were taken out. The name Stone, however, would give you some notion of the place, that there was originally some rock.

2742. Then does the present shipping trade of the place consist entirely of small coasting vessels and fishing boats ?—Yes, almost entirely at present. At one time foreign vessels occasionally came with timber, but there has not been much of that of late.

2743. (*Capt. Vetch.*) How many acres does the harbour contain at present ?—I should say perhaps four acres. There are two harbours, the old and the new ; the one to the north and the other to the south. I should think each about two acres.

2744. Are they dry at low water ?—They are almost dry at low water of stream tides, but not of neap tides.

2745. (*Capt. Washington.*) It is five acres, if you like to know. I am speaking without having reference to any measurement. I think it is fully what I say.

2746. (*Mr. Coode.*) Is there a plan attached to Mr. Stevenson's report ?—There is.

2747. Does that plan show the proposed improvements ?—It shows what he suggested himself.

2748. Is it suggested as a harbour of refuge, or simply for the trading purposes of the port ?—It went beyond the trading purposes of the port. It marked off a further harbour that might be built with more propriety and usefulness, and which was beyond the trade of the place altogether.

2749. And was the sum named in the report for which that work might be accomplished ?—There is an estimate attached to it. He proposed two or three scales, and there is an estimate applicable to one or two of them. What I have said, Mr. Stewart, one of the magistrates of the town of Stonehaven, will corroborate.

2750. (*Chairman.*) Can you hand in a list of the gentlemen who are with you ?—Yes.

Mr. STEWART examined.

ABERDEEN.

Mr. Stewart.

2 Sept. 1858.

2751. (*Chairman.*) What is your name?—William Stewart.

2752. And your occupation?—Sheriff clerk of the county of Kincardine, and agent for the Bank of Scotland.

2753. Do you agree generally in the statement you have heard made by the last witness?—I do.

2754. Is there any point on which you are disposed to differ from him?—No. The whole I could say in addition is that I think, from its locality, and the locality of the situation on the coast, from the depth of water, and the advantage that it has as a place that could be easily taken by ships in north-east winds on the coast,—I think it has a claim for consideration by the Commissioners. The depth of water is so considerable as to be almost any depth if you carry it out far enough. But at all times, from the depth of water, ships could enter.

2755. (*Mr. Lindsay.*) What is the opinion of the people of Stonehaven with regard to a national harbour of refuge on the north east coast of Scotland?—I could hardly say. I believe they are of opinion, so far as I could gather, that if there were such a harbour contemplated or thought necessary, the bay of Stonehaven is so situated as to be well worthy of the consideration and the examination of the Commissioners, to see whether or not it should not be more advantageous and less expensive to make it a harbour of refuge than any of the others that have been mentioned, such as Wick, Peterhead, Fraserburgh, and those places.

Mr. KINNEAR examined.

Mr. Kinnear.

2756. (*Chairman.*) What is your name?—Arthur Kinnear.

2757. What is your occupation?—Bank agent and solicitor, lately connected with the shipping office.

2758. Do you concur generally in the statements which have been made by the two previous witnesses?—Yes.

2759. Is there any point on which you differ from them?—No. I may say in addition that I have often heard seamen say that it is the most easily taken port in the east coast during a storm.

2760. (*Mr. Lindsay.*) Do you know what is the opinion of the people of Stonehaven with regard to a great national harbour of refuge on the north-east coast of Scotland?—The general opinion is that it would be more valuable to assist the smaller harbours on the coast than erect one great national harbour of refuge. That is certainly the opinion that I have heard.

2761. Have you heard any of them say that they thought such a great national harbour was necessary?—They thought perhaps it would be a desirable thing to have in case of accident, instead of being an absolute necessity. They thought perhaps the Commissioners might have visited this place personally, so that they might have formed their own judgment on the matter. We were so situated that we had to employ the engineers with a view of making the necessary plans, and modelling the plans to suit the present views.

2762. (*Capt. Washington.*) You are probably aware that two of the Commissioners had visited Stonehaven ten years ago, and made a full report of it before Parliament?—Yes. Perhaps an opportunity might be afforded to parties connected with Stonehaven of forwarding any additional evidence to the Commissioners in London, should it be desirable.

(*Chairman.*) The report which you have made will of course be duly considered by the Commissioners: but at the same time, to prevent the possibility of any misconstruction, I feel myself under the necessity of acquainting you that the Commission has been appointed for a special purpose, and of course they select such evidence as appears to them most desirable. In that view they thought it unnecessary to call upon the harbour trustees and parties interested in Stonehaven to give their evidence, simply because they are so entirely in possession at the Admiralty of all the circumstances connected with the port that they considered it unnecessary for the purposes of their inquiry. But at the same time you must permit me to add, that we are glad to have had the pleasure of seeing you here this afternoon; and as you happened to be accidentally at Aberdeen, we have been most happy to hear everything that you have had to offer, and you have been able also to give us some testimony as to the feeling entertained by the people of Stonehaven as to the general question, which of course is valuable to us.

(*Chairman.*) Is there any person present who wishes to tender further evidence with respect to this inquiry?

No answer.

Sittings at Aberdeen closed.

DUNDEE.

Friday, 3d September 1858.

PRESENT:

Admiral HOPE (Chairman).

Mr. LINDSAY.
Captain WASHINGTON.
Captain VETCH.
Mr. COODE.

Mr. SEWELL, Secretary.

Provost LUMGAIR, of Arbroath, examined.

DUNDEE.

Provost Lumgair.

3 Sept. 1858.

2763. (*Chairman.*) What is your occupation?—I am a merchant, the Provost of Arbroath, and chairman of the Harbour Commissioners.

2764. Have you any statement which you wish to offer to the Commissioners?—With your leave I will lay before them a very short statement, and afterwards prove it by evidence.

2765–6. In the statement you are about to make, I wish you to bear in mind that the primary object of this Commission is to inquire as to the most eligible site for a harbour of refuge on the north-east coast of Scotland. And therefore in any statement you make, or any evidence you bring forward, I wish you to recollect that is the primary object. You will be at perfect liberty also to make any statement, or give any evidence as to Arbroath, to show its eligibility for being a subsidiary harbour of refuge, if you wish to do so.—I wish to speak as to its being a subsidiary harbour of refuge. There are some gentlemen here from Arbroath who have been long at sea, and who can give much better evidence regarding this than I can; therefore I will dispense with making any remarks as to the subject of a general harbour of refuge, and confine myself to the claim of Arbroath as being a subsidiary harbour of refuge. By deepen-

DUNDEE.

Provost Lumgair.

3 Sept. 1858.

Chairman.

ing the harbour of Arbroath a few feet, it could be rendered very serviceable as a harbour of refuge for the greater part of the shipping frequenting this coast. If this were done, vessels could take it very often when they are compelled to run on shore or to attempt taking some other harbour in the north, in which case they are frequently wrecked, and a great many lives lost. I prove my case, not so much on the commercial grounds that it would benefit the harbour of Arbroath, as on the grounds of public utility and humanity. What I believe is, that if the harbour were deepened a few feet, a great many lives and a large quantity of property, which are now lost in consequence of vessels not getting into Arbroath from want of depth of water, would be saved. At present these vessels run to other places, the access to which is very difficult, and the vessels are often lost. Arbroath is very easily taken; the great difficulty is, the want of depth of water. It is only vessels of small size that can come in, and only during a short period of the day. If there were an additional depth of water of about three feet, vessels of the ordinary size on this coast could come in 12 hours out of the 24. In advocating a grant from government, I will prove that we do not seek this without having first helped ourselves. In order that the harbour might be put into the hands of trustees, and taken out of the hands of the Town Council, who retained the dock for municipal purposes, the inhabitants assessed themselves for these municipal purposes. A sum of 60,000*l.* was raised to improve the harbour, and this has been raised principally on the security of the merchants of the town, of country gentlemen, and of others interested. By this expenditure, great improvements in the accommodation have been made, and the only deficiency now is the want of depth of water. By an estimate prepared by Mr. Leslie, civil engineer, a gentleman of great experience, it is shown that an additional depth of three feet of water could be obtained by an expenditure of 10,000*l.* This would admit a much larger class of vessels than at present, and in states of the tide in which just now it is impossible for any vessel to come in. The Harbour Commission have been encouraged to make the application by the very favourable report of the Arbroath harbour made by the Tidal Commissioners in 1845, and by the report made by the Board of Admiralty to the Lords of the Treasury in 1848, copies of which I will place at the disposal of the Commissioners. I will just read the following short extracts from the report by the Tidal Commissioners in 1845.

"The estimated expense of executing these works, "as in nearly all similar cases, has proved too small. "As far as they have been carried out, they are con- "structed with deep foundations, and are of a substan- "tial and stable character. But the deepening of the "harbour, with its entrance and approaches, is still "unfinished; and having exhausted all their re- "sources, the trustees have memorialized Your "Majesty's government for a small grant to enable "them to complete the projected works, without "which what has been done will be in a great mea- "sure unavailable. The works proposed, it appears "in evidence, would give a mean depth of 16 feet "at high water of ordinary spring tides, they would "render Arbroath a tidal harbour of refuge for 12 "hours out of the 24 for all vessels of the size which "usually frequent that coast, and they would thus be "as great a benefit to the public as to their enter- "prising owners; for the greater part of that rocky "coast, when it becomes a lee-shore, is extremely "dangerous, as was too fatally proved in the gale of "January 1800, when 40 vessels were wrecked, and "13 of them within a few miles of Arbroath. "Taking all the above-mentioned circumstances into "consideration, it appears to the Commission that "this case comes so distinctly under the fourth head "of inquiry pointed out to us by our instructions, "that, if in any instance Your Majesty's government "should be disposed to aid the local exertions of the "trustees of a harbour, this case seems deserving of "encouragement; and we therefore humbly beg leave "to recommend to Your Majesty the prayer of the "trustees of the harbour of Arbroath."

I then hold in my hand a report by the Board of Admiralty to the Lords of the Treasury, dated 1848. In this it is said:—

"That the statements in the memorial of the trus- "tees are fully borne out by the evidence taken "before the Tidal Harbour Commission, and by the "report of the Commissioners. The simple facts of "the case connected with this harbour are so forcible "that the bare enumeration of them seems all that is "necessary. 1st, that a harbour in the position of "Arbroath, on the east coast of Scotland, is much "wanted. That the present harbour, even in its in- "complete state, has proved useful in many cases in "saving life and property, and that it is the station "from whence the Bell Rock lightkeepers are "supplied with provisions and stores, and help in case "of need. 2d. That this harbour, like many others "in Scotland, was the property of the town, and its "revenue was applied to lighting and paving the "streets, &c. 3d. That the harbour accommodation "having become insufficient for the trade of the "place, the community voluntarily gave up the whole "of the dues towards its extension, taxing themselves "instead for municipal purposes. . . . . 6th. "That the works, as far as they have been carried "out, are substantial and good; but the deepening of "the approaches to the harbour, an essential part of "the plan, still remains to be executed. 7th. That "in order to admit vessels of 15 feet draught of "water, it would be requisite to clear a channel 100 "feet wide, and 3 feet deep, for a distance of 230 "yards, out to low-water mark. 8th. That such a "work would cost 10,000*l.*, but the judicious expen- "diture of that sum would double the value of the "present works by rendering the harbour available "to all vessels that usually trade along the east coast "of Scotland. 9th. That the present income exceeds "3,000*l.* a year, but as the trustees are now paying "5½ per cent. interest for the greater part of the "harbour debt, they have no funds which can be "applied to further improvement."

Then comes a recommendation, or rather a reference to what has been done by the people of Arbroath, as showing their claim to attain aid:

"Considering the praiseworthy spirit evinced by "the inhabitants of Arbroath, and the personal "sacrifice they have made for the public benefit, the "value of a good harbour on that exposed coast to be "obtained at so trifling a cost, and that for want of "a little timely assistance, much of what has been "done is in a great measure unavailable, we feel that "we are fully justified in concurring with the report "of the Tidal Harbour Commission, that if in any "case Her Majesty's Government should be disposed "to aid local efforts in the improvement of a harbour "the trustees of Arbroath, 'under all the circumstances "'of the case, are specially deserving of such aid in "'order to enable them to deepen the entrance and "'approaches to their harbour, and to complete the "'works they have so well begun.'"

I may state that from all the circumstances of the Harbour Trust, a loan would not be so great a boon now as at the period when it was asked. We, the Harbour Trustees, now ask a favourable report on the part of this Commission, in regard to our application to receive a grant from Government of 10,000*l.* for the purpose of deepening the harbour and the entrance; and the Harbour Trustees believe that sum would be sufficient for the purpose. Such is a general statement of the application we make to the Commission, and the grounds on which we consider we are warranted in making this application, that is, the benefits that would result to the shipping generally from the deepening of the harbour, the greater security to life and property, the previous worthy efforts of the inhabitants of the town, and also the very favourable reports by the Tidal Harbour Commissioners and by the Lords of the Admiralty.

DUNDEE.

Provost Lumgair.

3 Sept. 1858.

Mr. Macdonald, the clerk of the Harbour Trustees, is present, and is able to give much fuller information on the subject than I can do, and there are three gentlemen present from Arbroath able to give information as to the harbour of Arbroath, and also as to the general question of a large harbour of refuge.

2767. How long have you been acquainted with the harbour of Arbroath?—I am a native of Arbroath, and have chiefly resided in it.

2768. Then are you well acquainted with the shipping interest?—Yes, but I am not much connected with it.

2769. In your opinion is it desirable that there should be a large harbour of refuge on the north-east coast of Scotland between the Firth of Forth and the Pentland Firth?—I cannot say that I have directed attention to the question of a national harbour of refuge. The trustees have directed attention to their own harbour as a subsidiary harbour of refuge, but not to the question of a general harbour of refuge. I think the shipmasters will give much better information on the subject.

2770. (*Mr. Lindsay*). Do I understand that 10,000*l.* would deepen the harbour to the extent of 3 feet?—That is Mr. Leslie's estimate.

2771. You did not make clear the object you had in view. Do you come here to ask Government to grant 10,000*l.*, or to lend it?—We ask it as a grant.

2772. Do you wish the Treasury to make an advance of all the money you require for making your harbour a subsidiary harbour of refuge?—I think the advantage to the shipping generally would be great from making Arbroath a subsidiary harbour of refuge, so that the sum of 10,000*l.* to be given by the government would be very well laid out for the public interest.

2773. Would not an outlay of 10,000*l.* tend very materially to improve the revenue of the harbour of Arbroath and the trade of that place?—No doubt it would after the works were executed; but it would be a great public benefit.

2774. But would it not be a far greater benefit to you than to the public generally?—It would be of great advantage to us; but we have already done a great deal, and we are not able to do more.

2775. Then I would like to know what benefit the general shipping interest and the public at large would derive from it. In the first place what would be the depth of water?—16 feet.

2776. What is the rise and fall of the tide at Arbroath?—I am not sure.

2777. What depth of water have you at low water?—In the harbour none; it is a dry harbour.

2778. What winds are the most dangerous winds on this part of the coast?—South-east.

2779. You say that it is for the protection of the shipping sailing along this coast, and for the safety of life and property,—say that a ship were caught in a south-east wind, which is the most dangerous wind, could she not run for the Firth of Forth and find safe shelter there, or for the Firth of Tay?—I believe the Firth of Tay is difficult to take, and the vessel may be too far in shore to gain the entrance of the Firth of Forth.

2780. Do you think that an expenditure of 10,000*l.* would make Arbroath safer to take in a south-east wind, than the Firth of Tay?—I am not sufficiently versed in these points to answer the question. Some of the shipmasters, who are practical seamen, will answer it much better than me. But I can speak to the general statement that Arbroath can be taken by vessels who can take no other port on the coast; and that vessels that have been compelled to pass Arbroath, from there not being sufficient depth of water, have been lost going to Montrose. One thing I may mention. a number of years ago several boats came from Peterhead, and they could find no shelter all the way along the coast until they came to Arbroath. Fortunately there was water for them in Arbroath, and they got in there.

2781. Do I understand you to say that between Peterhead and Arbroath there was no harbour where boats could take shelter until they came to Arbroath?—Just so.

Mr. JOHN MACDONALD examined.

Mr. J. Macdonald.

2782. (*Chairman.*) What is your name?—John Macdonald.

2783. What is your occupation?—I am clerk to the harbour trustees of Arbroath.

2784. Are you well acquainted with the shipping interest of Arbroath?—I have been clerk to the harbour trustees for a long time, but I am not a practical sailor.

2785. Will you state whether in your opinion one large harbour of refuge between the Pentland Firth and the Firth of Forth would be of benefit to the shipping?—I cannot give an opinion on it myself. Any opinion I have I have formed from the opinions of parties who pretend to know. And that opinion is, that small grants to small harbours would be much more beneficial than a large grant for a national harbour of refuge. Will you allow me to call attention to some of the statements made by the honourable gentleman on the right hand of the chair in regard to the public benefits that would arise from Arbroath harbour being deepened?

(*Chairman.*) Certainly.

(*The witness proceeded.*)—I hold in my hand a statement by six of the most respectable men in Arbroath prepared in 1845, one of these persons is now present, in which they give a list of a great number of shipwrecks, nearly 100, that they all agreed would have been prevented, and the lives of those lost saved, had there been depth of water in Arbroath harbour. Arbroath harbour is very easily taken; all acquainted with shipping state that the only want is the want of water. The document states:—"It frequently happens in the winter season, say three or four times a week, and sometimes with about a dozen of ships, that when driven out of the Forth or the Tay by westerly gales (which they often are without anchors, and with sails much damaged) they try to take Arbroath harbour, but in consequence of the insufficient depth of water that is found impracticable, that is, with ships which draw more than 12 feet of water. Vessels of less draught often get shelter. There is no other harbour that vessels can take with a gale of westerly wind along the whole coast." There never was a ship, in the recollection of any of the gentlemen named, that could not take Arbroath harbour in any state of weather, provided there were depth enough of water; and they never saw a vessel attempt to take the harbour but succeeded when there was sufficient water. The case that the Provost mentioned of a fleet of herring boats coming from Cromarty Firth, I was a witness of myself. They were caught in a tremendous gale, and were driven out of the Moray Firth. They tried Peterhead, but they could not manage in there. They tried Aberdeen, and one was wrecked there. They tried Stonehaven and then Montrose. There were about 20 boats. The gale was increasing, the sea ran exceedingly high, there was immense excitement, the whole town turned out, and the life boat was brought out. The boats got into Arbroath quite safe. That was because they did not require much water. The same day four vessels made signals that they wanted to come in, and they were warned off because the water would not admit them. The community of Arbroath have spent about 60,000*l.* upon improving the harbour; and they taxed themselves to make up the amount formerly given for municipal purposes. They borrowed money to improve the harbour, and many of them gave their own personal security for it. They cannot do more, and all that they intended to do is not done. They intended to deepen the harbour so as to admit vessels of 400 tons instead of vessels of

DUNDEE.

Mr. J. Macdonald.

3 Sept. 1858.

150 tons, and that would take in all the class of vessels frequenting the coast. All that we require is to deepen the harbour and the entrance. According to an estimate we have got from Mr. Leslie, a gentleman well known to the Commissioners, I have no doubt that can be done for something less than 10,000*l.* I have got the particulars of the estimate here, and will lodge them with the secretary. That is what we want, and we consider the matter one of great public importance. I have noticed, in the evidence taken before the Committee of the House of Commons, Mr. Calver, one of the witnesses stated he considered Arbroath harbour of only local importance ; but it is not so. It affects the lives and the property of the shipping interest generally, and not that of Arbroath only. Seeing that Arbroath has exhausted its own means, I think the public would get a very good bargain in the advantages they would obtain for the small sum now asked. I have held the situation of clerk and secretary to the Harbour Commissioners since they were first incorporated by Act of Parliament, and I will be very glad to answer any further questions.

2786. (*Mr. Lindsay.*) As you have now stated some facts of which I was not aware, can you now tell me how the 60,000*l.* was raised, and over what period it was expended?—It was raised by the Harbour Trustees partly on the security of the harbour dues, and partly on the security of private individuals. There were about 70 individuals who came forward and were security for the money.

2787. How was the 60,000*l.* expended? — In making a new breakwater and dock.

2788. And in deepening the channel? — That was what we could not accomplish. The expense of what we did exceeded the estimate.

2789. Then you spent the whole funds in the breakwater and dock?—Yes. There was nothing wanted but the deepening of the channel.

2790. Has there been anything done to deepen the channel of late years?—Very little ; we were not able.

2791. You said vessels take Arbroath in a westerly gale?—Yes.

2792. Do you mean to say that it is not safe for vessels in such gales to run for the Firth of Tay?—I believe the westerly gale would blow them out of the Tay.

2793. If a westerly wind blows them out of the Tay, does it not blow them from Arbroath?—It blows them to Arbroath, that has been proved often. You have got the statement of these 6 men which I read, and no better evidence could be given. They state that it happens three or four times a week in the winter season, that vessels are driven out of the Tay by westerly gales, and that they could take Arbroath were there sufficient depth of water.

2794. Are you able to answer the question, what course a ship must steer to enter the harbour of Arbroath?—I could not answer that question.

2795. Where did those ships belong to that were lost?—To various places. Besides these, I have got a list of five known cases, two of them belonged to England, and three of them to Arbroath. They were wrecked just for want of water in Arbroath. Everybody stated that the want of depth of water was the sole cause of the wreck in each of these cases. In each case, too, every soul on board was drowned.

2796. At what period did these 100 cases occur?—During a long period from 1800 downwards, but these five cases happened within the last few years.

2797. Did I understand you to say that these 100 vessels were lost within the last 50 years?—Within the last 45 years.

2798. What was the average size of these vessels?—From 100 to 150 tons. The five vessels were the schooner *Ellen and Jane* of Arbroath; she could not take the harbour from want of water, and she was driven northwards and lost all hands, 7 in number, off Stonehaven, on the 26th of February 1852. There was the sloop the *North Briton* was lost from the same cause off Montrose, and all hands lost, on the 22d December 1855. There was the schooner *Mavor* lost, from the same cause, near Montrose, on the 6th February 1856. The brig *Dew Drop* of Whitby, bound from Hartlepool to London, and after being as far as Flamborough Head was driven back, the gale being from the south-eastward, and becoming water-logged, ran for Arbroath, and ran ashore near the entrance to the harbour on 6th February 1854. The schooner *Commerce* from Aberdour, on a voyage from Elsinore with wheat, was lost on 9th January 1854.

2799. (*Mr. Coode, showing a plan.*) Does that plan show the harbour of Arbroath in its present condition?—No, it does not.

2800. Have you got such a plan?—No. Mr. Leslie furnished a plan which was laid before the Admiralty in 1848.

Mr. George Kidd examined.

Mr. George Kidd.

2801. (*Chairman.*) What is your name?—George Kidd.

2802. What is your occupation?—I am a shipowner in Arbroath.

2803. How long have you been connected with the shipping interest of Arbroath?—50 years and upwards.

2804. Have you ever been at sea?—For 35 years.

2805. In what capacity?—For 22 years I was a shipmaster.

2806. In what trade were the vessels employed which you commanded?—First in the coasting, and then in the Baltic, in the Baltic principally.

2807. Have you ever returned from the Baltic late in the year?—Often, at all times of the year.

2808. What was generally your landfall returning late in the year?—That depends on the wind. We generally steered from the Naze, and make the land farther north if the wind was from the south, and farther south if the wind was from the north. When the wind is fair, we make for the Bell Rock.

2809. What are the most prevalent winds there late in the year?—Westerly and south-westerly.

2810. And when these winds prevail, generally speaking, what part of the coast do you make first?—When the winds are from the west, generally St. Abb's Head, and sometimes as far north as Peterhead, and sometimes as far south as Shields. Then with a north wind we always made for the land wherever we could touch it.

2811. In taking your departure from the Naze of Norway late in the year, what course did you generally steer?—We generally steered for the Tay when the wind was southward. When the wind was from the south, we made the land generally more north, perhaps Buchan Ness.

2812. Is the land above Peterhead good to make?—Oh yes, it is very high, and you can see the land a far way off.

2813. Will you explain what course you steered with the wind south-west? — We steered for the Tay.

2814. And when the wind was from the south-west, how could you steer for the Tay?—Oh, that was a contrary wind and we did not steer for it. We were obliged to tack, and we made the land anywhere between the Tay and Peterhead, wherever we could reach it.

2815. (*Mr. Lindsay.*) From your great experience I would like to know if you think it would be desirable to have a national harbour of refuge somewhere between the Pentland Firth and the Firth of Forth? What I mean is a harbour into which ships could enter, of all sizes and at any time of the tide?—It would be very desirable to have a national harbour of refuge if it was placed in a proper situation.

2816. Now between the two points I have named, what point would you consider the most desirable for a national harbour of refuge?—I do not know where there would be an available place to make a harbour of refuge. Near the Pentland Firth you have the Moray Firth; and in the south you have the Firth of Forth. It would be of the greatest use in the Moray Firth or the Firth of Forth.

2817. Whether would you prefer Wick, Fraserburgh, or Peterhead?—I do not think any of them available, because at Peterhead you can run up the Pentland Firth to Cromarty; and at Wick, when the wind is east, you have the Moray Firth, and, if the wind is south, the Pentland Firth.

2818. When you were a master, have you sailed often through the Pentland Firth?—Yes.

2819. Did you consider it dangerous?—Yes; the Pentland Firth is dangerous if you go against the tide; if the tide is favourable it is not so dangerous, you can go through quite easily.

2820. Supposing that the Government decided to spend 300,000*l.* on the north-east coast of Scotland, whether do you think that 300,000*l.* should be spent in making one great harbour of refuge, or expended over various harbours for effecting improvements upon them; which of the two plans would tend most, in your opinion, to the saving of life and property of those frequenting these coasts?—I decidedly think that the money distributed in improving the present harbours would do much more benefit than to expend it in one large harbour.

2821. Then you think that for the saving of life, for the saving of property, and for the benefit of commerce, the 300,000*l.* would be better spent it distributed over various harbours than by forming one large harbour of refuge between the points I have named?—I do.

Mr. DAVID LESLIE examined.

2822. (*Chairman.*) What is your name?—David Leslie.

2823. What is your occupation?—I am a shipowner in Arbroath.

2824. How long have you been connected with the shipping interest of Arbroath?—For the last 40 years.

2825. Have you ever been at sea, and for what period, and in what capacity?—I have been a shipmaster for about 40 years.

2826. And in what trade were the ships employed which you commanded?—Principally on the coast and in the Baltic trade.

2827. Have you ever come home from the Baltic late in the year?—Frequently.

2828. What are the prevalent winds in the North Sea late in the year?—It is generally from the westward that there are heavy gales.

2829. And taking your departure from the Naze of Norway with the wind southward and south-west, how would you make your passage?—I would endeavour to make for the entrance of the Firth or the Bell Rock.

2830. Do you mean that you work to windward for the Bell Rock?—Yes.

2831. Therefore I understand that you would not stretch across until you made the weather shore?—Not with a south-west wind.

2832. Would you do so with the wind in any other direction?—With the wind at the south or south-east.

2833. Suppose the wind hung to the north-west and you were bound to Dundee, how would you endeavour to make your passage?—That is a wind almost right on end. The course would be about west and by north.

2834. In such a case would you stretch across to the weather shore or work to windward for your port?—I would endeavour to work to windward.

2835. Have you any opinion as to the necessity of a large harbour of refuge on the east coast of Scotland between the Firth of Forth and the Pentland Firth? and if so state it.—It would be very desirable to have a harbour of that sort.

2836. And where do you think the most eligible site for such a harbour?—Somewhere between Peterhead and the Tay.

2837. State your reasons?—About Peterhead, Wick, or Fraserburgh, you can always run for the Moray Firth, and Cromarty is the best harbour in the world.

2838. Are you therefore of opinion that Cromarty supersedes the necessity of a harbour of refuge at Wick, at Fraserburgh, and at Peterhead?—Yes.

2839. Is Cromarty easy of access in all winds and all weathers?—Quite easy with a sea wind, with a wind from the eastward and southward and so on.

2840. But if you were bound for Dundee, would not running for the Cromarty Firth in bad weather lose a great deal of time and a great deal of distance?—Yes.

2841. (*Mr. Lindsay.*) You said that you thought the best part for a harbour of refuge, if there was any, should be between Peterhead and the Tay?—Yes.

2842. Have you in view any particular point where such a great harbour could be made?—Well, I could not say positively what might be the best spot.

2843. Do you think if such a spot could be found, it would be more to the advantage of commerce, and tend more to save life and property, than if the sum to be expended in such a harbour were spread over various harbours between these points, for deepening and improving them and making them accessible at all times of the tide?—I think it would be better to spend the money in improving existing harbours.

2844. Do you know Arbroath very well?—Yes.

2845. Say that Arbroath harbour were deepened as proposed by Provost Lumgair, during what winds could vessels take Arbroath when they could not get into the Tay?—With the wind blowing north-west you cannot sail into Tay, if it is blowing hard, and yet it is easy to take Arbroath with a north-west wind.

2846. That, of course, will depend on the position of the ship at the time?—Yes, vessels belonging to the Tay often come to the Arbroath; those that find water.

2847. The usual track between the Firth of Forth, and suppose a vessel in the Baltic, and well to eastward of either of these points, and so she was obliged to steer for a harbour in this particular part of the coast, could she get into Arbroath when she could not get into Tay?—With a sea wind, she can always get into the Tay when the weather is clear.

2848. What depth of water have you at Arbroath?—13 feet at high water.

2849. What is the rise and fall?—At neap tides we have nine feet at high water.

2850. What water have you in the channel at low water?—It is dry, quite dry, at low water.

2851. If Arbroath harbour were improved in the way the Provost proposes, would it still be a dry harbour at low water of spring tides?—No, just now it is barely dry; during low water of high spring tides it is barely dry.

2852. Then the expenditure of 10,000*l.* would give 3 feet more water?—I am not very well acquainted with these matters, but it would do a great deal towards it.

2853. Then if 10,000*l.* were expended upon it, it would only be an ordinary harbour, and vessels could only take it at high water?—We would have 16 feet at high water, and vessels of 300 to 400 tons could take it.

2854. (*Capt. Washington.*) What is the average

DUNDEE.

Mr. David Leslie.

3 Sept. 1858.

Captain Washington.

draught of water of coasting vessels generally along this coast?—10 to 11 feet.

2855. In the event of the harbour being deepened to the extent that has been proposed, could ordinary coasting vessels enter at neap tides as well as spring tides?—Quite so.

2856. Would you hesitate to take Arbroath, supposing there were depth of water, in a southerly gale?—No, if there was sufficient water.

2857. That is, if you had a vessel drawing 10 feet of water, and there were 13 feet in Arbroath harbour, would you venture in, in a southerly gale?—I would never hesitate.

2858. Is there any space or outset from the harbour?—None at all.

2859. Is it easier to take a harbour in which there is no outset?—Yes.

2860. Supposing there were depth of water, would it be as easy to take Arbroath as Montrose?—With the ebb tide it is very difficult to take Montrose. The entrance is very narrow.

2861. Do I understand you to say that, supposing there were depth of water, you would rather run to Arbroath than to the Tay or Montrose?—I would, and I have done it.

2862. Is it your belief that the several vessels wrecked you have heard mentioned could have been saved if there had been depth of water at Arbroath?—I am perfectly satisfied that they could. The *Dew Drop* and the *Commerce* were at the bar, and could not come in.

Mr. George Shield examined.

Mr. George Shield.

2863. (*Chairman.*) What is your name?—George Shield.

2864. What is your occupation?—I am a ship-master.

2865. In what trade were the vessels you commanded?—I have been in all trades. In the Baltic trade in my time, then in the Mediterranean trade, particularly in the Baltic trade.

2866. State your opinion as to the necessity or otherwise of a large national harbour of refuge between the Pentland Firth and the Firth of Forth?—I think if the money were laid out in improving existing harbours, it would do a great deal more benefit.

2867. (*Mr. Lindsay.*) I understand it to be your opinion that if a sum of money were voted, it would be much better to spread it over various harbours on the north-east coast than to expend it on any one harbour of refuge in particular?—My opinion is, that it would be better to spread it over various harbours.

2868. But say that the Government decide to have one great national harbour of refuge, what point of the coast would you consider most advisable?—If it was to be between Peterhead and the Tay, that would be the best situation, because if you were off Peterhead you could find a passage either to the Firth of Forth or the Moray Firth.

2869. And what particular part of the coast between Peterhead and the Tay would you recommend?—I cannot say where there would be ground and depth of water. I cannot point out a spot.

2870. (*Capt. Washington.*) You have heard what Mr. Leslie stated respecting taking Arbroath harbour—the facility of taking it—do you agree with him?—Yes I think there would be great benefit from three feet more water.

2871. Do you agree with him in saying that the harbour would be taken easily generally?—It is a very easily taken harbour. There would be no danger of damage hardly if it were not for want of depth of water.

Mr. W. E. Baxter, M.P., examined.

Mr. W. E. Baxter. M.P.

2872. (*Chairman.*) You are member for Montrose?—I am, and I am largely engaged in the commerce of Dundee.

2873. Have you any direct connection with the shipping interest?—None.

2874. Have you read the report of the Select Committee on harbours of refuge?—I have not read the whole, but I have read a considerable portion of it.

2875. Are you aware of the proportion which the maritime population of this country bear to those who are not in any way connected with the sea, and who are able-bodied and might be called upon to bear arms in defence of the country?—No, I am not.

2876. You are aware, however, I presume, that the proportion of the maritime population which may be called upon for the defence of the country, is very much smaller than that of the remainder of the population from which the army is recruited?—Certainly.

2877. Taking that into view, how would you, who have a large stake in the country, be disposed to view a considerable grant of the public money for the purpose of meeting the great risk to which the maritime population of this part of the coast, whether engaged in the passing trade or in the fisheries, are exposed?—I have long been of opinion that it would be a far wiser course to sanction the expenditure of small sums of money in improving the harbours along the coast, than in erecting harbours of refuge at a very large outlay of money, particularly as the experience of these harbours has not been satisfactory, I instance the harbour of Dover, where a very large sum has been expended, I am afraid to say how much, but it is known, no doubt, to many members of the Commission. I understand that on the harbour of Alderney 1,300,000*l.* have been expended on works, which we are now told require a great farther expenditure before they can be of the slightest public benefit. I understand that in Portland also, where a large sum of money has been expended, the benefit has not been at all commensurate with the expenditure; and although no doubt, in my humble opinion, it would be of great benefit that we should have as extensive harbours of refuge as possible, and although property may be saved to some extent by the erection of these works, I really cannot possibly bring my mind to believe that the amount of benefit which can be derived from such a vast expenditure would be sufficiently great to warrant the government of the country in making such a grant. Suppose we had a large harbour of refuge at Wick, and one on the north-east coast of England, and another on the coast of Ireland, I have no doubt that in the course of a few years some few vessels would take refuge there, but I think very great doubt might be entertained whether or not the public money might not be very much more satisfactorily and economically applied in aiding, as stated by some of the preceding witnesses, existing harbours who have already helped themselves, and where the expenditure of a few thousand pounds might render them quite sufficient to meet all the requirements of that part of the coast.

2878. And therefore, on principle, you would not object to a judicious outlay of the public money on harbours with a view to the saving of life?—On the contrary, I think in a time of peace, and when the finances of the country admit of it, that it is a wise and beneficial expenditure of the public money. It is an expenditure which other nations have sanctioned, and which I see no good reason why the greatest commercial nation in the world should not sanction, but very much the contrary.

2879. (*Mr. Lindsay.*) You read the part of the report referring to the east coast of Scotland?—Yes.

2880. Do you agree with it?—I am not sufficiently acquainted with nautical affairs to give distinct evidence as to whether or not we ought to have

vast harbour of refuge on the north-east coast; but I have a preliminary objection, as I stated before. Even supposing it were made out to my satisfaction that a few lives, and some property, were saved every year, I think the benefits would be very small from the erection of such a large harbour. I think it would be doubtful whether the legislature should sanction grants of such sums of money as have been expended on Dover, on Alderney, and on Portland.

2881. You are of opinion that a great public benefit would arise if a certain sum of money were expended over various ports on the north-east coast?—Yes, and on various ports throughout the country.

2882. Would you think it advisable also, or have you heard an opinion expressed among your constituents, that it would be advisable to spend the public money in the erection of one great harbour of refuge on the great north-east coast of Scotland?—I should like to speak cautiously on that point, because I doubt some gentlemen entertain the contrary opinion. All I can say is, that in this locality I never heard any man, whether acquainted with nautical matters, or connected with our commerce and manufactures, ever express a decided wish for such a harbour of refuge as that now referred to.

2883. You have alluded to the north-east coast of England. Do you think a great harbour of refuge is not necessary there, having in view, first, the saving of life; second, the saving of property; and, third, the increased facility to commerce?—I am not competent to answer that question, not being acquainted with nautical matters, or with that particular part of the coast. I have heard seamen and men interested in our commerce and manufactures complaining of the want of some port on the north-east coast of England, to which they could occasionally put in. At the same time, I have no doubt many of them think that there are various ports that might be improved at a comparatively small expenditure, and that that would be a preferable mode of expending money to erecting one enormous harbour at one point even on the north-east coast of England.

2884. Now, say that the Government should decide upon distributing a certain amount of money on the harbours of this coast; in which way, in your opinion, should that money be distributed, whether as a grant to the different harbours, or in the shape of a loan repayable at a fixed period, at a low rate of interest?—I should think that would depend very much upon circumstances. I should think you would require to judge of each individual case by itself.

2885. Do you not think it would be advisable, if the government were to give to harbours a fixed sum of money in the shape of a grant, that it should be required that the parties locally interested should in each case expend a sum equal to the grant?—That would depend upon circumstances. It would depend on what they had previously expended, and upon the particular circumstances of the Harbour Trustees at the moment. I would say that if a locality had spent 20,000*l.* on a harbour, it would be rather too much to ask a grant of 20,000*l.* from the public funds; but I am not prepared to say that a direct grant would not in many instances be preferable to either a loan or a grant with stipulations attached.

2886. (*Capt. Washington.*) I think I understood you to say that you did not see any necessity for a harbour of refuge on the coast of Great Britain?—I should like to explain that I doubt very much whether the benefits to be derived from such harbours of refuge as those at Dover and Portland would be commensurate with the enormous outlay; but I think it an exceedingly wise expenditure in a time of peace, and when the finances of the country admit of it, to give grants to harbours not exceeding a certain sum of money.

2887. You are aware that the subject under inquiry at this moment is harbours solely for the mercantile shipping of this country?—I understood so.

2888. May I ask you to look at the chart which I hold in my hand; you see it is a chart showing the wrecks which have occurred on the coasts of the British isles during the last five years?—Yes.

2889. You see that the total number of wrecks have been 5,128?—That is the number.

2890. And the total loss of life 4,148?—Yes.

2891. Do you not consider that, both as a question of humanity and policy, every effort should be made to endeavour to prevent that loss of life?—I decidedly think so.

2892. Do you conceive that in this rich country any very large sum of money would be too much to expend in saving the lives of 4,148 persons?—Certainly not, if smaller sums of money more judiciously expended would not serve the same purpose.

2893. (*Capt. Vetch.*) Supposing it were decided to expend the public money in the erection of a large harbour, have you any opinion as to about what particular part of the coast such a harbour should be placed?—No, I should think that would require either a nautical man frequently on the coast or a man acquainted with the wants of each locality. Probably it would be judicious to expend a sum of money at Peterhead as well as at Wick, Arbroath, and other places My strong opinion is, that, whatever sum of money is allocated by the government or the legislature, it should not be expended in one place.

2894. That it should be distributed over existing harbours rather than spent on one great harbour of refuge?—Yes.

2895. (*Mr. Coode.*) You speak of the inexpediency of expending one large sum in constructing a great harbour of refuge. Do you think that there is no exception to the proposition you have laid down, that the sum should be expended upon small harbours and improving them?—I doubt if there is any exception. My mind is certainly not made up.

2896. Do you think you have a sufficient knowledge of the whole coast and of the dangers of that coast to enable you to give an opinion?—Certainly not, and I studiously avoided doing so. In answer to the first question of the Chairman, I said I had no practical knowledge of the coast, and that the opinion I stated was given with great submission as an opinion formed upon imperfect premises, but an opinion on a matter which it was my duty as a member of Parliament to look into somewhat.

2897. You speak of the large sums expended on the harbour of Dover, and have mentioned 1,300,000*l.*?—Yes.

2898. Do you happen to know the exact amount expended there; do you know if 800,000*l.* have been expended there?—1,300,000*l.* was stated last year in the House of Commons.

2899. Already expended?—Yes; the statement was made several times in the course of the debate, and, so far from its being a mistake, I understood the gentleman whose duty it was to prepare the estimates admitted it, and it never was disputed.

2900. You speak of the expenditure at Portland; are you aware of the exact amount there expended?—I have forgot it, it was a very large sum. I think we were asked for an additional 60,000*l.* or 70,000*l.* last year.

2901. Are you aware of the total amount expended there?—I have forgot it.

2902. Do you know the amount of the shelter afforded there by the expenditure up to the present time?—No, but I have heard complaints of the amount of the dues, and shippers have said that in running in there for shelter they were running from Scylla into Charybdis.

2903. Can you tell the amount of the dues levied there?—No, I cannot.

2904. Can you tell whether there has been any imposition of dues since the money was expended on constructing the harbour?—No, I cannot.

2905. (*Mr. Lindsay.*) Captain Washington has referred to a very large loss of life along the coast

DUNDEE.

Mr. W. E. Baxter, M.P.

3 Sept. 1858.

Mr. Lindsay.

of Britain; would you think that the expenditure of a sum of money in improving the existing harbours throughout the whole of Scotland, England, and Ireland, would tend more to reduce the number of these fearful casualties than the expenditure of that sum in the erection of three or four great harbours of refuge?—I do not doubt it; it stands to reason.

2906. (*Capt. Washington.*) I think, if I understood you aright, you stated the expenditure at Dover at 600,000*l.* or 700,000*l.*?—No; I said it was a very large amount, but I had forgot the exact sum.

Then I am gratified indeed to be able to inform you that there has not been 300,000*l.* expended at Dover. You stated that there had been a million and a quarter expended at Alderney; there has not been the half of that sum expended there, and you may like to know that there is not one halfpenny of dues charged at any harbour of refuge.

(*Chairman.*) I feel much obliged to you, Mr. Baxter, for having come forward at my request to give your evidence on this occasion.

Mr. G. Welch examined.

Mr. G. Welch.

2907. (*Chairman.*) What is your name and your occupation?—George Welch. I am at present a ship agent and shipowner to a small extent.

2908. Have you ever been at sea?—Yes; I went to sea in 1827, and left off in the end of 1849.

2909. Have you formed an opinion as to the necessity or otherwise of a national harbour of refuge on the coast between the Firth of Forth and the Pentland Firth?—I do not see that such a harbour is very much wanted.

2910. Will you state the grounds on which you have formed that opinion?—The grounds on which I form that opinion are, that at the north part of the coast you have mentioned there is the Moray Firth, which I consider a very excellent natural harbour, at the bottom of which lies Cromarty, a place which can be taken with sea winds at any time; and at the southern part of the limits you have mentioned there is the Firth of Forth, also an excellent natural harbour.

2911. (*Mr. Lindsay.*) You have been at sea?—I have.

2911*a*. Have you ever run for the Moray Firth?—I have not.

2912. Have you ever heard shipmasters say that in running for the Moray Firth they have met with baffling winds in the bight of the bay?—I have never heard such remarks made.

2913. Have you ever gone through the Pentland Firth?—Frequently.

2914. Do you consider it a dangerous passage for vessels to make?—Yes, in bad weather, and indeed I may say in any weather where the tides are so very strong, I consider it somewhat dangerous.

2915. Would you have any hesitation in running through the Pentland Firth with a strong south-east gale and an ebb tide?—None whatever.

2916. Would you with a flood tide in such a gale have any hesitation in attempting to go through?—I would not like so well to attempt it with a flood tide, but if I did I would keep to the southward of Stroma, and by that means would avoid the worst part of the tide.

2917. Have you ever anchored in Longhope and those other harbours of refuge about the Orkneys?—I have frequently anchored in Longhope, but it is such a long time ago that I would not like to say that I had any nautical experience of that place. It was when I was an apprentice in the whale trade that I frequented that harbour.

2918. (*Capt. Washington.*) You are master of the Trinity House, Dundee, Mr. Welch?—I am boxmaster of the seamen fraternity.

2919. What number of pilots have you?—I think there are thirteen or fourteen.

2920. Do they ever pilot ships for the north of Scotland as far as the Pentland Firth?—No.

2921. What is their limit?—The River Tay.

2922. May the entrance to the Tay be taken without danger in a south-east gale?—It depends on the extent of the gale and the state of the tide. At low water and with a south-east gale of wind which has lasted some time, and consequently a sea got up, it would be dangerous, with a vessel of any considerable draught of water, to attempt to take the Tay at low water.

2923. But at half tide?—At half tide there would not be so much danger; and I should think that with a vessel not drawing over twelve or fourteen feet of water, at half flood with a south-east gale of wind, there is not much risk in taking the Tay.

2924. And at high water?—At high water none at all.

2925. Then in fact we may look on the Firth of Tay as a harbour of refuge at tide time for all vessels frequenting the coast of Scotland?—I do.

2926. Is it sufficiently buoyed and lighted to enable a vessel to take it without danger?—It is so well buoyed and lighted at present that I am unable to see any improvement that could be made upon it. Improvements suggested by Mr. Stevenson of Edinburgh, and by the Admiralty through Mr. Stevenson, have all been made.

2927. There are facilities at Dundee for repairing ships?—Yes.

2928. And for repairing machinery as well as ships?—Yes.

2929. (*Mr. Lindsay.*) What part of the navigation of the Tay is the most dangerous? Is it the sandbanks outside?—It is what we call the bar.

2930. How far is the bar from the docks here?—It is about twelve miles.

2931. And how far outside from the narrower part of the river?—From the Buddonness Point to the bar is four miles.

2932. Are they shifting sands?—They do shift; the bar shifts.

2933. The channel is between the sands?—Yes.

2934. Are a portion of the sands dry at low water?—Yes, a considerable portion of the south bank, and a small portion of the north bank, a little from the dry land.

2935. Would it be safe for vessels to run, during a south-east gale at high water spring tides, for the Tay?—Provided the vessel was not drawing more than sixteen feet of water, I should say it was safe to run in any gale of wind.

2936. (*Capt. Washington.*) You have said there are shifting sands; do you mean to imply that they shift often?—No, what I meant was that we find the depth of water on the bar varies occasionally.

2937. And the sands are on each side of the bar?—They are on each side of the channel.

2938. And the edges of the channel are buoyed on both sides?—On both sides, with a large fairway buoy outside the river.

2939. Quite so; I was afraid the impression would go forth that it was a shifting sand across the bar which would prevent a vessel taking it?—Not at all. I only meant to say that the depth on the bar varies a little, and I think it is principally with a north-east gale of wind, that perhaps spreads a little of the sand over what we call the bar.

Mr. Thomas Neish examined.

Mr. Thomas Neish.

2940. (*Chairman.*) What is your name?—Thomas Neish.

2941. What is your occupation?—Merchant and shipowner.

2942. For what period have you been connected with the shipping interest?—Nearly forty years.

2943. State your opinion as to the necessity of a large national harbour of refuge on the north-

coast of Scotland ?—I may say that, not being a seafaring man, or one that has been much at sea, I cannot speak altogether from experience ; but I can say this much, that I am confident the general opinion of Dundee, and of those connected with the mercantile and shipping interests, is that no such thing as a harbour of refuge is required on the east coast of Scotland.

2944. Will you state to the Commissioners your opinion as to whether, taking into view the large call that in a period of war is necessarily made on the maritime population of the country, for its defence, in proportion to those who are called to serve the country in the army, you object to the expenditure of a considerable grant of money with the view of reducing the numbers of lives which are lost annually among those who are engaged in the coasting trade, and in the fisheries ?—It may be certainly quite justifiable in some parts of the land ; but I do not think that it would be at all justifiable to expend a large sum of money on this coast, because we have a very small number of shipwrecks on the east coast generally, and the loss of property would not justify it, in my opinion. And that is the reason that I believe I am correct in saying that those who have the greatest interest in the shipping of the port, and in the mercantile prosperity of the town, are decidedly of opinion that no such thing is required ; and hence the very little interest that the people of Dundee have taken in the question. From the circumstance of a deputation from Peterhead to Dundee having brought letters of introduction to myself, I introduced them to the gentlemen in this town whom I thought most likely to be acquainted with the subject ; and from the conversations I have since had with the merchants and shipowners here to whom I introduced that deputation I have been confirmed in the opinions I had previously formed ; and I am decidedly of opinion that the town of Dundee is against a harbour of refuge on the north-east coast of Scotland. The only exception is, that some consider that, if a harbour is at all necessary, it must be merely for the protection of the fishing at Wick.

2945. I therefore understand you to say that you do not object to a grant of money to save life or property by erecting harbours ; but that you are against the erection of a harbour on this coast ?—I do not think any one could object to a grant of money to save life and property, but it is quite possible to "pay too much for your whistle," as we say in Scotland, which is done in many instances. The general impression here is, I do not say how far it is correct, that in nine cases out of ten where money has been expended on harbours of refuge, there has not been value got for that money.

2946. (*Mr. Lindsay.*) Do you think there is any other port on the north-east coast of Scotland, where a sum of public money could be judiciously expended besides Wick, keeping in view the saving of life and property ?—No ; I know there is a great desire on the part of other ports to get a grant of public money if they could. We in Dundee have expended a great deal of money ; and our opinion is that if they want to improve their harbours, they should do it themselves. At the same time, if the expenditure of a few thousand pounds on the improvement of harbours would save life and property, most certainly it should be done.

2947. As you have consulted with many of your fellow townsmen on this subject, and as Dundee is an important port on this coast, can you state what is their opinion generally in regard to voting sums of money for the improvement of various harbours along the coast, where the local authorities have really not the means of improving these harbours and deepening them ?—I have already in some degree answered that question; because I have said that if it could be done for 20,000*l.* or even 30,000*l.* or 40,000*l.*, so that these harbours could be made to a certain extent harbours of refuge, and save life and property, most decidedly I think it should not be objected to ; but if the effect of the expenditure on these harbours was merely to improve the local trade, the feeling in Dundee is that the towns desirous of such improvements should make them at their own expense.

2947*a*. Then you think there are some cases, where the local authorities could not raise the money themselves, where a sum of public money might be voted for the improvement of harbours along the coast, on the condition that these were made harbours of refuge for the vessels frequenting these coasts generally, I mean auxiliary harbours of refuge ?—I would say that is proper ; but the great question would be what harbour ought to get the grant.

Captain EWING examined.

2948. (*Chairman.*) What is your name ?—Thomas Ewing.

2949. What is your occupation ?—I am a shipmaster.

2950. How long have you been at sea ?—Forty-five years.

2951. In what capacity ?—I was about thirty years a shipmaster.

2952. In what trade ?—Chiefly in the coasting trade.

2953. You have commanded steam-vessels between Dundee and London, I think ?—Yes.

2954. For how many years ?—Twenty years.

2955. Have you any opinion to offer to the Commissioners as to the necessity of a harbour of refuge on the north-east coast of Scotland, that is from the Firth of Forth to the Pentland Firth ?—No ; I have no opinion to offer.

2956. Have you any opinion to offer to the commissioners as to the necessity of a harbour of refuge on the north-east coast of England ?—Yes, there is plenty of room for harbours there.

2957. Where would you be disposed to say is the most eligible site for a large national harbour of refuge on the north-east coast of England ?—I would say Filey Bay.

2958. Will your state to the Commissioners your reasons for so saying ?—It is half formed by nature.

2959. Why do you select that particular part of the coast as the most eligible site of a harbour of refuge ?—Because it is half formed by nature, and the situation of it.

2960. By the situation of it, do you mean that it is the most eligible point of the coast for ships to take refuge in ?—Yes.

2961. Will you state to the Commissioners your reasons for saying so ?—Probably Bridlington Bay is in the neighbourhood, and that is a good harbour of refuge.

2962. (*Mr. Lindsay.*) You have been twenty years trading between Dundee and London ?—Yes.

2963. Say that a great harbour of refuge was to be made on the north-east coast of England, whether do you think one in Filey Bay, or Hartlepool Bay, would tend most to the saving of life and property ?—Well, I could not give an answer to the question.

2964. You have not considered it sufficiently ?—No.

2965. Do you know much of the north-east of Scotland, to the northward of Dundee ?—Not a great deal.

2966. Then you are not prepared to speak as to the desirability or otherwise of a great national harbour on the north-east coast of Scotland ?—I do not consider there is any necessity for it.

2967. Do you think there would be no necessity for aiding the existing harbours, with a view of saving life and property ?—I think some of the harbours would be better to be improved, Arbroath, for instance.

2968. But I am speaking of the saving of life and property of the ships frequenting that coast ; say, if such aid were to be given to harbours along the coast, what point of the coast between Dundee and the

DUNDEE

Captain Ewing.

3 Sept. 1858.

Mr. Lindsay.

Pentland Firth would, with an improved harbour, tend most to save life and property ?—I do not know any harbour on the east coast of Scotland, that you could improve to any great extent.

2969. You do not know any harbour to the northward of Dundee that could be made a harbour of refuge suitable for the vessels frequenting the coast to enter at all times of the tide ?—No.

2970. (*Capt. Washington.*) Captain Ewing, are you acquainted with the coast between the Firth of Forth and the Pentland Firth ?—No.

2971. Have you ever had occasion to run to Fraserburgh ?—No, I have been in Cromarty.

2972. And that is a good place, is it not ?—It is a good natural harbour.

2973. Still, as a sailor, I presume you think that everything that can be done to save sailors' lives should be done ?—Certainly, I would say that.

2974. You probably know that eight hundred sailors' lives are lost every year around our own coast ?—Yes.

2975. You think it is worth trying to do something to save these lives ?—Well, if harbours of refuge would save them, it would be worth doing so ; but I am not of opinion that would save them. I have known many vessels lost going into harbours of refuge.

2976. I presume you refer to bar harbour, or tidal harbours, or harbours encumbered with sand ?—Yes.

2977. But supposing a harbour made in a convenient situation, accessible in all winds, and with no shoals in its neighbourhood, would not that be a desirable place to take ?—It certainly would, if there were no shoals.

2978. Had you ever occasion to run into a harbour of refuge ?—No.

2979. You have always commanded a fine steamer, I suppose ?—No, I had other vessels beside that.

2980. (*Capt. Vetch.*) How many years have you commanded a vessel ?—For about forty years.

2981. Had you ever occasion to run into a harbour of refuge ?—Yes.

2982. Which did you run into ?—Into the Humber.

2983. What other place ?—Bridlington.

2984. Was that in a steam-boat or a sailing vessel ?—A sailing vessel.

2985. Any other place ?—Harwich.

2986. Any other ?—Shields.

2987. Were you compelled to go into those places owing to the weather ?—Yes.

2988. Did that frequently happen ?—About once a year.

2990. (*Mr. Coode.*) You know the north-east coast of England ?—Pretty well.

2991. Is there any point more than another where vessels congregate in great numbers ?—Yes.

2992. At what point ?—Bridlington Bay and Yarmouth Road.

2993. That is, vessels at anchor ?—Yes.

2994. Is there no point more than another where you have seen vessels beating about ? I am speaking of vessels at sea.—I have seen vessels at all parts of that coast.

Mr. W. E. Baxter, M.P., re-called and examined.

Mr. W. E. Baxter.

2995. (*Chairman.*) You have heard, Mr. Baxter, that Mr. Neish stated in his evidence that the small attendance here to-day is a proof of the slight interest which the merchants and shipowners of Dundee take in this harbour of refuge question. Do you agree with that evidence ?—I would say the only interest the shipowners of Dundee take in the question is, that they are fearful of a large sum of money being expended at a particular place without any great benefit being derived. I believe Mr. Neish expressed the general sentiments of the mercantile body when he stated that there was no feeling among them that there was a necessity for a great harbour of refuge on the east coast of Scotland. I certainly never heard any one express an opinion that such a harbour was necessary.

Sir John Ogilvy, M.P., examined.

Sir John Ogilvy.

2996. (*Chairman.*) You are the member for Dundee ?—I am.

2997. Have you any opinion to offer to the Commissioners as to the general feeling of the merchants and shipowners of Dundee on this question of harbours of refuge ?—No, I have never heard the question much discussed, but so far as my observation goes, I should say my opinion concurs very much with that expressed by Mr. Baxter and Mr. Neish, I believe the small attendance here to-day may be attributed to the fact that many were not aware that this meeting was to be held ; but I believe it is quite correct that the inhabitants of Dundee do not take a deep interest in this question.

2998. (*Mr. Lindsay.*) If a sum of public money is voted among the harbours of the north-east coast of Scotland, do you think it would give more satisfaction to your constituents—seeing that they want no portion of the money—if it were spread over various harbours along the coast, or expended on one particular point? If you would rather not answer this question, just say so ; but if there is any feeling among your constituents on the subject, I wish to know which way it tends ?—Without giving an opinion as to other parts of the country, I think they would be in favour of such a grant as that to which you refer being given in small sums to existing harbours rather than to one large harbour.

2999. (*Capt. Vetch.*) Supposing the government were disposed to make a grant to the various harbours now existing, do you think there would be any difficulty in getting the parties supposed to be more particularly benefitted by that grant, to aid in producing an equal sum for the object?—If your remark applies to the harbour of Arbroath, which I suppose it does from the evidence led to-day ? I would say that while, as a general rule, it would be desirable that aid should be given by local contributions, I consider that in the case of Arbroath that has been already done, as they have already expended so much on their harbour that they may be said to have already complied with the rule.

Captain Ritchie examined.

Captain Ritchie.

3000. (*Chairman.*) What is your name ?—David Ritchie.

3001. What is your occupation ?—A shipmaster.

3002. How long have you been at sea ?—45 years.

3003. In what capacity ?—Principally in the Baltic trade, in the Mediterranean, and in the American.

3004. Was it as master, and if so, for how many years ?—I have been about 29 years a shipmaster.

3005. If you have any opinion or otherwise as to the necessity of a national harbour of refuge on the north-east coast of Scotland, state it to the Commissioners, —My opinion is, that we have not in Scotland so much necessity for harbours of refuge as there is on the north-east coast of England.

3006. Have you anything further to state ?—I have nothing further to state.

3007. (*Mr. Lindsay.*) Do you know the north-east coast of England well ?—Yes, I have been familiar with it all my life.

3008. Do you know the north-east coast of Scotland ?—Yes.

3009. Are there better tidal harbours in Scot-

DUNDEE.

Captain Ritchie.

3 Sept. 1858.

land than in England?—There are not many tidal harbours in Scotland that you can run into as a place of safety.

3010. Can you tell me what ports there are between the Firth of Forth and the Pentland Firth where ships of about 300 tons could take refuge during a south-east gale, or an easterly gale, at low water?—There is no place but the Firth of Forth and Cromarty where vessels of 300 tons could enter at low water.

3011. Then do you not think that life and property are placed in great jeopardy when there is no harbour along that whole line of coast that even so small a ship as one of 300 tons could enter at low water?—Yes, they are.

3012. Is there no port except Cromarty, between the Pentland Firth and the Firth of Forth, where a vessel drawing 12 feet of water could enter at low-water spring tides during a south-east gale?—Yes, the river Tay.

3013. No other?—They could run to Montrose; but it is narrow and more difficult to take.

3014. Then, could a vessel at low water enter the Tay with safety, drawing 12 feet of water during a south-east gale?—Oh yes.

3015. There is only the Tay, then, with that wind?—Yes, with a heavy gale and a running sea.

3016. What ports between, say the Tyne and Yarmouth Roads, could such a vessel run for during an easterly gale, and at low water?—I know of no harbours that ships of that size could run into, drawing 12 feet at low water.

Mr. JOHN JACK examined.

Mr. J. Jack.

3017. (*Chairman.*) What is your name?—John Jack.

3018. What is your occupation?—Harbour-master of Dundee.

3019. Will you state to the Commissioners what is your opinion as to the necessity of a large national harbour of refuge on the north-east coast of Scotland?—I am very little acquainted with that coast.

3020. Would you therefore decline to give any opinion?—On that subject; if it was the north-east coast of England, I could give an opinion.

3021. Well, will you now state to the Commissioners what is your opinion as to the necessity of a harbour of refuge on the east coast of England?—We have no harbour of refuge after you pass the Humber till you come to the Firth of Forth. You have an anchorage in one direction, but not any safe anchorage for easterly gales.

3022. Have you any opinion as to the most eligible site for such a harbour of refuge?—My opinion would be, to put it as near the centre as possible between St. Abb's Head and the Humber, which I would say was about the Tees, or Hartlepool, or somewhere thereabouts.

3023. Can you state more particularly to the Commissioners your reasons for selecting the neighbourhood of the Tees or Hartlepool?—It is most embayed, and when off it you can take the assistance of the tide, and it is more central than any other quarter.

3024. (*Mr. Lindsay.*) Do you think a harbour of refuge at Filey Bay would be desirable?—You have got anchorage not far from Filey Bay if the wind is to the north; but if you are north there is nothing between St. Abb's Head and Flamborough Head. My opinion would be that to put a harbour of refuge at Filey Bay is too near the quarter where you can get anchorage.

3025. Whether do you think a harbour of refuge in Hartlepool Bay or Filey Bay would tend more to save life and property?—I should say Hartlepool Bay or thereabouts.

3026. From your knowledge of the north-east coast coast of England, whether do you think a sum of money expended in one great harbour of refuge, or that same sum distributed over various harbours there, so as to make them fit to receive at half tide the description of vessels usually trading along that coast, would tend more to save life and property?—I would have a harbour of refuge rather than distribute the money among these ports, as I do not see what good it would do to distribute the money in that manner.

3027. Do you not think it would tend to save life and property if various of these harbours along the north-east coast were made accessible to vessels at half tide in strong easterly gales?—It is my opinion that to make one harbour that would take ships at all tides and at all weathers would do more to save life and property than to distribute grants among existing harbours for improvements which would not make them of any service in a gale of wind.

3028. Say that it rested between two points, that is to say whether it was more advisable to expend a sum of money to make one harbour to take vessels of all sizes at any time of the tide, or to spend that sum of money over say those harbours that could take the usual class of vessels trading along the coast at all times of the tide; which course would tend most to save life and property, speaking now of all times of the tide?—The harbour of refuge still is my opinion.

3029. It is your opinion that one great harbour of refuge on the north-east coast of England is more advisable than to distribute the same sum over existing harbours?—Yes, more particularly from the form of the coast.

3030. (*Capt. Washington.*) As an old sailor, and as one who has been associated with sailors all your life, do you think that harbours of refuge should be on the bight of the bay or on a prominent point of the coast?—So long as a sailor has a little room he can make the best of it; but I would never put a harbour on a point, there are two sides and it is not easy to take.

3031. Do you consider a harbour of refuge specially designed to catch vessels that are disabled and can not get off the shore?—That is my opinion.

3032. Is it your opinion that a large sum of money should be expended on a place for the convenience of vessels stopping to get a fair wind?—Yes; but for the saving of life and property it should be down in the bight of a bay.

3033. (*Mr. Coode.*) You have spoken of the north-east coast of England. Do you happen to know whether the greater number of wrecks have occurred to light or loaded vessels?—I have no particular knowledge on that point. One remark I would make, which is this, that for one ship we have wrecked going round the north coast of Scotland I would say we have fifty on the coast of England, so that the necessity is greater to have a harbour erected there in the first place.

3034. That is not quite a reply to my question, which had reference to whether there were more light or loaded vessels wrecked on the coast of England?—Oh, more light vessels; I have seen twenty-two vessels lost in one gale. The great loss on the north-east coast is the light colliers coming down.

3035. If you were told that the Government returns show more loaded vessels wrecked than light ones, would you say they were wrong?—If they said that about Yarmouth Roads more loaded vessels were lost I would think them right, but on the north-east coast of England there are more light vessels lost.

3036. You made some remarks as to the eligibility of different positions for harbours of refuge, and as to the bight of a bay being preferable to a point. Would not a point be easier made?—I think a prudent shipmaster would keep off the shore as much as possible.

3037. Did you ever see vessels brought up on the north side of Flamborough Head?—Often.

3038. If they were brought up there, supposing a gale of wind were to spring up could they remain?—You must slip and just make the best of it.

3039. But if there were a harbour there, their

DUNDEE.

Mr. J. Jack.

3 Sept. 1858.

Mr. Coode.

position would be much improved?—Yes; but there might be fifty harbours there to keep all safe.

3040. Is there anything like fifty waiting-places on the north-east coast of England?—No; but I could get fifty anchorage places.

3041. Are you aware that a great many coal-laden vessels bound to the southward get baffled by head winds off Flamborough Head?—That often occurs.

3042. And that such vessels often go in and anchor in Filey Bay?—They do at times.

3043. Does that often happen in the winter season?—It may; but it is not a pretty place to go by.

3044. Do you think that vessels bound to the southward are peculiarly liable to be baffled by head winds?—Head winds often at all places.

3045. Does it not often happen that vessels bound to the southward just manage to get Flamborough Head, and are there met by head winds?—Yes; and ships coming the opposite way the same.

Captain D. CRIGHTON examined.

Captain D. Crighton.

3046. (*Chairman.*) What is your name?—David Crighton.

3047. What is your occupation?—I am a shipowner.

3048. Have you any opinion as to the necessity of a harbour of refuge on the north-east coast of Scotland?—I scarcely think that a large harbour of refuge is necessary on the north-east coast of Scotland.

3049. How long have you been connected with the shipping trade of Dundee?—I have been resident in Dundee since 1820, and I went to sea in 1805.

3050. Being agent for Lloyd's you must be tolerably well acquainted with the loss which takes place by shipwreck on this coast?—Yes.

3051. Have you anything further to state to the Commissioners as to these harbours of refuge?—I think, as has been stated by some of the gentlemen before, that if some of the existing harbours were improved it would be more beneficial to the north-east of Scotland than one great harbour would be for the safety of life and property.

3052. And with reference to the north-east coast of England, can you offer any opinion?—In my younger days I was well acquainted with the north-east coast of England, when it was worse lighted than now; and when harbours of refuge would have been more available; but I do think that a harbour of refuge there would be of great advantage indeed.

3053. Where would you be disposed to say would be the most eligible place?—From the immense number of vessels proceeding from coal ports, and verging to the Tees and Sunderland, I should say about the Tees would be the best place for the saving of life and property.

3054. (*Capt. Washington.*) You thought it desirable rather to give money over existing harbours than to one harbour?—I think a large sum would be more beneficially disposed of if it were given to improve existing harbours than to one large harbour to the north-east.

3055. Do you think it would be fair to these harbours that they should advance a certain portion to meet any grant that must be given?—I should think that, as they have a local interest, that would be very proper, if they have not already expended large sums.

3056. Many of the harbours have already made large outlays, have they not?—Yes.

3057. Dundee, for example?—Yes.

3058. And Arbroath?—A considerable sum there.

3059. And Montrose?—They have made a very good dock there, but I do not think much has been done to improve the entrance to the harbour.

3060. And Peterhead?—I believe they have expended a large sum there.

3061. And Fraserburgh?—I never was in Fraserburgh.

3062. Have you ever been in Wick?—I happened to be there last year; it is a very crowded place.

3063. Were you there in the herring season?—No; in the spring.

3064. Do you know the number of fishing boats?—From a thousand to twelve hundred annually.

3065. Would these boats be in danger in a gale of wind?—I would think so.

3066. How many lives may be exposed in these twelve hundred boats?—There are five men in each boat.

3067. Then there would be six thousand lives exposed there; and at low water, in case of a sudden gale of wind, they have no place to run for?—No place.

3068. Do you think something should be done to provide shelter for these boats?—I think something should be done.

3069. Is it within your knowledge, having been at Wick, that ten years ago, in one single night, about fifty boats and thirty-five lives were lost?—I heard of the loss of these boats at that period.

3070. Do you think it desirable that everything should be done to prevent the recurrence of a similar calamity?—I think it desirable that everything should be done to save life and property; and as the fishery there is so important, it might be very much improved for the accommodation of the fishery.

Captain WALKER examined.

Captain Walker.

3071. (*Chairman.*) What is your name?—John Walker.

3072. What is your occupation?—A shipmaster.

3073. What vessels have you chiefly commanded?—I have been chiefly in the coasting trade.

3074. North or south?—South of the river Tay.

3075. Have you any opinion to offer as to the necessity for a national harbour northward of the Tay?—No; I could not speak to that.

3076. State to the Commissioners what is your opinion as to the necessity of a national harbour on the east coast of England?—My opinion is, that it would be a great saving both to life and property, and that it is necessary such a harbour should be erected.

3077. Where would you point out as the most eligible site for such a harbour of refuge?—Filey Bay.

3078. State your reasons for doing so?—My first reason is, that about that point generally the wind is to the southward, we find, when we get as far as Flamborough Head the wind gets a little more southerly, and the vessels, if deeply laden, have no other point of refuge until they run to the Firth of Forth. Again, on the other hand, the vessels coming light and going north, and the wind from the westward, find on opening up the head from the south, that the wind comes in from the north. They then take shelter in Bridlington Bay generally, or else run for the Humber. In running for the Humber many of the light vessels fall to leeward, and others again are afraid to lie in the bay for fear of the wind coming from the south-east, which would embay them, and they would have no other resource than to run on shore or to the dry harbour at Bridlington. Then the steam trade there is greatly increasing, and we often have to run from the north part of Yorkshire to the Humber for shelter and coals; and I think that if we had a harbour of refuge at Filey Bay we would be likely to have a coal depot there too, by which we would not have to run so far to seek coals.

3079. (*Mr. Lindsay.*) Have you spoken to many masters of ships as to the necessity of a harbour of refuge on the north-east coast of England?—Yes.

DUNDEE.

Captain Walker.

3 Sept. 1858.

3080. Whether do they, as a rule, give preference to the Tees Bay or Filey Bay?—Filey Bay generally.

3081. Whether do you think a sum of money spent in a harbour of refuge at Filey Bay, or that sum expended over four or six harbours in the north-east coast, so as to make them accessible at low water for the vessels usually frequenting that coast, would tend most to save life and property?—I really believe in the large harbour.

3082. (*Capt. Washington.*) Do I understand you to say that a harbour of refuge in Bridlington Bay is desirable?—No; in Filey Bay.

3083. I think you said your chief reason for mentioning Filey Bay was, that coals might be found there?—No, not the chief, but one of the reasons.

3084. What would be your chief reason?—Not only the extent of damage done to the vessels beating about in that locality, but the distance they have to run down from coal ports deeply laden, which is great.

3085. Then you do not agree with Captain Jack, that a harbour of reguge should be placed in the bight of the bay?—Not in that locality.

3086. Do you mean by "that locality" the north-east coast of England?—Yes; if there were to be two harbours, that would be a very good site for one.

3087. What do you mean by "that"?—About Hartlepool. If there were to be two harbours of refuge that would be a good site for one; but if there is to be only one, then Filey Bay is the more eligible.

3088. But generally on any coast, would you think it desirable to place a harbour of refuge in the bight of a bay, or near a prominent point?—That would entirely depend upon the locality, I think.

3089. You have seen a small pamphlet drawn up by the Committee, who propose Filey Bay as a harbour of refuge?—I have seen it, but I have not had time to read it.

3090. (*Mr. Coode.*) Are you aware, from your own experience, that large numbers of vessels are often congregated off Flamborough Head?—Yes.

3091. Have you seen them?—Yes.

3092. Is it a very common occurrence?—Yes.

3093. Have you ever had occasion to bring up off Flamborough Head yourself?—Never.

3094. Have you ever seen vessels brought up there in passing?—Yes, very often.

3095. Do you command a steamer or a coasting vessel?—A steamer just now.

3096. How long have you been in that steamer?—Three years.

3097. About how many times have you passed Flamborough Head in the course of these three years?—About seventy or eighty times, going and returning.

3098. I understand you give a very decided preference to Filey Bay as the site of a great harbour of refuge?—Yes.

Mr. G. WELCH re-examined.

Mr. G. Welch.

3099. (*Chairman.*) Will you state to the Commissioners what is your opinion as to the necessity of a harbour of refuge on the north-east coast of England?—I think a harbour of refuge in the Tees Bay is highly desirable, either Redcar or Hartlepool; but from the little knowledge I have of that locality I should say that Hartlepool is the better place of the two.

3100. You have said that you have little knowledge of that locality. Do I understand that remark to apply to the coast generally, or to the immediate locality of Hartlepool?—To the immediate locality of Hartlepool.

3101. (*Capt. Washington.*) Are you aware that a large number of vessels are driven ashore every year at Hartlepool Bay?—I have seen it stated in the newspapers.

3102. You are a sailor?—I should not like to be called no sailor.

3103. I should like to hear your opinion, whether a harbour should be on the bight of a bay, or on the prominent point of a coast?—I should say the bight of a bay. An important reason is, that I should never seek a harbour of refuge until all other means of safety were exhausted, and then I would be more likely to fetch the bottom of a bay than a weather point.

3104. If your vessel were disabled, would it be possible to reach a prominent point?—I would be more likely to reach the bottom of a bay than a prominent point.

3105. (*Mr. Lindsay.*) But if you were to windward of both at the time, and your vessel were disabled, whether would you reach the prominent point or the bay first?—The prominent point, of course.

3106. If that is your opinion, if there were two harbours, one in the bay and one on the point, would you not run to the nearest?—Decidedly.

3107. Well, whether is the Tees Bay or Flamborough Head more in the track of vessels going along the coast?—The Tees Bay.

3108. What does that arise from?—From being centrally situated between Flamborough Head and the coal ports, where the great number of vessels trade to London; for instance, Shields, Sunderland, and those places. I mean that Hartlepool is more centrally situated than Filey Bay, or any other part of the coast.

3109. Is Hartlepool in the track of vessels from Dundee, or the Scotch coast generally, to London?—Yes.

3110. Is it as much as Flamborough Head?—Quite as much. It lies not so much to the course of the vessel in ordinary weather. With off-shore winds, and favourable weather, we cross the bay; and when I speak of a harbour of refuge I would not say it was necessary to provide a harbour of refuge for a westerly wind.

Mr. WILLIAM NICOLL examined.

Mr. Wm. Nicoll.

3111. (*Chairman.*) What is your name?—William Nicoll.

3112. What is your occupation?—A shipowner.

3113. Have you been long resident in Dundee?—More than thirty years.

3114. You have heard the statement made by two or three of the former witnesses, that the small attendance here to-day indicates the opinion of the mercantile men in Dundee as to the non-necessity of a harbour of refuge on this district of the coast?—That may be accounted for by their being generally not acquainted with nautical affairs.

3115. And therefore you attribute it to that cause, and not to any particular opinion which they entertain upon the subject?—Yes.

3116. (*Mr. Lindsay.*) Have you formed any opinion as to the necessity or desirability of a harbour of refuge on this coast?—I do think there is a necessity for harbours of refuge on this coast.

3117. Have you any idea about what point of the coast, if such a harbour was to be made, it would be most desirable to erect it, considering the objects in view?—I would not be in favour of expending a large sum of money upon one part of the coast.

3118. Would you think it more desirable to separate a grant of public money over various parts of the coast?—I would.

3119. Do you think that would tend more to save life and property?—I do.

3120. (*Capt. Washington.*) Are you acquainted with the north-east coast of England?—Part of it.

3121. You have traded from Dundee to London?—No, I never was a sailor.

DUNDEE.

Captain Neish examined.

Captain Neish.

3 Sept. 1858.

3122. (*Chairman.*) What is your name?—James Neish.

3123. What is your occupation?—It is jack on shore now, but my occupation was at sea till within the last twenty-two years.

3124. How long did you follow the sea?—For upwards of thirty years, and it is upwards of fifty-five years since I first went to sea.

3125. In what trade were you employed?—Generally in the Baltic trade.

3126. In what capacity?—As an apprentice, mate, and master.

3127. How many years as master?—I was only one voyage as master on this coast, and that tired me of it.

3128. You have heard the question put to the last witness as to whether the thin attendance here to-day indicates an opinion among the mercantile men of Dundee and the shipowners as to there being no necessity for harbours of refuge; what is your opinion?—My opinion is, that they are all so much interested in their own affairs that they think nothing about this, and care less.

3129. (*Mr. Lindsay.*) Have you any opinion about harbours of refuge on this coast?—No.

3130. If it is the opinion of Government that they should devote a certain sum of money to that purpose, from your great experience, whether do you think that a sum spent on one harbour at a particular point of the coast, or distributed over the existing harbours, would tend most to the saving of life and property?—As I know no place where one great harbour of refuge would be of service on this coast at low water in all states of the wind and weather, it is out of the question to spend money on such a harbour, and it would be more beneficial to expend the money on various harbours.

3131. But if a place could be found where vessels of all sizes, and during all winds, could find shelter at any time of the tide, whether do you think the sum would be more beneficially expended at one place, or distributed over various harbours?—I should think that one place would be of more service generally.

(*Chairman.*) Is there any person present who wishes to tender further evidence with respect to this inquiry?

No answer.

Sittings at Dundee closed.

LEITH.

Saturday, 4th September 1858.

PRESENT:

Admiral Hope, (Chairman).

Sir Frederic Smith.
Mr. Lindsay.
Captain Washington.
Captain Vetch.
Mr. Coode.
Mr. Sewell, Secretary.

LEITH.

4 Sept. 1858.

Mr. Wm. Thompson, merchant, Leith:—I have come here to represent the district of Anstruther and Cellerdyke, where the inhabitants wish generally to have a harbour of refuge. The matter, I may state, has been brought before the Lords of the Treasury, and I have a copy of the memorial which has been forwarded to their lordships, and I am ready to answer any questions connected with this proposal which the Commissioners may think proper to ask me. I am in charge of this memorial, gentlemen, and I have connected with it evidence that the memorialists wish to tender to the Commissioners.

(*Chairman.*) We shall be happy, Mr. Thompson, to receive it at a later period of the sitting.

Mr. Broadfoot examined.

Mr. Broadfoot.

3132. (*Chairman.*) What is your name?—John Broadfoot.

3133. What occupation do you follow?—Merchant and ship agent at Leith.

3134. How long have you been connected with the port of Leith?—I have been connected with the port of Leith all my life.

3135. How many years actively so?—For 30 years more or less in active agency.

3136. Could you furnish us with the names of captains of vessels trading out of this port, whose evidence would be of value to us in this inquiry?—I should be able to do so, but not from memory alone; but if some time was allowed me by the Commissioners to do so, I could give the names of shipmasters who have spent all their lives on the north-east coast of Scotland.

3137. And of those who have traded between this port and London?—Yes; also of those who have commanded vessels to London. I can easily procure this. They are men who have had long experience in this trade before steam became so common, and who have commanded vessels of large size—men who have great practical knowledge of the general inconveniences and obstructions to the coasting trade.

3138. Will you be good enough to forward, at your convenience, to the Secretary of the Commission, the names of a few of the captains whom you might consider most worthy to be consulted, from age, experience or reputation, who have a knowledge of the north-east coast of Scotland, and also of the east coast of England?—It will afford me much pleasure, and I shall endeavour to do so.

3139. (*Mr. Lindsay.*) I should like to ask Mr. Broadfoot his opinion on one point. You say, as the Government has been considering the formation of a great harbour of refuge on the north-east coast of Scotland, on what point of that coast between the Firth of Forth and the Pentland Firth, do you consider the construction of such a harbour would do most for the facilities of commerce and the saving of life and property?—My opinion would rest on Peterhead and Cromarty, I mean the Moray Firth. The Firth of Cromarty is naturally formed by the sutors of Cromarty.

3140. As there is a natural shelter there already, do you think a harbour of refuge is necessary in addition?—I am quite of opinion that Peterhead would afford great facilities for saving life and a large amount of property if a harbour of refuge was to be erected there.

3141. Whether would you consider Peterhead or Wick the better point for the formation of a harbour of refuge?—Well, I have had no practical experience of Wick, but I have been frequently to Peterhead and have had occasion to take shelter there, and all along I have thought that the natural capacities and

capabilities of the place, which could be increased, would make a very excellent harbour.

3142. I should like to have your opinion on another point. If the Government decided upon spending the sum of 300,000*l.* on the north-east coast of Scotland, whether do you think that that sum would be better spent in one great harbour on the coast, or would be better applied if it were spread over the existing harbours, say, half a dozen of them, so as to make them accessible for the usual vessels frequenting the coast?—You mean the usual vessels frequenting the north-east coast of Scotland?

3143. No, such as the Baltic and Archangel ships, averaging perhaps 350 tons or thereabout. Do you think that the sum of money I have mentioned would be better spent in one great harbour, or in improving the existing harbours, so as to make them accessible to these ships at all times of the tide?—If you could make two or three small harbours, so that they might receive vessels at half tide, it would do much more good than if you brought the money to one large harbour, because we know that vessels on this coast are frequently caught in heavy north and north-east gales of wind, and have not got the power to run up to one great port; and it is much better, therefore, that we should have four or five ports, so as to be applicable to this very important branch of our commerce, I mean the fishing trade. The fishing trade is a trade of great importance, and accidents often happen to fishing boats when they are overtaken, as they often are, by violent gales of wind going into the harbour. And five or six harbours of refuge, capable of receiving boats at all tides, and commercial vessels of 300 or 400 tons at half tides, would be much better, in my opinion, than one would be; for one would not be accessible at an hour's warning, as it would need to be.

3144. Your opinion is then that by spreading money out in the way which you have mentioned, it would be the means of giving much greater facilities of commerce, and saving life and property?—It is; that is my opinion.

3145. Do you know anything personally of the north-east coast of England?—I cannot offer any opinion on it.

3146. Can you tell me anything about this harbour of Leith, and what amount of money has been expended on the docks and piers?—I can hardly state from memory. There is, if I mistake not, a debt of about 208,000*l.* on the docks, or above that, 240,000*l.* I hope it is obsolete. It is an old debt, and it hangs around our necks like a millstone, and there is no doubt that all the people at Leith are very anxious to get quit of it. Otherwise, without it, the trade of the port yields a sufficient surplus revenue to enable us to carry on operations.

3147. Was this debt contracted for the construction of the docks or the pier?—Principally for the construction of the west wet docks, I believe it was.

3148. Where was the money obtained for those very fine piers which we see running into the Firth?—The money was originally obtained for building the piers in this way. We had formerly, when I was in business, only one short stone pier at Leith. The money obtained for the elongation of that pier formed part of the debt hanging upon us, and the money for the other piers was obtained out of the regular revenues of the docks.

3148*a*. Have you ever received a loan from the Government?—So far as my knowledge goes, beyond the 240,000*l.* advanced by the Government to finish the improvements of the west dock, we have not got any.

3149. Was this in shape of a loan by the Government, advanced for the purpose of finishing those works?—It was given as a grant, and not as a loan. It was an advance on the security of the docks constructing at that time.

3150. It was a loan then? Did you pay interest on it?—No, we paid no interest on it.

3151. Have you any fixed time named to repay the loan to the Government?—No, none whatever.

3152. Have the Government security for the repayment of the loan?—They have security over the revenues of the harbours and docks of Leith.

3153. Have they exacted any interest yet?—No, they have exacted no interest.

3154. What would you suppose the depth of the water is at Leith at low water spring tides?—There are two docks; the east and the west dock, and we have also a new one. At low water spring tide there is no access either to the old or to the new docks.

3155. What is the depth of the channel?—The channel between the piers is about nine feet deep at low water. Mr. Macgregor will, perhaps, be kind enough to assist my memory.

(*Mr. Donald Macgregor.*) The depth from the extreme entrance of the channel up to the Victoria Dock gates at low water spring tides is nine feet and a half. We sometimes have 23 feet in the channel at high water spring tides, showing a difference between high and low water marks of 14 feet spring tides.

(*Mr. Broadfoot.*) If I may take the liberty of mentioning it to the Commissioners, there is a brother merchant present who has given more attention to the Leith docks and their claims than myself; I mention the name of Mr. Donald Macgregor.

Mr. Donald Macgregor examined.

3156. (*Chairman.*) How long have you been connected with the shipping interest?—Since 1838 I have been connected with shipping.

3157. Are you able to offer to the Commissioners any opinions as to the most eligible site for a harbour of refuge either on the north-east coast of Scotland or on the east coast of England?—Yes, I think I can give a very decided opinion upon that. We want a harbour of refuge on the north-east coast of Scotland and the north-east coast of England. As to the particular locality, that, as far as Leith is concerned, is a matter of less thought to us than the obtaining a harbour of refuge. The matter of locality is not so much considered.

3158. (*Mr. Lindsay.*) Have you paid much attention to shipping matters?—I have paid very great attention to shipping.

3159. Have you not formed any idea as to what point of coast would be most suitable for a harbour of refuge?—Well, the matter will rest, I should say, between Peterhead and Wick. Peterhead for the Baltic and Archangel boats, and on the other hand Wick for its locality and its connection with the fishing trade and the American trade. The fishing and American trade render it necessary that there should be a harbour of refuge constructed at Wick.

3160. Could you give us a list of shipmasters who have had a good deal to do with this trade, and the London and American trade, and others?—As regards harbours of refuge on the English coast there are many gentlemen here who can give opinions about that, as they are well qualified, much better than myself to do so.

3161. You have heard the question put to Mr. Broadfoot in regard to whether the sum of 300,000*l.* spent at one spot in the construction of one harbour of refuge, or having it spread over a number of small harbours so as to admit vessels at half-tide, would be better. Can you give us your opinion upon this point?—The question is not a simple one, because if you could get that sum of money and spread it over three or four small harbours, and make them all available, it would be much better than spending the money on one large harbour; but then again, if you could only make one good harbour for the money only, it would be much better to do that than to make two or three bad harbours of a smaller size, for

LEITH.

Mr. Donald Macgregor.

4 Sept. 1858.

Mr. Lindsay.

they would be of very little use compared to the larger one.

3162. Then you say, that if with this sum of 300,000*l.* you could make a harbour in which ships of all sizes could take at any time of tide, and one which would afford shelter to vessels in all winds, this money would be better laid out on a particular point of the coast than if it were applied in the other way, that is, in making four or five harbours along the range of the north-east coast, so as to be suitable to receive laden vessels of 300 tons and under at half-tide. Would you prefer the latter, is that what I am to understand ?—Indubitably not. I would sooner have the larger harbour so as to take in ships of all sizes.

3163. Then say we could with that sum of money improve the existing harbours, so as to receive ships of 300 tons at low water at spring tide. I am speaking of the four harbours to receive vessels not larger than 300 tons ?—I think at the present moment, looking at the present state of things, I would be inclined to an opinion in favour of the four small harbours ; but again looking at the future state of things and the prospects of the country, and the commerce of the country generally speaking, it would, I think, turn my opinion in favour of the one large harbour.

3164. As you are aware, there is a very large trade carried on on the north-east coast of England ?—I am aware of it.

3165. Do you think then that one large harbour of refuge is necessary on the north-east coast of England ?—Well, as to that I cannot speak with any great amount of certainty, but you would do much better if you could obtain the opinion of men from North Shields, who are competent to form an opinion on the matter. My own opinion would be very general, and the Commissioners would do much better if it obtained theirs.

3166. Are you aware that the north-east coast of England is much more important, in regard to its large trade, than other coasts ?—I am.

3167. As to you not being able to give anything but a very general opinion, what I want is the opinion of an intelligent shipowner, who has no direct interest in the trade of the north of England ?—I understand you perfectly.

3168. Can you give the Commissioners any idea which you may have in your mind as to the desirability of any particular site on the north-east coast of England, for the construction of a harbour of refuge ? I merely want your ideas on that point ?—I have a steamer running between this and Rotterdam, and we have no place between the Firth of Forth and the Humber in which a steamer can run into in case it is overtaken by a heavy gale of wind. Generally speaking, vessels go out from the port of Leith very heavily laden, and there is no place but Holy Island to make to in case of stress of weather. Holy Island is a very awkward place to make to, and a dangerous one, and there cannot be two opinions as to the necessity for making a harbour of refuge between the Firth of Forth and the Humber.

3169. Then what point do you consider a harbour on the north-east coast of England would be most advantageous ?—I cannot help thinking that some place somewhere about Whitby or Scarborough, would be a very excellent site ; but I am not competent to form an opinion on the subject. I would strongly recommend you to take the opinion of shipmasters engaged in the London trade, who could tell every thing about the nature of the coast. I think that men who have been knocking about on that coast for forty years, or perhaps all their lives, would be the very men to give an opinion on the subject.

3170. Would you still give the preference to four small harbours, if they were provided on that coast, and made suitable for ships of three hundred tons, and at low water ?—In the present state of things, I would have four small harbours, but in looking to the future of things, I would much prefer the harbour for large ships at all states of the tide. The tendency of the trade, I may venture to state, is decidedly towards ships of large dimensions ; and in ten years from this time I dare say there will be very few ships of three hundred tons in existence. The tendency is all towards steamers—large steamers; and in fact I may say, as large ships as can possibly be employed in the trade.

3171. Then the tendency is to the coasting trade being conducted wholly by steamers ?—Yes, our small coasters are very fast disappearing year by year before steamers.

3172. Are screw steamers employed ?—Yes, the trade is almost entirely done by screw steamers ; at least to a very great extent.

3173. (*Capt. Washington.*) In the event of a war with the northern powers of Europe, would it not be desirable to have a harbour which could protect ships of war on the north-east coast of Scotland ?—There is no other place for their protection than those now in existence.

3174. Then they would have no protection if a war were to take place ?—No, they would not.

3175. Then looking to the trade passing through the Pentland Firth to Archangel and the Baltic, you think protection is required for those ships ?—I do.

3176. And what would you think the best position for the construction of a harbour of refuge for these vessels ?—Why I should say Peterhead, most assuredly.

3177. On what account ?—Because it is more centrical in position. It is more convenient for all boats.

3178. What do you think would be the distance from Peterhead to the Pentland Firth ?—I should say about 120 or 140 miles.

3179. Is there not a harbour at Scrabster ?—There is a very fair natural harbour I believe at Scrabster.

3180. Then your opinon as to the Pentland Firth is that it is a rather formidable place ?—I should say it is. I should say that very few of the enemies' ships would care to cruise about the Pentland Firth in the event of a war.

3181. Have you been there yourself ?—No, I have not been there myself.

3182. (*Capt. Vetch.*) Mr. Macgregor, did you not mention Holy Island as a place for small vessels? You say it is an awkward place of refuge; are the capabilities of the place at all improveable ?—Well, I should say the less improvement made at Holy Island the better, for the access is so very dangerous that vessels running for it very often get into mischief. I certainly hope they won't improve it, the access to it could scarcely be worse than it is.

(*Capt. Vetch.*) I recollect going into Holy Island harbour (on the 19th November 1821) before daylight, in the brig of war *Protector*, which I believe saved the ship. I thought I should never get out of it again, and that our ship would have been lost.

3183. (*Mr. Lindsay.*) What about the Leith Docks ? How much money has been expended upon them ; I mean, how much altogether in their construction and formation ?—Well, the question is a difficult one to answer, and on this account : the city of Edinburgh had a superiority over the harbour and docks of Leith previous to 1838, but now we are under a new constitution, and have nothing to do with the city of Edinburgh. Edinburgh had borrowed from the Treasury the sum which has been mentioned by a witness, viz., 228,000*l.* and odd for the construction of a harbour and docks. The harbour and docks were then invested with a special commission which numbered eleven representatives altogether. Three of these were appointed by the town council of Edinburgh, three by the port of Leith, and five by the Lords of the Treasury. The harbour and the docks were vested in them, subject to this debt of the Goverment, which amounts to 228,000*l.* Upon this 228,000*l.* no interest was to be paid until there was a surplus, that is, we were not to pay any

interest upon it until we had some money to pay it with. But in return for this again, we became bound to pay so much money towards the support of the ministers, so much for the city creditors, and so much towards the funds of the High School, amounting to the sum of 7,680*l.* a year. The interest upon this 228,000*l.* is, I hold, just being paid annually in the shape of these sums which are being regularly paid over to the city of Edinburgh creditors, in support of the clergy and the High School. On this matter there was a good deal of discussion both in Leith and in Edinburgh. The interest of this money was to be deferred until there was a surplus revenue to pay it with after paying this sum of 7,680*l.* The city of Edinburgh was not getting the money, it was not getting payment, and the college was going to wreck, professors were not receiving their pay. The truth was, the city of Edinburgh had become bankrupt, and there was a great outcry. In order to arrange matters it was agreed that the Government should advance this 228,000*l.*, and that the harbour and docks of Leith should be burdened with the debt. They said, Oh! we will keep over the debt, we will hand the debt over. I don't think this fair. I suppose they did not know very well how to come before Parliament without this story. We in Leith did not think ourselves fairly used by them. They have got only the trouble of appointing five commissioners, and they put us to the trouble of being in continual correspondence with the Treasury for all to no purpose. They never will get anything; indeed they look upon it quite as a bad debt.

3184. But still, have you to pay this 7,680*l.*?—Yes, to the city of Edinburgh, to the city of Edinburgh creditors, to the college, and to the High School.

3185. From what sources was this payment to the city derived before?—It was derived from the general resources of the city of Edinburgh.

3186. Then in fact the general revenues of the city of Edinburgh have been saddled upon the public purse?—To a very great extent.

3187. Have they not been so altogether, according to your statement, to the extent you have named?—Practically this 7,680*l.* was a Government grant, because the Government would release their hold of the interest of this money, 228,000*l.*, on condition that they should be paid.

3188. In fact, the city of Edinburgh has received from the Treasury the sum of 228,000*l.*?—It looks very like it.

3189. Because you were bound to pay annually 7,070*l.* [*Witness interrupting*, 7,600*l.*,] Well, this 7,600*l.* and odd which the city of Edinburgh had formerly been obliged to pay?—This 228,000*l.* was borrowed by the city of Edinburgh and not by us; we never got any of it. The Treasury were entitled to take the docks altogether, and in my opinion it would have been a good job if they had done so. But instead of doing this they gave us a new constitution, burdening the revenues for this annual payment of 7,680*l.*; and we are merely keeping back the question of interest until we are able to do it.

3190. What is the state of the revenue and expenditure now derived from the docks?—We have a surplus, but it is being swallowed up fast by the increasing necessities of the port. We must make all those modern improvements which are being carried into execution at all other ports, in order to keep up the reputation of Leith as a port, or the port will soon lose its name.

3191. Then over and above this payment of 7,680*l.* to the clergy and colleges you say you have a surplus?—We have.

3192. What does it amount to?—Oh, it varies; I should say it averages from 1,200*l.* to 5,000*l.* per annum.

3193. Not higher or lower than those sums?—No.

3194. Do you allow this sum to accumulate as a fund?—We have borrowed upon the strength of this considerable sums from several of the Scotch banks for the extension of the docks, the deepening of the water, and other alterations and improvements. We have got an additional depth of nine or ten feet more water than we had before, and we are likewise engaged in building a new graving dock, so as to be able to accommodate vessels of large size; so that in the course of the next 40 years, even supposing there is a surplus going on, it will be all disposed of.

3195. Then the banks, if I understand you rightly, have not got security over the surplus revenue to cover their advances?—Yes.

3196. (*Sir Frederic Smith.*) Will you look at this chart (*producing a chart of England and Scotland*, i.e., *the east coast*)? You will see that by this chart, with the exception of Sunderland, the greatest number of wrecks have occurred off the Firth of Forth in the course of the last five years?—I see by the chart it is marked so. There may have been. I should not at all wonder at it.

3197. How do you think this is to be accounted for?—I think it is accounted for wholly by so many vessels running for the Firth of Forth in heavy gales of wind, from the Humber.

3198. This then is an excellent harbour, in your opinion, the Firth of Forth?—It would be a very admirable harbour if properly attended to.

3199. Could it not be made available for vessels running there, if something were done to improve its capabilities?—It would form a very valuable harbour for the Shields colliers.

3200. But your opinion is, that harbours of refuge, if constructed on the north-east coast, would prevent any of these casualties which have occurred?—Well, these vessels must have been wrecked before they got to the Firth of Forth, that are marked on this chart.

3201. (*Capt. Washington.*) All these wrecks, which are set down here are wrecks which have occurred in the different small harbours of the Firth of Forth—In some of the great gales of wind which arise a great number of vessels are wrecked through taking the wrong side of Inchkeith Island, and there are a great many also which take place just at the foot of the strait. If a breakwater could be erected, it would be of great service, it would give us smooth water, a breakwater from Inchkeith to the Black Rocks. A good many vessels coming up to Inchkeith without pilots are wrecked at Inchkeith.

3202. It is an important question for the Commissioners. We are told that if there were two harbours of refuge erected at Cromarty, and the Firth of Forth, they would be of very great use in preventing wrecks, and other casualties. The Firth of Forth does not appear to be that valuable harbour of refuge which it might be. What would you suggest to improve it?—If the breakwater I mentioned was erected from Inchkeith to the Black Rocks, it would form a most excellent safeguard, and not only give us smooth water, but would form the very best harbour and contain the whole navy of Britain.

3203. Have you any notion as to the expense of the undertaking?—The expense would certainly be very considerable.

3204. When did the change take place by which you were bound to make these payments to the High School, the college, and to the clergy of Edinburgh?—In the year 1838.

3205. Under the order of the Treasury?—No, under the Act of Parliament.

3206. How do you entitle it?—It is called an Act for the settlement of the affairs of Edinburgh and the harbour and docks of Leith.

3207. Can you give us a copy of the Act?—It followed on the reports of some special commission of the House of Commons inquiry into these matters, and they recommended that these annual payments should be made, and the government debt withdrawn altogether or cut in half.

3208. From the answers you have given to Mr. Lindsay previously, you say the smaller harbours, if

LEITH.

Mr. Donald Macgregor.

4 Sept. 1858.

Captain Washington.

erected, would not give that assistance that one large harbour would give if it were erected at Peterhead ?—Yes, I understand they would not give such protection.

3209. (*Capt. Washington.*) You mentioned St. Margaret's Hope as a national harbour of refuge, can you say that it is a safe one ?—No ; you cannot run up it at night. It is all very well in the daytime.

3210. Is it sufficiently lighted, buoyed, and beaconed ?—It is buoyed and beaconed sufficiently for daytime, but it is not lighted at all.

3211. Then by simply lighting that, do you think it would make a good harbour of refuge ?—It would make a very good harbour to run for at night.

3212. Are you acquainted with the Yarmouth Roads, do you know they are well buoyed and beaconed ?—I have passed through them. They are lined with sands and they are lighted, and ships constantly run through at night both ways.

3213. Is there any reason why St. Margaret's Hope should not be as safe if it was as well lighted as the Yarmouth Roads ?—I would not like to sail there without a pilot ; strangers sometimes get on the sands at Yarmouth, and I would not like to go at night without a pilot.

3214. Then your opinion is, that this approach to St. Margaret's Hope, if lighted, would be an excellent harbour of refuge ?—I don't say that, but it would be of great importance to have the Firth of Forth lighted above Leith. If it were so lighted you would have a good many vessels running up the Firth of Forth for shelter. The lighting of our Firth of Forth has been very well attended to, and if anything could be well done to improve it, it would have been done already. We have very important places at Grangemouth, Alloa, and Borrowstounness, and if lighting could have been done easily for night vessels, it would have been effected there.

3215. Are you aware that night lights were recommended to be placed on the Orkneys and the Shetlands ?—I am aware that they would be of very great service there.

3216. But you do not know that they have been placed there ?—I do not know myself that they have been placed there.

3217. Well, they have not been placed there; so it shows that it does not follow, that because it could have been done, it would have been done. Do you know that it would be a great advantage to the pilots in the Firth of Forth if it were better lighted ?—Beyond a doubt.

3218. Are you a practical sailor ?—No, I am not a practical sailor ; but there are several gentlemen here who would give this Commission valuable information, and may I be allowed by you to call some of those gentlemen.

(*Chairman.*) We shall be happy to hear any gentleman who you may wish to call.

Captain Dickson examined.

Captain Dickson.

3219. (*Chairman.*) What are you, Captain Dickson ?—I am a retired shipmaster.

3220. How many years have you been connected with the shipping trade ?—I was for fifty-eight years at sea before I retired.

3221. What vessels were you principally employed in commanding, and where did they trade to ?—They traded between Leith and London.

3222. And how many years were you a captain?—Twenty-eight years.

3223. Have you any opinion to offer the Commissioners as to the eligibility of a site for the construction of a harbour of refuge on the east coast of England, or can you give an opinion as to the necessity for the formation of such a harbour ?—One is very much wanted indeed.

3224. What is your opinion as to the site, then ?—I should say Hartlepool.

3225. Will you state your reasons for preferring Hartlepool ?—It is a deep bay, and if ships are taken into it not one out of a hundred would get clear out of it ; and if there was a harbour formed at the bottom of the bay, it would be the means of saving a large amount of life and property.

3226. (*Sir Frederic Smith.*) Have you been in the habit of running for any of these harbours on the east coast of England at low water ?—There are no harbours which you can take at all. I have been to Shields at high water. I have run into it, but at low water there is no place to run to along the whole range of coast.

3227. What would you do if caught in an easterly gale on that coast at low water ?—I should decidedly work the ship out, or else I would be blown ashore.

3228. But if you were not bound to any one of the ports, would you keep clear of the bay ?—I would get into the bay.

3229. You might keep out of it ?—I would not go there if bound to Hartlepool.

3230. Supposing you were bound south of Hartlepool considerably, say to London, you would not then remain in the bight of the bay ?—No.

3231. If the wind were to chop round to north-east, could you get out of the bay ?—I could not get out.

3232. Then altogether you consider Hartlepool as the best district for a harbour for vessels so caught from Flamborough Head to the Firth of Forth ?—I do.

3233. Do you ever meet with foul wind off Flamborough Head ?—Yes.

3234. Were you ever obliged to come back to the Firth of Forth when so caught ?—No, I was never.

3235. If a south-east wind arose would you keep out at sea ?—I should do so.

3236. And on the whole you prefer Hartlepool Bay ?—I do prefer it. A vessel caught there is more likely to find the bottom of the bay than any other point. And, therefore, Hartlepool Bay, I think, is the best point for a harbour of refuge.

3237. Have you ever navigated the north coast as far the Baltic ?—Not much. I have been north, but not a great deal.

3238. In returning from the Baltic do you make Buchan Ness, or do you come straight on to the Firth of Forth ?—I come straight on to the Firth of Forth.

3239. Are you anxious to have a harbour of refuge at Peterhead ?—We should be the better for it certainly, but it would not be so important as a harbour on the south.

3240. (*Mr. Lindsay.*) Then do you think the harbour of refuge more wanted on the north-east coast of England than on the north-east coast of Scotland? —Yes.

3241. What are your opinions about Filey Bay, which is close to Flamborough Head, as a site for a harbour of refuge ?—It would not be so good as one at Hartlepool.

3242. Then you think more lives and property would be saved by a harbour of refuge at Hartlepool ?—I do.

3243. (*Capt. Washington.*) Have you traded much along the coast ?—Yes ; I have.

3244. For how long ?—For forty years.

3245. Between where ?— Between Leith and London.

3246. Have you ever had occasion to run yourself for shelter ?—I never had any place to run for shelter all along the east coast, but I have had occasion to run up to the Firth of Forth.

3247. Where did the foul wind generally catch you ?—From all parts of the Scotch coast.

3248. But I mean the gale of wind which generally caught you, obliging you to run to the Firth of Forth ?—About the Fern Islands.

3249. And have you known many wrecks take place at Hartlepool?—Yes, I have known a great many.

3250. Compared with other parts of the coast?—Yes, more than any other part of the coast, except near Whitby, where there are perhaps more than off any other ports of the coast.

(The name of Captain Hall was at this stage of the inquiry called, but that gentleman was not in attendance.)

Captain BENJAMIN MANN examined.

3251. (*Chairman.*) What has been your occupation, Captain Mann?—Shipmaster.

3252. Between what ports have you commanded ships?—Between Leith and London.

3253. How long have you been a shipmaster?—For thirty years.

3254. Of what description were the vessels that you commanded? I mean were they steamers or sailing vessels?—They were first smacks, and then schooners.

3255. Have you any opinion to offer the Commissioners as to the most eligible site for a harbour of refuge on the east coast of England?—I think Hartlepool is about the best point for general use to the shipping of any place from the Fern Islands to Flamborough Head.

3256. Do you consider such a harbour wanted?—I do, and often wish we had one there. We have been caught on that coast several times. Very many ships have gone ashore there.

3257. Do you know the coast of Scotland north of the Firth of Forth?—Yes, I know it. But I have no opinion to offer the Commissioners as to the necessity for a harbour of refuge on that coast.

3258. What do you think about Peterhead?—Well, a great many people speak about Peterhead as a good place, and I think so myself, because it is on a point of land, and ships cannot get past it when there are east winds. Vessels either bound north or south could go in there.

3259. (*Sir Frederic Smith.*) Do you know Filey?—Yes, I have been in Filey Bay.

3260. What do you think of Filey Bay as a place for a harbour of refuge?—Further than this I don't know much about Filey Bay, but that I have been at anchor in it.

3261. What wind are you protected from there?—From the north-east wind.

3262. What sort of breakwater would you require to complete your protection there?—Really, I could not say, but I should say it must be a very long one.

3263. Do you know Redcar?—No.

3264. Then on the whole you give the preference to Hartlepool?—I do. For vessels caught off Flamborough head or off Filey Bay can either get to the north or south, but if they are caught in the bight of Tees bay they cannot well get out. A great many ships are caught on shore there.

3265. Have you ever seen them running from the shore?—I have seen fleets of colliers running from Flamborough Head. This was a few years ago.

3266. How many have you seen at a time?—Oh, maybe as many as a hundred.

3267. For those vessels, which would have been the better port as a harbour of refuge?—Well, there is no place between the Humber and the Firth of Forth.

3268. Are you aware of any wrecks which have taken place in the Firth of Forth during the last five years?—Oh, many.

3269. How do you account for those wrecks?—By reason of persons not being well acquainted with the coast or not seeing the land. Many ships get embayed at Dunbar Bay, because they are not acquainted with the nature of the land or do not see it.

3270. If persons were well acquainted with the Firth of Forth would there be any danger in running in?—If a man only gets sight of the Mary Island there is no fear but that he can run up the firth safely.

3271. (*Mr. Lindsay.*) Have you been master of one of those crack vessels called Leith smacks?—Yes; they are well-manned able boats. Sometimes we went into Holy Island and into the Humber, but there is no harbour along the coast which a man can take at all in bad weather.

3272. If there had been a harbour of refuge on the east coast of England would you have taken it on many occasions?—Yes, I certainly would, that is when I was master of a Leith smack.

3273. You say you prefer Peterhead, which is on a point of land on the north-east coast of Scotland. Why would you prefer it, and why prefer Hartlepool for being a deep bay on the east coast of England? How will you reconcile these opinions?—Peterhead Bay is a deep bay. I should say it is a much better site than Wick; it is on a point of land the other side of Buchan Ness.

3274. But why do you prefer a point of land on the east coast of Scotland when you prefer a bay on the north-east coast of England?—Because there are many vessels that cannot get up the Moray Firth in bad weather, and they would go for Peterhead, and it is a pity there is not a harbour of refuge at Peterhead, for the lives and property of many persons would be saved.

3275. (*Mr. Coode.*) Were you not exposed to considerable risks in Tees Bay on the east coast of England?—We were.

3276. Could you not have got out?—I often watched the opportunity, to see if there was a sign of wind shifting, so that I might get out to sea, but if there was a breakwater in Filey Bay I would put in and shelter there. I have seen many times large fleets driven from Flamborough Head as far as there. Those large fleets would have been very much benefited by a harbour in Filey Bay.

(*Mr. Macgregor.*) May I, gentlemen, volunteer a piece of information which would absolve the Firth of Forth from all the black-balling it has got? We don't often hear of wrecks occurring here, but we have an immense number of small traffic in the Firth of Forth, colliers and vessels laden with pig iron, on the Fife coast a great number of them carry coals. Whenever there comes on a gale of wind down they go, and then down goes a black mark or a black cross on the chart.

Captain ALEXANDER BROWN examined.

3277. (*Chairman.*) What occupation have you followed, Captain Brown?—That of shipmaster.

3278. For how many years have you been at sea?—Forty years.

3279. And in what vessels were you employed? What kind of vessels were they you commanded?—Between Leith and London.

3280. Were they the ordinary sailing vessels?—They were formerly smacks, and then a splendid class of clippers.

3281. Have you any knowledge of the Firth of Forth, I mean the coast of Scotland north of the Firth of Forth?—No, I have not.

3282. Are you of opinion that there is any necessity for a harbour of refuge on the east coast of England?—I am. It would be very beneficial both for the saving of life and property if we could get one formed.

3283. Have you any opinion as to the most eligible site for such a harbour?—Well, fixing a line between Flamborough Head and the Farn Islands, I would say the most adapted place is Hartlepool.

3284. You say you prefer Hartlepool. Will you state your reasons for preferring Hartlepool to any other place?—I will. Because when a gale of wind arose a vessel could not clear herself off Flamborough

LEITH.

Captain A. Brown.

4 Sept. 1858.

Head, or between Flamborough Head and the Farn Islands.

3285. (*Mr. Lindsay.*) Do you think that if a harbour of refuge was constructed in Hartlepool Bay, it would do more towards the saving of life and property than a harbour in Filey Bay?—I do.

3286. Does this arise from the fact that when vessels are caught by the east gales which are the most dangerous on that coast, they could get more easily to Hartlepool Bay than to the north of Flamborough Head?—Yes.

3287. From your experience does the danger arise principally when vessels are caught to the northward of Flamborough Head?—Vessels going south are often driven back there by heavy gales of wind which are frequently occurring.

3288. If harbours such as Hartlepool, Sunderland, and the Tyne could be improved so that laden vessels of 300 tons could enter them at all times of tide, do you think the expenditure of money in that way would do more to the saving of life and property than the erection of one great harbour?—No; a vessel bound north of those ports could fetch Hartlepool when it could not fetch either of those north ports, such as Sunderland or the Tyne, and in the same way vessels going south could not possibly get to Filey Bay. In my opinion, Filey Bay is all very well for vessels which are close by it, but they could never get to it from the north in an easterly gale.

3289. (*Capt. Vetch.*) Are you of opinion that many wrecks take place north of Hartlepool Bay?—A great many in the course of the year, annually. If caught off there in a southerly gale or a strong easterly gale, they must either try to run to port or go ashore, but if they had a harbour at Hartlepool to run to it would prevent these things from happening.

3290. Then you think that Hartlepool requires artificial shelter for the prevention of these dangers?—Yes.

3291. (*Mr. Coode.*) Of the vessels wrecked off Hartlepool Bay are the greater number of them laden or light?—Oh, partly both.

3292. Are you aware that the greater number of them are laden?—Well, I should say more were laden than not.

3293. Do you think there are more vessels caught off the bay of Hartlepool than off Flamborough Head?—I do.

3294. Do you not think a harbour would be better a little south of Hartlepool for vessels caught in the bight of the bay?—I do.

3295. Have you seen many vessels caught off Flamborough Head?—Yes, I have, I have seen many waiting for the westerly wind, and I have seen many wait for shelter.

3296. Then if those vessels had occasion to wait there and the wind came on from the east, would a harbour of refuge be better at Filey Bay than at Hartlepool?—Well, it might suit those vessels which were there at the time, but if you take a general average for all classes of fleets of ships lying along the coast, it would be much better for them if there was a place at Hartlepool.

3297. And you think Hartlepool Bay is the safest place?—Yes, it is the safest place you can get; it is the most likely place.

3298. What do you suppose is the best place for vessels to run to that are bound to the south, and caught in head winds along that part of the coast?—Well, there is no place that I know of excepting the Humber. That is the only place.

3299. Where do you get the head winds mostly?—Oh, from all parts of the coast.

ROBERT COLME, Fisherman, examined.

Robert Colme.

3300. (*Chairman.*) What is your occupation?—I am a fisherman and a pilot.

3301. Are you acquainted with the North Sea and the Pentland Firth?—I am.

3302. How many years have you been pilot in the Queen's service?—Eight years.

3303. (*Mr. Lindsay.*) Have you had much experience in navigating the north east coast of Scotland?—Not a very great deal, except when I went in fishing boats.

3304. How long have you piloted on the north-east coast?—About eight years.

3305. How long have you been going between the Firth of Forth and the Pentland Firth?—Do you mean how many journeys I have made?

3306. Yes.—Well, I really can scarcely say.

3307. Have you made a hundred?—Well, I dare say not.

3308. About fifty?—Yes, I might say fifty.

3309. Then, as a pilot, what is your opinion as to the necessity of a harbour of refuge between the Firth of Forth and the Pentland Firth? Do you think there is any necessity for it?—There is very great necessity for it, particularly in the winter season, for vessels coming from the Baltic and from America. Between the Firth of Forth and the Pentland Firth there is no place except Cromarty where you may take a vessel to.

3310. Is navigating Cromarty Bay easy?—That depends very much on the winds.

3311. Do winds very often blow home there during easterly gales?—Yes, very often.

3312. During an easterly wind is there any difficulty in getting out of Cromarty?—No, no difficulty.

3313. Have you any baffling and variable winds to encounter in the bight of the bay at Cromarty? Have you ever encountered any?—I cannot say I have.

3314. Speaking in a commercial point of view, and looking to the saving of life and property, what point along the whole range of the coast do you think most suitable?—Why, Peterhead.

3315. Why so?—Because it commands both north and south; that is, that a vessel getting into Peterhead in a heavy gale of wind cannot reach the Moray Firth, and a vessel, if she could get round Rathlin Point, she might get to Cromarty; that is, if the wind were south-east.

3316. And if the wind were south-east she could get to Peterhead?—Yes. If a vessel can get out to sea there is no danger about getting to Cromarty.

3317. Do you know the fishing stations between Leith and Peterhead?—I know most of them.

3318. Name one of them in particular where the expenditure of money would be the means of saving life and property.—There is not a fishing station anywhere in the Moray Firth where a harbour within five miles would not be of much service both to life and to property.

3319. Then what points do you think would be so improved by the expenditure of money as to save the lives and property of fishermen?—I should think Craigroan.

3320. Have you anything to tell the Commissioners as to the small harbours of the coast near Craigroan?—Well, man is a selfish animal; we all look to our home first.

3321. Where is your home?—At Newhaven. As to Newhaven, we want something to be done very greatly, or we shall soon have to remove, because the grounds are all going away.

3322. Is Newhaven a fishing station?—Yes.

3323. How many boats are there engaged in the fishing trade there?—About 300.

3324. Have you a harbour there?—No, we have no harbour at all. We have sent petitions to Parliament, but somehow or other they don't seem to take any notice of them, or they are not supported, or something; at least we don't hear anything about them after they are sent.

3325. Do you think the improvement of Newhaven would be the means of saving a great number of lives?—Yes, I think it would.

3326. Have you a pier there?—Yes, we have a pier, but no harbour. It has been the means of saving life and property without a harbour, and I don't know what it would be with one.

3327. Is Newhaven much exposed?—Yes, very much so.

3328. Can boats enter Newhaven at all times of the tide, or in an east gale of wind, or at high water?—No; they can't enter at all.

3329. At what time of tide can they enter?—You cannot get there at all at high water spring tide. A harbour has been talked of at Newhaven, and we have had estimates, but we could not meet them. They were too high. We applied to the Fishery Board.

3330. What did the Fishery Board say?—Oh, I think the board wanted us to raise a part of the 14,000*l.* which was the sum fixed upon to make the harbour. They were, we understood, to give two thirds of the money, and we were to subscribe the one third; but we could not find the money to do so.

3331. You were too poor?—Yes, we were; I suppose so.

3332. Then do you think the construction of a harbour of refuge at Newhaven would be the means of saving life and property?—Yes, I should say so.

3333. If such a harbour as that proposed or talked about were erected, could boats take it in all weathers?—Yes.

3334. Have you had any experience on the north-west coast of England?—Except Shields, I have not had much; not much beyond that.

3335. Can you give any opinion on the necessity for a harbour of refuge on the north-east coast of England?—I am not competent to form an opinion.

3336. (*Capt. Washington.*) You are a pilot?—I am.

3337. And you have piloted at St. Margaret's Hope?—Yes.

3338. Can a vessel run through there by night?—A pilot could take her up.

3339. In daytime, could a strange vessel do so?—Yes, easily.

3340. If it was lighted, as it might be, could strangers use it as a harbour of refuge?—Yes.

3341. Where would the lights be placed?—One should be placed on Inchcolm, and one on Garvie Island.

3342. Then you think two small lights would make St. Margaret's Hope a harbour of refuge?—Yes. There is nothing in the way except a small rock above Queensferry, which is a bad place if the weather is thick.

3343. Is it lighted?—Yes, it has got a large beacon on it. Ships can hardly run foul of it in daylight.

3344. (*Chairman.*) In a heavy easterly gale of wind could a stranger run up the Firth of Forth to St. Margaret's Hope in safety?—Yes, if he had confidence in his chart, and if he sees the buoys on the Drum Sand.

3345. How would a vessel do in thick weather?—Well, he must have a thorough knowledge of the depth of water.

3346. Then in thick weather, unless the land is not visible, could a stranger go by his soundings?—Not very well.

3347. Do I understand you to say that if the Firth is lighted as you have named, a stranger could run up to St. Margaret's Hope in a heavy easterly gale at night?—Yes.

3348. (*Capt. Vetch.*) Do you know Fraserburgh?—Yes, I know Fraserburgh well.

3349. Did you ever see a number of vessels lying at shelter in the bay there?—I have.

3350. How many vessels at a time?—Perhaps fifteen or twenty.

3351. In west gales of wind, when a vessel could not come up in heavy weather, have you seen them take shelter there?—Yes. When a heavy westerly wind is blowing, vessels bearing up on Banff Bay will get anchorage there, or at Lossiemouth; but, when they can get off, they may go to Fraserburgh.

3352. If, with baffling variable winds, or other contrarieties, the vessel could not make to Cromarty Bay, could it not find anchorage at Fort George?—Oh yes.

3353. And in unfavourable wind?—Yes.

3354. Failing this, could you get out there?—Yes, but as to getting to Cromarty in a gale of wind, if a vessel will work there is nothing to stop her getting anchorage.

Mr. William Thompson examined.

3355. (*Chairman.*) What are you, Mr. Thompson?—I am a merchant and shipowner at Leith.

3356. What is the nature of the information you wish to render to the Commissioners relative to Anstruther?—The necessity of a harbour of refuge for the fishing-boats employed in that locality.

3357. Will you now proceed with your statement, observing that the present object of this inquiry is a national harbour of refuge?—The fishing property of the district of Anstruther is second to Wick alone, in Scotland; and, from the memorial I hold in my hand, it seems that there are employed, official boats, during the last three years, belonging to the two towns of Anstruther and Cellerdyke, 315 boats. This is on the average. The present accommodation in the harbour is quite insufficient for the trade carried on. Besides being the fishing station at the mouth of the Firth, the harbour is frequented by boats from all the fishing towns in the Firth, Newhaven and Dunbar, and other places. There is no place to which the fishing boats of Anstruther can run to, if a violent east wind comes on. In the year 1856 a very serious gale of wind, which took place when the harbour was crowded with shipping, did a great amount of damage to property, and also some loss of life occurred; all this arising from the crowded state of the harbour. A heavy gale occurred during the fishing season. Here is a copy of a memorial (*producing a paper*) signed by 1,243 fishermen belonging to the Firth of Forth, and 370 belonging to the district immediately adjoining Anstruther, asking for some assistance to enable them to construct a harbour of refuge, for their own use, and that of all engaged in the fishing about the Firth of Forth, showing that it is not merely a local matter, but that it is a matter affecting the interest of all the fishing places connected with the Firth of Forth, representing, I believe, no less than 700 boats. The value of the fishing in that quarter is about 85,000*l.* per year. This was the average of the five years ending 1857. Plans were prepared by the Messrs. Stevenson, C.E., for a harbour which would be quite sufficient for the whole of the fishing on the Firth of Forth, showing that a harbour could be provided at an expense of 30,000*l.* The locality is willing to raise 12,000*l.* if a loan of 18,000*l.* was advanced by Government; and the revenue of the fishing, which amounts to 1,200*l.* a year, would be handed over in security for the payment of the interest and the redemption of the debt. In the the memorial which I have handed in there are statistics given, on which my statements are established.

3358. And you are quite sensible that the port of Anstruther is not one, either in point of situation, or capacity, or capability, for the formation of a national harbour of refuge?—Decidedly so.

3359. And you don't think that on the north-east coast of Scotland a harbour of refuge is needed?—Well, as a shipowner, I don't think there is any necessity; but certainly on the north-east coast of England one is greatly needed.

3360. State on what ground you have formed that

LEITH.

Mr. W. Thompson.

4 Sept. 1858.

Chairman.

opinion with respect to a national harbour of refuge not being required on the north-east coast of Sotland? —I think that for foreign vessels and coast-going vessels there is no occasion for a harbour of refuge; but, as regards the fishing, there is required a harbour of refuge at Wick. For the ordinary vessels or foreign going ships there is no need for one.

3361. State on what ground a harbour of refuge is required on the east coast of England? — Between the Firth of Forth and the Humber there is no harbour which a vessel can take. There are an immense number of vessels going to the ports of Shields and Newcastle, and when a gale arises they are liable to get on a lee shore, and there is great difficulty in working out from it. There is no protection between the Firth of Forth and the Humber.

3362. Have you formed any opinion as to the most eligible site?—I agree with the evidence which has been hitherto given, that Hartlepool or thereabouts is, perhaps, the very best place that could possibly be selected for the locality. I am not a practical man, but having occasionally gone along the coast I may say that my private opinion is, that the bay is perhaps the most suitable place.

3363. Were you ever at Holy Island?—I once put in to Holy Island, and I lay there for two days; and certainly it is not at all an easy place. I certainly would not like any shipping of mine attemping Holy Island.

3364. (*Sir Frederic Smith.*) You said that there were 315 boats at Anstruther. Do you mean that those boats belong to Anstruther alone?—No; they belong to Anstruther, Cellardyke, and Pittenween; all of which form a connection with one another.

3365. And you say, that as far as regards the fisheries, that collection of boats is next to Wick?—Yes; it stands next to Wick according to the fishery returns.

3366. Have you ever made a voyage to the Baltic from Leith?—No.

3367. Do you know much of the east coast of Scotland?—No, beyond what I have heard, and from the reports of the shipmasters. We have a number of vessels trading to North America from Leith, and they never complained of want of shelter.

3368. As a shipowner, would you be willing to pay a passing toll for a harbour of refuge at Peterhead? —No, I certainly should not.

3369. Would you do so for a harbour south?—I would willingly, as a shipowner, do so for vessels trading to the south on the east coast of England.

3370. Are you aware that there is an objection to paying toll at Peterhead?—I believe there is. There is Rattray Riggs, near Peterhead; and my fear is, that in a gale of wind ships should go there, and make for Peterhead. Of course it would be for a practical man to consider this, and also as to the danger of the rocks.

3371. (*Mr. Lindsay.*) Have you not heard many loud complaints on the part of the shipping interest against passing tolls?—Yes.

3372. Don't you think that putting on a fresh tax would be complained of by the shipping interest?— It would.

3373. Do you think we can tax any particular class of the community for a national harbour of refuge?—I think it would be an unfair tax. I would object to the passing tolls altogether. I don't think it is fair.

3374. How many boats did you say there were at Anstruther?—315.

3375. Is that the highest number?—No; sometimes there are between 500 and 600 during the fishing season.

3376. What is the number of men employed in these boats?—There is a population of about 7,000, and half of them are fishermen.

3377. How many men are required for a boat?— About six or eight.

3378. Have you known the lives of these men placed in great jeopardy?—Yes; I have known many lives to be lost. Within the last three years, two steamboats were lost on a reef of rocks coming to Anstruther. One of them was a Dundee ship, and the other was an Aberdeen one.

3379. Do you think if a harbour of refuge was made there, it would be the means of saving life?— It would, to a very great extent.

3380. What kind of harbour is there at Anstruther now?—It is formed by two piers running out.

3381. Could boats take it at all times of the tide? —No, only at half tide up to high water.

3382. Can the boats take it in gales of wind at half water?—Yes, I should say they can. The reef of rocks is covered at half tide, so as to allow a fishing boat to pass over it.

3383. What is the revenue of the harbour at Anstruther?—500*l*. The people of Anstruther are willing to raise 12,000*l*., if they can get a loan of 18,000*l*. from the Government for the formation of a harbour of refuge.

3384. Besides the revenue 12,000*l*., the revenue of the harbour will be included in the indemnity?—Yes; they will give it as security for the loan.

3385. Do you think that if such a harbour was erected there, many more boats would frequent the place than now?—That depends very much on the shoals of fish. Next to Wick it is the principal place to which boats resort. The fishing has been on the increase.

3386. What has been the increase?—The record begins in 1842, at 45,000 barrels, and it rises up to 49,000 barrels in the next year. The average from 1850 to 1857 was 68,000, and last year it was 95,000. Application has been made to the Treasury for the construction of a harbour.

3387. (*Capt. Washington.*) You say that 500 or 600 boats frequent the locality. In the event of a gale of wind rising, how would they escape it?— Their only course would be to run up to Leith roads, or else to Elie.

3388. Is there any shelter at Elie?—There is, but it is a worse harbour than Anstruther. The present proprietor, Mr. Reard, has got an Act of Parliament for the improvement of the harbour, but it has not been begun yet. I am speaking of it as it is at present.

3389. Do you think the fishermen are entitled to have a harbour of refuge constructed for their service? —I do. The loss of life has been very great among that class. They are well deserving of protection, as they are of great importance to our commerce.

3390. When is the fishing principally done, by day or by night?—The fishing is all done by night. Vessels go out in the evening, and return to port in the morning.

3391. How many men are there manning these boats?—Taking the average, about six men to each boat.

3392. And these men are exposed to their calling how long in the year?—They are engaged during nearly the whole of the year. January, February, and March they are employed in the herring fishery. In July, August, and September is the fishing season. In other months they go for cod and ling.

3393. How far do they go out?—They go about 20 miles from the mouth of the firth. They are more exposed than any other trade on the coast of Scotland. This extends generally to all the fishing along the coast, the fishing in the Moray Firth, and on the coast of Caithness also. I am glad they are doing something at Wick. Something should be done for the protection of this class of vessels.

3394. Have you ever been at Wick?—No, I have never been there; but I know its general situation, and that it is a little south of the Pentland Firth. I am not sufficiently acquainted with the bay to say whether a fishing harbour would be well at Wick or not. My opinion would only be from hearsay.

3395. (*Capt. Vetch.*) What are your opinions as to a harbour of refuge north of the Firth of Forth?

—I don't think it would be necessary for the sea-going trade.

3396. But you mentioned that it would be necessary for the shipping at Wick?—Yes.

3397. (*Mr. Coode.*) And the value of the fish last year was how much?—The number of barrels was 95,000. I don't know their value, but the average value of the last five years was 85,794*l.*

3398. (*Capt. Washington.*) Then you state that boats were wrecked at Cellerdyke?—Yes; in 1856 very serious damage was done. This memorial states the fact. It is signed by 1,243 fishermen. The boats were caught at night during a gale, and driven from their moorings, and 16 of them were most severely damaged. Most of the damaged boats belonged to Buchan and other places.

3399. Were any lives lost?—No.

3400. Has any great loss of life occurred in the fishery in the Firth of Forth?—Oh yes; in coming in, boats which could not find shelter were sometimes lost, and boats lying off swamp. There is no harbour to which they can run.

3401. Can they not run into Dunbar?—If the wind is south-east they cannot do so.

3402. Has any loss of life taken place off Dunbar—the fishing there?—I don't know. Latterly there was a great loss of life at Helmsdale and Wick, off the coasts there.

3403. Do you know of any loss of life during the last three years off the coast of Scotland?—I have seen accounts of them in the newspapers. In 1856 there was a most enormous loss at Wick, and scarcely a season passes in which there are not occurrences of this kind—loss to fishing boats.

3404. Are you aware that 100 lives were lost off the north-east coast of Scotland in 1848?—I cannot say what the number was.

3405. But you say that a harbour of refuge sufficient for the fishing boats should be erected wherever needed?—Yes.

3406. (*Mr. Lindsay.*) Are you aware, of your own knowledge, whether the loss of life is greater in proportion to the number of fisherman employed than it is amongst men following other maritime pursuits?—Without being able to say positively, my impression is, in reading the accounts of the losses, and on considering the matter, that it is so.

3407. Then you say that there is a greater average loss among fishermen than among any other sea-going class?—No.

3408. Have you any means of obtaining the returns of the lives lost?—I think, with a little exertion, I could get them.

3409. Could you get them for the last 5, 10, or 20 years?—I would not go as far back as 20 years, but I dare say I could get them for 5 or 10 years past.

3410. (*Chairman.*) Then will you do so, and hand them in to the Secretary?—I will.

Mr. Charles Jackson, of Gretham Hall.

3411. (*Chairman.*) What do you wish to offer, Mr. Jackson, on the subject of the present inquiry?—I have no evidence to offer personally. I am one of the Commissioners of West Hartlepool. My being here to-day is purely accidental, and being very much interested in the formation of a harbour of refuge on the north-east coast of England, I have been endeavouring to get the opinions of nautical men on the subject, and on the nature of the different points of coast; and I have them here to offer if the Commissioners will take them. You will find evidence that is very valuable here.

The witness then produced papers, and handed them to the Secretary.

3412. (*Chairman.*) Do you wish these witnesses to be called?—I do.

(*Secretary.*) They have already been called.

(*Mr. Macgregor.*) Two of them, I think, are present now.

3413. (*Chairman to witness.*) Have you anything to offer yourself?—No.

(*Chairman.*) I think that anything you have to offer on the subject of harbours of refuge on the north-east coast of England would be much more properly given before the Commissioners when they visit that district.

(*Witness.*) My only object is that I thought this evidence that I have would be valuable.

3413*a*. (*Chairman.*) Is there any person present who wishes to tender further evidence with respect to this inquiry?

No answer.

Sittings at Leith closed.

GLASGOW.

Monday, 6th September 1858.

PRESENT:

Admiral Hope (Chairman).

Sir Frederic Smith.	Captain Vetch.
Mr. Lindsay.	Mr. Coode.
Captain Washington.	Mr. Sewell, Secretary.

Mr. Allan Gilmour examined.

3414. (*Chairman.*) What is your name?—Allan Gilmour.

3415. What is your occupation?—I am a merchant and shipowner.

3416. How long have you been connected with trade?—I have been resident in Glasgow twenty years, but I have been connected with trade for a longer period.

3417. In what trade are the vessels in which you are interested chiefly employed?—Chiefly in the North American trade in timber and cotton, but some are employed in other trade.

(The Chairman then instructed the Secretary to place a chart of the north coast of Ireland in the hand of Mr. Gilmour.)

3418. Do you see Portrush on the chart?—I do.

3419. Are you of opinion that a harbour of refuge at that part of the coast would be beneficial in any degree to the Clyde shipping engaged in the American trade?—I certainly think not.

3420. Will you state to the Commissioners the reasons which have induced you to adopt that opinion?—I think not, because vessels coming from the Atlantic Ocean have our harbour quite clear to them; and then again, suppose there is any real case of necessity, they can run into Lough Foyle, and I cannot see the least need in any way for harbours of refuge.

3421. Are you of opinion that there is any other point on the coast on which a harbour of refuge might

GLASGOW.

Mr. A. Gilmour.

6 Sept. 1858.

Chairman.

be desirable for ships trading with America?—No, I see no use in harbours of refuge for ships of large tonnage. I may state that I am not a nautical man, and it is only as a merchant that I am expressing an opinion.

3422. Are you interested in any ships which take the course by the south coast of Ireland?—My ships either go out by the north or the south passage, according to the direction of the wind. That is a matter left entirely to the discretion of the captain, and must depend upon the wind and weather.

3423. Are you of opinion that an improvement of the harbours of Carlingford and Wexford would be desirable to afford refuge to shipping bound in that direction in bad weather?—I do not think so at all. I cannot say how beneficial it might be to small coasting, but it is not in any way necessary for vessels of large tonnage.

3424. Do you see Douglas, Isle of Man, on the chart?—I do.

3425. Have you any opinion as to the necessity or otherwise of a harbour of refuge there for the benefit of shipping?—I do not think that there can be the least need of a harbour of refuge. I cannot see on what account an outward-bound ship in distress should run there; she would be much more likely to run for Liverpool, and a vessel going in a contrary direction would be more likely to make for the Clyde.

3426. Looking further south on the chart about the neighbourhood of the Land's End, say St. Ives, have you any opinion as to the necessity or otherwise of a harbour of refuge at that point for ships bound to the southward?—I am not particularly well acquainted with that part of the coast, but as regards my opinion, I should say that there was not the least need of one.

3427. Will you inform the Commissioners what is the nature of the shipping in which you are chiefly interested?—They are ships varying from 600 to 1,600 tons.

3428. (*Mr. Lindsay.*) Speaking generally, is it your opinion that harbours of refuge, if established, would be the means to any great extent of saving life and property? I ask you as one of the largest shipowners in the country?—I believe that harbours of refuge, marked down as such, are the means of causing loss of life and property rather than of saving it, by inducing captains to run down to them instead of keeping the sea. I believe that if a ship is well found and properly fitted out, it is far better to keep the sea than to run for a harbour of refuge. The instructions which we give to the masters of our ships are, in the event of any accident, if it is necessary, to return to the port from which they started, but by all means to keep the sea, and not to run for a harbour of refuge. These are our instructions, and it may, perhaps, not be amiss to state, that out of our large number of ships we have only lost 10 during the last 20 years. I cannot state positively, but I believe we have made 1,700 voyages to all quarters of the globe.

3429. What is the tonnage of the vessels in which you are interested?—About 25,000 tons, and that is not so much as it used to be; that is the amount held directly by our own house, but there is more with which our interests are connected.

3430. Are you aware that there is annually a loss of 800 lives, and that shipping property to the extent of 1,250,000*l.* is also lost?—I know the amount of loss is large.

3431. Do you not think that harbours of refuge would tend to reduce that serious loss of life and property?—I do not think that it would.

3432. Are you speaking with regard to those points alluded to by the chairman, or with regard to the whole north-east coast of England and east coast of Ireland?—I take the country generally. As I have said, my observations apply to harbours of refuge marked as such; vessels are caught in a gale of wind, and the master makes up his mind to run for one of these harbours, when he ought to do nothing of the kind; and it is in making for these very harbours that accidents very frequently occur. I believe, also, that at present there are plenty of harbours to which, in cases of such necessity, a vessel can safely go.

3433. Then is it your opinion that there is a greater loss of life and property occasioned by attempts to run for these harbours than there would be if none existed?—Certainly it is, and for the reason which I have already given, that it is generally safer for vessels to keep the sea than to run for a harbour of refuge when caught in a storm.

3434. Then it is your opinion, that if ships caught in a heavy gale were to be hove-to instead of being run for a harbour, there would be a smaller loss of life and property than there is at present?—That is my decided opinion.

3435. So that if it were determined to expend three millions of money on the construction of harbours of refuge, you do not think that the expenditure of that large sum would tend to reduce the frightful casualties which now take place?—I think it more than doubtful.

3436. Are you acquainted with the east coast of Scotland?—No, I cannot say that I am.

3437. With the north-east coast of England?—No, I never examined it particularly.

3438. Are you aware that in that part of the coast between the Firth of Forth and the Pentland Firth, with the exception of the Moray Firth, there is no place for a ship to run for shelter?—I have ships every year running through the Pentland Firth engaged in the timber trade with Hull, and I have never lost a single ship upon that coast.

3439. Then do you think that in the event of harbours of refuge being constructed, shipowners would gain anything by a saving of maritime insurance, that is, do you think the premiums paid would be lightened by their construction?—I believe not, I do not think it would make any difference.

3440. Your experience has been confined to the larger class of vessels, but do you mean your present observations to apply to all classes of vessels, large as well as small?—Yes, I think they will apply to all vessels.

3441. Then you have not heard any desire expressed on the part of your captains, or on the part of any large number of the captains with whom you have necessarily been brought in contact, for the construction of harbours of refuge?—No, I have not.

3442. (*Capt. Washington.*) I think you stated that you are not a sailor?—Yes, I said so. I am not a sailor, but I have been a good deal to sea.

3443. And have you been so fortunate as to have had none of your vessels caught in distress except the 10 you have mentioned?—In the course of 20 years we have only lost 10 vessels.

3444. Do you remember where they were lost?—I could not at this moment, but I could in a very short time ascertain.

3445. Perhaps you could let me know on some future day?—I remember that I lost three in the St. Lawrence.

3446. You lost none on the coast of the United Kingdom?—No.

3447. As a large shipowner your opinions carry great weight, and I want to know whether examining the east coast of England, and remembering that 10,000 vessels pass annually, and out of that number some few must be embayed and unable to get an offing, would you still adhere to the opinion that there is already a sufficient number of harbours?—Yes, I believe there is sufficient room for more vessels if they are in proper order.

3448. But while, as a matter of fact, a number of wrecks does take place every year, do you remain of the same opinion?—Yes.

3449. Would it not be humane to find places of shelter if we found that they are absolutely required?—I admit that if you could make a place of

shelter which could be accessible at all times without risk it might be desirable.

3450. Are you aware that in the south-east coast of England ships have not any place of escape if caught in any easterly gale?—I believe that it is so. I am only speaking as a merchant, and I have told you that in my experience I have had ships passing through the Pentland Firth going to Hull, deeply laden with timber; and I don't remember one getting in distress, and they pass through chiefly in the very worst months of the year.

3451. Yours are large and well-appointed ships; but is not your case the exception, and not the rule?—I cannot say.

3452. Did I understand you to say, that if a place of shelter could be erected on the east coast of England at a moderate expense, you should think it desirable to erect one?—That may be qualified. I do not mean to say that if such a place could be erected cheaply, it might not be desirable; but then look at the cost, and I must still repeat that ships in straits instead of running for those harbours of refuge should keep out to sea, and harbours of refuge marked down as such are very likely to induce masters of ships to to run down to them instead of keeping at sea as they ought to do.

3453. May I ask what you mean by the expression, "harbours of refuge marked down as such"?—I mean that if harbours are marked down on the chart as harbours of refuge, captains are very apt to run for them.

3454. At present none such exist, and the proposal into which we are inquiring is as to the expediency of constructing some places of shelter; does that circumstance alter your opinion?—In my experience (and experience is, perhaps, better than any opinion), I have had large ships carrying heavy cargoes passing through the Pentland Firth, and I never lost any of them.

3455. (*Chairman.*) I think you stated, in a former part of your evidence, that you were prepared to lodge a statement of the vessels you have lost, with some details, with our Secretary?—I can tell it at once.

3456. At present?—No, but in a very short time.

3457. Will you at your convenience forward to the Secretary to the Commission a detailed statement, with the fullest information which it is in your power to afford, as to the number of ships that have been lost amongst those interests with which you have been connected, giving us every detail connected with it?—Yes, I shall be happy to do so.

3458. Can you inform us, as your experience relates to large and well-found ships, whether there is a feeling among shipowners that a captain should do all in his power to continue his voyage and not run into port?—I think every man of consideration and spirit would keep out to sea, and endeavour to make his passage. There cannot be any doubt about it, I should think.

3459. Do I understand you to say that you give positive instructions to the masters of your vessels to act in that manner?—Yes, we have the instructions printed, and by them our captains are desired never to put into any port in case of accident, but to return to the port from which they sailed.

3460. Would you be good enough to lodge a copy of those instructions with the Secretary to the Commission?—I should like to look through them before I promise.

3461. By all means; and if there is anything you would like to omit perhaps you would oblige us with an extract?—Certainly.

3462. Are you still disposed, on consideration, to consider harbours of refuge unnecessary for the smaller class of vessels, as well as for that class of large and well-appointed ships with which you have been connected?—There may be exceptional cases; but taking it as a great general principle, I believe that at present there are sufficient harbours open for any vessels caught in a gale of wind, and I believe that even for that small class of vessels; but then, again, I must qualify that by saying that, although I have been a good deal at sea, I am not a practical seaman.

3463. Are you aware that the existing harbours, which you have stated in your opinion to be sufficient, are tidal harbours, and can only be entered at high water, or that vessels laden cannot enter them except at a favourable moment?—That, no doubt, is so.

3464. Is it, in your opinion, the duty of shipowners to send their ships from port so found as to be able, if caught in a gale, to keep the sea?—I have no hesitation in saying that it is their duty, and also their interest, to do so.

3465. Have you ever examined the wreck chart of the years 1852–53–54–55?—I have not, but I have seen the wreck chart of some years.

3466. I suppose that you are aware that the average loss of life annually is 800?—I am not aware what is the exact amount, but I believe that it is very large.

3467. You are aware that a very large amount of property is sacrificed annually?—I am.

3468. Should you think the imposition of a passing toll for the construction and repair of harbours of refuge an injustice?—Certainly I should.

3469. You think the imposition of such a toll would be a grievance?—Most certainly I do. It would be taking from men like myself; or, in fact, it would be picking our pockets without any return whatever.

3470. Then, I understand it to be your opinion that harbours of refuge are unnecessary, that ships ought to keep the sea, and that it is the duty of every shipowner to find his ship in such a way as to enable them to do so?—Certainly, that is my opinion.

3471. (*Mr. Lindsay.*) Is it not a fact that a very great number of vessels are lost from being badly found?—Yes, I believe so.

3472. Would the formation of harbours of refuge tend to encourage shipowners to find their vessels better, or would it have a contrary effect?—I believe that it would encourage them to send their ships to sea in a worse condition even than they do at present.

3473. Then, are you of opinion that if the owners of ships knew that there were no harbours they would for their own interest find their ships better than they do at present, and that if there were some of those harbours to run into the tendency would be to induce them to find them worse than they do at present?—Yes, that is my opinion.

3474. Be good enough to look at the wreck chart for a moment, and tell me whether it is not the case that a large number of wrecks appear to have taken place near the entrances to the harbours?—Do those marks indicate wrecks?

3475. (*Mr. Lindsay.*) Yes. Do you not observe a large number of wrecks near the entrance of the harbours?—A very large number of ships appear to have been lost at the entrances of harbours.

3476. (*Chairman.*) Is there any suggestion, or are there any observations, which you would wish to address to the Commissioners?—I would wish to say a few words on a point which, although perhaps, strictly speaking, it is not connected with harbours of refuge, yet nevertheless, has reference to the number of shipwrecks, and is, I think, of great importance. It is as regards the improvement of our seamen. I think that a great many shipwrecks occur from ships being manned by sailors who do not know their duty. I do not know the cause, but this I feel, that seamen have deteriorated, and that you can't depend on them as you formerly could do. This I know is foreign to the case of harbours of refuge, but it is so distinctly connected with shipwrecks that I think it ought to be taken up by the Commissioners. Many wrecks occur in consequence of ships leaving port with crews unfit to manage the vessel, and I think that one of the most crying evils connected with the mercantile marine of this country

GLASGOW.

Mr. A. Gilmour.

6 Sept. 1858.

is the fact, that one fourth, if not one third, of English seamen afloat are sailing under fictitious names, and that is a question which ought to be taken up and considered as being very intimately connected with the question of shipwrecks.

(*Sir F. Smith.*) I think this is a most important part of the subject, for, of course, as the object of harbours of refuge is to save life and property, it is desirable to ascertain if we can accomplish that object in any other way.

3477. Do many ships leave English ports insufficiently manned as regards the number of the crew?—No, not inadequately manned with regard to number, but they often leave port with their crews in such a state that they can't take care of the ship.

3478. Do you mean that the crew is not composed of seamen?—Some of the crew or all the crew may be regular seamen; but what I mean is, that they leave port in a state of intoxication, and consequently wrecks occur.

3479. Do I understand you to say that even if the crew is fit under ordinary circumstances to navigate the ship, they leave port in such a state of inebriety as to be disqualified to do so?—There can be doubt of that.

3480. Is the remedy not in the hands of the shipowner?—Not necessarily.

3481. Is not the captain appointed by the shipowner?—Certainly he is.

3482. Well, then, is a captain justified in going to sea with his crew in such a state?—No doubt he takes the responsibility on himself, but often he is unable to know what state part of the crew is in.

3483. Does the responsibility of collecting a good crew rest entirely with the captain?—Every captain is obliged to engage men, under the provisions laid down by Government.

3484. Do you think the Government responsible for this state of things?—I have no hesitation in saying, that our mercantile marine law is very defective.

3485. Could you explain to the Commissioners what modification of it would conduce to improvement?—I have already endeavoured to impress upon the Government the principle, that seamen should be engaged under the same certificate as officers of ships are, and I am perfectly persuaded that if seamen were engaged and taken on board ship under those certificates, we should get better men; and I believe, and I state it most sincerely, that the adoption of that principle would confer a great benefit both upon the seamen themselves and on the country generally.

3486. You say, I think, that a large number of seamen enter under fictitious names. Can you assign any reason for their doing so?—The reason is very simple:—the Government, although they have shown every desire to perfect as far as possible the mercantile marine Act, still they have gone the wrong way to work. As the case at present stands, a seaman engages in this country and goes to another port; he deserts his ship there, and is engaged at a shipping office under another name, and returns to London The consequence of this state of things is, that men can't be trusted, and they go on in that way for years and years, obtaining money, not for the purpose of benefiting themselves, but to be squandered in debauchery. This is really and truly the case; and any large shipowner, or any one who knows anything about the matter, will confirm what I say.

3487. Do you see any remedy for such a state of things?—The remedy that I have proposed is, to apply the same rules and regulations, so far as regards certificates to seamen, which are now applied to their officers on board the same ship; the adoption of such a plan would be very simple, as I have already explained to the Government. Let each man have a certificate of identity, by which he can be traced. If that certificate be lost, then the man would be looked upon as a deserter, if he could not show how he had lost it.

3488. I think that it is easier to talk about the adoption of such a system, than to carry it into operation?—I really see no great difficulty, and I am sure that such a system carried into effect would do more for the preservation of life and property than any number of harbours of refuge that could be constructed.

3489. But do you not see that, under the system you propose, there would be no safeguard against a man of bad character borrowing a ticket from a good man, and so imposing on the shipowner? How would you propose guarding against that?—It is always easy to point out exceptional cases, and we all know that there have been many frauds even in our own class of society; but I think my proposal as a great general system quite practicable. I have never heard of a case of the misuse of a certificate on the part of a captain or any officer of a ship, although, as regards numbers, there is a captain with three officers in every large ship who sail under these certificates; and I cannot see the least difficulty in extending the same principle to seamen, not only as an act of justice to themselves, but as being likely to confer great benefit upon the country, and to tend, to a considerable extent, to the preservation of life and property.

(*Sir F. Smith.*) If it could be carried out, I admit that the project looks well.

3490. (*Mr. Lindsay.*) Was it not the case that some such plan was once adapted in the form of a register ticket?—Yes, but the plan adopted as carried into practice was totally ineffective. I have now in my office a statement which would show that since the year 1852, my firm has lost no less a sum than 20,000*l.* by the desertion of sailors.

3491. Do I understand you to say that, since the year 1852 you have lost the large sum of 20,000*l.* by deserters alone?—That is the case.

3492. To what parts of the world do the ships in which you are chiefly interested trade?—To all parts; to Callao, New York, the West Indies, Mobile, New Orleans, St. Thomas, and in fact to all parts of the globe.

3493. Do you think that the plan which you have shadowed forth would tend to any extent to check desertion?—I have no doubt that it would, to a very great extent.

3494. But are you not aware that there was a plan brought into operation for registering seamen by giving them each a ticket of registration, and that that plan turned out a signal failure?—No doubt that is so, but the reason is easily pointed out. Those tickets were rendered worse than useless, from the facility with which they could be procured; and upon the loss of a ticket the people at the Custom House would grant another upon payment of half a crown, or any other small fee they might think fit.

3495. Then you think that the main cause of the failure of that plan was, that a man, if he should lose his ticket, was able to get another on the payment of a small fee?—Just so, I have no doubt about the matter.

3496. What plan would you adopt? Would you rigidly require, in all cases where seamen came forward to engage themselves, the production on their part of a ticket of registration?—Most certainly, what I should require would be this:—I should have a register of all seamen, requiring them to have a certificate from the minister or magistrates of their parish, stating who and what they are, and where born; and, every man having such a ticket, I should compel any one who lost his, to prove how and where he lost it before he could get another. It is a very simple thing. If a man could show that he had actually and absolutely lost the ticket, and explain how he had done so, I should have no doubt or hesitation in giving him a new one, but if he could not do so, I should hold him to be a deserter. I propounded this plan some years back to Her Majesty's Government, and the objection taken by the Government was, that the regulation would be too stringent, and would have the effect of driving seamen into foreign service. Now to that objection I can only say, let them who want to go, go.

but I am satisfied that with a very few exceptions they would not go. I am perfectly persuaded that English seamen would act differently, and would be as careful of their ticket of registration as their officers now are, and they would soon begin to find the benefit of it. Another objection to my plan was, that it would increase the rate of wages; well, it would do so, but I am prepared to pay an increased rate of wages to get well qualified crews. If we do increase the rate of wages, we know the beginning and the end; and to get proper and efficient crews, I should never object to the rate of wages being increased; and from my long experience and study of the subject, I am quite confident that we shall never have seamen in this country in the state of efficiency they ought to be in until some such plan be carried into operation.

3497. Is it not a fact that there is a very large number of British seamen in the American service?—No doubt that is so.

3498. Do you not think that the stringent regulations which you propose would have a tendency to drive many more men into that service?—I believe not; but I say again, let them go if they are inclined; we should be no worse off than we are at present, for we should have them throughout the world, and could employ them as foreign seamen, and have their services just as we do at present.

3499. Turning from that point to the one which is more immediately the subject of our inquiry, you say, so far as I remember, that one cause of a very great number of shipwrecks is, that ships put to sea in many instances with their crews or a portion of their crews in a deplorable state of drunkenness. Now can you propose any alteration connected with the mode of shipping seamen which would be likely to prevent in any degree such melancholy occurrences as too often take place?—Well, I have not been thinking lately upon that subject, but I do not know anything that would tend to check such a state of things so much as something which would improve the condition of the seamen, and make them a more regular set than they have hitherto been.

3500. The point is one of the greatest importance, and perhaps you would have no objection to turning it over in your mind with a view of seeing if any alteration as regards the machinery of the shipping office could be made which would in any way tend to mitigate these frightful evils; and having so turned the matter over would you kindly put your views into writing and send them to the Secretary to the Commission?—The fact is, that it is a very large subject.

3501. I do not refer to the general subject, but I speak merely of the machinery connected with the shipping offices; and it would be of great service to the Commissioners if you would consider the subject with the view of seeing if any alteration could be made which would tend to mitigate the evils which at present exist?—I have no hesitation in saying that in my opinion shipping offices have not done any good whatever.

3502. Perhaps you would prefer now stating to the Commissioners the point in which you consider that the shipping offices have been a failure?—Yes, perhaps it would be better that I should state that now; it would be more to my convenience.

3503. Do you think that the evils which have been named prevail to a greater extent now than they did before shipping offices were established?—I think not—— the evil is increasing, in my opinion; crews of ships are taken to sea in quite as inefficient a state as formerly, and I believe that more drunkenness prevails now than formerly did.

3504. Is it your opinion that shipping offices have in any way produced that result?—That I cannot say, but I believe that the only benefit produced by the Marine Act was the regulation requiring an examination of masters and officers of ships; that I believe is the only point in which the Mercantile Marine Act has proved of any real benefit.

3505. Do you think that shipping offices have tended in any way to elevate the character of the seamen, and to afford facilities to the shipowner, and have thus been of any benefit?—Most decidedly not, I believe they have been quite the reverse.

3506. Then do you not think that they have elevated the character of the seamen?—Most certainly not, quite the reverse.

3507. Do you not think that they have been of benefit in keeping seamen from the clutches of the crimps?—No, I do not think anything of the kind.

3508. Why, does not the Act prohibit any shipowner from engaging seamen except from the shipping office?—Yes, that is so, but I do not think anything of that.

3509. Do you think that it is the case that the crimps act in spite of the law, and that engagements are made through them?—They do not openly violate the law, but the seamen lodge in their houses, and they keep their things, and get their advance notes, and having them in their power they make their own arrangement with them, and then themselves take them to the shipping offices.

3510. Then is it your opinion that the crimps find as much occupation now as they did before the establishment of the shipping offices?—That is certainly my opinion.

3511. Can you propose anything in addition to what you have already stated, which would in your opinion tend to improve the condition of the seaman, and send him to sea a better man than he at present generally goes?—I have thought a great deal upon this subject, and taken a great deal of trouble about the matter, and as you know, Mr. Lindsay, some years ago I placed before the government a scheme which I had drawn out for registering seamen, which I have explained to the Commissioners; that scheme, however, was objected to on the ground that it was too stringent and would drive men into foreign services, and also that it would tend to increase the rate of wages; and since its rejection I have taken little interest in the matter. I am perfectly satisfied however, that even if my plan should raise the rate of wages it would be much better; it would be all the better for the shipowners, for we should get better men; and if it would drive men into foreign services, which I do not think it would do, we should be none the worse, and it would come to quite the same thing, for they would not be driven out of the world, and we could employ them as foreign seamen. I say again, most emphatically, that the subject is one which ought to meet with the most careful and anxious consideration at the hands of the Legislature, for I believe that a vast number of shipwrecks, which occasion an immense loss of life and property, are caused by ships leaving port with their crews in an inefficient state.

3512. Do you think that a more stringent system of registration would tend to lessen the number of wrecks?—I have no doubt on the subject. Let the sailors be placed on precisely the same footing as regards a certificate as the masters and officers at present are, and I believe that efficient crews would be obtained, and a large number of wrecks prevented.

3513. Under the provisions of the Act the masters and mates of ships are required to undergo an examination, would you be disposed to extend that provision to the seamen?—No, certainly not. All that I want is, that the men should be required to produce a certificate of their birth and their native place, and where they last came from, and then it would be known at once who and what each man was.

3514. Would you not, before granting such a certificate, require some proof of qualification as a seaman?—No, I do not think that would be necessary for the object. I should explain that what the shipowners require is, to have some hold upon the seaman which can enable them to compel him faithfully to perform his duty. It must always be borne in mind, that you cannot legislate for seamen in the same way that you can for persons who are settled in any locality, and the error which the government have committed has been to

GLASGOW.

Mr. A. Gilmour.

6 Sept. 1858.

Mr. Lindsay.

forget that circumstance. You have no hold upon them; they shift like the sand of the sea, here to-day, and away to-morrow. It is very difficult to deal with them, and that more particularly as at least one fourth if not one third of the men are at present sailing under fictitious names, and surely it is for the government to find out a remedy for such a state of things.

3515. Is it your opinion that, when a seaman engages to perform certain duties at a certain rate of wages, the law should punish him more severely than it does at present if he should desert without completing the term for which he had engaged himself?—In point of fact the law at present is quite unable to reach him.

3516. You think, as I understand, that some stringent law should be enacted to compel a seaman to fulfil his contract?—Most certainly, I think so.

3517. Would it not require a very stringent law to prevent a seaman who had engaged at say 2*l.* 10*s.* a month accepting an offer of 10*l.* or 12*l.* a month?—No doubt it would be a great temptation for the man, but then again the country has within its reach the means of making regulations which would prevent such offers as 10*l.* or 12*l.* a month being made.

3518. How can this country possibly regulate the demand and supply. In Quebec 10*l.* a month is given as wages, and that high rate is caused by the demand for seamen, as they are very scarce there; and I cannot see how we can pass any law to regulate the rate of wages throughout the world?—I think that we might pass a law which would have the effect which I have mentioned in this way:—we might enact that ship-builders in the colonies where there are no native sailors should be compelled to import a certain number of seamen to man their ships; that would be no great hardship, and it would tend to equalise the rate of wages.

3519. That is to say, that you think that at Quebec, where they are building a great many ships, the builders should send to Liverpool or to other ports for seamen instead of tempting seamen away from their vessel by the offer of an extra rate of wages, unless they can find an American crew and master to man those ships?—Certainly, I think so. I well remember, in one of the interviews I had with Mr. Labouchere, I told him that such a law had been enacted in New Brunswick, and he replied that he had never heard of it? I was much astonished at that observation, and I was more astonished to find that the government had afterwards refused their sanction to it. I do not think that anything could be more just or reasonable than such an arrangement, and I could never understand why it was disallowed by the government.

3520. Was any reason ever given why the home government did not sanction that enactment?—None that I am aware of; I never heard of any.

Mr. John Allan examined.

Mr. John Allan.

3521. (*Chairman.*) What is your name?—John Allan.

3522. What is your occupation?—I am a merchant and shipowner.

3523. How long have you been connected with the trade of Glasgow?—I should think about twenty years.

3524. For the whole of that period as a shipowner?—Yes.

3525. Had you previously been yourself at sea?—Yes; I had previously been at sea for a period of about eighteen years.

3526. May I ask in what capacity?—I served on board ship in all capacities from apprentice to master.

3527. During how long a period did you act as master?—I cannot exactly say.

3528. I do not want to know the exact time, but about how long?—Well, speaking from recollection, I should say about eight years.

3529. Where did your vessels principally trade to, that is, how were they chiefly employed?—Mostly in the trade with North America.

3530. What is the trade in which you are now chiefly interested?—Well, chiefly in the North American trade; but my ships occasionally go to the East Indies, to South America, and other parts of the world.

3531. Have you any opinion to offer to the Commissioners as to the necessity or otherwise of a harbour of refuge upon the north coast of Ireland, say in the neighbourhood of Portrush?—I do not think that there is any necessity for a harbour of refuge in that neighbourhood. I myself never found any need for one.

3532. State to the Commissioners the reasons you have for entertaining that opinion?—I do not think that there is any need for one, for inward-bound ships could always find shelter, while outward-bound ships could run out in almost any state of the wind.

3533. Have you any opinion to offer to the Commissioners as to the necessity or otherwise of improving the harbours at Carlingford, Waterford, and Wexford, with a view of affording a refuge to shipping from the Clyde in bad weather when bound southward?—I have no particular opinion to offer on the subject, but I do not think that such improvement is necessary as regards shipping from the Clyde.

3534. Have you any opinion to offer to the Commissioners as to the necessity or otherwise of a harbour in the Isle of Man as regards Clyde shipping?—I do not think that a harbour there would be of any advantage to Clyde shipping.

3535. Will you look at the chart, about the neighbourhood of the Land's End, and tell the Commissioners if you see any need for a harbour of refuge in that neighbourhood, say in the vicinity of St. Ives?—I do not think that there is any need for one; I never found the necessity for one.

3536. Will you state to the Commissioners briefly, the reasons upon which you have arrived at that conclusion?—I think generally that it is far better that a ship should keep the sea than attempt to run into a harbour of refuge. I may state that I very much agree with Mr. Gilmour, in his opinion with regard to a vessel keeping at sea or going into port, and I do not think it desirable, if it can possibly be avoided, that any ship should run for a harbour in the event of a storm after she has once left her port.

3537. You have heard Mr. Gilmour's evidence?—Yes, I have.

3538. Has Mr. Gilmour expressed any other opinions in which you are disposed to say that you also concur?—I concur very generally with the opinions he has expressed. I do not agree with him in every minute particular, but generally speaking I agree with his views on the subject.

3539. Would you be good enough to state to the Commissioners any of the points to which Mr. Gilmour has referred, in regard to which you would be disposed to dissent from his views?—I do not at this moment remember any particular opinion from which I dissent. As regards the east coast of Scotland, it might be advisable to establish some place of refuge for the numerous fishing boats there under their lee. I do not know the coast myself. I am not acquainted with it, but I have often seen that in an easterly gale there has been a severe loss among the fishing boats, but I see no necessity for any such harbour for foreign ships. I have never myself lost a ship on the coast, nor have any of my ships ever met with an accident there.

3540. What is the average burden of your ships in tons, and what number of ships are you interested in?—I think that I am interested in about seventeen sailing ships, which average from 600 to 700 tons, as the ships run from 300 to 100 tons.

3541. Are you also interested in any steam ships?—Yes, I am.

3542. Will you state the number of steam vessels and their burden in tonnage, in which you are interested?—I am interested in five steam vessels, and I should think that they average from 1,800 to 2,200 tons.

3543. I am to understand then, that you, as an owner of a large and well-found class of ships, entertain a distinct opinion that national harbours of refuge are not required upon the east or north coast of Ireland, or the west coast of Scotland, but that you feel strongly the necessity of a harbour of refuge on the east coast of Scotland, for the benefit of the fishing vessels plying their traffic on that coast?—I think that a place of refuge on that coast would be beneficial. I see that in easterly gales there is considerable loss on that coast, and if a harbour could be made in a secure and accessible spot, I think that it would be very desirable. I guard myself, however, by saying, that I am only speaking in a general way, for I am not acquainted with the locality.

3544. Then you think that, as it appears clear that great loss of life does occur, if such a harbour could be constructed it would be very desirable to construct it?—Yes, that is my opinion.

3545. (*Sir F. Smith.*) If I understand you rightly, you are opposed as a general principle to harbours of refuge?—Most decidedly so.

3546. You think that, if vessels are properly found and properly manned on leaving port, a captain should endeavour to proceed with his voyage without reference to any harbour of refuge?—Certainly I think so.

3547. You think that in a well found ship, the captain should make every effort to reach his destination, and should not require a harbour of refuge in any way?—Yes, that is my opinion.

3548. As a shipowner, should you object to paying a passing toll for the construction and maintenance of a harbour of refuge?—Yes, certainly I should, as I consider them quite unnecessary.

3549. Are you acquainted with the east coast of England?—I cannot say that I ever sailed along it.

3550. Do the observations which you have made to us apply to small coasting vessels as well as to larger ships?—Yes, I think they apply equally.

3551. Have you examined the wreck chart?—No, I have never seen it.

(*Sir F. Smith to the Secretary.*) Will you be good enough to place the wreck chart in the hand of Mr. Allan?

3552. Do you see by that chart that a great number of wrecks are marked as having taken place on the east coast of England?—I do.

3553. Are you of opinion that a great proportion of these catastrophes have resulted from vessels going to sea with crews not in a fit state to navigate them?—I do not think that there can be any doubt upon the subject.

3554. Are you, of your own knowledge, aware that in many instances crews go to sea in such a state of intoxication as to be unable properly to navigate their vessel?—Yes, I have known repeated instances of it.

3555. Have not shipowners a remedy in their own hands?—The only one I know is, to wait till the crew have had sufficient time to get sober.

3556. May I ask you if in your experience crews are in the habit of going on board their ships on leaving port in a state of drunkenness?—Yes, it is very common indeed.

3557. Can you not suggest any remedy for such a deplorable state of things?—The only way I can see to avoid casualties from that cause is, to wait till the men are sober before putting to sea. To put an end to the drunkenness, the only way I can see is to elevate the character of the seaman.

3558. Would not a captain who perceived that his crew were in such a condition, as a matter of course, delay his departure?—Captains are frequently compelled to do so.

3559. (*Mr. Lindsay.*) You are opposed to the construction of harbours of refuge in general?—I am.

3560. Would you, as a shipowner, object to pay a tax in the shape of a passing toll, to defray the expense of the construction and maintenance of such harbours?—Certainly I should, for I consider them useless.

3561. You would consider it an injustice to be called upon to pay extra taxation for the construction of such harbours?—Yes, I should most decidedly; but at the same time I think it might be desirable to establish a place of refuge on the east coast of Scotland.

3562. I understand you to mean, that, although, generally speaking, you would object to paying a tax in the form of a passing toll for the construction of harbours of refuge, yet that, as a large shipowner, you would not object to pay your quota for the establishment of a place of refuge on the east coast of Scotland; am I right?—Yes, I should not object to an increase of taxation for the construction of a harbour on the east coast of Scotland, if I was satisfied that the work was judiciously and properly done.

3563. In saying that you are opposed to all harbours of refuge, do you mean your observations to apply merely to Portrush and the other places to which the Chairman has alluded, or do you mean them to be quite general?—I mean them to be quite general. I think that we have harbours enough as it is.

3564. In fact, you mean generally that there is no necessity for the construction of harbours of refuge?—Yes, that is my meaning.

3565. From your experience, do you think that if harbours of refuge were constructed, ships would often be saved by running into them?—I am afraid that it would be just the reverse.

3566. Did you hear Mr. Gilmour's evidence as to the drunkenness which prevails on board ships leaving port?—I did.

3567. Is it your opinion, that of late years that drunkenness has been on the increase?—Well, I cannot speak exactly as to that; it may be that, because the ships now-a-days are larger and require more men in them we perceive the drunkenness more.

3568. Do you think that the general character of seamen has improved or otherwise since you yourself commanded a ship?—I do not think that their general character has improved; in fact, I should say rather the reverse.

3569. Do you think that they are more given to drink and disobedience than they formerly were?—I think that more desertion takes place now, and that demoralizes the men very much; and it is also a fact to be regretted, that most of the seamen now-a-days have two or three names.

3570. Is it your opinion that a system of registration such as has been shadowed out by Mr. Gilmour would tend to prevent desertion?—Yes, I think it would have that effect.

3571. Do you not think that that system would have the effect of driving a great many sailors into the American service?—Well, perhaps it might have that effect upon some, but on the whole I should think it would do good.

3572. Do you think that it would tend in any degree to elevate the character of the seamen?—Yes, I feel pretty sure that it would.

3573. Do you think that the shipping offices have been productive of any benefit?—I think that they have not, that is, as regards the common seamen.

3574. I am anxious to have your opinion upon this point. The shipping offices, I believe, require an examination in the case of masters and mates?—Yes, they do so.

3575. But as regards the men, you do not think that they have been productive of any benefit either to themselves or to the shipowners?—I think that that they have not.

3576. Could you mention to the Commissioners any point in which the working of the shipping offices might in your opinion be improved?—I am not

GLASGOW.

Mr. John Allan.

6 Sept. 1858.

Mr. Lindsay.

prepared to mention any improvement which occurs to me at this moment.

3577. Do you experience much trouble in getting men on board after you have engaged them at the shipping offices?—You have no conception of the trouble we have in getting men on board.

3578. Do you think that arises from the action of the shipping offices? Do they consider that they have performed all their part of the agreement when they have engaged the men?—After the offices have engaged the men the sailors at once get dead drunk, and it is impossible to know where to find them; and even if you do find them, they sometimes get two or three together, and refuse to go on board. The owner of the offices can, legally speaking, be asked to put them on board, but, practically speaking, his services are quite useless.

3579. If the shipping masters of the ship were vested with magisterial powers, that is to say, with the power of punishing those men who refuse to go on board ship after they have engaged themselves, do you think that would tend to mitigate the evil?—Yes, I have no doubt that it would considerably.

3580. The process now, I believe, is, when a man declines to go on board ship after engaging himself, to get a summons from a magistrate, and that takes up a great deal of time, and the owners are naturally anxious to get their ships to sea, and they cannot detain the master to appear against deserters, so that, in point of fact, they escape unpunished, and therefore men break with impunity the engagements into which they have entered. That is so, if I am not much mistaken?—Yes, that is how the case stands.

3581. Then do you not think that vesting the shipping masters of the ship with magisterial power would tend greatly to mitigate the evil?—Yes, I think that it would very much.

3582. Do you not think, also, that it would tend to check the evil if it were made part of the duty of the master of the shipping office to see that the men went on board after they were engaged?—Certainly, I think that it would.

3583. You think, then, that it ought to be made the duty of the shipping offices not merely to engage the men, but also to see them on board ship after they were engaged?—Yes, that is my opinion.

3584. Do you think, also, that the owners of ships should not be called upon to pay the fees until the engaged men are fairly on board ship?—That, I think, would be of great advantage.

3585. As the matter stands at present, I believe that the shipowner is compelled to pay the fees when the men are engaged, whether they go on board or not?—Yes, that is the case.

3586. It is a matter of truth, indeed there is no possibility of denying the fact, that a very large amount of wrecks, most lamentable wrecks, take place every year shortly after vessels leave port, when the crews are in such a state of stupidity from drunkenness that they are unable to manage the ship. Now I ask you, as a man of large experience, do you think that some such alteration in the machinery of the shipping offices as I have just shadowed forth would tend to lessen the number of those wrecks by sending men on board more regularly, and in a better state of sobriety, than they are sent on board in at present?—I think that it would.

The Chairman having inquired whether any of the Commissioners wished to put any other question to the witness, and being answered in the negative, said that the Commissioners would not detain him any longer.

Mr. Hugh Tennant examined.

Mr. Hugh Tennant.

3587. (*Chairman.*) What is your name?—Hugh Tennant.

3588. What is your occupation?—I am a brewer.

3589. Have you been accustomed to yachting, and if so for how long a period?—I have been accustomed to yachting for 25 years.

3590. Have you ever turned your attention to the subject of the necessity of constructing harbours of refuge?—I have.

3591. Have you formed any opinion which you should wish to offer to the Commissioners on the subject?—I have sailed a great deal round the coasts of Scotland and Ireland, and up among the Orkney Islands, and in my opinion, from my experience of the coast, it would be most desirable to establish harbours of refuge at different parts of the coast. I think that either Wick, Peterhead, or Fraserburgh, would be very desirable places for the construction of such a harbour, and such a place of refuge would be most desirable for vessels engaged in the fishing and coasting trade.

3592. Will you state your views as to the most desirable place for constructing a harbour of refuge on the north-east coast of Scotland, bearing in mind that Wick, Peterhead, and Fraserburgh are the three sites to which our attention has been more particularly called by the Committee of the House of Commons?—I am disposed to think that owing to the amount of fishing which is carried on in summer in the neighbourhood of Wick, that that would perhaps be the more desirable site of the three. No doubt a great number of vessels pass along by Peterhead; and I saw a statement from which it appeared that 15,000 or 20,000 vessels passed Peterhead every year, besides ships in ballast, and perhaps Peterhead, as regards larger vessels, would be the most desirable locality; but, taking into consideration the vast extent of the fisheries at Wick, I am inclined to think that a harbour of refuge at that point would be more generally useful.

3593. Looking at the danger which they respectively encounter in the vocation they follow, which class of men do you consider have the greatest claim upon the country for the erection of a harbour of refuge to save them from exposure to shipwreck, the men engaged in the fisheries and in the coasting vessels, or those engaged in the passing trade?—I think that those men engaged in the coasting trade and in the fisheries are the more particularly and immediately concerned, especially those engaged in the coasting trade, for the coasting vessels run at all seasons, while the fisheries are confined to a short time during the summer months, and therefore I do not consider the fishing vessels so important to consider as the coasting vessels.

3594. Another site has been mentioned for the erection of a harbour of refuge, in the Isle of Man. Will you state your opinion upon that subject?—I can only say that I have frequently been to the Isle of Man, and have been very anxious to get in, but I could find no place which I considered secure. At Ramsay the water is very shallow and you cannot get far up the bay, that is to say far enough for shelter. Douglas is very much exposed in certain winds, and then it is impossible to lie there.

3595. For what class of vessels do you think a harbour in the Isle of Man would be desirable?—For larger vessels.

3596. Do you think that a harbour on the coast of Ireland would be desirable?—Yes; I think Portrush would be a very good site.

3597. I understand that with reference to small craft you think that a harbour of refuge at Wick would be desirable, and that with reference to larger vessels, it would prove advantageous to construct harbours of refuge on the south-east coast of Ireland and in the Isle of Man?—Yes, I think that those would be very desirable points for the construction of harbours for large ships.

3598. What is the best point, according to your judgment, for the construction of a harbour of refuge in the Isle of Man?—I think perhaps Ramsay would be the best place, if the bay could be deepened, for

there is very good shelter if vessels could get in, and the place is easy of access.

3599. What site would you be disposed to recommend for a similar purpose on the north-east coast of Ireland?—Well I cannot say that I have paid so much attention to that question; but I have often heard that there is a very great want of a harbour of refuge there.

3600. (*Mr. Lindsay.*) In giving an opinion upon the most desirable place for a harbour of refuge on the east coast of Scotland, do you think that a harbour at Wick would be preferable to one at Peterhead, for the saving of life and property, with regard to all descriptions of ships?—No, but I beg to express with great diffidence my opinion, that, considering the large number of vessels employed in the fisheries in the neighbourhood of Wick, and the value of those fisheries, I think it would be very desirable if a harbour of refuge could be established at Wick sufficient to serve for both large and small ships.

3601. Do you mean for foreign-going vessels?—Yes, I think it would be desirable to erect a harbour of refuge for the wants of all descriptions of vessels.

3602. I think you say that the number of fishing vessels in the neighbourhood of Wick renders it more desirable than Peterhead as a locality for the establishment of a harbour of refuge?—Yes, I think so, because the boats engaged in the fisheries are very liable to be suddenly taken by a gale of wind when on the fishing ground, and they would then be able to run into Wick. At the same time for larger vessels Peterhead would be I think the better locality, but as we can hardly expect to have two harbours of refuge constructed, I should prefer seeing one constructed at Wick.

3603. Supposing it were decided to construct one harbour for all descriptions of vessels, whether do you think that a harbour of refuge at Wick or Peterhead would tend most to the preservation of life and property?—I almost think that one at Wick would do so.

3604. (*Capt. Vetch.*) I think you said that the fishing at Wick is confined to a few weeks in the summer?—Yes, that is the case.

3605. Is that during the time of the herring fishery?—Yes.

GLASGOW.

Mr. Hugh Tennant.

6 Sept. 1858.

3606. If they are liable to stress of weather during a fine summer, they are not likely to proceed to sea for white fish in winter, should you think they were?—I should think not.

3607. On the coast further south the fishermen, I believe, fish for herrings also during the summer, and in the winter for cod, is it not so?—I believe it is.

3608. If the fishermen at Wick knew that they had a place of refuge to run into, do you not think that they might be induced to do the same thing?—I should think it very probable.

3609. (*Chairman.*) Is there any observation which you would like to make to the Commissioners?—Yes, I may mention that if harbours of refuge were generally established and diffused about, it would enable us to get marine insurances effected at a much lower rate than at present, and in that case shipowners should I think be ready to pay some small tax for the benefit of those harbours of refuge.

3610. Are you acquainted with the names of any masters of vessels at present in Glasgow who could attend and afford any information on the subject of this inquiry?–I think Captain Crawford of the Sasine Office, who has had great experience, could afford you some information; and I will venture to say, that I think that if you get some first-rate masters of ships before you, you will probably hear a very different account of the advantage of a harbour of refuge from that which you here heard from Messrs. Gilmour and Allan.

3611. Will you state the names of any such masters who are available for this inquiry?—I do not know any immediately, but I will endeavour to get you a list of two or three names if you intend to continue the examination to-morrow. I have no doubt I should be able to find several in the harbour of Glasgow able to give very valuable evidence to the Commissioners.

3612. When could you be prepared to hand in a list of those names?—I will go after one now.

3613. Will you lodge it with the Secretary?—Yes, I will endeavour to provide him with one.

MR. JOHN CAMERON examined.

3614. (*Chairman.*) What is your name?—John Cameron.

Mr. John Cameron.

3615. What is your occupation?—I am a steam-packet agent.

3616. Have you heard the evidence of the former witnesses?—I did not hear the whole of Mr. Gilmour's evidence, but I heard the latter part of it.

3617. Did you hear the other witnesses?—Yes, I did.

3618. Have you any opinion to offer to the Commissioners as to the necessity or otherwise of constructing harbours of refuge on the north-east coast of Scotland?—No, I am only connected with the north-east coast of Ireland.

3619. Well, then, will you state your opinion as to the necessity or otherwise of harbours of refuge on the north coast of Ireland?—I think a harbour of refuge at Portrush, such as I have seen proposed, by joining the Skerries, would be a most invaluable harbour.

3620. Will you state to the Commissioners the reasons you have for entertaining that opinion?—In the first place it is an iron-bound coast, and as storms there are by no means uncommon, captains would be glad to have a place of refuge to run to in that locality.

3621. Are you acquainted with Islay?—No, I have not been there.

3622. Supposing that there were good anchorage in the bay of Loughindall, would that be as good a locality for a harbour of refuge as Portrush?—No, I do not thing that it would be as good.

3623. Will you state why you think that it would not be as good?—Why, for ships passing along the north coast of Ireland, a harbour at Portrush or the Skerries would be more easy to get to.

3624. Have you any opinion as to the necessity or otherwise of a harbour of refuge in the Isle of Man?—No, although I have often passed the island, I dont know that I can offer any information on the point.

3625. Do you know any cases of shipwreck or loss of life which might have been prevented if there had been a harbour of refuge at Portrush?—There have been many cases of shipwreck at Rathlin, not very far from Portrush, and the steamers have gone to the assistance of ships in distress in that neighbourhood, and I have no doubt that a harbour of refuge would be of great advantage.

3626. (*Capt. Washington.*) Did I understand you to say that the steamers frequently went to the assistance of ships in distress in that locality?—Yes, that is the case.

3627. Do you know Church Bay?—Yes, I am acquainted with it.

3628. Do you consider that a favourable site for a harbour of refuge?—No, not so favourable as Portrush, because it is not so much sheltered.

3629. Have you seen the plan proposed for the construction of a harbour of refuge at the Skerries?—Yes, I have seen it.

3630. Where do the vessels with which you are connected trade to?—To Sligo, Derry, Belfast, Liverpool, and other ports.

3631. Do you think that a refuge harbour made at the Skerries would be taken advantage of by other vessels as well as by the steamers and regular vessels trading on that coast?—Yes, I think so.

3632. Is there a large traffic carried on?—Yes, a very large traffic.

3633. Could you give any statistics as to the

GLASGOW.

Mr. John Cameron.

6 Sept. 1858.

Captain Washington.

number of vessels which pass that way?—I doubt if I could; I do not know if they are all registered.

3634. Can you ascertain the number of steamers that pass?—Yes, I can ascertain that, and make up a statement.

3635. It is a most important element in the inquiry before we decide upon the locality for a harbour of refuge to know how many vessels pass along the coast, and will you supply the information?—I will endeavour to supply the number of steamers.

3636. Do you think that Loughindall would be a good locality?—Not so good as the Skerries, where there is almost a natural harbour already; and I have heard that steamers have often taken refuge there, and a harbour there would be most beneficial.

3637. What do you think of Church Bay as a site?—I do not think it as favourable a place as the Skerries.

3638. (*Capt. Vetch.*) Can you tell us how many vessels trade between Lough Foyle and the Irish Sea?—Yes, there are ten going and ten coming every day.

3639. In passing from Lough Foyle to Fair Head do the vessels run through the Skerries?—No, they generally pass outside.

3640. In the event of a gale springing up from the east, do they ever take refuge in Church Bay?—They do sometimes, but that is very seldom.

3641. Is there good holding ground there?—I could not speak with any certainty on the subject, but I believe not.

3642. Do any sailing vessels take the same course as these steamers?—Oh yes, a great many, but their course will depend upon the wind.

3643. But large ships from the Atlantic, I believe, pass outside Rathlin Island, is that so?—Yes, I believe that that is the case.

3644. Then a harbour of refuge at the Skerries would not be of any advantage to those vessels?—I do not know that; I think that they would be very likely to take advantage of it, and in the event of their being caught in a gale of wind I have no doubt that they would be glad to have a harbour of refuge there to run into.

3645. A gale of wind from what quarter?—From the north-east.

3646. (*Mr. Coode.*) You have stated, I believe, that, in your opinion, a harbour of refuge at the Skerries would be preferable to one at Loughindall; is that opinion formed upon the ground of there being greater facility for the formation of a harbour at the Skerries, or is it upon the general ground that the position would be more advantageous for the protection of shipping?—For both reasons; I consider that at the Skerries a harbour of refuge is half formed already, and at present vessels often take refuge there.

3647. But, irrespective of all facility for construction, do you consider the position of the Skerries at Portrush preferable to that of Loughindall or Church Bay?—Yes, I consider it the better locality.

3648. Will you state to the Commissioners the reasons upon which you have formed that opinion?—I cannot state them in detail, but I have often passed there, and I have heard masters of vessels say that they prefer the Skerries. It is a more sheltered situation, and more protected from the north wind, and larger.

3649. But assuming that a good harbour of refuge, as regards shelter and capacity, could be made at Loughindall, which locality would you prefer?—I have seen the plan of a proposed harbour at Portrush, but not having seen any plan for the construction of a harbour at Loughindall or Church Bay, I can express no opinion.

3650. Assume that a harbour can be made equally capacious and equally sheltered at Loughindall, which site would you prefer?—I should prefer the Skerries, so far as my own trade is concerned.

3651. Do you think that the greater number of masters of ships are of opinion that Portrush is the better position?—I believe that the masters of ships are unanimous upon that point, but there are many masters of ships who could give you information on the subject.

3652. Will you be prepared to furnish the Commissioners with a list of masters of ships at present in Glasgow, who would come before us and state their views upon the subject?—I think Captain Turnbull will be here by to-morrow. Captain McGowan, of the *Garland*. Captain Thompson, master of a sailing vessel, will, I think, be in town to-morrow. Captain McLachlan, of the *Rose* steamer; these are all I can remember at present. O yes, there is Captain Johnstone, harbour master, of Glasgow, who could also give you very valuable evidence.

3653. If the Commissioners resume their sitting to-morrow at 11 o'clock, do you think that the masters you have named could be present?—I think all but one, who will not be in Glasgow until Wednesday.

3654. What is the name of that one?—Captain McGowan.

3655. Are you prepared to say that you will secure the attendance of the remainder?—Yes, I think I can say so.

3656. Is there any other observation you would wish to offer to the Commissioners?—No, I think not; there is a steamer sailing to-morrow which will pass the Skerries, and I shall be happy to give the Commissioners a free passage, and then they can judge for themselves.

(*Chairman.*) Thank you, you are very kind; but we have a steamer of our own; we are, however, equally obliged to you.

Bailie CLANSTEN examined.

Bailie Clansten.

3657. (*Chairman.*) What is your name?—William Clansten.

3658. What is your occupation?—I am an insurance broker and underwriter.

3659. Can you name any persons who could appear before us at 11 o'clock to-morrow, who could give us evidence bearing upon the subject of the present inquiry?—I think the persons mentioned by the last witness could give valuable evidence; and there is also Captain Small, who has had considerable experience, and Captain Rain, resident at Greenock.

Captain CRAWFORD examined.

Captain Crawford.

3660. (*Chairman.*) What is your name?—T. Crawford.

3661. Have you been in the room during the inquiry?—No; I have only been here about 10 or 15 minutes.

3662. Have you followed the sea?—I have for nearly 40 years.

3663. In what capacity?—I have served in every capacity; from apprentice up through the different grades to that of master.

3664. For how many years have you served as master?—For about 30 years.

3665. In what class of vessel have you chiefly been employed?—For 20 years I have commanded steamers in the Liverpool and Glasgow trade, and I have commanded steamers in other trades.

3666. Are you acquainted with the north-east coast of Scotland?—I am very well acquainted with it.

3667. Have you any opinion to offer to the Commissioners as to the necessity or otherwise of a harbour of refuge on that coast?—To what part of the coast do you refer?

3668. Have you any opinion as to the necessity of erecting a harbour of refuge at any place between the Firth of Forth and the Pentland Firth?—Yes, I entertain an opinion on the subject.

3669. Will you state that opinion?—I consider that Wick would be the most favourable place for the construction of a harbour of refuge.

3670. Will you state the reasons which have led you to such a conclusion?—Because I think that it is more exposed; and I also think that a harbour would be more easily constructed there than at any other point.

3671. Do I understand you to say that you prefer that locality because it is more exposed, and that a harbour there would be easily constructed?—Yes, that is my opinion.

3672. Have you any opinion to offer to the Commissioners as to the necessity or otherwise of a harbour of refuge on the north-east coast of Ireland?—Yes, I entertain an opinion upon that subject.

3673. Will you state it?—My opinion is, that no harbour of refuge is necessary there; at least, I know no place on that coast which to my mind stands in need of such a harbour.

3674. Have you any opinion as to the necessity or otherwise of a harbour of refuge in the Isle of Man?—Yes, I have formed an opinion on that point, too.

3675. Will you state it to the Commissioners?—I think that Douglas is the most desirable locality for a harbour of refuge in the Isle of Man.

3676. Will you state the reasons which lead you to entertain that opinion?—I think that, from its proximity to Liverpool, a harbour of refuge constructed there would be of great benefit to trading ships generally.

3677. Have you any opinion to offer as to the advantage or otherwise which would be derived by the Liverpool and Clyde shipping by an improvement of the harbours of Carlingford, Waterford, and Wexford, with the view of affording them refuge in the event of meeting with bad weather?—No doubt an improvement of either of those places would be of great advantage.

3678. Do you consider that such improvement would be of so much service as to warrant the expenditure of the national funds for such a purpose?—Yes, I think that it would.

3679. Have you any opinion as to the necessity or otherwise of a harbour of refuge in the neighbourhood of the Land's End?—No, I have formed no opinion on the subject.

3680. (*Sir F. Smith.*) I think I understand you to say, that you do not think a harbour on the north coast of Ireland necessary?—No, I do not think that it is.

3681. Do you not think that vessels going to America along the north coast of Ireland may stand in need of a place of protection?—If they should be in a storm they always have Lough Swilly to run into.

3682. But is it not difficult to run in there?—No, it is the easiest place to run into on the north coast of Ireland.

3683. Do many sailing vessels pass that way?—Yes, a great many.

3684. If the Commissioners have heard evidence to the effect that Lough Swilly is a difficult place to get in and out of, do you dissent from that evidence?—Yes, certainly I do.

3685. Then you think that there are sufficient places of refuge on the north coast of Ireland already?—Speaking as a practical man, and having been in most ports of that coast, that is my opinion.

3686. Were you ever at Portrush?—No, I never was there.

3687. Are you aware that it has been proposed to construct a harbour of refuge there?—Yes, I have seen the proposed plan.

3688. I believe the bay there is very nearly landlocked?—Yes, I believe that it is.

3689. Do you still think that it would be undesirable to expend 400,000*l.* or 500,000*l.* there in constructing a harbour of refuge?—I can see no use for it except in the case of a few small coasters.

3690. Why do you think that an improvement of the harbours of Carlingford, Waterford, and Wexford would be so desirable?—On account of the number of vessels that pass close by those ports.

3691. You are not of opinion, then, that it is desirable that vessels should leave port under instructions to keep the sea and not to run into harbours of refuge?—No, I am not of that opinion.

3692. But ought not captains to endeavour by all means to prosecute their voyage?—Why they can't do so against contrary winds, and they must take shelter as a general rule.

3693. Do you think that a tax in the shape of a passing toll should be levied upon vessels to aid in construction and maintenance of harbours of refuge?—Yes, that is my opinion.

3694. Do you think that a portion of the necessary fund should be paid by the shipowners, and the remainder should be defrayed from the general taxation of the country?—Yes, I think that would be a fair arrangement.

3695. May I ask you if you are acquainted at all with the navigation of the Bristol Channel?—I have been up it as far as Cardiff.

3696. Have you any information you could give the Commissioners with regard to the ports in that channel?—No; I am not well enough acquainted with the locality.

3697. (*Mr. Lindsay.*) Have you ever heard any complaints on the part of shipowners as regards being called upon to pay passing tolls for the construction and maintenance of these harbours?—No; the complaint has never reached me.

3698. Do you think that shipowners as a body would consider it a hardship to pay a passing toll for the construction and maintenance of harbours of refuge?—No; some may think so, but I do not.

3699. Do you consider that it would be more just to tax the shipowners for the construction and maintenance of harbours of refuge than it would be to throw the whole burden upon the consolidated fund?—Yes, I think so; that is, I think that it would be only just to make the shipowners pay their fair proportion.

3700. Would you think it unjust to throw the whole burden on the shipowners?—Yes, I should not think that fair.

3701. Would you consider it unjust to tax them to the extent of one moiety?—No, that I think would be fair enough.

3702. Then it is your opinion that if harbours of refuge are constructed one moiety of the expense should be borne by shipowners, and the other moiety should be thrown on the consolidated fund?—Yes; I think that would be a satisfactory arrangement.

3703. Are you acquainted with the north-east coast of England?—Yes, very well.

3704. Do you think that the construction of harbour of refuge on that coast would tend to the preservation of life and property?—Yes, I think it would do so to a great extent.

3705. Whereabouts on that coast do you think that it would be most desirable to construct a harbour of refuge?—I am not a scientific man, but I should fix on Hartlepool.

3706. Whether do you think that a harbour of refuge at Filey Bay or Scarborough would tend most to the preservation of life and property?—I should think a harbour at Filey Bay.

3707. Do you think that a harbour of refuge there would tend more to save life and property than one at Hartlepool?—(No answer.)

3708. How many voyages have you made between Liverpool and Glasgow?—I could scarcely remember the number, but I have been on that station for twenty-two years, and have been going generally three times a week.

3709. Then you have made between 2,000 and 3,000 voyages?—Yes, about that number.

3710. From your great experience on that coast do you think that a harbour of refuge in the Isle of Man would be the means of saving life and property in

GLASGOW.

Captain. Crawford.

6 Sept. 1858.

Mr. Lindsay.

the case of vessels belonging to Liverpool and vessels belonging to the Clyde proceeding to sea?—I think that it would be a very desirable place for a harbour of refuge for vessels from Liverpool waiting for a fair wind, and for vessels from the Clyde going to sea or proceeding down channel.

3711. Do you think that it would be a safe place for vessels bound for Liverpool to run to in stormy weather, when it would be dangerous to run for the channel?—Yes, that is my opinion.

3712. You think that it would form a safe refuge for many vessels?—Yes, I think that it would be made use of by a great many vessels in a north-west wind.

3713. Do you think such a harbour there would be most used by outward-bound ships, and that it would tend to preserve life and property?—Yes, I think so, for vessels would run in there instead of incurring the risk of keeping out at sea.

3714. It has been stated in evidence before us, that a great number of shipwrecks arise from the crew going on board in a state of drunkenness, which renders them incapable of managing the vessel. Now, from your experience as a shipping master, can you state if you have observed that crews frequently go on board in a state of drunkenness?—There can be no doubt that such is the case.

3715. Could you suggest any remedy to the Commissioners, or could you recommend any alteration in the machinery of the shipping offices, which you think would tend to prevent the fearful state of things which at present unfortunately prevails?—So far as the Clyde is concerned, the danger from that cause is not by any means so great as it is at Liverpool, because sailing from Liverpool it is a very short distance down the Mersey and the vessel is at sea in a short time, whereas, going from Glasgow, the crew have time to get sober in the passage down the Clyde, in addition to which, ships frequently shelter for a time at the tail of the bank.

3716. You mean that that delay gives the men time to get sober, and to be brought into some sort of discipline?—Yes, just so.

3717. But it is the fact that a very large number of vessels are dispatched from port with the crews in a state of drunkenness?—Yes, unquestionably so.

3718. Could you suggest any remedy for such a frightful state of things?—Yes, I could suggest a remedy, but the great difficulty would be to apply it.

3719. Will you inform the Commissioners what that remedy is?—The only remedy I know would be to reduce the number of public houses.

3720. (*Capt. Washington.*) Did you hear the evidence of Mr. Gilmour?—No, I did not.

3721. Have you sailed ever from the coal ports on the east coast of England?—I have.

3722. What point on that coast do you consider the best for the construction of a harbour of refuge?—Well, I should say Filey Bay.

3723. Have you been at Hartlepool?—Yes, I was once wrecked in the neighbourhood.

3724. Do you think a harbour of refuge in Filey Bay would have saved you?—Yes, in my opinion it would have done so.

3725. Will you state the circumstances under which you were wrecked near Hartlepool?—We had been driving about for nearly a week in the North Sea, with the wind in various quarters, when a strong gale sprung up from the eastward, and so we were embayed there, and could not get out.

3726. But if you were embayed, how could you have got to Filey Bay?—If there had been a harbour there at first we should have run there, but there being none we preferred, on account of the sand, to run the ship ashore at Hartlepool.

3727. Was your ship a good sailer, and well found?—She was well found, but was not a particularly good sailer.

3728. Taking the usual class of colliers, would they under similar circumstances have been able to reach Filey Bay?—I think that they would.

3729. Is it not a fact that a great many go ashore in Tees Bay?—I believe they do.

3730. Do you consider that these vessels would in many instances be able to run into Filey Bay if there was a harbour there?—I think so, but it would depend upon the state of the wind.

3731. May I ask you what you consider the best locality for a harbour of refuge, the bight of a bay, or the prominent or salient point?—I should consider the bight of a bay the best locality.

3732. (*Capt. Vetch.*) To advert to the track between America and the Clyde and Liverpool, let me ask you if any of the vessels in that trade, when homeward-bound, would pass near Portrush?—Only in very extreme cases, if they were afraid of being caught on a lee shore.

3733. How far north of Portrush is the general track of those vessels?—That would depend upon the wind, but generally speaking all large ships go north of Portrush.

3734. Do you find large ships ever taking a course near Portrush?—Never with an easterly wind.

3735. Then practically, if a harbour of refuge were constructed there, its advantages would be restricted to steam boats?—Just so.

3736. To revert for a moment to Douglas. Are you aware that vessels from Liverpool are frequently unable to enter the bay in its present condition?—Yes, I am aware that such is the case.

3737. And the consequence is, that delay is caused?—Well, there is sometimes a little delay.

3738. Do you consider it important, in dealing with that place, to make a harbour of refuge of a capacity to admit all descriptions of vessels?—Yes, I think it would be very advantageous.

3739. (*Mr. Coode.*) Are you aware whether or not vessels are frequently detained at Flamborough Head, loaded vessels bound for the south?—Yes, I have seen it happen.

3740. Has it ever happened to yourself?—Yes, it has.

3741. It is, I believe, a matter of common occurrence?—Yes, there is no doubt that it is so.

3742. I believe there is great danger to the ships detained there from the risk of collision?—There is certainly.

3743. Speaking of the abstract question, you have stated that in your opinion the bight of a bay is preferable, for the construction of a harbour of refuge, to the prominent or salient point, but may there not be exceptions to that rule?—Certainly there may, everything depends upon the peculiarities of the place.

3744. (*Chairman.*) Suppose that it were finally determined to construct a large national harbour of refuge upon the east coast of England, what spot in your judgment would be the most suitable, Filey Bay or Hartlepool?—I should decidedly be inclined to say Filey Bay.

3745. If I am not mistaken, you have expressed an opinion that a harbour of refuge at Wick would be a very desirable thing?—Yes, I think that it would be very advantageous.

3746. State whether you consider it advisable to construct a harbour of refuge at Wick with a view to the benefit to be derived by foreign ships, or more especially with a view of benefit to the large number of vessels engaged in the fisheries there, and to suit exigencies of the coasting trade?—I think that it would be chiefly advantageous to the fishing boats and vessels engaged in the coasting trade.

3747. Supposing that the government should determine to spend a certain sum of money in constructing a harbour on the east coast of Scotland, with a view to the preservation of life and property, how would you be disposed to expend it? Would you chiefly take into consideration the claims of the men engaged in the fisheries and the coasting vessels, or would you principally have regard to the exigencies of the foreign trade?—I should say, that the persons engaged in the fisheries and in the coasting vessels have a more urgent claim for provision to be made for them.

3748. You will see, by looking at the wreck chart, that in proportion to other parts of the coast, wrecks on the north coast of Ireland, or at the entrance of the Clyde, have not been so numerous; now how do you view that circumstance as bearing upon the question as to there being a want of a harbour of refuge in that locality or not?—Do you mean as regards the entrance to the Clyde.

3749. Both as regards the entrance to the Clyde and the north coast of Ireland?—I am not aware of many wrecks occurring on the north coast of Ireland, or at the entrance of the Clyde, for want of a harbour of refuge.

3750. Do you see by the chart that a large number of wrecks and casualties occur annually near Liverpool?—I do.

3751. Can you suggest any remedy with a view of remedying the evil?—No, I do not know that I can.

3752. (*Sir F. Smith.*) I think you stated that you considered that the bight of a bay was better adapted for the construction of a harbour of refuge than the prominent or salient point?—Yes, if the bay is large and extensive.

3753. But what is your general opinion?—I have not studied the matter scientifically, but certainly, as a general rule, I think so.

3754. Well then, that being the case, how is it that you recommend Filey Bay for a harbour of refuge in preference to Hartlepool, seeing that Hartlepool lies much deeper back than Filey on the eastern promontory of Flamborough Head?—Because I think a harbour there would be more easily constructed, and it is better situated, and of greater capaciousness.

3755. Are there not frequently a great number of vessels detained at Flamborough Head?—Yes, I believe that there are.

3756. (*Mr. Lindsay.*) You have been asked about the north-east coast of England, now I should like to put a question to you with regard to the east coast of Scotland; are you familiar with that part of the coast?—With part of it I am well acquainted.

3757. Now suppose that the Government decide upon establishing a harbour of refuge on the east coast of Scotland, the object being in the first place the preservation of life, in the second place the protection of property, and in the third place to afford facilities for commerce, and taking into consideration the property which is afloat in the North Sea, and the large number of lives which are at stake in ships bound for the Baltic, for Archangel, and other northern ports, and also for America through the Pentland Firth, taking also into consideration the number of vessels employed in the coasting trade, and the number of men engaged on board of them, and also the number of boats engaged in the fisheries on that coast, and the number of lives at stake in that employment, and also the value of the property; taking all these things into consideration, and supposing that it were decided that there should be only one harbour of refuge constructed upon that coast, upon which of the three points would you decide that it should be established, Wick, Peterhead, or Fraserburgh?—I should have little hesitation in deciding upon Wick.

(*Mr. Cameron.*) I have drawn up a short list of masters who, I believe, will be able to attend to-morrow.

(*Chairman.*) Will you read it?

(*Mr. Cameron.*) "Captain Brown, Captain Wilkie, Captain Jones, Captain Campbell, Captain Conch, and Captain Johnston, harbour-masters."

(*Chairman.*) Will those gentlemen be ready to appear before us, say at 11 o'clock to-morrow?—

(*Mr. Cameron.*) Yes, I think that they will.

Captain GOODWIN examined.

3758. (*Chairman.*) What is your name?—John Goodwin.

3759. What is your occupation?—I am a seafaring man.

3760. How long have you followed the sea?—Since the year 1829.

3761. In what capacity?—From apprentice, through all grades, to master.

3762. How long have you been a master?—About 14 years.

3763. In what trade have the ships which you have commanded chiefly been employed?—Both in the foreign and coasting trade.

3764. Do you know anything of the north-east coast of Scotland?—Yes, I am acquainted with it.

3765. Have you any opinion to offer as to the necessity or otherwise of a harbour of refuge on that coast at any point between the Pentland Firth and the Firth of Forth?—I have been often to Wick in command of a ship, and I should think that a harbour of refuge there would prove of great advantage.

3766. Supposing that the government should determine to spend a certain sum of money in the construction of a national harbour of refuge on the east coast of Scotland, which place should you consider the most suitable for that purpose, Wick, Peterhead, or Fraserburgh?—I should say Wick would be a very good place for a ship running in an easterly gale of wind in a spring tide, causing a heavy sea.

3767. Have you any opinion to offer as to the necessity or otherwise of a harbour of refuge on the north coast of Ireland, for the benefit of shipping from the Clyde, or from Liverpool going south?—No, I have no opinion to offer. I am well acquainted with the Skerries and Portrush. At the Skerries there is almost a natural harbour at present, and a sailing ship can easily beat through between the Skerries and the mainland, and get shelter from the north-east or north-west gale of wind. There is good anchorage there, and I should sooner come to these than in any harbour on the coast; and another great advantage it has is, that it can easily be run into at all times without a pilot.

3768. Have you any opinion as to the necessity or otherwise of a harbour of refuge in the Isle of Man?—Well, I have never been in at the Isle of Man, although I have frequently passed in sight of it.

3769. (*Sir F. Smith.*) Have you ever passed by Portrush?—Yes, very often; in fact, I have frequently run in there.

3770. Did you run in to take refuge there?—No, I never went in to take refuge there.

3771. What depth of water is there under the lee of the Skerries?—Well, I could not pretend to say exactly, but I should, speaking at random, say about ten fathoms, but there may be less perhaps.

3772. However, do you think that there is a considerable depth of water?—Certainly, there is enough to float any size ship.

3773. I believe that from the position of the rocks it is already to a certain extent a harbour of refuge. Is that the case?—Yes, it is a good natural harbour.

3774. Then supposing that it could be completed at a small expense, and made into a perfect harbour, do you not think that it would be very desirable?—Yes, perhaps it might be.

3775. Have you ever navigated the north-east coast of England?—Yes, I have done so.

3776. Have you ever observed any necessity for a harbour of refuge on that coast?—I have not myself much considered the matter.

3777. Have you been on the Yorkshire coast?—I have.

3778. And have you seen vessels detained there?—Yes, frequently.

3779. Have you ever seen them obliged to bear up from Flamborough Head?—Yes, I have.

3780. Do you think that a harbour at Filey Bay

GLASGOW.

Captain Goodwin.

6 Sept. 1858.

would be of service to those vessels?—Yes, I think it might be.

3781. (*Mr. Lindsay.*) What is the name of the ship you command?—The steamship *Glasgow*, running between Glasgow and New York.

3782. What is her size?—About 1,960 tons burthen.

3783. In what trade was the vessel engaged in which you were brought up?—Both in the foreign and coasting trade.

3784. Then I am to understand that from a boy employed in vessels on the coasting and foreign trade, you have risen to your present high command?—Yes, such is the case.

3785. Have you often gone through the Pentland Firth?—I should say scores of times.

3786. Do you think that there is any risk in running through the Pentland Firth in a south-east gale of wind?—I myself would rather not do it, at any time when the wind was from the southward.

3787. Not even with an ebb tide?—No, I would rather not do it even then.

3788. Have you known many vessels to be lost in the Pentland Firth?—There have been a good many ships lost there, I myself have been in the firth at all times, both night and day, but I would not like to run in there in a south-east gale of wind.

3789. Do you consider that the danger arises from the tides in that firth in a south-east wind?—No doubt then the tides are much higher than when the wind is blowing from any other quarter.

3790. May I ask you if, from your experience, you consider that there is danger in running through the Pentland Firth even in light winds?—No doubt; for without sufficient wind you could not get sufficient way upon your ship to keep her under command.

3791. Then am I to understand that you consider it more dangerous to take the Pentland Firth in light winds than in a gale?—Well, in a gale of wind you may keep command over your ship, but if there is no wind you cannot keep her in her proper course, and the tide will carry her anywhere.

3792. You are familiar with the navigation of this particular line of the coast, and I wish to ask you, as a man of experience, your opinion upon this point: Suppose that the government were to decide upon constructing one national harbour of refuge upon that coast, which locality would you consider the most suitable for the purpose of protecting life and saving property, Portrush or some place in the Isle of Man?—A very considerable number of ships pass by the Skerries.

3793. Taking all things into consideration is it your opinion that it would be more desirable to construct a harbour of refuge at the Skerries than it would be to do so in the Isle of Man?—Yes, that is my decided opinion.

3794. (*Capt. Washington.*) I think you say that you have been at sea some 20 years?—I have followed the sea since 1829.

3795. Taking all things into consideration, do you think that harbours of refuge are, as a general rule, desirable for the larger and better found class of ships?—Yes, I think that they are.

3796. Were you in the room when Mr. Gilmour and Mr. Allan were giving their evidence?—No, I was not.

3797. I think I understand you to say that a harbour of refuge at the Skerries would be very desirable for the north going trade?—Yes, that is my opinion.

3798. With regard to the construction of a harbour of refuge in the Isle of Man for the benefit of ships engaged in trade in the Irish Sea, and ships from Liverpool and the Clyde going southwards, do I understand you to say that such a harbour is, in your opinion, unnecessary?—I cannot really say, for I never was in any harbour there.

3799. I do not speak of any harbour existing at present, but suppose that a good harbour of refuge suitable for every description of vessel could be constructed at Douglas, do you think it would be desirable to construct one?—Most decidedly; yes.

3800. Are you acquainted with the east coast of Ireland?—I am to a certain extent.

3801. Do you know Carlingford, Waterford, and Wexford?—I know Carlingford.

3802. Do you think that if the channel leading to the present harbour at Carlingford were deepened and widened, so that the harbour was made accessible to every description of vessel at all times of the tide, do you think that it would be desirable to improve the present harbour to that extent?—Yes, I think so, for at present ships of any size cannot run into it.

3803. Would you consider a similar improvement desirable in the case of the present harbour at Waterford?—I really cannot say, for I never was at Waterford.

3804. (*Mr. Coode.*) I think you have spoken of the Skerries at Portrush as a most favourable position for the construction of a harbour of refuge; now with regard to the opposite coast, do you know Loughindall and Church Bay?—Yes; as regards Loughindall there is no water, and the bottom is foul, in addition to which it requires a person to be very well acquainted with the navigation to run in at all.

3805. How often have you been in there?—At least a dozen times.

3806. Have you brought up there a dozen times?—Yes, I have.

3807. Have you ever found your anchors drag?—No; but I have seen twenty vessels ashore, at a time.

3808. Can you tell the Commissioners how it happened that those vessels drove ashore?—Yes, I think I could give a reason for it.

3809. Will you state it to the Commissioners?—The water is shallow, and there is a most dangerous sea with a strong tide, and the bottom is foul, and makes very bad anchorage.

3810. Are you acquainted with Church Bay?—I am.

3811. Do many vessels anchor in that bay?—I never myself anchored there, although I have been there; but that was merely to wait for the tide.

3812. Is Church Bay used regularly by vessels as a waiting place for the tide, or do ships run there for shelter in bad weather?—I think it is more used as a waiting place for the tide.

3813. Do many vessels run to Loughindall for shelter?—Yes, a great many.

3814. If it were possible to make a good harbour of refuge at the outer part of Loughindall, do you think it would be desirable to do so?—No, I do not think it would, for the tide is too strong there, and the sea too heavy.

3815. But assuming that a perfect harbour of refuge could be made there, do you think it would be desirable to make one?—No, I do not; for, as I said, the tide is too strong, and the sea too heavy.

3816. But assuming it were possible to construct a perfect harbour of refuge which should be completely sheltered from the sea, would there be then any objection to vessels running for it?—Yes, there is this objection, that there is a very strong tide in Lagness Bay, and that bay so strongly resembles Loughindall Bay that masters, if they had not got proper bearings, would be as likely to run for one as the other.

3817. If a proper harbour of refuge could be constructed there, and the entrance to it could be well marked, so that any master of a vessel could readily find his way in, do you still think that there is any objection to that locality for such a harbour?—Yes, I consider that the strong tide to be encountered in reaching it forms a very strong objection.

3818. Then, as regards locality, what do you consider the best position for the construction of a harbour of refuge?—I should say that on the west side of the Skerries, or Portrush, was the best adapted for the purpose.

3819. Is there any tide there which would make that situation objectionable?—There is no doubt a strong tide there, but there is not so heavy a sea as at Loughindall.

3820. Does the tide at the Skerries run nearly as strong as it does at Loughindall?—Yes, it runs as strong, but the sea is not so heavy.

3821. Can you account for that in any way?—No, I cannot say how it is unless it arises from the foulness of the bottom at Loughindall.

3822. Then upon the whole, you think the Skerries decidedly the best position for a harbour?—Decidedly so, I have no doubt on the subject.

3823. I think you told us, that a great many vessels run into Lochindall, does not that indicate that if a harbour of refuge were made there, it would prove of very great advantage?—I am not prepared to say that.

3824. But if many vessels run in there at present, surely they would be able to run in if a proper harbour of refuge were constructed, and do you still consider that there is any objection to such a harbour being made?—I think that many would not run there, but they might if the wind was from the east.

3825. Does your experience enable you to say that there would be no danger in running into the Skerries if a proper harbour were made there?—I do not think that there would be any whatever.

3826. Do you know the nature of the holding ground there?—Yes, I do, and it is very good indeed.

3827. Is there a firm hold for a ship's anchor?—Yes, particularly so as the bottom is blue clay.

3828. Is the whole of the anchorage ground blue clay?—That I cannot say, I can only speak of those parts where I myself have anchored.

The Chairman having inquired whether any of the Commissioners wished to examine the witness any further, and having received a reply in the negative, Captain Goodwin withdrew.

Mr. TURNER, Town Clerk of Glasgow, examined.

3829. (*Chairman.*) What is your name?—Angus Turner.

3830. You are, I believe, town clerk of Glasgow?—I am.

3831. Have you seen the list of witnesses who have been before us during the course of this inquiry?—Yes, I have looked through it.

3832. Do you consider that those witnesses fairly represent the feeling of the shipping interests, both the shipowners and the shipmasters of this locality?—I think, in addition to the witnesses you have heard, it might be proper to take the opinion of persons more immediately connected with the coasting trade, as distinguished from the foreign trade and the trade between Glasgow and America. The witnesses you have heard are, I believe, almost entirely engaged in the foreign trade, and I think there ought to be some witnesses examined whose interests are confined to the coasting trade, which, in my opinion, more requires the advantages of harbours of refuge than the larger and better found class of ships.

3833. In speaking of these witnesses whom you consider ought to be examined, are you alluding to shipowners or masters of ships in the coasting trade?—I allude both to shipowners and to masters commanding the smaller class of vessels.

3834. Will you be prepared to procure the attendance of any such witnesses by eleven o'clock to-morrow?—I think many of them can be in attendance.

3835. Have you any further suggestion to offer which may contribute to our obtaining the information which we require?—I observe that there is a society in existence which has taken up with great energy the question of the construction of places of refuge on the coasts of Scotland—I mean the Society for the Vindication of Scottish Rights; and I see that Lord Eglinton has been on various occasions speaking very strongly upon the subject of the necessity of provision being made for the construction of harbours of refuge for the shipping on the coasts of Ireland and Scotland. I think that it might be desirable that some officers of that society, which has expressed such strong opinions, both in representations to Parliament and in the local press, should be called upon to assign some reason for those opinions before the Commissioners.

3836. Do you think that you could procure the attendance of the secretary to the society here to-morrow at eleven o'clock?—I have seen here to-day Mr. Dreghorn and Mr. Burns, who are both officers of the society; they have gone away now, but I have no doubt that they will be prepared to-morrow to state their views to the Commissioners.

(*Chairman.*) Very well, then, we shall be happy to hear them.

Tuesday, 7th September 1858.

PRESENT:

Admiral HOPE, Chairman.

Sir FREDERIC SMITH,
Mr. LINDSAY,
Captain WASHINGTON.
Captain VETCH.
Mr. COODE.
Mr. EVANS, Secretary.

Captain MAIN examined.

3837. (*Chairman.*) What is your name?—Hugh Main.

3838. What is your occupation?—I am master of a ship.

3839. How long have you been at sea?—Forty years.

3840. In what trade were the ships in which you have been employed chiefly engaged?—Between Liverpool and Glasgow.

3841. Are you acquainted with any part of the east coast of Scotland?—No; I cannot say that I am.

3842. Have you any opinion as to the necessity or otherwise, of constructing a harbour of refuge in the Isle of Man?—I think that Ramsay Bay would be a very suitable place for the construction of one.

3843. Are you of opinion that Ramsay Bay is the best site for the construction of such a harbour in the Isle of Man?—Yes, I think it is the best locality.

3844. Will you be good enough to state the reasons upon which you have come to that conclusion?—The bay is easy of access, the water is shallow, and it is very easily got into both from the north and south.

3845. What is your objection to Douglas Bay as regards the construction of a harbour of refuge at that point?—I am not very well acquainted with it, but I think that, comparatively speaking, the bay is small and the water is a little deeper.

3846. Do you consider that a harbour of refuge in the Isle of Man, say at Ramsay, would be of use for the coasting trade between Liverpool and Glasgow?—Yes; I feel sure that it would.

BIBLIOTECA DEL C.O.A.M.

GLASGOW.

Captain Main.

Sept. 1858.

Chairman.

3847. Will you state your reasons for coming to that conclusion?—I think that a ship coming from Liverpool with the wind from the westward or north-west would fetch Ramsay Bay quite well.

3848. Are you acquainted with the north-east and east coasts of Scotland?—No; I cannot say that I am.

3849. Are you acquainted with the north coast of Ireland?—I have no particular acquaintance with it.

3850. Then you are not prepared to offer to the Commissioners any opinion as to the necessity or otherwise of constructing harbours of refuge on those coasts?—No; I am not.

3851. (*Sir F. Smith.*) How long have you followed the sea?—About 40 years.

3852. How long have you commanded a ship?—I should say for about 33 years.

3853. Has your whole time been taken up in navigating between Glasgow and Liverpool?—My time has chiefly been occupied on that line, but I have made other voyages.

3854. Would you tell me where those voyages were made to?—I have been to the Brazils, to Portugal, and other places.

3855. Have you ever sailed round the north coast of Ireland?—Yes; I did once sail round it.

3856. May I ask if that was lately?—No; I should say that it was above 20 years ago.

3857. Were you in command of a ship at that time?—I was.

3858. Did you meet with any adverse weather?—No; I do not remember that I did.

3859. Did you put into Portrush or any other port?—No.

3860. Will you tell me the various anchorage grounds round the Isle of Man?—I am not acquainted with any, except the east part of Ramsay Bay.

3861. Have you ever been wrecked?—Yes, I have.

3862. May I ask where?—In the Brazils.

3863. Do you ever find on leaving port that your crews are in a state of drunkenness, and therefore unfit to work the ship?—No; I have always found my crews perfectly sober.

3864. Then you have never had any complaint to to make on that head?—No; none whatever.

3865. (*Mr. Lindsay.*) You say that you prefer Ramsay Bay for the erection of a harbour of refuge to Douglas Bay, is that on account of your being better acquainted with Ramsay Bay than you happen to be with Douglas Bay?—Of course it is the case that I know Ramsay Bay; and I think it is easier of access.

3866. Do you think that a harbour of refuge constructed in Ramsay Bay would be the means of saving life and preserving property to any very large extent?—Perhaps it might, for there have been many wrecks at the north end of the Isle of Man.

3867. From your long experience as captain of a ship, do you think that if a harbour of refuge had been constructed at Ramsay Bay it would have been the means of saving life and property to a large extent?—Possibly it might.

3868. Do you know any instance of ships having been lost which would in all probability have been saved if there had been such a harbour of refuge?—Yes; I think several ships might have been saved which were lost by driving from their anchors.

3869. Was there any loss of life in any of those wrecks?—I think so, but I do not clearly remember.

3870. Would a harbour of refuge constructed in Ramsay Bay in the Isle of Man afford any facility or advantage to ships belonging to the Clyde or to ships bound for Liverpool?—I think it would be an advantage to ships going down Channel to Liverpool.

3871. Do you think it would be any advantage to ships bound to the Clyde as well as to ships bound to Liverpool?—It would be of advantage to vessels bound from the Clyde, but not to inward-bound ships, for they would not get so far to leeward.

3872. (*Capt. Vetch.*) I think you said that you had never been to Douglas?—Yes; I was once there many years ago.

3873. Are you aware that by running out a pier in Douglas Bay from the Two-Gun Battery Point you could get anchorage with 8 or 9 fathoms of water?—I was not aware of it, but I never paid particular attention to the subject.

3874. Which do you consider the most dangerous part of the passage between Liverpool and the Clyde?—I should say all along the coast of Galloway.

3875. What part of that coast would you consider the most dangerous?—I should say from the Mull to Corsewall Point.

3876. (*Mr. Coode.*) You say that you prefer Ramsay Bay as a position for a harbour of refuge, are you aware of the number of wrecks which occur in Ramsay Bay as compared with those which occur at Castleton?—No, I cannot say that I am.

3877. I see by referring to an official document that 54 wrecks have taken place within a short distance of Castletown during 25 years, while the number has only been 29 in the neighbourhood of Ramsay Bay?—A great many fishing boats frequent that part of the coast.

3878. Do you attribute the number of wrecks to that circumstance?—That may be the cause, but I really cannot say.

3879. (*Chairman.*) Suppose that a harbour of refuge could be constructed at Douglas, providing sufficient accommodation for the wants of the trade, should you still consider Ramsay the better site?—Yes, that is my opinion.

Captain KELSO examined.

Captain Kelso.

3880. (*Chairman.*) What is your name?—John Kelso.

3881. What is your occupation?—I am master of a ship.

3882. How long have you commanded a vessel?—About 30 years.

3883. In what trade have the ships in which you have sailed been chiefly employed?—I have been employed in the foreign trade and the coasting trade, but chiefly in the coasting trade.

3884. What coasting trade have you been chiefly employed in?—On the north-west coast of Ireland, and in fact all round the three kingdoms.

3885. What foreign trade have you been engaged in?—I have been to Quebec and the West Indies.

3886. Have you made any voyages to the Baltic?—Yes; I have made three or four voyages there.

3887. Have you formed any opinion as to the necessity or otherwise of constructing harbours of refuge on the north-east of Scotland; if so, will you inform the Commissioners what conclusion you have come to?—Upon the north-east coast of Scotland I consider that a harbour of refuge would be very desirable about the locality of Wick, and I think that Sinclair's Bay, as being both easy of access and very roomy, would be well adapted for the construction of such a harbour.

3888. Will you state, without any reference to the exact locality, what are your reasons for considering that a harbour of refuge is necessary in that district of the coast?—I think that such a harbour is necessary, because in that district there is a great traffic with the Baltic, the North Sea, and Archangel, and round the north coast.

3889. Have you had any personal experience of the necessity of a harbour of refuge in that district when trading there yourself?—Yes, I have.

3890. Would you be good enough to state to the Commissioners any particular instance in which you have found the necessity for such a harbour?—Yes; on one occasion in particular, when I was going through the Pentland Firth, the wind chopped round

to the south-east, and there was no place that I could get into but the Moray Firth, and the result was that I was dead locked at Duncansby at the head of the firth.

3891. Do I clearly understand, that you decidedly prefer Wick to Peterhead for the construction of a harbour of refuge?—Yes, that is my opinion.

3892. Will you state the reason why you prefer Wick?—I prefer it on account of the vast concourse of vessels from all parts which there is always in that locality.

3893. Have you any opinion to offer to the Commissioners as to the necessity or otherwise of a harbour of refuge in the Isle of Man?—No; I don't see that the construction of a harbour of refuge in the Isle of Man would be any benefit to us in the Clyde, but it might be of use as regards large ships from Liverpool falling in with westerly or south-westerly gales; those large ships require some place of refuge to run into.

3894. Then I understand you to say that as regards the Isle of Man a necessity does exist for the construction of harbours of refuge for large Liverpool ships?—Yes, that is my opinion.

3895. That being the case, what part of the Isle of Man do you consider to be the best adapted for the construction of such a harbour?—I think the best place would be inside Langness Point.

3896. Will you state the reasons that you have for considering that, the best locality?—A vessel going up St. George's Channel may weather the Calf and get in there; but if the harbour were at any place to the east of that point, heavy ships could not get up to it.

3897. Have you formed any opinion as to the necessity, or otherwise, of a harbour of refuge upon the north coast of Ireland, for the benefit of Clyde or Liverpool ships?—I think that any harbour constructed in that locality ought to be upon the lee and not upon the weather coast; and I see no necessity for any harbour of refuge upon the Irish coast; in general the gales blow from the south-west, and a harbour might be constructed at Loughindall or at Islay, by making a breakwater similar to the one at Plymouth Sound.

3898. Have you formed any opinion as to the advantage to be derived by ships going down St. George's Channel, by the improvement of the harbours of Carlingford, Waterford, and Wexford?—Certainly some improvement is very much wanted in the harbour at Waterford.

3899. Will you state why you consider such improvement necessary?—I think that it is required, because there is no place to run into from Queenstown to Tuskar, as it takes a man well acquainted with the navigation to get into the passage.

3900. Have you formed any opinion as to the necessity, or otherwise, or of the advantage to be derived from the construction of a harbour of refuge in the neighbourhood of the Land's End?—Yes. I think that a very good harbour of refuge might be constructed in Mount's Bay.

3901. (*Mr. Lindsay.*) You said, I think, that in your opinion a harbour of refuge would be very desirable at Wick, and would be the means of saving many lives and much property, there being at present no place of refuge for shipping upon that coast?—Yes, that is my opinion; but with a south-east wind one might run through the Pentland Firth.

3902. Would you hesitate in taking the Pentland Firth?—Not generally; but I might hesitate with spring tides.

3903. Have you often made a passage through the Pentland Firth?—Yes, I have frequently done so.

3904. It is considered a dangerous passage, is it not?—Yes, it is.

3905. From what does the danger arise?—There is a very heavy sea running during spring tides, and I have known a ship go down with all hands on board.

3906. Would you be good enough to tell us what was the size of that ship?—I should think she was about 120 tons burthen.

3907. Was she lost during a gale of wind in attempting to run through the Pentland Firth against adverse tides?—Yes; that was the case.

3908. Have you ever been in the neighbourhood of Fraserburgh and Peterhead?—I have often passed those places.

3909. Taking all things into consideration, the traffic with the Baltic, with Archangel, and with America, through the Pentland Firth, taking also into consideration the number of vessels engaged in the fisheries upon that coast, and also the number of ships engaged in the coasting trade, is it your opinion that Wick, Peterhead, or Fraserburgh would be the best place for the construction of such a harbour?—It is my opinion that Wick would be the most suitable locality.

3910. I think I understood you to say, that you considered that a harbour of refuge would be desirable at Langness Bay or Castletown Bay, may I ask you if you have ever anchored at either of those places?—I have been there dodging the tide, but I have never anchored there.

3911. Do you think that Langness Bay would be a good place for the construction of a harbour of refuge?—Yes, I think one might be constructed thereby running a breakwater out from the point.

3912. You think then, that if a breakwater could be constructed outside Langness Point that a good harbour might be made there?—That is my opinion.

3913. Do you think that a harbour there would be more desirable than one at Douglas or Ramsay?—Ramsay is very easy of access from the southward, but large ships could not well fetch up there in a heavy gale of wind.

3914. Would you prefer Ramsay Bay to Douglas Bay for the construction of a harbour of refuge, supposing that government decided upon constructing one in that locality?—I think that Ramsay Bay is better suited for the purpose than Douglas Bay, as regards heavy shipping.

3915. I think I understood you to say, that if a harbour of refuge were to be constructed in the north channel, you would prefer Loughindall as a site either to Portrush or any other point? — Yes, that is my opinion.

3916. Have you ever been in Loughindall?—Yes, I have.

3917. What sort of anchorage is there there?—There is very shallow water up from Saltpans to Bowmore.

3918. May I ask about what depth of water there is?—There is different depth in different parts, 9, 4, and 5 fathoms.

3919. But is not that quite sufficient depth of water for a ship to anchor in?—Yes, there is plenty of water; but in a heavy gale of wind a breakwater is required on account of the heavy sea, to afford a secure anchorage for heavy ships.

3920. At Bowmore is the depth of water 3 fathoms?—Yes.

3921. Are you speaking of low water or at spring tides?—At low water; but I do not mean close into Bowmore.

3922. Do you think that if a breakwater were made there it would tend more to the preservation of life and protection of property than any harbour which might be constructed at Portrush?—Yes; that is my opinion.

3923. How would you propose constructing a breakwater at Bowmore, the town lying east and south east?—I would run it from Saltpan's Point across towards Langness.

3924. What sort of anchorage ground is there?—There is very good holding ground.

3925. As the bay is at present without the protection of a breakwater, have you known ships drag their anchors there?—Yes; I have known 17 do so in one night in a south-west gale.

GLASGOW.

Captain Kelso.

7 Sept. 1858.

Mr. Lindsay.

3926. About how many ships were there in the bay at the time?—I should say about 20.

3927. And out of 20 ships in the bay, in one night, 17 have been driven on shore?—Yes, I have known that to be the case.

3928. It would appear then that a very heavy sea runs into that bay?—Yes, there is.

3929. Was it in consequence of that heavy sea that the vessels dragged their anchors?—Yes, I should think that was the main cause.

Mr. DAVID DREGHORN examined.

Mr. David Dreghorn.

3930. (*Chairman.*) What is your name?—David Dreghorn.

3931. You are, I believe, a town councillor of Glasgow?—Yes.

3932. May I ask in what capacity you appear here?—As connected with the Society for the Vindication of Scottish Rights.

3933. Will you be good enough to state to the Commissioners your opinion as to the advantage or otherwise of the construction of harbours of refuge on the north-east coast of Scotland?—I am not myself personally very conversant with it, but the subject has undergone much discussion in the society of which I am a member; it has been very frequently referred to at public meetings, and the society generally have considered it a great grievance that, as regards the Scottish coast, no harbours of refuge have been constructed. In England harbours have been constructed at the public expense, but not one has been constructed in Scotland with, I may say the small exception, that 2,000*l.* was expended at Portpatrick. The Earl of Eglinton is the president of the society to which I belong, and in speaking on the subject of the construction of harbours of refuge upon the Scottish coast, at a public meeting in Edinburgh, in November 1853, said, in reference to the subject, "The winds blow as hard on the Scotch "shore, and the eastern shore is as bleak as any that "a mariner has to contend with; and a Scotch "sailor's life is as dear to his family and his country "as that of any, but we have no Dover, no Harwich, no Portland, no Jersey, no Holyhead; in fact, "there is not a harbour of refuge from Wick to Berwick." I think there can be no doubt that a harbour of refuge on the east coast of Scotland would tend greatly to the preservation of life and property. I have myself been in a yacht, and have found how great an advantage it would have been to have had a harbour of refuge. I may say also, that at a meeting of the society to which I belong, a very large shipowner expressed his opinions upon the subject.

3934. (*Mr. Lindsay.*) May I ask his name?—Certainly; it was Mr. Mitchell; and he said, in referring to the subject of harbours of refuge, "One other "great and important matter in which Scotland has "suffered a grievous injustice, is the total want of "harbours of refuge. There is indeed expended on "Portpatrick the sum of 2,000*l.*, but that is not a "harbour of refuge; no vessel can enter the rocky "narrow channel. It is merely a packet station for "the carriage of mails from Scotland to Ireland, from "Cape Wrath to the Mull of Cantyre, one of the "most dangerous coasts in the world; where I have "seen the Atlantic rolling in waves 25 feet high, in "which no vessel could be safe, although the ship "and her ground tackle be all of the best description. There is not one. But if we had harbours "of refuge, such a shipwreck as that of the *Annie* "*Jane*, with the loss of 340 souls, would have been "prevented, and much valuable property would be "saved. A vessel of my own was a few years ago "wrecked on the same spot, dashed to pieces, and all "on board perished; but had there been a harbour "of refuge the catastrophe would have been prevented. Now, I think we should all put our "shoulders to the wheel to get harbours of refuge "along the coasts of Scotland, and, I think, if we "were unanimously, knocking at the Treasury door "until we were listened to, we would undoubtedly "succeed. Then, with regard to the east coast, the "navigation there, like the west coast, is highly "dangerous, and there is not a harbour there either. "No doubt Queensferry is a harbour of refuge, but "no thanks to Government for that, to nature only "are we indebted for it, as Government has not laid "out a farthing on its construction. But while such "is the case as regards Scotland, what has been done "in the same field in Ireland? At Howth, a poor "fishing village, they have expended half a million "of money in making a harbour; which, now that "it is constructed, no vessel can get into it. When "over lately, I looked at it with astonishment. I "recollected that when the *Great Britain* was built, "they had to take down the dock walls to get her "afloat; but this Howth Harbour was exactly the "reverse, you cannot get a vessel into it. There is "another great grievance, the light dues. The "Trinity House takes out of the country yearly "30,000*l.*, which they spend nobody knows how. "They are an irresponsible body; but if they were "called upon to spend that money drawn from our "shipping alone, in building harbours of refuge, the "saving to life and property would be incalculable." At another meeting of the society Mr. Hugh Tennant drew attention to the small sum of money spent in the improvement of the Scottish coast. He said, "The survey of Scotland was commenced so far "back as the year 1809, it was then discontinued for "three years, in order to expedite the survey of England; it was renewed in 1813, and, with certain "intervals, was languidly carried on until 1822, in "consequence of the demand made for the completion "of the survey of Ireland. The whole sum expended "on the Scottish survey until the beginning of this "year has been 130,000*l.*, while 800,000*l.* has been "expended on the English, and 850,000*l.* on the Irish "survey. The survey of our coast has been much "neglected, and the money granted quite inadequate "for the accomplishment, within a reasonable time, of "an object so important to navigation." At the close of his speech Mr. Tennant also observed:—"It is "also material to keep in view the very marked "neglect exhibited towards Scotland in the very "important matter of dockyards, arsenals, and harbours of refuge. It is an astounding fact that "while there are eight dockyards and six arsenals in "England, all supported at the public expense, such "establishments are wholly unknown in Scotland. "Vast sums have also been expended in England and "Ireland on harbours of refuge; thus, the following "are the estimates as returned to Parliament of the "cost of such works now in course of construction in "England:—Dover, 245,000*l.*; Harwich, 110,000*l.*; "Alderney, 620,000*l.*; Jersey, 700,000*l.*; Portland, "588,950*l.*; Holyhead, 91,279*l.*; making a total of "2,355,229*l.* While in Ireland 1,000,000*l.* has been "expended in Kingstown Harbour, and in the "Channel Islands the same amount has been granted "for the breakwater at Jersey, in Scotland the "paltry sum of 2,500*l.* has been granted for the "packet station at Portpatrick; and hence, as already "noticed, nothing that can with propriety be termed "a harbour in Scotland has received any Parliamentary grant. This exclusion is all the more "remarkable, from the circumstance that repeated "applications have been made for a share in such "grants, enforced by strong and peculiar claims on "any enlightened Government. I would just refer, "in illustration, to the case of Peterhead. It is well "known that Peterhead is the only place on our "eastern coast adapted, according to the opinion of "the most eminent engineers, as a harbour of refuge; "and thus a rocky and dangerous line of coast, extending 250 miles, and having no intermediate point "of shelter between the Friths of Forth and Cromarty, "and along which, and the port of Peterhead, it

"appears from official returns that no less than "11,453 vessels, exclusive of those in ballast, passed "in 1845, going and returning from the Baltic, "Norway, and Sweden, as well as our eastern ports, "are in this way left without protection. So early as "1705, the Scottish Privy Council—that is, before the "Union—recognized the importance of this harbour "as a national undertaking; but though the subject "has been strongly urged upon successive adminis-"trations, no grant has yet been obtained for an "object so necessary to our inland and foreign navi-"gation." I myself have nothing to say personally on the subject; but I may state that I was lately in a yacht on the west coast in a strong gale of wind in Lamlash Bay, and the vessel was in a very uncomfortable state, and if a breakwater were erected there it would form as good a harbour of refuge as any that could be required on that coast. As regards the necessity for a harbour of refuge in the Isle of Man, I cannot speak from personal experience, but I have always heard, as regards the western coast, that a harbour of refuge at Loughindall would be desirable.

3935. (*Mr. Lindsay.*) Then the grievance complained of by the society of which you are a member, extends to the non-construction of harbours of refuge on the east coast of Scotland?—Yes, that is so.

3936. As regards the west coast of Scotland, what is your opinion as to the necessity for the construction of a harbour of refuge?—I think that a harbour at Loughindall would be of advantage; if a breakwater were constructed at the northern entrance of Loughindall Bay, it would render the place a much more secure anchorage than it is at present.

3937. Have any complaints been made by the society to which you belong as to the construction of a harbour there?—Yes, great complaints have been made that the bay there at present was not a proper place for anchorage.

3938. Are you aware of any representations having been made to the Government by the society to which you belong of the necessity of constructing harbours of refuge upon the east coast of Scotland?—I understand that such representations have been made. I believe that the proceedings of the society for the Vindication of Scottish Rights have been from time to time duly made known to the Government.

3939. Are you aware whether or no any hopes have been held out by the Government in answer to such applications?—Yes, I think that hopes have been held out to us.

3940. Do you think that Mr. Mitchell himself would be willing to come before us and give evidence?—Yes, I believe that he would.

Captain TURNBULL examined.

3941. (*Chairman.*) What is your name?—James Turnbull.

3942. What is your occupation?—I command a steam ship.

3943. How many years have you been at sea?—I cannot say exactly, but I should say about forty years.

3944. How many years have you been master of a vessel?—Twenty-two years.

3945. What sized vessels have you commanded?—They have been from 110 to 700 tons burthen.

3946. In what ports have the vessels in which you have been employed chiefly been engaged in trading?—I have been principally employed on the Irish station, and for thirty years I have served on ships engaged in plying between Glasgow and Liverpool and Ireland.

3947. Have you formed any opinion as to the advantage, or otherwise, of the construction of a harbour of refuge in the Isle of Man, as regards the passing trade?—In my opinion Ramsay Bay would be the best place for the construction of such a harbour.

3948. Will you state your reasons for thinking that Ramsay Bay would be a better locality than Douglas Bay?—In a south-west gale of wind Douglas Bay is not so easy of access.

3949. Is it your opinion, taking everything into consideration, that the construction of a harbour of refuge in the Isle of Man would be a good thing for ships passing in that direction?—Yes, I think a harbour of refuge in Ramsay Bay would be a very desirable thing.

3950. Will you state the reasons you have for holding that opinion?—In a westerly gale of wind, vessels which could not make Holyhead might get into Ramsay; with a north-west or south-west gale they would get to leeward of the island.

3951. Are you speaking of vessels from Liverpool and from the Clyde?—Yes; in a gale from the west or north-west Ramsay Bay would be a great advantage to them as a harbour of refuge.

3952. Can you offer any opinion as to the advantage, or otherwise, of the construction of a harbour upon the north coast of Ireland?—Yes; I think the Skerries, at Portrush, would be a very good locality for the construction of a harbour of refuge.

3953. Would a harbour of refuge there be of advantage to the passing trade?—Yes; in a north-west gale of wind vessels could run in there.

3954. Are you acquainted with Loughindall Bay?—I myself was never there.

3955. But would you prefer, if a harbour of refuge were to be constructed in that locality, that it should be constructed on the Irish coast, or on the opposite side?—I should much prefer the Irish coast, for vessels in a north-west gale of wind might run into the Skerries at Portrush, which could not get into Lochindall Bay.

3956. (*Sir F. Smith.*) Have you seen the wreck chart which has been published?—No, I have not seen it.

(*Sir F. Smith to the Secretary.*) Will you be good enough to place the wreck chart in the hands of the witness?

3957. (*To the witness.*) Do you see that a great many wrecks are marked upon that chart as having taken place opposite Liverpool?—Yes, I see that there are a great many marked down upon it.

3958. Have you yourself ever been in danger of being wrecked, either upon entering or leaving the port of Liverpool?—The banks opposite the entrance to Liverpool are very dangerous in a gale from the north-west.

3959. Do you think that the loss of life, and the many wrecks, may in any degree be attributed to the state of the crews when they leave port; I mean, the drunken state?—I really cannot say.

3960. In your experience, have you noticed that it is the habit for vessels to leave port with their crews in a state of intoxication?—I myself never saw anything of the kind.

3961. To what would you attribute the number of wrecks in that locality?—It would be to vessels being caught by a north-west wind, and not being able to keep off the lee shore.

3962. Have you ever been upon the north-east coast of England?—No, I never was there.

3963. Do you know the east coast of Scotland?—Yes, I am well acquainted with part of it.

3964. Have you ever commanded a ship that ran upon that coast?—Yes, I have commanded a steamer running between Leith and Hull.

3965. But as regards the north-east coast between the Frith of Forth and the Pentland Firth, are you acquainted with that part?—No further than that I have just gone round it, and I don't pretend to know the coast sufficiently to offer any opinion with regard to it.

3966. (*Mr. Coode.*) I think you said that you preferred Portrush as a site for the construction of a

GLASGOW.

Captain Turnbull.

7 Sept. 1858.

Mr. Coode.

harbour of refuge to Loughindall ?—Yes, that is my opinion.

3967. Do you form that opinion as regards the locality itself, without regard to any facility for the construction of such a harbour ?—Yes, I think that that would be the most desirable locality.

3968. Do you think that a harbour of refuge constructed there would tend more to the preservation of life and protection of property than a harbour constructed anywhere else in that neighbourhood ?—Yes, that is my decided opinion.

Mr. JOHN MITCHELL examined.

Mr. John Mitchell.

3969. (*Chairman.*) What is your name ?—John Mitchell.

3970. What is your occupation ?—I am a merchant and shipowner.

3971. Are you acquainted with the object and intention of our inquiry ?—Yes, I think I am.

3972. Will you state to the Commissioners briefly your opinion generally upon the subject of harbours of refuge, that is, if you entertain any ?—I may state generally that great advantage would be derived, both by the shipping interest and by the public at large, if more harbours of refuge were constructed. The result must be a reduction in the premium upon maritime insurances, as the risk of loss would be considerably diminished.

3973. How long have you been connected with the shipping interest ?—I should say about 30 years.

3974. In what trade were the ships employed in which you have been interested ?—Oh, they have gone to all parts of the world ; the East and West Indies, and, in fact, to all quarters of the globe.

3975. Are you acquainted with the north-east coast of Scotland ?—I know a little about it.

3976. Have you any opinion to offer to the Commissioners as to the best point upon that coast for the construction of a harbour of refuge ?—No ; but I have heard and believe that a harbour of refuge is very much required upon that coast.

3977. Then you are not able to assign any particular place for the construction of one ?—No ; but I have heard and believe that one is much wanted on that coast.

3978. Do you think that a harbour of refuge is required anywhere upon the west coast of Scotland ?—One is much less required there than anywhere else, for we have there a great number of very fine natural harbours, such as Lamlash Bay and Rothesay Bay ; in fact, I don't know any river the entrance to which is better protected than the Clyde ; but it would be a great advantage if those natural harbours of refuge were buoyed off.

3979. Does not the duty of buoying them off fall upon the Northern Lights Board ?—The Commissioners of Northern Lights have nothing to do with the matter ; but it would be of immense advantage to have those natural harbours buoyed off.

3980. Do I understand you to say that there is no public body charged with the duty of buoying off those harbours ?—No, certainly not ; there is no fund for the purpose. These harbours are quite free, and any vessel that likes may run in, and pay nothing ; but it would be of immense advantage to have them buoyed.

3981. Have you any opinion to offer to the Commissioners as to the advantage or otherwise of the construction of a harbour of refuge at Portrush ?—I think that the construction of a harbour of refuge there would prove of great advantage for vessels going out to the north. I am not certain that that would be the best locality ; but a harbour of refuge is very much wanted in its vicinity.

3982. Could you mention any other site that you would think preferable to Portrush ?—No ; I do not know that I could name any particular spot.

3983. Have you formed any opinion as to the advantage of a harbour of refuge being constructed in the Isle of Man ?—Yes, I have thought over the subject.

3984. Will you state to the Commissioners the opinion that you have formed ?—Well, I think that it would be a very great advantage to vessels going from and coming into the Clyde, as Liverpool is a remarkably bad harbour to get into in a gale of wind, owing to the numerous sandbanks in its vicinity.

3985. To go to the Irish coast, do you consider that an improvement of the existing harbours at Carlingford, Wexford, or Waterford would be advantageous ?—There can be no doubt whatever about the matter.

3986. Will you state your reasons for saying so ?—At present a vessel drawing any depth of water cannot get into them ; and if the channel were deepened 15 or 20 feet, ships might run in at all states of the tide.

3987. In what would the advantage consist ?—Why, I can only say that I myself have had a vessel go ashore on that coast, and been much damaged ; and I know that if there had been a harbour of refuge, she could have run there for protection.

3988. As regards the neighbourhood of the Land's End, have you any opinion to offer to the Commissioners as to the advantage or otherwise of constructing a harbour of refuge in that locality ?—I am not certain about the matter ; but I think a good site might be found about the Skerries.

3989. I think I gather from your evidence that you consider that the construction of harbours of refuge for ships in stress of weather would be advantageous ; but have you any opinion to offer to the Commissioners as to the advantage or otherwise to be derived by the use of such harbours by vessels not absolutely in distress, but delayed by bad weather, as regards a saving in wear and tear ?—They might be of some advantage in that respect, but very few vessels would run into a harbour of refuge unless they were compelled to do so ; for captains would much prefer keeping on their voyage then run the risk of delay.

3990. Am I to understand that it is your opinion that in a mercantile point of view it is better that a ship should bear the wear and tear of lying to in a heavy gale of wind than that she should run into a harbour of refuge ?—In a mercantile point of view time is of the utmost importance, and a saving of time being a saving of money I think it would be better for a captain to keep the sea, if he possibly could do so, and stand the wear and tear rather than run into a harbour of refuge.

3991. Then, in point of fact, the object is to make as speedy a passage as possible ?—Yes, just so ; it is the duty of every captain, even in bad weather, to do all that he can to make a good passage.

3992. Have you ever made a practice of underwriting ships ?—Yes, I insure largely ; in fact I pay nearly 10,000*l.* a year for insurances, and I underwrite to a considerable extent also.

3993. (*Sir F. Smith.*) Are you in the habit of insuring all your ships ?—Yes, that is my practice.

3994. Are you of opinion that the construction of harbours of refuge along the coast would tend to diminish the rate of insurance ?—I have no doubt that it would, and to a considerable extent.

3995. That being the case then, I presume that you, as a shipowner, would not object to pay a passing toll for the construction and maintenance of harbours of refuge in return for the benefit you would thus derive in the reduction of the premium upon maritime insurances ?—No, I do not think that any shipowner would grudge the money if he were sure that it was properly and judiciously applied.

3996. Then do I understand that it is your opinion that if harbours of refuge were well placed and properly constructed, and the expenditure well regulated and properly applied, the shipping interest would not object to contribute their fair proportion towards the

expenditure?—No, I do not think that they would, for the saving upon maritime insurances would more than counterbalance any sum they might be called upon to contribute.

3997. I think you have expressed an opinion in favour of the construction of a harbour of refuge at Portrush?—There or somewhere in the vicinity.

3998. Have you ever considered the question of the expediency of constructing a harbour of refuge at Lochindall?—No, I have never thought about the matter.

3999. Then you are not prepared to offer any opinion to the Commissioners upon that point?—No, I am not.

4000. Now, as regards the Isle of Man, which point there would you prefer as to the locality for the construction of a harbour of refuge?—I should have thought Douglas was the best place; but I have not deeply considered the subject. Douglas seems to me to be much more sheltered than Ramsay, and from the natural formation of the bay, I think that much less expense would be incurred in the construction of a harbour there than would be the case at Ramsay.

4001. As regards the entrance to the Clyde, I think you said that there were very good natural harbours, but that they wanted to be buoyed off. Do you think that shipowners would grudge the expense?—No, I do not think they would.

4002. Supposing that it were determined to levy a toll for the expense of buoying off their natural harbours, how do you think it would best be collected?—I think the custom-house officials would be the proper persons to collect the toll, both for the expense of buoying, and also of constructing and maintaining harbours of refuge, and I certainly do not think that shipowners would grudge the expense.

4003. As regards the north-east coast it has been suggested to us that instead of laying out the public money in the construction of two or three harbours, the same money would be more advantageously expended in improving the harbours which already exist, is that your opinion?—It would be very desirable to improve the present harbours.

4004. Are you aware, or do you think it probable, that the class of vessels employed in the coasting trade has very much increased as regards size of late years?—I do not think that the coasting vessels have increased so much in size as the vessels employed in the foreign trade.

4005. But do you think that the improvement of existing harbours as regards deepening and widening the entrance would affect ships employed in the coasting trade?—Yes, I think that it would.

4006. I think that speaking of the harbours of Carlingford, Waterford, and Wexford, I gathered from your evidence that it would be desirable to improve them so that ships could enter at all times of the tide rather than to construct a new harbour of refuge?—No doubt that would be a great object, and it would be a most advantageous thing so to improve those harbours that ships could run in at all stages of the tide.

4007. Do you mean ships of all tonnages?—Large vessels now-a-days draw less water than large ships did ten years ago; a modern constructed ship of 1,000 tons does not draw more water than an old fashioned ship of 600 tons.

4008. Have you seen the wreck chart?—No.

(*To the Secretary.*) Will you be kind enough to shew the witness the wreck chart?

4009. Now from your practical knowledge do you think that any of those wrecks could have been avoided if harbours of refuge had been in existence?—No doubt of it, not half of them would have occurred.

4010. Are you aware also that taking an average of 5 years 800 lives have been lost annually by shipwrecks?—I know that a great number of lives have been lost.

4011. Do you imagine that any large proportion of that loss resulted from vessels being sent to sea badly found?—No doubt in some cases.

4012. Do you imagine that any of those ships were lost in consequence of leaving port with the crew in such a state of drunkenness as to be unable to manage the ship?—Hardly a crew leaves Liverpool or Glasgow without a large proportion of the crew being in a state of intoxication, and when a ship arrives at a foreign port some of the men get drunk again, and others desert and engage themselves on board other ships under different names.

4013. Do you know, of your own knowledge, of any ship being wrecked on account of the drunken condition of the crew?—I do not know of any, but I know that many wrecks occur upon leaving port from that cause.

4014. (*Mr. Lindsay.*) Did you hear Mr. Gilmour give evidence?—I heard part of his evidence, but not all of it.

4015. From what you now state to the Commissioners you appear to dissent from the views expressed by that gentleman?—Most decidedly so; and I must say that I was quite astonished at hearing that evidence.

4016. I understood Mr. Gilmour to state that in his opinion a great number of wrecks took place in consequence of ships running for harbours of refuge, may I ask what orders you give to your captains?—I give them orders to keep the sea at all times if they possibly can do so, and not to run into port unless in cases of absolute necessity.

4017. Now, for instance, in the case of a ship meeting an adverse wind and making no progress, even though the ship might not be in jeopardy, do you think that the master would be acting prudently if, to save wear and tear, he ran into a harbour of refuge?—Unless there was danger of running upon land I think he ought to keep to sea.

4018. Do you yourself think that the shipping interest would object to pay half the cost of the construction of harbours of refuge?—No, I do not think that they would.

4019. Are you not aware that even at present a great many complaints have been made against the payment of passing tolls?—Yes, perfectly; I have made many myself, but those complaints refer rather to the manner of collecting the toll than the toll itself; for instance, I think it is a most unreasonable thing to demand a passing toll from a ship that does not pass at all, and many of my vessels have to pay passing tolls to harbours when they never see them or go near them, and that I think a very great hardship.

4020. Then you think that the hardship consists in being taxed for the support of a harbour from which you derive no benefit?—Just so, I think the tax ought to be paid by vessels using the harbour.

4021. As far as I understand, it appears to me that you consider that any tax which might be levied for the construction and maintenance of harbours of refuge ought to be paid only by the ships which make use of such harbours?—Yes, that is my decided opinion.

4022. But do you not think that the adoption of such a system would be calculated to prevent masters of ships making use of those harbours?—I think not; and it appears to me to be only common justice that those who really get the benefit of the harbours should pay for them, and no captain of a ship would ever in case of absolute necessity be deterred by the consideration of expense from making use of such harbour, I can assure you.

4023. I think you said that there has been a large increase in the size of ships engaged in the foreign trade of late years, has there been any corresponding increase in the size of vessels employed in the coasting trade?—I think steam ships are now taking the trade from the old class of vessels employed in the coasting trade.

4024. Do you think they are doing so to any con-

GLASGOW.

Mr. John Mitchell.

7 Sept. 1858.

Mr. Lindsay.

siderable extent?—Yes, I should say to a very great extent.

4025. Is it not the case that about two thirds of the coasting trade is carried on now by steam vessels?—No, I should think not so much as two thirds.

4026. Would you say one half?—No, but I should think one quarter of the trade is.

4027. Is it your opinion that the building of steamers is on the increase just at present?—No, I should think not just at present.

4028. Do you think that the building of sailing vessels is on the increase?—No, I think not.

4029. Then I am to understand that upon the whole you are of opinion that harbours of refuge are necessary as a means of saving life and protecting property to a considerable extent, and also for affording great facilities for commerce?—Yes, I am clearly of that opinion.

4030. And are you, as a large shipowner, and, therefore, deeply interested in the matter, so strongly of opinion that the construction of such harbours of refuge is a matter of necessity that you are willing to pay a fair proportion towards their construction and maintenance?—Yes, if the money be properly expended I would pay my share with the greatest pleasure.

4031. That is to say, that you would not object to the shipping interest being called upon to pay one moiety of the expense of the construction and maintenance of such harbours of refuge, if the tax were levied in the form of a passing toll upon vessels actually making use of the harbours?—Decidedly; I myself should have no objection.

4032. (*Capt. Washington.*) I think you stated that you were an underwriter?—Yes, that is the case.

4033. Is it a fact that in winter vessels passing through the Pentland Firth pay a double rate of premium on insurance?—Yes, that is the case, to my own knowledge.

4034. Do you think that that is the best proof which could be given of the risk to ships passing through the Pentland Firth?—Yes, I think so.

4035. Do you know of any other test which could be compared to that, as showing the risk and danger involved in the navigation of that firth in the winter months?—Yes, I should think that the number of vessels lost in that firth is another test. I lost one myself there some few years ago. She was a total wreck, and nothing was saved at all; and that was close near where the *Annie Jane* was lost with 340 passengers on board.

4036. Were any lives lost in your ship?—Yes, four men perished, but the remainder of the crew were saved.

4037. May I ask how many years ago that occurred I mean the loss of the *Annie Jane* and of your own ship?—I should think about five or six years ago.

4038. Do you know of any similar disaster to shipping occurring on that coast?—No; I cannot say that I do.

4039. Then, in your opinion, the most serious disaster to shipping which has occurred upon the east coast of Scotland occurred in the Pentland Firth?—Yes, decidedly so.

4040. Should you, then, be disposed to agree with any opinion which may have been given to us to the effect that there is no danger in navigating the Pentland Firth?—I can only say that, as far as my experience goes, there is great danger; and I think the increased rate of insurance required by underwriters is a very good test in the matter.

4041. Did you ever in your whole life hear a doubt cast upon the matter?—No, I cannot say that I ever did; it is generally admitted to be a most dangerous navigation.

4042. I think you said something about the necessity of buoying off the natural harbours at the entrance of the Clyde?—Yes; I think it would be of great advantage.

4043. I think you said also that you did not think that the Commissioners of Northern Lights were bound to place buoys there. Are you aware that they place them in the Moray Firth?—No, I am not aware that such is the case.

4044. Buoys are placed all along the east coast by the Commissioners of Northern Lights, to the best of my belief; are you aware whether that is so?—No, I do not know anything about it.

4045. Are you aware of any application having been made upon the point to the Northern Lights Commissioners?—No; I do not know of any application ever having been made.

4046. I think, though, I am not wrong in saying that the Commissioners of Northern Lights buoy all the east coast of Scotland?—That may be so, but I do not know.

4047. But do you not think that the same Act of Parliament which gave the Commissioners power to levy dues for lighting purposes also imposed upon them the duty of buoying where it might be necessary?—Well, I do not know; but we do not get any help from them here.

4048. I do not know whether it is done by private agreement or not, but I feel sure that the Northern Lights Commissioners buoy the east coast of Scotland?—I cannot say; but certainly they do not buoy the west coast.

4049. The Firth of Forth, the Moray Firth, Inverness, and Cromarty, are all buoyed by the Commissioners of Northern Lights, I feel certain?—That may be so; but we get none of those good things here.

4050. I think you say that you yourself, as a large shipowner, would be prepared to pay any amount that was fair and reasonable for the construction and maintenance of harbours of refuge?—Yes; decidedly so.

4051. Do I understand you also to say that shipowners, as a body, would gladly pay any fair and reasonable amount for the construction of harbours of refuge, having in view the benefit which they would derive in the diminution of the premiums on maritime insurance?—Yes; that is my opinion. If the expenditure were judiciously managed, and applied to its proper purpose, I think that no shipowner would grudge paying his share at all.

4052. (*Mr. Coode.*) Do I rightly understand you, that in the wreck of the *Annie Jane* 340 lives were lost?—Yes; I believe that was the number.

4053. I think you also said, that in a ship of your own, which was lost in the same locality, there was a loss of life. Can you tell me how many people perished?—There were four persons drowned.

4054. Were they the whole crew on board the ship at the time?—No; there were 12 hands on board, and the rest were saved in boats.

4055. (*Mr. Lindsay.*) I think that you stated just now that you are of opinion that generally speaking shipowners would not object to the payment of tolls for the construction and maintenance of harbours of refuge in consideration of the advantages which they would derive from the decrease which would take place in the rate of insurance. May I ask you if you have talked with many shipowners upon the subject?—Yes; I may say that I have.

4056. And may I ask if those shipowners with whom you have conversed have expressed any objection to the payment of a portion of the expense necessary for the construction of harbours of refuge in the form of a passing toll?—Well, of course there are differences of opinion on the subject; but, speaking generally, I think that the shipowners are agreeable to being taxed for that purpose if they receive any guarantee that the money will be judiciously and properly expended.

4057. Do you not think that the nation would gain largely by the construction of harbours of refuge?—I think that the construction of such harbours would be a great gain to shipowners, to underwriters, and, in fact, to the whole commerce of the country generally.

4058. Do you think that they would be the means

of saving life to any considerable extent?—Yes; I think that they would.

4059. I think I gather from you that you consider that the owners of ships ought to contribute a fair proportion towards the construction and maintenance of harbours of refuge?—No; I consider that the sum might most legitimately be raised as a national tax; but at the same time I think, that rather than go without the advantage to be derived from the construction of harbours of refuge, the owners of ships would, generally speaking, not at all object to paying their fair share of the expense.

4060. Then, if I understand you correctly, you think that such harbours ought to be constructed by the nation, but, rather than forego the advantages to be derived from them, you, as a shipowner, would be willing to contribute a fair proportion towards their construction?—Yes; I would not object to contributing a fair proportion.

4061. Have you yourself underwritten ships passing through the Pentland Firth at any time?—Yes; I have done so.

4062. Have you ever charged double premium upon the insurance upon ships passing through that firth?—Yes; I have done so upon ships passing through in the winter.

4063. Do I understand you to say, that in cases where the premium would be 20*s.*, you in winter time would charge 40*s.* upon vessels passing through the Pentland Firth?—Decidedly so.

4064. Would you decline taking the risk at a less premium?—Yes, I should.

4065. May I ask you if in winter time you would charge an extra rate of premium upon ships going north of the Orkney Islands?—Yes; I should do so in winter.

4066. Would the premium upon ships going north of the Orkney Islands be as heavy as it would upon ships going through the Pentland Firth in winter?—Well, I think that it would.

4067. Now, will you let me clearly understand, is that increased rate of premium caused by the dangers of the navigation of the Pentland Firth in winter, or from the general danger of navigating in northern latitudes during the winter months?—Well, the winter season is very bad for the navigation of the Pentland Firth, and it becomes dangerous.

4068. Let me clearly understand you. If a vessel were offered to you, and the owner told you that she would not go through the Pentland Firth, or north of the Orkney Islands, would you be disposed to make any difference in the rate of insurance?—Yes; I think that a less premium would be demanded. A ship coming from America to the east coast of Scotland, either through the Pentland Firth or by the Orkney Islands, would be charged a higher premium than one merely going to Glasgow.

Mr. George Smith examined.

4069. (*Chairman.*) What is your name?—George Smith.

4070. What is your occupation?—I am a shipowner and ship agent.

4071. How long have you been connected with the shipping interest?—About 18 years.

4072. In what trade have the ships in which you have been interested been chiefly employed?—Almost exclusively in the trade with the East Indies.

4073. Are your ships, generally speaking, of considerable size?—Yes; they are about the largest sized ships that sail from the Clyde.

4074. Have you formed any opinion as to the advantage or otherwise of the construction of harbours of refuge on the west coast of Scotland, and if so, will you state it to the Commissioners?—I have not given the subject much consideration; but my own impression is, that upon that part of the coast they would be of little or no use; indeed, I do not know of any place where a harbour of refuge would be desirable all along the west coast of Scotland.

4075. Have you any opinion to offer as to the necessity or otherwise of the construction of harbours of refuge on the north coast of Ireland?—Yes; I may say that I have seen a petition praying for the construction of a harbour of refuge at the Skerries, which I was asked to sign; but I refused to do so, as I considered it would be an unnecessary waste of public money.

4076. Do you know Loughindall?—Not very well. I know the position of it, and have been in that quarter, but I have only seen the place itself from a distance.

4077. Are you acquainted with the north-east coast of Scotland?—Yes; I may say that I am.

4078. Have you any opinion to offer as to the advantage of the construction of a harbour of refuge upon that coast, either as regards the passing trade, or as to contributing to the safety of persons engaged in the fishing trade there?—Yes; I think a harbour of refuge is very necessary upon that coast, and that it is much wanted by the boats engaged in the fisheries. I think that if such a harbour could be constructed at a moderate expense in the neighbourhood of Wick it would be very desirable.

4079. You, as a large shipowner, have a large stake in the question. Would you be disposed to object to any expenditure of the national funds for that purpose?—Not if the money were judiciously expended; but care would have to be taken that particular places were not selected for jobs or party purposes. I cannot think that any harbour of refuge can be necessary at Portrush.

4080. May I ask what instructions you give to your captains with reference to making use of harbours?—As far as we are concerned, our instructions to our masters are not to make for any harbour of refuge, but to keep out to sea, and continue on their voyage, if they can possibly do so.

4081. Although such instructions might be applicable to large and well-found ships, do you think that they would be applicable to a smaller class of ships not so well found?—My impression is, that they would be generally applicable to all ships. As a general rule, masters of coasting ships are acquainted with every hole and corner on the coast, and it is very rarely that we hear of a coasting vessel being lost. The want of education on the part of the masters of those ships has been spoken about, and attempts have been made to get them under the same control as masters of foreign going vessels, but if we look to the facts of the case, it is clear that those vessels must be most admirably managed when we consider the great number of them and the very few losses that occur.

4082. Supposing that the Government came to a determination of expending a considerable sum of money in the construction of a harbour of refuge, with a view of saving life and property on the north-east coast of Scotland, both as regards vessels engaged in the coasting trade and vessels engaged in the foreign trade, where do you consider would be the best locality?—I think that the number of persons engaged in the coasting trade on that part of the coast must be much greater than those engaged in the foreign trade, and I think that Wick would be a very good place for the construction of such a harbour; there are at times as many as 1,400 boats engaged in the fisheries, having on an average each 5 or 6 men on board.

4083. (*Sir F. Smith.*) I think I understood you to say that the captains and masters of vessels engaged in the coasting trade are so well acquainted with all the natural harbours and places to which they can run, that in consequence the loss of life and property is very limited, is that so?—Yes, in the particular district to which I referred.

4084. Do you mean the west coast of Scotland?—

GLASGOW.

Mr. George Smith.

7 Sept. 1858.

Sir F. Smith.

Yes, that is the only district of which I speak of my own knowledge.

4085. (*Mr. Lindsay.*) Will you state to the Commissioners what is your general opinion upon the subject of the construction of harbours of refuge, not confining your opinion to those particular points to which your attention has been more particularly called, but taking into consideration also the Bristol Channel, the north-east coast of England, the east coast of Scotland, what do you think as to the expediency of constructing such harbours as a means of saving life and property ?—I must say that I question very much whether any advantage would have arisen in the cases which have been referred to by Mr. Mitchell, if any harbours of refuge had existed on the east coast of Scotland. In the case of the *Annie Jane*, I do not think that the existence of a harbour of refuge would have been the means of saving life, because persons acquainted with the navigation of the Pentland Firth could have run either to the north or to the south and have found shelter. In the Orkney Islands there are numerous natural channels which a vessel could run into if the approaches to them were properly lighted, and, generally speaking, I cannot say that it is my opinion, that, speaking generally, any great advantage could arise from the construction of such harbours.

4086. But allow me to ask you if it should appear in the course of the present enquiry that harbours of refuge, well constructed and well planned, would be the means of saving life and property to a considerable extent, would you, as a large shipowner, object to being taxed for the construction and maintenance of such harbours, or is it your opinion that the nation should bear the whole of the expense so incurred ?—If it were found to be necessary or desirable for the preservation of life and property that such harbours should be constructed, I think the fairest way of meeting the expense would be to cast a moiety on the consolidated fund, and the remaining moiety upon the shipping interest.

4087. Is it your opinion that that moiety should be levied in the form of passing tolls, or do you think that the expense should be borne by those ships which used the harbour ?—I think that a passing toll would be the best means of levying the amount, for if it were thrown upon those ships alone which use the harbours, it will fall very heavily on them.

4088. It has been stated to us, in the course of the inquiry, that it is a common practice for ships to leave port with their crews in a state of drunkenness, and that consequently the lives of those on board are placed in great jeopardy ; can you speak as to that point of your own personal knowledge ?—I am sorry to say that it is a common practice for crews to go on board in a beastly state of drunkenness.

4089. Do you think that in that respect things have become worse since the establishment of the shipping offices ?—I do not think that they have made things worse, but I am satisfied that they have caused no improvement.

4090. Do you think that the evil prevails to a greater extent than it did many years ago ?—I have not noticed any material alteration myself.

4091. Do you think that any alteration in the machinery of the shipping offices could be made which would tend to the improvement of the existing state of things ?—The only thing I can suggest would be to make the men more dependent upon character ; it is desirable always that shipowners should have some hold upon the crews, and it was a great mistake ever to do away with the system of registration; that system might have been much improved, but by abolishing it seamen are able to take any number of aliases, and the constant practice is for men to engage themselves under fictitious names. An improvement of that system might easily have been effected, which would have tended to make seamen depend upon the possession of a good character, and that would have been of great advantage; the great defect of that system as established was, that it afforded too great facilities for obtaining tickets of registration.

4092. Have you ever found that after you have engaged seamen they have declined going on board their ships ?—Very often indeed.

4093. But have you no remedy in such cases ?—No real remedy. By the law as it at present stands we are enabled to stop the day's pay for every day a seaman remains on shore after the end of his leave, but no master would ever entertain the idea of stopping a sailor's pay, it is a thing they would not like to do, and even if they were to do it it would be no return to us for the injury which we sustain, frequently being compelled to keep 30 men waiting at the tail of the bank until the whole crew have gone on board.

4094. What facility have you for compelling men to go on board after they have signed articles ?—If you can get your hands on the sea you can compel the owner of the shipping office to put them on board.

4095. Has the shipping master power to compel the officers of the shipping office to put them on board ?—I am not aware if he has ; I cannot answer the question, nor do I know if their officers can punish the men for not joining their ships after engaging themselves.

4096. (*Capt. Washington.*) Are you yourself a sailor ?—No ; I am not.

4097. I ask the question in reference to the opinion which you expressed that there was no great difficulty in the navigation of the Pentland Firth ?—I am no sailor, but I have been through that firth.

4098. Are you an underwriter ?—I was one some years ago.

4099. But you are not at present ?—No.

4100. Did you ever underwrite vessels passing through the Pentland Firth ?—No ; I do not remember that I ever did so.

Captain KELSO re-examined.

Captain Kelso.

4101. (*Capt. Washington.*) Did I understand you to say that in your opinion Wick or Sinclair's Bay would be a better site for the erection of a harbour of refuge than Peterhead ?—Yes ; that is my opinion.

4102. And I think that the reason you assigned for that opinion was the large number of vessels engaged in various trades in the neighbourhood of the Pentland Firth ?—Yes, that is so.

4103. What is your opinion with regard to the construction of harbours of refuge on the Irish coast ?—I do not think that they are much wanted there.

4104. Do you think that, as regards St. George's Channel any harbour of refuge would be desirable ?—I think that such a harbour constructed in Mount's Bay would be of considerable advantage.

4105. That would be as regards ships running up channel ?—Yes, and outward bound ships.

4106. Coming back to the north, is there any place where you think that a harbour of refuge would be beneficial ?—I do not see any locality better adapted for the construction of such a harbour than the Isle of Man.

4107. And in the Isle of Man which locality would you prefer ?—I should consider Langness Point a very good place.

4108. Do the tides run strong at Langness Point ?—From three to four knots an hour.

4109. Now, does the tide run nearly as strong as that in Douglas Bay ?—No, there is scarcely any tide at all there.

4110. But is that not in favour of selecting Douglas Bay for the construction of a harbour of refuge?—Yes, that circumstance perhaps might.

4111. Are you acquainted with the harbour at Carlingford ?—Yes.

4112. Do you think that it would be desirable to to deepen and widen the approach to the present harbour ?—Yes, I think that it would.

4113. Going south, do you think that it would be desirable also to improve the harbour of Waterford?—Yes, I think that it would be, but sailors are afraid of getting among the rocks on that coast.

4114. Do you know Carnsore Point?—Yes.

4115. Do you think that a harbour of refuge there would be of any advantage to shipping?—I do not think that one is wanted there at all.

4116. Now suppose the bar of the channel at Waterford were deepened 20 feet at low water, would that be of any benefit to shipping in your opinion?—(No answer.)

4117. Is there any difficulty in taking Queenstown?—It is very well buoyed.

4118. Are you acquainted with the north coast of Ireland?—Yes; I have traded between Liverpool and Sligo and Westport.

4119. For how many years?—About six or seven years.

4120. Would any advantage be derived from the erection of a harbour of refuge in that locality?—Yes, I think it would be desirable to construct one somewhere about Galway, on the west coast.

4121. Do you think that another is wanted upon the north coast, near Lough Swilly or Lough Foyle?—No; I do not think that a harbour of refuge is so much wanted on that coast as on the Highland side to which ships might run in a westerly or south-westerly gale of wind.

4122. Have you ever been at anchor in Loughindall?—Yes, frequently in south-west gales.

4123. Could you get in there in a north-west gale?—Not unless you are to the westward of it.

4124. Is the holding ground there good?—Yes, there is very good holding ground; but the sea is very heavy there, and the water shallow.

4125. Do you think that a breakwater run out from Langness Head would be of advantage?—I think a breakwater from Saltpans half across the bay would be of great advantage.

4126. Would there be sufficient depth of water?—Two cables from Bowmore there are, just opposite the place, two fathoms, and the depth coming in is from 9 to 2 fathoms.

4127. Would you rather see a harbour there than at Portrush Skerries?—Yes, for the safety of large heavy ships.

4128. Does the tide run very strong at Langness Point?—Yes, about eight knots an hour.

4129. Do you know Church Bay, Rathlin; and if so, do you think that there would be any advantage in constructing a harbour there?—A very good harbour could be constructed at the north-east point of the bay, and would be useful to ships passing through the north or south channel; but a place of refuge is not so much required there as in the south channel during south-west wind.

4130. (*Capt. Vetch.*) In going to America, along the north coast of Ireland, do you take the course from the Mull of Cantyre, keeping outside the light-house at Innistrahul?—Vessels give the lighthouse a wide berth.

4131. Do you know if any vessels take refuge in Lough Swilly or Lough Foyle?—Very likely some do.

4132. Would a harbour of refuge in that locality be useful in any way?—In a north-west gale it might be useful for a great number of steamers and coasting vessels, but I consider that a harbour on the Highland side would be more beneficial.

4133. (*Mr. Coode.*) Supposing that equal accommodation could be provided at Waterford as at Wexford, and at the same expense, which place would you prefer?—I should certainly prefer Waterford.

4134. Will you state your reasons for preferring Waterford?—Because there is easy access to it, and there are no banks in the way, and you have the slack as a guide, however dark it may be; whereas, about Wexford there are a great many banks in the way.

4135. (*Mr. Lindsay.*) Have you ever been on the north-east coast of Scotland?—Yes.

4136. Have you formed any idea as to the necessity of the construction of a harbour of refuge between the Firth of Forth and the Pentland Firth?—I do not see any place where a harbour would be more useful than at Wick or Sinclair's Bay.

4137. Do you think that a harbour of refuge constructed at either of those localities would prove of benefit to all descriptions of vessels, or merely to those which are engaged in the coasting trade and in fisheries on that coast?—I think that it would be of advantage to all classes of ships. There is a great concourse of vessels about the Pentland Firth. Large ships to North America, as well as vessels going to the North Sea and the Baltic, and those engaged in the coasting trade and in the fisheries, meet in great numbers near the Pentland Firth.

4138. Is it your opinion that more vessels pass in the neighbourhood of Wick than of Peterhead?—Yes, I think so.

4139. Are you taking into consideration vessels from the north of England trading to the Baltic?—Yes, there are a great many of those vessels.

4140. Then am I to understand that, in your opinion, Wick is the most desirable locality on that coast for the construction of a harbour of refuge?—Yes, I should think either Wick or Sinclair's Bay the most desirable localities for that purpose.

4141. (*Capt. Vetch.*) Do you think a harbour at Sinclair's Bay would be as approachable as one in any other locality?—Yes, I do; and perhaps more so.

Captain JOHNSTONE, Harbour-master of Glasgow, examined.

4142. (*Chairman.*) What is your name?—J. Johnstone.

4143. What is your occupation?—I am harbour-master of Glasgow.

4144. Previous to obtaining that situation, what occupation did you follow?—I was a seafaring man.

4145. Did you ever command a vessel?—Yes, for about 13 or 14 years.

4146. In what trade was the vessel which you commanded chiefly engaged?—In the foreign and coasting trade.

4147. From Glasgow to anywhere else?—Yes. from Glasgow to Liverpool.

4148. Have you formed any opinion as to the advantage or otherwise of the construction of a harbour of refuge anywhere in the Isle of Man?—Yes; when I have been sailing in the neighbourhood I have often thought that such a harbour in Ramsay Bay would be of great advantage.

4149. Will you state the reasons which led you to think so?—I found many times ships waiting to get out, and it is very hard to get out in an east or south-east wind.

4150. Do you consider Ramsay Bay a better site than Douglas?—Yes, I think that it is better adapted for the purpose.

4151. Will you state your reasons for thinking so?—I think that Douglas Bay is too small. There is much more accommodation at Ramsay Bay than at Douglas.

4152. Have you formed any opinion as to what particular class of vessels would derive most advantage from a harbour in the Isle of Man?—I think that a harbour of refuge there would be very advantageous to all vessels, both those engaged in the foreign and those engaged in the coasting trade.

4153. (*Mr. Lindsay.*) Were you ever on the north-east coast of Ireland?—No, I never was there.

4154. Have you formed any idea as to the necessity or otherwise of a harbour of refuge in that

GLASGOW.

Captain Johnstone.

7 Sept. 1858.

Mr. Lindsay.

locality?—No; I have not turned the matter over in my mind.

4155. You have been in communication with a large number of masters of vessels, can you tell us whether you have heard any of them state any opinion as to its being desirable to have a harbour of refuge there?—I have frequently heard it said that such a harbour would be of advantage there.

4156. Have you ever heard anything about the anchorage at Loughindall? I mean have you ever heard any masters of ships express any opinion upon that subject?—Yes, I have heard masters of ships say that they could not depend on the anchorage there.

4157. But supposing that equally good anchorage can be found there as at Portrush, and that a harbour of refuge equal in point of accommodation could be constructed there, to which would you give the preference; to Loughindall, or to the Skerries at Portrush?—I am not able to express any opinion of my own upon the subject. I can only state what views I have heard expressed, and I have always heard the Skerries preferred to Loughindall.

4158. (*Capt. Washington.*) I think you said you are harbour master of Glasgow?—Yes; that is so.

4159. Then I presume that you are well acquainted with all the points within the jurisdiction of the Clyde trustees?—Yes, I think I am.

4160. Something has been said of natural harbours at the entrance to the Clyde not being properly buoyed, do you know anything of it?—No; I have not heard of any complaint being made.

4161. I believe those harbours are not within the jurisdiction of the trustees, but are at the entrance to the Clyde?—I have never heard of any complaint being made.

4162. Is the mouth of the river, which is within the jurisdiction of the Clyde trustees, properly lighted and buoyed?—I think so; and I do not think any port is better lighted.

Bailie CLANSTON re-examined.

Bailie Clanston.

4163. (*Chairman.*) Have you been in the habit of underwriting ships to any considerable extent?—Yes, to a very considerable extent.

4164. Will you state to the Commissioners whether in your opinion the construction of harbours of refuge would tend in any degree to lessen the rate of premium upon maritime insurances?—I am not inclined to think that it would. At the present moment the rates of premium are screwed down so low that there is very little margin left for diminution.

4165. Are you in the habit of charging an additional rate of insurance upon ships going through the Pentland Firth?—There is a difference in the rate paid by ships from America to the west coast and the east coast.

4166. May I ask how much?—It sometimes comes to about 20 per cent., and in other cases not to five shillings. Much depends on the amount of the premium. Upon American ships the increase of the premium is very small.

4167. Is there much difference in the rate of insurance charged in winter and summer upon vessels going through the Pentland Firth?—Upon coasting vessels the difference is considerable, but there is not so much difference upon foreign ships.

4168. (*Sir F. Smith.*) Do you mean that there is an increased premium for foreign vessels or for coasting ships?—There is an increase in the case of both; but with regard to foreign-going ships the premium is very much the same throughout the year, but upon coasting vessels the increase for going through the Pentland Firth in winter is at least double?

4169. Are you of opinion that harbours of refuge are more necessary for coasting vessels than for foreign vessels in that locality?—I am.

4170. Is that opinion founded on the fact that the premium on insurance is so high?—I think that coasting vessels always hugging the shore are more exposed to risk.

4171. Do you think that many wrecks result from crews going to sea in a state of intoxication?—I think a great deal of loss arises from that cause.

4172. (*Mr. Lindsay.*) Supposing the case of a ship going to the Baltic from Glasgow, would you charge a lower rate of premium if there were a prohibition to going through the Pentland Firth?—No, I think not.

4173. Would you make any difference between a ship going through the Pentland Firth and one going north of the Orkney Islands?—No; a ship would be allowed to take her own course.

4174. If a vessel were going from Glasgow to Peterhead, would you make any condition that she should not go through the Pentland Firth?—I should generally make a condition that she should go through the Caledonian Canal; and that would make an alteration in the premium.

4175. In taking the risk on a ship bound from Glasgow to Peterhead, would you have a clause inserted in the policy, that if she went through the Pentland Firth there would be an extra premium to be paid?—No, I should not.

4176. Then does the entire rate of premium depend generally upon the danger of navigation in northern latitudes in winter, or upon the danger of the navigation of the Pentland Firth in particular?—Generally there is a great difference upon ships in winter coming to the east or west coast; I should charge 25 per cent. more upon a ship coming from Quebec to Peterhead, than I should upon one coming to Glasgow.

(*Chairman.*) Is there any person present who wishes to tender further evidence with respect to this inquiry?

No answer.

Sittings at Glasgow closed.

PORTRUSH.

Friday, 10th September 1858.

PRESENT:

Admiral HOPE (Chairman).

Mr. LINDSAY.
Captain WASHINGTON.
Captain VETCH.
Mr. COODE.

Mr. EVANS, Secretary.

PORTRUSH.

10 Sept. 1858.

I, Counsellor Tottenham, Dublin, with whom is Mr. Alexander Keenan, Ballycastle, appear in support of a memorial from Ballycastle praying that the claims of that place to be made a harbour of refuge should be taken into consideration. I also ask liberty, as I have been unable from want of time to bring several witnesses before the Court, to cross-examine those produced in support of the harbour of Portrush.

(*Chairman.*) That is not in accordance with our usual course of procedure, and the better plan for you will be to meet the Commissioners at Belfast, at their meeting there on Monday the 13th of September, with any witnesses available.

Mr. Samuel Patton, Harbour-master of Portrush, examined.

Mr. Samuel Patton.

10 Sept. 1858.

4177. (*Chairman.*) What is your name?—Samuel Patton.

4178. What is your occupation?—Harbour-master at Portrush.

4179. Have there been any wrecks within the last few years here?—Eleven.

4180. Do vessels at present take advantage of the Skerries as shelter?—They do.

4181. Is that a return of wrecks you hold in your hand?—It is.

4182. Do you wish to put it in?—I do.

4183. Is it the general opinion of owners and captains of vessels frequenting the port, and passing east and west of it, that there should be a harbour of refuge at Portrush?—It is. I have heard it very generally talked of, and it is my opinion that for all kinds of vessels it would be of very great advantage to have it, and they would take less freight if there were a harbour of refuge at Portrush. During the month of February 1857 there were 14 vessels windbound in Larne Lough bound for Portrush, Londonderry, and Lough Swilly, one of them for five weeks. The captain of that vessel told me, that if there had been a harbour of refuge at the Skerries he could have made his voyage in as many days, because he would have had a place to run for in any gale of wind and with any tide.

4184. In the event of a harbour of refuge being made at the Skerries, which sound in your opinion should be closed?—Decidedly the western sound.

4185. What are your prevailing winds?—West and north-west.

4186. In what direction do the tides run?—North-west; consequently that causes a very heavy sea in the western sound.

4187. State the number of coasting vessels that pass here?—607 vessels, with a register tonnage of 61,451 tons; that only includes the number from 12 different ports.

4188. From what source did you get your information?—From the Customs.

4189. Can you hand in the return from them?—Yes.

4190. State the number of foreign vessels that took the North Channel from Liverpool and Glasgow for 12 months, as far as you can?—866 vessels; the tonnage from Liverpool being 9,681 tons. The tonnage from Glasgow is not given, but that number includes the vessels from Glasgow.

4191. From what source do you obtain your information?—From the Customs and coast guards.

4192. Have you any other returns you wish to put in?—No; but I wish to state that I saw 17 vessels anchored in the Skerries roads at one time.

4193. What do you mean by the last few years?—Fifteen years. From 1843 to 1858.

4194. How long have you been harbour-master?—Three years.

4195. How long have you resided in Portrush?—Twenty-five years.

4196. What was your previous occupation?—In business.

4197. Were you connected with seafaring matters?—I was not.

4198. (*Mr. Lindsay.*) How many of those vessels that were wrecked would have been saved if a harbour of refuge as proposed had been made at Portrush? Can you state?—I can state as to one of them, the *George A. Hopley*; decidedly, she passed here about 4 o'clock P.M., going west; 'twas then blowing very fresh, and after she had passed an hour out of sight she returned again, when there was a gale of wind blowing and a very heavy sea running; she was then opposite Broad Sound Skerries, and there would not have been the slightest difficulty in coming inside the Skerries roads and riding there in safety had the harbour been made; her cargo was valued at 66,000*l.*

4199. Was she in a disabled state?—She was in a disabled state in coming back from the westward; she went ashore shortly afterwards on Bally Agherton Strand, near Port Stewart.

4200. Was it on account of the heavy sea which you say was running?—Clearly and decidedly; she always made leeway until she went ashore.

4201. Did she not drop an anchor?—Not until she was going ashore.

4202. I think I understood you to say that the most dangerous winds are those from west and north-west?—Yes.

4203. Would ships not find safe shelter in Lough Foyle during west and north-west winds?—It is very difficult to enter.

4204. What is the width of the Lough from the mainland to the Tun banks?—I cannot say.

4205. Is there any other among the list of 11 vessels wrecked that would have been saved if there had been a harbour here?—Yes; the second vessel on the list, the *Strangford*, would have been saved.

4206. How was the wind when she was wrecked?—The wind was north-north-west.

4207. Was she lost in running for the harbour?—She went outside the south pier of the harbour just as she was entering it. She was not well found in ground tackle, and was afraid to take the Skerries.

4208. How do you make it out that a harbour of refuge would have saved that ship, if she was wrecked entering the harbour?—If the west sound had been closed up he would not have depended so much on his ground tackle outside the harbour, but would have gone to anchor in the Skerries.

4209. It was on account of the insufficient shelter he would have had in the Skerries that he ran to the harbour?—Yes; that is the testimony of the master himself.

4210. Can you name any others in particular?—I cannot.

4211. But you think those two would have been saved had the harbour been made?—Most undoubtedly. The information I got about the others was from the pilots.

4212. You are not able to speak of them from your own knowledge?—Quite so.

4213. (*Mr. Coode.*) Were there any lives lost?—One of the pilots can tell you.

James Campbell, Pilot, Portrush, examined.

James Campbell.

4214. (*Chairman.*) What is your name?—James Campbell.

4215. What is your occupation?—I was formerly pilot.

4216. How long were you pilot, and what is your experience at Portrush?—I was 55 years licensed pilot, and have been at sea frequently.

4217. Are the Skerries good ground for shelter and anchorage?—Very good holding ground.

4218. Would you consider the Skerries more suitable for a harbour of refuge than Loughindall or Rathlin?—I would.

4219. Suppose the harbour were made at Portrush, which sound do you consider should be closed?—Broad Sound should be kept open, because the sea comes from the north-west.

4220. What is the character of your duties as pilot? Is it simply to bring vessels into the harbour, or are you a pilot all along the coast?—All along the coast, but principally for Coleraine and Portrush; that is what I get my licence for.

4221. You stated that the Skerries afford good ground for anchorage; will you tell me the nature of the holding ground?—When we were riding in a gale, I have lifted clay on the anchor more than once or twice.

4222. Is there any difficulty in purchasing the anchor?—When the anchor has settled down, and has a good hold, it takes a good heave to get it up.

PORTRUSH.

James Campbell.

10 Sept. 1858.

Chairman.

4223. Is the anchorage generally clear of rocks?—There are no rocks in the anchorage at all.

4224. You stated that the Skerries is very much more suitable for a harbour of refuge than Loughindall; will you tell me why?—Loughindall is a very bad place for holding an anchor, as there are 5 or 6 fathoms of grass, which chokes the anchor.

4225. Were you ever in Loughindall?—Several times.

4226. How often?—As many as ten. I knew I was sometimes bound by the west, and had to go round past Loughindall, because I knew the anchorage would be choked.

4227. What is the greatest number of vessels you ever saw in Loughindall?—Sometimes eight or ten, bound west.

4228 Did you ever see a vessel drive at Loughindall?—I did.

4229. How was the wind?—North-west.

4230. Is north-west right into the anchorage?—Right into it.

4231. This vessel, which drove with the wind, went right on shore?—She went ashore.

4232. You state that the west sound should be closed, or rather that the broad sound should be kept open; what are your reasons?—Because the heavy sea that we have comes from the north-west. The sea that breaks outside is not a heavy sea; in the broad sound no heavy sea comes in all over the little islands and western sound, though dangerous winds come.

4233. (*Mr. Lindsay.*) You know the whole of this coast pretty well?—I know it pretty well.

4234. What course do you steer going into Loughindall? What is your course on entering the bay?—East-north-east; after you get to the narrow point of land at the anchorage, south-east. Ships are well protected there, so far as the land shelters them.

4235. Is the shelter at the mouth of the bay?—At Bowmore, and that is where the anchorage is choked.

4236. Is it full of grass?—It is.

4237. What is the holding ground?—I do not know whether it is clay or not.

4238. Do you know Lough Foyle?—I do.

4239. Have you been ever there?—Very often.

4240. Is there any shelter from west and north-west gales?—There is good shelter when you go up about ten miles, but no shelter anywhere below that.

4241. Where is there any shelter in Lough Foyle during westerly gales? how far up?—Nine miles from Quigley's Point; no safety below Culmone.

4242. Is there any difficulty in taking Lough Foyle during west and north-west gales?—It cannot be taken at all during ebb tides.

4243. Is it on account of the strength of the current that ships cannot take it at ebb tides?—Generally it is impossible to take it.

4244. What is its running-out speed?—Eight or nine knots in ebb.

4245. Have you ever known any vessels lost taking Lough Foyle?—I have.

4246. Could you say about how many?—I can't recollect how many.

4247. Mr. Patten gave us a list. Do you remember any of them? First, there is the *Exmouth* from London in 1843. Do you remember her loss? It was a very sad one.—I do not recollect it.

4248. There is another. Do you recollect the loss of the *Reliance* in 1851 at Portballintrae?—I do.

4249. Do you remember, was it blowing strong at the time?—Not very hard.

4250. How was the wind?—About north.

4251. How was she wrecked?—He took Bengore Head for the Bull of Rathlin.

4252. There is another sad loss, the brig *Liverpool* in 1841, near Port Stewart. Do you remember it?—I do.

4253. How was the wind?—North by east.

4254. Do you recollect any other wreck?—Yes; I recollect a schooner called the *Abbey* that drove into the rocks between Portrush and Port Stewart.

4255. Would that vessel have been saved if there had been a harbour of refuge at Portrush?—She would have been saved.

4256. How?—If there had been a harbour of refuge they would have run for it certainly.

4257. (*Capt. Washington.*) You stated you could not take Lough Foyle in a north-westerly gale. What is the reason?—The entrance is west by north. I knew a ship belonging to Derry that was in under Innistrahull Head, and though he was bound for Derry, he had to run away for Lough Larne.

4258. How far is it from Lough Foyle to Lough Larne?—Fifty miles.

4259. And he had to run 50 miles before he could get into a place of safety?—Yes.

4260. In a south-westerly gale?—Yes; and if there had been a harbour of refuge at Portrush he would have went there.

4261. How far is Innistrahull from Portrush?—About nine miles.

4262. In the case of that vessel was she wrecked?—She was not; she went on to Larne.

4263. Do you know of any other vessel that had to run away?—Several; some to the harbour at Portrush, and some to the Skerries.

4264. Even in the present state of the roadstead, do they run here?—They do in a south-westerly gale.

4265. In what wind can you get into Lough Foyle?—North and east by south; but with any westerly wind we cannot get into Lough Foyle.

4266. What are the worst winds on this coast?—North-westerly.

4267. Do north-westerly winds send in the heaviest seas?—Yes.

4268. Do you know of any vessel having been wrecked on the Tuns at the entrance of Lough Foyle?—I did. I once offered to take a ship into Lough Foyle for three pounds, or sixty shillings, and boarded her for that purpose; but the captain said he would see me three times damned first. I then left her, and in three quarters of an hour afterwards she was on the Tuns, and went to pieces. That was a long time ago.

4269. Where was she bound for?—Liverpool.

4270. Those ships that ran away to Larne, why did they not stop at Ballycastle?—That was no place at all.

4271. It is quite open?—It is; some vessels stop a tide there; but it is no place of safety, a child would not take a vessel into Ballycastle Bay.

4272. Were you ever there?—I have "dodged" a tide in it.

4273. Suppose it was made into a harbour of refuge, would it be a suitable spot?—I think they tried that before and lost their money.

4274. Oh! that was a small pier; but suppose a large pier was run out would you consider it as suitable a place for a harbour of refuge as the Skerries?—I would not think it would, there is no breakwater there.

4275. It is nine miles from Church Bay to Rathlin; does the tide run rapidly through Rathlin Sound?—Nine knots an hour.

4276. Is it rough to take a passage in an easterly gale in a flood tide?—They sometimes take that passage when they can't help it.

4277. Do vessels ever take it?—Large vessels go on the outside.

4278. Do vessels take Church Bay?—Yes; and in easterly winds they have shelter there.

4279. Have they good holding ground?—Never saw an anchor coming home.

4280. (*Mr. Coode.*) You say the Skerries roads are clear of rocks?—Never met any stony ground nor rocks.

4281. If on the plan before me I have rocks and stones shown in several parts, would you say it is correct?—Never knew of any, and no man was oftener on the Skerries.

4282. (*Chairman.*) You stated the loss of an American vessel?—Yes.

4283. Would she have been lost if you had taken charge of her?—I am sure she would not.

4284. How was the wind?—The wind was south-south-east.

4285. What was her tonnage?—700 tons.

4286. (*Capt. Washington.*) You say you think that broad sound should be left open?—Yes.

4287. Does a north-westerly gale bring the sea in by the broad sound?—No; the waves all come in by the western sound, and not at the broad sound.

4288. Are there many hold this opinion as well as yourself?—Yes.

4289. How many pilots are at Portrush?—Six.

4290. Where are they licensed for?—Coleraine and Portrush.

4291. Is that all?—Yes.

4292. What draught of water can be got into the Bann?— Nine feet over the bar at high water in spring tide.

4293. Is there a good deal of trade to Coleraine now?—Not so much since they got the harbour extended here; a great many more vessels go to Portrush than to the Bann.

4294. Where do you get your licence from?—The Customs at Coleraine.

4295. (*Chairman.*) Did I understand you to say that with a north-west wind blowing, a vessel could not go into Lough Foyle?—She could not if it was blowing a gale with an ebb tide.

4296. With a north-west wind could she come to the Skerries?—She could.

4297. If it was a flood tide could she get into Lough Foyle?—Yes, if she was able to carry as much sail.

4298. In an ebb tide how far to the northward must the wind be to take a vessel in?—She might fetch in with a north-north-west, but no farther to the westward.

Mr. HUTCHINGS, Second Master, R.N., and Chief Officer of Coast Guard, Portrush, examined.

4299. (*Chairman.*) What is your name?—Hutchings.

4300. What is your occupation?—Second master and chief officer of coast guard.

4301. How long have you been in Portrush?—Four years.

4302. Had you any previous knowledge of this district of coast?—Not any.

4303. Have there been any wrecks on this coast within those few years, and if any state the dates?—There have been three wrecks during the time I have been here.

4304. Have you had any knowledge of these wrecks previous to your coming here?—No.

4305. Is there good holding ground at the Skerries?—Very good.

4306. Do vessels at present take advantage of the Skerries as a place of safety?—There is no other place available.

4307. In your opinion which sound should be closed?—The western.

4308. Can you state the circumstance attending the wrecks which occurred within your knowledge?—I can.

4309. Do so?—The greatest wreck was that of the *George A. Hopley;* the wind was blowing a gale from north-north-west; she came through Rathlin Sound with a fresh breeze from south-east; the wind suddenly shifted to north-north-west, and blew very hard. I first saw her off Ramore Head, about a mile off shore, with a close-reefed topsail and foresail; she was then on the star-board tack, but making a great deal of leeway; about three hours afterwards, about half-past eight in the evening, she was very close to the black rock, near Port Stewart; the tide caught her there, and took her out to sea, but about half-past eleven o'clock P.M. I received notice she was ashore on Ballyagherton strand. I took the captain's deposition, and he said he attempted to wear off the Tun banks, but he got so close on he had to let go his anchors, and was taken right along the strand at Port Stewart until he struck on the beach; she became a total wreck, and lies there now.

4310. You told us of three; will you state the circumstances attending the wrecks of the other two?—The second was the *Strangford,* a small schooner bound for Derry with coals from Troon; she bore up for Portrush Harbour, and had just succeeded in getting in the harbour, but unfortunately her anchor did not hold, and she drove against the south pier; her remains are there now. With regard to the other I can scarcely call it a wreck. I rendered some assistance to her in the Skerries; she did not become a wreck, but was in distress.

4311. Does the wind often shift from south-east to north-west and blow hard?—Never saw it so strong before as I did when the *Hopley* was wrecked.

4312. Had it been blowing hard from south-east for some time?—No; it was in July, and came on very unexpectedly.

4313. Which is the heaviest weather on these coasts? From what direction does the wind come?—From north-north-west to west.

4314. How do these north-west winds commonly commence?—There is generally a heavy swell a few days before, and the glass rises suddenly; they come on occasionally from north-north-west and occasionally from west.

4315. The heaviest north-west gales do not commence at south-west and back round, but commence at west and freshen up into a gale?—Yes.

4316. Describe the nature of the holding ground at the Skerries?—Blue clay covered with from 6 to 8 inches of sand, and is quite clear of rocks.

4317. Have vessels any difficulty in purchasing their anchors?—It requires a very strong heave, in my experience, to lift an anchor.

4318. Did you ever know an instance of a vessel driving from her anchors?—Never heard of one.

4319. Did you ever hear of one parting from her anchors?—I have heard of their chains going, but I cannot say of my own knowledge, for it was not in my time.

4320. You stated that the broad sound should be kept open; would you give your reasons?—Because there is not near so much sea in a gale of wind, nor is there so much tide; no vessel would attempt the west sound in a gale of wind.

4321. Why would no vessel attempt the west sound?—On account of the heavy seas and strong tides setting through it.

4322. And therefore you are clearly of opinion, that if a breakwater be made it should be by joining Revigally Point to the small islands?—Decidedly.

4323. Blowing hard from the north-east, is there no sea sets into the anchorage through the broad sound?—No.

4324. (*Mr. Lindsay.*) You say in four years there have been three wrecks on this coast?—Only two; to the third I only rendered some assistance.

4325. One of them was the schooner to which the the harbour-master referred?—Yes.

4326. And the other is the large vessel?— Yes.

4327. Were there any lives lost?—All the lives saved.

4328. If there had been a harbour of refuge at Portrush, would that vessel have been saved?—Certainly; she would not have gone in at Port Stewart.

4329. Whydid not the captain take advantage of the present shelter?—He knew of an anchorage inside the Skerries, but did not know his way into it; he had no large plan of the place, but merely a coasting chart. He told me, had he known his way in he would have gone.

4330. If the vessel had run in would she have been saved?—Certainly.

4331. Would she have been saved equally as well

PORTRUSH.

Mr. Hutchings.

10 Sept. 1858.

Mr. Lindsay.

with the present shelter as if the harbour was made?—I believe so.

4332. Do you know Lough Foyle?—I do not.

4333. Do you know Loughindall?—I do not.

4334. (*Capt. Washington.*) Do you live in sight of the Skerries?—No; I live facing the harbour.

4335. Do you see the Skerries daily?—Yes.

4336. Through which sound do the heaviest seas come in a north-west gale?—Through the western.

4337. Are you quite certain?—I am quite distinct on that point.

4338. You stated there was a strong tide running past the western entrance, I think?—The flood tides run to the north-west, in a north-west direction, through the roadstead; in the offing it is more to the westward; it sets through or across the western sound.

4339. Is it rapid?—Four or five knots.

4340. Are you able to pull against it?—No.

4341. Does it run equally strong through the broad sound?—I have not been in it.

4342. Are you quite sure the heaviest swell sets through the western sound, and not through the broad sound?—Certainly.

ALEXANDER McALLISTER, Chief Boatman, Coast Guard, Portrush, examined.

Alexander McAllister.

4343. (*Chairman.*) What is your name?—Alexander McAllister.

4344. How long have you been in the coast guard?—Twenty-seven years.

4345. How long have you known Portrush and the Skerries Roads?—Eighteen years.

4346. Do you consider a harbour of refuge necessary there?—I do.

4347. Are vessels going north about on the increase?—Five to one from what has passed out and in, even in my time. I have seen as many as six outward and one inward bound vessel pass in one afternoon.

4348. Do vessels at present take shelter in the Skerries?—They do.

4349. Is there good holding ground at the Skerries?—There is.

4350. In your opinion, which sound should be closed?—The western sound.

4351. You say you consider a harbour of refuge necessary at the Skerries; tell me why?—From the number of vessels that take shelter there; and because that, on two occasions, wrecks occurred that would not have happened if a harbour had been there, because they would have taken shelter and been saved.

4352. To what description of vessels would this harbour be of most use?—To the larger engaged in the foreign trade and the smaller vessels engaged in the coasting; it would be of use to both. I recollect three different vessels standing off for days, not able to make their own port; and if we had had a refuge harbour at the Skerries, these vessels could have taken shelter there. One of them was bound for Derry, wind west-south-west.

4353. In what direction does the wind blow hardest?—From west-north-west to north-west, and the north-west never dies in debt if it blows from south-east; it very often chops round to the north-west, particularly in squally weather.

4354. What time of the year have you the worst weather, generally speaking?—I would say that we have very coarse weather during eight months of the year, from September to the month of April.

4355. What is the largest number of vessels that you ever saw at once in the Skerries?—I have seen a considerable number of vessels there. I never counted them, but I would say I have seen so many as ten.

4356. Had all these a pretty good shelter?—They had a favourable shelter, but not to be considered a safe shelter. It is necessity that makes them avail themselves of it. I knew of one instance of a vessel from Wick, commanded by a young man of the name of Hamilton, from this port, that was forced to run for the Skerries. She got round by the east end during one of the worst gales I have seen, and rode it out there in safety.

4357. How was the wind?—The wind was northward.

4358. Does it often blow hard from the north?—Not so often as from north-west. The north-west is a particularly heavy wind.

4359. Have you heavy winds from north-east?—The winds from north-east do not rise so heavy a sea as those from north or north-north-west.

4360. (*Mr. Lindsay.*) How long is it since you knew you were to be here as a witness?—A few days ago.

4361. Did you see the list of questions?—I have not seen anything before to-day.

4362. Were you aware that this question, "Do you consider that a harbour of refuge is necessary at Portrush," would be asked you?—It was commonly understood that that would be one of the questions asked; and my opinion is that it is necessary.

4363. So you are aware, I suppose, that the principal object of a harbour of refuge is to save life and property?—These are the first two objects.

4364. Say that, had a harbour of refuge been made here 18 years ago, can you tell the Commissioners what amount of life and property would have been saved by that harbour; for you have had some days to consider the matter?—I did not think I would have been called on to answer that question.

4365. You knew you would be asked the question, "If a harbour of refuge was necessary at Portrush," and you might have known that you would be asked on what grounds you came to that conclusion?—There have been several cases of shipwreck; and if those vessels that were wrecked had been able to avail themselves of a harbour of refuge here, there would have been a great deal of life and property saved, as, for instance, in the case of the *Exmouth*.

We had this explained before by another witness.

4366. Do you know of no other vessel?—Since I came here I know of none.

4367. Do you know of no life or property that would have been saved by a harbour of refuge during the 18 years you have been on this station?—The *Charlotte* was wrecked west side of Rathlin Island, bound to Portrush, wind north-west. If a harbour of refuge had been formed here she would have availed herself of it, and been saved. It blew strong in for part of that day, and there was a heavy sea running. The pilots were not able to board her from the harbour; the consequence was she became embayed, and was wrecked off the present harbour.

4368. Do you recollect the wreck of the *Baron Haynau*?—I do.

4369. How was the wind?—The wind was not blowing a gale.

4370. Do you recollect the wreck of the *George A. Hopley*?—Yes. She could have availed herself of the anchorage at the Skerries, and if she had, she would have been saved with the anchorage as it is; but with a harbour, as proposed, she would evidently have been saved.

4371. Do you know of any lives that would have been saved during 18 years?—There were no lives lost on this part of the coast.

4372. Do you know Lough Foyle?—I never was round that quarter.

4373. Do you think that many vessels taking the north-about passage from Liverpool would avail themselves of shelter at the Skerries during strong north-west winds, when they could not make their port westward?—Undoubtedly, for I see a great number of vessels standing off and on when the wind is blowing north-west.

4374. Have you had any conversation with masters of ships taking this channel in the coasting trade?—Yes.

4375. Do they think a harbour of refuge necessary here?—They do.

4376. Is there a greater number of vessels passing in and out Channel from Liverpool and Glasgow now from what there used to be?—Five to one.

4377. (*Capt. Washington.*) Are you often afloat on the roadstead of the Skerries?—Sometimes.

4378. Once a day?—Of course not.

4379. Once a week?—I would not be so often.

4380. Once a month?—I would say I am more than that.

4381. Is it part of your duties to board vessels that arrive in the roadstead?—Not unless there are any suspicions attached to them.

4382. Do not the coast guard keep a list of vessels that arrive?—They do when they board them.

4383. You do not board every vessel that arrives in the roadstead?—Not unless they are suspicious.

4384. Have you ever pulled out through the west sound against the tide?—It is very heavy pulling with a four-oared boat.

4385. Did you ever pull out of the broad sound?—Very frequently; there is not half the tide running in at broad sound that runs in at the west sound, nor half the sea.

4386. Do you live in sight of the roadstead?—I do; and have lived there for 18 years, and it is my opinion in north-west gales a greater amount of sea comes in at the western than at the broad sound.

4387. Does the sea ever break in the inside of broad sound?—Never saw it break there, but it breaks over the small rocks.

4388. In an eastern gale is there much sea in the roadstead?—Not a very heavy sea, a vessel could ride in the Skerries in an eastern gale.

Mr. W. C. Gage, Newtownlimavady, examined.

4389. (*Chairman.*) Where is your residence?—Newtownlimavady, in the county Derry, halfway between Londonderry and Coleraine.

4390. Did you ever live here?—I did, between the years 1830 and 1836.

4391. Did you ever know of vessels going north about being detained by contrary winds?—On several occasions.

4392. Are you tolerably well acquainted with this district of the coast?—I was born here.

4393. Have you been much at sea?—No; I have been mostly engaged in mercantile pursuits, and served in Gibbs, Bright, & Co.'s office in Liverpool.

4394. Were you employed in any other way?—I was 4½ years a banker, and am now a land agent.

4395. You have no special connexion with the shipping interest?—None.

4396. Have you formed an opinion as to the necessity of a harbour of refuge at the Skerries?—It would be of the greatest advantage, looking on it as a passenger port for the north of Ireland.

4397. Do you feel yourself competent to offer an opinion with special reference to the importance of the Skerries as a harbour of refuge?—The north-about passage is more in vogue now than it was when I was in Liverpool, and it would therefore be of great advantage to have a harbour of refuge here; thus I have known a vessel, after beating about the channel, put into Cork Bay, whereas a vessel that was commanded by a master who knew the channel north-about had reached an American port as soon as the other had dropped her anchor in Cork. When Captain Davenport, master of the *Robert Napier* steamer, commanded a ship sailing from Liverpool, he told me that he always preferred a north-about channel, and that the same thing occurred to him once, that he had been to his port in America before another vessel going south-about was out of the chops of the channel.

4398. (*Mr. Lindsay.*) How do you think that the formation of a harbour of refuge at Skerries would be a convenience to the passenger trade from the north of Ireland?—Because the emigrant ships now leaving Derry and Belfast would leave this harbour.

4399. Why would emigrant ships prefer leaving this harbour to Londonderry or Belfast?—It is easy of access, railways leading here from both those places; and by leaving this harbour you would get to sea at once.

4400. Are there not railways leading to Londonderry as well?—There are, but they end at Portrush.

4401. Why should you desire that they would embark from this port?—Because vessels from Londonderry or Belfast come within eight miles of Portrush before they can lie out to go to America.

4402. They would be nearer to their destination going out from Lough Foyle than if they left from this, would they not?—I suppose they would by about four miles.

George Scott, Pilot, Portrush, examined.

4403. (*Chairman.*) What is your name?—George Scott.

4404. What is your occupation?—Licensed pilot, Portrush.

4405. How long have you been pilot?—Thirty-eight years.

4406. Are you well acquainted with the coast?—Tolerably well.

4407. How far does your licence extend?—My licence confines me to Portrush and Coleraine.

4408. But you have a good knowledge of other portions of the coast?—I have been to other places.

4409. Suppose the harbour were made here, which sound would you leave open?—I would close the western sound.

4410. Have there been any wrecks on this part of the coast of late years?—There have been no wrecks but what have been enumerated, except the *Fair Trader* that was wrecked at west side of bar, and the wreck of another small vessel that came ashore on Bangore Head, and no account could be given of her.

4411. Is it the opinion of captains and sailors that there should be a harbour here, and is it your opinion also?—It is.

4412. Would you state your reasons?—The first reason is, that a good many vessels bound to west of Ireland can't get a harbour of refuge here, and are obliged to bear up for the first harbour they can catch, say Belfast, Lough Londonderry, or Strangford, Lough Ryan, Lamlash, and Clyde on the larboard side. I have known vessels run to all of these places for want of a harbour of refuge.

4413. What are your heaviest gales?—I have seen heavy gales from the north-west and west, but the heaviest sea is from north-west.

4414. From what direction do your heaviest winds blow?—Many south-west gales are heavy, but there are heavy gales from other points. West winds are the principal ones on this part of the coast.

4415. Have you ever known it to blow hard from south-east, and then to chop suddenly round to north-west, and blow a heavy gale of wind?—I have often seen it blow strongly from south-west, and chop suddenly round to north-west.

4416. For what description of vessels do you consider this harbour would be most useful, for coasting or foreign trading vessels?—It would be useful for all kinds. I have seen foreign vessels of a large description taking shelter in the Skerries, and have seen small ones also, and I have seen several coasters and foreign vessels running by.

4417. Are you acquainted with Lough Foyle?—I have been in it.

PORTRUSH.

George Scott.

10 Sept. 1853.

Chairman.

4418. Have you a good knowledge of it ?—I would not say I have a perfectly competent knowledge of it.

4419. Would you engage to take a vessel into it ?—I would.

4420. With the wind how far to the west would you take a vessel into Lough Foyle ?—With a flood tide and the wind at north-north-west; she might go in with an ebb tide, but I would not like to take her in.

4421. (*Mr. Lindsay.*) What position were those ships in, which you say ran for Lamlash ?—Some under Innishowen Head, some between Bengore Head and Innishowen, and some between Bengore Head and Innistrahull, bearing up.

4422. You say you have been 38 years a pilot ?—Yes.

4423. Do you know of any instances where life would have been saved if there had been a harbour such as proposed at Portrush ?—I am convinced the crew and passengers of the *Exmouth* would have availed themselves of it. He was within 1½ miles of Portrush under close-reefed topsail, and was wearing the ship; he was then on the north tack and went away westward. He then wore the ship and put the main topsail abaft for a few minutes; he lay in that position for some time, and I imagined he was wanting to run into the harbour, but she was lost. If there was a harbour of refuge, all vessels would know and take advantage of it in distress.

4424. If she had come into the roadstead would she have been saved, as you say there is good holding ground ?—I think she would have been saved, had her captain known the Skerries as well as I do.

4425. Then it is your opinion that she would have been saved with the Skerries as they are ?—It is because I have seen vessels come to anchor in all parts of the roadstead.

4426. (*Capt. Washington.*) What holding ground is there in the Skerries ?—Clay, with sand on the top.

4427. You have been in a vessel anchored there that brought up clay on her anchor ?—I have; but it requires a tolerably heavy anchor, with a breeze to sink it.

4428. Are you a pilot for Lough Foyle ?—I am not; but I went in there with a vessel.

4429. Did you ever take a vessel into Loughindall? —Never.

4430. Were you ever in Ballycastle Bay ?—I have gone into the bay to dodge the tide.

4431. How was the wind ?—It is a good place for dodging a tide if the wind is south or south-east.

4432. Did you ever come to anchor in it ?—I would not come to an anchor in Ballycastle Bay, but I have seen other vessels at anchor there.

4433. Have you had occasion to run through the channel to find a refuge ?—Once.

4434. Where did you run for ?—I went to Belfast Lough.

4435. What distance is that from Portrush ?—It is about 50 miles.

4436. If there had been a harbour of refuge at Lough Foyle, could you have brought that vessel in ? —I could not, for I was bound to Derry to get quarantine ground, and the wind was north-north-west.

4437. If the Skerries were made into a harbour of refuge, would many vessels take shelter there ?—I am sure there would; for I once saw a large Prussian ship coming in for shelter here.

4438. Do you think it would be worth asking the government for 100,000*l.* to make the Skerries into a harbour of refuge ?—If one vessel was saved, and the lives of the crew, it would be worth three times that amount; for I think one human life worth the wealth of England.

4439. (*Mr. Coode.*) Is the holding ground good next the west side ?—It is hard ground next the breakwater, and under the lee of it the bottom is gravelly.

4440. Did you ever see a vessel dragging her anchors ?— Never; but saw some parting their cables.

4441. How would you anchor a vessel in the Skerries ?—I would drop her anchor at south-east, and her moorings to the breakwater, so that she would be moored stem and stern.

4442. Is there any sea in the harbour with the wind north-east ?—A skiff could pull across the Skerries, and be completely safe.

4443. With the wind round to the east ?—Merely a jebble, nothing to hurt a ship; saw them riding out a heavy wind without injury.

4444. Did you ever see a vessel part her anchors with the wind at east ?—One.

ALEXANDER CLARKE, Pilot, Portrush, examined.

Alexander Clarke.

4445. (*Chairman.*) What is your name ?—Alexander Clarke.

4446. What is your occupation ?—Pilot, at Portrush.

4447. How long have you been pilot ?—Twenty-eight years.

4448. In your opinion, which sound of the Skerries should be closed ?—The western sound.

4449. Do you know of any wrecks that have not already been enumerated ?—Not one.

4450. Is it the opinion of captains and seamen that there should be a harbour of refuge at Portrush ? —I heard them very often speak of the necessity of having one.

4451. Have you ever been in Loughindall, and do you consider it suitable for having such a harbour ?— Never knew of any large ships going there for shelter; the water is shallow.

4452. Is Rathlin good holding ground ?—I have gone past it with gales of wind from east-south-east, and tried Church Bay, and had to run for the Skerries, for an anchor never fetches up there.

4453. What is the nature of the bottom of Church Bay ?—Spotty bottom.

4454. Is there no good holding ground there ?— There is one spot of clean sand, but if you miss that your anchor will not hold.

4455. Is it your opinion that there should be a harbour at the Skerries ?—It would be very useful for ships beating in and out channel. I have known ships beating about for eight or ten days between Rathlin and Innistrahull, without being able to get to the westward.

4456. What is the objection to Loughindall as an anchorage ?—It is not a place heavy ships run for; small ships going for the west of Ireland do go there. Large ships go into Lamlash, but never enter into Loughindall.

4457. What is the reason ?—It is bad holding ground, and the water shoals.

4458. (*Mr. Lindsay.*) What is the depth of water at Bowmore ?—Three or four fathoms.

4459. Would you have any hesitation in running for Lough Foyle during a westerly gale ?—I could not get in with that wind.

4460. Could you get in with a north-west gale ? —It would take a good working ship to go in.

4461. Have you known many vessels lost taking Lough Foyle ?—Not many; I cannot say.

4462. During your own experience as a pilot, has any vessel been lost on the Tun banks ?—I recollect one vessel, the *Jenny Campbell.*

4463. Do you remember any other vessel being lost on the Tun banks ?—No, not there; but I knew of a vessel going ashore at Greencastle with a gale of wind.

4464. Do you think many of those vessels which you saw beating off here would take shelter there ?— I do not; but it would save the crews of vessels off shore many a hard night's fatigue, and the vessels

much wear and tear, if a harbour of refuge was made at Portrush.

4465. Do you think it would offer great facilities to commerce if there was a harbour of refuge here?—I do.

4466. (*Capt. Washington.*) Did you say that ships bound to Derry go to Lamlash because they could not get into Lough Foyle?—I did; and I knew ships belonging to Derry come to Skerries, and I knew of one ship having to leave her anchorage in Lough Foyle, and was obliged to run into this harbour, and some gentlemen here know that same vessel to have been the brig *Fly*. There are very heavy gales in Lough Foyle, and there is no safety there until you get up to Quigley's Point; below that ships are in no safety in Lough Foyle.

PORTRUSH.

Alexander Clarke.

10 Sept. 1858.

4467. You say that in westerly gales you cannot take Lough Foyle, and that ships at anchor inside are sometimes driven from them?—Just so; it is not a harbour of refuge until you are well up.

Captain THOMPSON, Master Mariner, examined.

4468. (*Chairman.*) What is your name?—Thompson.

4469. What is your occupation?—Master mariner.

4470. How long have you been master?—Since 1843.

4471. In what class of vessels have you chiefly commanded?—My first command was in the East India trade, in ships belonging to the Messrs. Richardson, London; after that, in a steamer, on the east coast of Scotland; then from Liverpool, in the American trade; and from Liverpool to Melbourne.

4472. Are you acquainted with the east coast of Scotland?—I traded in a small steamer of my own to all the small ports there.

4473. Have you formed an opinion as to a site for a harbour of refuge on that coast?—I have not; did not go so far up as Wick, and could form no opinion whether Banff or Peterhead would make the best harbour of refuge.

4474. Do many vessels use the north channel in preference to the south channel?—A great many.

4475. State their reasons for doing so?—The first is, that we can get into open water quicker. Another important reason is, that vessels from the Clyde for America are nearer their destination by that passage; and it is said they charge heavier dues for lights in the south channel than they do in the north. I believe they have repealed that charge, but I am not aware.

4476. What is your experience of the tides in the north channel with regard to large ships?—The tides run very rapidly, and very varied in their directions in the northern parts of the coast. About Islay we find the currents varied, both in their velocity and direction, always setting on the coast of Ireland.

4477. Would a harbour of refuge at the Skerries tend to diminish the number of wrecks on the west coast of Scotland?—I think it would. Vessels would would not then run for the only open refuge at Loughindall, if they had one down here to come to.

4478. To what class of ships would this harbour be of most service, coasting or foreign?—Both class of vessels would equally take advantage of it on account of the facilities it would afford vessels going westward. Instead of running down to the south channel, they would take refuge here. Indeed, I have been taken away myself once or twice.

4479. In endeavouring to make your passage with a well-found ship in hard weather, would you keep the sea as long as possible?—If the refuge was near, and no hope of the weather clearing, I would make for the port of safety, if I could do so without expenses.

4480. Do you think a refuge harbour made here would be useful as a port of call for ships from the Clyde and Liverpool, or vessels coming in by the north channel to wait for orders?—For orders from the Clyde or the east coast of Scotland, this would be a good place to receive them, whether they would come on or go to other places.

4481. (*Mr. Lindsay.*) By taking the north-about passage from the Clyde or Liverpool, would it be shorter than to go south-about?—From Clyde, through the north channel, certainly; but from Liverpool, it would depend on the wind. No man will beat down the English channel in the face of a south-west wind, if he knows the north channel.

Captain Thompson.

4482. Do you think that there being no place of shelter in the north, induces people to take the south channel?—Oh, certainly.

4483. As a master of a ship, of considerable experience, would you have any hesitation in running for Lough Foyle, provided the wind suited?—I cannot say what wind would suit.

4484. Suppose the wind at north-north-west?—It would not tempt me to go up, unless I could get up far enough. I was never in Lough Foyle but once or twice, and I found I would have to run a long way up, and that it would take me a long time to get down again.

4485. Did you pay much attention to Lough Foyle?—I did; and it appeared to me that the Tuns lay very much in the way, and that a ship must get close on the lights before she could shape her course up.

4486. Do you know Loughindall?—I do not.

4487. Suppose you were going out or coming in the north channel, and, looking at the chart, would you be afraid to go in to Loughindall?—I would not be afraid to do anything in safety.

4488. If there was great necessity?—I think I would do it if there was no other place.

4489. Say the anchorage was as good at Loughindall, and the shelter made equally as good as what it would be at the Skerries, which place would you have least hesitation in running for?—The Skerries, on account of the currents. I do not think the currents run strong here.

4490. Do you think a harbour of refuge is so much wanted here that the shipping interest would be content to pay a passing toll for the accommodation afforded to them?—Shippers do not like to pay more than they are doing at present; but it would be very useful.

4491. Do you think that they would get an equivalent for any tax that might be levied, provided the Government would construct and maintain this harbour by a passing toll?—I think they might through time, but not immediately; and I think underwriters would be a little easier on that account.

4492. Do you think that a harbour of refuge here would induce underwriters to lower their premiums for insurance?—If they saw by experience it would be advantageous to them, but not at first. It would induce them to take the risk with greater facility, but it would not lower their premiums at present.

4493. (*Capt. Washington.*) You said you were not in Loughindall?—I did.

4494. And that the tide runs very strong at the Runs of Islay?—Yes, and was very glad to get away once.

4495. How did you obtain your information?—More from the directions than from personal experience.

Captain JOHNSTON, Master Mariner, examined.

4496. (*Chairman.*) What is your name?—William Johnston.

4497. What is your occupation?—Master of a steamer.

4498. How long have you followed the sea?—Thirty-five years.

Captain Johnston.

4499. How long master?—Twenty-six years.

4500. Always in the same trade?—No.

PORTRUSH.

Captain Johnston.

10 Sept. 1858,

Chairman.

4501. How many years in the steam trade as master?—Since 1844.

4502. Previous to that, what size of a vessel did you command?—I have sailed in ships of all kinds, but it was a small ship of 136 tons burthen which I first commanded in the foreign trade.

4503. What experience have you of the north coast?—A good deal of experience.

4504. Do you consider it necessary for the security of vessels and life that there should be a harbour here?—It would be very necessary.

4505. Do you consider the Skerries the most suitable place in the north?—I do not know any place so well suited.

4506. Is the Skerries good anchorage ground?—Yes, and I have sometimes availed myself of them as a place of security.

4507. Would Ballycastle Bay be a suitable place for a harbour of refuge?—I think not.

4508. Would Lough Foyle be a suitable place?—It is not easy to get into Lough Foyle; you must have a leading wind. The tide runs strong. It would take a smart ship to beat in.

4509. Have you known many shipwrecks to take place on the north coast?—A good many, but never kept an account of them. The last I remember was an Austrian ship called the *Ann*.

4510. Would you run for Islay in a gale?—Not if I could help it. With wind at south-west ships could leave the Skerries, but not Lough Foyle.

4511. State your reasons for saying that Ballycastle Bay is not a suitable place for a harbour of refuge?—Bad outlet, and the anchorage is bad unless you make a very small harbour.

4512. Do you know Loughindall well?—Never was in it.

4513. Tell me why you consider the Skerries the most suitable place for a harbour of refuge?—It is the only place you can make between Malin and Fair Heads.

4514. Should you consider that harbour of refuge would be useful as a port of call?—It would I think.

4515. For what ships?—For ships of all classes, but principally for those engaged in the American trade from the Clyde, and for West Indiamen, which come in and go out this way.

4516. (*Mr. Lindsay.*) How long have you been master of a steamer?—Since 1844, running between London, Londonderry, and Liverpool.

4517. Do you know of many vessels lost in attempting Lough Foyle?—Not many.

4518. Do you consider the navigation dangerous?—I do. A ship will not fetch in with the wind anything to west of north-north-west.

4519. Do you think a harbour of refuge at Skerries would save life and property?—I do.

4520. Do you remember any other wrecks than the one you mentioned?—I do not.

4521. Can you see many ships beating to windward here that would have been glad to take shelter in the Skerries?—Yes.

4522. (*Capt. Washington.*) How long have you traded between Derry and Liverpool?—For the last 14 years three times a week along the northern coast.

4523. Have you known an instance of a vessel not being able to get into Lough Foyle?—Yes, and not long ago ships bound in there were obliged to go off. I have known vessels bound for Derry to lie for five weeks in Loughindall after being off the port, and could not get in. If a harbour of refuge had been here they would have availed themselves of it, because there would be no difficulty in getting in.

4524. (*Chairman.*) What number of vessels, from your own knowledge, would you be disposed to say, bound for Derry, had to go to Loughindall?—I know of one. She was off the port, but did not get into Lough Foyle, but drove up as far as the Mull of Cantyre.

4525. What was the size of this vessel?—230 tons.

4526. Did you happen to know where she was from and her cargo?—Miramichi, with timber.

4527. Can you give us any other instance of the same thing having happened?—I could not remember the time, but many vessels were obliged to go over there. I could name the *Merrimack* and the *Superior*, vessels of about 500 or 600 tons burthen, and many others; but I cannot recollect the circumstances.

4528. Did they lie there in safety?—I do not know. I never was there.

4529. (*Capt. Washington.*) What are the heaviest gales on this part of the coast?—From west, west-south-west, to north-north-west, but the heaviest sea comes from north-west.

4530. Is it against these gales that the harbour of refuge is wanted?—Yes.

4531. Could a ship get into Lough Foyle with the wind anything to the west of north-north-west?—Not except she could carry canvass.

4532. When we speak of a gale of wind do you speak of a time when she could carry canvass?—A ship could not get in except under close-reefed topsails.

4533. Are you well acquainted with this part of the coast?—I am.

4534. Are there sufficient lights for the safety of navigation?—I do not think there are. There is one wanted to light into the sound at Rathlin.

4535. Is there not one there?—Yes, but it is for the outward-bound vessels.

4536. Where would you place such a light?—On Bengore Head or Sheep Island.

4537. Are there any more lights wanted?—I do not know that there are.

4538. Is Lough Foyle well lighted?—It is; but there might be one above Magill's Point, at M'Kinney's Bank.

4539. Is the lough well buoyed?—It is, by Beresford of Derry.

Mr. Barry Duncan Gibbons, Chief Engineer of the Board of Works, Dublin, examined.

Mr. B. D. Gibbons.

4540. (*Chairman.*) You are Mr. Gibbons, and chief harbour engineer of the Board of Works?—Yes.

4541. How long have you been connected with the Board of Works?—Thirty years.

4542. How long have you been engineer?—Twelve years.

4543. Have you made an estimate of the cost of constructing a harbour of refuge as shown on this plan?—I estimated what it would cost to do the work as shown in the map before you.

4544. Have you any plan to put in evidence?—I have not.

4545. Are there any sections prepared by you?—They were given to me prepared by Mr. Hemans and Mr. Langon, and are substantially the same as those shown in the plan of the map attached to the evidence taken before the Select Committee of the House of Commons.

4546. Do you still think the estimate sufficient to complete the work?—I do.

4547. In your experience do many vessels avail themselves of harbours of refuge?—I have no local experience, but I know Kingstown Harbour, as it is under my direction, and immense numbers of vessels avail themselves of it.

4548. (*Capt. Vetch.*) Does the line marked red on the plan show the extent of the work in the proposed harbour as regards the estimate?—The work is limited to the red marks in my estimate, not to what would make it a complete roadstead.

4549. Are the stones in the vicinity of this breakwater suited for the purpose?—They are peculiarly suited for it, as they rise in large masses and are sound stones.

4550. Have you any sections of the proposed work?

—I drew sections of what I thought would be sufficient to make a rude bank of stone level with high water, and then to construct a wall like that at Holyhead.

4551. What would be the height of the work ?—Eighteen or twenty-one feet above high-water mark. I estimated for twenty one feet.

4552. How much of that would be faced with stone ?—From the low-water line, in fact as near as possible like Holyhead. I would not make it quite perpendicular. I am sure those two piers would convert this into an excellent roadstead.

4553. Would it not be more improved by extending the pier farther into the broad sound ?—That would give a larger area landlocked, and would interfere with the access.

4554. Have you provided for quays ?—I have not.

4555. You are decidedly of opinion that it would be better to close up the western sound ?—Yes ; because our worst enemies are the north-west winds, and you leave an easy access to the harbour. By shutting up the western entrance you preserve the general area of the harbour from the west winds, but by shutting up the northern entrance and leaving the western open you would make scarcely any change from its present state.

4556. Would you consider it necessary to reduce the width of the broad opening ?—By reducing the dimensions of this opening you contribute to the stillness of the water inside, and the only limit to the contraction of that would be the leaving of sufficient facility of access.

4557. Is there a heavy sea running through Broad sound ?—There is comparatively little sea rolling through this sound, but there must be some sea running.

4558. With respect to those faced stones, you propose placing above high-water mark, do you think there is a sufficient supply in the quarries ?—I think there is.

4559. Would you dress them ?—Partly, but I would leave them in a rough shape, using the best and flattest of them to unite the courses; if you use good cement you can build a good wall even with rubble stones.

4560. How long would it take to construct this breakwater ?—It would be best not to hurry the work on, but to take five or six years for doing it.

4561. Could you get lime in the vicinity ?—I do not think we have good lime here, that would have to be imported; we would use hydraulic lime prepared for similar purposes.

4562. (*Mr. Coode.*) Is the plan you estimated for attached to the Report of the Select Committee of the House of Commons ?—My estimate is made with regard to closing the western sound and filling up the spaces between the other rocks, and was based on the official plan before me, and if it is not the identical plan, the amount of work on the one I estimated for and the plan before me is substantially the same.

4563. Did you make longitudinal and transverse sections of the work ?—Surely.

4564. Then you made close calculations of the quantity of material that would be consumed ?—That is impossible, it must be an approximation ; but it was sufficiently close to make me sure that the estimate is sufficient to cover the work.

4565. What is the rate per ton at which you set down the cost of working ?—Two shillings and ninepence per cubic yard.

4566. From your experience at Kingstown you were able to estimate the quantity of material that would be consumed ?—I am satisfied that I am correct.

4567. Would you use cement below low-water line? —I would use it when I had constructed work, but you cannot be so certain of cement until the work has risen a little above high water.

4568. You would dress the first few courses ?—In quarrying, you will find that several of the stones come out with natural beds, and I would bring the others into something of that shape, so as to have them resting close together without depending on the cement.

4569. What sizes would you use in the first course of the wall ?—The largest that could be got.

4570. What weight could stones be raised for the purpose ?—About 25 tons is the maximum ; but I never made an actual work of larger stones than 10 tons.

4571. How would you set these large stones ?—From stagework.

4572. To what extent would you use stones of 25 tons weight ? I would think it must be to a limited extent ?—I would use them to the largest extent I could get them.

4573. You know something of the nature of the quarry, to what height on the wall would you carry these stones ?—I would not get them for the whole of the first course, but only for the sea face.

4574. And you think that you could obtain as many of these large stones as would carry you along for the first course next the sea ?—I am quite certain I would ; for the only limit to the weight of the stones is the power of moving them. You will find bunches of very superior stone, but not very continuous ; there could be plenty of stones got from 12 to 15 tons weight ; and by the judicious use of powder you might get stones, even 100 tons weight, out of the quarry.

4575. Were you not connected with the works of the present harbour at Portrush ?—To some extent ; there are stones there weighing 12 tons, but the appliances for moving them were of a wretched nature.

4576. Would you have any difficulty in getting the stones from the quarries ?—There is no doubt but you could bring the stones from the quarry.

4577. (*Chairman, who submitted a plan of the breakwater proposed to be made to Wick to the witness.*) Do you see that plan of Wick Bay ; what would be the effect of a sea in a heavy gale of wind, coming right into the entrance ?—I think it would make it very much disturbed inside.

4578. What would be the effect of a sea on vessels taking the harbour ?—They would likely go on either pier. Looking on this plan, it appears to me that there would necessarily be a very heavy roll of sea into the mouth of it ; it would break on either pier head, and give you broken water right across it ; and, I think, in some cases would endanger the safety of vessels against either pier head.

4579. Does your entrance at Kingstown resemble that ?—It does not.

4580. In what does it differ ?—The worst wind at Kingstown instead of coming directly into the entrance comes over the pier, and that is from the north-east. There is no analogy between this harbour at Wick and Kingstown Harbour.

4581. (*Capt. Vetch.*) Are you aware of the set and direction of the tides at Wick, and the natural influences at work there ?—I know nothing at all about it.

4582. Would your opinion of Wick in some degree alter, if you found that an east wind is not the worst wind ?—In that case my observations fall to the ground ; I spoke of it as if this was the worst wind.

4583. If you were aware that there is a tide running across the harbour at 3 or $3\frac{1}{2}$ knots an hour, would that alter your view of the case ?—It would to this extent, that such a tide running at right angles to the entrance, would have a material effect in diminishing the roll of the sea at the entrance.

4584. If you had learned that the fishermen, generally at that port 6000 in number, were satisfied and approved of that entrance, would you think their views entitled to credit ?—Perhaps it is a fault of mine, but I am not in the habit of giving much credit to the opinion of such persons. I admit I am wrong, and that the opinions of a body of people should be entitled to credit ; but I judge from the physical facts

PORTRUSH.

Mr. B. D. Gibbons.

10 Sept. 1858.

Captain Vetch.

before me, and not upon the opinion of people who do not reason much upon things of the sort.

4585. Suppose the pier of that work brought up for 12 feet below low-water mark, would you expect there would be a percussive sea on that wall, the depth being 6 fathoms?—I have no doubt there would be a broken sea against the whole face, but I do not attach much importance to that, for the sea that would do most mischief would be that breaking on the heads.

4586. With what force might a wave come against such a breakwater?—I have seen a wave going 18 feet over a wall.

4587. Your opinion is that a greater depth of water would make it more dangerous?— No ; it would generate a higher wave, and some of the blue water would go over, but it would not do much harm.

4588. If on the pier head the waves were repelled by the breakwater and reflected, would you not expect that the same action would take place between the two piers as on the outside, and would the waves not recoil from that face?—Surely.

4589. If it recoiled from the pier heads and for some distance on each side of them, would not the wave be preserved from breaking from the sympathetic action of the waves along the shore?—The wave would break on both sides and would make disturbed water ; and if a vessel was not in the centre of the course she would strike against some of the pier heads.

4590. Do you agree with the theory of Sir Isaac Newton that a wave entering a harbour of this sort would diffuse and exhaust itself by curved lines extending from shore to shore, and that the wave so entering is lessened in height exactly in proportion to the extent of the line of that particular part of the wave?— It would expand in curved lines and extend itself to get rid of the force that gave rise to it.

4591. You would not conceive that a wave so entering would run with the same velocity as it would in the open sea?—Certainly not, for that would be supposing that no breakwater whatever exists.

4592. (*Mr. Coode.*) I asked you a question with reference to the identity of this plan, marked B G, with that on which you founded your estimate of 100,000*l.*, as given in your evidence before the Select Committee of the House of Commons in 1858 ; do you think still that that sum would suffice for the work shown by the red lines on this plan?—I do.

4593. (*Mr. Lindsay.*) Do you think that any engineer, however eminent, by having a plan brought before him of a place he never saw, and knowing nothing about the currents, nothing about the headlands, nothing about the sets of tide, and nothing about the prevailing gales of wind on that particular part of the coast,—do you think he can form an opinion as to what description of harbour would be most suitable?—If he is so thoroughly ignorant as you have described, he will know nothing; but if you show him the direction of the winds and currents it will afford him more information than he would get from a personal examination ; it is on the assumption that it is required that he gives his opinion.

4594. Then he can offer no opinion unless those points are named?—No.

4595. If he is asked for an opinion the whole of those points should be laid before him?—Certainly.

4596. (*Capt. Washington.*) You were engineer of Kingstown Harbour?—Yes.

4597. Do vessels take Kingstown Harbour in gales?—Very often.

4598. Do they ever strike against the pier?—None have struck within the last twenty-one years.

4599. Were you ever on the east coast of England?—Never.

4600. Do you know Newhaven?—I do not.

4601. Do you know that the entrance has been changed from 290 feet, and that it is now only 120 feet wide, and do you know that vessels take it in any wind?—I do not ; but a vessel might take it.

4602. Do you know Howth Head?—I have seen it.

4603. Is the entrance 500 feet wide?—I should say it is not more than 300 feet.

4604. Is it often taken by coasters?—It is.

4605. Are vessels taken frequently against the pier head?—I believe so.

4606. Then you are of opinion that a 500 feet opening is the smallest opening that should be made for a harbour of refuge?—A vessel should have at least that ; unless she was directly in the entrance she would run some danger. My mind is, that a harbour of refuge ought to be wide enough to receive any vessel in any wind.

4607. Would 500 feet be sufficient for a harbour of refuge at Wick?—Not for foreign vessels, but for coasters it is more than ample.

4608. (*Chairman.*) With reference to the troubled sea, how would that affect fishing boats?—It would affect them very seriously ; but they could take an entrance of 100 feet wide, while a ship of 200 tons burthen could not take an entrance of 500 feet wide.

4609. Do you know of any harbour having an entrance similar to Wick?—I do not know any harbour of that description having one 500 feet wide. There was some reference made to a harbour of refuge on the east coast, and a fact struck me with reference to Loughindall. Comparing the value of that as a harbour of refuge with the Skerries, I was supposing the case of a vessel obliged to bear up to the westward. We will suppose a ship bearing up for Innistrahull, and obliged to run for a harbour ; if she bears up for Loughindall she necessarily runs down on a lee shore, and she steers for it, not by sight, but by compass ; she does not see, and looking to the chart there is strong tides running north from it, and every direction across ; still she runs for it, and if she misses it she is on a dangerous lee shore. I am supposing the wind at north-north-west. If she runs for Portrush she has a guide to it ; the well-marked headlands from where she bears up at, until she reaches it. And even should she not see it she still is not on a lee shore, and the worst that can occur to her is, that she has to go down the Irish sea. If she runs for Loughindall, and does not hit it, she is on a lee shore and cannot escape. I know it is presumptuous for me to talk in this way in the presence of nautical men, but there is something in it.

Mr. William Dargan, examined.

Mr. Wm. Dargan.

4610. (*Chairman.*) Have you examined into the details of the expense of carrying out the harbour of refuge?—I have.

4611. Are you still of opinion that the sum is sufficient?—I am quite certain of it.

4612. (*Mr. Lindsay.*) Have you anything to add to what you have already stated in reference to this work?—I think everything has been said. It has capabilities for a harbour of refuge greater than any other on the coast. There is greater safety for vessels, the site is peculiarly well situated, and the materials necessary are convenient.

4613. Do you think that everything that has been said in its favour has been said?—I think so.

4614. (*Capt. Washington.*) You are a very large contractor for public works?—I am.

4615. Have you any hesitation in carrying out the work?—Not the slightest; and if you were in a condition to make the contract with me now I would accept it, and I feel I could make a good bargain of it, so far as I know.

Captain G. A. Bedford, R.N., Admiralty Surveyor, examined. PORTRUSH.

Capt. G. A. Bedford. R.N.

10 Sept. 1858.

4616. (*Chairman*). What is your occupation?—Admiralty surveyor.

4617. How long have you been in that situation?—Fourteen years.

4618. Have you been present at this inquiry?—Yes.

4619. Would you favour the Commissioners with your opinion as to whether, viewing the vicinity of Lough Foyle, a harbour of refuge is necessary at Portrush?—I quite agree with the statements of previous witnesses as to the difficulty of entering Lough Foyle with a north-west wind. A vessel running down under a north-west wind would not be able to get in with an ebb tide without being liable to be thrown on the Tuns. The worst weather is from north-west, but it might be from north-north-west and be equally as bad. If a vessel were a little to the west of Lough Swilly she would have no occasion to go into Lough Foyle. Lough Swilly is a clear entrance of three miles of deep water, and the Swilly Rocks lie so as not to interfere with the navigation of the lough. I know it was stated by Sir James Dambrain, who should have known better, that the rocks lie in the middle; but such is not the fact.

4620. State your opinion, viewing the vicinity of Lough Foyle and Lough Swilly, whether the sum of money proposed should be expended at Portrush.—I heard the evidence at this inquiry. Some one said that captains of vessels would not run for the Skerries, because they did not know their way in. It is not visible at night, but it might be made visible by a light advantageously or properly placed. When Mr. Gibbons gave his evidence of a vessel being obliged to bear up with the western winds, he might as well have assumed the winds from the north, when the objection to run on a lee shore would be considerably stronger in the case of Portrush than in that of Loughindall. If you run for Portrush, if the wind is from north or north-west, and the weather is so misty as to oblige her to keep close in here, if she miss the entrance she is lost; there is no escape. With regard to Loughindall, with the wind west or north-west blowing into the north channel, supposing her to miss, as Mr. Gibbons assumed, no captain with his senses would attempt to enter Loughindall; but he would have an opportunity to run farther, because he is not embayed, as he would be in Portrush, but would be able to pass on. The difficulty at present as to Portrush is, that it offers considerable refuge if it were better known and lighted, so that a vessel might enter it at night. I do not mean to say the danger would not be as great of becoming embayed; still I object to the closing of the western sound. Suppose it were blowing a gale of wind from west-south-west, a vessel would be unable to enter Lough Foyle; and supposing her to bear up to Skerries, it seems to me a doubt whether that vessel could enter in at the broad sound, whereas, if the western passage were left open, she could get in with all winds, a most essential point in harbours of refuge. With regard to the great objection to keep open the west sound, if the smaller islands were closed up, and a breakwater extended with a curve to the north-west, it would cover materially the west passage from the sea which sets in upon the shore, and would protect it from the heavy swell which might make the west passage dangerous. By closing up the western passage the tide setting to the east would run right across the broad sound, and with a west-south-west a vessel could scarcely enter the broad sound with an easterly running tide. My opinion is, that by making a breakwater inside of the small isles, and continuing it a little way to the north-west, would be the proper plan. I would prefer keeping open even both sounds, because a harbour of refuge should be accessible under all circumstances, and it would not be so open with the western channel closed up. The best anchorage is not on the western side, nor is it the anchorage a vessel takes. I do not conceive either that the sea setting in to the west sound would make any material sea to vessels riding under the south side of the "Big Skerries." It is too small an entrance to allow any sea to set in that would injure the roadstead. The heavy swell sets in along the line of coast, and not along the shore. The sea expends itself on the western Skerries, crosses the western sound, and breaks on the east side of Ramore Head. I would prefer the tide setting directly in or out of a harbour I was taking, and not across it. I think if the west sound were closed the bight which would be produced would in the course of time be silted up by sand, and the sea setting in to the broad sound would render the port unsafe for easy anchorage. The great desideratum is to put a light upon the Skerries rocks, that a vessel in the darkness might be able to make use of it. Suppose I were at Innistrahull, I would not run down on the coast even suppose there were a harbour of refuge at Portrush. The evidence given by nautical men seems to show that they did not make use of it because it was not known; but that might be said with respect to other places on the coast.

4621. (*Mr. Lindsay.*) After the statement you have made, and considering the object we have in view, the saving of life and property, and giving facilities to the trade and commerce of England, and looking to the harbours that now exist, do you consider that the Government would be warranted in voting 100,000*l.* for the construction of a harbour here?—It would be of great benefit if a commercial harbour was made here; but in my opinion it is not essential. If those works were carried out, it would enable them to make this a commercial port without the cost that would be incurred if the works had not been entered on. As a favourable position for a harbour of refuge it will do well enough if lighted. I have many complaints of the Irish coast with regard to lights, and the almost total neglect of the Irish ports. During my survey of the west coast I have known several vessels, being unable to get into Golla roads, bearing up for Lough Swilly and Loughindall.

4622. Then I understood your opinion to be, that you think Government, looking to the place as a harbour of refuge in the strict sense of the word, would not be warranted in laying out money to make the proposed harbour at the Skerries, but that, looking to it in a commercial point of view, you think the matter worthy of consideration. Do you mean of national advantage?—No, but merely to the commerce of this immediate district, with the port of Derry so close at hand.

4623. Then the great want, in your opinion, on this coast is more lights?—Yes.

4624. You think that something ought to be done at the Skerries?—Certainly; because by this means it would be made accessible; but if it is made a harbour of refuge, I differ with those who recommend the closing of the western sound.

4625. (*Capt. Washington.*) Are there no other lights wanted along the coast?—Their name is legion, and there is a great complaint for the taking of the light off Arranmore.

4626. When was it taken away?—It was decided to light Tory Island and Rathlin O'Birne instead of having the light on Arranmore. The light on Tory Island was exhibited in 1832, and that on Ruthlin O'Birne in 1857; the light on Arranmore was taken away at the same time that Tory Island was lighted, so that 44½ miles of dangerous coast was left without a light; but even with the light on Rathlin and Tory Island, there should be one on the salient point of Arranmore. Vessels coming from America, and being to the southward of their reckoning, and not seeing Tory Light, are in great danger of becoming embayed somewhere near Arranmore.

4627. Is Galway Bay sufficiently lighted?—It is with regard to ships going in; but the taking away

PORTRUSH.

Capt. G. A. Bedford, R.N.

10 Sept. 1858.

Captain Washington.

the light from the summit of Arranmore has thrown a considerable portion of the north sound, including Killemey Bay and Greatman's Bay, the chief resort of the numerous fishing craft of Galway, into darkness; and I represented some years ago, before the change took place, that there should be some light on Straw Island, which would render Gregory's Sound available for ships to run through, and also get into Killemey Harbour. Any vessel having got so far west of Galway as the Arran Islands, and the wind veering round to westward, are obliged to run to Galway roadstead; whereas, if they had a light on Straw Island they might hold their ground in Killemey Bay. I have received several complaints from various seamen for want of this light on Straw Island,—looking to the steam communication between Galway and the United States.

4628. Is Galway Bay sufficiently lighted?—It is not.

4629. Where is the light wanted?—A light is required at the Marguerita and Black Rocks.

Captain Fraser, R.N., Admiralty Surveyor from Portrush to Dublin, examined.

Captain Fraser, R.N.

4630. (*Chairman.*) What is your occupation?—Admiralty surveyor from this to Dublin.

4631. Have you been long on the coast of Ireland?—Thirty years.

4632. Will you favour us with your opinion as to the necessity of a harbour of refuge?—Certainly; but I think it would save the time of the Commissioners when I state that, having heard the evidence of Captian Bedford, I fully concur in everything he has stated, except in one or two points connected with this locality. I think, in the first place, that the broad sound should be closed entirely, to make a complete breakwater. The broad sound should be closed up; and I consider that, without the western entrance and the eastern entrance being completely left open, vessels under no circumstances in northern gales, being obliged to bear up, would be able to avail themselves of the security it would afford. It appears to me that even in the present moderate breeze that is blowing from southward scarcely any sea comes in from the western sound, but that it is rolling very heavily through the broad sound, that is the wave that breaks along this shore. This 100,000*l.* is asked for a good object, and if even double that sum was required it is due to this coast, not only as a national work, but also to the country generally; for even was it the saving of one life, as I heard it stated to-day, it would be worth the whole sum. If the broad sound were filled in it would be a magnificent breakwater, which would afford shelter to a large amount of shipping, and I think would be very well suited as a rendezvous for ships of war in the event of this country being engaged in war. There is deep water and good holding ground; but as for blue clay, so far as we have been able to ascertain, we can find none. We have had a small steamer anchored in every direction inside the Skerries for the last day or two. We gave a large scope of cable, and a back turn, to get a good grip, but uniformly the anchor came up plashed with seaweed, and not the slightest appearance of mud. The anchor was a small one, and there may be mud; but whether or not, it does not materially affect the question. The holding ground is sufficiently good for any purpose. It is quite clear from the evidence that the Skerries in their present state do not afford sufficient shelter to save life and property, nor do I see how the harbour could ever be turned into any commercial purposes, for the sea breaks along the shore, as at this moment, though it is a south breeze. As to the west coast, or Lough Foyle, I can give no evidence, only that I perfectly agree with the opinions expressed, that from the difficulty in entering Lough Foyle it could not be made available for a harbour of refuge.

4633. Have you any information to give us with respect to Ballycastle?—The coast is very foul.

4634. Have you any idea of the best site for a harbour?—I would prefer the north-east angle of the coast if a place could be availed of near the entrance of the channel.

4635. What is your opinion with respect to Church Bay?—A good asylum might be made there, but it would be completely lost as a commercial harbour; and, if by forming the one you could combine the other, I think it would be well to do so.

4636. Is the result of your evidence, as, looking to the safety of life and property, and to facilitate commerce, that a harbour of refuge should be constructed here?—It is; that is my opinion.

4637. I understood you to say you would keep the western sound open?—Yes.

4638. Why do not heavy seas come in from the west and north-west?—They come directly on the shore even with the wind, as now, off shore; the swell that is generated outside rolls full through the broad sound.

4639. This western passage open, would ships lie in completely smooth water in safety during west and north-west gales?—I think so; there would be to a certain extent the same action in the roadstead, with the wind blowing west, as it does now, in the broad sound.

4640. Have you well considered that opinion?—I have studied it.

4641. You differ with the evidence of Mr. Gibbons and those other gentlemen who have given evidence?—I do; it is right that every facility should be given for entrance, but the swell is so great that comes through the broad sound that I do not think it should be left open. As a nautical man it would strike me that if you leave the west sound open, you must, during west and north-west winds, have a very troubled sea at the spot.

4642. Where is the best anchorage?—South of the Skerries is the best anchorage.

4643. (*Capt. Vetch.*) Can you tell us the direction of the wind yesterday?—It was from south-west.

4644. Did you observe a very heavy sea coming in the broad sound?—I did.

4645. And that it broke very heavily on the strand?—Yes; it spread itself to the west, and broke along the shore as it is doing now.

4646. The wind being from the south-west, did you observe breakers coming in from the west?—There were breakers, but no swell.

4647. Did the swell come in from the west, or through the broad sound, the wind being off shore at the time?—Certainly not.

Mr. Hoskyns, Admiralty Surveyor from Lough Foyle to Belfast, examined.

Mr. Hoskyns.

4648. (*Chairman.*) What is your occupation?—Admiralty surveyor from Lough Foyle to Belfast.

4649. How long have you been connected with this coast?—Five years.

4650. Will you state your opinion as to the necessity or advantage of having the Skerries converted into a harbour of refuge?—I explained my views in a report sent to the House of Commons in December. I still concur in those views, and have nothing further to add.

4651. What is the nature of the Skerries?—We examined it very carefully, and I never saw anything in the anchorage but sand; it is black trap rock which forms a black sand, and has the appearance of blue clay.

4652. Is it good holding ground?—It is fair enough.

4653. As to Lough Foyle, you have heard the opinions of the witnesses as to the ineligibility of it as a refuge harbour with the wind north-west?—No

harbour can be protected with the wind blowing a gale right out of it; but with a moderate gale and a flood tide a vessel could get in.

4654. How far to the northward must the wind be to enable a vessel to run in?—Nothing to the west of north-north-west, except with a flood tide and not more wind than she can carry sails for.

4655. (*Mr. Lindsay.*) The object of a harbour of refuge being to afford facilities for the safety of life and property, and for ships to take to during a heavy gale of wind, the prevailing winds along the coast considered, would you think Lough Foyle a harbour of refuge?—It could scarcely be considered a harbour of refuge.

4656. Which sound would you leave open?—I propose to leave the western sound open.

4657. (*Capt. Washington.*) Did you survey Lough Foyle?—Yes.

4658. How long were you in Lough Foyle?—A year, and had an opportunity of seeing it in all sorts of wind.

4659. You heard it stated that a vessel in a westerly gale was driven out of Lough Foyle?—I did; and suppose she must have been badly found, for, once inside the heads, Lough Foyle is a safe harbour; there is half a mile between Innistrahull Head and the Tuns.

Mr. MAGOWAN, Master Mariner, examined.

4660. (*Chairman.*) How long have you followed the sea?—Fifty years.

4661. Have you been present during this inquiry?—I received a telegraphic message from Mr. Caldwell, our agent, and left Derry and came here to give evidence.

4662. Do you concur with the evidence that has been given as to the necessity of a harbour of refuge at Portrush?—I have been 18 years a ship master on this coast, and I give it as my opinion that there is a great necessity for a harbour of refuge here. In 1841 I was commander of a coasting schooner between Liverpool and Sligo; I fell in with a heavy gale from north-west, 15 or 20 miles west of Tory Island; the ship being disabled, I was glad to run her here, but had to bear up as far as Larne; from the appearance of the Skerries Rocks on my chart I did not wish to go in, for I thought I would be too much exposed to the heavy swell coming through the broad sound. That was why I went to Larne, because I could take neither Lough Swilly, Lough Foyle, or Loughindall.

4663. How long have you been in command of a steamer?—Since 1843.

4664. You are decidedly of opinion that a harbour of refuge would be of advantage to vessels from Liverpool, the Clyde, Belfast, and the south channel?—For every vessel going north-about.

4665. (*Mr. Lindsay.*) What trade were you in?—Between Sligo and Liverpool, London and St. Petersburg, Liverpool and Rotterdam.

4666. From practical experience would you say that a harbour of refuge here would give greater facilities to commerce?—It would be the means of saving much life and property. In 1839 six vessels were lost between Innistrahull and the west end of Rathlin during a north-west gale.

4667. Would these have been saved had there been a harbour of refuge here?—Two of them were wrecked west of Rathlin, and if there had been a harbour here they might have been saved.

4668. (*Mr. Coode.*) How many lives were lost—I would say there were 30 lives lost on tha occasion.

(*Chairman.*) Is there any person present who wishes to tender further evidence with respect to this inquiry?

No answer.

Sitting at Portrush closed.

LONDONDERRY.

Saturday, 11th September, 1858.

PRESENT:

Admiral HOPE (Chairman).

Mr. LINDSAY.
Captain WASHINGTON.
Captain VETCH.
Mr. COODE.
Mr. EVANS, Secretary.

Mr. ABRAHAM HARVEY STEWART examined.

4669. (*Chairman.*) You are secretary to the Port and Harbour Commissioners?—I am.

4670. Have you any observations to offer respecting the advantages which would arise from the formation of a harbour of refuge at Portrush?—A harbour of refuge near the mouth of the Foyle would be very desirable, but I am not prepared to say that Portrush would be the proper place for constructing it.

4671. Would you state your ground for entertaining that opinion?—My ground for entertaining that opinion is from the great difficulty ships frequently meet in getting into the Foyle, with a heavy sea rolling in from the Atlantic.

4672. Have you any permanent interest in the shipping of Derry?—I have not directly; but as a servant of the Port and Harbour Commissioners, I would desire that the trade of the port should improve.

4673. You can give information as to the trade of the river?—Yes, I can.

4674. How many vessels arrive annually?—We have about 1,200 arrivals and sailings.

4675. Does this include steam ships?—Yes.

4676. How many steam ships have you?—I think about seven.

4677. Where do they trade to?—Principally to Liverpool and Glasgow.

4678. In the 1,200 sailings and arrivals, I understand the steamers are included?—Yes.

4679. What is the present revenue of the Port and Harbour Commissioners?—Last year their income was about 5,000*l.*; but the rates were altered in former years, and they have been altered this year, so that I cannot tell the sum exactly. If the present rates be levied for 12 months, and no increase take place in the trade, I would take this year's income at 8,000*l.*

4680. How is the river managed?—By the 15 Commissioners.

4681. How are they appointed?—They are elected by rated occupiers and shipowners.

4682. What improvements have been made in the river during the last ten years?—The flats have been

LONDONDERRY.

Mr. A. H. Stewart.

11 Sept. 1858.

Chairman.

dredged, lights have been erected, and buoys stationed at several points.

4683. What sums have been expended in this way during the last 10 years?—I am not prepared off-hand to state exactly. Dredging the flats cost about 5,000*l.* the river lights some 1,500*l.*, and the improvements in buoys and beacons about 1,500*l.*

4684. How was the capital of the commissioners raised?—It was raised at first by rates on ships alone. At the present time it is raised by rates on ships and goods.

4685. Was any of the money borrowed?—Yes, a sum was borrowed on the security of the rates.

4686. What rate of interest do you pay?—Five per cent.

4687. Have you effected all the improvements by borrowing? Have you obtained any grant?—None, except from the Irish Society, who have voted us 7,000*l.*, payable in seven yearly instalments.

4688 Is this a free grant or merely a loan?—It is a free grant. The society have also given the land on which to construct the quays.

4689. What is the Irish Society?—They are the lords of the soil at Derry.

4690. Consequently they have a pecuniary interest in increasing the value of the land?—Yes.

4691. Of whom does the Irish Society consist?—It consists of merchants of London, appointed by the corporation of London.

4692. Do they form a Board?—Yes, consisting of a governor, deputy governor, and 24 assistants, with a secretary who resides in London, and an agent residing in Derry.

4693. How were they constituted?—By Royal Charter.

4694. What date?—In the reign of James the First.

4695. (*Capt. Washington.*) You said there were seven steamers connected with the port, where do they trade to?—There are three sailings weekly to Liverpool, and occasionally one every day to Glasgow. There are five sailings weekly to Glasgow at present. There are sailings to Morecambe and Belfast also.

4696. Is there a sufficiency of lights and beacons in the river?—Yes, I think so. Vessels sail out of the port at all hours.

4697. Are the lights on Innishowen Head sufficient?—Seamen say they are not well distinguished, they say they cannot well distinguish the inner from the outer light.

4698. Are they on a level?—They are nearly so.

4699. Has any accident arisen from the circumstance to your knowledge?—I don't know of any resulting from this circumstance.

4700. Could you suggest any remedy?—I have heard it stated, and I think it feasible, that if the inner light were raised, it would remedy the matter complained of.

4701. What is the extent of the quays?—They extend from the bridge downwards 2,400 feet, and 340 feet more are contracted for.

4702. Was this done at the expense of the trustees?—Yes, at the cost of 22,000*l.*, and a further sum of 3,000*l.* independent of the price of the land.

4703. The trustees had to buy up the land at a high price?—Yes.

4704. (*Capt. Vetch.*) I think you said you considered the expenditure of a sum of money for making a better entrance to the Foyle desirable, but that Portrush was not the proper position?—I am not prepared to say that.

4705. Suppose a pier were run out from Warren-point, would not that shelter vessels entering the river?—I think it would prevent the flow of the tide inwards.

4706. Is there any other place which could be occupied for sheltering vessels at the mouth of the Foyle?—I don't know of any without incurring enormous expense.

4707. But suppose 100,000*l.* were to be laid out, as is proposed, at Portrush, where would you apply it?—The expense of removing the Tun bank would be enormous. I would not give an opinion.

4708. Suppose the government gave 100,000*l.*, you do not know where you would employ it?—I do not.

4709. (*Mr. Coode.*) Is it your opinion that vessels experience great difficulty in entering the Foyle?—It depends on the state of the wind. In a south-south-west gale it is very difficult to enter; when the wind is from the north-west a vessel might get shelter.

4710. (*Mr. Lindsay.*) How much money have the Port and Harbour Commissioners borrowed?—Under 20,000*l.*

4711. Is that all?—Yes; but the compensation given to quay owners may be considered as borrowed money also.

4712. What are your liabilities altogether?—Close upon 80,000*l.*

4713. Does that include the amount allowed as compensation to quay owners?—Yes.

4714. How much more will be required to complete the works at present in progress?—About 40,000*l.*

4715. In all, you require 120,000*l.*?—Yes.

4716. To pay for which you have an income of 6,000*l.* annually?—Yes.

4717. Suppose you got money through some other channel at a rate below 5 per cent., you could offer a security of 8,000*l.* per annum?—Yes, and we could increase it to 11,000*l.* per annum if the higher rates were imposed.

4718. You hope your revenue will never be less than 8,000*l.* per annum, if the works were completed?—I expect it will exceed that sum.

4719 (*Mr. Coode.*) What increase of depth of water has been obtained by dredging the flats?—About 2 feet; there were deep pools made at various places, but the action of the paddles of the steamers has equalized the depth.

4720. Can the steamers come up to the quays at low water?— Very few of them but can.

4721. What is the depth on the flats at low water?—Eleven feet at low water at spring tides. At the quays it varies from 7 to 14 feet.

4722. Have you a graving dock or patent slip?—We have contracted for one at an expense of 18,000*l.*

4723. Is it included in the sum you say would cover all your liabilities?—Yes, I did not take any revenue from the slip, as I calculated it would only pay itself.

4724. Who are the engineers?—Messrs. Stevenson, of Edinburgh.

4725. When is the work to be completed?—In three years.

4726. Is there a great want felt for it?—Yes, vessels coming in damaged have frequently to go to the Clyde for repairs. If we had a slip they could be repaired on the spot.

4727. (*Chairman.*) Is the deepening of the flats included in the 120,000*l.*?—No, it is confined to works already in progress, to the quays and graving dock; but not to the flats.

4728. Has there been any estimate made for deepening the lough?—Yes, Messrs. Stevenson estimated it at 10,000*l.* It was a parliamentary estimate.

Mr. Alexander Lindsay examined.

Mr. A. Lindsay.

4729. (*Chairman.*) How long have you been connected with the Port of Londonderry?—For twenty years.

4730. Have you been connected with the shipping?—No; but I have had experience in the management of steamers. I have been a Port and Harbour Commissioner since the Act came into operation four years ago.

4731. You are acquainted with the object of this inquiry?—State the opinion you entertain respecting the formation of a harbour of refuge at Portrush?—I believe the opinion generally entertained here re-

Mr. A. Lindsay.

11 Sept. 1858.

specting the making of a harbour of refuge at Portrush is, that it might interfere with the trade of Derry.

4732. Do you think it would?—I don't think it would interfere prejudicially.

4733. Do you think it would be of advantage?—I think it would generally, though in some respects it might interfere.

4734. In the case of ships making the passage north-about, do you think it would be of advantage to them?—Yes, and ships not making the passages north-about might come in if there were a harbour there. Many ships would make it and wait for orders, that now go to Queenstown and elsewhere.

4735. (*Mr. Lindsay.*) The Commissioners can increase the rates, and consequently the revenue?—Yes, if it is considered necessary they can increase the rates to 12,000*l.* without any increase of trade.

4736. If you increase the rates to the maximum you can raise your revenue to 12,000*l.*?—Yes.

4737. (*Capt. Vetch.*) Is it not generally considered that there is a difficulty in entering the harbour at certain times?—Yes; but I am no authority.

Mr. John Munn, jun., examined.

Mr. J. Munn, jun.

4738. (*Chairman.*) How long have you been connected with the port of Londonderry?—For about 25 years. I have been a Commissioner since the Act was passed.

4739. Do you concur in opinion with the gentlemen who have preceded you respecting the proposed harbour of refuge at Portrush?—The impression of the Harbour Commissioners was, that the construction of a harbour of safety at Portrush would be injurious to the trade of Derry if in passing, a toll were laid on steamers; and it was feared the advantages would not compensate from the amount they would have to pay. That was the principal difficulty in the minds of the Commissioners.

4740. If Portrush were to become a place where vessels could be easily chartered and at less insurance, besides being a place of call for vessels from the north of Europe, the United States, and Canada, would not that compensate for your objection?—My impression is, that if the toll were levied nothing could compensate for that tax.

4741. Your opinion is, that it would tell disadvantageously on the steam trade?—Yes, and the steamers carry on the principal trade of the port.

4742. But if that point were met, would you withdraw your exceptions?—I would object in any case.

4743. (*Mr. Lindsay.*) You, as representing the shipping trade of Derry, consider you would not derive sufficient advantages by the construction of a harbour of refuge if you had to pay a passing toll?—Yes, because we have competent men on board our steamers, and they don't require a harbour of refuge.

4744. But you consider a harbour of refuge desirable?—Highly desirable.

4745. But you object to the principle of a passing toll?—Yes.

4746. (*Capt. Vetch.*) If any passing toll were established, would it not be in some degree compensated by an increase in the trade of the port? Or would the trade be so small that it would give no aid to the undertaking?—It is to the principle I object.

4747. But you would give something if it were advantageous?—However great the advantage, I would oppose it on principle. I would oppose it as far as the trade of Derry is concerned.

Mr. John Mehan examined.

Mr. John Mehan.

4748. (*Chairman.*) How long have you been connected with the port of Londonderry?—I have known it for the last 20 years. I have been a Commissioner since the Act was passed.

4749. Have you anything to offer in addition to the gentlemen who have preceded you?—No; I quite agree with them in what they have stated.

Mr. Samuel Hatrick examined.

Mr. S. Hatrick.

4750. (*Chairman.*) What calling are you?—I have been a seaman for 39 years.

4751. How long have you been a shipmaster?—For 29 years.

4752. In steam or sailing vessels?—I have been mostly engaged in the foreign trade. For the first five years I was in the coasting trade.

4753. Where have your vessels traded to generally?—To the Baltic, the Black Sea, the Mediterranean, &c.

4754. Where did your ships sail from?—From Derry.

4755. Do you know Portrush?—Yes.

4756. And the Skerries?—Yes.

4757. Were you ever anchored there?—Yes. The wind was blowing from the south and west down the river, I had no difficulty in getting in. Coming to an anchor, the windlass was upset, and tore out the hawse pipes. We were obliged to slip and run for Larne.

4758. How was the wind blowing?—From the west-south-west.

4759. Did it blow hard?—Yes, and there was a very heavy sea through the west passage, so much so that the vessel would tauten the cable and then range ahead again.

4760. (*Chart handed to witness.*) Mark on the chart where you were anchored?—I was anchored just under the Great Skerry (marked in chart A,B,C). We were getting a hawser to fasten to a ring under the rock when the ship was pitched right off. It was fortunate we did not make it fast as we would have had to cut the hawser.

4761. Look at the points marked?—Yes, I see the letters, and understand them.

4762. From the sea which ran in there, and the experience you had, suppose a breakwater were built to protect the Skerries, where would you place it? Where would it stop the sea most?—I could scarcely say. The sea comes as much through the west opening as through the north.

4763. You know the Broad Sound and the West Sound?—Yes.

4764. Was the sea breaking in both?—Equally so. The sea was topping the rocks, and coming right through.

4765. Did the sea break right across the Broad Sound?—Yes.

4766. And the West?—Yes. It was fairly coming over the rocks.

4767. (*Mr. Lindsay.*) When you were obliged to slip, the wind was from west to south-south-west?—Yes.

4768. When you saw the ship heaving so, you considered she was in danger?—In imminent danger.

4769. Would a breakwater closing the West Sound or closing the North Sound make smooth water inside?—I think not. I am sure of it.

4770. How had the wind been blowing previously?—There were gales from the north-west.

4771. You attribute the heavy roll of the sea behind the Skerries to the gale from the north-west?—Yes.

4772. Did you ever run into Lough Foyle in a heavy gale?—Yes.

4773. Did you ever take it in a north-west gale?—Yes.

4774. Suppose the ship well to the westward, and caught by a north-west gale, could she come in safely?—With a strong north-west wind it is not likely.

LONDONDERRY.

Mr. S. Hatrick.

11 Sept. 1858.

Mr. Lindsay.

4775. You did not tell us how you entered the Skerries. How was it ?—By the west.

4776. Had you any difficulty in making them ?—No.

4777. You have been there at other times ?—Yes, but I have never taken them when it was blowing hard.

4778. (*Capt. Vetch.*) You have been frequently in the Skerries ?—Only once to anchor.

4779. At other times you have passed through them ?—Yes.

4780. Do you consider it a safe place to anchor ?—I would not anchor there again for any consideration.

4781. (*Mr. Coode.*) What caused you to take shelter there ?—The wind was blowing down the river ; and when we came off it, we put back to the Skerries, as two pilots who were on board said if we put back to Portrush the weather might moderate, and we could take the river next morning.

4782. Then you ran to the Skerries after attempting to enter the river ?—Yes.

4783. Does it occur frequently that a vessel off the mouth of the Foyle would return to the Skerries ?—Not often.

4784. What is the greatest number of vessels you have ever seen at the Skerries for shelter, at one time ?—Never more than one.

4785. (*Chairman.*) You know Loughindall ?—I was in it eight or nine times.

4786. What kind of a place is it ?—It's a middling good harbour.

4787. What kind of vessels were you in ?—I was in vessels of 400 tons. There were only two feet more water inside the harbour than the vessels were drawing. Larger vessels lay outside of the Saltpans.

4788. Is it a good holding ground for vessels ?—Very good. It is good all over the anchorage. Outside it is not so good. There is too much long grass growing there, and the vessel is liable to choke if she does not get the cable quick, and is not liable to hold.

4789. If the ship gets plenty of cable she will hold on ?—Yes. Loughindall is a very good harbour for vessels bound for the river Foyle that can't get in.

4790. Do vessels often go there when unable to make for Derry ?—Not often.

4791 Did you ever know an instance of a vessel being detained there for a long time ?—I knew of it, but it's a long time ago.

4792. What was the longest detention you have known ?—Two weeks, of any vessel from Derry that I remember.

4793. Do you know Lough Ryan ?—Yes.

4794. What kind of a harbour is it ?—Very good.

4795. Do you know Campbellton ?—I was only once in it.

4796. Do you know Lamlash ?—Yes, I know it, I was there often.

4797. Are these places well known to coasting vessels passing here ?—Quite well.

4798. Do you think it would be good for Derry and the passing trade, to have a harbour of refuge at the Skerries ?—I am very doubtful of any of the sounds when filled keeping the sea from running in, I don't think any of them would stop it.

4799. (*Mr. Lindsay.*) Considering the number of natural harbours you have got, Lough Ryan, Loughindall, Campbellton, and Lamlash, do you think a harbour of refuge necessary in this vicinity ?—If it could be made at the Skerries to keep out the sea, it would be very desirable ; but I am doubtful it would answer.

4800. Do you know any place convenient, better suited for a harbour of refuge than Portrush ?—I don't know.

4801. Does the grass grow generally in Loughindall ?—No, it is only in the outer part.

4802. (*Capt. Vetch.*) You said you had only once taken refuge in the Skerries, and never anchored but once ?—Yes.

4803. And you say you were eight or ten times in Loughindall ?—Yes.

4804. Do you consider that a pier run out from the Saltpans would be a benefit for ships ?—I am very sure it would.

4805. Would the expenses incurred by the erection of such a pier be large ?—I think not, I never saw a heavy sea at the Saltpans, and vessels can ride easily.

4806. Do vessels from America to the Clyde or Liverpool put in there ?—Oh yes. The last time I was there seven vessels were lying.

4807. What was the largest number you ever saw lying in Loughindall ?—Ten.

4808. Had you any particular difficulty in entering it in any case ?—None.

4809. (*Mr. Coode.*) You saw the grass in the outer anchorage at Loughindall ?—Yes.

4810. Did you ever bring up any of it on your anchor ?—Yes.

4811. What length was it ?—About three feet long, but it is generally longer.

4812. If you were told it grew to the length of five or six fathoms, would you believe it ?—I never saw any of that kind.

4813. What was the colour of the grass ?—It was brighter than ordinary seaweed.

4814. Is it a flat grass ?—Yes.

4815. (*Chairman.*) Do you know Lough Swilly ?—No, but I have often passed it.

4816. Are there not strong tides off Loughindall ?—Yes, but they slacken as they enter the harbour.

4817. Do they make the harbour difficult of access ?—No.

JAMES MCDAID examined.

JamesMcDaid.

4818. (*Chairman.*) What profession are you ?—I am a pilot.

4819. How long have you been a pilot ?—For 29 years.

4820. Where are you pilot for ?—Lough Foyle.

4821. Are you acquainted with the neighbouring coast ?—No, I am on the Derry station.

4822. Do you know the Skerries ?—I have not been there for the last fifteen years.

4823. Then you don't feel competent to offer any opinion as to its being suitable for a harbour of refuge ?—No.

4824. Do you know Lough Swilly ?—I never was in it.

4825. Do you know Loughindall ?—I was in it when I was young, but I have no remembrance of it.

4826. (*Chart handed to witness.*) In Lough Foyle, when it is blowing a hard gale from the north-west, point out how high you could place a ship at anchor ?—Yes, she must be under small canvass ; she would make up under Magilligan Point. If it was intended to get the ship to anchor I would take off the canvass and get as close by Carnashamra Bay as possible. When I would come up there, the vessel would go into deeper water. The bay is good holding ground.

4827. Do vessels often anchor there when the wind is from the north-west ?—Yes, especially when it is ebb tide, and when they can't work further up the lough.

4828. What depth is the water there ?—Eight or ten fathoms.

4829. How many vessels have been there at one time ?—I never saw more than one or two at anchor at once.

4830. Were the vessels driven in from stress of weather, or were they bound for the port ?—I never saw any vessels anchored except those bound for the port. I saw vessels from stress of weather come in and anchor in Moville Bay.

PHILIP MCDAID examined.

LONDONDERRY.

Philip McDaid.

11 Sept. 1858.

4831. (*Chairman.*) You are a pilot?—Yes.

4832. How long have you been a pilot?—Since 1836.

4833. Where are you pilot for?—For Lough Foyle.

4834. Are you pilot for the adjoining coast?—Yes, as far as the district goes.

4835. How far do you go?—As far as we can board ships outside.

4836. Do you know the Skerries?—Yes.

4837. Were you ever at anchor inside the Skerries?—No.

4838. Do you know Loughindall?—No.

4839. Do you know Lamlash?—No.

4840. Or Port Ryan?—No, I was never in it.

4841. Will a vessel enter Lough Foyle, when the wind is blowing a heavy gale from the north-west?—As long as she can carry close-reefed canvass, that is reefed topsail and reefed courses, she will.

4842. Have you seen many vessels from stress of weather in the lough during a north-west gale?—I never took particular heed to the number.

4843. What size of vessels have you seen, were they large ships?—Some of 800 tons.

4844. If you were bringing in a ship, with a gale blowing from the north-west show on the chart where you would place her at anchor?—In an ebb tide I would bring her just under Carnashamra, in water from 6 to 8 fathoms, and would anchor midway between Carnashamra and the Perch. If the wind was from the south-west I would give her any anchorage out in the Foyle where she would fetch. If there was no anchorage where the vessel would fetch, I would keep her along the land to take her off. If the wind appeared to fly into the north-west, I would reach Culdaff and Glengad, and if it appeared to come from the south, I would reach the county Antrim side of the lough.

4845. Do you know Lough Swilly?—Yes.

4846. From what you know of the place, can you say if it is easy to enter during a north-west wind?—Yes, it is.

4847. How far must the wind be up to get in?—I am not so much acquainted with the place as to be able to answer that question.

4848. (*Mr. Lindsay.*) How many vessels took refuge in the course of a year?—Large and small, about 300.

4849. Since you became pilot that would be 6,000?—There might be that many, but I kept no calculation.

4850. How many vessels have been during that time lost on the Tuns?—I know of three.

4851. How did they get on?—One got on during the night, the wind being from the north. They were not acquainted with the place, and had no pilot on board. Part of the hands was saved. The ship became a total wreck. Another case was that of a barque going out to North America. She run down to leeward, and broke close into the Tuns.

4852. How was the wind?—It was north-west and by west. The ship became a total wreck, but the hands were saved.

4853. What was the other vessel?—The brig *Tamandra* of Derry. She got on by the tide setting to leeward over the Tuns.

4854. Were the vessels light or heavily laden?—The two brigs were loaded, and the barque was light.

4855. When you say a ship would find safe anchorage in a north-west gale, you mean she would get it south of the lighthouse?—South and west of the lighthouse.

4856. Between Dunmore and Innishowen Heads, do you consider there is any anchorage a ship could take with the wind off the land?—No, I do not.

4857. Could she anchor between those points during a southerly gale?—No.

4858. In point of fact, there is no anchorage between these points?—None that I know of.

4859. A vessel must be south and south-west off the lighthouse before she obtains safe anchorage?—She must.

4860. (*Capt. Vetch.*) Do you know Warrenpoint?—Yes.

4861. Is there any shelter there?—Yes, in westwardly winds.

4862. Suppose a pier run out there, would it be any benefit with the wind from the west or the north-west?—Yes, it would be a shelter.

4863. (*Chairman.*) Have you ever heard of pilots and their boats being blown off the land and lost?—Yes.

4864. How often has this happened within your recollection?—I knew of it once or twice. We lost a boat last season.

4865. What kind of boats were they?—Large skiffs.

4866. How many of a crew do they carry?—Five, six, or seven, according to the weather.

MR. ABRAHAM HARVEY STEWART re-examined.

Mr. A. H. Stewart.

4867. (*Chairman.*) You wish to make a statement respecting these pilot boats?—Yes; with respect to the pilot boats the question of the propriety of having large vessels which could stay at sea and meet ships before coming near the harbour has been often discussed. The difficulty of keeping such vessels at sea was the reason why the present system has been continued so long.

4868. In what does the difficulty consist of keeping them at sea?—From the tremendous sea off the north-west coast, and from their having no immediate port of refuge to run for.

4869. Would you be disposed to say that a harbour of refuge at the Skerries would offer advantages for abandoning the old system?—Any place to which the boats could run under a heavy gale of wind, any harbour in this vicinity would be an advantage.

4870. If such were made, would you change the system and use decked boats?—Yes. It is desirable to have a class of large pilot boats off the coast. It would induce vessels to come north-about. Masters would come this way expecting to get a pilot boat at sea. At present they can't get one till they come to the Tun Bank.

JOHN GILLESPIE examined.

John Gillespie.

4871. (*Chairman.*) You are a pilot?—Yes, six years in April.

4872. Where are you pilot for?—For Derry.

4873. Do you know Loughindall?—I was never in it, but I could make it.

4874. Do you know Lamlash?—Yes. It is a good anchorage.

4875. Do you know Lough Ryan?—Yes, it is a fine place; but it is difficult to get into it sometimes.

4876. You know Campbellton?—Yes.

4877. Do ships often run into these places, and take refuge when coming from the west and when outward-bound?—They can take Lough Ryan or Lamlash.

4878. Do you know that they do so?—Yes, they do.

4879. Have you been in Portrush?—I have been in it four or five times.

4880. During heavy weather?—Not much.

4881. Can you form any opinion of the Skerries as an anchorage?—They are very good, but I would rather run past them, and take Lamlash or any port in the Clyde.

4882. Do you know the West and Broad Sounds?—Yes.

4883. Suppose the West Sound were closed up, would it alter your opinion of the place as an anchor-

LONDONDERRY.

John Gillespie.

11 Sept. 1858.

Chairman.

age ?—If the West Sound were closed up we could get in through the Broad Sound.

4884. Which would you prefer to have closed up ?—The Broad Sound.

4885. Why ?—Because it has more of a line of breakwater than the other.

4886. Suppose this were done, would it alter your opinion as to taking vessels into the Skerries ?—I can't say till I tried it.

4887. You mean to say you would rather run past and make the Clyde ?—Yes, unless I was sheltered and in safety.

4888. Are you satisfied with the description of pilot boat at present in use ?—They serve us.

4889. If others offered, would you not prefer a decked boat ?—I don't know. It's a bad coast.

4890. But if there was a harbour of refuge at the Skerries, would it not alter your opinion ? — It might.

4891. Would you think it safe to anchor there ?—If the wind were from the south-east it might, but the north-west wind is what I most dread.

4892. (*Mr. Lindsay.*) Do you consider there is any anchorage between Dunmore and Innishowen Heads ?—I don't think there is. There is Culdaff Bay ; but I would not fancy it, even with the wind off the land.

4893. Could you make the lough with a gale from the north-west and caught coming from the westward ?—If not bearing sail I would not care. With reefed top-sails and without courses I could come inside the lights, and could ride there safely. Vessels often ride there clear of the swell.

4894. (*Capt. Washington.*) With the lights bearing about north coming in, could you bring them to bear north-north-east ?—Under some circumstances I think I could.

4895. (*Capt. Vetch.*) Do you think it would be any advantage if a pier were run out from the shore ?—It would depend on the kind of pier made.

4896. Could you point out what kind would be most useful ?—I could not.

4897. (*Chairman.*) With the wind blowing hard from the north-west could you get inside the lights ?—We could get inside generally.

4898. With a flood tide what would be the result ?—It would be the same.

4899. If the wind veered to the north ?—I would lay up and come up the river.

4900. (*Capt. Washington.*) Are the Innishowen Lights all you could wish ?—They are first rate.

4901. Did you hear any fault found with them ?—Coasters say they cannot distinguish the lights. There is one now halfway down the tower, which has been lighted for the last six months.

4902. (*Chairman.*) How far from the shore do you go to pick up a ship ?—Sometimes 10 miles in good weather ; in bad weather we keep inside the buoys. We are not able to go further.

4903. What prevents you from going further ?—The boats would not live in it, they would founder.

Mr. Abraham Stewart remarked that the pilots were expected to board vessels one mile outside the Tuns.

4904. (*Mr. Lindsay.*) What draught of water will take a ship to Derry at high water of spring tides ?—With a south west wind it would take 19 feet.

4905. What is the difference between the spring and neap tides ?—From 4 to 4½ feet.

4906. Have you known vessels drawing more than 19 feet come up ?—I knew some, not many. Very few of that draught come here.

(*Chairman.*) Is there any person present who wishes to tender further evidence with respect to this inquiry ?

No answer.

Sitting at Londonderry closed.

BELFAST.

Monday, 13th September 1858.

PRESENT :

Admiral HOPE (Chairman).

Mr. LINDSAY.
Captain WASHINGTON.
Captain VETCH.
Mr. COODE.

Mr. EVANS, Secretary.

BELFAST.

Mr. Tottenham.

13 Sept. 1858.

Mr. Tottenham, Barrister-at-Law :—I hand in a letter which I accidentally opened, it having been addressed to my private residence ; but I found on opening it that it was directed to the Commissioners for Harbours of Refuge. It is an official letter, and I sealed it as soon as I found what it was, and I now hand it in.

The Memorial from Ballycastle, as handed in by Mr. Tottenham :—

To the Right Honourable Spencer Horatio Walpole, Secretary of State for the Home Department.

The Memorial of the undersigned Gentry, Clergy, Merchants, Traders, and other inhabitants of the town and neighbourhood of Ballycastle, in the county of Antrim,

Showeth,—

THAT Hugh Boyd, Esq., the proprietor of the town of Ballycastle, and of a considerable estate adjacent thereto, is and has been for a period of upwards of forty-four years a lunatic, and his estates have been during the whole of that time under the management of the Court of Chancery ; and that owing to this unfortunate circumstance no steps were taken to bring the peculiar advantages of the port of Ballycastle, as the site for a harbour of refuge, before the notice of the late Committee of the House of Commons.

That in consequence of the appointment of a Royal Commission for the purpose of taking evidence on the spot as to the capabilities and advantages of Portrush (amongst others) as a harbour of refuge, your Memorialists feel it incumbent upon them to place before you their reasons for believing that the Commissioners ought to receive evidence such as they are prepared to offer of the paramount advantages of Ballycastle over Portrush or any other port within the district for such a purpose.

That the port of Ballycastle is about four miles to the west of the great promontory of Fair Head, and opposite the island of Rathlin, from which it is distant about five miles ; that all ships from the Clyde, Liverpool, &c., which take the north-about passage to America pass between Ballycastle and Rathlin ; that the storms against which it is of the utmost importance to provide shelter for shipping on the north coast of the county of Antrim, are those chiefly from the north-west ; ships do not encounter these storms until after they pass Fair Head. With a harbour of refuge at Ballycastle they would ride at anchor in safety until the weather should become sufficiently moderate to enable them to pursue their voyage ; whilst they would find it all but impossible in such gales to reach Portrush, a further distance of twenty miles.

That after ships pass Rathlin Island and Ballycastle Bay they are at once in the open sea, and comparatively free from the risk of being wrecked, but, if compelled by stress of weather, they could easily return to Ballycastle for shelter, while if compelled to go to Portrush they would have to deviate from their direct course from ten to fifteen miles at the least, and would thereby incur considerable delay in prosecuting their voyage.

BELFAST.

Mr. Tottenham.

13 Sept. 1858.

That the capabilities and advantages of Ballycastle for a harbour of refuge are very great, the lofty cliffs completely sheltering the bay from all storms from the west, south-west, south, and south-east, and we might almost add, the east; most excellent anchorage and holding ground; deep water; an inexhaustible supply on the spot of materials of the very best description, consisting of whinstone, freestone, limestone, &c., all of which can be obtained for the mere cost of raising; and that there are no valuable private rights, such as exist in the present harbour of Portrush, and of which no mention was made before the Committee, to be purchased up at an extravagant price.

That Ballycastle is peculiarly well situated for the protection of the shipping trade of Scotland, Liverpool, and Belfast, and in the event of a war that a small fleet of ships of war would from that harbour be able to protect our trade along the whole northern coast of Ireland, as well as afford similar protection to the trade of the Clyde, Ardrossan being only four hours distant from Ballycastle by a first-class steamer; and that batteries upon the island of Rathlin and upon the heights of Fair Head, and the other lofty promontories adjoining, would completely protect such a harbour from the attacks of an enemy by sea.

That, in addition to the above reasons, your Memorialists beg to state, that the town of Ballycastle lies in the centre of a rich agricultural district, abounding too with mines and minerals of the most valuable description, consisting of coals (the mines of which have been partially worked for centuries), ironstone, copper pyrites, fire clay and brick clay of superior quality, sand suitable for the manufacture of glass, &c. &c.; all of which, now lying neglected for want of a harbour, would add vastly to our national wealth, and promote employment, if such a harbour was constructed; while, on the contrary, Portrush is entirely destitute of any such mineral wealth, and owes its insignificant trade to its being at present the port of the town of Coleraine; and further, that surveys and maps of a proposed railway of only nine miles in length, from Ballycastle to join that from Ballymena to Coleraine, were made some time since, and, if completed, such a railway would afford direct communication to all parts of Ireland.

Your Memorialists, for these reasons, and many others which they are prepared to give in detail before the Commissioners, urge respectfully upon your attention the claims of Ballycastle, and pray that you will be pleased to give instructions to the Royal Commissioners to hold an investigation thereon.

(*Chairman.*) Mr. Tottenham, do you appear on behalf of those who have signed this Memorial to advocate the claims of Ballycastle?

(*Mr. Tottenham.*) I do.

(*Chairman.*) And are you engaged professionally?

(*Mr. Tottenham.*) I am.

(*Chairman.*) Have you any statement, with regard to Ballycastle, which you wish to tender in addition to the Memorial read?

(*Mr. Tottenham.*) If you allow me to make a few observations I shall do so, and then proceed to hand in a list of witnesses (much less than I should have presented if I had had sufficient notice), and also the questions to be asked these witnesses by the Commissioners.

(*Chairman.*) Proceed.

(*Mr. Tottenham.*) I think it quite unnecessary to point out the geographical position of Ballycastle, as the Commissioners are fully aware of it; and a reference to the map will show at once the nature of its advantages, in point of position, over Portrush. It is very nearly the most northerly part of the county of Antrim; Fair Head is the most northerly point, and it is only a few miles off Ballycastle. Portrush, on the contrary, is a deep embayment; it is stated in the Memorial to be about 20 miles from Ballycastle, but it is not quite so much; it is only about 16 miles. If a line be drawn from Fair Head to Malin Head, which is the most northern termination of Ireland, you will find that all ships going from Clyde, Liverpool, or Belfast, by the north-about passage, keep a very considerable distance to the north of Portrush, whereas, passing through the Sound of Rathlin and Ballycastle Bay, they are not more than three miles from Ballycastle town. Portrush is distant from the imaginary line that I propose to draw, 10 miles in the nearest direction. In case a storm should take place from the north-west, catching a ship passing outside that line, it would be extremely difficult to reach Portrush. I am speaking now of vessels in the foreign trade, not of mere coasting vessels bound to Londonderry or elsewhere on the coast. For such vessels there would not be the slightest difficulty, I apprehend, to reach Ballycastle. The north-west is the favourable gale for them after they pass Rathlin Island to Malin Head, and all they would have to do would be to ride out the gale, sometimes not an easy task, but it is still easier than to bear against it; and one great advantage is that they could at discretion either resume their voyage when the wind became favourable, or, if the storm continued, they could round the promontory of Fair Head and take the south passage. One of the great objections raised by one witness (a gentleman remarkable for some little matters which I need not now introduce, Captain Johnston) at Portrush, against the Ballycastle case, was that it had a bad outlet and that the water was too deep for the construction of a breakwater. In my innocence I thought that deep water, if not very deep, was rather an advantage for a harbour of refuge, so as to take in ships of Her Majesty's Navy, and other large ships, to such a harbour. Evidence will be produced to you to show, I hope to your satisfaction, that the water does not exceed ten fathoms in depth at the extremity of the proposed breakwater. The breakwater proposed to be made has not yet been laid out by an engineer to the extent that would warrant me in bringing it before you, but a harbour and pier for merely commercial purposes was planned about a couple of years ago by a skilful engineer, at the request of the Earl of Antrim. The plan for that harbour I have here ready to produce to the Commissioners if they will allow me; but it is not so extensive as the one now proposed to be made. The materials for the formation of that harbour are very easy of access. Mr. Macartney, in his opening statement at Portrush, mentioned that the Earl of Antrim, with munificence and liberality, was perfectly willing to present to the Government the materials of the breakwater (not the pier) at Portrush. As I am informed, there are no materials for the formation of the pier—for the fine cut stone and hammered stone parts of the pier—and attending closely to Mr. Gibbon's examination, it was stated that it was likely that a pier would not be built, but only a breakwater for a harbour of refuge solely, and without any reference to commercial purposes. At Ballycastle, within a few yards of the proposed breakwater and pier, there are lofty cliffs of whinstone rising to a considerable height above the water. The breakwater can be made of rocks out of that cliff. Alexander Boyd, Esq., the brother and heir presumptive to the lunatic, and who will become entitled to the estate, authorized me to say that so far as he was concerned, the Government shall have, if it were considered right to form such a harbour at Ballycastle, or the contractor shall have the entire materials of the breakwater free of cost. Within two miles of the site of the breakwater, two miles from the shore, and with a road to it from Ballycastle, lies a sandstone quarry of unlimited extent and of the finest description of free stone. That quarry is let, under the Court of Chancery, at an insignificant rent. It is my duty to mention that fact to the Commissioners lest they should suppose it was in the possession of the owner of the manor; but I have no doubt, having had the pier before the Court of Chancery with reference to a harbour for commercial purposes, that the court would purchase up the interest of the tenant in that freestone quarry, as it is trifling and then, so far as Mr. Alexander Boyd is concerned, that freestone quarry is at the disposal of the Government. I believe within half a mile of Ballycastle exists an unlimited supply of white limestone, of the finest description. That limestone is in the tenancy and occupation of Mr. Alexander Boyd, under the courts, so that he has complete power over it. There are very extensive coal mines, as probably every one of

BELFAST.

Mr. Tottenham.

13 Sept. 1858.

the Commissioners are aware, which have been worked for centuries at Ballycastle, therefore the facilities for burning lime and smelting minerals are great. Mr. Alexander Boyd has instructed me to say that that limestone quarry shall also be placed, without any cost save that of burning the lime, at the disposal of the Commissioners. I think I shall not detain you longer on that subject, for if a pier and breakwater are to be constructed the present will be to the contractor and not to the Government, for the Government will not make it. I should observe, that Mr. Gibbon stated there was no lime at Portrush capable of being used for the breakwater, and that it will have to be imported. I do not know whether the fine limestone of Ballycastle will suit or not. I state the fact that it exists; and therefore I think I may claim for Mr. Alexander Boyd the same degree of munificent liberality which Mr. Macartney did for the Earl of Antrim. I think that Mr. Lindsay stated that on several occasions at Portrush that the objects in view in the construction of a harbour of refuge were threefold:—First, the preservation of life; second, the preservation of property; and, third, the promotion of commerce. With regard to Portrush, the harbour may, if constructed there, preserve life and property; and I entirely agree with the evidence before you, that the preservation of a single life is worth the 100,000*l.* proposed to be spent, or any other great sum. But what will it do for the promotion of commerce? And I am not now speaking in a general point of view; but of the commerce of this country. The only evidence in favour of Portrush in a commercial point of view is that of Mr. Gage. He stated at Portrush that the harbour of refuge—

(*Chairman.*) I have no wish to shorten what you have to state in favour of Ballycastle, but excuse me for saying that the object of the Commissioners is to select sites for national harbours of refuge, not with the view of promoting the commerce of particular ports.

(*Mr. Tottenham.*) Yes, you will find that in one of my letters to the Secretary of State I dwelt upon harbours of refuge as for the purpose of developing the resources of the northern parts of the county of Antrim, and thereby promoting the national wealth. I am sorry to detain you, but I think it necessary to make the statement from the fact of Ballycastle having been entirely forgotten in the House of Commons. I am now speaking of it in a national point of view. Ballycastle and its neighbourhood have an unbounded supply of minerals of the finest description, an enormous quantity of which is exported (a vast quantity of iron is exported) at present to Scotland. The iron is particularly rich. It is calcined on the spot, for it is composed of black band ironstone in courses with coal, and the stone consumes itself, and is its own fuel. I have specimens of this iron now in Belfast to show to the Commissioners in its raw and calcined state. At the present there are no means for obtaining facilities for the exportation of ironstone, except from a rough pier at the mines, about a mile from Ballycastle, on that side of Fair Head, but in rough weather no vessel can venture near it. Small vessels do go near it in smooth weather, and from that they are sent to Scotland. Now ships do take refuge in Ballycastle Bay in rough weather, but in rough weather they do not go near the pier. On Saturday I may mention that there was a ship lying in the Bay of Ballycastle which came to take in a cargo of that same iron ore, but from fear it could not go near the pier, and lay at anchor all day. If a breakwater, such as I have described, were made, it would extend half a mile from the rock called Craignascarf, which is in a direct line to the Rue Point in Rathlin Island for a quarter of a mile or rather better, and from that the direction proposed is, after you go about 500 yards in a direct line, you would then bend round to a point south of Fair Head, that would leave an immense space of water perfectly protected from every sea. I need not go into the propriety of a harbour of refuge on the northern part of the county of Antrim, and you have also evidence before you of the principal gales to which that coast is exposed, as some point from north to north-west. To the north-west and to several points east of north, Ballycastle Bay is perfectly sheltered by Rathlin. Fair Head lies due east, and every point from east to north-west is completely sheltered by lofty cliffs; to the wind from the north-east and a point to the north and north-west, therefore, it is only exposed. From the north-west gales it is perfectly sheltered. The Mull of Cantyre is only 12 miles from Fair Head, and the small space of sea between the Mull of Cantyre and Fair Head effectually prevents any rough sea in Ballycastle Bay. When a storm rages it is true it raises a rough sea, but nothing more than the wind can catch in the bay, and the second part of the pier I describe will shelter it from that, and the first 500 yards of the pier will protect it from the sea rolling in from the Atlantic and leave it quiet water in the Bay of Ballycastle. Now, when a ship goes from Liverpool and passes Fair Head, and if she is caught in a north-west storm, she can make Ballycastle Bay with the greatest facility, whereas if she were caught before she arrived before Portrush she would probably be wrecked in an attempt to make the point in a north-west gale. A ship that would be caught beyond that, nearer Malin Head, of course would have a better chance of going safely into the broad sound of Lough Foyle. And I have been informed that Ballycastle Bay contains most excellent anchorage ground, and that so lately as April last one vessel rode out, with two anchors, a gale of very great violence from the north-east in perfect safety. You will have some evidence produced of the number of wrecks that have taken place on Rathlin Island and elsewhere in that neighbourhood, without going to Portrush. At present, from the want of a harbour of refuge, vessels (a great number) do not come between Rathlin and the main land, but keep to the north of Rathlin; and the memorial was in error in the word "all" there, but was corrected in my letter to the Secretary of State, and made "many" vessels instead of "all" vessels. If a harbour of refuge were there, the direct line being from Fair Head to Malin Head, all ships bound to the North American ports would pass between Rathlin and Ballycastle, knowing that they could, in a gale, have no difficulty in getting into a safe harbour. Sometimes there is an objection to a harbour, that when ships get in they cannot get out. That is not the case with regard to Ballycastle, for with an ebb tide they can get out, no matter what wind is blowing, so that when a ship in refuge there wishes, she can go out and pursue her voyage when the wind becomes favourable. Mr. Macartney, in his statement the other day, mentioned that the first witness produced before the Committee of the House of Commons was the late Chairman of the Board of Works, Sir John Burgoyne. I rather wonder that he mentioned it. Sir John Burgoyne states—

(*Chairman.*) Mr. Tottenham, allow me to ask you if you have any detailed plans and estimates which you intend to lay before the Commissioners, for a national harbour of refuge in Ballycastle Bay?

(*Mr. Tottenham.*) I have not; I came unprepared. If I had had a fortnight's notice I would have had them, but I received the Secretary of State's answer to the letter I addressed to him only the morning of the day before I went to Portrush, which was the day before you arrived there; but would you permit me to say, if my evidence here would warrant me, to be authorized to produce to you further evidence in London, I think you will recollect that you stated so in Portrush.

(*Chairman.*) I think you will recollect that I stated at Portrush that your communication had been forwarded to me by the Secretary of State, but that it had reached me so short a time previously that I had been unable to bring it under the consideration of my fellow Commissioners. You are aware of the fact that three of them visited and inspected Bally-

castle Bay in the *Banshee;* and since the meeting in Portrush I have had an opportunity of bringing before the Commissioners your proposal for a national harbour of refuge at Ballycastle Bay. Now the resolution come to on the subject is this, that as regards position and expense of construction, the site is so entirely ineligible that it is not necessary to enter into any evidence on the subject, but I did not like to stop you, as we were anxious to hear any brief statement you might like to make. My opinion really is, however, that it has extended already beyond the length that the subject demands, and a good deal of irrelevant matter has been introduced into your speech; that is inevitable, however, not being a nautical man yourself, but to us professional men, who understand the subject, it was apparent that you introduced a good deal of extraneous matter that had nothing to do with it. Under these circumstances, we think it quite unnecessary to trouble you any further at present, or go into any evidence on the subject, but should you, on further consultation with an engineer, of such eminence as you may think proper to consult, desire to address a memorial to the Commissioners, we shall be happy to receive the memorial, with detailed plans and estimates of expense, in London.

(*Mr. Tottenham.*) Then you do not wish us to produce evidence to counteract the evidence against Ballycastle given at Portrush?

(*Chairman.*) There is nothing in what I have said to warrant the statement that the evidence heard at Portrush affected our opinion. My statement was, we professional men, qualified to judge on the subject, inspected the locality, attentively considered it, and we have come to the opinion I have announced to you.

(*Mr. Tottenham.*) My impression was that if we would be able to produce local evidence in favour of the harbour, and then if we would be able to produce in London detailed plans and specifications of the proposed breakwater and pier, you would allow me to do so.

(*Chairman.*) No; if you recollect I said that the Commissioners reserved to themselves the right of judging what evidence was or was not relevant. I distinctly reserved to the Commissioners the right of judging of the relevancy of the evidence that you would produce.

(*Mr. Tottenham.*) Then with respect to that, if you consider the plans and estimates feasible and could be carried out, I will have the trouble to bring the witnesses to London that I have here to-day.

(*Chairman.*) Under these circumstances I imagine the course is to lodge detailed plans and estimates, and we will proceed to consider them, and if it were then thought desirable to have further evidence, the evidence would be brought over to London at our expense.

(*Mr. Tottenham.*) Then with regard to the witnesses I have brought here to-day, I can only bring them back again, of course not at your expense.

(*Chairman.*) There are several officers and persons whom I summoned, and of course they will be of no expense to you, but of all others we know nothing. If you had stated to me at Portrush that you wanted those persons as material witnesses, I would have granted their expenses as well as that of the naval officers and others summoned.

Mr. Robert Corry examined.

4907. (*Chairman.*) You are a shipowner in Belfast?—Yes.

4908. How long have you been connected with the shipping interest of Belfast?—Ten years.

4909. What is the nature of the shipping with which you are connected?—Principally in the foreign trade, both in the East India and North American trades.

4910. Then have you ships going north-about?—Often.

4911. Are you aware of the objects of this inquiry?—Yes.

4912. Now would you give to the Commissioners your opinion as to the necessity or advantage of a harbour of refuge to be constructed at the Skerries?—I went round within the last month and looked at the place, and what I understood is, that in 99 cases out of every 100, our ships went outside Rathlin, and I think that there would be far more losses going in to look for a harbour of refuge than to keep out at sea.

4913. But I want to know your opinion as a shipowner, should it be decided to construct a national harbour at the Skerries?—My opinion, is, that it would be a waste of public money. The fact is, I think it would be a job to put such a harbour of refuge there.

4914. Had you ever large ships trading to the Baltic?—Yes; we do a great deal in the Baltic trade, but not with my own ships.

4915. Have you any opinion to offer as to the advantage of a national harbour of refuge on the east coast of Scotland?—I have not. It might be advantageous to have it in some place. I see by the wreck chart that there are more wrecks there than either at Rathlin or Portrush, and I find that there is not even a rocket station along all the north and west coast of Ireland till you go to the entrance of Sligo Bay.

4916. Have you any opinion as to the Isle of Man; could anything be done there which would be beneficial to the trade of Belfast in the way of refuge?—There might be in the way of steamers, but my way is to keep out at sea as much as possible.

4917. Have you read the report of the Committee of the House of Commons on the subject?—I have read a short report.

4918. Do you recollect the proposition for the improvement of Carlingford Bay and Waterford and Wexford harbours as harbours of refuge; what is your opinion as to that?—I think I recollect one was the deepening the harbour of Carlingford Bay. It might do for coasters, but I think it would be better for them to keep out to sea.

4919. (*Mr. Lindsay.*) Do you think that you have sufficient harbours of refuge already on the coast?—I do.

4920. Therefore it is your opinion that it would be wasting the public money to attempt making a harbour of refuge at Portrush Skerries?—I do.

4921. And therefore, holding that opinion, you do not think it desirable to have a harbour of refuge at Ballycastle?—I think it would be no use. It is very good for a private speculation, but not for a public work.

4922. Say that it was decided to have a harbour of refuge on that part of the coast, whether would you prefer Ballycastle Bay to the Skerries?—I think the most natural place would be the Skerries, but I think it would be more hurtful than good. It might be useful for coasters now and again, but they have Derry Lough and sea room, so that there is considerable safety.

4923. Then is it your opinion that a harbour of refuge is not necessary on any part of the coast of Ireland?—I do not speak generally, I only speak of the places I know.

4924. Then you think there are sufficient natural harbours of refuge in the north channel?—I do.

4925. You say that a harbour of refuge in the Isle of Man might be useful for steamers; would it not also be useful to sailing vessels?—Well, I am not a good enough sailor to say whether it would or not, but I think it would not be of much use.

4926. Have you any idea in your own mind of the best place in the Isle of Man?—I have not; I often heard Peel spoken of, but every one would like a harbour near his own place.

BELFAST.

Mr. R. Corry.

13 Sept. 1858.

Mr. Lindsay.

4927. But do you think that a refuge harbour there would be of any use to foreign-going vessels ?—I think that a refuge harbour there would be of no use to foreign vessels. I do not think that it would be of great use to us.

4928. Is there not a large coasting trade in the Irish Sea ?—There is.

4929. Are they not occasionally caught in a storm, and have they not to seek for a harbour of refuge ?—Well, they have to run for natural harbours of refuge.

4930. You are aware that there is a proposal to deepen the bar at Carlingford to allow vessels to get into the natural harbour that already exists ?—I think it would be wiser to do that.

4931. You are aware that the estimate is very trifling ?—Yes.

4932. Should you think 20,000*l.* or 30,000*l.* well laid out in forming the natural harbour of Carlingford Lough into a refuge harbour for coasters ?—If useful in saving life and property of course it would be well laid out.

4933. Are you acquainted with Waterford ?—I am not.

4934. (*Capt. Vetch.*) Your vessels from America coming north about, if unable to prosecute their voyage east of Malin Head, where do they take shelter ?—I think they go out to sea, and if they could not they would come back again into the Lough.

4935. In like manner in their voyages outward, do they take refuge anywhere ?—No, never. In fact I would dismiss a master at once who would offer to go into a place like that at the Skerries.

4936. Did these vessels, going or coming, ever put into Loughindall ?—I had a large vessel put into Loughindall two years ago. The main and mizen masts were cut away. She was going to the Clyde, and could not make there.

4937. Did Lough Swilly ever serve as a place of shelter ?—I believe for small coasting vessels it does, but I never knew our large ships to go there.

4938. (*Mr. Coode.*) Did you dismiss the master of the vessel for putting into Loughindall ?—I dismissed him, but not for that circumstance.

4939. Then you think a harbour of refuge may be of use under certain circumstances ?—Yes ; natural harbours of refuge are of use.

4940. You seem to have studied the wreck chart, and you state that harbours of refuge may be of use to coasting vessels. Now do you know the proportionate number of wrecks of coasting vessels compared with those foreign-going ?—I do not. I see a great number of wrecks on the English coast, but not many in the Irish Channel.

4941. (*Chairman.*) I think you said that the vessel put into Loughindall with loss of the main and mizen masts ?—Yes.

4942. Could you furnish us with a detailed statement of the circumstances ?—Yes.

4943. (*Mr. Lindsay.*) Was it blowing a gale of wind when the ship put in there ?—Yes. I do not know how it was, but she was wanting to go to the Clyde and could not make it. It was blowing a hurricane.

4944. Did she reach the harbour without the main and mizen masts ?—They cut away the mizen mast to make her wear, and the other mast to make her ride it out.

4945. And she brought up in safe anchorage in that state in Loughindal ?—Yes.

Mr. James Barnett examined.

Mr. J. Barnett.

4946. (*Chairman.*) What is your occupation ?—I am a shipowner ; I have been connected with the shipping interest of Belfast for some 30 years.

4947. What is the nature of the shipping trade in which you are now engaged ?—They are now in the foreign trade ; but I formerly had vessels in the coasting trade.

4948. And when you had did they ply to all parts of the coast ?—Yes.

4949. Did any of your vessels go to the Isle of Man, or different parts of the coast of England ?—They have occasionally put wind-bound into the Isle of Man in stress of weather.

4950. Where do your foreign vessels trade ?—To the United States, the Mediterranean, and different other places.

4951. State any opinion you entertain of the advantage or necessity for a harbour of refuge at the Skerries ?—I have no doubt whatever but a harbour of refuge at the Skerries, on the plan furnished to me in London by Mr. Macartney, would be exceedingly advantageous to the coasting trade ; but I question very much if it will be of the slightest use to the larger vessels. It might be getting out, but in coming in it would be exceedingly advantageous to run for such a harbour as could be constructed at the Skerries.

4952. Are you aware that pilots from Lough Foyle in bad weather frequently board vessels after they have got inside of the lough, and that they have not been able to board vessels at sea ?—I am not aware of that, but I have no doubt of the fact. From the position of the lough and the position of the sea it would be very difficult for pilots to board vessels there.

4953. As a shipowner, is it your opinion that it would be of advantage to vessels proceeding round there, that the pilot vessels of Lough Foyle should be decked vessels, so that they could board vessels eight or ten miles from land, instead of not boarding them till they came inside of the Tun banks ?—It would be exceedingly advantageous to the trade, but I question if it would pay the pilotage establishment. If Portrush were constructed into a harbour of refuge it would be an advantage to have pilots at sea, but vessels coming into the channel never look for a pilot off the north coast, and there are not sufficient vessels trading to pay for such a pilotage establishment as we have here.

4954. But would you extend that statement that vessels passing do not look for a pilot to vessels under stress of weather ?—I think it would be of use if it was a foreign vessel, but none of our own vessels require it. The masters of all our own vessels are so well acquainted with the navigation of the channel as to be able to come in without pilots ; but a foreign master who had never been here before would be benefited by having pilots.

4955. Then would it alter your opinion as to the advantage to the general trade of the country of a harbour of refuge at the Skerries if I were to tell you that one reason why the pilots of Lough Foyle have not a better description of boats is, that they have no harbour that they can run into in bad weather ?—Well, you know that is a question which I have not considered.

4956. (*Mr. Lindsay.*) From your long experience as a shipowner do you think, in a national point of view, that a harbour of refuge is necessary in the north channel ?—I think that harbours of refuge are exceedingly desirable in all places along the coast, at intervals from each other, but I question if there is any place in the north channel available for the formation of a perfect and safe harbour of refuge. Ballycastle has been mentioned here. Now I think that Ballycastle would be a far easier place at which to construct a safe harbour of refuge than at the Skerries or Portrush. Ballycastle is an approachable coast ; the Skerries an iron-bound, dangerous coast, and a vessel must be in great difficulty when it would venture to come near the Skerries in a gale of wind.

4957. What are the prevailing winds there ?—West. It is west or north-west for nine months in the year, perhaps.

4958. As you seem to have formed an opinion as regards Ballycastle, have you any idea of what the

cost of forming a national harbour there would be?—Not the least; I only speak of Ballycastle and Portrush, because they were mentioned here. In Portrush, on a calm day, I have seen vessels lying so uneasy, that I have no hesitation in saying they would have broken off if a gale of wind had risen; they could not readily have kept their hold with a pair of anchors and chains.

4959. Then you object to Portrush because of the heavy rolling sea?—I do.

4960. Then is there not a heavy sea in Ballycastle Bay? — No, it is circumscribed; it is a narrow channel compared to Portrush.

4961. (*Mr. Lindsay.*) I asked that question because I was one of the three Commissioners who inspected it, and though the wind was blowing off the land, there was a very, very heavy sea rolling into the bay.

4962. (*Mr. Barnett.*) A breakwater has been constructed at Plymouth, and a pier at Kingstown Harbour, and one tenth the sum would construct a safe harbour at Ballycastle Bay.

4963. (*Mr. Lindsay.*) Have you considered what part of the bay would be best for it?—No, that is an engineering question.

4964. Being a practical man I will show you the bight of the bay, and ask your opinion. Say that a harbour of refuge was made in Ballycastle Bay, the great object would be to protect ships during the north-west gales?—Yes, from the north-west and west-south-west.

4965. They would be protected by the land to the south-west?—Yes.

4966. But it would be necessary to run out a pier so as to protect them in north-west gales?—Yes.

4967. Say that a ship was caught in a north-west gale and was obliged to run for this harbour, a harbour so constructed as to protect vessels in north-west gales, would not the ship be down on the lee shore before she could get into that harbour?—No, it does not follow that it would be down on the lee shore. If the vessel was running from sea, outside Rathlin, to escape from a north-west gale, she would have the harbour and everything connected with it before her so that there would not be any occasion to come into the lee shore. She would naturally round too wherever she came to anchor.

4968. But during a north-west gale the eastern-most part of Ballycastle Bay would be a lee shore?—It would, of necessity.

4969. Well, consequently, to get round the pier or breakwater that would be necessary to protect ships in north-west gales, she would require to run down very close to the lee shore?—Not at all, it would depend upon the room there was to enter the harbour. If you circumscribe the entrance so that it is necessary to run down on the lee shore, well; but I should say if there was a violent gale from the north-west, and captains of vessels found they could weather Fair Head, that they would run for either Campbeltown, or Belfast Lough, or Lamlash.

4970. Then, in your opinion, to make a harbour at Ballycastle Bay sufficient to protect ships in north-west winds, it would be necessary to carry a breakwater or pier a considerable length into the bay, so as to keep them sufficiently free from a lee shore in running for the proposed harbour?—Undoubtedly it would.

4971. Well, would not that considerably increase the cost?—No question but it would, and if you ask my opinion of Ballycastle and Portrush, I would say that neither would be eligible for a harbour of refuge except for the coasting trade. In all cases the coasting trade would be greatly benefited by a harbour of refuge at Portrush and one at Ballycastle; and not that they would be available in gales of wind, but that they would be available in head winds, so that when they could not work their way by sea they could run into Portrush or Ballycastle, and remain till the wind shifted.

4972. But as the main object of a great harbour of refuge constructed at the cost of the Government is to save life and property, you, I understand, think that there is no port in the north channel where such could be constructed; and, secondly, that on account of the many natural harbours that exist, it is hardly necessary—are those your views?—My view is that neither of the places that have been mooted are available for a harbour of refuge such as that you describe; they would be exceedingly useful harbours of refuge for the coasting trade, for people who are continually running along the shores might be able to take these harbours when stronger and larger ships would not be able to attempt it.

4973. Then for the convenience of the coasting trade these harbours might be useful?—Yes.

4974. Do you think a harbour of refuge useful at the Isle of Man?—I think it is exceedingly desirable, but I do not think it necessary at all round the Isle of Man. There is sea room enough.

4975. Then you do not think it necessary for the saving of life and property at the Isle of Man?—I do not think it necessary for the saving of life or property at the Isle of Man to go to very great expense with a view to that, for at the neighbourhood of the Isle of Man we seldom hear of losses of life or property. A vessel sailing past the Isle of Man in a gale of wind can take the lee side of it if she choose, and there are harbours all round the island that vessels can run into unless they are too large, but there is no place at all on the coast of Ireland that you could make a harbour of refuge equal to our own harbour here as a harbour of refuge. It is accessible from all points of the compass, and no matter whether you are on the shore or whether you let go, you are secure, you are perfectly safe.

4976. Have you good anchorage at the mouth of Belfast Lough?—Yes.

4977. Are you sheltered in all winds?—No, not from the east and south-east, but a vessel running into the harbour can take shelter, by going into Bangor Bay on the one side or under Black Head or White Head on the other, or in Carrickfergus Bay it will be perfectly safe.

4978. What water have you at low-water spring tides all the way coming up to Belfast?—I think 20 feet would be about the average. I think the deepest draught of water we can bring up to the quay is 20 feet or 20½ feet. I had a vessel come up some months ago drawing 20 feet 6 inches.

4979. Do you know Waterford or Wexford sufficient to give an opinion?—I do not. Carlingford is a desirable place for a harbour of refuge, because we have a natural harbour, and it only wants the channel deepened and widened, and I believe that a small sum would do that effectually.

4980. Then you think that the deepening and widening of Carlingford would be of advantage to the foreign as to well as the coasting trade?—Yes, to all vessels if caught in a gale of north wind, and a good harbour there would be a desirable thing.

4981. (*Capt. Washington.*) Are you acquainted with Waterford?—I am not.

4982. You are aware that a large trade passes out by the south channel?—Yes, I know the position of Waterford.

4983. You are aware that there is a natural harbour there very like that at Carlingford Lough?—I believe so.

4984. Do you think if a small sum were laid out in deepening the entrance it would be of advantage to the trade?—I think it would be advantageous, in all cases where a small sum of money would improve a natural harbour, for the Government to do that.

4985. (*Capt. Vetch.*) May I ask, Have you ever been in Douglas Harbour in the Isle of Man?—I believe I have; I was cast away on the Isle of Man about ten years since, and I visited several places then, and I believe I was in Douglas Harbour.

4986. Are you aware that sometimes, in certain winds, steam packets from Liverpool are not able to get in?—So I have heard.

BELFAST.

Mr. J. Barnett.

13 Sept. 1858.

Captain Vetch.

4987. Are you aware that Douglas Harbour is sheltered on three sides, and open only to the east? —I am not aware, but I suppose that is the case.

4988. Then as that is the case, I wanted to ask you if running out a pier to protect the east side is not the proper course to take?—It would be exceedingly desirable, provided the expense would not be too great, such as Mr. Lindsay objects to at Ballycastle.

Mr. ROBERT BRIGGS, Master of a Steam Ship, examined.

Mr. Robert Briggs.

4989. (*Chairman.*) How long have you followed the sea?—I have been at sea 15 years; and I have been about seven years a master.

4990. What vessels did you principally command? —I have been in the foreign trade, but lately in the cross channel coasting trade.

4991. In what direction along the coast have your vessels been employed?—Crossing the channel from Lancashire to Belfast, and from Belfast down to Londonderry.

4992. Have you any opinion to offer to the Commissioners as to the advantage of a harbour of refuge at the Skerries?—I think it would be very desirable there should be one there. There was an instance two or three years ago in which a large American ship was lost not far from Portrush. There was also another instance of a ship being embayed to the eastward of Burford Head—both large ships in the foreign trade. Had there been a harbour of refuge at Portrush most probably both vessels would have been in safety.

4993. Have you ever been at anchor in the Skerries in bad weather?—I have been in the Skerries Roads. I have had occasion to lie there as far as two days consecutively.

4994. From what direction was the wind?—The wind was about south, having had to run back from Fair Head.

4995. And the wind being off shore, was the water smooth?—Quite.

4996. Have you ever been in the Skerries with a heavy wind from the north-west?—I have been in, but not in bad weather.

4997. Are you acquainted with the Isle of Man?— Yes.

4998. Would a harbour of refuge at Douglas be of use to the Liverpool trade?—It is very requisite indeed in the winter months. I traded to the Isle of Man for two years.

4999. Will you state the reasons on which you form that opinion?—A gale of wind from the south-east breaks heavily across the entrance against the piers, which renders it highly dangerous to take.

5000. And on what part of the Isle of Man would it be most advantageous to the shipping to have a harbour of refuge, supposing one to be made?—Well, there is so little difference between Ramsay Bay and Douglas, the distance is so short, that suppose a vessel caught in a south-east wind, say at the Bell Buoy, Liverpool, and obliged to bear up, there could be little difference in the choice, supposing that each of the sites were equally eligible, which I think they are about.

5001. (*Mr. Lindsay.*) Do you know the names of the two vessels lost in the neighbourhood of Portrush? —One was called the *Susan Hopley*, a large American ship, and the other ship was not lost, but was brought up by a steamer.

5002. What reason have you for supposing that the American ship would have been saved had there been a harbour of refuge at Portrush?—Evidently, the vessel being on a lee shore, if there had been a harbour she would have been brought up. I think if there had been a harbour of refuge, known as such, he could have caught it.

5003. Have you ever been at Loughindall Bay?— I have not; but I think that, from the examination of a previous witness, the anchorage can't be good in which a ship is obliged to cut away her masts to ride.

5004. Have you ever been in Lough Swilly?—I have not. I went down three months by land to look at it; but I never had occasion to call at it, and I never went to the entrance of it.

5005. When you say that a harbour at the Skerries or the vicinity is desirable, do you mean to apply your observations to the coasting trade, or to coasting and foreign. Would it be necessary in your opinion for all descriptions of ships?—I think if it were established it would be used by all coasting and foreign.

5006. Is it the case that a coasting vessel, bound round to the west of Ireland, and having got as far as Innishowen Head, were a wind from the west would have no shelter till she came to Larne or Campbeltown on the opposite side. Has a ship not good shelter in Lough Foyle?—Supposing she were taken short before she got to it, there would be difficulty in a ship fetching into Lough Foyle in a north-west gale. I have seen Lough Foyle that you could not take it even with a steamboat; the sea was breaking across the entrance to it so hard that it was not safe to attempt it.

5007. Would she not be safe when above the lighthouse?—No, the sea was breaking right across there from the Tun banks to the main land.

5008. You expressed an opinion that a harbour of refuge would be necessary at the Isle of Man, but you did not give a decided preference to Douglas or Ramsay Bay. Say that it was decided to have one harbour there, and that the choice rested between Ramsay Bay and Douglas, I would like to know, if in such a case as that, which point would be the most useful for saving life and property, and afford the greatest facilities to the shipping?—I would say Ramsay, because there is more room. In Douglas Bay there is not sufficient extent for a national harbour of refuge.

5009. Then your opinion is, that the harbour at the other place would be useful, but that if it were to rest between these two places (the one to have it and the other not) that you would give the preference to Ramsay Bay because there is more space?— Yes, because there is more rolling ground.

5010. (*Capt. Washington.*) Do you consider Belfast a national harbour of refuge at all times?—Yes, but there is not the shelter from the east, the same as the gentleman who last gave his evidence supposes.

5011. Where would a vessel go to under such circumstances?—By coming sufficiently up the lough she would get into safe water.

5012. In fact Belfast has the advantage of being a natural harbour accessible at all times?—Yes, and is used as such.

5013. Are you acquainted with Carlingford?— No, I am not much acquainted with the coast to the south.

5014. Nor with Waterford?—I know nothing of it further than in passing it while in the foreign trade.

5015. Did you ever go into Lough Swilly?—I did not.

5016. Had you ever occasion to run for Loughindal?—No, it is not much frequented. Coasters don't like it, it is a bad riding place; it is not a safe place. It is a very bad riding; vessels ride very heavy; but I am merely speaking from hearsay.

5017. (*Capt. Vetch.*) I think you mentioned you were trading to Douglas for two years?—Yes, for two summer seasons.

5018. And the Bay of Douglas is of considerable depth of water; there are 12 or 14 feet anchorage in the bay at time of low water?—Yes.

5019. Therefore it is accessible at all times of tide for steamers?—It is.

5020. With respect to Ramsay, are you aware if it is a dry water harbour?—Both are equally dry. I was speaking of the bay.

5021. I am speaking of the harbour of Ramsay, which consists of a river which is dry at low water, is it not?—Both harbours are equally dry within the piers at low water. You can't approach the pier at Ramsay so near as at Douglas.

5022. Yes; but you are aware that in the Bay of Douglas there are 14 feet of water?—There are; you can't get so near at Ramsay, but you can get very near the pier at low water.

5023. I think the harbour of Ramsay is defended by a pier entirely dry at low water, is it not, and you must anchor outside?—It is further off than at Douglas.

5024. And you are aware that it has no defence; it is open to the north, and east, and south, but that Douglas is sheltered on three sides?—There is almost, I think, the same shelter as at Douglas; there is a deep bay off Ramsay, and the island on three sides.

5025. (*Mr. Coode.*) You have spoken of vessels running back through the north channel, to Larne; is that common?—In the coasting trade it is.

5026. How many vessels have you known do so during a gale?—There might be from ten to twelve perhaps, or from 15 to 20, according to the length of the spell of west winds. By a sudden shift of wind that is about the amount of fleet that run back.

5027. At what point, generally, do they bear up?—Fair Head principally; they very seldom go further. If there is a wind check they are nearly sure to get it there.

5028. Then if a vessel were caught there in a west wind, would Portrush be a fair place for her?—No, there is nothing else than to go to Larne.

5029. But I think you said that vessels caught off Innishowen had run for Larne?—If they are caught in that part of the westward, which does occur.

Captain WHITE, Harbour-master of Belfast, examined.

5030. (*Chairman.*) How long have you been harbour-master of Belfast?—I have been about six years harbour-master of the port of Belfast. I commanded a steamer here 25 years since, generally through the channel.

5031. And from what period have you been at sea?—I went first in 1814, but I was frequently ashore. I could always get the command of a ship when I wanted it. I was master of a steamer for five years, and I was for five or six years master of sailing vessels.

5032. And where did the vessels trade to which you commanded?—When I was in the coasting trade the steamer ran to Belfast, Carlingford, and Wexford, and Dublin.

5033. Are you acquainted with the Isle of Man?—I am.

5034. Are you acquainted with Portrush and Lough Foyle?—I know Portrush, and I have been looking forward to it for the last 20 years as a place for an asylum harbour in the north channel, for I am an advocate for them on a large scale.

5035. When I said Portrush, I should have said the Skerries Roads; do you know them?—Yes; I have been off the Skerries Roads in a wind which was off the land, but I did not presume to go up to them. My opinion is, that if these rocks of which the Skerries are composed, were connected with the land, it would make a harbour that would be safe in all weathers.

5036. Am I to understand that you are decidedly of opinion that it would be an advantage to the coasting trade?—Not only to the coasting trade, but to the general trade, except this, that masters have got instructions from their owners not to take any harbour; but I am an advocate as an old ship-master, to take a harbour at a proper time, and the ship and cargo are safe till a proper wind sets in.

5037. Then, such being the case, would you give your opinion of the necessity for a harbour of refuge at the Isle of Man?—As to the Isle of Man, you know there is an immense trade, both by the north and south channels, to Liverpool and the ports on the channel, and vessels, if the wind be from the south and south and east and can't fetch into Liverpool, they are still in the channel. They can't get into Holyhead, and they have to lay to, or seek an asylum harbour, and the only one for them at present is Belfast Lough. Numbers of vessels seek to find shelter on the north side of the Isle of Man. I would have to disagree, however, with Captain Briggs, the last witness, who advocated Douglas or Ramsay for an asylum harbour. When a vessel wants to seek it, it is on the north shore; and you will find therefore, if you refer to your chart, that Peel is the place where an asylum harbour should be made, if made on a sufficiently large scale.

5038. Now, will you give your opinion of the necessity or advantage for improving the entrance at Carlingford Bay, and the entrance to Wexford and Waterford, not with the view of improving the ports locally, but with the view of serving as subsidiary harbours of refuge to the passing trade?—If you will look at the chart you will find from the north and south lights on to Dundrum Bay, that there is a large inlet there. Vessels are often caught, and must go ashore there, or seek a harbour, and Carlingford Lough, from what I know of it, is capable of great improvement, and I believe at small expense.

5039. Now, as to Wexford?—As to Wexford I am afraid you will never make it a harbour of refuge. There is a shifting sand there, such as that they could not cause the anchorage to remain any given depth. I understand a harbour of refuge to be a harbour that could admit vessels at any time.

5040. But if it could be made, you consider the site an eligible one, and that it would be useful to the passing trade?—I think it has been in contemplation to make a harbour round near the Saltees, near New Ross and Waterford, and then from Wexford to make a canal through for the local trade.

5041. As to Waterford; do you think that that would be a useful place for vessels at all times?—Nature has done a great deal for it, and by a little deepening it could be made a splendid harbour, and I have no doubt if it were made but it would be useful for the passing trade as a harbour of refuge, because there is nothing of the kind nearer than going up to Cork.

5042. (*Mr. Lindsay.*) The last witness said that Belfast Lough was used as a harbour of refuge; is that so?—So it is. Those vessels that come round the Isle of Man for Liverpool, if the gale continues, do not let go their anchors, and they come into Belfast Lough during the southerly gales. If head winds from the west, they could fetch round the Isle of Man, and go to Liverpool, or, during the northerly gales, if they can't get out by the north channel.

5043. Have you any idea of the number of vessels that take Belfast Bay for shelter in the year?—We do not take an account of them, only of those that come to the quays; but I have seen 150 vessels, or thereabouts, coming in for shelter. They are principally coasters from the Scotch and Cumberland coasts.

5044. The bay, however, is open to the north and east winds?—It is, but there is good anchorage. They never drive ashore with an east wind; they drive up the lough.

5045. Well, but in driving up the lough, if they were large ships would they not go ashore?—Yes, if they went very far they might, but there would not be any harm. There may be a heavy sea; but there is never such a heavy sea in the lough that a row boat can't communicate with a ship.

5046. In fact there is no scope for a sea running into Belfast Bay?—No.

BELFAST.

Captain White.

13 Sept. 1858.

Mr. Lindsay.

5047. What number of vessels enter Belfast Lough during the year?—Well, up to 6,000 vessels of all tonnage are reported at my office.

5048. What draught of water, at high-water spring tides, is in the shallowest part?—We have 20 or 21 feet, but we do not like to bring up vessels of more than 18 feet. We have 21 feet down to the light.

5049. There have been great improvements made in the harbour?—Yes.

5050. How is the harbour managed?—By Local Commissioners.

5051. How are they appointed?—There are five appointed every year. They are chosen by those in the town who pay a certain amount of rates. The Commissioners remain in office three years.

5052. What is the revenue of the Commissioners?—The Secretary can answer that better than I can.

(*Mr. Wm. Thompson*, Secretary of the Belfast Harbour Commissioners). Has the revenue been about 35,000*l.* last year?—I am ordered to furnish to the Commissioners the last annual report of the Belfast Harbour Commissioners.

5053. (*Capt. Washington to Capt. White.*) What number of vessels come up to Belfast quay in the year?—Nearly 6,000.

5054. Are there sufficient pilots for the trade of the port?—Yes. We have 21 pilots, three pilot-masters, and two mates.

5055. Do they reside in the lighthouse in the lough?—We send them there in the first instance, and they are then drafted into the pilot cutter, which is always cruising on the station off Gray Point and Carrickfergus.

5056. Do you think it is right, in any large harbour with a large traffic, to let pilots go out in open boats?—The trade would be badly attended to in such a harbour as this, if the pilots used their own boats as formerly. The custom was that formerly a man got a licence with three or four boys, and he wrought as he pleased.

5057. How long is it since the pilots were put upon the new footing?—In 1844. The superintendent of pilots at the time found the necessity of putting them upon the new footing.

5058. Is the lough sufficiently lighted, and buoyed, and deepened?—It is.

5059. At whose expense?—It was done at the expense of the Harbour Commissioners at a large cost. The pilotage dues do not cover the expense.

5060. Then the Harbour Commissioners deemed it necessary to have a pilotage establishment, even at an annual loss?—Yes. A number of the masters and mates of steamers have taken advantage of the Board of Trade Act, 1844, and got out licences.

5061. Are the pilots quite sufficient for the wants of the port?—They are.

5062. I understood you to say that you were acquainted with Waterford?—No, I said Wexford. I never was in Waterford Harbour, but I was off it, and, judging by the chart, it is capable of great improvement.

5063. You know Carlingford Bay?—Yes. I traded there with steamers.

5064. Do you think it desirable, if a breakwater could be erected there at small cost, to do so?—No doubt of it, as it is a very fine harbour.

5065. Are you acquainted with Loughindall in the Island of Islay?—I am acquainted with it on the chart; I was too near it one morning.

5066. How was that?—I thought I would get ashore.

5067. How was the wind?—It was to the west.

5068. Could you not get into the harbour?—I could not. In the first instance I was becalmed, and got into the Runs of Islay, and I was in danger of going ashore. It is a place that is likely to take a great deal of money, but it would make the finest harbour of the north channel, it lies so open to the north channel.

5069. Are you aware that many vessels take refuge there during the year?—I find that vessels coming from the Baltic report that they have been there, but they don't like it.

5070. Why?—It is an open roadstead. It is capable of great improvement.

5071. What depth of water did you say could bring ships up to Belfast quays?—We do not like to bring up more than 18 feet, but vessels drawing 20 feet have come up.

5072. Do the mail steamers sail from Belfast at all times of tides?—Yes; the Scotch mail steamer sails at eight o'clock and never detains.

5073. (*Capt. Vetch.*) With respect to the Glasgow steamers, do they always arrive at the proper time?—When they have a south-west gale they may be two hours behind it, but they never put back.

5074. Does it ever happen that when they have come into the entrance of the lough, they cannot come up from a fog?—That frequently happens, and a prudent ship-master will let go his anchor anytime in a fog.

5075. (*Chairman.*) Did you hear the question put to a former witness relative to the pilots of Lough Foyle picking up ships farther out at sea?—If you make the Skerries an asylum harbour you want no pilot no more than going into Kingstown.

5076. Do you think it an advantage to the foreign trade not acquainted with the coast, to be able to pick up pilots at sea?—No doubt of it; I have myself found the Garnock pilots inside of Rathlin Island, looking out for ships there.

5077. And what description were they, were they foreign or home?—They were foreign. In the home trade the masters are all pilots.

5078. Then you consider it an advantage, if the formation of a harbour at Portrush enabled the Lough Foyle pilots to go farther out to sea with a better description of boats?—Yes; they would be much farther out to sea if they were lying in the Skerries than they would be in Lough Foyle, and they could board vessels much farther out to sea,

5079. (*Capt. Washington.*) Are you acquainted with the Balbriggan Skerries?—I have seen it, but I have not been close to the harbour.

5080. Then you can't give an opinion as to a harbour of refuge at Balbriggan Skerries?—They want one very much there, for there is nothing from Kingstown round.

5081. What distance is that?—Some 20 miles.

5082. Do you think it necessary to place a refuge harbour every 20 miles along the coast?—No, but from the formation of the Irish Channel a great number of vessels get embayed there and can't get out.

5083. Is Kingstown used as a harbour of refuge?—It is used, but it is too small.

5084. (*Mr. Coode.*) Suppose that a harbour of refuge was made at Loughindall, would you consider the Run of Islay as any formidable objection?—No doubt of it, but it is the best place you can get on the coast, and there would be no run in the harbour if a proper breakwater were made.

5085. Then, taking the whole of that district, you are of opinion that Loughindall is the best place for it?—Yes, from the way it is situated in the north channel.

5086. Then you give the preference to it over the Skerries of Portrush and Ballycastle. Taking the whole of that part of the sea, which of the three would you prefer, supposing that only one was to be made?—I would say, that Loughindall for the general foreign trade was the best, for it might save a great number of vessels from getting ashore in the Hebrides.

5087. Do I understand you to say, that a harbour of refuge at Loughindall Bay would save

more lives than one at Portrush Skerries, or one at Ballycastle ?—I would say, that they would be both necessary; the one for a vessel before she goes in past Innistrahull, and the other when she gets into the channel. They want one somewhere near Derry Lough, and nature has done so much for Portrush that I think it should be made there.

5088. But supposing only one was to be made, which would you give the preference to ?—Well, that is a difficult question to answer, for half a dozen vessels pass Portrush looking for a harbour of refuge for one that passes Loughindall.

5089. But I presume wherever a harbour of refuge were made it would become notorious; and that being the case, which then would you give the preference to ?—I would say Loughindall.

Captain MICHAEL M'LOUGHLIN examined.

5090. (*Chairman.*) How long have you followed the sea?—I am a steamboat-master; I have been at sea 24 years, and I am now going on seven years as a master.

5091. And what vessels did you principally sail in ?—Steam vessels as master, and I have been five years out of that pilot in Lough Foyle.

5092. And where were the steamboats employed that you commanded ?—From Glasgow, Derry, Belfast, Sligo, Fleetwood and Moorecombe.

5093. You have been present during the inquiry ?—Yes.

5094. Give your opinion as to the necessity or advantage of a harbour of refuge at Portrush ?—I think it would be, in my opinion, greatly wanted.

5095. State the reasons why you think it is greatly wanted ?—I have often been there myself both days and nights beating about in a steamer, and could not call in at Portrush; and I have been at anchor for several hours in the Skerries waiting an opportunity to land cargo and passengers, and after waiting there for hours we were forced to slip and leave. And we were forced to weigh anchor on several occasions and bring a cargo and passengers to Derry from Glasgow, and the same from Derry to Glasgow again. I have had to carry a cargo from Glasgow to Derry to land at Portrush, and I could not go in with it. I might have gone into the Skerries Roads and have lain for days and nights, but then I would have missed my regular hours of sailing, therefore I took it to Derry to call at Portrush on my return to Glasgow, but the weather did not permit me to land, so I beat about for some time and I had to take it on with me to Glasgow.

5096. I understood you to say that you anchored in Skerries Roads in bad weather, is that so ?—Yes.

5097. How was the wind ?—The wind was west and north-west.

5098. Was there a heavy sea in the Skerries Roads with that wind ?—There was not a very heavy sea; I could lay in safety in the Skerries Roads and a gale from the north-west.

5099. You know the west sound and the broad sound in the Skerries Roads ?—Yes.

5100. Now, if one or other of those two could be closed by a breakwater, which would you prefer to be closed for shelter ?—I would prefer the broad sound on the Skerries side to be closed up, leaving the west end open.

5101. Will you state your reasons ?—My reason is that there is not such a long fetch from the west and north-west by having the west sound open. Having the broad sound open, the whole force of the north-west swell completely pours into it, so much so that although I am going there these last 20 years, I would not take in hand to enter the broad sound in a gale of wind. I would, at the west side, in any sort of weather, or I would on the east side.

5102. You know the Isle of Man ?—Yes.

5103. Would a harbour of refuge be useful to the passing trade of the Isle of Man ?—Indeed I think it would be much required.

5104. Where would you place it ?—My opinion would be in Ramsay Bay.

5105. State your reasons for that opinion ?—My reason is that I think there is most room in it; though both Ramsay and Peel are dry harbours.

5106. Do you know anything of Carlingford ?—No, I am not acquainted with the south side.

5107. (*Mr. Lindsay.*) When you state that a harbour of refuge would be necessary at Portrush Skerries, do you mean that it is necessary for the coasting trade and the trade of Portrush, or do you mean to apply it to the foreign trade, and useful for the saving of life and property ?—I mean, in the first place, the saving of life and property; and, in the second place, for the safety of coasting. During my five years piloting in Lough Foyle, I have seen foreign ships out at sea ten or twelve or fourteen days beating out in the channel, with the wind at the west and north-north-west, and after all that having to bear up and go into the south channel; and I have no doubt that they were not more than 15 or 20 miles nearer Belfast Lough when a calm south-east wind set in.

5108. Can you name any instance where life and property could have been saved had a harbour of refuge been at Portrush ?—In 1847 or 1848 a brig went to wreck on the Tuns, and if such a thing as a harbour of refuge had been at Portrush, I have no hesitation in saying that both life and property would have been saved. There were four lives lost.

5109. Say that it was decided to make in that vicinity one harbour of refuge, whether would you give the preference (always considering the saving of life and property, and foreign as well as coasting trade,) to a harbour at Portrush Skerries or at Loughindall ?—I would give the preference to the Skerries. I do not know the anchorage at Loughindall; but I think that the site at the Skerries would be much more likely to save life and property than at Loughindall.

5110. (*Capt. Vetch.*) Don't you consider that the Skerries, as they now stand, are, to a certain extent, a harbour of refuge ?—I do.

5111. That, in fact, the coasting trade can now obtain shelter there ?—They do. I knew of a vessel that was at Innishowen Head running in there. She was commanded by a man who knew it, and she lay, not for days, but for weeks, in safety. I have known ships for America bound from Liverpool 14 days beating from the Bull of Rathlin to Inistrahull, but were frightened at the Tuns. And at last he ran into Lough Foyle, and he was only 24 hours in when the wind shifted. If a harbour of refuge had been at Portrush, shelter would have been taken the first day. I also knew of a ship, during my time of piloting, (and I put one of the pilots in myself,) get as far up as Greencastle in Lough Foyle, slip both her anchors, and had to run to the Clyde, where if there had been anything of the kind along the coast, it would have saved them from going to the Clyde.

5112. (*Mr. Coode.*) What was the size of the vessel that ran from Greencastle to the Clyde ?—Between 600 and 700 tons. She was timber laden, bound from Quebec to Londonderry.

5113. Why did she run ?—A gale of wind came on, and she slipped her anchors and ran to Clyde, to save herself from the Tun banks.

5114. Have you come through the west sound in a gale of wind ?—I have come through it in a gale of wind from all directions.

5115. Did you notice the difference between the sea in the west sound and broad sound ?—Yes; I would not take the broad sound on any account, and I have been going there for the last 20 years.

5116. Was the difference very material as to the sea in the west sound, and that in the broad sound ?—A very material difference, and besides there was a straight run. It is not one tenth the fetch from the

BELFAST.

Capt. Michael M'Loughlin.

13 Sept. 1858.

Mr. Coode.

west that there is in the north-west. I went into Portrush when a mate of the same vessel that took the cargo past Portrush, and it cost our company upwards of 500*l.* to get out of it. I am now speaking of Portrush Harbour and not of the Skerries.

5117. I suppose you damaged yourselves greatly?—We did not damage ourselves a great deal. There was opposition, and we got in, and the other boat did not. Our cant rope broke, and we came athwart, and carried away the next vessel, and the next, and so on.

5118. Did you go there for shelter, or in the ordinary course of trade?—In the ordinary course of trade.

5119. What size was the vessel you speak of?—She was about 400 tons register. The *Thistle.*

5120. Then you have a decided opinion that if one or other of the sounds at Portrush Skerries were closed, it should be the broad sound, and that the west sound should be left open?—Yes.

5121. Have you come through the west sound in a gale of wind?—I have done so scores of times in gales from the west and north-west.

5122. Have you ever come out of Portrush Skerries with a gale of wind from the west?—I have, with a gale in all parts. I have been running there for seven years as master once or twice a year.

5123. (*Capt. Washington.*) You know the small Skerries?—Yes.

5124. And you know the large Skerries?—Yes.

5125. (*Chart handed to witness.*) You see the rocks marked West Skerries?—I see the little Skerries.

5126. Now, if we left both sounds open, and joined the West Skerries altogether, and made a breakwater of them, and also blocked up the passage between the Middle Skerries, would that give additional shelter?—It would not break much swell from the north-west. I do not think it would be worth doing it for the additional shelter it would afford. If the broad sound were left open, it would be very difficult to hold in the Skerries Roads.

5127. Would it not be of advantage to have upon the Skerries a small light?—It would be of great advantage.

5128. Would you have the light placed on the Ramore side or on the Skerries?—I would say on the Skerries, on the extreme west end, provided the broad sound was filled.

5129. But suppose both sounds were left open, do you not think it would be of sufficient importance as a roadstead to place a small light there?—It would be of great advantage; but I always take it at night, both coming and leaving it without a light.

5130. But you are well acquainted with the coast; do you think, for those who are not acquainted with it, that it would be of advantage to place a small light there?—It would be of great advantage.

5131. (*Capt. Vetch.*) Have you ever witnessed the fact that even in a south-west wind there was a very heavy sea breaking over the broad sound?—There has been a bad sea, but nothing compared with what it is from the west and north-west.

Mr. TIPPETT, Coast Guard Service, examined.

Mr. Tippett.

5132. (*Chairman.*) How long have you held your present appointment?—I am in the coast-guard service; I have been at Ballycastle 15 years since the 6th of April last. I am aware of the nature of the anchorage in Ballycastle Bay.

5133. Give your opinion as to the advantage generally of a harbour of refuge on the north coast of Ireland, for the passing trade, whether foreign or coasting?—I do not know very much of Portrush.

5134. But first give your opinion generally, without reference to the locality?—I think a harbour of refuge would be very advantageous, and of course I speak of the locality that I know, or about that neighbourhood.

5135. State your reasons why you think it would be of advantage to the passing trade?—Because of the number of wrecks, and the number of vessels obliged to run for some place of shelter when caught in a gale of wind.

5136. What are the winds from which you consider a harbour of refuge would be of most service in affording shelter?—From the west and north-west.

5137. From what direction is the heaviest weather and heaviest sea?—There is a very heavy sea from south to north-west. I speak now of the ground sea, from storms in the Atlantic, which is thrown in and spent on the coast. The ground sea does not extend farther east than Fair Head. I was stationed to the east of Fair Head, at Tor Head, for 12 months, and there was no ground sea there.

5138. Give your opinion to the Commissioners as to the most advantageous position for a harbour of refuge?—I think it might be made in Ballycastle Bay.

5139. State the grounds on which you come to that conclusion?—I do not know that that will be better than Portrush. When a comparison is made between two places there is very much for and against both, as there is in everything in this world. There are many advantages in Ballycastle Bay that Portrush does not possess, both in a nautical as well as a political point of view.

5140. Be good enough to state the nautical and not the political advantages of Ballycastle Bay?—It has been stated that it is available for vessels passing from east or west, all vessels from Liverpool, and all vessels from America.

5141. And are you able to offer any opinion of the nature of the construction at Ballycastle, as respects the supply of stones and the depth of water?—I am acquainted with the depth of the water. My station is from Fair Head to Kane Bawn Hard, 16 miles west of Ballycastle.

5142. What would be the depth of water into which you would have to run the breakwater to get the same area of shelter as is proposed at Portrush?—I think that nine fathoms would be the greatest depth, commencing at a point called Craignascarf.

5143. Have you any idea of the length of the breakwater?—No; but I suppose a little more than half a mile would do it.

5144. And what would be the average depth of the water?—It would commence at four to five fathoms, and increase gradually to a little more than nine fathoms at Craignascarf.

5145. Have you any opinion to offer to the Commissioners as to the pilotage question—that a harbour of refuge might enable pilots to employ a better class of boats and pick up vessels at sea?—I have no remark to offer on that subject.

5146. (*Mr. Lindsay.*) Do you know of your own knowledge that the running of a pier out to nine fathoms would give the same area of sheltered anchorage as we now have inside the Skerries?—I think not so much.

5147. Would it give half the sheltered anchorage?—Very much more than one half.

5148. Have you measured it?—No.

5149. Then how do you know it will give half as much?—I think so, by looking at it.

5150. Would you be surprised if you were told it did not give half as much?—I would not.

5151. Would you be surprised if it did not give one fourth?—I think it would give more than that.

5152. Then it is only a supposition on your part?—I do not know the Skerries.

5153. Then suppose we make such a pier as would give sufficient shelter from a north-west gale, would you run for the roadstead with a ship?—I would, and be glad to get it. I have seen many vessels which would have been glad to get it. When a vessel is discharging cargo at Ballycastle, and the wind checks round to the north west, she is obliged

to run round Fair Head, and is detained there many times three or four weeks before she can return.

5154. What is the nature of the shore on the east part of Ballycastle Bay; are there no rocks?—One half of it is rocks. There is a beach strand one and a quarter mile, and then a rough coast from that to Fair Head.

5155. You say that there is a heavy ground swell coming in there, and of course a heavy sea comes in with a north-west gale?—There would.

5156. And would you not, as an old sailor, be afraid to get on that shore?—I would not, if there was a breakwater.

5157. You would be obliged towards the shore to get shelter to leeward the pier which you propose?—Why, that would depend on the position of the vessel.

5158. Saying that you were caught to the west of Ballycastle with a gale of wind from the north-west and you found it necessary, to bear up you would consequently be obliged to run towards the south-east part of the bay, which is a lee shore?—Yes.

5159. And then to haul up till you get under the lee of the breakwater you propose?—Yes.

5160. Then would there not be very great danger in doing so?—I think not.

5161. Do you know Portrush?—I do not know it perfectly. I have been there.

5162. Then, as a sailor, and if there is to be a harbour of refuge, which would you prefer, at Portrush or Ballycastle Bay?—Some have an objection to both places.

5163. But you can't say to which the greater objection applies?—(*No answer.*)

5164. Do you think, as a servant of the Crown, that the Government would be warranted in spending a large sum of public money in the construction of a harbour of refuge at Ballycastle, with the view of saving life and property?—There is not sufficient trade there at present to warrant that.

5165. I ask it upon national grounds?—Well, I think so.

5166. Do you think that, on national grounds, Government would be warranted in spending 100,000*l.*?—I do; and 200,000*l.*

5167. Do you think Government would be justified in spending 300,000*l.*?—I am not an engineer, and I don't know what such a pier would cost; but I think that Government would be justified in laying out a great deal of money in saving life and property, for vessels that were taken short in a north-west wind in the channel.

5168. Now, you said there were objections to both places; in the first place would you let us hear your objections to Ballycastle as a site for a harbour of refuge?—Well, there are certainly not so many objections to Ballycastle as to Portrush.

5169. But I want to know your objections to Ballycastle as a harbour of refuge?

After a long pause without an answer Mr. Lindsay resumed.

5170. I asked that, because you volunteered the statement. If you are not prepared to answer the question, I will put it in an easier form. What are the advantages of Ballycastle over Portrush?—It would be more sheltered.

5171. How more sheltered, is there any shelter now at all in Ballycastle Bay from a north-west gale?—At present there is not; but there would be if there was a breakwater.

5172. But with the same expenditure of money would not the Skerries be as well sheltered as Ballycastle Bay?—It would not.

5173. That is a supposition on your part, is it not?—It is; I have seen a plan of filling up the Skerries, which appears to be good.

5174. Then your opinion is that better shelter could be obtained in Ballycastle Bay than at Portrush for a less sum of money?—It is.

5175. And that is one reason why you give the preference to Ballycastle Bay?—Yes.

5176. Then, if it were proved that that does not exist, that preference of yours would fall to the ground?—Oh, certainly.

5177. Would you state some other reasons why you give the preference to Ballycastle over Portrush?—Because it is better situated as to the channel.

5178. And how?—Why, it is better situated as to its position being more easterly; it is nearer the other channel; it is nearer the Glasgow side.

5179. What other channel?—It is nearer the channel which we are now in; that is another reason why I prefer it.

5180. Now, suppose a ship caught in a north-west gale between Fair Head and Malin Head, do you think she would reach Ballycastle with much greater facility than Portrush?—I don't know that she could. I don't think she could.

Captain JOHN CAMPBELL examined.

5181. (*Chairman.*) What is your occupation?—I am master of a steamer at present; I have been 17 years at sea, and 7 years a master.

5182. In what trade have the vessels in which you have been employed been chiefly engaged?—The American, West India, and Mediterranean trade.

5183. Have you been present at this inquiry?—Yes.

5184. Give your opinion to the Commissioners as to the advantage or necessity of a harbour of refuge at Portrush?—I agree with the harbour at Portrush.

5185. State the grounds on which you come to that opinion?—I have often put back, when I could not take Derry Lough; and I was obliged to run into Belfast Lough going to the Baltic.

5186. What kind of a place is Lough Larne?—It is a small place; and one would be required to be well acquainted with it. I thought it better to run for Belfast Lough.

5187. Have you ever been anchored in the Skerries Roads in bad weather?—No. If there had been a harbour there I would not have run to Belfast Lough, nor yet would I if I could have taken Derry Lough.

5188. Detail to the Commissioners the reason why you could not take Derry Lough?—It was blowing such a heavy sea upon the Tuns, right across.

5189. How was the wind?—About north-west, and the sea was running nearly the same.

5190. Do I understand that the sea was running nearly north-west?—We were running down with a wind which was north-west, expecting to take Derry Lough, but we could not haul up again; we could not take sufficient canvas to get into the lough.

5191. And so you brought up in Belfast Lough, being afraid to try Derry Lough?—Yes, after beating down as far as Barra Head.

5192. Do I understand you distinctly to say that the sea was breaking right across from the Tuns to the opposite shore?—As near as possible. You could not make out the channel; you could not make out the buoys going in.

5193. Are you acquainted with the Isle of Man?—Yes.

5194. Have you any opinion as to the advantage of a harbour of refuge there to the passing trade; if so, state it?—I would speak in favour of Ramsay Bay.

5195. And why?—For space to be able to turn your ship, which you could not do at Douglas nor Peel. Neither at Douglas nor Peel you can't turn your ships in the harbour, you are obliged to back out.

5196. But suppose a harbour of refuge to be made at both places, giving ample room to turn the ship, have you any preference to state for one over the other, with the view to the facility given at either in bad weather?—I think Ramsay is more sheltered

BELFAST.

Captain John Campbell.

13 Sept 1858.

Chairman.

in more points. In fact it is the only place you have to go to when you are bound either to Liverpool or Belfast.

5197. But suppose a harbour to be constructed, equally well sheltered, I want to know if you have any preference for Ramsay over Douglas in point of situation? — I would still speak in favour of Ramsay.

5198. Do you know Wexford or Waterford?—I do not know them as a coaster; I know the Dublin Skerries.

5199. Are there any facilities there for a harbour of refuge?—I do not think it is required, as they are so near Kingstown.

5200. Do you know Carlingford?—No.

5201. (*Mr. Lindsay.*) Do you know Loughindall?—No.

5202. Looking at the site of it—what do you say? Whether, do you think a harbour at Loughindall or at the Skerries would be the greatest protection to life and property, and afford the greatest facilities to commerce?—I do not think anything at all of Loughindall, for it is so far out that I would fetch windward except I had a disabled ship.

Captain JOHN M'CLANE examined.

Captain John M'Clane.

5203. (*Chairman.*) What is your occupation?—I was 29 years and 6 months at sea, in all capacities connected with the mercantile marine, before I resigned; but I was only three years master before I got charge of the Sailors' Home. I have been five years at home on the 29th October.

5204. In what direction did your vessel trade?—I served my time from Troon to Dublin, and made 31 voyages in that direction; and after that I made 31 voyages from Belfast, north and south, in the foreign trade. I traded to the United States and our own colonies.

5205. Do you know the Skerries of Portrush?—I never was inside of the anchorage; but I would have been glad if I had been there often. When we were as far as Inistrahull we were obliged to put back to Belfast Lough while the wind continued; we were obliged to bear up in a fine able ship.

5206. You are well acquainted with the trade here, I suppose?—Yes.

5207. Does it often happen to ships that they have to put back when they are as far as Inistrahull?—We have known them to be further to the westward, though I never was.

5208. Does it happen to many vessels to be put back?—I have known a considerable deal in winter time—in the fall of the year; and very few of the masters that I have been acquainted with since 1830 ever inclined to run for such a place as Loughindall. They are not acqainted with the coast nor with the run of tides, therefore it is with reluctance if ever they take such a place.

5209. How many vessels have you known in Belfast Lough at a time, which have put back from stress of weather from the north channel?—I could not decide upon that point; but it is looked upon as a ready access going from north to south. I think the great run of our wind-bounders is bound south, but we have had many bound north.

5210. Do you know Loughindall?—Yes; I sailed 18 months out of it.

5211. What kind of a place is it to run to?—The shallowest part is 13 feet low spring ebbs; but the anchorage is from 3 to 4 and 4½ fathoms, and a flood tide with a south-east wind is the worst to contend against; but the anchorage is excellent good; it could not be better.

5212. And is it easy of access?—I should think so. Owing to the shore laid down on the chart, it causes strangers to be doubtful, but it is easy with a wind from the west-north-west to the south-south-east to bear in.

5213. And is it much resorted to by the coasting trade?—Very much.

5214. And by the foreign trade?—There are but few large vessels, and I think it is owing to the position on which it is shown on the chart, and probably owing to the book of directions not giving the same quantity of water as is found in it, a circumstance which we have long felt in Belfast and its trade.

5215. Do you know Larne Lough as a harbour of refuge?—I have heard of as many as 110 vessels being in Larne Lough at the time salt was manufactured there—before the duty was taken off salt.

5216. (*Mr. Lindsay.*) Do you think if Larne Lough were better known it would be more frequented by large ships?—I think so, since a light has been put upon the larboard and another upon the port end going in, and a buoy on the west side. A vessel will make greater freedom on account of the maiden light and the buoy on the Hunters' Rock. The anchorage is good.

5217. What description of ground?—Clay; and another advantage is, that if a man gets taken short and loses his anchors he can have them replaced.

5218. And can ships get shelter there in all winds?—Yes.

5219. At what depth of water?—At from three to four fathoms; but most vessels take the Cutter's Road or Yellow Stone, on the Island Maga side.

Captain DAVID PATTON examined.

Captain David Patton.

5220. (*Chairman.*) What is your occupation?—I have been at sea 25 years. I am a shipmaster for 19 years. I was first in the West Indian trade, and latterly in the American trade, coming in both channels.

5221. Are you acquainted with the Skerries Roads?—I can't say that I am perfectly acquainted with them.

5222. What is your opinion as to the necessity or advantage of a harbour of refuge in that district of coast to vessels bound foreign?—From my own experience, in sailing from Derry, Belfast, and Liverpool, I don't think that there is anything of the kind required at the Skerries, and I have gone both channels.

5223. Are you acquainted with Carlingford Bay?—I am, a little.

5224. Do you know Wexford or Waterford?—I don't know Wexford, but I have been in Waterford.

5225. Do you think it would be of advantage to have those harbours so improved, that vessels from Liverpool could take advantage of it in bad weather?—Well, having Kingstown to run for, it would be an intricate place to run for Wexford. I think it would be better to run to Kingstown than to take the risk of Wexford.

5226. What kind of ships did you command?—From 148 tons up to 1,500 tons.

5227. As a general rule, in a well found ship, would you prefer keeping the sea to making a harbour of refuge in bad weather?—If I thought I could make a passage I would.

5228. But viewing the tear and wear of the vessel, and perhaps the damage to the cargo, that would arise from bad weather, would you consider it your interest to keep your ship at sea, or to take shelter and wait for a fair wind and moderate weather?—Most decidedly, I would say take the harbour to save the wear and tear and the cargo.

5229. Do you think a harbour such as we describe on the north coast of Ireland would be useful as a port of call for ships belonging to the Clyde and Liverpool?—I say that there is excellent anchorage in Derry Lough. Portrush town is a bad place to

lay in, but a large ship running from the west, if it could not take Derry Lough, I think would be better to take Belfast Lough where there is no risk.

5230. Are you acquainted with the Isle of Man?—I am not very much; I never sailed to the Baltic; I know nothing of the east coast of England; I only know London.

5231. (*Mr. Lindsay.*) Is it your opinion, when a ship encounters a heavy gale in the channel, and she can't make headway against it, that it is far more to the advantage of the owner that she should take a harbour of refuge, if she could conveniently enter?—Not with a large ship, as long as she was able to keep at sea.

5232. Say that you met a westerly gale when you were to the westward of Rathlin, and that you found you could make no progress after beating about for two days, do you think it would be more for the interest of the owner of that ship for you to take a harbour of refuge, if there was one conveniently situated, than it would be to keep firing away?—I think it would be to the advantage of the owner and for the benefit of myself and crew to take Belfast Lough, and my reason is, that if the wind should shift to the east I would have room to run out.

5233. But it would be a run back for a long way?—Well, but eight or nine hours of east wind would take it up.

5234. Well, suppose there was a safe harbour at the Skerries, where you could get good anchorage, would you still in that case go into Belfast Lough?—I would rather not go so far back, but I would be sooner under way, and if I got an east wind I would soon pull up.

5235. Then you do not think that it would be any great advantage to your employers to have such a harbour?—I think that it is necessary to have such a harbour at Portrush, as I frequently could not make any progress thereabouts.

5236. Do you know Loughindall?—I do; I have been in it frequently.

5237. Looking at it from all points, the facilities to commerce, one of them being a harbour of refuge to prevent the necessity of beating to windward when you are making no progress, and looking to the saving of life and property, whether do you think a harbour of refuge would be of most service at Portrush or at Loughindall?—A great deal of money would require to be expended at Portrush, but Loughindall is a natural harbour, and you could run in there at any time.

5238. But say a sum of money, like 100,000*l.*, were expended at Portrush and at Loughindall, to make each a harbour of refuge, which do you think, in a nautical point of view, would be the best, Portrush or Loughindall?—At Portrush certainly, as we have very little intercourse with Loughindall, being out of the channel; all our intercourse is to the southward.

5239. (*Chairman.*) What kind of a place is Lough Larne? Is it a place where a large ship can run for in bad weather?—No; a small coaster, drawing from eight to eleven feet at most, may run for it. Eight feet is the most, and no vessel drawing ten feet need attempt it. A ship might anchor in the bay, but she might as well be out in the channel.

5240. (*Mr. Lindsay.*) Have you been in Lough Larne?—I have.

5241. I understood from the last witness that ships could find shelter in it from all winds in three to four fathoms. Is that the case?—No, it is not the case.

Mr. Alexander M'Bride examined.

5242. (*Chairman.*) What is your occupation?—I have been a seafaring man for 18 years, and now I am a general speculator.

5243. Do you know Portrush?—Yes, I am well acquainted with it.

5244. Have you ever been at anchor there in bad weather?—Yes, once in the Skerries Roads. The wind was from the north, and we rode a gale of three days at the back of the Big Skerries. She was a coaster.

5245. Do you think there should be a harbour of refuge there?—I think it is necessary to have a harbour of refuge there. The spray broke over us; but we would have rode in safety if there had been a harbour of refuge there.

5246. Do you know the Isle of Man?—Yes; I have been in Derby Haven in bad weather.

5247. Is there any site in the island which you would select as a harbour of refuge?—Well, there are two sites, going round the south channel, that is, the Calf of Man, and Castleton would be the first port and most convenient, and going round the north, Ramsay Bay is the best.

5248. Is Ramsay Bay more convenient than Douglas Bay?—Yes, it is central, and the other two points come nearer the channel.

5249. (*Mr. Lindsay.*) Where do you live?—I live in Ballycastle.

5250. You said you were a general speculator; tell me what you speculate in?—I deal in grain.

5251. How would you like to speculate in a harbour of refuge at Portrush?—I offered to subscribe myself 50*l.* to it, as a harbour for commercial purposes.

5252. What advantage has it as a natural harbour of refuge?—It has a good bottom of clay and a good entrance.

5253. As a national harbour of refuge would you give the preference to Ballycastle over Portrush?—Being a native, of course I would give the preference to Ballycastle Bay; the coast is more clear in Ballycastle Bay, and the holding ground is better.

5254. Are there any other advantages which Ballycastle possesses?—It is landlocked by the cliffs from all winds, but from the north-west, round to the north-east.

5255. What length of pier, in your opinion, would be necessary to run out to afford good shelter in a north-west gale?—I have been out with the engineers sounding and making lines for the pier there. It has first to be taken from the shore 120 feet, then there is a natural rock continuing that 76 feet long, having 19 feet water along its whole length at high water, and never less than 16 feet; and then, by extending that rock for a quarter of a mile, and then curve it and go south and by east, it would enclose a large space of water; say, three quarters of a mile from the shore, and half a mile the other way.

5256. What length of pier altogether would be necessary from this rock?—We thought if we extended it 150 feet from the rock, that that would accommodate from 14 to 16 vessels, and they would lie at 14 feet to 27 feet in high and low water. We were sounding for a local harbour two years ago, and we were sounding also for the large harbour. A quarter of a mile from the point of this rock was our view, and then to turn it up for rather better than another furlong.

5257. And what area of sheltered anchorage at three fathoms would that give?—The lowest water at the point of the old pier is 12 feet. I could not say the area of ground it would make, but it would throw the north-west swell up to the Colliery Bay. We have often a north-west swell there when we have no wind.

5258. Then you did not make any estimate of the space there would be for vessels at an anchorage of 3 to 4 fathoms?—No.

5259. There is a heavy swell there in a gale?—Yes, and where there is not wind there is.

5260. And considering the swell, would it not be dangerous with that swell rolling on to a lee shore?—There is a natural rock a mile distant from the shore; and they would turn a kind of breakwater to the south-

BELFAST.

Mr. Alexander M'Bride.

13 Sept. 1858.

Mr. Lindsay.

east, but we consider it would not be dangerous, as we have eddy tides, nine hours flood and three hours ebb. The eddy tides extend to a mile into the bay, and we have a variation of tides in the bay towards the shore in the west. There would be least half a mile open from the projected breakwater for vessels to come in.

5261. And in entering between them in a north-west gale, would you not say that the heavy swell would catch a vessel broadside on ?—I think not ; a vessel coming into the piers would come in smooth water.

5262. From what you describe, it strikes me it would take her broadside on ?—No, the breakwater is so that she could put up canvass and round it.

5263. (*Capt. Washington.*) Do you know the Carrickbannon Rock ?—Yes, it lies to the north-north-west about a mile.

5264. Is it a dangerous rock ?—It is tolerably ; but it is suggested to blow it up.

5265. Does it show at low water ?—It does. I have stood upon it ; it is a peak of limestone ; it lies in the open sound, three miles towards Rathlin.

5266. Is not that the reason why vessels keep out of Ballycastle Bay ?—No, the north channel is the widest, and that is the inducement.

5267. Is that rock marked ?—No, a man gave up the contract he had to do so about 18 months ago. He is named Gillespie.

5268. Is it marked to prevent a vessel running upon it ?—No ; but it is seen nearly always, for a little break in the water nearly distinguishes it. I have been in Loughindall also.

5269. How often ?—Repeatedly. I was in it last summer was a year for nearly a week.

5270. Is it good anchorage ?—Anything that is good is far up, opposite the town of Bowmore.

5271. How many vessels were lying there ?—I never saw more than three or four. There is a ridge of sunken rocks just along the anchorage that runs a considerable way into the bay, and to escape them you have to take the north shore opposite very close.

5272. Did you ever know any vessels wrecked upon them ?—Yes ; a large vessel was ashore last year and remains there; I don't know her name. I saw a vessel driven from her anchor there with a south-west wind, and the sea runs as far up as Port Charlotte, where there is a little creek, and then it becomes safe. I know that Ballycastle is more eligible than Loughindall, for Islay is a very barren place, and it is not much resorted to by shipping for produce. I hand in a list of casualties at the places I have mentioned

Mr. W. Thompson, Secretary to Belfast Harbour Board, examined.

Mr. W. Thompson.

5273. (*Mr. Lindsay.*) You heard the question I asked the harbour-master ; now in continuation of that I would ask you what is the present revenue of the Board ?—Last year it was 36,900*l.*, and it is increasing every year.

5274. How is your harbour maintained ?—By dues upon shipping and goods.

5275. Have you ever received any aid from Government or from any other source ?—No.

5276. Then all the money expended in the improvement of the port has been obtained from your own resources ?—It was all borrowed. We had money borrowed from the Board of Works, but it was so clogged that we had to return it.

5277. At what rate did they advance it ?—I do not recollect. It was repaid again, to enable the Board to borrow from private individuals.

5278. And why ?—Because they would not give enough.

5279. Were there any other unusual conditions ?—Not that I recollect. It was simply that they would not lend enough, and they would not allow money to be borrowed from private individuals or from any other channel while the Harbour Board was in their debt. When the loan was repaid, the money was borrowed from private individuals to complete the works.

5280. (*Capt. Washington.*) Can you state what amount was laid out in harbour improvements ?—I can't tell exactly without the returns, but it was upwards of 500,000*l.*

5281. Had you any contribution from Government towards that ? — None whatever. The whole was laid out of the borrowed money, or from the revenue derived from the port.

5282. Is there every facility for repairing ships at Belfast ?—Yes, there are two graving docks and a patent slip.

5283. And sufficient length of quays for the purposes of the trade of the port ?—Yes ; at present there are very good sheds on the quays. I now hand in returns from the commencement of the harbour in 1786 till the present time.

(*Chairman.*) Is there any person present who wishes to tender further evidence with respect to this inquiry ?

No answer.

Sitting at Belfast closed.

ARDGLASS.

Tuesday, 14th September 1858.

At a Sitting held at the residence of George Beauclerc, Esq.,

PRESENT :

Admiral Hope (Chairman).

Mr. Lindsay.
Captain Vetch.
Mr. Coode.
Mr. Evans, Secretary.

ARDGLASS.

14 Sept. 1858.

10 A.M.—Resolved, That the Commissioners are prepared to view the harbour of Ardglass, and to accept any memorial or other document which the parties concerned may tender with a view to its restoration.

Commissioners visited harbour and quays, with the damaged pier.

Noon.—Commissioners returned, and received from Mr. Beauclerc the under-mentioned documents :—

Act of Parliament 7 & 8 Geo. 4. chap. 69.
Copy of a Report of Capt. Denham and Mr. Rendel, recommending the restoration of Ardglass Harbour.

ARDGLASS.

14 Sept. 1858.

Petitions to House of Commons :—
(1.) From inhabitants of Arklow.
(2.) From inhabitants of St. Ives and other places in Cornwall.
(3.) From inhabitants of Penzance.
(4.) From fishermen of the Isle of Man.
(5.) From fishermen of Cornwall.
(6.) List of wrecks.
(7.) Petition from Douglas, Isle of Man.
(8.) Ditto from Newry, Ardglass, &c.
Abstract of an Address for rendering Ardglass port a safety harbour (pamphlet by G. Beauclerc, Esq.)
Mr. Ogilvie's title to certain dues for Ardglass.

GEORGE BEAUCLERC, Esq., of Ardglass, examined.

G. Beauclerc, Esq.

5284. (*Mr. Lindsay.*) Was it the case that Mr. Ogilvie gave up his manorial rights and dues as concerned the harbour; and in consideration thereof that the Government would undertake to make and maintain the harbour of Ardglass?—It was so.

Mr. HUGHES, Harbour Master, examined.

Mr. Hughes.

5285. When was the first breach in the breakwater made?—In October 1838.

5286. Was notice soon after given to Board of Works?—Yes.

5287. When did the Board of Works send to examine it?—In about nine months afterwards.

5288. And when did the final destruction of the pier take place?—At the time the Board of Works was working on the damages—perhaps two months after they came down.

5289. What was it brought the Board of Works down?—Various applications were made.

5290. How many applications were made?—Several.

5291. And did the Board of Works pay attention?—None, till a second and more dangerous breach was made.

5292. Is the harbour better or worse than in its early state before the money was expended on it?—It is in a far worse state now.

5293. (*Mr. Coode.*) Do you think the steps taken by the officer of the Board of Works were judicious, when he did come?—No, quite the contrary; because he sapped out the foundation on the seaward side. We warned him he was wrong, because the first winter gale would fill up all and knock down the pier.

5294. In what season of the year did this take place?—Winter.

5295. To what extent was this sap of the foundation carried?—Thirty feet.

5296. With what object was the sap made?—Made with a view to filling up with timber.

5297. Do you believe that this sap or excavation was the cause of the pier being overturned?—No doubt of it.

5298. (*Chairman.*) How long have you been resident at Ardglass?—39 years. I am a native of Inch, near Downpatrick. Have been harbour-master 13 years. Occupation before, schoolmaster and teacher of navigation, and surveyor. At sea in early life eight years.

(*Mr. Beauclerc in reply to Mr. Coode.*) The harbour-master collects the dues.

(*Chairman to Mr. Beauclerc.*) Will you forward to the Commissioners any documents which may bear on the case, and which may not be before them?—I will.

After the foregoing evidence it was notified that the Commissioners have resolved not to entertain any proposition for the larger scheme of making Ardglass a national harbour of refuge.

Sitting at Ardglass closed.

CARLINGFORD BAY,

OFF ROSTREVOR.

Tuesday, 14th September 1858.

PRESENT:

Admiral HOPE (Chairman).

Mr. LINDSAY.
Captain WASHINGTON.
Captain VETCH.
Mr. COODE.
Mr. EVANS, Secretary.

Mr. JOHN RAMSAY, C.E., examined.

CARLINGFORD BAY.

Mr. John Ramsay,

14 Sept. 1858.

5299. (*Chairman.*) How long have you been acquainted with the Bay of Carlingford?—I have known it for the last 23 years.

5300. Proceed to offer to the Commissioners your reasons for believing in the practicability of removing the bar at the entrance of the Bay of Carlingford, as a means of making it as available as possible for a refuge harbour.—I may hand in my report to the committee of the Navigation Company, which I made after examining the bar, with the map and the details of the several borings I made upon it as my answer.

5301. To what do you attribute the formation of the bar?—I think it is a natural formation that never was deepened, nor had it ever less water upon it than at present. I do not attribute its formation to deposit such as usually forms on bars and anything in the way of rocks.

5302. (*Capt. Vetch.*) Have you satisfied yourself, by the number of borings made, that there might be no rock or other hard substances in other places?—I took them without choice or selection of the spot, having previously made a chart of the bar and arranged the places on it intended to be bored. I found I succeeded in making the borings at these places. The borings were made with an augur without difficulty and without shifting the augur, which shows that nothing in the shape of rock exists. All rocks lie at an angle, and even supposing it to exist in layers, it would be hardly possible to get a rock so open that the augur would go straight down.

5303. Did you come to any rock in any place?—I did not find any.

5304. How many borings did you make?—I made 15 or 16 of them.

5305. Then you infer that having made 15 borings

CARLINGFORD BAY.

Mr. John Ramsay.

4 Sept. 1858.

Captain Vetch.

without finding a rock, you are fully justified in stating that it is clear ground?—Just so. Would you allow me to mention that on Cranfield Point, which appears to be at the shore a mass of solid rock, that I went ashore, and turned over several large stones, and found clay underneath; and it appears to me that the new channel discovered by Mr. Hoskeyns, which runs farther away to the south, separates the line of rock from the clay; that the line of rock is from where the present light stands and Ballagan Point, and that the new channel separates the clay from the rock.

Show us which is the new channel on this map.

Witness pointed out the channel.

5306. What was the nature of the stones you got on the bar? Were they like any of the rocks in the vicinity?—They were round boulder stones, tossed about in the tide, and seemed a good deal honey-combed. They were limestone.

5307. Have you ever made any computation of the quantity of cubic yards that would be necessary to dredge out?—I did. I also made a section of the bar, which if you will allow me I will hand in (paper marked) I calculated from that section, by Sir John Macneill's tables, and found the quantity to be 338,822 cubic yards, the channel being between 500 and 600 feet wide. I started the bottom at 500 feet, and sloped upwards to 600 feet; and I estimated it at 1*s.* 6*d.* the cubic yard to 25,412*l.* In taking 1*s.* 6*d.* as the figure, I have a good margin, as I have frequently had done dredging for the Navigation Company during the last 23 years, at 3*d.* per cubic yard.

5308. Then I understand you to say that 25,000*l.* would accomplish what is now required to make the entrance available?—I think so.

5309. In what period of time could it be accomplished?—I suppose in about three years. I have lifted with the Navigation Company's dredge one thousand tons per day; but I took it at 500 tons, allowing for the bad weather, and knowing that we could not work more than four or five months in the year. At that rate, three years would do this work.

5310. (*Mr. Coode.*) You spoke of large stones existing on the bar; did you raise any of them?—I did. They were not very large.

5311. What was their size in cubic feet; what was their weight?—They weighed not more than four or five cwt.

5312. Have you been able, from the clearness of the water, to see the nature of the surface of the bottom?—In my report I stated that some days the water was so clear that I distinctly saw the bottom of the bar, and on sinking a boat hook and plunging it I found the water got muddy, which gave the idea that the bottom was clay, and induced me to commence boring.

5313. Then do you apprehend that the stones you grappled and raised were as large as any now on the bar?—I think some were larger and some smaller.

5314. Was there much shingle on the surface?—Yes. There seemed to be a good deal, and stones and sea wrack growing in abundance; I saw it distinctly on the bottom. My report states that the borings were 18 to 20 feet, taking low water as the data. It was at low water we did the operation.

5315. Then, with regard to the dredgings done at 3*d.* per cubic yard, in what depth of water were they made?—From 9 feet to 20 feet.

5316. What was the average depth?—It was at tide works we did the dredging.

5317. What was the mean depth of the material dredged at 3*d.* per cubic yard?—We began to dredge in the river at high water in 18 to 20 feet, and we dredged till it was only 9 feet, when we left off. In the canal at Newry we began again at 11 feet and terminated at 19 and 20 feet.

5318. Were the stones on Cranfield Point smaller than those you found on the bar?—They seemed to be boulders in each case. The idea was, that the shore being covered so closely with stones, like the face of a rock, that it was a solid rock, and therefore to prove that the borings made were clay, I went and turned over several of the stones, and made excavations under them and dug up clay.

5319. I see a place, when you approach within the bar, marked "New England," is that a rock?—I believe it is, but I have no specific knowledge of that whatever. It is surrounded with very deep water, and I apprehend there would not be much difficulty in removing it.

5320. Then with regard to the tenacity of the material which you bored on the bar, do you imagine it is of the same character as that which you dredged in the upper part of the navigation?—I would not say that. It is stiffer decidedly; but I lately did dredge the solid rock, only it was of a loose nature.

5321. Have you any samples of the materials you raised?—No; I am sorry to say, that although I kept some for a length of time, they were not carefully preserved of late.

5322. Have any borings been made since 1835?—Not that I am aware of. I went on the bar in 1853, and as I had an augur with me and was on board the steam tug, I penetrated a few inches and brought up clay, but I did not go down any depth.

5323. Have you had occasion to take soundings at the bar, just within and without it?—In the line of the bar I have done so.

5324. Did you find any variation in the depth?—None whatever; I found the same to-day as I did in the year 1835.

5325. You think, from your knowledge of the locality, and the prevailing winds and the sea, that the period you have named would be ample to complete the work?—I should say so.

5326. You have no doubt either as to the time allowed, or the sufficiency of the sum?—I have not. I think the sum stated is a very fair one.

5327. Can you speak as to the precise set of the flood or ebb tide in the Lough?—I can't speak particularly.

5328. (*Mr. Lindsay.*) I know nothing about engineering, but as a practical man I want information. Are you quite satisfied in your own mind that the bottom soil of the bar consists of clay?—I am quite satisfied of it. The impression was so strong in my mind, and the circumstances connected with it so clear in my recollection, that I have not the slightest hesitation. Upon one occasion, while taking a boring, I was anxious to try if I could make to the rock, and I had gone down a good depth when the flood tide came upon me, and as we were not able to pull out the augur, we left it till the next tide (for 24 hours), and then we had very great difficulty in getting it out of the bar.

5329. And your remarks apply to the whole depth of the channel proposed to be cut?—I should say so.

5330. As you have estimated the work at 25,000*l.*, at what depth of water do you propose to cut?—Twenty feet deep, and between 500 and 600 feet in width.

5331. What would be the length of the narrowest part of the channel?—The length of the channel is from 2,600 to 2,700 feet.

5332. And for 25,000*l.* you would cut it 20 feet deep at low water mark, spring tides?—Yes.

5333. Now, does the cost of deepening increase with the depth?—It does.

5334. That is, the cost of cutting from 16 feet to 20 feet would be considerably less than cutting from 20 feet to 24 feet?—Yes. As the bar forms a sort of a cone, the average length at 20 feet deep would not exceed 1,500, whereas if the depth be increased from 20 to 24 feet, the length would be 2,500 to 2,600 feet, and the quantity to be dredged would be increased, and the expense also in the same proportion.

5335. Have you turned over in your mind the cost of a channel, such as that proposed, so as to give a depth of 24 feet at low water spring tides?—I have not.

5336. Could you give a rough estimate of what it

would cost extra, so as to give four fathoms water at low water spring tides?—It would be nearly 12,000*l.* to 15,000*l.* more.

5337. Then for an outlay of 40,000*l.* we would obtain a depth of four fathoms at low water spring tides?—Yes.

5338. What depth of water is now on the bar at low water spring tides?—From eight to nine feet.

5339. Well then, you made your calculation at 18*d.* the cubic yard, and you stated that you had contracts with the Navigation Company at 3*d.* per cubic yard in cutting it nine feet low water and twenty feet high water; how is there the great difference between 3*d.* and 18*d.*, just six times?—There are two reasons for that. I want to show that the estimate I made gave a fair sum for doing the work. The next thing that makes it so much larger is in consequence of the great difficulties to be contended with at the bar. We have no tides nor storms to contend with at Newry. While at Newry we can work nine months the year round, and you could only work four or five months at the bar.

5340. Yes, but as you would only pay your hands while they were employed why make such a difference as six times?—Because contract work is much dearer than that done by an engineer. In my calculation I conceived they would do it by contract, and that was the reason why I put in so large a sum.

5341. But as an engineer would you always put in such a large margin for profits?—I would.

5342. Then a contractor's must be a very profitable business. Do you know the area of good anchorage water over four fathoms here?—I believe the anchorage is very good. I always hear that, but during my residence in Newry I have heard of vessels dragging, but I have never heard of them losing their anchors. I hear it is good holding ground.

5343. Have you ever heard of a vessel, when once she got inside, drifting from her anchors?—I have not.

5344. (*Capt. Washington.*) You have not told us where you purpose taking the stuff that you dredge?—I purpose taking it to deep water, and dropping it from barges.

5345. What plant do you require?—It would require a steam dredge of from 25 to 30 horse-power, and one steam tug and three barges, which would be used for the purpose of towing away into deep water the barges as they were filled, and also to bring them back again, and perhaps even to take a vessel in tow.

5346. (*Capt. Vetch.*) In addition to dredging out the channel, have you other works to propose for the better securing of the interests of the harbour?—I would suppose that the present lights would appear well circumstanced, but I think that it would require good buoys outside, although if the channel were made in the direction of the present lights, I do not think that is at all necessary.

5347. Then you propose only beacons and lights?—I think so.

5348. (*Mr. Coode.*) Have you consulted a nautical man as to the sufficiency of the width of the channel. 500 feet wide by half a mile long?—No, I have not.

5349. (*Mr. Lindsay.*) You have told me roughly what it would cost to have the channel deepened to 24 feet at low water, spring tides, and to the width of 500 feet. It strikes me, as a sailor, that 500 feet is a narrow pass for a ship in distress seeking for a harbour of refuge. Do I understand you to mean that 500 feet is the surface width of the channel?—The bottom is 500 feet; the surface 600 feet.

5350. Now, could you roughly give me an estimate of about what it would cost to make a channel of 1,000 feet wide and 24 feet deep?—It would be very nearly double that.

5351. Then, for a sum of 80,000*l.* you would have a channel 1,000 feet broad and 4 fathoms deep?—I should say so.

Captain LEONARD WATSON examined.

5352. (*Chairman.*) What is your occupation?—I am Lloyd's agent and surveyor for the registry of shipping, and harbour-master. I have been sailing in this port since 1812.

5353. You heard the description given of the bar by Mr. Ramsay?—I did.

5354. Do you concur in the correctness of that description?—In a great measure.

5355. Do you differ from it?—As a seafaring man I would be inclined to have a greater width in the entrance, and have it eighteen to twenty-two feet at low water spring tides.

5356. But it is more as to the character of the bar I want to know?—For many years previous to the boring, as far back as 1825, I frequently drifted down and sounded on the bar, and I can bear out his (Mr. Ramsay's) remarks as to the quality of the stones; they are round boulder stones.

5357. I suppose you know the bar; is there any difference in it in point of depth?—Not the least.

5358. (*Mr. Lindsay.*) During your long experience here, have any vessels been driven from their anchors?—Once; in 1839, a vessel was at anchor in Warrenspoint Roads, the wind was from west-north-west, but she merely dragged along her chains, and received no damage. It was a perfect hurricane.

5359. The south-east and the south winds affect vessels here?—Generally a heavy sea rolls in from the south-east over the bar.

5360. Well, but does a heavy sea tumble into the usual anchorage?—It is a very trifling sea. I scarcely know of a solitary vessel that dragged her chains in the usual anchorage, if the tackle was good, during the last forty years.

5361. What area of anchorage have you above four fathoms?—Above the Greenore Point there is a flat that extends across from the Black Rock.

5362. I mean, what is the acreage of anchorage, in water from four fathoms upwards?—It would require a little consideration; but I would say in round numbers 1,000 at least.

5363. Well, now, as an old sailor, would you think that a channel 600 feet wide would be sufficient?—Certainly not.

5364. Would you not think that to make a proper harbour of refuge, so that ships of all sizes might enter at all times, that there should be a channel of 1,000 feet in width?—I should say so.

5365. Do many ships take it for a harbour of refuge now?—No, not a great number. I refer to my report to Captain Washington, and also to my report to Lloyd's, from 1832 till 1858.

5366. Ships do not come here for shelter to any extent?—No; they are afraid of the bar, and very naturally. If they were convinced that the channel was deepened, the vessels bound down the channel from Liverpool, and meeting with heavy south-west gales, I am of opinion, would bear up for Carlingford, having so good landmarks as the mountains on each side.

5367. What dues are charged on vessels taking shelter?—They are charged a guinea each, if they do not belong to the port. Lord Claremont is the proprietor now, and it was formerly the Marquis of Anglesey. It is a manorial right granted by King James.

5368. And is he bound to do anything in return for the dues?—No, nothing of any consequence.

5369. Is he not bound to maintain the buoys and beacons in an efficient state?—No; I was appointed by the late Marquis of Anglesey in 1828, and Colonel Armstrong, his Irish agent, informed me I must be very cautious in erecting buoys and beacons, or making any changes.

5370. I asked the question, because there seemed

CARLINGFORD BAY.

Capt. Leonard Watson.

14 Sept. 1858.

Mr. Lindsay.

to me to be very few buoys and beacons, and a great many shoals.—There are no funds to erect them.

5371. Well, that is the reason why I asked the question if the lord of the manor, in return for the right of levying dues upon ships frequenting the harbour, is not bound to do something in return. Now, are you sure, that with this money which he levies upon ships, he is not bound to maintain the buoys and beacons?—I pay double the rent to Lord Claremont for the right of levying the dues that I did to the late Marquis of Anglesey.

5372. Then you pay rent for it?—I do.

5373. And what do you do in return?—I have but little funds to lay out.

5374. But if you rent it you are supposed to do something for it?—I keep up the present buoys and beacons.

5375. Now do you think there are sufficient buoys and beacons?—They certainly are not of the magnitude they should be; I have not funds to erect buoys sufficient for such a bay.

5376. What dues do you collect annually?—About 80*l.*; but I can't exactly tell you at present.

5377. What do you annually expend to maintain the buoys. Do you expend it all?—Oh no; from 25*l.* to 30*l.* is all.

5378. Then you get 60*l.* a year for collecting it?—No. There are two men to pay who assist me. They get the one-third of the anchorage dues, and that leaves me very little for my trouble.

5379. What rent do you pay his lordship?—I pay him 40*l.* a year.

5380. So that he is a clear gainer of 40*l.* a year, for which he does nothing?—Quite so.

5381. How many buoys have you from the lower one up to the beacons?—Seven buoys and purchases.

5382. Then one-fifth of the shoals are not buoyed nor beaconed?—When I got the appointment in 1828, there were scarcely a purchase or buoy in the Lough.

5383. But are there not dangerous shoals in the Bay?—I can't say that there are; vessels do not often meet with an accident in the bar.

5384. Are there no dangerous shoals in the bay that ought to be marked?—I do not think there is any danger.

5385. Do you not call a shoal dangerous? I come into the bay and see all smooth; I see nothing to mark a shoal, which has only two feet of water upon it; do you mean to say that somebody is not at fault?—Somebody is at fault, but I am not. But from my knowledge of it, I have not heard of any accident happening upon it.

5386. But do you not think that besides the dangers of the bar, vessels do not come in because there are not sufficient marks to warn them of the dangers within the bay?—I am certainly not aware of that.

5387. (*Capt. Washington.*) What number of vessels arrive in Carlingford Lough annually?—I can't say at present, large and small.

5388. Does any one keep a register of such arrivals?—Yes; the Custom House.

5389. But that is only of loaded vessels; is there any account of all vessels making use of Carlingford Lough as a refuge harbour?—I think not; but I think I could make out a correct list and furnish it to you.

5390. Have you any particular account of the wrecks?—I have a return of the wrecks from 1832 till 1858. I refer to the return I sent to Captain Washington. (*Handed in.*)

5391. You said a width of 600 feet was not sufficient entrance to the Lough?—I did, in my opinion.

5392. Are you largely acquainted with the piers and harbours of the coast of Ireland?—Not further than Newcastle and Armalong.

(*The witness then handed in a letter to the late Secretary of Lloyd's, in* 1839.)

5393. Are you acquainted with Sunderland or Newcastle?—No; I was not in Sunderland since the piers were completed.

5394. Do you know the width of the entrance of the Tyne at Shields?—No. I have not been there since 1816; but I should say the width was about half a mile, so far as my recollection goes. You asked me a question, gentlemen, relative to the depth of water north of Greenore Point, across the channel. There are about two fathoms water across there. That is the shallowest part over our bar, and where we are now at anchor. It is a clear flat across.

5395. (*Mr. Coode.*) Do you mean between Greenore Point and Earl Point?—To the north and west of Greenore Point.

5396. Is that the greatest depth of water at spring tides?—It is farther up, two miles off Greenore Point.

5397. Do you think it desirable that a greater depth of water should be obtained on the New England Rock?—I never heard of an accident upon it.

5398. Might it not be in the way, if the channel were improved, and a vessel attempted to enter in a dark night?—I think it necessary to remove that rock.

5399. And Videl Rock?—I can't speak so much of it. I know its situation is near Greenore Point and Watson's Rock, farther up.

5400. Neither Videl Rock nor the New England Rocks are buoyed or marked by perches. Do you not think they should be marked with buoys?—I do not know of an accident at them, for vessels can't proceed over the bar, either in or out, unless they have water over these rocks; but I think if the channel were deepened, the water over Videl and New England Rocks should also be deepened, and over any other shoals whatsoever.

Mr. Hoskyn, R.N., examined.

Mr. Hoskyn, R.N.

5401. (*Chairman.*) Do you know Carlingford Bay?—I am well acquainted with Carlingford Bay for a year and a half.

5402. Now, supposing the bar deepened as proposed, are you of opinion that the anchorage inside would form a sufficient harbour of refuge in point of shelter?—Yes.

5403. What wind blows directly into the bay?—The south-east.

5404. Have you seen it in a heavy gale of wind; and is the water smooth?—A vessel with good ground tackle should ride it out. It is sheltered from the rough sea.

5405. But it is not a sea to prevent a boat crossing, except under very peculiar circumstances?—It is not.

5406. What, in the rough, is the area of sheltered anchorage, speaking of it above Greenore Point?—About 300 acres.

5407. That is free from any danger whatever?—Yes.

5408. (*Mr. Lindsay.*) What depth of water is in those 300 acres at low-water spring tides?—From 6 to 12 fathoms; and above Greenore Point there are about 700 acres of anchorage.

5409. Would ships be sufficiently protected in the 300 acres in a heavy gale?—I think they would be well protected from the south-east winds and west gales. A boat could cross over.

5410. Could a boat land from a ship in a south-east gale?—She could land at Cranfield Point. A boat could pull away from a ship in safety.

5411. Do you think the shoals sufficiently buoyed and beaconed?—I do not.

5412. Do you think that is one reason which prevents ships coming in there?—I do not know; but they do not come in when they might. There are no buoys nor beacons to speak of in the Lough; but Captain Watson gave the true reason why there were no accidents, that vessels don't come in. If it were deepened you would have casualties immediately, unless it were buoyed and beaconed.

5413. Then, if the proposed channel were cut, it would be absolutely necessary to buoy and beacon every shoal before a vessel could come in?—Quite so.

5414. From your experience along the coast do you know of any place in this vicinity or along the coast here, where a better harbour of refuge might be made at as small a cost?—I do not know of any other place.

5415. Do you know anything of your own knowledge of the description of the ground on the bar?—I do not; I never bored the bar.

5416. With regard to the stones which Mr. Ramsay described as of moderate size, are you aware, of your own knowledge, that they are so?—I am not; but from a surface examination I think some of them are very long, as long as a boat; 22 feet or 23 feet long. I discovered that by feeling them with a long iron-pointed pole.

5417. They may be embedded so as to be stones or rocks of enormous size for aught you know?—I have not bored it, but I have seen the surface. I state this from probing it in one particular spot.

5418. Is it in that spot they propose to cut through?—Yes; the cut would come across that.

5419. Then, from your experience in such matters, you think it would be desirable to have surveys and borings made again?—I think that borings and sections would be the way to settle that point. There is abundance of clay at Cranfield Point, and the large stones are on the surface, where the clay and rocks intersect each other.

5420. Now, speaking to you as a sailor of experience, say that the channel were cut as proposed, would you have any hesitation in running for it in a heavy south-east gale?—Not without a good channel.

5421. Would you consider the proposed width of 500 or 600 feet sufficient?—I do not think it would. A bad steering ship in an ebb tide would veer a good deal; and that would not be great space in the channel.

5422. From your practical experience, do you think there should be a greater width?—I think there should be more than at Kingstown where there are no tides; but here you might have to steer for half a mile against them.

5423. Do you think, where there is a tide, the width between the piers should be more considerable?—I do not refer to the sea so much as to the tides. If a ship be hard to steer against such a tide as we have, for a quarter of a mile, she would be ashore if there were only 500 or 600 feet of channel. There is a very bad sea here in a south-east gale.

5424. Do you consider the sea so coarse at such times that it is dangerous for a ship to run in during a south-east gale and ebb tide?—Not if there was a sufficient depth of water.

5425. What sand would there be on the bar now at low water?—If the wind is to the eastward it is smooth by Helly Hunter's Rock.

5426. Say if there were a channel made 24 feet deep at low water spring tides, would a vessel run for it in a heavy gale at low water if she drew 20 feet?—I think a vessel drawing 20 feet of water might, but it would be easy for a vessel to keep off for an hour or two till flood tides.

5427. (*Capt. Washington.*) Did you make the Admiralty survey of Carlingford Bay up to Newry?—Yes.

5428. And you are thoroughly acquainted with every bar and shoal laid down in it?—Yes.

5429. During the course of that survey did you find no little difference on that bar?—We found a deep channel not in the old surveys. A ship could draw 18 feet water through it; at this moment there is 18 feet water in Carlingford Lough channel at low water and spring tides.

5430. Could a steamer take it?—A steamer at any tide could take it, but it is not buoyed nor beaconed. I erected temporary beacons to point it out, and I believe they are there still.

5431. Does it rest with the local authorities or the Ballast Board of Dublin to buoy such a channel?—I do not know; but I believe the local authorities.

5432. Can you repeat the names of the shoals that have not beacons that ought to have them?—Yes; one is necessary at the Sears, a buoy and perch at Haulbowline and New England rock, a large purchase on Sheep Rock, and we want a buoy on the rocks off Greenore Point. There are two bad rocks off it; and also a large buoy is wanted on the large Sound and Earl rocks, and a buoy is wanted on Stalker's Rock. There are two buoys wanted at the Flats at Carlingford, and two on the Flats on Killowen; and it is almost necessary to have a light on Black Rock to enable vessels to come up there at night in safety near Warren Point.

5433. There is nothing to light, even steamers, up to Warren Point?—No; there is no pier, but there is a quay there. There would be no difficulty in placing a light there, but the better position is on the Black Rock as you approach the anchorage at Warren Point.

5434. Is the bar sheltered from the winds from outlying shoals and rocks?—The Helly Hunter Rocks protect it from the east winds.

5435. Tell the limits to which it is protected and exposed?—It is perfectly exposed from the east-south-east round to south-by-west; and the Helly Hunter Shoal breaks the sea from it in some degree, and in the east gales the water is tolerable on the bar, but for seven points on the compass it is exposed.

5436. Would the tides set fairly through the proposed cuts?—I think so, if made in the direction of the channel shown on the plan. The tides set from the south-west when they pass the lighthouse, and through the deep water channel to some extent. That is the natural course for the tides to follow the channel, and if a deep cut were made in that direction it would have the ebb tide fairly through it.

5437. Do you know the entrance to the Thames or to Liverpool?—I am not intimately acquainted with them; and I don't know that their entrance does not exceed 600 feet.

5438. Supposing the channel dredged to 20 feet low water spring tides, and that 600 feet was the width of the surface at that time, at one hour of flow could you tell me what the width of the channel would be?—In the first hour there would not be over a rise of six inches; in the second hour there would be a foot. After the first quarter flood it rises 6 inches in 10 minutes, or 3 feet in the hour.

5439. Could you, from any of your plans, draw out a diagram, showing how the channel increases in width at one hour and two hours' flow, &c.?—Yes.

5440. Suppose there were 600 feet channel at low water, at every hour, up till the depth was 20 feet, would not the extent of channel of that depth be much greater than at first?—Yes.

5441. Then, except at low water it would be more than 600 feet, and would rapidly widen?—Yes; and if it were clay it would be deepened by the tide running through it.

5442. You spoke of the rock you found; have you any reason to believe it was fixed in the earth?—No; but supposing it was a boulder, a few pounds of powder would soon blast it. I have known of rocks of 80 tons raised.

5443. (*Capt. Vetch.*) The entrance to the Lough is exposed to only seven points of the compass. Suppose now the channel were dredged and buoys and beacons put down, would there be any difficulty to vessels on these seven points finding their way in?—No; there would be no lights required.

5444. I say, suppose the channel to be dredged, as detailed by the engineer, and buoyed and lighted as you have suggested, there would be no difficulty in vessels from those seven points finding their way into the harbour for shelter?—No.

5445. They would have a certain course, in which it would be of advantage to them. And, in fact, it would be a complete harbour of refuge to passing vessels with the wind on shore?—Yes. I think it very desirable that the New England Rock should

CARLINGFORD BAY.

Mr. Hoskyn, R.N.

14 Sept. 1858.

be removed or lowered, so as not to be in the way of passing ships coming in; to buoy it would not be sufficient.. I might add that it would be necessary to buoy that rock off Greenore Point. If that rock was removed vessels might run up to the very far end for shelter.

5446. (*Mr. Coode.*) Can you give the name of that rock?—I believe it is generally known as Helpin's Rock.

5447. You stated that you had seen a large stone, about the size of a jolly boat; can you put in evidence, as nearly as possible, the position of that boulder?—(*Witness pointed it out on the chart.*)

5448. Have you ever taken observations as to the direction of the tide in the centre of the line of the proposed channel?—No; but you will see from the course of the tides that they turn through it.

5449. From your knowledge of the state of the tides here, can you state that the tides will run fairly through it?—I think if a channel were formed it would. A great portion of the ebb tide runs now through the 18 feet channel, and the velocity of the tide over the site of the proposed channel is somewhere about three knots an hour at the south end, and four knots at the inner side. I found no other large stones, and so far as I know that was quite an exceptional case; but it is almost impossible from a surface examination to say what the bottom of the bar is.

5450. (*Chairman.*) Would you point out to me on the chart where this 18 feet channel is?—(*The witness pointed out the channel.*)

5451. How long has that channel been known?—I do not think it was known before the spring of 1857.

5452. And it is much too circuitous to be of any service for a harbour of refuge purpose?—Yes, it is.

5453. Have you any knowledge of the coast in the vicinity of the bay?—Yes.

5454. Is the entrance easily made in thick weather?—It is.

5455. Have you considered the question of lighting, supposing this cut to be made?—Yes. It would be necessary to place leading lights, and there would be no difficulty in doing so.

5456. (*Capt. Washington.*) You are acquainted with the north-east part of Ireland; is there any place in which lights are wanted?—Yes; there is a lighthouse built at the entrance to Lough Strangford; I think it should have a light; it is very much frequented. There is also a lighthouse on Angus Rock, and as it is covered, vessels have great difficulty in going in without the light.

5457. Whose duty is it to light it? The tower was built by the Ballast Board of Dublin, and also all round the coast, except the immediate harbour lights. Do you know if it was represented that it was not lighted?—I believe it has been. I think a light is very much called for in Rathlin Sound. There is a light on the island, but it does not show towards the sound at all; it shows to the Carrickvaughan rocks, and steamers coming up the channel do not see it.

5458. Where would you have such a light placed; on Sheep Island or Rue Point, to the south of Rathlin?—Sheep Island would be probably the better position for it.

5459. Is the Carrickvaughan rock dangerous?—It is; it is uncovered in low water, and the tide sets directly towards it.

5460. Is it in the immediate approach to Ballycastle harbour?—Yes.

5461. Is there any other light necessary?—I do not think of any others at present. It was suggested that a light would be most useful on McKinney Bank, in Lough Foyle, and a pile light might be placed there with very great advantage, and there would be no difficulty in doing it.

5462. Otherwise, Lough Foyle is well lighted?—Yes.

5463. Coming to Carlingford Bay. Is it not the practice to carry away lime from between the lighthouse and Killagan Point?—It was the practice, but they are now prevented. That place is for shelter. It is my opinion it should not be carried away, and that if it is removed, my opinion is that the removal should be stopped.

5464. Who has the power to stop it?—I believe the Admiralty have the power, but no local authority have any power in the matter.

(*Mr. Wm. Kirk, M.P.*) It would be well to put upon your notes that all the boulder stones which stud the bar are covered with luxuriant sea-vegetation tangles, many of which are as thick as a stick, being two inches in diameter.

(*Mr.. Hoskyn.*) I know it is the case; so much so, that you can't see the stones on the bar for it.

(*Chairman.*) Before I close the proceedings I want to know if any gentleman present wishes to offer any remark, or tender evidence to the Commissioners in addition to what we have heard? Is there any point bearing upon the subject we have not noticed?

(*Mr. Kirk, M.P.*) I have a very favourite scheme upon the subject. I can't call it evidence; it is simply evidence of a suggestive character, and I will only make a very brief observation. I think that if some of the hulks that are in dock at Chatham and Sheerness were brought to our harbour, and some of the convicts put on board, they might remove the bar to any width or depth without any additional cost to the public. That is my scheme. They could be usefully employed here; and a very limited number of sailors and marines could keep them safely, while their labour, now unproductive to the country, would then be of essential service.

Sitting at Carlingford Bay closed.

DOUGLAS,

ISLE OF MAN.

Friday, 17th September 1858.

PRESENT:

Mr. LINDSAY, in the Chair.

Captain WASHINGTON.
Captain VETCH.

Mr. COODE.
Mr. EVANS, Secretary.

DOUGLAS.

17 Sept. 1858.

(*Mr. Lindsay.*) I may state that our object here as Commissioners is to examine and inspect for ourselves your harbours. As you are aware, we have already a large amount of information bearing upon them, and therefore it will not be necessary to go into details to any great extent; but, as we take Douglas first, if any gentleman on the part of Douglas has any information to add, or anything to state which may have arisen since the evidence in this Blue Book was taken, we shall be much obliged to him if he will now state his case.

Mr. THOMAS GARRETT examined.

5465. (*Mr. Lindsay.*) What is your occupation?—Nothing at present; a gentleman, I suppose.

5466. Do you appear on the part of the Local Commissioners?—No; on the part of the inhabitants of the town.

(*Mr. Lindsay.*) If you please, we should prefer hearing some one on the part of the Local Commissioners first, and after that, we will hear evidence on the part of the town.

Mr. RICHARD QUIRK examined.

5467. (*Mr. Lindsay.*) You are, I believe, the Receiver General?—I am.

5468. You appear, I understand, on the part of the Local Harbour Commissioners in this place. Have you any statement to make on the part of those gentlemen, or any information to render which the Commissioners do not already possess. If so, we shall be very glad to hear it now?—Mr. Chairman and Gentlemen, various representations have been made by the Local Commissioners to the Treasury at different times as to the bad state of the harbours of the island. These representations, at the recommendation of the Governor, at length obtained attention, and in 1853 an Act of Parliament passed putting funds in the possession of the Treasury, and giving the direction of the works to the Tynwald Court. The Commissioners of Harbours were instructed by the Treasury to procure plans of the various improvements required, and in consequence they engaged Mr. Walker of London, who prepared a Report. Mr. Walker, I should say, visited the island twice, and had one year two assistants here. He had been here before, and was perfectly well acquainted with the harbours. The result was, that plans were sent in to the Tynwald Court, and they are the plans which I now beg leave to bring before you.

5469. Are these the plans?—Yes. (*The plans were handed in.*) The plans were recommended by the Tynwald Court, and for the most part approved by the Lords of the Admiralty.

5470. Is this the plan to which you are now referring?—Yes; this is the plan with regard to Douglas. It was sent up to the Admiralty, and approved in many respects, but in many others approbation has been withheld.

5471. Will you leave this plan, or a copy of it, with us?—Certainly.

5472. Then we will mark the plan A, and it is in reference to plan A that you are now speaking. Just go on with your statement. You say this plan was submitted and approved of by the Admiralty?—No; partially approved of.

5473. Will you state what are the objections which the Admiralty have to it?—If you will allow me, I will state the objections. The lieutenant-governor sent me copies of letters transmitted to him by the Lords of the Admiralty, containing their objections as to Douglas.

5474. Just state what those objections were on the part of the Admiralty?—They were six in number. Perhaps I had better read them:—"1st. The pier to be "provided on the seaward side with a parapet rising "to 7 feet above the proposed platform, or 17 feet "above high-water mark of spring tides. 2d. The "upright walling of the pier to rise in courses of "masonry from 12 feet below low-water mark, on "both sides. 3d. The rubble base not to rise above "10 feet below low-water mark. 4th. The end of "the pier to be carried up in steps, to admit of "further extension. 5th. The basement course to "be of stone, and not cement. 6th. The width "of the platform to be increased seven feet at least." These were the six points upon which it was thought necessary to remark and object to.

5475. These were the six objections which the Admiralty raised to the proposed plan?—Yes.

5476. Have you an estimate of the cost of this plan of breakwater?—There was only a certain sum which could be expended.

5477. But had you an estimate?—The estimate was according to the money to be expended. Mr. Walker suggested the greatest length of pier which he thought could be constructed for the money.

5478. What is the length of pier shown here?—540 feet, on that plan.

5479. Did Mr. Walker give you an estimate of what that 540 feet pier would cost?—He did to the Government.

5480. Do you know what that sum was?—32,000*l.*

5481. The 540 to 550 feet would have cost 32,000*l.*?—Yes.

5482. Is this pier, as shown here, part merely of a large scheme to be carried out hereafter?—Decidedly it was intended to be so.

5483. Then do I understand the Admiralty prevent you expending 32,000*l.* on the pier as proposed, unless you make such alterations as will meet the objections raised?—I think the pier on that plan is according to the directions of the Admiralty. Mr. Walker's first draft was to 27 feet low water, but this plan terminates at 29 feet low water, according to the directions of the Admiralty.

5484. What was the estimate of the original pier which was to extend out to 27 feet at low water?—I think 28,000*l.* That is, the inward line on the plan.

5485. Would such a pier as that, ending at 27 feet low water, have satisfied the wants of the port?—I very much doubt it.

5486. Is that on account of its not being of sufficient length to protect the mouth of the harbour?—On account of its confining the bay too much.

5487. What do you mean by confining the bay too much? Do you mean giving too small an area of water?—Just so.

5488. Then do I understand you to state, on the part of the local commissioners, that to be sufficient to protect the bay you ought to run out a pier from Douglas Head, or one of a different form from this?—Undoubtedly the outer line is more desirable.

5489. Have you considered the cost of a pier carried from the outer head?—The funds which we have at our disposal, unless amalgamated with a larger sum, would go a very small way to the construction of a pier running out from Douglas Head.

5490. I beg your pardon; repeat your answer.—It would go a very small way towards making a pier to Douglas Head.

5491. What prevents you from meeting the objections which have been raised by the Admiralty,—the objections which you have read. What prevents the Local Commissioners from complying with the suggestions made by the Admiralty?—The deciding what works shall be made is with the Tynwald Court. The head of the Tynwald Court is the governor, and he has written a letter upon the subject, which I beg to read.

5492. Will you give us the substance?—He had a communication from the Tynwald Court, and he recommended the waiting until the result of this Royal Commission was known. The Local Commissioners were directed to hold all works over until the result of your deliberations was known.

5493. What is the date of that letter?—The 4th of August.

5494. Will you read the letter?—It is addressed to me.

5495. Who do you say it is from?—From the governor.

"Government House,
"SIR, 4th August 1858.

"I enclose, for the information of the Commissioners of Harbours, copies of two letters from the Secretary of the Admiralty, of 25th June and 26th July, in reference to the plans for the proposed

DOUGLAS.

Mr. R. Quirk.

17 Sept. 1858.

Mr. Lindsay.

works in the harbour, and I also return the plans for Douglas, Ramsey, and Peel, the two latter having the assent of the Board of Admiralty affixed to them; and I would call the attention of the Commissioners especially to the observations made by the Admiralty with reference to the construction of the breakwater at Peel, to which I would recommend that the attention of the engineer should be directed.

"I inclose also a letter from the Secretary of the Treasury, of the 3d instant, from which you will see it is the intention of the Government to introduce a Bill into Parliament next session to provide the necessary powers to borrow money for the works, and that it is proposed that the commencement of these works should be postponed, to see the result as affecting Douglas of a Royal Commission on Harbours of Refuge about to be issued, and I have to inform you that the Tynwald Court have assented to the arrangement.

"I trust, however, that early next spring the Commissioners will be in a position to proceed with the works.

"I am, Sir,
"Your obedient servant,
(Signed) "CHARLES HOPE."

5496. That refers more particularly to the harbour of Peel, does it not?—It refers to the whole of the works until your decision is known, whether certain works can be blended with our own.

5497. Have you any proposal to make to us on the part of the Harbour Commissioners?—The Harbour Commissioners are but the executive of the Treasury, and the Tynwald Court to carry out instructions. I would be loath to give any opinion upon works upon which there are so many gentlemen more competent to speak than myself.

5498. Of course you have had notice of our visit and are aware of our object in coming. Have you, on the part of the Harbour Commissioners, any proposal to make to us; that is to say, have you any proposal to make with regard to the harbour of Douglas?—As to the plan, I think that drawing not extended seaward enough. Supposing the Commissioners are obliged to fall on their own resources, of course they cannot go so far.

5499. Then you think that even out to 29 feet at low water, is not sufficient to protect your harbour?—Even that is not sufficient. It would be a prospective benefit to the public at large, if it were further extended.

5500. That is to say, you desire to have it further extended to sea, but you have no funds?—That is so.

5501. That is the case; and if the Government intend this pier to be carried out, the Government must aid you with funds for the construction of it?—Yes.

5502. (*Capt. Vetch.*) This plan which you have now laid on the table, is the plan prepared by Mr. Walker, and approved of by the Admiralty. The Admiralty have no objection to the plan; as regards the sections they have objections, but not in any degree to the plan. Is that the case?—Yes.

5503. This is the plan that was proposed to the Admiralty, of which Mr. Walker made the drawing, and which the Island authorities transmitted to the Admiralty for approval. The Admiralty have approved of the plan as far as it goes, but the Admiralty have objected to the sections of the work. I ask you whether that is the case or not?—Yes; it is here in the copy of Mr. Corry's letter.

5504. I think the sum which the Court of Tynwald propose to expend on this pier is 32,000*l.*?—Yes, 32,000*l.*

5505. And I think I observed, from the proceedings of the Committee on Harbours of Refuge, a proposition was there made that a further sum of 40,000*l.* should be devoted by the Government, if approved of by the Commissioners, for its extension?—I am aware of that.

5506. (*Mr. Lindsay.*) Have you any other information to give to the Commissioners in regard to Douglas, which we do not already possess?—The improvement of Douglas Harbour has been the subject of communications and publications for many many years.

5507. Then you have no further information beyond what we already possess?—If you will permit me for a moment to go back to former times, Sir John Rennie had an important plan for a breakwater.

5508. I think we have already Sir J. Rennie's plan in evidence?—The Commissioners of Harbours cannot act here.

5509. We have the whole of that already, Mr. Quirk.—The local Commissioners sent the then high bailiff to Liverpool, to get the consent of the shipowners to Sir J. Rennie's plan. They held a meeting at the Chamber of Commerce, and decided that the plan was too small for a breakwater, and they sent over their own surveyor, Captain Denham, who suggested a larger plan.

5510. Was there any estimate given of the cost of Sir J. Rennie's plan, which, as I understand, was a breakwater with entrances on each side of it?—I think it was 30,000*l.*

5511. What acreage of water above 3 fathoms would that have given?—I think he speaks of 40 acres.

5512. Forty acres of 3 fathoms and upwards?—I think so.

5513. Have you any other suggestion to make in regard to Douglas?—Nothing; but I wish to press on the Commissioners that the improvement of the harbour is no novel subject. Two memorials were sent to the Treasury at different periods, and I beg the attention of the Commissioners to the last few lines of this one. I have the pleasure of quoting Captain Washington.

5514. Then, Mr. Quirke, you lodge a copy of this memorial?—If you please, and this is another.

5515. Do you desire to lodge it also?—If you please.

5516. (*Capt. Washington.*) On reference to the published statement, you wish to correct what you have said as to the cost and space of Sir J. Rennie's plan?—I do.

5517. Was it not 45 acres and 216,652*l.*?—Yes.

5518. That was Mr. Rennie's estimate in 1835?—Yes.

5519. Was there any earlier plan, prior to that of Sir J. Rennie's?—Yes.

5520. Can you tell me the earliest plan, I mean for enclosing the whole bay, not for your own little harbour, but for the whole bay?—The next was by Captain Denham.

5521. But none before Sir J. Rennie?—There was Sir W. Hilary's, in 1826.

5522. Sir W. Hilary, a resident here, proposed to enclose the whole bay?—No; merely a breakwater.

5523. Have you put in that plan?—I can give it.

5524. Had Sir W. Hilary been long a resident in Douglas?—I should think for 30 years.

5525. Should you think he was fully acquainted with the wants of the place?—Yes; that is of the wants 32 years ago.

5526. As far back as 1826 it was the desire of Douglas to have a larger harbour than at present?—Yes.

5527. Was nothing done on Sir W. Hilary's plan?—Nothing.

5528. Then 9 years later either the Tynwald Court or the Harbour Commissioners applied to Sir J. Rennie?—In 1835 the Commissioners invited Sir J. Rennie to the island.

5529. The Tynwald Court had nothing to do with that?—The Tynwald Court were only empowered in 1853.

5530. Did the Harbour Commissioners represent the feeling of the authorities and the public?—I have no doubt of it.

5531. Then again in 1835 it was the wish of the public to have a large plan for enclosing Douglas Bay?—Yes, or to make a harbour of refuge here.

5532. Why was that plan not carried out?—Want of support, want of means.

5533. For want of funds it fell to the ground?—Yes; it fell to the ground because our friends in the Town Trust of Liverpool then got changed.

5534. Just so. What was the next plan proposed after Sir J. Rennie's?—I think Mr. Timperley's, our engineer.

5535. Can you show a copy of that plan? was it larger?—It was merely an extension from the head, similar to Mr. Walker's proposal.

5536. What was the next proposal after Sir J. Rennie's?—Mr. Timperley's, our resident engineer.

5537. In what year?—In 1846.

5538. In 1846 Mr. Timperley proposed another plan. You said something of Mr. Denham, when was that?—In 1834 or 1835.

5539. Sir J. Rennie made one plan, and then Mr. Denham another?—No; they were two in the same year, Sir J. Rennie's and Mr. Denham's.

5540. Which was the larger?—Mr. Denham's was considerably larger.

5541. Then you began with a small plan. Sir J. Rennie increased it still larger. Mr. Denham increased it larger still. Now what was the next plan?—Mr. Timperley's was the last.

5542. Was it larger or less in area than the former?—Considerably less.

5543. Was Mr. Timperley limited by the funds at his disposal in preparing that plan?—Oh yes.

5544. Then that is no proof that a small plan only was necessary, but merely that means only allowed him to design a small plan?—Yes; and I believe Mr. Walker was confined in the same manner.

5545. Have you a copy of Captain Denham's plan?—No, I have not.

5546. Does it exist anywhere?—It is drawn in pencil on Sir J. Rennie's plan.

5547. Did Captain Denham ever do more than draw it in pencil over Sir J. Rennie's plan?—I do not know whether he did it.

5548. Did he write any report?—Yes.

5549. Was it ever printed?—Yes; I have it in print.

5550. Do you know whether a copy of that report was presented to the Tidal Harbour Commission of 1845?—I do not think it was asked for.

5551. Can you furnish this Commission with a copy of Captain Denham's report?—Yes.

5552. That plan enclosed the largest space. Was that generally approved of?—Yes; the merchants of Liverpool said that Sir J. Rennie's plan was too small; they wrote to the Chairman of the Harbour Commissioners, my predecessor, to that effect, and the reply was, that Douglas Bay was large enough, and they could take as much water as they liked.

5553. Was it proposed that the shipowners should contribute to make a harbour of refuge?—I do not think that was put before them.

5554. Did they express a strong opinion in favour of it at a public meeting?—Yes, I have the papers here.

5555. Is there any doubt on your own mind, as representing the authorities and the public here, that a large harbour in Douglas Bay is desirable?—I think so.

5556. Do you believe it would be the means of saving life?—I do think so.

5557. And preventing the loss of property?—And preventing the loss of property.

5558. (*Mr. Coode.*) The sheltered area, according to Sir J. Rennie's plan, was to be 45 acres. Can you tell us what are the maximum and minimum depths over those 45 acres?—From 31 feet to 6 feet, perhaps.

5559. Do you commence at the 6 feet line?—Yes.

5560. Is not the calculation up to low water?—Yes, up to low water.

5561. (*Mr. Lindsay.*) One question more, does the memorial from the merchants of Liverpool refer to the necessity of a harbour of refuge in the Isle of Man, or does it specifically refer to Douglas?—It refers specifically to Douglas.

5562. If a pier were carried out 800 or 850 feet in length would that satisfy the Harbour Commissioners?—What plan do you mean.

5563. The plan lodged. Would a pier carried out 800 or 850 feet from the Two-Gun Battery satisfy the Harbour Commissioners?—I very much doubt if it would.

5564. Why so?—Even if that plan were adopted you would require a greater extension than 800 feet.

5565. Then I understand that an extension from 550 to 850 feet would not sufficiently protect the harbour?—I beg your pardon, I did not follow the question.

5566. I ask if a pier of 850 feet in length were run out from the Two-Gun Battery Point, would that sufficiently protect the harbour?—It would protect the harbour sufficiently.

5567. Would the Harbour Commissioners be satisfied with a pier run out to the extent I have named, or do I understand you to say they would not be satisfied?—If that work were adopted with a view to extension, perhaps they would.

5568. With a view to further extension beyond 850 feet?—Mr. Timperley, our engineer, proposed 200 yards at first, when I wrote to him at Glasgow, where he was with the Glasgow Trustees, to give me an estimate, he sent me word that 300 yards would be necessary.

5569. That is 900 feet. Is it also the view of the Harbour Commissioners that a pier of 900 feet from the Battery Point would be necessary?—It was the suggestion of our engineer. I do not know whether the Commissioners expressed any opinion on that point.

5570. But are you prepared to express any opinion on the part of the Harbour Commissioners with regard to it?—Our object was to look to the inner harbour which was in a very disturbed state for years. It was so much complained of for many years that our desire was for any means for the protection of the harbour. We were glad of anything to protect it. But of late years vessels have grown so in size that we want a larger area.

5571. Do I understand that if a pier were extended to 850 feet from the Two-Gun Battery Point, there would not be sufficient area for the local trade, and it would not afford sufficient protection to the harbour?—It would afford sufficient protection to the harbour, but as a defence to vessels I think it would be too short.

5572. What do you mean by a defence to vessels; do you mean vessels seeking shelter in the bay?—Yes, vessels coming to the roadstead. It was quite gratuitous on the part of Mr. Timperley to suggest 300 yards; I told him he had better keep to his original proposition; we should be very glad to get an instalment.

5573. (*Capt. Vetch.*) Do you happen to be aware, Mr. Quirk, that the line which was proposed and approved of from the Two-Gun Battery by the Court of Tynwald is the same that was proposed to extend on to 1,100 feet, and into 32 feet of water, by the Admiralty?—I am not aware of any proposition of that kind.

5574. And that the only limitation to a smaller extent, as here shown, was owing to the want of funds to carry it out in its entirety, viz., to the distance of 1,100 feet?—May I ask whether that was the proposition from the Admiralty?

5575. Yes, it was.—I am not aware of the existence of such a plan.

5576. (*Mr. Lindsay.*) Have you anything to state to the Commissioners which they do not already know with regard to the other harbours of the island?—Nothing further that I am aware of.

5577. Have you anything on the part of the har-

DOUGLAS.

Mr. R. Quirk.

17 Sept. 1858.

Mr. Lindsay.

bour Commissioners to state as to Ramsey, Peel, Port Erin, or Castletown ?—I think the plan for Ramsey very well to enable them to land passengers.

5578. To what plan do you refer ?—To the extension of Ramsey pier.

5579. Have you the plan of the proposed extension of Ramsey pier ?—Yes ; it is here.

5580. Is this the plan (*produced*) ?—Yes ; that is the plan.

5581. You will send us a copy of this plan, and we will mark it B ?—Certainly.

5582. The plan proposes an extension of the north pier ?—Yes.

5583. In what direction will it run ?—It is on the plan about south-east.

5584. To what length will it be extended ?—230 yards.

5585. Will the whole pier be 230 yards, or the extension ?—Yes ; the extension.

5586. Is there any estimate of the cost of the proposed extension ? — Mr. Walker estimated it at 7,000*l.*

5587. We shall hear the Committee from Ramsey. Have you anything to say as to Port Erin ?—It would make a very good asylum for the herring fleet.

5588. Have you any suggestions to offer with regard to it ?—None, except that I am quite sure it would be a very valuable work if means could be found for it.

5589. As applicable to the fishing trade or the general trade ?—I should say the fishing trade entirely. We have about 300 boats of our own, 300 from the south of England, and about 150 carriers to the English market.

5590. Then I understand there are about 300 Manx boats. How many strange boats frequent the island? —About 300 more.

5591. Then, in the season, there are about 600 boats fishing in the different harbours of the island ? —Yes.

5592. Is there much loss of life among those boats? —No, not loss of life, but of property.

5593. Have you known any case of loss during the last 10 years of the fishing boats ?—There are very few cases, they always watch for the weather ; but they are surprised sometimes, and are lost.

5594. Has there been a large loss of property in the fishing boats ? Have many fishing boats been lost of those frequenting or belonging to the island ? —Not many ; occasionally accidents take place, but they are generally on their guard.

5595-6. Does that arise from the men exercising great prudence and caution, avoiding proceeding to sea, when the weather is threatening, or how ?— They are better found, better sailors, the boats are better, and there are fewer accidents. But they are kept in harbour when they ought to be fishing, for want of being afloat. That always is the difficulty ; they are kept in harbour when they ought to be afloat.

5597. Do you mean that on account of there not being a place of shelter to run for in a gale of wind, they are afraid of putting to sea ?—Yes ; they are afraid of putting to sea.

5598. But is it not the case, that if there comes a south-east gale they can find shelter in one harbour, and if a north-east gale in another harbour, and that those two harbours are not far apart ?—Yes.

5599. Is that the case ?—Yes.

5600. Is that one reason why so few boats are lost? —Very probably so.

5601. Then why do you think a harbour of refuge so very necessary for fishing boats ?—On account of their being able to remain always afloat, and having the opportunity to put to sea if the weather moderates.

5602. Then it is more necessary to facilitate the fishing trade than to protect life and property ?—It would give facilities to the fishing trade.

5603. Then you think it more necessary for that purpose than for saving life and property ?—So far, I do ; because in 1847 a near relative of mine got an account of the earnings of the fishing boats for that year, and it was 80,000*l.* clear gain, allowing for everything ; that was in 1846.

5604. (*Capt. Washington.*) That was not the value of the whole fish taken ?—No ; a balance was struck.

5605. The fishermen really gained and pocketed a sum of 80,000*l.* ?—Yes ; that was the profit.

5606. Have you ever heard the fishermen say they would contribute towards making a fishery harbour? —I have heard of it.

5607. Do you know, of your own knowledge, that they will ?—I am not that side of the island, but I saw a subscription list to the extent of 810*l.*

5608. At one port, or more than one ?—At one port, Port Erin.

5609. The fishermen would contribute above 800*l.*? —They would.

5610. To return once more to Douglas Bay, do I understand you to say, the feeling of the authorities and public here is, and has been for the last 30 years, that a harbour of refuge is required in Douglas Bay? —Yes.

5611. And nothing but a want of means has prevented its being carried out ?—Nothing but a want of means.

5612. Have the plans of the different engineers ever been exhibited, that the sailors might have an opportunity of expressing their opinion upon them? —I remember when Sir J. Rennie's plan came in, I put out advertisements asking the public to inspect it. There never had been an engineer in the island before. That was in 1835. The plans were very nicely done, and I was proud to show them. We invited the public by advertisement, and a good many came.

5613. The plan has two entrances, one to the north and one to the south. Was that plan generally approved of by seafaring men ?—There was no objection raised. They deferred a good deal to the authority of Sir J. Rennie—that it must be right.

5614. Have you any masters of ships sailing out of Douglas ?—Yes.

5615. If they were caught in a gale of wind, and had to take the harbour, they would not ask Sir J. Rennie's opinion, I suppose ?—I should think not.

5616. I should think not, either. Then you cannot tell the Commissioners whether one or two entrances would be considered best ?—Not of my own knowledge. I am quite sure Sir J. Rennie's plan, which is open to south-east gales, is wrong. I think that is wrong.

5617. Probably there will be some seafaring men, pilots, who will give us their opinion ; so I need not trouble you.

5618. (*Mr. Coode.*) You said you saw a subscription list at Port Erin, to the amount of 800*l.* Was that a proposal to contribute annually, or to put down that sum at once ?—It was a subscription of a certain sum.

5619. Do you remember the greatest amount per boat, down in the list?—I can scarcely speak to that.

(*Mr. Lindsay.*) We will not trouble you any further, Mr. Quirk. We are much obliged for the evidence which you have given us.

Mr. Edward Quayle examined.

Mr. E. Quayle.

5620. (*Mr. Lindsay.*) What are you ? — Master mariner.

5621. How long have you been master of a ship ? —I have been 25 years master of a steamer.

5622. Where do you belong to ?—To Douglas.

5623. Where has your steamer been trading ?— To Liverpool.

5624. You have been trading between Douglas and Liverpool ?—Yes.

5625. Are you so employed at the present time?—Yes.

5626. What are the heaviest winds that blow into Douglas; which give the heaviest sea?—South-east winds.

5627. Are you often prevented from landing your passengers?—Yes.

5628. How often in the course of the season have you not been able to land your passengers?—I should say three or four times a year.

5629. Do I understand that three or four times a year you could not even lower boats, but have been obliged to put to sea until the weather moderated?—At least until the water was such that we were able to make for the harbour.

5630. Have you had any accidents in landing passengers?—None.

5631. None of your boats have ever been swamped?—No.

5632. Having great experience as a practical man, look at this plan A, and tell me, do you think a pier going to that length would afford sufficient protection?—It would protect the harbour quite sufficiently, but leave very little room if there were large ships and a number of small vessels wanting to come into the bay.

5633. But would it leave room enough for vessels frequenting this place?—I do not think it would.

5634. Not even for local traders?—It might for the local traders; but there are a great many colliers passing.

5635. But it would leave no room for ships seeking shelter?—No, not in that way.

5636. Say this pier were carried out 850 feet, what then?—Then it would leave too little room still.

5637. Do I understand you to mean that it would leave too little room to the north for ships to get into the harbour?—Yes.

5638. During your long experience on this coast have you known of many shipwrecks and loss of life?—I have known of a great many.

5639. Can you state any case where, in your opinion, a harbour of refuge would have been the means of saving life and property?—I have been the means of saving many lives myself.

5640. But do you know any particular case of ships or lives being lost which would have been saved by a harbour of refuge?—There was the *St. George* steam packet lost on St. Mary's rock, that was in 1830; and the *Vigilant* cutter was lost on St. Mary's Rock.

5641. Were any lives lost?—No.

5642. Would a harbour of refuge have saved those vessels?—No doubt of it.

5643. How was the wind?—South-east.

5644. A strong gale from the south-east?—Yes. We had one of our packets, at the time the *St. George* was lost, in the bay, but steam was up, and we went to sea.

5645. Supposing there was to be only one harbour of refuge to the island, and considering the passing trade to Liverpool or the Clyde, at what point of the island do you think a harbour of refuge would afford the greatest facilities to shipping, and be the best means of preserving life and property?—If you extended a breakwater in Douglas Bay out from the outer head, I think it would afford sufficient room for passing vessels.

5646. Speaking of the passing trade, and trade generally, do you think Douglas the best site for a harbour of refuge?—There is no such place to Holyhead.

5647. For the passing trade, would you think it the best point?—I should not think it quite as extensive as it ought to be.

5648. But as to the site?—The site is very good, because vessels can get out of Douglas Bay with any wind, except south-east.

5649. You think that as a site it is as good as any other in the island?—Yes.

5650. Then your objection is to the limited space?—Yes.

5651. Have you seen the plan of Sir J. Rennie's breakwater? What do you think of it?—I think it a very bad plan.

5652. State your reasons?—It is open to the worst point, and there would be a heavy sea.

5653. Then the heaviest sea sets round Douglas Point?—There is a heavy swell when the wind is south-south-west.

5654. What are the heaviest seas in the bay?—When the wind is south-east or south-south-east. When it is more to the east it is not such a "fetch."

5655. Then you object to Sir J. Rennie's plan because one entrance is open to the south-east swell?—Just so.

5656. And you think that whatever is done, we ought to continne the pier from Douglas Point or Battery Point, and that the passage should be to the north?—Decidedly so.

5657. (*Capt. Washington.*) I think you said you have run into Douglas Bay frequently with the wind blowing hard?—Yes.

5658. Did the steamer which you commanded carry the mails?—Yes.

5659. And there were no means of landing the mails at low water?—Not any.

5660. Neither mails nor passengers?—Neither.

5661. Is that the case now?—Frequently. I think you, Captain Washington, on one occasion were with me.

5662. I am sorry to say I was, and I had the pleasure of rolling about in Douglas Bay for six hours; but that was twelve years ago. Do you mean to say the same state of things exists now?—Yes. Not long ago, the boat with the mails was detained five days, and could not get out to sea.

5663. Why so?—Because there was a wind on the shore blowing a gale of wind. That was this spring.

5664. The mails, and of course all the passengers, were detained five days in the harbour, and could not get out?—Yes.

5665. Do you know how long the steam packets are in going from Liverpool to New York?—They sometimes go in ten days.

5666. Well, then, it appears that this important island, the Isle of Man, with its capital of Douglas, within how many miles of England?—Seventy-five.

5667. Within seventy-five miles of England, has its passengers and mails detained as long as it would take to go half way across the Atlantic?—Yes, or to go to Newfoundland.

5668. Why the island might as well be at Newfoundland?—Just as well.

5669. Surely that is a bad state of things?—Very bad.

5670. What is the remedy?—There is no remedy unless the Government give us a breakwater.

5671. A breakwater to shelter the harbour?—To shelter the harbour.

5672. Have any wrecks ever occurred in the bay?—Oh yes.

5673. The two you have mentioned?—Yes; and I went out myself in my vessel to save a crew,—that was 17 or 18 years ago.

5674. I hope you got the medal from the Life-boat Institution?—I got one from Lloyd's.

5675. That is still better; but do you know of no other wrecks?—There have been a great many.

5676. Within the last few years?—There was one on the rocks last Tuesday morning.

5677. Wrecked?—I do not know whether she was wrecked.

5678. How was the wind?—South-east.

5679. Blowing hard?—No.

5680. What was her name?—The *Lord Nelson*, I believe.

5681. Within the last few years do you know of no other vessels?—I have seen fishing boats on St. Mary's rocks.

5682. We will come to fishing boats afterwards, Have you known of men being drowned in Douglas Bay within the last four years?—Not that I am aware of.

DOUGLAS.

Mr. E. Quayle.

17 Sept. 1858.

Captain Washington.

5683. Within the last 10 years?—Not unless some of the boatmen tumbled over the quay.

5684. Is it a common practice for the boatmen to tumble over the quay?—Sometimes they do when half-seas over.

5685. Are the piers lighted?—Yes.

5686. And kept clear. Is there nothing on them to trip a person up?—No.

5687. Do you happen to know that some shoal water runs off to the east of St. Mary's rocks?—Yes.

5688. Then do you think it necessary to run off a a pier from those rocks?—It would be better.

5689. Because you said you would close the south-east entrance, and enter from the north?—Yes.

5690. But there is some very shoal water to the north?—I think there is sufficient water.

5691. Do you think the pier from St. Mary's rocks better than from Conister rock?—I think it better.

5692. What distances?—I should think 300 yards.

5693. Are you acquainted with any of the pier harbours about England?—No.

5694. Three hundred yards is a good deal?—Perhaps not so much,—200 yards.

5695. Do you believe that if such a breakwater were erected many vessels would take advantage of it?—I believe so.

5696. Do you think a breakwater on the east or on the west side would be more generally useful to ships?—On the east side.

5697. Why?—Because there is more traffic. The traffic is principally on the east side.

5698. Do you know what is the greatest number of vessels you ever saw at anchor in Douglas Bay?—I think I have seen about 20.

5699. Then in a south-east gale, where, if they could not come here, would they go?—They would keep to sea, or off the Calf of Man.

5700. Is there not a very rapid tide off the Calf of Man?—Yes.

5701. Then it is not a good place to round in a gale of wind?—No.

5702. You are in the Liverpool trade, and have not had occasion to go round?—No; I never had.

5703. Are you acquainted with Langness Point?—Yes.

5704. Do you ever get near it in crossing over to Liverpool?—No; we generally keep our course more to the northward and eastward.

5705. Did you ever hear of sailing vessels getting on Langness Point?—Yes.

5706. Is it of frequent occurrence?—I heard the other day of one.

5707. Is there any light?—Yes, in the fishing season.

5708. Who puts it up?—It is lighted by the Harbour Commissioners, and placed on Fort Island.

5709. Where is that?—At the east end of Langness.

5710. There is a light at Derby Haven; is that what you mean?—Yes.

5711. But you don't call Derby Haven Langness Point?—It is part of it.

5712. But when you said there was a light on Langness, I thought you meant there was a light to prevent vessels going on the ness near?—Near the mouth of Castle Bay.

5713. Well, is there any light there?—No.

5714. Any beacon or buoy to warn off that point?—There is a landmark. The *Racehorse* was lost off that point.

5715. What was the *Racehorse*?—A sloop of war.

5716. How long ago?—Twenty-two years ago.

5717. Were many lives lost?—Yes.

5718. How many?—I don't know. Many of the crew and officers, as they were going out in boats.

5719. Then since a sloop of war was wrecked on Skerrans Rock has any vessel since that time been wrecked on that point?—I have not heard of any.

3720. Is there anything to warn vessels off that point in a fog?—There is nothing on the Skerrans.

5721. Does the tide run rapidly off that point?—Yes.

5722. Can you see the light from Castletown?—You cannot.

5723. Have you not Port St. Mary Light?—Yes.

5724. How far off have you seen that?—Seven miles in clear weather. Going to Belfast I have seen Port St. Mary Light frequently.

5725. (*Capt. Vetch.*) I think you say the heaviest sea in Douglas Bay is when the wind blows from the south-east?—Yes.

5726. Does it beat strongly on the outer head?—Very heavy sometimes.

5727. Have you ever seen the spray go over the lighthouse?—Yes.

5728. And green water?—I have seen green water go up to the base of it.

5729. There is great tumult, and a heavy sea?—Yes, a very heavy sea.

5730. (*Mr. Coode.*) You said the *Lord Nelson* got on the rocks last Tuesday morning?—Yes.

5731. Would a harbour of refuge have prevented that?—I should think so.

5732. What were the circumstances of that casualty?—I do not know. I was in the bay. It was blowing a smartish breeze from the south-east.

5733. Do you know whether the *Lord Nelson* had been lying in the bay?—I dare say she had.

5734. Would a harbour of refuge have enabled the mail steamer, which was detained five days, to get to sea?—Decidedly so.

5735. Was there a heavy sea at the harbour's entrance which prevented her getting out?—Yes; we could not get her round.

5736. If you could have got clear, you would not have hesitated to make the passage?—I should not.

5737. Then it was solely in consequence of the sea just off the harbour's mouth that you could not put out?—Precisely so.

5738. (*Mr. Lindsay.*) One question more. Can you tell me, whether ships leaving Liverpool, and taking the north channel, go to the east of the Isle of Man or to the westward?—To the westward.

5739. Always to the westward?—Yes.

5740. By returns which we have, we find that by far the largest number of wrecks are on the east side of the island. Can you account for that?—Because there is the greatest traffic on that side.

5741. Do you mean the greatest traffic with regard to the coasting trade?—Yes, with regard to the coasting trade.

5742. Have you any suggestion which you would like to offer to the Commissioners in regard to a harbour of refuge?—The only thing I can suggest would be the largest plan, Captain Denham's plan.

5743. You prefer that plan because it is the largest?—Yes.

5744. Because it would give the greatest area of shelter?—Yes.

(*Mr. Lindsay.*) We will not trouble you any further. We are much obliged to you for your evidence.

Mr. Robert Gellings examined.

Mr. Robert Gellings.

5745. (*Mr. Lindsay.*) What are you?—Assistant harbour-master.

5746. Have you anything to state to the Commissioners with regard to the necessity of a harbour of refuge at this particular site of Douglas?—Yes; there is one required.

5747. Do you think it is required for the passing trade as well as the home trade?—Yes.

5748. Are there many ships which put into the roadstead now for shelter?—Yes, a great number.

5749. How many at one time have you seen?—Taking the fishing boats?

5750. No, excluding the fishing boats?—I have seen 20 and 30.

5751. Any large ships?—Coasters and schooners, not very large.

5752. How many fishing boats have you belonging to the island?—About 300.

5753. Have you any strange boats as well?—About 200 come from the West of England.

5754. Then there are 500 boats. How many belong to Douglas?—There are very few belonging to Douglas; they come from other parts of the island.

5755. How many boats fish out of Douglas?—I do not think any boats belonging to Douglas.

5756. How many bring in fish?—About 200 or 300.

5757. Have you known any accidents with those boats?—Sometimes.

5758. Tell us when?—The fleet was lost about seventy years ago.

5759. Has there been no loss of life more recent than that among the boats frequenting Douglas?—Not many.

5760. Is your harbour dry at low water?—Yes, at spring tides.

5761. Have you anything further to add?—Captain Wilson lost his boat's crew at the mouth of the harbour.

5762. Was that during a heavy gale of wind?—Yes, coming in.

5763. Was the crew all lost?—Yes, I think so.

5764. What other ship do you know of?—The *City of Glasgow* steam packet was lost.

5765. How long ago?—About thirty years ago.

5766. Were any lives lost?—I think not; but they were taken ashore naked.

5767. Was she trading here?—She called here.

5768. Then if there had been a harbour of refuge that vessel would have been saved?—Yes.

5769. Would a pier from the Two-Gun Battery of 550 feet sufficiently protect your harbour?—I think it would be entirely too small.

5770. Would any increased security be given to the present piers if such a breakwater were made?—It would break the water.

5771. Which is the heaviest sea?—South-east.

5772. Then, during the heaviest sea which now breaks in right over the pier,—and the spray I am informed even goes over the top of your lighthouse,—the proposed pier would protect the harbour, would it not, during those gales?—Yes; but the east wind is a very heavy gale, though not quite so heavy a sea.

5773. Is there a heavy sea when the wind blows from the east?—When it is blowing hard.

5774. Would not the proposed pier protect the harbour during an easterly gale?—No, it would not.

5775. Would it have that effect if extended to 800 feet?—There would still be running with an east wind.

5776. Do I understand you to say that if the pier were carried out to the extent of 800 feet, the sea would still run into your harbour during a gale from the east?—Yes.

5777. Have you any suggestion to make as to a breakwater which shall afford shelter to your own trade, protect your harbour, and afford accommodation for the passing trade also?—A harbour of refuge, you mean?

5778. Yes; have you any suggestion to offer?—I think it should be a breakwater from the Big Head lighthouse running east-north-east.

5779. You think a breakwater running from Douglas Point east-north-east would do?—Yes; running past Conister's Rock.

5780. Running from Douglas Point in the direction of Conister's Rock?—No; in this direction east-north-east.

5781. What length of pier would that require?—I suppose that would require 600 or 700 yards.

5782. Do I understand you to say that nothing short of a pier of 600 yards in the direction you name would afford sufficient shelter in the harbour, give the desired accommodation to the local trade, and to a certain extent to the passing trade?—No, I think not.

5783. Nothing short of that would be sufficient?—No, I think not.

5784. Saying that such a pier as this on the plan (A) were run out from the Two-Gun Battery, would the steamboats be able to land their passengers there at all times in smooth water?—Yes, they might.

5785. Would steamers lay alongside it in safety?—Yes, I think so in the bight; still there is no road from the town there at present.

5786. Could not that be easily remedied?—You must cross the harbour.

5787. But there is a bridge, I understand, across the harbour?—Yes.

5788. What distance would it be from the bridge to the pier—to the inner part of the pier?—Well on to a mile. It would be more than a mile.

5789. Have you measured it; are you sure it would be more than a mile?—I think it would.

5790. Is there no road part of the way?—Yes, to Fort Anne.

5791. What length of road would be necessary to complete the connection between the present road and the pier?—About half a mile. It would require a sea wall as well.

5792. Are you aware of any difficulties beyond the expense, of which you cannot speak?—It is all private property.

5793. Do you not think that the parties interested, if it were for the public good to make the road, would come forward readily?—I can't tell.

5794. (*Capt. Washington.*) You are assistant harbour-master?—Yes.

5795. Is there a harbour-master besides you?—Yes; John Clegg.

5796. Is he here to-day?—I don't know; he was not brought up to the sea.

5797. How long were you at sea?—Near 30 years.

5798. In what trade?—Betwixt here and Liverpool, generally.

5799. In a steamer or a sailing vessel?—In a sailing vessel.

5800. Have you often been round the Calf of Man?—Yes, I have; often.

5801. Are there good lights on it?—Yes.

5802. Is there a good light on Douglas Head?—Yes.

5803. By whom is it kept?—By the harbour authorities.

5804. Do you know at what expense?—I am not certain as to the expense of it. About 140*l.*

5805. Have you ever been in the lantern?—Yes.

5806. How is it lit?—By reflectors.

5807. Has it ever gone out?—I never heard of it.

5808. Have you a light at the pier head?—Yes.

5809. Is it a tide light or all night?—All night.

5810. Do steamers come in at night?—Yes.

5811. If a steamer arrive at half-ebb, can it come in?—No; there is too little water.

5812. How long would she have to wait?—About six hours.

5813. Has it occurred often, within your knowledge, that a steamer has had to wait?—Yes, very often.

5814. Do freshets come down your harbour very often?—Not very often.

5815. Do you scour out the harbour?—Yes.

5816. Is there any mud in the harbour?—Yes; high up.

5817. Do you take any means to remove that mud?—Yes; it is removed by a flat.

5818. What is done with it?—Country farmers sometimes draw it away for manure.

5819. Is it useful for manure?—I believe so.

5820. Do they pay anything for it?—Nothing, I believe; it is quite useless.

5821. Which is it, useful or useless?—I believe it is quite useless.

DOUGLAS.

Mr. Robert Gellings.

17 Sept. 1858.

Captain Washington.

5822. If you don't understand don't answer. Are any complaints made of mud in the harbour preventing ships taking up berths ?—Yes.

5823. Do you do anything to remedy that ?—Not much. We have done a little. The flat is ready.

5824. Is your quay clear. Are there no blocks of timber on it—no herring casks ?—At the present time there are a few going by the packet.

5825. No boiler plates ?—Yes ; landed from the packet.

5826. Is the south quay under your charge ?—Yes.

5827. Do you know that more than half of it is at the present moment blocked up with boiler plates and blocks of timber ?—The gasworks are making alterations.

5828. Have you occasion to go up to Fort Anne ?—Yes.

5829. Do you know that at a sharp corner there are 10 boiler plates projecting into the road ?—The gas works are making alterations.

5830. As you are harbour master I only ask if you know these things. To return to the refuge, where do you think the entrance should be ?—To the eastward of Conister.

5831. Do you know that there is shoal water to the eastward of Conister ?—Yes, close over, but there is a good bay.

5832. Do you know any instance in which life would have been saved by a breakwater in Douglas Bay ?—I cannot tell the time, but several lives have been lost.

5833. In your recollection ?—Yes.

5834. Can you state where ?—On Douglas beach.

5835. It is distinctly your opinion that a larger harbour would be better for shipping ?—Yes.

5836. And you believe it would be resorted to by many shipping ?—Yes.

5837. (*Mr. Coode.*) You think that a large space is required in Douglas Bay, to afford proper shelter ?—Yes.

5838. Supposing there were a larger space at Ramsay, should you have any objections to offer to the construction of a harbour there ?—I cannot say.

5839. Can you tell us to what port the largest number of fishing boats belongs ?—I think to Peel.

5840. Can you tell us how many ?—I cannot say how many to Peel, but 300 to the Isle of Man.

5841. You say none belong to Douglas ?—I think not any.

5842. Can you tell us how it is there are so many sailing from Peel and none from Douglas ?—I am not prepared to speak as to the cause of that.

5843. Do you not know that the fishing commences there ?—Yes.

5844. (*Mr. Lindsay.*) Have you any further information which you desire to give to the Commissioners with regard to this harbour of refuge ?—No, nothing more.

5845. (*Capt. Washington.*) Do the fishing boats occasionally fish from Douglas ?—Yes.

5846. To what number ?—There are 200 here now.

5847. Where do they come to ?—To the upper part of the harbour.

5848. Have you room for them ?—We have not sufficient room. The harbour is quite blocked up at times.

5849. If the mud were removed would there be more space ?—More water, but not more space.

5850. Are the fishing boats prevented going out sometimes ?—Sometimes the weather is bad when the tide is in the harbour, and when it moderates they cannot get out, and they lose their fishing. If there were a breakwater they could be always out.

5851. Do they lose much money by being kept out of a night's fishing ?—Oh yes.

5852. What is the value of a night's fishing to those 200 boats ?—I cannot tell.

(*Mr. Lindsay.*) We will not trouble you any more.

Mr. Henry Gill examined.

Mr. H. Gill.

5853. (*Mr. Lindsay.*) What is your occupation ?—I have been to sea for 30 years ; I am a shipmaster, at present retired.

5854. Do you reside at Douglas ?—I have resided here for 45 years.

5855. How long since did you retire from the sea ?—18 years.

5856. In what trade were you employed ?—In the foreign trade out of Liverpool.

5857. How long were you in command of a ship ?—22 years.

5858. To what ports chiefly did you trade ?—To Newfoundland, North America, West Indies, the Brazils, and the East Indies.

5859. What is your opinion with regard to the necessity of a harbour of refuge for the Isle of Man ?—I think it would be of essential service, not for our own local purposes alone, but for the general trade of the surrounding ports.

5860. State you reasons why you think it would be of general service ?—Vessels leaving Liverpool with the wind south-east, which chops round to the south-west, and comes on to blow, have to put back to Liverpool, and run the risk of going on the Liverpool banks, whereby many lives are lost. But if there were a harbour of refuge on the Isle of Man, they would put in and wait for better weather.

5861. Does the wind very often chop round as you describe ?—Yes, very often.

5862. Looking to the general trade ; looking to the question of a harbour refuge in its proper sense, that is to say, to be a benefit to all ships, what site do you, in your opinion, consider the best for a harbour of refuge ?—I should say from Douglas Head, according to Captain Denham's plans. Nothing can be better than that in my opinion.

5863. Would you think it necessary, as a harbour of refuge, that the pier should be extended?—Not for general purposes ; it might be necessary for a fleet of men-of-war, but for trading purposes I think Captain Denham's would be sufficient.

5864. You think that nothing less than that would be sufficient ?—No.

5865. Have you any idea of the cost ?—No ; that is a thing which I have never estimated.

5866. Say that a harbour of refuge could be made in another part of the island, that would afford an equal area of shelter at one half the cost ; presuming that such a harbour could be formed at Port Erin or Ramsay Bay, affording equal shelter to that proposed by Captain Denham, and capable of being constructed at half the cost, would you say, as a gentleman of considerable experience, that the site ought to be at Douglas ?—I should say that it ought to be at Douglas, because we have stone on the spot.

5867. Suppose it was half the cost, and afforded equal shelter ?—I would prefer Douglas.

5868. Do I understand you to say, you prefer Douglas because a harbour of refuge at Douglas would be likely to tend to save more lives and property than a harbour at any other part of the island ?—I think it would.

5869. Is that your reason ?—It is.

5870. You alluded to vessels from Liverpool, what passage do vessels leaving Liverpool take ; to the east or the westward of the Isle of Man ?—They pass round the Calf.

5871. Then if a harbour of refuge were constructed at Douglas, that would not be in the track of ships leaving Liverpool and taking the north channel ?—No ; but if they were caught in a gale of wind Douglas would be on their lee.

5872. That is, if the wind shifted suddenly and they could not get round the Calf, they would then have Douglas to run for ?—Yes.

5873. Do you know anything of Port Erin?—I have seen it. I have been there.

5874. Bearing always in view that I am now asking questions as to a harbour of refuge in a national point of view, do you think that site not so good a site as Douglas?—Not at all.

5875. State your reason?—My reason is, because ships coming from Liverpool do not come that side at all.

5876. Going where to?—Bound down St. George's Channel.

5877. Is there any other reason?—No other reason. Where one ship passes there, there are 20 pass this side. Of course a harbour of refuge would be of great service to trade on that side of the island.

5878. I am speaking on the presumption that there would be only one harbour of refuge; what do you say to Ramsay?—Ramsay is very good as a roadstead.

5879. Better than Douglas?—It is more convenient and easier of access.

5880. As you know about this bay, and are a nautical man, do you see this plan?—Yes, I see it.

5881. Do you think a pier such as that, if extended out to 800 feet would be of much service to ships passing?—There would not be sufficient space for large ships.

5882. Not sufficient space?—Not half space enough.

5883. Speaking as if you were in command of a ship of 500 tons?—I would not take it.

5884. Do I understand you to say that if a pier were run out from the Battery Point to the extent of 850 feet, and you were caught in a south-east gale, in command of a ship of 500 tons, you would not take such a harbour?—If there were no other resource I would.

5885. Would you think there was great danger?—Yes, with a ship of 500 tons.

5886. Then if you could keep to sea you would prefer to keep to sea?—Yes, I would.

5887. How, in case there were a breakwater from Douglas Head?—There would be sufficient space then to bring up in.

5888. Then your objection to a pier from Battery Point is twofold; first, that there is not sufficient space, and second, that it runs in the line of the best anchorage in the bay?—Yes.

5889. If a pier were carried out from Douglas Head and properly constructed, you would have no hesitation then in running with a 500 ton ship for the roadstead of Douglas?—None whatever.

5890. In the heaviest gale?—Yes, in the heaviest gale.

5891. And you would not think there was any unusual risk in doing so?—No more than running for any other port of refuge.

5892. Would a pier from Battery Point be sufficient for the local trade and vessels frequenting the bay?—It might for some time, but during the fishing season there would not be sufficient space there.

5893. But if it were carried 850 feet out, would there not be sufficient space for the local trade?—I think not; when all the fishing fleet were there the passage would be blocked up, steamers would be obstructed, and there would be no room for windbound ships.

5894. Then you could not call it a harbour of refuge?—No. It would shelter the present harbour, but as a general harbour of refuge it would not be the thing at all.

5895. (*Capt. Washington.*) I think I understood you to say that a pier as proposed in Mr. J. Walker's plan marked A to run off the Two-Gun Battery would run right through the best anchorage in Douglas Bay?—Yes.

5896. Therefore you are of opinion that any breakwater to be constructed should be carried much further out?—It would be much better, and of more general service.

5897. Would you recommend one or two entrances into such a harbour?—I think one would be sufficient.

5898. Where would you place that entrance?—According to Captain Denham's plan, to the north-east.

5899. Does the north-east send in a very heavy swell?—No; south-east.

5900. Is it the south-east or the south-west which sends the heaviest swell into Douglas Bay?—It is sheltered from the south-west. It is the south-east.

5901. Yes, but the heaviest swell?—The south-east.

5902. We are speaking of Douglas Bay, not of the tidal harbour in Douglas Bay. Which wind causes the greatest swell?—Within the head a south-east wind, but without the head a south-west wind.

5903. You have said, I believe, that the greater part of the coasting traffic passes on the east side of the island?—Yes.

5904. Have you seen what is called the wreck chart of the Isle of Man?—I think I have.

5905. Will you take that chart into your hand? (*Chart handed to witness.*) You will observe that it is a chart purporting to show all the wrecks which have occurred during 25 years?—Are the wrecks marked here?

5906. In black dots. Each black dot denotes a wreck.—I do not know that I have seen it before.

5907. Do you understand now you see it?—Yes.

5908. Do you notice that on the west side 17 black dots only appear in 25 years, and on the east side 123 black dots appear?—Yes.

5909. To what do you attribute that very much greater number of wrecks on the east side to what there are on the west side?—It is because almost all the vessels from Liverpool pass on the east side, and they are sheltered if ever they go near the west side.

5910. Where are the vessels bound to which go on the east side?—The coasters generally pass round the Point of Ayr; for Belfast and Derry they generally go round the Calf, though sometimes they take the north route.

5911. Of what is the traffic made up?—Vessels from Liverpool principally, and in the coal trade.

5912. Did you ever hear a desire expressed in Liverpool for a harbour of refuge in the Isle of Man?—Yes.

5913. I think you have said you would prefer Captain Denham's plan?—Yes.

5914. Who sent him to make a plan?—I was not here at the time.

5915. Did the trustees of the port of Liverpool?—I believe it was the dock trust and the merchants.

5916. And they paid all the expenses?—I do not know. He was their surveyor.

5917. And people who employ men generally pay them their expenses?—I should think so.

5918. Is not that an indication of the feeling of the merchants of Liverpool, that they send their own surveyor over here to plan a port of refuge?—I should think so.

5919. Have you ever known any great detention occur at Douglas—that steamers could not get to sea or land their mails and passengers for want of shelter?—Last March our steamer could not get out for five days. She could not wind in the harbour for the heavy sea; whereas, if there were a breakwater outside, she could have gone to sea.

5920. So that the swell was not so great, but that a well-found steamer could have put out?—A steamer could have gone out.

5921. The detention was solely attributable to the defects of the existing harbour and want of shelter?—Yes.

DOUGLAS.

Mr. H. Gill.

17 Sept. 1858.

Captain Washington.

5922. In that wreck chart is there any statement of the loss of life in the 25 years?—Yes. "The "dots represent the number of wrecks which have "occurred between 1821 and 1846, as per printed "Return. 144 wrecks; 172 lives lost; value of "property estimated at 250,000*l*."

5923. (*Mr. Lindsay.*) From your long residence here do you remember many cases where boats coming here could not land their passengers?—Frequently.

5924. Do you remember any particular case with regard to the Whitehaven boat?—There was one case which occurred lately.

5925. Will you state to the Commissioners what the particulars of that case were?—I only know the boat came in at night. It was supposed she had anchored in the bay, and she drifted out to sea. The passengers thought she was still in the bay, and went off to her into a boat, and they got drifted out to sea also.

5926. Were the boats saved?—The steamer went out, and picked them up.

5927. Were they safely embarked with all their luggage?—I believe they threw over their luggage to save the boat from swamping.

5928. Then they were in great peril?—Yes, they were.

5929. Do you remember the loss of the *Bell*?—Yes; I saw that.

5930. State the particulars.—She was wrecked on the Calf of Man, along the rocks.

5931. What was the size of the vessel?—Of 200 tons.

5932. How long ago was it?—In 1848 or 1849.

5933. Did she become a total wreck?—No.

5934. Were the crew saved?—Yes.

5935. Was the cargo saved?—She was in ballast.

5936. Was she got off?—She was floated off with puncheons.

5937. How was the wind?—From south-west at the time, or about south.

5938. Would a harbour of refuge have saved that vessel, and prevented her going on the rocks?—No doubt about it.

5939. Have you any information you would like to give which has not been elicited by the questions?—I have no information to give, only that I am confident a harbour of refuge in Douglas would be the saving of many lives and much property. A vessel leaving Liverpool, if she has not fetched Holyhead or got round the Calf of Man when a gale springs up, where is she to go to? Vessels so situated must turn back again, and they are frequently lost on Liverpool banks; whereas, if there were a harbour at Douglas, they could take it.

We will not trouble you any further. We are much obliged to you for your evidence.

Mr. Edward Moore examined.

Mr. E. Moore.

5940. (*Mr. Lindsay.*) What is your occupation?—Secretary and agent to the Isle of Man Steam Packet Company.

5941. How long have you been secretary?—Above twenty-eight years.

5942. How many boats do the company own?—Four, at present.

5943. Where do the boats trade to?—Almost entirely between Liverpool and Douglas.

5944. How often do your boats sail?—In summer time, generally eight to nine times a week; and in winter, three to five times a week.

5945. How many passengers land and embark in the course of a year? Have you any return?—I have. I took a copy from the book this morning. It is for last year, 1857. Over-sea passengers, by the company's boats, 89,643.

5946. Was that number conveyed by your own company?—By our own boats. This is taken from our books. During the four months of the year, June, July, August, and September, the proportion of the 89,643 was 75,766.

5947. Passengers landed?—Landed and embarked.

5948. Do you know the number of passengers who land and embark at Douglas in the course of a year?—I have no idea. Probably, by other means of conveyance to the island, 10,000 more than we bring; say 55,000 or 60,000.

5949. Do 55,000 or 60,000 persons land annually at Douglas?—No, but principally at Douglas. There is the Whitehaven packet, to Ramsay and Castletown.

5950. How many other boats trade to Douglas?—None. From Whitehaven there is a boat which trades from Whitehaven to Dublin, and calls at Douglas for passengers. There are no other steamers belonging to the port.

5951. Have you often known those boats unable to proceed to sea on account of the risk?—On many occasions. It is impossible to round a boat in Douglas Harbour in a south-east gale, even a moderate gale, and I have seen boats injured in attempting it. The boats now are so much larger than were formerly used that the risk is much increased.

5952. Are the passengers unable to land?—That frequently takes place. In all cases at half ebb and half flood with an on-shore wind.

5953. Have you known many passengers prevented embarking on account of the risk and danger of being obliged to embark in small boats in the bay?—That must often occur.

5954. Have you known inconvenience arise to passsengers from having to embark in small boats in the bay?—Very frequently. I have known boats leave the bay without mails or passengers, being obliged to escape for safety.

5955. And losses have been sustained by parties not being able to get to Liverpool by such and such times?—Yes, to a considerable extent.

5956. If there were a pier in the bay, so that passengers could embark at all times, do you think that the intercourse between this island and England would be greatly increased?—Yes; but more is required. We want to land passengers at low water without small boats.

5957. But if a pier were so constructed that passengers could land and embark without the necessity of going into small boats, do you think the traffic would materially increase in passengers?—I have no doubt of it.

5958. Would such a pier as that which is proposed in plan A meet the object in view?—Do you propose landing on the pier?

5959. Yes.—It would be a serious inconvenience to have to go round such a distance into the town.

5960. But if a road were made?—It would still be inconvenient.

5961. But if there were no inconvenience. Do you think the inconvenience of driving that distance anything like the inconvenience of being obliged to land and embark in small boats?—I think a majority of the passengers would prefer the small boats.

5962. Even if there were a good road?—Yes. It would be a very serious inconvenience to have to come that distance.

5963. Even if there were cabs?—But all passengers cannot afford cabs.

5964. It is very right to speak of the poor people, because those are the people to be considered in the first place; but what greater distance would they have to walk from the proposed than they now have to walk from the existing pier?—I do not think one in twenty would prefer going round the road to going in small boats; because fear is the only thing which prevents persons going in small boats, and in fine weather there is no fear.

5965. You think the risk of embarking in small boats has not so much effect as the fear?—I think so.

because in twenty-eight years I have embarked an immense number of persons in boats without accident. I have often known a boatfull get a good ducking at the pier head with an on-shore wind, but nothing serious.

5966. Then, as far as regards the safety of passengers, you do not think a pier necessary?—I think that to cause smooth water to be at the pier head for embarking and landing passengers more essential; because many time we cannot land and embark our passengers with an on-shore wind. We cannot do so at spring tides. There was a little jetty placed at the Pollock rocks by the Harbour Commissioners to obviate the inconvenience. At low-water spring tides passengers still land and embark at this jetty, which is a very inconvenient road into the town, clambering over the rocks.

5967. From the tenor of your evidence am I to understand that such a pier as is proposed from the Two-Gun Battery is not of any moment?—I think it would be of essential benefit to the company.

5968. In what way?—In the protection of their boats during on-shore winds, when they are frequently obliged to go to sea for safety.

5969. Speaking as regards passengers and the public, do you think such a pier as that would afford very great accommodation?—Yes, so far as the accommodation of passengers, decidedly.

5970. You think it would afford great accommodation?—Yes, decidedly.

5971. Have you any plan to suggest which would afford greater accommodation at all states of the tide?—According to my views there was a plan of a pile pier running out from the pier head to eleven feet of water at low tide, which would be better. The plan was furnished by our engineer, and he surveyed and found the ground adapted for deep driving of piles.

5972. To carry it on from the stone pier?—He proposed stone as far as low water, and then a wooden jetty.

5973. We have been told that not only does the spray go over the pier, but over the top of the lighthouse. Do you think it possible to erect any wooden construction which could stand the shock of the sea?—From what I hear of the Mayport pier, there is a much heavier sea on that pier. Though a rough sea, ours is not a very swelling sea, which perhaps would be the case in a more open situation.

5974. In the event of such a pier being made, could you always land and embark passengers?—I do not think it would be above ten or twelve times a year that we could not. South-easterly gales are few and far between.

5975. Could you in all other gales, except a south-easterly gale, land and embark passengers?—Yes, in all other gales, and even in an easterly gale, because the pile pier would protect the vessel inside.

5976. Then passengers would be able to land at all times of tide, and you could land and embark your passengers in all winds except a south-easterly gale?—Decidedly.

5977. Then am I to understand that, considering the safety of boats and passengers, you think such a pier as that would suit you better than a pier from the Two-Gun Battery?—I believe it would be more beneficial to the interests of the town of Douglas and the Isle of Man to have that pile pier without a breakwater than to have a breakwater without a pile pier.

5978. Just so. That is the substance of your evidence?—I have heard the late Captain Gill, a captain who was in our employ for about 20 years, always set his face against this plan of a pier from the Two-Gun Battery. He said it would completely destroy the bay, because it would be running into the best anchorage of the bay.

5979. (*Capt. Washington.*) What number of steamers arrive at and sail from Douglas every week?—We sail six a week, and generally three extra boats. In summer we average eight a week.

5980. Eight sailing and eight arrivals?—Yes.

5981. Is there any other company?—The Whitehaven Company. Their boat comes once a week, and goes on to Dublin.

5982. How often do they touch at Douglas?—Once a week. Then we often have pleasure trips round the island.

5983. As often as once a week?—Yes, as often as six times a week, according to the state of the weather.

5984. Might we take the steam traffic to be ten arrivals and ten sailings a week?—Yes, in summer time.

5985. And in winter?—Four perhaps a week, I should think.

5986. Including the mails?—Yes, including the mails. I put down the mails at three a week, and the Whitehaven boats at two a week.

5987. And those are the steamers which convey the 89,000 passengers?—They are the same boats as have conveyed the mails for nearly 28 years.

5988. Have there been many detentions in embarking mails and passengers, or landing them?—Yes, they have occurred very frequently, and more so in winter than in summer. I know on one occasion we dare not run for Douglas Bay, we went the other side and landed the mails at Port Erin. The return mails were sent across to Port Erin, and the vessel never came to Douglas at all that trip.

5989. And the only remedy for that is a breakwater in the bay?—I think so. One of sufficient extent that those who come after us may be satisfied with it.

5990. (*Mr. Lindsay.*) Following up some of the questions, and speaking to you as the representative of the Isle of Man Steamboat Company trading here, you stated that for the purposes of your company you would rather have a continuation of the present pier to a pier from the Two-Gun Battery. I want to know whether, with the same objects in view, you would prefer it to such a breakwater?—As to the pier running from the inner or outer side, the effect is the same, as far as the company is concerned, except that the enclosed space is much smaller with the pier running from the inner than if it runs from the outer side.

5991. All points considered, you state it as your opinion that a continuation of the present pier is the best?—And protection of it besides.

5992. You would require a breakwater also?—That would make it complete.

5993. But if it were a question of a breakwater, as shown in plan A, or the continuation of the present pier, which do you think would suit your purposes best—which would you choose between?—I myself would choose the pier rather than a breakwater without it. You might have a road round, but still it would be very inconvenient to have it.

5994. Could you land at all times on the pier from the Two-Gun Battery?—Oh yes.

5995. (*Capt. Washington.*) How far out would the pile pier be carried?—To 11 feet of water at low-water spring tides.

5996. To enable you to land passengers at all times?—Yes.

5997. Do you know the length that would require?—There have been plans.

5998. Such a plan is not recommended by the Tynwald Court?—I believe the Admiralty objected, but not the Tynwald Court. The Government greatly advocates it.

5999. What would be its length?—Its length would be 600 feet.

6000. Do you know the estimate of the cost?—6,000*l.*

6001. And you think it worth that sum?—I think so to the company, if they could afford to do it.

6002. You consider a landing pier of that kind for passengers to Douglas absolutely necessary?—I do think it decidedly necessary.

6003. (*Mr. Coode.*) Supposing a breakwater were made according to the plan A, with facilities for landing,

DOUGLAS.

Mr. E. Moore.

17 Sept. 1858.

Mr. Coode.

and a road to the town, should you think a pile jetty still necessary ?—With bad weather the road would be preferable ; but if you take the ordinary weather during the summer, the greatest majority of passengers would prefer the jetty.

6004. During bad weather they would prefer the road?—Yes, as it would obviate the necessity of small boats. There is a great objection to small boats.

6005. The pier would obviate the necessity of using small boats ?—Decidedly.

6006. Then a road and breakwater would meet that objection?—Yes ; except the inconvenience of landing so far from the town.

(*Mr. Lindsay.*) We will not trouble you, Mr. Gill, any further.

Mr. Thomas Garrett examined.

Mr. T. Garrett.

6007. (*Mr. Lindsay.*) What is your occupation ?—Gentleman.

6008. You are not engaged in business ?—No.

6009. Are you a resident at Douglas ?—Yes.

6010. Have you been long a resident here ?—All my life.

6011. Are you a holder of property or land ?—I am owner of house property in the town.

6012. Is this question of a harbour of refuge one to which you have given attention?—I have given it some little attention.

6013. The Commissioners will be very glad to hear any points of information which you can give them. As their time is limited, you will confine yourself as much as possible to that information which they do not already possess. As you are aware, they have a large amount of information bearing on the subject, but still, we shall be happy to hear any suggestions which can be offered. —Upon hearing that the Commissioners were coming to the island a public meeting was convened by the high bailiff, and a committee appointed, of which I was a member, to communicate to the Commissioners. They have drawn up a letter to the Commissioners, which I shall be glad to read.

6014. As you have been kind enough to give each Commissioner a copy of that letter, and I presume it is your desire to lodge it, perhaps you had better call attention to the leading points in it?—I think the people of the town will be more satisfied if it is read throughout.

6015. We are anxious to meet the wishes of the town. If that is their wish we will hear it ?—This is the letter :—

" Gentlemen,—At a public meeting of the inhabitants of the town of Douglas, held on the 7th instant, convened by public advertisement, and presided over by the high bailiff, we were appointed a committee to confer and communicate with you on the advantages of an asylum harbour being established in Douglas Bay.

" The serious inconvenience and loss to the shipping and mercantile community of this kingdom occasioned by the want of a harbour of refuge in the centre of the Irish Sea, of such a depth of water that the largest vessel could take refuge therein from storms with all winds, and at all times of the tide, is universally felt and acknowledged.

" In the opposite ports of Lancashire, Cumberland, and the south ports of Scotland, although one-third of the commercial shipping is registered, and that about 20,000 vessels, with an aggregate of 3,000,000 registered tonnage pass the coast of this island annually, there is not a harbour north of Holyhead to the Firth of Clyde which can afford shelter to a vessel in distress at low water, or at half-tide, except Liverpool, and that port can only be taken by certain winds.

" The port of Douglas, although a dry harbour, has, since the abolition of the dues on vessels entering the harbours of this island, become a resort for a large and increasing amount of shipping seeking shelter in tempestuous weather ; and we feel considerable confidence in stating that, with a comparatively small outlay, its bay is capable of such improvements as would render it the most complete and secure national harbour of refuge, and wherein are eligible situations for the erection of dockyards and graving docks, which no doubt would be wanted for the repairs of shipping having sustained damage off the coasts ; and there are springs of excellent water, capable of supplying the largest fleet, close to the shore.

" The amount of shipping entering the harbours of the Isle of Man since the abolition of the dues on vessels has increased from 90,000 in 1844, to 218,000 in 1854 ; in addition to which an increasing number of vessels seek shelter in its bays and along the coast.

" The whole of Douglas Head being an entire mass of rock, rising to a considerable height, it would only be needful in the construction of a breakwater, as the stones were quarried, to roll them into the sea ; and larger stones, of any weight, for facing the breakwater, are to be procured close to the sea, a few miles distant.

" The Isle of Man fisheries appear as yet to have been very inadequately estimated as a nursery for British seamen. Making harbours along its coast, accessible at all times of the tide, would assist in obviating the inconvenience to which the British Government is frequently exposed in the procuring of seamen for the navy. At present many thousands of pounds are annually lost to the nation by there being no harbour along the coast of this island accessible at low water, whereto the fishing fleet may resort in case of being overtaken by tempestuous weather. The coasts of this island are frequented by fishing boats from Cornwall, Torbay, and several ports in Ireland and Scotland, which, with the Manx boats, make a total of upwards of 1,000 in number engaged in the fishery. The value of the 600 Manx boats and nets amount to upwards of 80,000*l*., which produce about a 100,000*l*. per year, and are manned by about 4,000 men and boys ; so that there are on this coast more than 6,000 men and boys engaged in fishing, besides a large number in the carriage of salt from England, and fish to the opposite ports, whence it is transferred to the large towns of Manchester, Birmingham, Sheffield, &c., &c.

" Placed as the Isle of Man is in the centre of the three kingdoms, the importance of its relative situation in a naval point of view appears to have been lost sight of. It is worthy the grave consideration of the government to anticipate the possibility of this island, in the event of war, being made use of by the enemy. The establishment of a harbour of refuge in Douglas Bay, wherein a fleet of Her Majesty's navy might lie with safety, ready at any time of the tide to repel an attack of an enemy on this or the opposite coasts, would prevent such occurrences as took place in former wars, when the enterprising French commander 'Thurot,' and the daring adventurer 'Paul Jones,' caused much alarm in these seas ; and during the revolutionary war in which we lost the United States of America, their cruisers captured several valuable vessels not many miles distant from this coast. Capt. Washington, R.N., in his letter to the Secretary of the Treasury, dated Woolwich, 4th December, 1850, recommends 'a breakwater in Douglas Bay, to ensure a place of landing and embarkation at all times of the tide for Her Majesty's mails, for troops, and for coaling a war steamer, in case of need, a point of some consideration to a channel where, on both sides, all are tidal harbours.'

" By the establishment of a harbour of a refuge on the coast of this island, it would become not only, as the Tidal Harbour Commissioners term it, the 'beacon of the Irish Sea,' but it might also become the citadel of the Irish Sea.

" On referring to the report on a proposed asylum harbour in Douglas Bay, of Captain H. M. Denham, R.N., addressed to the Secretary of the Liverpool Dock Trustees, dated Liverpool, 31st October, 1850, we find that he states—

"'I satisfied myself that Douglas Bay, in point of locality, capacity of water, surface, area, natural features, and freedom from contiguous danger, is a fit position for forming a safety harbour, as a central refuge for vessels navigating the Irish Sea. A less enclosure than I suggest, would not, in my opinion, give Liverpool that proportion of refuge space for her shipping interest, which the port ought to have in prospect.'

"Sir John Rennie, F.R.S., in his report on an asylum harbour in Douglas Bay, addressed to his Excellency the Lieut.-Governor of this island, dated London, 2nd April, 1835, states :—'That there is no low-water harbour of any magnitude between Holyhead and the Firth of Clyde, except the packet harbour of Whitehaven and Port Patrick, a distance of upwards of 300 miles on the east side of the channel, from whence it arises that vessels outward bound from Liverpool when prevented from continuing their voyage by strong westerly winds, are driven back, and are compelled to beat about the channel during long nights and stormy weather, at the imminent risk of shipwreck. The large fleets of colliers from Whitehaven, Workington, and the coast adjacent, from 70 to 100 and upwards of which sometimes leave those ports at one tide, and by which Dublin and a large portion of Ireland are supplied with coal, experience similar difficulties in their voyages, and frequently suffer shipwreck for want of a proper port of refuge to run to in event of need. Upon a careful consideration of the chart of the Irish Channel, and more particularly with reference to the important port of Liverpool, it plainly appears that the Isle of Man occupies the most central position, and lies, as it were, in the main track of all vessels proceeding from and returning to Liverpool by the north entrance to the Irish Channel, as well as the immense intercourse by steam between Scotland, Ireland, and England, and of the extensive fleet of colliers and other vessels, from Whitehaven, Workington, Allonby, Maryport, and the towns on the Solway Firth, to Dublin, Drogheda, Newry, Belfast, and the adjacent coasts. The island moreover is easily accessible, particularly on the east side, in consequence of there being plenty of water close to the shore, with good holding ground for anchorage, and no sunken shoals and rocks; so that during the prevalence of westerly winds, vessels usually take shelter under the lee of the island until they are enabled to proceed on their voyage.

"Douglas being the centre and the most populous part of the island, and in other respects possessing the advantages above mentioned, appears on the whole extremely well adapted for an asylum harbour.

"'View the question in this light and that the whole shipping interest of the Irish channel is concerned, I scarcely think that accommodation for less than 150 or 200 vessels of all classes at low-water would suffice.'

"In the examination at the port of Fleetwood, on the 14th October 1845, before R. Godson, Esq., Q.C., M.P. and Captain Washington, R.N., the harbour master of that port, Capt. Head, who had been 34 years at sea, in almost every trade, stated :—'I should think that if a harbour of refuge is to be formed, that Douglas Bay in the Isle of Man would be the best. Great Ormshead would be objectionable, because vessels could not get out at all during north and north-west winds. Douglas Bay would be better than any part of the coast of Ireland. Had often talked the subject over with pilots in Liverpool, and they were of the same opinion.'

"Captain A. McNeilage examined. 'Thinks a harbour of refuge most wanted in Douglas Bay.'

"Sir Charles Lushington, Judge of the Admiralty Court, at a banquet at the Trinity House, presided over by His Royal Highness the Prince Consort on the 3rd July last, stated, 'It is not of British vessels we speak every day, but our ports, especially the port of Liverpool, are so thronged with vessels from every port in the world, and especially from the United States of America, that I speak the truth when I say, that within the last two months of my time one-half of it has been engaged upon foreign vessels. From the very mouth of the Mersey down to the coast of Ireland—there it is, I regret to say, that we have had some of the most unfortunate collisions and the greatest loss of life.'

"In the evidence taken before you at Glasgow within the last few days, Mr. Hugh Tennant, who had been for 20 years accustomed to yachting, stated:—'He thought there should be a harbour of refuge at the Isle of Man. He had been frequently at the Isle of Man, but could get no place there to put in with safety. In certain winds Douglas was very much exposed. For large ships the north-east coast of Ireland and the Isle of Man were the most desirable for harbours of refuge.'

"Captain Crawford stated, he had been captain about 30 years. He was 20 years in command of steamers between Glasgow and Liverpool. 'On the north and east coasts of Ireland he does not know any place requiring a harbour of refuge. He thinks, Douglas, Isle of Man, requires one, owing to its facility to vessels generally. He thinks harbours of refuge would be of considerable advantage. He was 23 years going three times a-week, or between 2,000 and 3,000 times, along the Liverpool and Glasgow course, and he thinks a harbour at the Isle would be a safe refuge for many vessels to Liverpool in adverse winds, but it would be most useful to outward-bound vessels.'

"We have carefully examined the various plans for proposed breakwaters in Douglas Bay, as ordered to be printed by the Honourable House of Commons, 5th August 1851, together with those subsequently proposed by Mr. Walker and Captain Vetch, R.E., and we consider Mr. Walker's plan not so well adapted for the requirements of the port. The space enclosed by Captain Vetch's plan would be so occupied by vessels seeking shelter, that it also would be inadequate for a general harbour of refuge. And the space being so occupied, we fear that the free egress and ingress of the several steamboats belonging to and frequenting the port would be prevented. A large portion of the best anchorage of the bay would be occupied by a breakwater so placed. Our opinion is confirmed by the foregoing representations of the several competent persons named, that nothing less than the proposed amount of water space by Captain Denham would meet the present requirements.

"We, therefore, are of opinion, that extending a breakwater from Douglas Head Lighthouse on a north-easterly direction would be the most suitable, and most economical in the erection.

"The inconvenience of the delay which has already taken place in erecting a breakwater in Douglas Bay, has often been apparent in the landing of the annually increasing thousands of the manufacturing and rural population of Great Britain, who resort to this port as their favourite watering place, many of whom are often in peril in passing to and from the steam-packets in this bay, in small boats, and it not unfrequently happens that on the arrival of the mail steam-packets they are obliged to stand out again to sea, with goods, passengers, and the mails, from inability to land them.

"During the spring of this present year the mail packet was prevented getting out of port, owing to the boisterous state of the sea at the pier for *five* days.

"So far back as March 1846, the Tidal Harbour Commissioners report 'That everything that care and skill can suggest as to lights, beacons, and improvements of the harbours of this island would be well bestowed, and tend to prevent the recurrence of the numerous wrecks that have taken place around its shores. (See also a letter from the Lords of the Admiralty to the Secretary of the Treasury, 23rd October 1850,) and that marked neglect prevails throughout, and the evils of irresponsible self-elect authority but too manifest.' Yet nothing has been

DOUGLAS.

Mr. T. Garrett.

17 Sept. 1858.

Mr. Lindsay.

done by the British Government to remedy the many grievances of which the shipping interest of this island have to complain.

"We have the honour to be, Gentlemen,
Your obedient Servants,
THOMAS GARRETT.
WM. HENRY CUBBIN.
HENRY GILL, Shipowner and late Shipmaster.
CHARLES CALEY, Merchant.
JOHN KERMODE, Commander of the Steamship *Tynwald.*
EDW. QUAYLE, Commander of the Steamship *Douglas.*

"To Her Majesty's Commissioners on Harbours of Refuge."

6016. You desire to lodge that letter in evidence?—Yes.

6017. Do we understand that this letter was adopted at a public meeting of the inhabitants of Douglas?—No; it is presented to you by the committee appointed at a public meeting of the inhabitants of Douglas.

6018. Well, that is the same thing. Do I understand that this letter contains the views of the majority of the people of Douglas?—I should think nine-tenths of them.

6019. Then the views of nine-tenths of the people of Douglas, as they appear to have adopted the plan of Sir J. Rennie, are, that they require space enough to accommodate not less than 200 vessels?—They are in favour of either Captain Denham's or Sir J. Rennie's plan.

6020. Sir J. Rennie states in his report, that if a harbour of refuge is constructed well, it ought to be one to accommodate 200 vessels at low water?—Yes.

6021. And that plan the people of Douglas think ought to be adopted?—We are not bound to any particular plan, so that the pier commences at the outer head.

6022. Have the people of Douglas considered the cost?—I do not think it is the business of the people of Douglas to consider the cost, when it is to be for a general harbour of refuge.

6023. But when the people of Douglas desire to draw from the Exchequer money for the construction of a harbour of refuge, they ought to have some idea of what they will require to construct what they want?—We are taking the matters in a different light. The people of Douglas consider they are entitled to some consideration as remitting so much annually to the British Government, that some amount should be laid out for the accommodation of the country, and that the island should not be neglected as it has been since 1803 or 1804.

6024. Tell me in what way Douglas has been neglected more than any other place in Her Majesty's dominions?—I do not think there is any proper representation. The island is in such a position that it is not represented in the local government. There is no communication with the British Government, and any business to be done goes solely through the government officials.

6025. Have you not a representative in your governor?—He is appointed by the British Government, and official representations go through him.

6026. They go through him exactly in the same way as if he were a Member of Parliament?—It may be so, but it is not so effective.

6027. Then that is the only grievance of the Isle of Man, that it has not a representative in Parliament?—That is one grievance.

6028. What grievances have you to complain of greater than many other ports might complain of? Have you been more hardly dealt with?—We complain first, that we are not represented at the Board of Commissioners.

6029. But that is not a question which affects the Imperial Government. I wish to know what grievances you have against the Imperial Government. Have they attended to your interests less than they have attended to those of other parts?—I do not know what they have done in other countries, but I know they have pocketed the money of this country and never returned us any.

6030. What money?—The surplus revenue of the country, after paying all the expenditure. That is a great grievance. They have not laid it out on our harbours, and when we want money we have to mortgage our harbour funds.

6031. Do I understand you to say that the balance of revenue over expenditure goes to the Treasury?—Yes.

6032. And is swallowed up in the one great fund?—Yes.

6033. And you do not receive any equivalent?—None.

6034. No equivalent for the money which the Imperial Treasury derives from you?—None that I know of.

6035. (*Capt. Washington.*) I think you said the Treasury returns none of the funds?—Not for harbour purposes.

6036. From where do the funds for the Harbour Trust arise?—Out of the revenue, 2,300*l.* was set apart, which has been mortgaged more than once; a certain portion is set apart for the redemption of that mortgage.

6037. Do you know how that sum of 2,300*l.* was decided upon?—In 1844, the British Government proposed to bring in a Bill to alter the custom laws of the island. At that time dues were charged on goods and vessels going into the ports of the island. On the return of the Receiver General's accounts that balance was appropriated to the maintenance of harbours—the balance of 2,300*l.*; but on further examination, it turned out to be 2,500*l.*, and that sum of 2,300*l.* was entered in the Act of 1844, and remains so at present.

6038. Just so. All harbour dues are given for the use of harbours. So, correctly speaking, that is not a portion of revenue. Can you tell us how the harbours of England are supported?—Under local management by local dues.

6039. Then the Isle of Man harbours are placed exactly in the same position as the harbours on the coast of England in that respect?—They were, but they are not now.

6040. Do you mean that the dues would have increased?—They would.

6041. It was the intention to make the harbour free for all vessels. Do you not think that measure very beneficial to the island?—Very great benefit.

6042. Are you not aware that heavy dues deter vessels from entering harbours?—Yes.

6043. I believe it has affected Bristol so much that from being a first class port, it has fallen to a sixth class port?—Yes.

6044. So the Isle of Man is saved from that?—Yes.

6045. (*Capt. Vetch.*) I should like to know what parts of the Isle of Man have the greatest reason to complain?—In a great measure, the whole island has to complain that the Commissioners of Harbours are not popularly elected. For instance, here is one complaint. It was a recommendation of the Tidal Commissioners, that a bell buoy should be erected on Langness, it has not been done. If the persons elected Harbour Commissioners were interested in shipping it would be done. I find at Ramsey, a gentleman living in the country elected, instead of a merchant, or some one interested in a port.

(*Capt. Washington.*) I submit that this body, the Harbour Commissioners, do all they can, and I submit that we should not enter into trifling details as to the management of harbours.

(*Mr. Lindsay.*) We are sorry to curtail in any way the expression of views on the part of the people of Douglas, but as we are here for one object, I and my brother Commissioners think we should not go

beyond that object. The matter into which we are now entering is in their opinion, and I must say I agree with them, irrelevant, and we cannot receive any further evidence of that kind. There unfortunately seems to be a difference of opinion among the people as to local management.

6046. (*To witness.*) Can you speak on the part of the inhabitants with regard to the proposed harbour of refuge. It is on that point we want evidence?—I am quite aware of that, but I was asked questions about our grievances.

6047. We cannot, as Commissioners, enter on the question of local grievances. We are come upon national objects. As far as the national object of a harbour of refuge, can you, on the part of the inhabitants of Douglas, give any opinion as to the pier proposed to be run out from the Two-Gun Battery?—I have no opinion individually further than that I have heard from captains of vessels they think it very injurious, as it would fill up the best anchorage of the bay.

6048. Do I understand that it is your own opinion, and the opinion you have learnt from various masters of ships, that this pier, if carried out, would do more injury than good?—Certainly. It is the opinion I have heard expressed by several captains of vessels.

6049. Is it their opinion that if anything is to be done for Douglas Bay in the shape of a harbour of refuge that it must be upon a plan somewhat enlarged, or on that proposed by Captain Denham?—Yes. They all think it should commence at Douglas Head Lighthouse in a north-east direction.

6050. As far as regards the local trade, would such a pier as this from the Two-Gun Battery be more convenient, all points considered, to the people of Douglas, and more to the public advantage than the extension of the present pier, upon which we have heard an opinion expressed by Mr. Moore?—All have expressed their opinion that it would be more convenient for the passenger and shipping trade of the island to have a breakwater, leaving out of the question at present the landing stage.

6051. I am speaking as between a pier from the 2-gun battery and the extension of the present pier, so far as the convenience of persons landing and embarking is concerned. Are you able to speak as to that?—I think they would prefer a breakwater.

6052. If it rested between a pier from the Two-Gun Battery to the extent of 800 feet, regard being had to the convenience of the people of Douglas and the public frequenting the island, which would they prefer?—I think they would prefer a landing pier from the pier head.

6053. (*Capt. Vetch.*) Are you aware of the fact that the Committee of the Court of Tynwald brought into notice the subject of this pier projecting from the Two-Gun Battery, that they put the case before two captains of steam packets trading to Liverpool, and that one preferred the line shown on the plan, and the other preferred a line inside of it?—I am not aware of that, but the view entertained altogether was to meet the funds which were available. That was the object in sanctioning those plans at all.

6054. (*Mr. Coode.*) You have stated, that an expression of opinion was obtained from some masters, at a meeting lately held. State what number were present?—I think half-a-dozen—more than half-a-dozen, besides sailors.

6055. How many altogether?—From 25 to 30.

6056. All seafaring men?—Yes.

6057. Were they unanimous in the expression of their opinion?—They were all unanimous.

6058. (*Capt. Washington.*) In this very able statement which you have read to the Commissioners, do we understand you to say that all the committee concurred in it?—Yes; all in the island.

6059. Was it read to the public or confined to the committee?—Confined to the committee.

6060. Have you any doubt that it does represent the opinion of the public?—Not the least.

6061. (*Mr. Lindsay.*) We will not trouble you any further. We are much obliged to you.

Mr. Robert Marshall examined.

6062. (*Mr Lindsay.*) You see this plan, marked A?—Yes.

6063. Are you the owner of property somewhere situated at Fort Anne?—Yes.

6064. What extent of property do you hold?—The whole of the right of this road.

6065. The whole of the right of road?—From the small beach.

6066. Is it called the small beach?—It is. The beach outside the gate, opposite Fort Anne.

6067. Should a pier be made from the Two-Gun Battery, would it be necessary to make a road from the point to the quay?—Yes.

6068. In order to connect it with the present road, would you, as an owner of property, have any objection to the road being made?—Not any.

6069. None whatever?—None whatever.

6070. What facilities would you give?—I would give the whole of my property on the same terms as the other owners: if they would give theirs, I would give mine.

6071. Say now that people were exorbitant in their demands, what would you do?—I cannot say what I should do.

6072. Then you mean to say—— ?—That if other people would give the ground, I would do the same.

6073. But would you not be disposed to set an example?—Yes, I would.

6074. You would give the ground free of any charge?—Yes, I would.

6075. Then the difficulties which have been stated in making the road, as far as the proprietors are concerned, are more imaginary than real, at least so far as you are concerned?—It is all imagination. The proprietor, before I got it, made application for a pier, and at the time he proposed to give the land.

6076. And as far as the other proprietors are concerned, you think that no obstacles would be thrown in the way?—Not any.

6077. Is there any part of the shore to the Two-Gun Battery belonging to the Government?—I am not aware of that.

6078. (*Capt. Washington.*) Do you know to whom the land belongs?—I do.

6079. You do?—Mr. Goldie.

6080. Is he resident here?—Yes.

6081. Does he own the whole of the point?—The whole of it.

6082. And Douglas Head also?—And Douglas Head also.

6083. Do you anticipate any difficulties in obtaining possession of the land for such a purpose, if it were wished?—I should hope not.

6084. (*Mr. Coode.*) Are you owner of the foreshore all through, from Fort Anne to the battery?—Yes.

6085. For the whole distance?—Yes.

6086. Does your property extend eastward of the battery?—No.

6087. What is its eastward boundary: is it the battery?—No, it does not go so far as the battery.

6088. How far does it stop short of it?—It stops short at the property of Mr. Edwards.

6089. What proportion of the foreshore between Fort Anne and the battery do you own: do you own half?—About 100 yards, and all extending this way to the pier on the south quay.

6090. Do I understand that you only own 100 yards eastward of Fort Anne?—I do; and then you go on the rocks.

6091. You own 100 yards eastward, and all the way to the westward until you join the road?—Yes.

DOUGLAS.

Mr. R. Marshall.

7 Sept. 1858.

Mr. Coode.

6092. Who is the owner of the property between your boundary to the east, and the battery ?—Mr. Edwards, Mr. Quirk, and Mr. Goldie.

6093. Three proprietors: can you speak as to their readiness to assist ?—I do not think to make the road.

6094. How much would they give ?—You would take the rocks.

6095. To whom do the rocks belong ?—That is a question for the Government to decide.

6096. Are you speaking of rocks above high water or below ?—Above high water.

Mr. QUIRK re-examined.

Mr. Quirk.

6097. (*Capt. Washington.*) Do you know whether the War Office has made over to the Harbour Commissioners a portion of the battery such as Mr. Walker recommended for the proposed work ?—That is so.

Mr. ARTHUR BISTABLE examined.

Mr. Arthur Bistable.

6098. (*Mr. Lindsay.*) What is your occupation ?—I am an Irish barrister.

6099. Then you are here on a visit ?—I am residing here for my health.

6100. Have you any information to give us as to a harbour of refuge ?—In the month of July last my wife was going to Dublin, and she was going by the Whitehaven boat ; I accompanied to see her on board. I think it is a question both of a harbour of refuge and of gross negligence on the part of the captain of the *Queen*. I have some knowledge of sailing, and I never saw a boat so entirely mismanaged.

6101. Confine yourself to the harbour, any information on that subject we shall be happy to receive ?—The *Queen* was advertised to sail at 11 o'clock at night. It was on a Wednesday evening in the month of July last, and she came in to her time. There were two boats to take out the passengers. They were very large boats, and there were only two men to each. On that evening the boat fired her gun. We went out. I believe the *Queen* was not at anchor, but was just outside the harbour. There was an off-shore wind. We came out from the harbour in the two boats. The *Queen* drifted outwards. We arrived within hail of the *Queen*, and she told us to stand off. There were about 29 people in the boat. The boat become perfectly unmanageable in which we were, and was drifting out to sea from half-past eleven until five in the morning. It was such a night as I shall never forget. We were drenched to the skin. The boat became so unmanageable that about 20 bales of luggage were thrown overboard, including valuable plate, and the loss of the passengers was very great. The captain of the *Queen* came in very quietly, and anchored in the harbour, and left the boats out at sea from half-past eleven until half-past two.

6102. The substance of your evidence is to this effect, that you consider your lives were placed in great jeopardy by being obliged to go out in boats to embark in stormy weather ?—And that in the middle of the summer—in July. Several people experienced great loss from the luggage being thrown overboard, and I am quite satisfied there should be some sort of pier or harbour of refuge, into which boats could come and have smooth water.

JOSEPH HOGG examined.

Joseph Hogg.

6103. (*Mr. Lindsay.*) What are you ?—Boatman and pilot.

6104. How long have you been a pilot ?—About seven years.

6105. Are you a pilot out of the harbour of Douglas ?—Yes.

6106. Does your knowledge of the harbours of the island extend beyond Douglas ; do you ever pilot ships to other places ?—We never go to other places, but I am acquainted with all the harbours of the island.

6107. You are a pilot for the port of Douglas ?—Yes.

6108. And what have you to state to the Commissioners, any information which they do not already possess ?—I should say that if a breakwater were run out east-north-east from Douglas Head it would be of great service.

6109. Of great service in saving life and property ?—Yes, I have known vessels have their bottoms knocked out during a south-east wind.

6110. During your seven years' experience as pilot have you known of any loss of life or property which might have been avoided by such a harbour as you suggest ?—Yes.

6111. State any instance ?—A flat went ashore.

6112. Were any lives lost ?—We rendered all the assistance we could, and we got the crew out by lines.

6113. Speaking to you as a practical man, would such a harbour as this—a pier carried out from the Two-Gun Battery be of any service ?—It would not be of as much service as if it were carried from the big head.

6114. Would it afford shelter during south east gales to all boats and vessels usually frequenting this place ?—I do not think it would.

6115. You do not think it would even afford shelter to the local trade ?—I think not, but if it were carried from the big head, further out, it would afford shelter to all, and give good anchorage inside it.

6116. It is your opinion as a pilot that if it were carried from Douglas Head it would afford shelter to all the local trade, and do I understand you to say to the passing trade ?—Yes, when ships could not get round the Calf or return to Liverpool, they might have shelter inside.

6117. Speaking to you as a pilot ; say a pier were carried out 800 feet from the Two-Gun Battery, would you hesitate to run for the anchorage behind it with a 500 ton ship in a strong south-east gale ?—Yes.

6118. Take your time and consider. Say a pier were carried out from the Two-Gun Battery 800 feet, and you were in the channel, between Conister and that point, would you, if in a ship of 500 tons, caught in a strong south-east gale outside, be afraid to take this harbour ?—No, I would not.

6119. Do you think you would be running any unusual risk ?—No, I think there would be good anchorage inside.

6120. You think it would afford good and safe anchorage ?—Yes, but not so good as the other.

6121. What was the largest ship you ever saw anchored in Douglas Bay ?—I think the *Hastings* was the largest.

6122. What was the *Hastings* ?—A 60-gun ship I think.

6123. Do you know her draught of water ?—I think 24 feet.

6124. What was the largest merchant ship you ever saw anchored in Douglas Bay ?—I have seen one inside the head drawing 22 feet of water.

6125. Where from ?—Greenock or Glasgow.

6126. What brought her there ?—Some spars were gone, and she was short of water.

6127. She came to seek shelter ?—Yes.

6128. Have you known other vessels seek the shelter of the bay ?—Yes, but not so large.

6129. What tonnage ?—About 400 tons.

6130. And about 17 feet draught of water ?—Yes.

6131. Is the holding ground good ?—Yes.

6132. Is it better on the port side or bow ?—There is good clay in the centre part of the bay.

6133. Does it extend over all the bay ?—No.

6134. What part of the bay ?—From Douglas Head abreast of Conister.

6135. From Douglas Head to abreast of Conister is clay and good holding ground ?—Yes.

6136. (*Mr. Coode.*) Is it a matter of common occurrence that vessels caught with south-west gales run back to Liverpool ?—Yes, very frequently.

6137. Have you ever counted the number of vessels at one time in Douglas Bay ?—I recollect 28. I think there were 300 sail off one Monday, 12 went ashore.

6138. You say there were 300 sail off the bay, one Monday ?—Yes, the principal part of them ran back.

6139. Do you know how far they got back ?—We saw them about 12 o'clock at night.

6140. But where ?—They had to heave-to about half channel and the following morning about three o'clock they bore away across to Liverpool again.

6141. But where were you ?—Somewhere abreast of Langness.

6142. All these vessels were bound to the southward ?—We cannot say that all were bound south, but the greater number were.

6143. If there had been a harbour of refuge here you would have had the greater number put in ?—I have no doubt the greater number would.

6144. Can you give us any idea of the number of lives lost ?—I cannot, I know a good many were lost.

6145. Can you tell us in what year that occurred ?—28 or 29 years ago, turn September.

6146. It was in the month of September ?—It was in the latter end of September I know. We were bound in the river three weeks before.

6147. And you feel little doubt they would have put into Douglas Bay, if there had been a good harbour here ?—I do.

6148. Do you know whether any vessels foundered ?—One Welsh schooner foundered astern of us.

6149. How many lives lost in her ?—I think three. A lad clung to a small boat, and was picked up.

6150. (*Capt. Washington.*) Do you know any occasions when the Whitehaven packet could not land passengers or take them up at Douglas ?—I do.

6151. More than a dozen times ?—Yes, more than a dozen times. No later than last night at half-past twelve she fired her gun, but could not come in, or send in.

6152. Where did she go to ?—I do not know, she went out to sea.

6153. Is that a matter of frequent occurrence ?—There is great risk of landing passengers in a south-east wind.

6154. Was the wind south-east last night ?—It was.

Mr. William Callister examined.

6155. (*Mr. Lindsay.*) You are, I understand, one of the Harbour Commissioners ?—I am.

6156. And you appear here on the part of the people of Ramsey ?—Not specially in that capacity, for each of the Commissioners is a Commissioner for the whole island, but we are distributed over the island, some residing in one part, and some in the other.

6157. Can you state what views the people of Ramsey have with regard to the necessity of a harbour of refuge ?—As a matter of course they entertain but one opinion, that if there is to be a harbour of refuge for national purposes, Ramsey Bay is infinitely the best for that.

6158. Can you give to the Commissioners the reasons why they consider Ramsey Bay the best ?—First, because the bay itself is the most extensive in the whole island. Secondly, because it is on the direct line of the traffic between the Clyde and the Mersey, which is considerable. Thirdly, because all the reasons which Captain Gill has given in favour of Douglas apply with equal force, as to a harbour of refuge for national purposes, to Ramsey. The same facilities exist for its construction there as at Douglas, viz., Manghold Head consisting entirely of rock.

6159. When you say facilities, do you mean an equal space of sheltered water at the same cost as at Douglas ?—I am not prepared to speak to that point.

6160. On the part of the people of Ramsey, have you any suggestion to offer as to the preferable site for this harbour of refuge ?—Running in from a point to the westward of Maughold Head, and extending across the bay.

6161. To what length ?—Half a mile at least. There is no danger in Ramsey Bay of trenching on the ground for anchorage. You can go any length in that direction, say a couple of miles.

6162. Say a pier were constructed running for half a mile as you suggest, what extent of sheltered anchorage would that give of three fathoms and upwards ?—I am not prepared to state that, but speaking off-book I should say 100 acres.

6163. Have the people of Ramsay ever had any estimate of the cost ?—Not that I am aware of.

6164. (*Mr Coode.*) I think you said no estimate was ever made. Has there ever been any plan or design ?—Not such a one as that of which I have been speaking. Mr. Gibson, a very large shipbuilder, designed something at the present harbour, but it was not accessible at all times of the tide.

6165. Exactly. But there has been no plan for a harbour of refuge ?—None that I ever heard of. I may be volunteering a statement, but if only a moderate amount is to be expended I must candidly say I think Douglas is the point where that moderate amount would be best expended, more than at any other place.

6166. (*Mr. Lindsay.*) Take the purely imaginary sum of 80,000*l.*, is it your opinion that 80,000*l.* could be better expended at Douglas for national purposes, bearing in mind the saving of life and property and the facilities of trade than at any other part of the island ?—I am not prepared to answer in the affirmative if it is to be so large a sum as 80,000*l.*

6167. Take 50,000*l.* ? — Then I should say for 40,000*l.* or 50,000*l.* greater advantage would accrue from its expenditure at Douglas.

6168. You think there would be more advantage from its being spent in Douglas than any other part ?—I should say so decidedly.

6169. (*Capt. Washington.*) You are a General Harbour Commissioner ?—I am.

6170. Are any complaints made of the accommodation at Port Erin ?—Do you mean any application for a harbour of refuge?

6171. Well ; looking at the number of vessels congregated there, is it not very desirable a harbour should be constructed ?—Yes, very desirable.

6172. Have the Commissioners any funds ?—None.

6173. Is there the same request at Peel ?—Yes.

6174. Is a breakwater proposed at Peel ?—Yes, and about to be carried out.

6175. To what extent ?—200 yards.

6176. Is it sufficient for the wants of the fishermen ?—I understand from the local commissioners that if carried out it will be sufficient.

6176*a*. The local commissioners have funds for that ?—Provided the works at Douglas do not absorb too much of our funds.

6177. As one of the General Harbour Commissioners, you would be willing to devote as large a sum as possible for a breakwater in Douglas Bay ?—Yes, taking into consideration the fair and reasonable wants of the other ports.

6178. (*Mr. Coode.*) I think I understood you to say, that if it were a question of a large harbour of refuge you would prefer Ramsey Bay ?—If the Government are prepared to spend a quarter of a million,

DOUGLAS.

Mr. W. Callister.

17 Sept. 1858.

Mr. Coode.

Mr. R. J. Moore.

there is no comparison in the advantages of Ramsey Bay and Douglas Bay as a site for a harbour of refuge.

6179. Then the matter turns on the extent necessary?—Rather on the extent of money than the extent of accommodation.

6180. If a large harbour is necessary you prefer Ramsey, if a small harbour you prefer Douglas?—Yes, decidedly.

Mr. Robert John Moore examined.

6181. (*Mr. Lindsay.*) What is your occupation?—High Bailiff of the town of Peel.

6182. Then do I understand you as coming here to represent the views of the people of Peel?—I do.

6183. We shall be much obliged for any suggestions which you can offer?—I do not come here to represent the people of Peel to suggest or propose that Peel should have a harbour of refuge in a comprehensive sense of the term. We are not in a position to suggest such a thing as that; but I do ask for a harbour of protection for the fishing fleet. As long ago as the year 1790 or 1792 a suggestion was made then, in the time of the late Duke of Argyll, to run out a pier or breakwater from the Horse Point in a somewhat easterly direction. Subsequently our surveyor, Mr. Timperley, proposed a breakwater in a very similar direction, I think, extending 500 feet east of the Castle Rock. In the year 1845 the people of Peel in a body sent up a memorial praying that a breakwater in a very similar direction should be erected; and in 1856, when Mr. Walker came down to examine the different harbours of the island, we represented then the advantages which would accrue from a breakwater in the same direction. Mr. Walker, however, I believe, looked at the matter in a pecuniary point of view, and considered that a large expenditure should be made at Douglas, and recommended the expenditure of 2,000*l.* in internal improvements at Peel. Those internal improvements would not give us any protection or any safety, or any harbour into which vessels could come at low water. Mr. Walker's plans for Peel I objected to, and upon the appointment of a committee of the Tynwald Court I represented those objections to them. I should say, before I come to that, that Mr. Walker's plans were objected to by the Admiralty, shortly after 1856, perhaps about 1857, and a more comprehensive plan was suggested by Captain Vetch, adopting, to a very great extent, the different lines of breakwater which had been suggested in 1792, in 1840, and in 1845. He suggested that the breakwater should run nearly due east to the extent of 600 feet. That plan was submitted to a committee of the Legislature; we gave evidence of the great requirements of Peel, and the advantages to be derived from that plan. The consequence was, that a committee was appointed by the Tynwald Court, and they recommended the adoption of the plan proposed by Captain Vetch. The means arising from the insular funds being limited, the committee recommended the expenditure of 6,000*l.* toward that work. Since Mr. Walker has prepared his estimates we find that 6,000*l.* will not complete, or anything like complete, that great work, which, by the bye, has been sanctioned and approved not only by the insular legislature, by the Tynwald Court, but has lately been, within the last two months, approved and sanctioned by the Admiralty. We find by the estimate that the expenditure will far exceed 6,000*l.*, and that it will only serve to carry out the breakwater to the extent of 300 feet, so that, although we are in a position to commence our work, and we hope it will be commenced next year, the work can only be carried out to the extent of half what is proposed, and what is absolutely necessary. Therefore I suggest and move, on the part of the inhabitants of Peel, that this Commission, if they have the power, should grant us an increased sum to complete that work which has been proposed and sanctioned by the Admiralty. I am not prepared at this minute to say the exact amount which will be necessary to complete that work, but I will take it in this way:—I am perfectly aware that the expense per foot is much greater after the first 300 feet, because the work is then in deep water; but if the first 300 feet cost 6,000*l.*, I say the remaining 300 feet would cost a half more, or 9,000*l.* or 10,000*l.*, and I do not think too extravagant a sum to ask at the hands of Government to complete what is in fact a harbour of refuge for the fishing fleet. I think 10,000*l.*, in addition to the sum already awarded, will give that accommodation which the extent of the fishing gives us a right to ask. The 6,000*l.* is taken out of insular funds. When the insular funds give 6,000*l.* I do not think it is too much to ask the Imperial Government to give a greater sum. The advantages of the breakwater are obvious; it will afford us shelter for our vessels; it will protect the harbour from every wind, because at present Peel harbour is exposed to winds from the north-west and north. If the breakwater is carried across as proposed, there will be ample shelter not only for the fishing fleet of the island, but for all the fishing boats which frequent it.

6184. How many boats belong to Peel?—I should say that the number of fishing boats which exclusively belong to Peel amount to 150.

6185. How many fish usually in the season from Peel?—600. There are boats from the east coast of Scotland, Ireland, and England.

6186. Has any large loss of life occurred among the fishermen?—Not in my recollection among the fishermen, but great damage to the fishing boats. When the boats are obliged to run into the harbour there is great damage arising from the confined space within; but the great loss we sustain is, that during the time of high water, if the weather is any way unfavourable, the boats remain inside the harbour, and when it clears cannot get to sea. They thus lose the night's fishing, whereas, if the boats could lie at anchor, they would be always able to get to sea.

6187. You desire a harbour of refuge at Peel for the fishing boats more on account of the great facilities to the fishermen than for the protection of life and property?—To property it would be a great protection. I am happy to say that few lives are lost among the fishermen.

6188. Such a harbour would enable them to get to sea at times when they cannot get now?—Yes.

6189. Consequently they would make more money. Now, as in a pecuniary point of view they would gain very considerably by the construction of such a harbour as that, do you think they would object to an annual payment?—I am not prepared to say; harbours being free is a great advantage.

6190. But the advantage of such a harbour being so great, do you not think that the owner of each boat would be willing to pay two guineas per annum?—I cannot say.

6191. (*Capt. Vetch.*) Within your knowledge, of the fisheries does it sometimes happen that, with every prospect of good fishing from the port of Peel, the weather becomes threatening, and the fishermen dare not venture out, by there not being a safe shelter to run to, whereby they lose a night's fishing?—Frequently.

6192. Tell us the amount that the fishing is calculated to yield on a good night?—I am not in a position to state, but there are witnesses prepared with statistics to lay before the Commissioners.

6193. (*Mr. Lindsay.*) Representing as you do the views of the people of Peel, have you heard them express any opinion as to the best site for a national harbour of refuge?—I believe the general opinion to be, that if there is to be a general harbour of refuge Douglas is the best place.

6194. (*Mr. Coode.*) You said that 150 boats belong exclusively to Peel?—Yes.

6195. Can you tell us the next greatest number which belongs to another port?—I should say Port St. Mary.

6196. Can you tell us how many?—I do not know.

Mr. Robert Curran examined.

6197. (*Mr. Lindsay.*) What is your occupation?—Manufacturer and also shipowner.

6198. Are you resident at Peel?—I am.

6199. Have you anything to state with reference to a national harbour of refuge?—No.

6200. Then what have you to state as to a harbour of refuge at Peel?—I can give a few particulars as to the fishing fleet. There belong approximately to Peel 130 boats, to other ports of the island 100; boats from the coast of Cornwall, St. Ives, and Penzance, 150; from Irish ports, 150; from Scotch ports 50; from Cumberland ports, 20; total, 600 sail. They are manned by about seven men each, 4,200 men, and I suppose there are 2,000 hands employed in bringing fish and carrying it from the fishing stations to the different markets. We have not sufficient space in the harbour to shelter 600 boats in Peel, but we frequently have 400 sail in the harbour, and in this way a very great loss is sustained by the fishermen in consequence of there being no harbour of protection to which they can go and sail out at all times of tide. I will give an instance which frequently occurs. Suppose it is a stormy morning, a north-west wind, and a heavy sea on. At twelve o'clock there is every appearance of very bad weather; the crews consult, and they think it safer to run into the harbour than to put to sea, that is, if it is a north-west wind, which is a very bad wind at Peel. To escape that the boats all run for the harbour, and by half-tide ebb most of the vessels are aground. Suppose, as is frequently the case in a summer breeze, the wind abates, two or three of the lower tiers of boats which are not yet aground get out, and come in next morning well fished, some with 10, 20, or even 50 maize of herrings. I have made a careful calculation, and, speaking approximately, the loss sustained must exceed 5,000*l.*, which is a serious loss to a class of men who cannot afford it. For the size of the boats our fleet generally cannot be exceeded; there may be larger boats, but there are none better equipped with nets and gear. I am an owner myself, and I think I am speaking for the people of Peel generally when I say that if a breakwater were built we would double the number of our boats to-morrow. I am satisfied it would remunerate me, and I think every one at Peel would say the same. I have consulted with a good many, and that is unanimously their opinion.

6201. You say that if a breakwater, such as is proposed by Captain Vetch, were constructed, the gains of the fishing boats would be increased 5,000*l.* a year?—At the least.

6202. Do you think the Peel fishermen would have any objection to subscribe annually?—For an annual subscription I do not know. Many would give subscriptions.

6203. As their gains would be increased 5,000*l.* a year, do you think it would be hard to call upon them to pay 500*l.* a year?—I suppose not, but I am not sure what they think upon the subject.

6204. If they would gain 5,000*l.* a year, and pay even 1,000*l.* a year, out of it, there would still be an actual gain of 4,000*l.* a year would there not?—I am certain that if a sum were necessary to complete the works, provided they were only commenced, 500*l.* or 1,000*l.* would be raised.

6205. (*Capt. Washington.*) Do you know whether any of the men are enrolled in the coast volunteers?—Several.

6206. A large number?—I think a very considerable number.

6207. (*Mr. Coode.*) For what period does fishing continue off Peel?—Fishing commences the 1st of June and ends the middle of October.

6208. Does the loss apply while fishing from Peel alone?—From Peel alone.

6209. Do you think there is a proportionate loss at the other ports of the island?—Proportionate there may be, but I cannot speak so well as to them.

6210. But you do not see why it should not be so?—No; but at Peel, being the largest loss, it is much more severely felt.

6211. For what period does the fishing continue off Port St. Mary?—The fishing from Peel and Port St. Mary continue the same time; but on the west side of the island, off Douglas, it does not continue more than three or four weeks.

Mr. John Gill examined.

6212. (*Mr. Lindsay.*) What is your occupation?—Master mariner I have been.

6213. Do you reside at Peel?—Yes.

6214. How long have you been master of a ship?—Twenty-two years.

6215. What size vessels do you command now?—I do not command any now, I am retired.

6216. Say there was to be only one national harbour in the Isle of Man, a harbour suitable to receive vessels of all sizes, at what point of the island would such a harbour tend most to save life and property?—I think Douglas a very good place; central like.

6217. Do you think it better than Port St. Mary, Port Erin, or Peel?—There is more water in Douglas than Peel.

6218. Then, as a master of considerable experience, you think Douglas would be the best site?—Yes.

6219. Can you speak of the necessity for a harbour for the fishing boats at Peel?—There is a great necessity for it.

6220. Do you mean for saving life or facilitating trade?—A good many lives have been lost latterly on the coast.

6221. Do you know of any lives being lost among the fishermen?—No; but a good deal of property is damaged.

6222. Then your observation goes to show that there would be more facilities to the fishermen to go to sea?—Yes; and safety for the boats.

6223. Have you had any conversation with the fishermen upon the subject?—Yes; with a good many.

6224. Did you hear that they were ready to subscribe some small sum?—I did not hear them say anything about that.

6225. (*Capt. Washington.*) You say there is great want of harbour accommodation at Peel?—The harbour is too small.

6226. No safety for the fishing boats?—No.

6227. Then why do they come to that spot?—It is the general fishing place.

6228. Is the fishing better?—From Peel to the Calf the fishing is very good.

6229. And Peel is most convenient?—Yes.

6230. (*Mr. Coode.*) Do you know what was the loss of life in trading vessels last year?—Thirty lives at least.

6231. Would that have been avoided by a harbour of refuge?—If there had been a harbour of refuge the vessels would have made for it.

6232. Can you give us a list of those vessels, and the circumstances attendant on their loss?—There was the *Fleece* for one.

DOUGLAS.

Mr. John Gill.

17 Sept. 1858.

Mr. Coode.

6233. How many lives lost in that case?—I do not know. There was the *Mary Horton*; thirty persons lost and four saved.

6234. Where were they lost?—Between Derby Point and Glen William.

6235. Between Derby Point to the south and what point?—Glen William to the north, near Kirkmichael.

6236. What distance might it be between those points?—About eleven miles, I should think.

6237. Then, within eleven miles thirty lives were lost last year?—Yes.

6238. Were they lost during one and the same gale?—No.

6239. Can you give the direction of the wind in the gales when the vessels were lost?—The *Fleece* in a gale from south-west; the *Mary Horton*, south-east; and the *Duke of Richmond*, west-north-west.

6240. You say one vessel was lost in a south-east wind; that is an off-shore wind?—Yes.

6241. How do you account for that vessel being lost?—We cannot say, unless she capsized.

6242. Then a harbour of refuge would not have saved her?—Her head was to the north; perhaps she was waiting for water. If there had been a harbour of refuge she might have made in at one stretch.

6243. Can you speak of any other case of loss of life?—At Peel, some years back, there was a good many.

6244. Can you furnish the particulars of any other cases?—No, I cannot.

Mr. Moore re-examined.

Mr. Moore.

6245. (*Mr. Lindsay.*) As none of the fishermen are present, can you ascertain their views with regard to a harbour at Peel, whether they are willing to pay two guineas annually, or thereabouts, if the Government are prepared to add to the 6,000*l.*, the sum necessary to complete such a harbour as that you have suggested? Will you ascertain the views of the fishermen and furnish a return to the Secretary of the Commission?—The only difficulty I see is how you will enforce payment from other vessels.

6246. You are not to direct their views as to how it is to be collected, but ascertain the feelings of your own fishermen whether they are willing to pay that sum?—I will, and furnish the information as soon as possible.

6247. (*Mr. Coode.*) Can you furnish the Commissioners with a statement of the wrecks which have occurred during the last four or five years in the vicinity of Peel, the direction of the wind, the number of lives lost, and any circumstances which will throw light on the cause of wrecks?—I will. At present I am not in a position to state.

6248. (*Capt. Washington.*) I should like you to extend that to the whole island, in continuation of the returns which were made twelve years ago?—I will do what I can.

Mr. William Milner examined.

Mr. W. Milner.

6249. (*Mr. Lindsay.*) You appear, to a certain extent, on the part of the inhabitants of Port Erin?—I have been in the habit of visiting Port Erin every summer for several years past, and I take great interest in the poor men who are suffering a great deal for want of accommodation. From the frequent conversations which I have had with them, I am almost deputed to speak on their behalf. Port Erin is situated between St. Mary and Peel; it is the best port for fishing. There is nothing there but a fine expansive bay, and the erection of a breakwater, such as has been suggested by Captain Vetch, at a cost of 15,000*l.*, would afford ample protection. It would afford protection to the whole fleet, and at the same time to the coasting vessels. Three witnesses have been deputed by the whole fleet to say that they are prepared to pay 2*l.* a boat every season for the accommodation which they would receive until such a sum is reimbursed as the Government will advance. These poor men would be very glad if a like boon were accorded of getting a pier, but that would be of rather less advantage than the breakwater, and they will gladly refund such portion of the expenditure as the Commissioners or the Government determine it would be fair to ask from them.

6250. As I understand you have, very much to your credit, taken great interest in the welfare of the fishermen, more especially in the immediate neighbourhood of Port Erin, do you think that the fishermen are able from their earnings to pay two guineas a year towards the construction and maintenance of such a harbour?—My present conviction is, that not only are they able, but very willing and sufficiently honest to carry out the proposal they have made. Some of the old men say they would guarantee a contribution of five per cent.

6251. You think the facilities for making money would be so greatly increased that there would be no difficulty in their contributing annually a fee of two guineas?—My impression is that their gains would be so large that they could pay 2*l.* or 5*l.*, as offered, or 5*l.* a boat until the work was paid for.

6252. How many boats are there belonging to Port Erin?—I believe there are very few belonging to Port Erin. It is a very poor fishing village.

6253. How many boats frequent the port?—I have seen from 400 to 500 assemble in the bay.

6254. You have seen 400 to 500 boats anchored in Port Erin?—But these boats belong mostly to Douglas, Port St. Mary, and Peel, and include the Cornish, Irish, and Scotch boats. I have three men here whom I have selected as very respectable men, whose word may be taken if you will please to examine them.

6255. (*Capt. Washington.*) Is this liberal offer only from the Manx boats or from the Scotch and Irish vessels also?—I believe it is understood that all boats using the port shall pay that contribution.

6256. Is it within your knowledge that boats do pay in Scotland for harbours?—I have heard that they offered to do so, but I did not know that they did.

6257. Do you not know that the fishing boats at Wick have to pay 2*l.* a year?—I have heard something to that effect.

6258. (*Mr. Lindsay.*) Have you ever considered the question of Port Erin as a site for a national harbour of refuge?—I have felt very deeply interested in Port Erin, and I have made a great many inquiries. I find that the American steamers pass down the North Channel, and a great many vessels to Belfast and the north of Ireland. I have been at Port Erin five weeks last year, and I was there three months this year, and during those periods I saw a great number of vessels pass frequently and constantly to and fro, so that vessels come and use that channel to a great extent, and from my knowledge of the coast to St. Mary and Peel, I say the coast is exceeding dangerous. There is no shelter if a vessel is driven in, excepting at Port Erin.

6259. Do you know any instance of any wreck?—I have heard of several instances, the *Wilhelmina* was wrecked and a number of lives lost. I do not know how many, 10 or 12 were washed on shore. Vessels have gone down; a vessel went down in 1850; it was a fishing boat; she was swamped trying to get into port St. Mary; 120 maize of herrings were lost and the poor men belonging to her lost every shilling in the world.

Edward Farquhar examined.

E. Farquhar.

17 Sept. 1858.

6260. (*Mr. Lindsay.*) Do you belong to Port Erin ?—Yes, I was born there.

6261. How long have you been a fisherman ?—40 years.

6262. Say that there was to be one harbour of refuge and only one in this island, at what part of the island, as far as the safety of the fishing boats is concerned, would you put it ?—I think Port Erin the nearest place to the best fishing ground during the season.

6263. Is that the reason why you should prefer the site of Port Erin to any other ?—Yes.

6264. Is there any other reason ?—We are more exposed than any other port, we have to go round the Calf, and it is a very dangerous run.

6265. Have you known any lives lost for want of a place to run to ?—I was one night put ashore with 4 other boats.

6266. How long was that ago ?—10 years ago.

6267. Were all 5 boats lost ?—They were broken to pieces.

6268. Any lives lost ?—One.

6269. It would not be so much a harbour then for saving life as saving property and giving greater facilities to the fishermen ?—We lose a great deal by being kept in port.

6270. You lose a good deal by not having a harbour ?—Yes.

6271. The herring fishery is now coming to a close, is it not ?—Yes.

6272. You have had 3 months since the beginning of June. How many times have you not been able to put to sea for want of such a harbour ?—For two or three weeks we were only two nights out.

6273. Owing to stormy weather you were afraid to go round the Calf ?—Yes.

6274. If you had had a harbour here, would you then be afraid of putting to sea in stormy weather ?—We should have shot every night ; we should have known where to run to for safety.

6275. As a fisherman of long standing would you pay 2*l.* towards such a harbour every year ?—I have heard that before.

6276. You think you would be a considerable gainer by it ?—I should be quite willing myself.

6277. How about others ?—That is not known to me.

6278. But do you say they are willing ?—They said so before.

6279. (*Mr. Coode.*) What do you consider a fair average of a night's fishing ?—We reckon it from 10*l.* to 60*l.* or 70*l.*

6280. I suppose a take of 60*l.* or 70*l.* does not occur very often ?—Not very often, some of the boats have that and some none ; you may take it at 9*l.* or 10*l.* in a general way.

6281. Do I understand you to say that during those 2 or 3 weeks you would have been out every night if there had been good shelter under your lee ?—Yes.

6282. And the best takes of fish you reckon during unsettled weather ?—It is often the case.

6283. Is it the rule that you get more fish during unsettled than during fine weather ?—Yes.

6284. Is there any peculiar facility for getting to the fishing ground from Port Erin, do you get out easier ?—Yes ; because at low water, at Port St. Mary, it runs to the eastward, and we cannot run against it, but at Port Erin it runs to the westward and we can get out.

6285. Where is the fish chiefly landed which is caught on the west side of the island ?—At Port St. Mary.

6286. Why is it taken there ?—Because there is more shelter there.

6287. Have you ever spoken to the fishermen from the Irish, Scotch, and Cornish coasts, as to whether they would pay towards a harbour ?—No.

6288. You have not spoken to them ?—No.

6289. Have you known instances of wrecks at Port Erin where any lives have been lost ?—Yes.

6290. Do you remember any instance to give to the Commissioners ?—I remember the *Wilhelmina*.

6291. How long ago was that ?—Some years. I do not know how many.

6292. Is the holding ground good off Port Erin ?—Yes, very good.

6293. What does it consist of ?—Of sand on the top and stiff clay under.

6294. What is the thickness of the sand ?—Only a few inches. I have seen many a cable break, but never an anchor give way.

6295. (*Mr. Lindsay.*) We will not trouble you any further; we are much obliged for the information you have given us.

John Waterson examined.

John Waterson.

6296. (*Mr. Lindsay.*) What are you ?—A fisherman.

6297. How long have you been a fisherman ?—54 years.

6298. And do you reside at Port Erin ?—Yes,

6299. Did you hear the evidence given by Milner ? Yes.

6300. Do you agree generally in what he says ?—Yes.

6301. You will gladly subscribe annually ?—Yes, I will.

6302. Have you spoken to other fishermen ?—No, I have not.

6303. How many boats belong to Port Erin ?—They all belong to Port St. Mary.

6304. But what I want to know is, how many owners of boats live at Port Erin ?—A good many live there.

6305. Are there 20 boats belonging to the place ?—I cannot say.

6306. Do you know any case of your boats being swamped or lost ?—Yes, I was going out of Erin Bay when one boat was lost.

6307. If you had a harbour ?—If we had a harbour we should many times run a good chance of running round the Calf.

6308. If you had a good harbour, that boats could take at any time, would those boats have been saved ?—Yes, they would.

6309. Do you know of any boats being lost in the bay at Port Erin ?—I have seen them put ashore.

6310. On rocks ?—On rocks and a sandy beach.

6311. Do you remember any loss of life ?—No, not at Port Erin ; about the place, but not in the bay itself.

We will not trouble you any further.

John Waterson, jun., examined.

John Waterson, jun.

6312. (*Mr. Lindsay.*) What are you ; are you master of a fishing boat ?—Yes.

6313. Where does your boat belong to ?—The owner lives at Port St. Mary.

6314. Where does the boat sail from ?—Port Erin.

6315. Are you the master of the boat ?—Yes.

6316. Do you know of any boats in the immediate neighbourhood of Port Erin being swamped ?—Not in my time, but I saw a boat broke in Port Erin.

6317. Had there been a harbour would it have been saved ?—Yes.

DOUGLAS.

John Waterson, jun.

17 Sept. 1858.

Mr. Lindsay.

6318. Have you seen vessels take shelter in Port Erin bay?—Yes.

6319. Of what size?—Schooners and smacks.

6320. How many have you seen in the bay at once?—Seven at a time.

6321. Coasting vessels?—Yes.

6322. Have you seen any large ships there?—The largest ships have been brigs and schooners.

6323. Have you often been unable to put to sea in your boat?—Yes.

6324. What does it arise from, does it arise from your being afraid to put to sea, having no place to run back for?—Yes.

6325. Would you be willing to pay 2*l.* 2*s.* a year towards the harbour?—Yes.

6326. Have you had any talk upon the matter with other fishermen?—No.

6327. You think, if you were to pay 2*l.* 2*s.* a year, you would be a gainer by so doing?—Yes.

6328. (*Capt. Washington.*) As we may consider Port St. Mary and Port Erin the same, what accommodation is there for the fishing boats at these places?—There is no accommodation at Port Erin.

6329. What at Port St. Mary?—There is a quay, but we cannot take it of a dark night.

6330. Do any rocks lay off it?—Yes.

6331. Have you any buoys or beacons on it?—Yes.

6332. Is there any one you can mention which requires a beacon?—Yes, one.

6333. What is it called?—It is called Carrick.

6334. (*Capt. Vetch.*) Can you not get in at all times to Port St. Mary?—When the water is in.

6335. But when the tide is out?—No.

6336. But if there were a pier at Port Erin it would be used by all the boats frequenting Port St. Mary?—Yes, it would.

Mr. John Sainsbury examined.

Mr. J. Sainsbury.

6337. (*Mr. Lindsay.*) What is your occupation?—A farmer.

6337 *a*. Do you take any interest in the fishing boats?—Yes.

6337 *b*. Have you given any attention to the harbour of Port Erin?—Yes.

6337 *c*. What seems to be the general feeling?—They seem agreeable to pay 2*l.* per annum.

6337 *d*. How many have you spoken to?—I cannot say the number.

6337 *e*. Fifty?—No.

6337 *f*. Forty?—No. I should think about 30.

6337 *g*. And they seemed all agreeable?—Yes.

6337 *h*. Do you think it worth their while?—Yes, they would be well paid.

6337 *i*. And that was their feeling?—Yes.

6337 *k*. (*Mr. Coode.*) Have you any connection with the fishing trade in any way?—Not much, at present.

Mr. Alexander Sutherland examined.

Mr. A. Sutherland.

6338. (*Mr. Lindsay.*) What office do you fill?—An office in the Board of Fisheries, Scotland.

6339. (*Capt. Washington.*) Can you hand in a return of fishing boats respectively belonging to the Isle of Man?—I can name it to you.

6340. Can you name them briefly at once?—There is about 120 belonging to Peel of large fishing boats, about 95 to Port St. Mary, and seven to Ramsay. These are all the large fishing boats belonging to the island.

6341. None to Douglas?—None.

6342. Of small boats, how many?—I cannot tell.

6343. Can you furnish the number of boats, the number of men, and the value of the fishery? Do you not make such a return to the Fishery Board?—Yes.

6344. Was it published last year?—Yes, but it was not circulated as formerly.

6345. (*Mr. Coode.*) Does the period of fishing continue as long on the east side as on the west?—It commences generally at Peel first; within a week after that it commences at Port St. Mary. The boats belonging to Peel generally go out first; the Port St. Mary boats very soon follow to the fishing ground, and the united fleets fish off the Calf or off Peel, as they find the fish, and at the latter end of the season a part of the fleet come round to Douglas, and sometimes the whole.

6346. Should you say, as a rule, that the period of fishing is longer on one side of the island than the other?—Do you refer to Douglas.

6347. I speak of Douglas as compared with Peel?—There is no comparison.

6348. It is longer on the west than on the east side?—It is longer from the Calf to Peel; even during the period that a part of the fleet is at Douglas, some are still fishing on the Peel side, and the fishing continues for four months.

6349. How long is there good fishing on the Peel side?—Nearly the whole of those four months.

6350. During only a portion of the four months there is good fishing on the Douglas side?—Perhaps three weeks on an average.

6351. Then, in short, the fishing season extends over four months on the west side of the island, to three weeks on the east?—Yes.

6352. (*Capt. Washington.*) Do you happen to know the value of all the boats employed in the island?—I make a calculation annually.

6353. Can you tell us how much they were worth in 1846 and how much in 1857?—I can ascertain.

6354. Will you at your leisure furnish such a return to the Secretary of the Commission?—Yes.

The witness withdrew.

(*Mr. Lindsay.*) Is there any other gentleman who desires to offer any evidence with regard to the subject of the present inquiry either from Douglas or any other port in the island.

Mr. John Thomas Clucas examined.

Mr. J. T. Clucas.

6355. (*Mr. Lindsay.*) What is your occupation?—I am an advocate.

6356. Where do you reside?—I reside within a mile and a quarter of Port St. Mary and a mile of Port Erin.

6357. State to the Commissioners what you wish to express.—I very often see the fishermen, and they complain of the want of protection at Port Erin; and they say they could get a third more fish if there were a pier there. The fishing begins off Peel. The greater part of the boats belong to Peel, and the remainder to Port St. Mary. The fish, for the most part, is taken off the Calf lights. It commences from the 14th to the 20th of June, and continues up to the beginning of September, when they get fish on the Douglas side. Part of the fleet go on to Douglas, and the rest remain on the west side. Some years ago complaints were made of the want of shelter. Some meetings were held, and the fishermen offered subscription. All the masters in Port St. Mary offered to subscribe 5*l.* each. I saw the masters of about thirty boats. Some said they would give 3*l.*; all said they would give 2*l.*, not 2*l.* per annum, but 2*l.* In that way 800*l.* or 900*l.* was subscribed last year; there was a very large meeting, and it was proposed that they should pay an annual sum. The fishermen engaged to pay 2*l.* a year.

6358. How many attended that meeting?—Several hundreds.

6359. And they unanimously agreed to pay 2*l.*?—

There was no dissenting voice, and they said they would pay annually besides their subscription. They intended to take it out of their first earnings. The takings of a boat are generally divided into sixteen or seventeen shares, seven of which go to the boat. It was to be taken out of the first earnings, and some of the men said they would give a subscription of 5*s.*, 10*s.*, and 1*l.* The Manx fishermen want shelter, and to be able to leave at all times of tide to get to the fishing ground. A deep-water harbour would be of great use at Port Erin.

Mr. CHARLES STEARN examined.

6360. (*Mr. Lindsay.*) What is your occupation?—Master mariner.

6361. How long have you been master mariner?—Eleven years.

6362. Where do you trade?—Round the three kingdoms.

6363. In the coasting trade?—The coasting trade and sometimes the French trade.

6364. Speaking of a national harbour of refuge, what site on this island would you prefer?—I should say the south side.

6365. Do you mean Douglas Bay?—Yes.

6366. All things considered, do you think the site of Douglas Bay better than any other?—Yes.

6367. What part of Douglas Bay would you prefer?—That part which is now exposed.

6368. I understand you object then to the line from the Two-Gun Battery?—Yes.

6369. Do you consider that because it goes through the best anchorage it would do more harm than good?—It would do good to the harbour but not to the roadstead.

6370. What size ship are you master of now?—130 tons.

6371. Would you hesitate running into Douglas Bay in a heavy south-east gale?—Not the least.

6372. Then how do you make out that the pier would injure the anchorage?—Because we should not have room.

6373. There would be danger of collisions from crowding?—Yes, there would not be room.

Mr. THOMAS QUALTROUGH examined.

6374. (*Mr. Lindsay.*) What is your occupation?—Harbour master of Port St. Mary.

6375. Were you ever at sea?—Not except a little in the fishing way.

6376. How long have you been harbour master?—Four years. I was assistant harbour master four years before that.

6377. With regard to a great harbour of refuge, you have heard the witnesses. Now, what part of the island would you recommend?—According to the evidence I would recommend the south side.

6378. Do you mean Douglas Bay?—To the Calf of Man.

6379. Would you give the preference to Douglas Bay over Port Erin?—It would be good for the coasting trade, but Port Erin is too small; Douglas is better.

6380. Is the port of which you are harbour master very short of accommodation for the fishing boats?—Yes; and two-thirds of the fish taken on the coast are brought into the bay—40,000 maize out of 50,000. There are about 120 boats belonging to Port St. Mary, coasters as well as fishing boats.

6381. How many fishing boats?—Eighty-five.

6382. Are the fishing boats oftener at Port St. Mary than elsewhere?—Sometimes they are off Peel and sometimes off Port St. Mary, as the shoals vary according to the tides. Our harbour is much exposed. I have known several vessels get ashore in our bay.

6383. How many fishing vessels have you seen at one time in the bay?—I have known as many as 500 sail in the bay.

6384. (*Capt. Washington.*) At what time of tide can the fishing-boats come in?—About half-tide.

6385. And at neap tide you have not half accommodation?—No, there is not.

6386. You say there are wrecks: what are they owing to?—Want of protection to protect the bay. The bay is quite exposed to east winds.

6387. Are there no rocks in the bay?—Yes.

6388. Are they marked by beacons or buoys?—Some are. About a mile from the point there is the Skerrick rock.

6389. Is there not a light on Skerrick?—Yes.

6390. Is the light a good one?—No.

6391. What does it consist of?—A common silver reflector. It is not on the new principle.

6392. What is the expense of keeping up that light?—The light-keeper has four guineas. As to the oil, I cannot say.

6393. Would it be very expensive to have a better light?—No.

6394. How far can the light be seen?—From two to six miles.

6395. If the light were improved, do you think it would be the means of keeping vessels off Langness Point?—Yes, I have no doubt that our bay is very hard to make. There must be another light to guide them in.

6396. Notwithstanding these difficulties, the largest number of fishing-vessels do resort to Port St. Mary?—Yes, and some of the boats would give 5*l.* a boat towards a breakwater on the Point.

Mr. JAMES KIRMODE examined.

6397. (*Mr. Lindsay.*) What is your occupation?—Coaster.

6398. Are you master of a coasting vessel?—Yes.

6399. How long have you been master of a coasting vessel?—About twenty years.

6400. To what ports do you trade?—All the channel ports.

6401. Have you turned over in your mind the necessity of a harbour of refuge?—It is very necessary.

6402. From your experience, what point would be the best to select for the purpose?—Derby Haven would do very well.

6403. Do you think Derby Haven better than Douglas Bay?—To me it would.

6404. Is not the ground rather foul?—No.

6405. Is there good anchorage there?—Pretty fair.

6406. Good holding ground?—Yes.

6407. Do you think Port Erin would be more suitable?—Yes.

6408. Do you think either Derby Haven or Port Erin more suitable than Douglas Bay for foreign merchants?—Yes.

6409. Will you state your reasons?—It would be better for getting round the Calf.

6410. Any other reasons?—Nothing particular.

6411. (*Mr. Coode.*) Where do you belong to?—I belong to Port St. Mary.

6412. And you think Port St. Mary or Derby Haven preferable to Douglas Bay?—Yes.

6413. What do you think of Ramsay Bay?—It is a very good bay.

6414. You do not think it so convenient as Derby Haven or Port St. Mary?—Not to get round the Calf.

6415. (*Mr. Lindsay.*) What have you to say to a breakwater at Port St. Mary Point?—You propose to run a breakwater as far as low-water mark on the west side of the bay.

DOUGLAS.

Mr. J. Kirmode.

17 Sept. 1858.

Mr. Lindsay.

6416. Yes. Would that make Port St. Mary a good harbour of refuge ?—Yes.

6417. Would it be as good as Derby Haven?—They would be able to get out at all times.

6418. Do I understand you to say, speaking of a general harbour of refuge, that if a breakwater were run out from Port St. Mary Point, it would be better than from Douglas Head ?—I do not speak of a harbour of refuge as regard to that.

6419. You speak only of the fishing boats ?—Yes

6420. You do not think Port St. Mary so suitable as Derby Haven or Douglas Bay ?—A breakwater there would be of great value to the fishing and coasting trade.

6421. It would afford shelter not only for fishing boats but for coasters ?—Yes.

6422. Would it afford shelter in all winds ?—Yes, in all winds.

Mr. John Hudson examined.

Mr John Hudson.

6423. (*Mr Lindsay.*) What is your occupation ?—Master mariner.

6424. How long have you been a master mariner ?—Twenty-two years.

6425. In what trade are you employed ?—In the fish trade.

6426. What are we to understand by that ?—In the fishing.

6427. Where do you trade from ?—Port St. Mary.

6428. You heard what was said about a pier run out from Port St. Mary to a breakwater on the Point?—Yes.

6429. If such a breakwater were carried out, would it afford protection to the fishing-boats and the usual sort of coasters ?—Yes, for vessels up to 300 or 400 tons.

6430. Would it shelter vessels of from 300 to 400 tons ?—Except the wind was south-east and by south they would be sheltered.

6431. Has any injury occurred to the bay of Port St. Mary by the taking away the stones ?—Yes ; during the last fifteen years it was gone to the bad by shipping away the stones.

6432. Do you think the injury will be a great deal more if they take away more stones ?—Depend on that. It will get worse every year.

6433. You are convinced in your own mind that the taking away the stones from the south-west point towards the lime kilns has caused great injury to the shelter ?—We find it every year worse, and every man connected with the fish trade knows it as well as I do.

6434. You consider it worse now than it used to be ?—Yes.

6435. Was it better twenty-three or twenty-five years ago ?—With a rough wind from the south-west, no.

6436. Is there shelter at low water ?—None, if the wind goes due south.

6437. But if the wind is from the south-west, is there shelter at low water ?—There is, but if it veers one point we are done.

6438. If it blows hard can you run into the harbour ?—Yes ; sometimes 500 boats do so.

6439. If there were a jetty on the point, would that give protection ?—Of course, in all winds.

6440. Would there be any occasion then for the fishing fleet to lie out all night in heavy seas and great storms ?—None at all.

The witness withdrew.

Mr. W. F. Moore, the Harbour Commissioner for Douglas, said :—I should be very sorry if, in striving to get a large scheme, we should lose the smaller one, and I sincerely trust the Commissioners will allow us, if possible, to make a beginning in some way.

Sittings at the Isle of Man closed.

LIVERPOOL.

Saturday, 18th September 1858.

PRESENT :

Admiral Hope (Chairman).

Sir Frederic Smith.	Captain Sulivan.
Mr. Lindsay.	Mr. Coode.
Captain Vetch.	Mr. Evans, Secretary.

LIVERPOOL.

18 Sept. 1858.

(*Chairman.*) Is the Chairman of the Mercantile Marine Association present ?

(*Mr. Thompson.*) I attend as the Secretary. The association is composed of 800 masters connected with this port, and I, as their representative, have to ask you to adjourn for a day or two in consequence of the short notice. There are several masters present connected with the coasting trade, who wish to be examined, and who will be away on Monday, and we can bring further evidence on Monday or Tuesday.

What is your name ?

Edward James Thompson.

Prior to calling any evidence, Mr. Thompson, would you wish on the part of the association to make any remarks on the subject of our inquiry ?

The only remark which I can make is, that it appears to the association that this is not a shipowners' question only, but a question affecting life. The principal reason that this association wishes to bring evidence before the Commissioners is, that it considers it to be not merely a shipowners' question, but a question affecting the lives of masters, officers, and seamen. For that reason only it intends to bring evidence before you.

Who is your first witness ?

Captain M'Arthur, one of the oldest steamship captains from Liverpool.

Mr. John M'Arthur examined.

Mr. J. M'Arthur.

6441. (*Chairman.*) What is your name ?—John M'Arthur.

6442. And what is your occupation at present ?—At present? Not any at present.

6443. Have you been a seafaring man, and, if so, state for what time ?—I have been a seafaring man since 1818.

6444. In what trade were the vessels you commanded principally employed ?—Principally the coasting trade.

6445. For how many years were you a master ?—From 1832 in large steamers, large coasting steamers, prior to that in smaller ones.

6446. Did the vessels you commanded sail out of Liverpool ?—Yes.

6447. Have you any opinion to offer to the Commissioners as to the necessity or advantage of a harbour of refuge on the north coast of Ireland ?—Yes.

6448. Will you state that opinion ?—The Skerries of Port Rush is a very excellent harbour for vessels windbound.

6449. Have you ever been at anchor in the Skerries Roads ?—I never came to anchor, but I sailed to Port Rush for four years.

6450. Then you are well acquainted with the roadstead ?—Yes.

6451. Have you seen it in bad weather ?—I have lain there since.

6452. Have you ever steamed from it in bad weather ?—I have.

6453. Often ?—Once a week, twice a week.

6454. In bad weather ?—To and from. Yes, in all weathers.

6455. Have you steamed from it often in bad weather ?—I cannot positively say the number of times in bad weather, but we sailed once a week regularly from each end.

6456. Now tell me, with a heavy north-west wind where does the heaviest sea set in, at west sound or broad sound ?—At the east end, from Bangor Head to the east end of the Skerries.

6457. Do you know the broad sound of Skerries by that name ?—That is the sound from Moorhill, I presume, you mean.

6458. Do you know the west sound ?—I do.

6459. Well, in a heavy north-west gale is there a heavy sea setting through west sound ?—Not through the west sound, but across it.

6460. What is the name of the other sound ?—I do not know that it has any particular name.

6461. But you know the sound ?—Yes.

6462. In which does the heaviest sea set in a heavy gale ?—There is between the islands a heavy sea setting in, but I do not know that it is a sound at all.

6463. You stated that the Skerries is the place where you are desirous to have a harbour of refuge. I want to know your reasons ?—Particularly for the north channel.

6464. Why ?—Particularly for the north channel, going north-about.

6465. But why for the north channel? You can give me the reason why ?—Vessels are more apt to be taken with bad weather in the north channel, and would be glad to take refuge in such a harbour.

6466. Do you know the Isle of Man ?—Yes, I do, a little.

6467. Give me your opinion, if you have any, as to the advantage of a harbour of refuge at the Isle of Man for the Liverpool trade going north-about ?—Ramsey Bay, in all winds, is the only anchorage I know of.

6468. (*Sir F. Smith.*) How many ships have you commanded altogether ?—Well, a good many.

6469. In what year were you in command of ships ?—In '32, '33, '34, '35, '36.

6470. Can you give us the tonnage of those vessels which you commanded ?—I do not think there were any under 300.

6471. None under 300 tons, but over that tonnage ?—No, I think not, with the exception of one, which was over that.

6472. To what part of the world did you trade ?—From Liverpool to Glasgow, and Liverpool to the north of Ireland, and from Glasgow to Belfast.

6473. Did it ever happen to you to be wrecked ?—Never.

6474. Did you ever in the course of your voyage encounter such adverse and violent winds as to make you desirous to run for a harbour of refuge if one had existed ?—I have had occasion.

6475. And in those voyages where would you have desired to have a harbour of refuge ? In the course of your voyages what are the various points in which harbours of refuge would have induced you to run for them ?—I never had occasion to run for one but Lough Ryan.

6476. That is the only occasion ?—And to Ramsey Bay.

6477. That is not quite an answer to my question. I asked you whether in the course of your various voyages it has so happened that had there been harbours of refuge you would have run for them ?—Well, certainly, if taken in the north channel I would certainly run for one of the Skerries.

6478. Then, in point of fact, it has hardly ever happened to you that you wanted a harbour of refuge ?—Not often.

6479. Are you aware whether vessels leave port with the crew in a state unfit for navigation ?—No, I cannot say.

6480. Has it ever happened to you to have a crew in that state ?—No, never.

6481. Then you are not of opinion that casualties occur in leaving port through the state of the crew ?—No.

6482. (*Mr. Lindsay.*) Do you say, from your experience as a shipmaster, that you consider a harbour of refuge necessary in the north channel ?—I think it would be very useful; and, from the cases of wrecks I have seen in the north channel, close to Port Rush.

6483. And do I understand you consider the Skerries the best point for such a harbour ?—I do not see any other.

6484. During what winds do you consider a harbour of refuge of most advantage ?—It is of great advantage with all winds.

6485. But some are more dangerous than others ?—A north-east might; but still it is smooth water inside the Skerries.

6486. The north-east you consider the most dangerous wind ?—I do.

6487. Were you ever in Lough Foyle ?—Yes.

6488. Is it not a good harbour ?—Very excellent harbour.

6489. And a capital shelter from north-east gales ?—Yes.

6490. What distance from the Skerries ?—Not a very great distance.

6491. What distance to the westward of it ?—About sixteen miles.

6492. Have you ever been in Lough Laughan ?—Yes.

6493. Have you good shelter there in north-east winds ?—Excellent.

6494. What distance is that from the Skerries ?—About thirty miles.

6495. To the eastward ?—South and east.

6496. Well, then, twenty-six miles to the west and thirty miles to the east, are two capital harbours already made to hand, where ships can find shelter during the most dangerous wind ?—Yes.

6497. That being the case, do you think it worth while to spend the public money to create a harbour of refuge at the Skerries ? Do you think it necessary for saving life and property ?—I still think it is.

6498. Have you ever been in Loughindall ?—Never.

6499. You cannot speak as to the anchorage ?—No.

6500. You traded in a steamer between Liverpool and Glasgow ?—Yes.

6501. You often passed the Isle of Man ?—Frequently.

6502. Considering Ramsey Bay a natural harbour, do you consider a harbour of refuge at the Isle of Man necessary ?—I cannot speak as to any other part of the Isle of Man myself.

6503. But supposing you have a good harbour there, do you still think Ramsey the best site for a harbour of refuge ?—It can be made a very good harbour, and I think it is the best site.

LIVERPOOL.

Mr. J. M'Arthur.

18 Sept. 1858.

Mr. Lindsay.

6504. Say that a good site could be found at Douglas and Port Erin, which would you prefer, Douglas, Port Erin, or Ramsey; that is, at which of these points do you think a harbour would be of most advantage, a harbour of refuge, which you could take in all winds ?—Ramsey.

6505. You still think Ramsey would be the best point. You think Ramsey would afford greater facilities to shipping, and save more life and property, than at any other point ?—Yes.

6506. What is your reason for thinking so?—There is good holding ground.

6507. But supposing the holding ground were as good at other places. I am speaking of the site. What reason have you for thinking it is the best position for such a harbour ?—It seems more sheltered by the point.

6508. Supposing it were equally well sheltered at other places ?—I cannot speak so well as to other places.

6509. But say the shelter is equally good at other places, are you still of opinion that Ramsey is the best position ?—I am still of opinion that Ramsey is the best position.

6510. Can you state the reason ? Is it because more ships pass that particular point ?—No, they do not.

6511. Then what is your reason ?—There would be more room to work into the harbour. The Bahama Bank is outside, with a light on it, and there is plenty of room to tack into Ramsay Harbour by sailing ships. As to steamers, they can steam in with all ease.

6512. Do you know anything about the east coast of Scotland ?—Not much.

6513. Or the Bristol Channel ?—Yes, I have been up the Bristol Channel, but I do not know much of it.

6514. Or the north coast of England ?—No.

6515. (*Capt. Sulivan.*) You say you require a harbour on the north coast for outward-bound sailing ships particularly ?—And for inward-bound sailing ships too, with a north-east wind, when they cannot get up.

6516. North-east for inward, and west and north-west for outward-bound ships ?—Yes.

6517. Is there not good anchorage in Lough Foyle ?—After you are inside there is.

6518. But under the head. You are sheltered directly you are inside the head, are you not ?—Past the lighthouse.

6519. And with a north-east wind it is a fair wind to run up ?—Yes.

6520. And a fair wind out would be a fair wind for Liverpool ?—Yes, a west wind.

6521. North-west and south it would be. Then, with a harbour so near as Lough Foyle, I should like to hear your reasons for laying out money at Port Rush, with such a fine harbour for all these winds so near ?—It is a very fine harbour.

6522. Then on what grounds do you urge the necessity of having another harbour at Port Rush, when there is already a harbour which affords all the refuge which is necessary for that trade ?—Near these rocks vessels have been taken on a lee shore that could not make Lough Foyle at any price. There has been loss of life and property at Port Stuart. If it had been known there was a harbour as the Skerries is at present, no doubt, if published as such, those masters would have made for it.

6523. Then why did they not run for Lough Foyle ?—They were too far to leeward, but they might have reached out, and come in the east end of the Skerries or the west end of it.

6524. The difference, you know, is only 10 miles between the two ?—Vessels within 10 miles can fetch one and cannot the other. Loss of canvass is one thing which may affect it.

6525. Then, for vessels within those 10 miles, you would have a harbour of refuge. Do you think you would be justified in spending a large sum of money there when, 10 miles to the westward, there is already a good harbour ?—That is not for me to say.

6526. As to Ramsey, is it sheltered from the south round to the north by the west ?—Yes.

6527. Then it is only vessels outward bound from Liverpool that could ever take refuge in Ramsey Bay ?—I do not know.

6528. Then a wind that they could take shelter from they are already sheltered from. Is not that so ?—Yes.

6529. If a wind came from a quarter to make them exposed it would be a fair wind to go on, would it not ?—It would.

(*Mr. Thompson.*) Captain M'Arthur has commanded entirely steamboats, on which account he has not had to go into harbours of refuge or to seek shelter.

Mr. ARCHIBALD M'DARMAID examined.

Mr. Archibald M'Darmaid.

6530. (*Chairman.*) What is your occupation ?—Steamboat master.

6531. How long have you been a master ?—Since 1825.

6532. Since 1825 ?—1845, I mean.

6533. And how long have you been at sea ?—20 years; from that to 22 years.

6534. And in what direction have the vessels chiefly sailed that you have commanded ?—On the Irish coast; the west of Ireland.

6535. Have you any opinion to offer to the Commissioners as to the necessity or advantage of a harbour of refuge on the north coast of Ireland ?—The only place I know of is the Skerries, on the west coast of Ireland, that could be made. The Skerries is the only place that I know of that a harbour could be made properly for the safety of vessels.

6536. But state your reason for wishing to have one there at all.—That is a place where a harbour would be of very great use to vessels north the channel going out. I know they can take there when they cannot take Lough Foyle. Lough Foyle entrance is very narrow with banks; not very easily taken by strangers when they can take this either from the west or east.

6537. Do you know Loughindall ?—I have been there once or twice.

6538. But you do not know much about it ?—No.

6539. Have you been through the Skerries in bad weather ?—Yes, I have been in very bad weather, once with a steamer.

6540. And frequently ?—Yes.

6541. You know the entrance which is called the broad sound ?—Yes, I do.

6542. And you know the entrance which is called the west sound ?—Yes.

6543. In a heavy gale from the north-west through which of these entrances does the heaviest sea run ?—Through the west ground.

6544. Through the west ground ?—Yes, through the north-west wind.

6545. Through the west, and not through the broad sound. In the west sound is the heaviest sea ?—I consider so, because the north-west wind breaks off the end of the Skerries, and breaks the sea more than it does through the west sound.

6546. You have told me that you know the two entrances to the Skerries road; that which is called the west sound, and that which is called the broad sound. Now the question I ask you is this: Through which of those two entrances, in a heavy north-west gale, does the greatest sea run ?—Through the west from the north-west.

6547. Through the west sound or the broad sound ?—Through the west sound.

6548. Therefore, supposing a harbour of refuge was to be made at the Skerries Roads, which of the

two sounds would you shut up by preference?—I would shut up the west sound.

6549. You would shut up the west sound?—Certainly.

6550. Have you ever been at anchor in the Skerries roads in heavy weather?—Never.

6551. Do you know anything of the Isle of Man?—A little.

6552. Do you think a harbour of refuge is required at the Isle of Man for the Liverpool trade?—I do not see that there is any use for it there.

6553. You do not see any use for it?—No.

6554. (*Sir F. Smith.*) Where have you traded?—To Londonderry, Glasgow, and Sligo.

6555. Never to America?—No, never.

6556. Did you ever go the south passage from Liverpool round the south of Ireland?—No, never.

6557. Did you ever take the north passage?—Always either round the Calf of Man or round the Point of Ayr.

6558. Have you ever found the necessity of a harbour of refuge?—I have many times put into harbour, and if there had been a harbour of refuge in the way I should have been very glad to put into it.

6559. Are you of opinion that harbours of refuge are desirable for the safety of life?—Certainly.

6560. Supposing you had the public money at your disposal for that purpose, where would you apply that money?—In the Skerries Road, certainly.

6561. Is there no other point in the voyage from Liverpool to the north of Ireland, where a harbour of refuge is required?—A harbour is required at many places; but I consider a harbour there enough for the vessels which frequent it.

6562. You tell us harbours of refuge are required in many places. Will you specify where they are required?—When it blows a gale of wind, we generally go into some harbour, if we can manage it, such as Ramsey, which I have been obliged to do sometimes.

6563. Perhaps it will not give you too much trouble to describe the voyage of a ship leaving Liverpool, and encountering bad weather in any point. Tell us where, on meeting with foul weather, you would like a harbour?—It depends entirely on the wind, where it blows.

6564. I will leave that to you. If you will state the wind, and the difficulty, and the remedy, I shall be much obliged to you. Supposing you were sailing from London with a fair wind, and were taken with an adverse wind at any point of the voyage, specify where a harbour of refuge would be useful?—I consider the Skerries the best place, because they are more exposed.

6565. But going to the north of Ireland, your voyage is nearly over there?—Yes.

6566. For instance, is not a harbour of refuge required at Dundrum Bay?—I do not know much of Dundrum Bay.

6567. But you have navigated round the north of Ireland many years?—Yes.

6568. But you have never been in Dundrum Bay?—Never.

6569. Do you know anything of Ardglass?—No.

6570. Have you ever been into Lough Foyle?—Yes.

6571. What do you think of that as a harbour of refuge?—I think a good deal of it; but the entrance is very bad.

6572. Bad, in what wind?—No heavy vessel can get into Lough Foyle in a heavy westerly wind.

6573. You say that in the Isle of Man no harbour of refuge is necessary?—I do say so, according to my experience.

6574. If you met with a strong adverse wind, would you bear up for Lough Foyle to come back again, or would you try for a harbour of refuge in the Isle of Man?—I know very little, I say, about the Isle of Man. I cannot say.

6575. (*Mr. Lindsay.*) Had you any conversation with any one before you came here to give evidence?—No.

6576. Was there no one who invited you to come?—No person, except our agent, Mr. Johnson.

6577. The agent for your steamer?—Yes.

6578. Did he state on what you were to give evidence?—No.

6579. Did he state simply you were to come and give evidence as to a harbour of refuge in the north channel?—Yes.

6580. He did not point out to you where?—No.

6581. He left it to your free will?—Yes.

6582. You heard the question I put to Captain M'Arthur. Looking, as I say, to those winds, which are the most dangerous? Considering that you have a natural harbour to the west, and another to the east, do you really think we would be justified in recommending the expenditure of a large sum of public money to make a harbour at the Skerries?—Yes; certainly, I would.

6583. In your great experience can you mention any ships or lives which would have been saved if there had been a harbour of refuge at the Skerries?—I have heard of a good many lost down there between the Skerries and Bangor Head; and I am positive sure if there were a harbour it would prevent their going ashore.

6584. Can you mention one ship that a harbour of refuge there would have saved?—I cannot name any ship.

6585. You can not name any one ship. Do you know anything about the north-east coast of England?—Very little.

6586. Nor the east coast of Scotland?—I have been there sometimes.

6587. Have you ever traded there with a vessel?—Yes.

6588. Which do you think the best site, Wick, Peterhead, or Fraserburgh?—Wick would be a better place than Peterhead.

6589. For what reason?—Peterhead is more exposed to the north-east.

6590. But is an equally good harbour, if it could be made, is it not?—I have never been in at Peterhead.

6591. But presuming that an equally good harbour could be made, at what point do you think a harbour of refuge would be of most value?—I think Fraserburgh the best of any of them.

6592. For what reason?—Because there is more room to go into it.

6593. Any other reason?—No; I think not. I have never been into either of the places, only passing. I do not know much about it.

6594. Then you can not speak much one way or the other?—No.

6595. (*Capt. Washington.*) I think you said you knew the east coast of Ireland?—The north-west coast only.

6596. Are you acquainted with St. John's light?—Yes.

6597. Near Dundrum Bay?—No; I have never been there.

6598. Then you never heard of a great many wrecks in the bay?—Yes.

6599. You know nothing of how those wrecks occurred?—Ten years ago they put a light on the point.

6600. Do you know of no wreck?—There have been a good many.

6601. (*Capt. Sulivan.*) Your experience has been entirely in steamers?—Yes.

6602. You have had no experience in sailing ships?—No.

6603. Then your experience does not enable you to speak as to advantages for sailing ships?—No; I have never been much in sailing vessels.

6604. Do you know how far Lough Foyle can be entered in north-west gales? Whether it can be easily entered in north-west gales?—It can be entered perfectly easy at north-west.

LIVERPOOL.

Mr. Archibald M'Darmaid.

18 Sept. 1858.

Capt. Sulivan.

6605. What are the winds for which you consider a harbour most needed?—North-east is the worst wind for Lough Foyle.

6606. For ships on that coast?—North-east is the worst.

6607. Do you consider north-west a bad wind?—North-west is not so bad as north-east.

6608. With north-west, if she stands out, she cannot be caught on a lee shore?—No.

6609. But if she were to windward far enough, she could fetch into Port Rush, and it is a fair wind for Lough Foyle?—Yes.

6610. If a ship were in danger with a north-west wind she could reach into Lough Foyle?—I should say so, if far enough to windward.

6611. And with west winds?—West and south-west cannot get in.

6612. But that is comparatively an off-shore wind, is it not?—But there is certainly the danger of a lee shore.

6613. Can a ship be in danger of going on shore through stress of weather, however bad it may blow off Lough Foyle with a west or south-west wind?—Certainly not.

6614. Then it must be north-west or north-east alone in which a ship is in any danger?—Yes.

The witness withdrew.

Mr. George Roach examined.

Mr. George Roach.

6615. (*Chairman.*) What is your occupation?—Master mariner.

6616. How long have you been a master?—From 28 to 30 years.

6617. And how long have you been at sea?—40 years.

6618. What description of vessel have you chiefly commanded?—Sailing ships.

6619. And in what direction have you sailed?—North and South America, and the Brazils.

6620. And what size ships have you generally commanded?—From 300 to 1,200 tons.

6621. Will you state to the Commissioners your opinion as to the necessity or advantage of so improving the harbour of Carlingford as to make it available as a subsidiary harbour of refuge for ships bound south out of Liverpool?—All that is required is deepening the bar.

6622. What sort of anchorage is there?—The anchorage without is blue clay. There is plenty of shelter inside. All that is required is deepening the bar.

6623. I am perfectly aware of the excellence of the bay of Carlingford, if the channel is dredged through the bar, but will you have the goodness to state your reasons why you wish a good harbour for shipping there?—There is no other place between Kingstown and Belfast. If that bar were open at all times of tide it would prevent ships going to Dundalk Bay, Drogheda, or Dundrum Bay; any ship could then always go, if there were sufficient water off that port, and could go at any time of tide. I have known ships lost close to the bar on that account; they could not keep off it until there was sufficient water.

6624. Have you any knowledge of Lough Strangford?—No.

6625. Have you any opinion to offer to the Commissioners as to the advantage of improving the harbours of Waterford and Wexford with the same view?—I should think Waterford harbour for deepening much preferable to Wexford, because the approaches are much easier; I consider that the approaches to Wexford are very difficult.

6626. Are you acquainted with Wexford?—No, I have not been in the port.

6627. Are you acquainted with Waterford?—Nothing more than passing by.

6628. Would you consider that if Waterford were made available as a harbour of refuge it would supersede doing anything at Wexford with the same view?—I should think it would.

6629. As respects a harbour of refuge somewhere in the neighbourhood of the Land's End, do you think there is any necessity for that for the Liverpool trade?—I should think not, for the Liverpool trade especially.

6630. Have you ever taken the passage north-about to America?—Frequently.

6631. And have you any opinion as to the necessity or advantage of a harbour of refuge on the north coast of Ireland?—The Skerries would be an excellent place for a harbour of refuge, I should suppose for that channel.

6632. For what description of vessels do you think it would be useful as a harbour of refuge, for coasting vessels or the foreign trade?—I think for both.

6633. Do you think the Skerries a roadstead which a large ship of 1,200 tons would willingly go near in bad weather if she could help it?—I am not acquainted with the roadstead.

6634. Do you think the coast in that vicinity a coast which a vessel would be willing to go near in bad weather?—Not if she could help it, but she might be forced to take it. If she had lost canvas any harbour there would be very necessary.

6635. Therefore, on account of accidents arising from stress of weather, it would be very useful?—I should suppose so.

6636. As a general rule in bad weather, in a large well-found ship, would you rather run for a harbour of refuge, or try and keep the sea and make your passage?—If the ship were well found I should prefer to keep the sea to running for any harbour.

6637. Amongst men in your mode of life is there any feeling as to credit or discredit in taking refuge in harbours in bad weather, instead of keeping the sea and trying to make a passage?—A good deal depends on the ship,—the way she is found, the way she is manned.

6638. But with a well-found ship and a decent crew would you ever do it if you could help it, having regard to your character as a seaman?—I would not put in unless something occurred. If all worked well, and the ship was in good trim, I should not bear up.

6639. Now will you view the question in this light,—might it not be more to the advantage of your owner that you should bear up rather than keep thrashing about at sea and expose the cargo and ship to wear and tear?—A good deal would depend on circumstances; if it were in the depth of winter, and a good harbour close to, I do not say but it would be very proper to take it; on the other hand, perhaps you might expect every moment a change of wind. A good deal depends on the time of trial; if I found the ship straining and labouring, and a chance of damaging the cargo, then I think it very right to bear up and take a harbour.

6640. And in such a case therefore the interests of your owner would be benefited by your taking a harbour of refuge?—Certainly, in cases of this sort.

6641. As respects a port of call, would any harbour of refuge be of use to the Liverpool trade on the north coast of Ireland, for ships to call and wait for orders?—Where?

6642. On the north coast of Ireland, for ships to call and wait for orders?—Yes, I should think it would.

6643. You think it might?—Yes.

6644. Is it at all the practice for American ships—the timber-laden ships homeward bound—to put into a port to wait for orders?—Yes, very often.

6645. What ports do they frequently use for that purpose?—Cork or Falmouth.

6646. And if you had a good harbour of refuge on the north coast of Scotland, do you think they would use that in preference to Cork or Falmouth?—They might reach that port when they could not reach

Cork or Falmouth. I have been glad to come in when I could not reach Cork.

6647. Have you ever been to the Baltic ?—No.

6648. (*Sir F. Smith.*) Taking the outward passage to America, what state of circumstances would induce you to give the preference to the north over the south passage ?—Bound for North America, if the wind were either south, south-west, or south-south-east, I should take the north channel.

6649. And would you more frequently if a harbour of refuge were on the north coast ?—Yes.

6650. That would induce you ?—It would.

6651. Have you ever seen a wreck chart of the Admiralty, showing the number of wrecks ?—No.

6652. It appears from this wreck chart that in those 5 years a great many casualties, collisions, and wrecks have occurred off Liverpool, can you at all account for that number. Upwards of 30 vessels appear to have been wrecked off Liverpool. To what do you ascribe that ?—There are great number of vessels frequenting Liverpool and the Channel from different parts; a great number meet off Liverpool and the Isle of Man.

6653. Do you imagine that those casualties arise from bad navigation or the bad state of the crews. (*The wreck chart was put into the hands of the witness.*) That is in the course of 5 years. Looking at that chart—the Admiralty wreck chart—you will see that a great many casualties occurred off Liverpool, and carrying your eye on to the north of Ireland, in the neighbourhood of the Skerries, you will find only 3 or 4 occurred there in the same space of time. To what do you attribute it ?—The greater number of vessels leaving Liverpool.

6654. The greater portion of the vessels leaving Liverpool do not take the north passage ?—No, I should think not, because more are bound south.

6655. You do not know the east coast of Scotland or England ?—No.

6656. Do you know more of the Isle of Man ?—No.

6657. Supposing you were going north about, and had not reached the passage going round to the Skerries, and were met by adverse winds, is there any port on the east coast of Ireland or the Isle of Man you would desire to make ?— The Skerries is the best place I should think for a harbour of refuge.

6658. What do you think of Carlingford ?— I thought you meant the north passage entirely.

6659. I take the whole passage. At what points would you desire a harbour, supposing there was no limitation ?—Carlingford I should say was the first place, and then a harbour in the Skerries after that.

6660. Supposing a vessel going south about met with adverse winds, say a south gale of wind, are there any points south of Liverpool where you would be disposed to seek for a harbour of refuge ?—Waterford would be the best port I should think for incoming ships.

6661. Have you ever been into Waterford ?— I have never been in it, but I have passed it.

6662. Has it ever occurred that a harbour of refuge would be useful to you there ?—It has been so.

6663. Have you any opinion to give as to Holyhead Harbour for the purposes of trade ?—No.

6664. Do you think that under any circumstances it would be useful to Liverpool ?—No.

6665. Have you ever been through the Pentland Firth ?—I have.

6666. Do you consider that a dangerous navigation ?—In clear weather, I think not.

6667. Does any state of wind or tide make a set through east or west ?—It is many years ago that I went. I have only been through once. I cannot give any opinion.

6668. Do you know anything of the Firth of Forth ?—No.

6669. Are you aware of instructions being given by the shipowners to commanders of vessels to keep the sea in all weathers ?—I never had such instructions.

6670. You think it would hardly be a fair instruction to give ?—There is a difference of opinion on that.

6671. As a question of life ? As regards property, the shipowner can keep himself harmless by insuring his vessel; but looking at it only as a question of humanity, and putting it to you in that light, is it a proper or fair thing to tie the hands of the commander, and render it impossible for him to go into harbour ?—I think that a discretionary power ought to be placed in the master.

6672. Has it ever occurred to you that wrecks have occurred off Liverpool by the crews going out in a bad state of discipline ?—I have frequently known instances of ships going to sea with their crews in a bad state; but I have never known of any bad effects.

6673. It has been given in evidence that collisions and wrecks have occurred very frequently from the crew being in a state of intoxication. Has that ever happened, to your knowledge, in the port of Liverpool ?—I have known instances, but I cannot mention any particular case where the vessel has met with any accident.

6674. (*Mr. Lindsay.*) You speak strongly in favour of Carlingford as a harbour of refuge ?—Yes.

6675. Arising from the fact that there is no shelter between Kingstown and Belfast, can you mention any instance in which, if there had been a harbour of refuge at Carlingford, vessels would have been saved ?—I recollect some time ago a very fine vessel, the *John Stump*, I think, from Calcutta, went ashore, trying to keep off with sprit sails; but she could not keep off. If there had been sufficient water she would have gone in.

6676. How was the wind ?—South-east.

6677. Blowing right on the coast ?—Yes.

6678. Were any lives lost ?—Yes.

6679. And that ship, you can speak of your own knowledge, would have been saved if there had been a harbour at Carlingford. Do you know any other instance ?—Yes; the *Myrtle*.

6680. How was the wind ?—The same way. She went ashore near the same place.

6681. Could she have fetched in ?—Yes, if there had been sufficient water.

6682. (*Capt. Sulivan.*) You consider Carlingford more in the line of vessels going south than vessels going north ?—I consider it suited both for north and south.

6683. Vessels going to the north would pass round the Isle of Man ?—Yes.

6684. Would they, with the wind south or south-east, go round the Isle of Man ?—Yes.

6685. And it would be a fair wind for that passage ?—Yes.

6686. Then only a north or north-west wind would stop them ?—And Carlingford would be a weather shore, and they could not run in.

6687. And Carlingford to be a lee shore would apply to vessels going south ?—Yes.

6688. For sailing vessels, do you consider a harbour of refuge should be one that they could go into with a leading wind ?—Yes.

6689. And that few ships disabled can work to windward ?—Yes.

6690. They cannot haul round, and work into a harbour ?—No.

6691. Therefore Holyhead, with a southerly gale, is very difficult for Liverpool ships to enter ?—Yes.

6692. In gales of wind which would make Holyhead almost impossible to enter, would not Carlingford be a dead lee shore, and a fair wind into it ?—Yes.

6993. Supposing for south winds ships use Carlingford, is it not also very desirable that they should have a fair wind out ?—Anything taking west would bring out of Carlingford.

6694. If you go into Carlingford with a south

LIVERPOOL.

Mr. George Roach.

18 Sept. 1858.

Capt. Sulivan.

wind, and the ship wants to go on her voyage, a west or north-westerly wind would be a fair wind?—Yes.

6695. And a leading wind out?—Yes.

6696. A fair wind in and a leading wind out are of great importance in a harbour of refuge, are they not?—Yes.

6697. The same would apply to Waterford. A south-east gale with homeward-bound ships, and a south-west or south with outward-bound ships, would be winds which would make Waterford available?—Yes.

6698. That also is a port you could run for with a disabled ship?—Yes.

6699. And in all dangerous winds?—Yes.

6700. And have a leading wind when you wanted to sail?—Yes, outwards.

6701. Or a west wind if bound up channel?—Yes.

6702. You say you would endeavour to keep the sea. In endeavouring to round the Tuskar is not a ship often in great danger, being caught by an adverse wind?—Yes.

6703. Generally speaking, it is not often that a merchant ship is so well found that she can thrash off a lee shore?—Yes.

6704. Then would it not be desirable that a vessel caught off a lee shore west of the Tuskar should go into Waterford rather than risk losing her sails or masts?—Yes, ships bound out.

6705. As to keeping the sea bound out with southerly gales, would there not be great danger, unless she were remarkably well found, trying to thrash off the south coast of Ireland?—Of course, if she could not fetch off the coast, Waterford would be most desirable to go into.

6706. Then, for the safety of the crew and the welfare of the ship, it would be desirable under those circumstances to go into such a port as Waterford?—Yes.

6707. Going north about, what are the dangerous winds in which you would like to make use of Port Rush?—North-east, I should say. A north-east wind blows into Port Rush.

6708. No man outward bound would go in in a north-east wind. That would be a fair wind out, would it not?—Yes.

6709. For outward-bound ships what would be the dangerous wind?—North-west.

6710. And north, I suppose, caught in the bay with sails gone?—North-north-west would do that.

6711. In any of those winds could ships run off to Lough Foyle?—I know it is a difficult harbour to go into for strangers. I know by my chart that it is not a good port to run for with a large ship.

6712. I am speaking of a fair wind?—Not for a stranger. It might do for people acquainted with it.

6713. (*A chart of the Skerries being shown to witness.*) You see the red lines blocking the harbour against west and north-west gales. Judging from the width of the passage to the east, in a north-east gale would it be safe to run, and to bring up with no more protection than those rocks afford?—I am not acquainted enough with the place to give an opinion of that.

6714. Supposing a wind blowing in the direction of that arrow, do you think any seaman in a large ship with a heavy sea would run into that place as a harbour of refuge, or that he could find shelter enough to make it a harbonr of refuge to him, trusting to those rocks to protect him?—I should think that a very heavy sea would set in there.

(*A chart of the Irish channel was put into the hands of the witness.*)

6715. You see that 10 miles to leeward of Port Rush is Lough Foyle. Into which would you take a heavy ship, if disabled, by preference, into Port Rush or up Lough Foyle?—I would take Port Rush in preference, because I could work in.

6716. But the danger?—I would not run for rocks like those.

6717. Would you rather drift out to sea than take either?—If the wind would allow it, I should prefer to go out to sea to take either.

6718. Have you ever been in Carlingford yourself?—Yes.

6719. Do you know anything about it inside?—I know it very well.

6720. Would you run right up if you had lost your anchors?—Yes.

6721. You think it a fit place to beach inside or run into the mud?—I would run right into the mud there.

Mr. Wallis M'Clennan, Master Mariner, examined.

Mr. Wallis M'Clennan.

6722. (*Chairman.*) What is your occupation?—Master mariner.

6723. And how long have you been at sea?—16 years.

6724. And how many years a master?—Seven years.

6725. In what trade have the vessels which you have commanded been chiefly employed?—Chiefly in the west coast and the North American trade.

6726. And therefore sailing vessels?—Sailing vessels.

6727. And you have been in the habit of taking the passage north-about?—I have been twice through that passage.

6728. Do you know Carlingford?—I have never been there, but I know its position.

6729. Knowing the situation of Carlingford, do you think that a harbour of refuge there would be of any use to the Liverpool trade, bound south-east?—I think not.

6730. You have heard the evidence of the previous witness?—I heard his evidence.

6731. State your reasons for differing from him?—Might I be allowed the chart? (*Chart put into the hands of witness.*) Carlingford, I think, is too close to Liverpool for a harbour of refuge. Generally vessels when they start wait until they see promising weather, and I think Carlingford too close to be of any very great deal of utility. I consider a harbour further along the coast would be much more useful.

6732. Then what have you to say to Waterford? Do you think that of any use?—I think it would be of a great deal more service that distance from Liverpool from what Carlingford would be.

6733. (*Sir F. Smith.*) Have you navigated the sea on the east coast of Scotland?—No.

6734. Nor of England?—I have been round, but I have not been in the habit of navigating that coast at all.

6735. Where have you generally traded?—Chiefly to Liverpool from the south coast, and from the Mediterranean. For the first few years I was mate of a steamer, and lately I have traded from various ports to Liverpool.

6736. You generally go to the southward?—Yes, to the southward.

6737. Has it ever happened to you to require a harbour of refuge on the coast of Cornwall?—No, it has never happened to me.

6738. Has it ever happened to you to require one on the coast of Ireland in the course of any of your voyages?—No, it has not.

6739. What size vessel have you generally commanded?—My present vessel, the *Star*, one of 700 tons, is the largest.

6740. She is a sailing vessel?—She is.

6741. Have you ever been by the north coast of Ireland?—I have been twice.

6742. Are there any circumstances of wind or weather which would make you prefer the north passage to the south?—There is one circumstance for which I prefer the south channel. The channel is wider

Mr. Wallis M'Clennan.

18 Sept. 1858.

and the currents are not so strong as in the north channel.

6743. Then if there were a harbour of refuge at the Skerries that would not tempt you to take that line, going to America ?—No, not at all.

6744. You would still keep the southern coast ?—Yes.

6745. You prefer Waterford to Carlingford ?—Yes.

6746. But supposing you were going to Belfast, you would rather have refuge there than go back to Liverpool ?—I should be pleased at such a thing if I were in the Belfast trade.

6747. Looking only to the saving of life, are there any points on the coast of England, Scotland, or Ireland, that you would recommend, either from your own knowledge or from conversing with seafaring men, where you would desire to establish harbours of refuge, looking to the safety of life alone ?—I think a port, to the west of Tuskar, would be of great service.

6748. Have you any knowledge of the Bristol Channel ?—I have a slight knowledge of it.

6749. You have a slight knowledge of it ?—Yes.

6750. Are there any ports there necessary for the saving of life ?—Not that I am acquainted with.

6751. You have never been into Padstow or St. Ives ?—I have passed close beside Padstow. It has a bad entrance, and is considered a bad harbour for strangers.

6752. Do you think it necessary ?—No vessels can run up and get shelter off Lundy.

6753. Have you ever commanded ships the owner of which has required you to keep the sea, and keep out of harbour, irrespective of life ?—Never.

6754. (*Capt. Sulivan.*) Do you know Port Rush ?—I know the locality of it, but I have never been there.

6755. Look at that chart. You see where the proposed breakwater is marked. You see that the rocks protect ships from the west and north and north-west. Supposing it were blowing a gale from the north-east, do you think that the captain of a deep-laden ship would run for and attempt to bring up in that place ?—I think not. I would not do it myself.

6756. You see that to leeward of that point, with a north-east wind, is Lough Foyle, and the Skerries are a little to the east of it, very close to it. With a north-east wind, judging of the Skerries by the sea you saw there, if you had to run in a disabled ship in a heavy sea, which would you run for, up Lough Foyle, or try to bring up in the open space between the Skerries ? Having seen the chart of the Skerries proposed harbour, would you with a north-east wind run for Lough Foyle, or bring up in the open space under the rocks ?—I would run up Lough Foyle.

Mr. JOHN GARSON examined.

Mr. John Garson.

6757. (*Chairman.*) You wish to make some statement relative to the Skerries ?—A great deal of interest has been taken in this inquiry in Dublin, Dundalk, and Drogheda, as far as Clogher Head. I do not speak for Dundalk, because I am more for Carlingford ; but persons in Dublin, and on the coast immediately adjacent, think a harbour very important at the Skerries. Having regard to the wreck chart, and the number of casualties which have occurred there every winter during easterly gales ; looking to the large coasting trade to Cumberland and across ; remembering that Drogheda, having a large coasting trade, is in easterly gales an unsafe port, owing to the bar ; and also having regard to the loss of life among foreign-going ships from Liverpool, many of which I could name—the *Chatham*,—a large loss of life by her and many others, there is a strong desire that a harbour should be made at the Skerries, but not to compete with a great harbour north of Clogher Head. It is very desirable to have a harbour there ; and I may add, that every facility will be given for the formation of a harbour by Mr. J. H. Hamilton, one of the members for the county ; and I may also state, that a large number of persons connected with the coasting trade are waiting at Dublin, and expecting to give evidence there, if they have an opportunity.

You are to understand that the communication which we have received on the subject of Drogheda has brought the Dublin Skerries under the distinct consideration of the Commissioners ; that on their arrival in London, after their tour of inspection, when they come to deliberate on the sites which shall be selected for harbours of refuge, the Dublin Skerries will be considered ; and that, in the opinion of the Commissioners, they have sufficient evidence on which to base their judgment. But should you on Monday think it necessary to tender any further evidence, they will be happy to receive it, though they think it unnecessary to go to Dublin or Drogheda.

(*Mr. Garson.*) I understand that, whether you are against the Skerries or for it, you think you have had sufficient evidence. In case the parties who are interested with me see fit to send a number of documents properly authenticated, is it too late to send them on without offering them to you publicly ?

(*Chairman.*) If the documentary evidence of which you speak be ready on Monday, your best course will be to tender it in evidence ; but should it not be ready on Monday, we will receive it in London as a memorial, to suit your convenience.

(*Mr. Garson.*) It is in Dublin.

(*Chairman.*) Precisely. We will therefore receive it in London.

Monday, 20th September 1858.

PRESENT :

Admiral HOPE (Chairman.).

Sir FREDERIC SMITH.
Mr. LINDSAY.
Captain SULIVAN.
Mr. EVANS, Secretary.

Mr. WILLIAM DAWSON examined.

Mr. William Dawson.

20 Sept. 1858.

6758. (*Chairman.*) What is your occupation ?—Commercial purely ; I have been in connection with ships all my life.

6759. Will you be kind enough to state shortly the substance of this memorial ?—The substance of that memorial is this—it would take me about ten minutes to read it, but I can, of course, say, that in the year 1851, I was in close communication with Mr. Thomas Vough of London, who took out patents for protecting ships by means of a breakwater. I have a model here, which is in detail, of Plymouth breakwater, and my object is to get this breakwater made in Canada for the English commercial community, and if that can be obtained with great rapidity, I should say let us get through Russia in the Baltic, as I have named in that memorial.

6760. Your memorial will be brought under the consideration of the Commissioners, and if upon consultation any further information respecting it is required, you will be informed. You have stated in

LIVERPOOL.

Mr. William Dawson.

20 Sept. 1858.

the memorial what your address is?—Yes, and the name of my solicitor, who will act for me in any case.

6761. Then we will not detain you any longer. —Do you require the log to which special reference is made in the memorial?

6762. I suppose you wish the log returned?—Yes.

6763. But the memorial we may keep?—Yes, it is the object of that.

Chairman.

Mr. Arthur Hawkins examined.

Mr. Arthur Hawkins.

6764. (*Chairman.*) What is your name?—Arthur Hawkins.

6765. And what is your occupation?—Master mariner.

6766. How long have you been at sea?—About 25 years.

6767. How long a master?—About 17 years.

6768. And as to the vessels which you have commanded, in what trade have they been chiefly employed, and have they been steamers or sailing vessels?—I have always been master of sailing vessels, and have traded principally to North America and the States.

6769. Give us your opinion, if you have any, as to the necessity or advantage of a harbour of refuge on the north coast of Ireland for the Liverpool trade?—I think a harbour of refuge in the north channel very desirable. Ships bound out would go that way, which do not now, and return that way, which they do not now.

6770. Be kind enough to speak louder.—I say a harbour of refuge would be very desirable in the north channel, as many ships would go that way in preference to taking the south channel, and return that way in preference to taking the south channel.

6771. You are acquainted with Lough Foyle, I suppose?—I have been in it.

6772. Are you acquainted with Loughindall, Port Ryan, Campbeltown, and Lamlash?—I have been in the last mentioned, Campbeltown I have not.

6773. Port Ryan?—No.

6774. Whilst all these ports which I have named exist, and are very good harbours of refuge, still you think an additional one on the north coast of Ireland would be advantageous?—I do.

6775. And where would you be disposed to recommend it to be placed?—I think about Port Rush or the Skerries would be a very desirable place.

6776. Are you acquainted with the Skerries?—I have been in the harbour of Port Rush.

6777. What size have the vessels been which you have commanded?—From 500 to 1,000 and 1,100 tons.

6778. Now, for vessels of that description, would it be chiefly with a view to accidents arising from stress of weather that you would wish to have a harbour of refuge?—Certainly; I have spent many unhappy nights in that channel, where there was no harbour of refuge to take, if I had wished to take it.

6779. Have you ever been glad to run back to Belfast Bay, or any of the harbours I have mentioned, through stress of weather?—You might be obliged to run for the south channel, or the Firth of Clyde, or Belfast, supposing you met adverse winds.

6780. But have you ever been obliged to bear up?—I have not.

6781. How many voyages have you made through the north channel?—About fifteen or twenty voyages.

6782. Have you ever been caught in bad weather in the north channel, homeward bound?—Yes, in very bad weather.

6783. And in such a case would a harbour at the Skerries have been of service to you?—I have not the least doubt that it would.

6784. You have not the least doubt that it would. Now, viewing the question of a harbour of refuge at the Skerries, do you think it would be used as a place of call for ships? Do you think it would be so used by the Liverpool trade?—I do not know.

6785. As a place of call for orders?—It might be a very good place, especially for ships bound up the Clyde and the east side of Scotland. It might shorten the passage considerably.

6786. Have you any opinion as to the advantage or necessity of a harbour of refuge down near the Land's End, for the Liverpool trade?—No, I have not.

6787. You cannot speak as to that?—No.

6788. Have you any opinion to offer as to improving the harbours of Carlingford, Wexford, and Waterford, on the east coast of Ireland, so as to make them subsidiary harbours of refuge?—I should say, as to the harbour of Waterford, it would be a very excellent harbour of refuge if the water were deeper, and also the harbour of Carlingford.

6789. And do you think they would be of great use to the shipping working down the south channel in bad weather?—I do.

6790. As to the Isle of Man, what do you say about that?—I cannot say anything at all about the Isle of Man.

6791. Nothing?—I have never been in any part of it.

6792. (*Sir F. Smith.*) Do you think harbours of refuge are at all required for the safety of the mariner?—Undoubtedly I do.

6793. You think them quite necessary for the saving of life?—Many a good ship is lost for want of a harbour of refuge.

6794. Having looked at the whole circle of the island, in what positions has it occurred to you, as an intelligent mariner, that harbours of refuge should be formed, independent of the course which you yourself have taken?—I do not know any other positions which I should recommend, beside those mentioned.

6795. You know nothing of the east coast of England?—No.

6796. Have you ever been to the Baltic?—I have, but I have always taken the course by the islands.

6797. Did you find any difficulty in navigating the Pentland Firth?—Sometimes it is a very dangerous passage; all the year round it is so during gales of wind, but especially in the winter season.

6798. Would you avoid it, if possible?—I very often went outside altogether, by Fair Island passage.

6799. Do you know any parts of the Orkneys?—I have been in Stromness.

6800. What is your opinion of Stromness?—That is a very good harbour.

6801. You are strongly of opinion that a harbour of refuge is desirable at the Skerries?—Yes.

6802. Are there no ports near which would answer the purpose in an emergency?—There is Lough Foyle, but it is not so easy taking, especially in the night time.

6803. In what wind is it difficult to take Lough Foyle?—Winds from the west and west-north-west and south-west.

6804. Is it the heavy sea running which makes it difficult, or is it the line of entrance?—You cannot take it with those winds.

6805. In the winds in which you want refuge, you cannot take Lough Foyle?—Not well, and especially in the night time.

6806. And you would be able, under the same circumstances, to take a harbour of refuge at the Skerries?—I should suppose so.

6807. You have no doubt of it?—I have no doubt of it.

6808. Have you ever put into any of the eastern ports of the coast of Ireland, as you were going to the Baltic?—I have been to Belfast.

6809. What do you think of Belfast?—Belfast Lough is a very excellent harbour.

6810. What do you think of Carlingford?—I have never been in Carlingford.

6811. Nor Dundrum Bay?—No.

6812. Have you ever been to Milford Haven?—No.

6813. You know nothing of the Bristol Channel?—No.

6814. Nor the ports near the Land's End?—No, I have never been to any port there.

6815. What is the largest size vessel which you have ever commanded?—1,100 tons.

6816. Have you ever been nearly wrecked in the course of your voyages?—I have been frequently in danger, but never nearly wrecked.

6817. In what position were you in danger?—Getting on a lee shore.

6818. What place was it, and what voyage?—I was once taken in a gale of wind in the north channel, coming from North America. I had to reduce the ship to a close-reefed main topsail, at the same time my main yard was badly sprung.

6819. You were disabled?—I was, and I was obliged to drift to sea.

6820. If you had not been disabled, should you have run to some port?—Not at all.

6821. Having been in a disabled ship, you think harbours of refuge desirable?—Yes.

6822. Very desirable?—Yes.

6823. Where would you be disposed to place them?—I was at the Skerries at that time.

6824. In fact the Skerries were to leeward of you?—Yes.

6825. You could not have taken Lough Foyle?—No, I think not, for the wind was from the south-west.

6826. Is that the only instance in which you have been in great peril?—The only one I can note at the present time.

6827. During 20 years at sea?—Not so much—17 years.

6828. Well, during 17 years a harbour of refuge would have been of great value to you once only?—I have been in such a position that a harbour of refuge would have been very desirable if there had been one.

6829. Where?—Coming from the Baltic and caught in heavy gales of wind, I have been liable to be drifted down on the Islands off Scotland.

6830. Is there much drift by that north channel?—A great deal, I should say.

6831. Did you ever see a wreck chart by any chance? If you look at that wreck chart (*the chart was handed to the witness,*) and the position in question, you will find very little of wreck or casualty, and almost everywhere else you will find there has been a great deal. Those black marks indicate vessels wrecked, and the crosses vessels in collision; and if you look near the Skerries you will find little indication of damage done there; and the inference to be drawn, is either that there is very little traffic, or that with much traffic very little harm arose. Must not that be so?—I suppose the dangers of the channel cause a great many ships to avoid it.

6832. And you have no doubt, that if a harbour of refuge were made at the Skerries that passage would be more used?—I believe so.

6833. And you believe that its use would be of great advantage to the commerce of this country?—Yes, I believe so.

6834. (*Mr. Lindsay.*) Which are the most dangerous winds in the north channel?—Winds from north-east round to south-east, and even round to south-west.

6835. Then you recommend the construction of a harbour at the Skerries or Port Rush. Say that if a harbour were made there, would you run for it in a north-east gale?—Not in a north-east gale.

6836. Then it would be of no advantage in the most dangerous wind?—If bound out I got a north-west wind round to north-east, of course I would run for that.

6837. From the north-west round to north-east; but would you have a shelter at Port Rush or the Skerries in a north-east gale?—I should suppose so if the harbour were properly constructed. It would be no use unless the harbour was constructed to give shelter for these winds.

6838. You would not take that harbour in a north-east gale, when it blows right into it?—Suppose I could not keep my ship off?

6839. Would you consider there was anything for you but certain destruction if you ran for that harbour in a north-east gale?—I might find shelter there, and not elsewhere.

6840. Would you find any shelter there in a north-east gale? Look at the chart. Look at it carefully, and tell me whether you would find any shelter there in a north-east gale? (*A chart was placed in the hands of the witness.*)—I should say that shelter might be found there.

6841. How can shelter be found there? See here. This is the mainland. This is the Skerries' roadstead. There is the north-east, and a gale from that point would blow right into the bottom of the bay. How can you say, you could find any shelter there?—Would you not rather take that, than go on the rocks?

6842. Would you, as a prudent master, run for that harbour in a north-east gale?—I would, to try to save the ship.

6843. Do you think there would be any chance of saving the ship with a north-east gale blowing right into the bay, and a heavy sea tumbling into it?—I consider it as safe to go into as to run ashore on the rocks.

6844. Would you consider that would be safe anchorage in a north-east gale?—I do not doubt that it would if properly constructed. It would be just the same as Holyhead harbour with a gale of wind from the north.

6845. (*Capt. Sulivan.*) You said that when your ship was damaged you would have gone into port if you could?—Had there been a harbour.

6846. The wind was south-west?—Yes.

6847. Look at that chart, and tell me whether, with a south-west wind, that is not as safe a place now as if any amount of money were expended upon it. Tell me, if you can, in what way would any amount expended add to the security of that harbour in a south-west wind?—As to what amount of money it would take I do not know.

6848. A south-west wind is right off the land, is it not?—Yes.

6849. Then no works to seaward can add to its security?—No.

6850. Then why, if it gives perfect security with a south-west wind, did you not use it?—The harbour of Port Rush?

6851. No, inside the Skerries. I think you have mistaken the whole of the evidence. We are not talking of the inner harbour of Portrush, but of the whole of Skerries Bay. Now, with a south-west wind, is it not just as good a shelter as if all those rocks were built on and made a breakwater?—It would not be safe to run in there at night with a large ship drawing 22 feet of water.

6852. If a breakwater were built all over those rocks would it be any more safe?—I should think so.

6853. With a south-west wind?—If it is a safe harbour it would be safer.

6854. With a south-west wind?—With a south-west wind, I do not know that it would make it any better.

6855. Exactly; but you spoke of a south-west wind. The Skerries could not have been under your lee. It must have been dead to windward?—No, I was off the island.

6856. Look at the chart. Then you must have been dead to leeward, and had to work up to the weather shore?—At the time I was taken in a gale of wind I was out here (*pointing to the spot in the chart*). Here are the Skerries.

LIVERPOOL.

Mr. Arthur Hawkins.

20 Sept. 1858.

Capt. Sulivan.

6857. From the point of Rathlin dead to windward ?—But the wind might have been more to the south.

6858. But that would have brought it more off shore, would it not ?—No.

6859. Would you have a harbour of refuge on the weather shore for a gale of wind off land ?—No ; I do not contend for that, not for winds off shore but for other winds.

6860. Then it does not apply to the case which you were speaking of ?—It might have applied, I might have taken the Skerries.

6861. How, by working to windward ?—Not at all ; I could have run down to it.

6862. How, with a north-east gale ? This island would be the same, whether a breakwater were upon it or not ; why will not ships go in and anchor now ; there would be no more protection if a breakwater were completed ; can you tell me that ?—I do not know.

6863. Do you think any person would run into a bay open to the north-east in a north-east gale, because a breakwater had been built to close the west side of that bay ?—No ; a ship would only run for a harbour of refuge if the master considered it to be a safe harbour.

6864. I ask you to look at the plan and, as a seaman accustomed to see a chart, tell me, does not the rock afford as much protection as if a breakwater were built ?—I do not know.

6865. (*Sir F. Smith.*) How many openings are there now into that bay ?—Into what bay ?

6866. The bay of the Skerries. How many openings are there existing at this moment ?—There are a great many openings among the rocks.

6867. Principal openings for vessels to go in?—Only two that a ship would take.

6868. It has been a question discussed before this Commission as to which of the two openings should be closed, the greater or less ;—which, as a seaman, would you recommend to be closed, and which to be left open ?—I should say the one on the north side.

6869. You would leave that open ?—Yes.

6870. Have you ever been there in a heavy gale of wind and seen the effect from the sea ?—No, I have not.

6871. In proposing that this bay should be made a harbour of refuge, do you contemplate that anything more would be done than to fill up that space between the rocks with a breakwater ?—No.

6872. Do you contemplate anything beyond that ?—I do not contemplate anything as to the fashion of the harbour. I suppose a safe harbour would be formed. I do not know how it would be drawn out.

6873. You give no opinion as to forming a harbour, but you go the length to say that a proper harbour, closed to the principal dangerous winds, is what you desire ?—Yes.

6874. Then I apprehend you would wish that security should be given against north-easterly winds ?—Security against any winds which would be dangerous on the coast.

6875. There must be some opening into the port; where would you leave that opening. Perhaps you have not considered that ?—No, I have not.

Mr. Samuel Robert Graves examined.

Mr. Samuel Robert Graves.

6876. (*Chairman.*) You are chairman of the Shipowners' Association ?—I am.

7877. How long have you been connected with the shipping interest of Liverpool ?—About twelve years.

6878. You are acquainted with the subject of our inquiry ?—I am.

6879. Have you read the Report of the Committee of the House of Commons upon the subject ?—I have.

6880. Will you now state to the Commissioners your opinion generally as to the necessity or advantage of harbours of refuge ?—Do you mean generally or in our own channel ?

6881. I say generally, because, as you have read the Report of the Committee of the House of Commons, I should be glad to have your opinion first, generally, of any of the districts named in the report. —It was quite impossible to read that report without coming to the conclusion that harbours of refuge would greatly tend to the preservation of life, especially on the eastern coast of England.

6882. As respects the preservation of property, what would you be disposed to say ?—I think that property also would be saved to a considerable extent,—that it would tend to the greater security of property.

6883. And are you of opinion that the greater security of property would tend to lower the rate of insurance ?—Undoubtedly.

6884. As respects the advantage of these harbours of refuge as ports of call to shipping, for the purpose of taking orders, have you formed any opinion on that subject ?—They would answer as later ports of call ; but I cannot conceive that they would be used as ports of call for taking orders generally. It is not so much to inward-bound ships that harbours of refuge would be useful as to the outward-bound ships.

6885. Are you personally acquainted with the north-east coast of Scotland, from the Firth of Forth to the Pentland Firth ?—Except so far as travelling on the coast, not sufficiently to speak with authority.

6886. Can you give any opinion as to the best site for a harbour of refuge in that district ?—I should decline to offer an opinion on that subject.

6887. Have you been at Wick ?—No ; not so far north.

6888. As respects the north coast of Ireland, you are aware that in the report of the Committee of the House of Commons, the Skerries roads are named as a site for a harbour of refuge. Should you consider the establishment of a harbour of refuge there decidedly advantageous to the Liverpool trade ?—I think if a harbour of refuge could be formed there at a moderate cost, and easy of access at all times, it would induce many masters, especially those who are engaged in the North American trade, to take the north passage, in the spring of the year more particularly. The distance would be shorter by some 500 or 600 miles.

6889. Then, as respects the improvement of the harbour of Carlingford Bay, Wexford, and Waterford, so as to make them subsidiary harbours of refuge, do you think that would be of decided advantage to the Liverpool trade bound south ?—I would suggest that, in order to give you the best information as regards the precise spots which shipowners deem most advisable for the interests of trade should be made the sites of harbours of refuge, after you have received the evidence by the inquiries which you are now holding, that evidence should be submitted to the association with which I am connected and other leading associations. With that information, and their own experience of their wants, they would be able then to give a much better opinion than I can hope to do. The subject has been very briefly considered. It is a very large question ; and we have no wish to recommend any expenditure which might be useless. I would request that, before you report, we should be favoured with the minutes of evidence taken by you. On those minutes, and with the experience to which I have referred, we might give an opinion which would be of some use to you. At the same time I shall be very glad to answer any question.

(*Chairman.*) I shall not fail to bring your suggestion under the notice of the Commissioners.

6890. (*Sir F. Smith.*) Of course the public journals will give you the evidence almost as complete as our minutes, and no doubt the evidence which will appear in the public journals will be discussed by the various societies to which you allude ?—Quite so.

6891. It will be open to any society to make any suggestion they think proper to the Commissioners.—The object of my remark was, that I consider it would be wrong, without giving the matter more mature consideration than we have yet given it, to prejudge the claim of any particular locality as the best site for a harbour of refuge.

6892. I think you mentioned that you had read the report of the Committee of the House of Commons?—Yes.

6893. I presume you have read some of the evidence?—Yes.

6894. Were you induced to do so by the interest which you take in the subject?—I was.

6895. I suppose you are not the only person of authority who has been induced to read it?—I cannot judge for others. The Blue Book is very voluminous. Blue Books do not usually attract much attention.

6896. That is very true; but a question connected with life, I am sure, in Liverpool, would always be well looked into. A question, also, connected with commerce would, I presume, excite vast interest here. The general subject must have excited attention before it was ever intended to send out a Commission.—It has not up to the present time; but now that it has been brought so prominently before us by your visiting here, will receive more careful consideration.

6897. I am very glad to hear some good will come of it, and perhaps you will be more likely hereafter to give more valuable evidence than at the present moment?—Not evidence as regards the opinion of experienced ship-masters; but if you wish for the opinion of the ship-owners of Liverpool to assist you in your report, it would be necessary to consider more maturely the subject, and to read up the evidence which has been given, and will be given, before we commit ourselves to any particular sites. For my own part, I would rather leave it to the opinion of practical navigators, who have all their lives been up and down the channel.

6898. I presume some are here to-day?—I presume so. Some were examined before the Committee of the House of Commons.

6899. Can you give any idea of the aggregate tonnage which leaves Liverpool?—I have it, but I have not brought it with me. I can furnish it to you.

6900. Is it the habit of the great ship-owners of Liverpool to insure their vessels?—It is.

6901. I presume you are of opinion, indeed you said so, that the cost of insurance would be diminished if harbours of refuge generally were established where they are required?—That would be the tendency.

6902. Do you imagine that the great ship-owners would object to contribute something, in addition to any supply by Government, towards forming them?—I do. I think they would object to the construction of harbours of refuge for the saving of life, if they are to be taxed.

6903. You think that the construction of harbours of refuge for the saving of life a national and not a commercial question?—I think mainly so; both lights and harbours of refuge.

6904. But as far as regards the saving of property and the reduction of premiums of insurance, those are special advantages to the shipowners, are they not?—I take it that the saving of property also is a national question. From the miscellaneous character of all British shipping, including Her Majesty's ships and the packet ships, they are indirectly just as much the property of the nation as the lives of subjects.

6905. No doubt, to a certain degree?—Yes, to a certain degree.

6906. Then you think harbours of refuge quite a national object, and that no passing tolls should be enacted?—None whatever.

6907. Are you aware whether it is the practice of any great shipowners to give directions to their masters to avoid running into port under any circumstances?—I am not aware. I speak for myself. In the experience of 10 years I have known instances of outward-bound ships finding it necessary to seek a harbour of refuge.

6908. Any homeward-bound?—None, except disabled vessels or vessels calling for orders.

6909. And are you aware of any of those disabled ships being wrecked in consequence of the want of a harbour of refuge? Can you supply the Commissioners with any cases which bear strictly and clearly upon the necessity of harbours of refuge?—I think I can give one.

6910. It is not a matter of curious questioning, but to elicit an important fact.—I can name one. That is the case of the American ship, the *Columbus*. She was unable to weather Canabeg lightship, and made for Waterford harbour. When she got in she was afraid to run for want of water. It ended in her going ashore, and a loss of 50,000*l*. If there had been sufficient water in Waterford she would have run up and been saved.

6911. Is that the only case which comes within your memory?—That is one. If I taxed my memory I dare say I could remember others.

A return of such cases would be very desirable.

6912. (*Chairman.*) Are you able to furnish such a return?—I can; but I should not wish it to be supposed that wrecks in the channel arise from the want of harbours of refuge. They do not to any extent. The majority of Liverpool ships are well found and need no harbour of refuge? The master of a well found ship will prefer to keep round channel as long as he can, but a great number of ill found and disabled vessels, from week to week and month to month, would find harbours of refuge decidedly desirable.

6913. (*Sir F. Smith.*) Then you are inclined to ascribe a great proportion of the wrecks marked on the wreck chart to vessels being badly found rather than to the want of harbours of refuge?—Not so much to vessels being badly found as to other causes. I look upon it the primary cause arises from the imperfect knowledge of tides and currents. Imperfect knowledge of tides and currents, neglect of the lead, and a bad look out, are the three chief causes of wrecks.

6914. Do you think that casualties have arisen in any degree from the want of sobriety in the crews leaving ports?—I have not, within my own knowledge, known instances which would warrant me in stating that.

6915. (*Mr. Lindsay.*) Have you had a meeting of the Shipowners' Society before you attended here to give evidence?—I called a meeting of the committee to ascertain their views and general principles.

6916. Then on general principles you speak the views of the association?—I do.

6917. You have read the report of the Committee of the House of Commons, I understood you to say?—Yes.

6918. By that report you see that in the last 5 years there has been an annual loss of life of 830 persons, and an annual loss of property, amounting to about a million and a half. The object which this Commission has in view is to see if they cannot in some way mitigate those fearful losses and reduce the heavy casualties along the coasts. To what extent do you think that harbours of refuge properly placed would tend to reduce the loss of life and property. Have you turned that over in your mind?—That is a very difficult question to answer.

6919. Would it to a large extent?—I think one of the greatest advantages of harbours of refuge would be to mitigate the evils of collisions. I think our losses in our channel arise more from collisions than any other cause, and I think many masters, rather than risk themselves to the perils of collision, would be glad if they had the opportunity of using harbours of refuge, without any expense of going in, until the gale was over, to avoid the possibility of collision.

LIVERPOOL.

Mr. Samuel Robrt Graves.

20 Sept. 1858.

Capt. Sulivan.

6920. You said that, in your opinion, larger loss took place from ignorance on the part of masters, want of attention to the lead, and not keeping a good look out, than to ships being ill-found. Are there not other causes which tend to these great losses, as well as the system of lights and disorganisation of crews; because, as our main object is to see if we cannot reduce this lamentable loss of life and the great loss of property, can you suggest anything to be done in that respect besides harbours of refuge? Have you anything to say as to lights?—I have always felt that when possible a fair-way light, 30 or 40 miles off land, is a most valuable light. I say, if it were practicable.

6921. You think it best to light the fair way instead of the dangers?—If we had to begin *de novo* I would advocate that. I should not advocate any change at present, but I think a more uniform system of buoying harbours would be advantageous, greater uniformity of coast and harbour lights would be an advantage. I am afraid that this new system which has been laid down by the Admiralty to come into operation in October will materially tend to increase loss of life in the channel, unless some efforts are made to induce all nations to adopt the same. At present there is one system in the Baltic which is quite opposite to ours; other marine nations, the Americans, for example, have a system of their own, and all meeting in the channel, I am afraid it will lead to very great confusion.

6922. With regard to the expenditure of money on harbours of refuge, is it your opinion that good would arise if part of the money were spent in buoying and lighting the natural harbours, making them easier of access than they now are?—I think it would be exceedingly useful.

6923. There are many harbours not lighted or buoyed now, consequently ships in distress are afraid to run for them?—What you suggest would be very valuable, more especially for the smaller craft frequenting our channel.

6924. Do you think they are more required for smaller craft than for larger vessels?—I think they are. With the exception of disabled ships, it is the smaller craft which do require them, and when a ship is disabled she is glad to take them.

6925. You are Chairman of the Local Marine Board. I should like to know whether the working of that Act has had any bearing on the safety of life and property. Has it tended to improve the condition of masters and mates?—I think it has to a great extent.

6926. Do you think the shipping offices have been of much benefit to seamen. Have they raised their character?—I think seamen have partaken of the improvement of all classes—that they are a more sober and more temperate class than they were formerly. I cannot say that I attribute it altogether to shipping offices. The shipping offices have to a great extent put down crimping. In this town it has been put down, but I am afraid they are not as skilful navigators as they were when the apprenticeship system was in operation.

6927. Is it not the case that a large amount of life and property is lost owing to the disgraceful state of the crew immediately after they proceed to sea?—I do not know that it arises so much from the disorderly state of the crew. The system is for the crew to go on board ship at the pier head, everything is new to them, and no doubt in the first 24 hours they are not so well up to the working of the ship as in 48 hours.

6928. Can you suggest any improvement in that respect? Has it struck you that any improvement can be made?—I think the doing away advances would be the most effectual means of stopping it.

6929. That is one means—is there any other?—I think the greater encouragement of sailors' homes would tend to moralise the men.

6930. After seamen are shipped at the offices do you experience much difficulty in getting them on board their ships?—We did experience that difficulty' but owing to the present arrangement—a large staff with an effective head—we do not experience the same difficulty we did some years ago.

6931. Then it is the duty of your officers to see the crew on board their ship after they are engaged?—It is.

6932. Was not that their duty previously?—It was their duty previously, but we had not the amount of staff necessary to do it.

6933. You had not sufficient to carry it out?—We had not sufficient to carry it out.

6934. In a word, is it the opinion of the Shipowners' Association of Liverpool that harbours of refuge are necessary or are desirable. Is it the opinion of the Shipowners' Association of Liverpool that harbours of refuge are necessary, or simply that they would be desirable?—The opinion of the Committee of the Association is that harbours of refuge would be desirable—speaking of our own locality.

6935. Speaking also of your own locality, the feeling is that harbours of refuge are not so desirable to them as shipowners to lead them to say that rather than be without them they would pay a passing toll for their maintenance. Do you understand that? Do they consider that harbours of refuge are desirable, but not to the extent that would lead them to agree to a passing toll for their construction and maintenance?—We are already suffering under what we consider too severe taxation, more than our neighbours, who are competing with us, and we steadily oppose anything in the shape of a passing toll, however desirous we might be of aiding in the construction of such harbours as would save property.

6936. Then, in substance, you think that if harbours of refuge are to be made, it is a national object, for the national good, for the benefit of the nation at large, and therefore they ought to be constructed and maintained solely at the cost of the nation. That is the opinion of the Shipowners' Association?—Quite so; and I do not think it admits of any other point of view at the present day than that.

6937. (*Capt. Sulivan.*) In the case of the English colliery coast the dangers of wreck are far greater at present than is necessary, according to the average loss, are they not?—They are.

6938. Supposing the premiums of insurance on the English colliery coast to be 10 per cent. annually, if half those wrecks were saved by harbours of refuge the premiums would be reduced one half in the course of time, would they not?—They would.

6939. And a number of lives would be saved in addition to the property saved, would they not?—Of course there would.

6940. And the shipowners as a body suffer some loss more than the insurance—they are not always fully insured?—They are not always fully insured.

6941. Then what objection would they make to pay half the premium which they pay to the underwriters to harbours of refuge if they save them from loss and save life as well, instead of merely receiving a certain per centage when loss has occurred?—If the shipowner received the difference of insurance which would accrue from harbours of refuge there is no reason why the ships in that particular locality should not be taxed; but it might so happen, and I am afraid it would happen, that competition would give the public the advantage of the reduction, and not the shipowner. therefore I would urge that it is more a national than a shipowners' question.

6942. Then why does competition not act in the same way at present. If you consider the dues to harbours of refuge as a case of premium, it is the same with premiums of insurance. Is it not exactly a similar case to insurance, with one exception, that one repays you after loss, the other prevents loss?—I do not quite see the point of view in which you wish me to see it.

6943. If harbours of refuge reduced premiums one half, and if half the present premiums of insurance were paid to harbours of refuge, would not that be

paying for the safety of property, with this difference, that you would save life and property instead of being repaid only for the loss of property?—I should look at that as paying to the Government with one hand and receiving it with the other—merely giving to the Government what would otherwise accrue to the public.

6944. But if you save paying to the underwriters or to a club in which your vessel is insured, and secure the safety of your vessel and crew by paying to harbours of refuge, is it not precisely the same thing?—You are supposing that a vessel is always trading between two ports?

6945. I am. I told you the east coast of England. I told you a collier running regularly between Newcastle and London, and supposing a harbour of refuge available at all times of tide, and all weathers, where the dangerous part of the coast is, and where wrecks now occur, prevented half those wrecks, whether it would not be better for the shipowner to pay a proportion of what he now pays for insurance to harbours of refuge, which would save life as well as property?—That would not be a passing toll then.

6946. Oh yes. I am speaking as if half the amount of premiums of insurance were paid in the shape of a passing toll at every voyage?—But, as a Liverpool shipowner, I should derive no advantage from the harbour you are now alluding to.

6947. I am alluding only to vessels which pass that harbour in their voyage, a harbour with depth of water sufficient to make it available at all times of tide?—Vessels running on that coast are liable to another competition, and that is the railroad, which renders it important that the ship should carry her cargo at the lowest possible price, and I cannot but think that if the premiums of insurance were reduced one half, the whole saving would go into the hands of the public, not into the hands of the shipowner, and I think the shipowner would rather pay it in the shape of reduction of freights than as a tax upon his vessel.

6948. But if on the average half the losses were saved, then does it make any difference whether the shipowner pays to the insurance club or to the harbour, if one is equally effective as the other in preventing loss; is it not another means of insurance?—I cannot see it in the light in which you wish to put it; one is a prospective good, the other is a positive good.

6949. Upon what principle would you rather pay five per cent. to insure for half the danger now existing, than pay five per cent. to harbours of refuge, which would save the whole loss, both of life and property?—There is something so obnoxious in the shape of a passing toll, that I should prefer to pay the underwriters rather than allow my ships to be taxed. In the present day we are open to competition, our neighbours are free from taxation, while we are suffering many burdens; but upon the broad principle, that everything should be free in the shape of shipping, I object to a passing toll.

6950. Then why do you insure your vessel?—I should be a very imprudent man if I were not to insure.

6951. Supposing the whole of the vessels now lost were saved by harbours of refuge, if you got the same safety for your vessels by paying towards them, and paying the same amount as you now do for insurance, you would not be the loser, would you?—If your premises were right I should agree with you, but, with every respect, they are quite wrong. You are now putting to me as a Liverpool shipowner the question of saving a ship in our channel, and upon a voyage of 12,000 miles you are only taking the risk of getting out of the haven; I think it is quite irrelevant to speak of avoiding one insurance by having a harbour of refuge or two in the channel.

6952. You were asked the question with respect to passing tolls generally, and the principle which applies almost directly to the east coast of England. I distinctly began by putting the question of an English collier ship passing in her voyages to and from harbours of refuge, and the question had no bearing at all on a case of a Liverpool ship, therefore the questions directly following you did not understand?—Oh yes, I quite understood.

6953. I think that if harbours of refuge at the same cost as premiums of insurance save property and save life in addition, the shipowner is better off than if he loses a ship and the money is recovered by him from the underwriters?—I stated early in my evidence that harbours of refuge tended to some extent to the preservation of life—to some extent I say, and not to the same extent to the preservation of property.

6954. And the premiums of insurance are only affected in the ratio of the saving of property?—The premiums of insurance are regulated by the reduction of the risk on the voyage which the underwriters may suppose harbours of refuge have afforded.

6955. But in saving that per-centage of property, you would also be saving life. That you allow. Then why would the merchant object to pay the same amount for the safety of his vessels with the addition of the saving of life that he would pay for insurance to recover only the money after his vessel was lost. That may be a point clear to mercantile men, but I cannot understand it?—Perhaps the best answer, rather than to argue, is to say that our premises are not at all the same. We look at passing tolls as so obnoxious in principle that we should very much prefer not having harbours of refuge if they are to be at the expense of the shipping interest of the country.

6956. Was it not the case that most of the harbours for which passing tolls were paid, had not depth of water enough for large ships?—That made the impost more objectionable.

6957. Do you not think that the objection to passing tolls would have been very much weakened if all the harbours had water available for large ships, at all times of tide?—I do not think it would.

6958. You were speaking of losses caused by neglecting the use of the lead?—Yes.

6959. Therefore, if there were greater facilities for using the lead in merchant ships it would tend to the saving of property?—I think it would.

6960. Are you aware that there has been for many years a simple contrivance, by which casts of the lead in short depths can be taken without the vessel heaving to?—I am.

6961. Are you aware whether merchants generally supply their ships with that apparatus?—You are not now speaking of the revolving lead.

6962. Oh no, the common lead for using without bringing to?—I think the better class do, but I should say the majority of ships are without them.

6963. Do you not think it would be much fairer to the masters, who suffer for the want of it, if owners of ships were to supply it, the cost of such a lead being only 1*l.* or 2*l.*?—I think any shipowner who was asked by his master to give him one of those leads would do it at once.

6964. What proportion of the ships with which you are acquainted have anything besides the deep sea lead and line?—I do not know the particular instruments which each master has, but we generally judge by the intelligence of the men that they have all they require.

6965. Is each master obliged to buy his instruments himself?—Sometimes he is, but sometimes he is not.

6966. Do you know any instance of a master being supplied with the simplest mode of sounding without heaving the ship to?—Yes, I do.

6967. But not generally?—A very large proportion of the vessels coming here are foreign shipping, at least a half; but of the vessels sailing out of Liverpool, most of them are supplied with all the modern appliances for ascertaining the depth of water, temperature, &c.

6968. Then has it never struck you as extraordinary, that in all the cases of loss into which the Board

LIVERPOOL.

Mr. Samuel Robert Graves.

20 Sept. 1858.

Capt. Sulivan.

of Trade have inquired from a Peninsular and Oriental steam ship down to the smallest coaster, there was never one in which such means of sounding were provided ?—I am very much surprised to hear it.

6969. It has never struck you in looking to these inquiries ?—No, it has not.

6970. You spoke as to bringing on a more uniform system ?—I have observed going in and out of harbours each has its own system as regards colour. One is red and white, another red and black—some green. Now I think if buoys were uniformly one colour on the starboard and another colour on the port side, it would be useful in entering harbours. I think the Scotch system differs from the Irish.

6971. I think the Scotch system is similar to the Liverpool—black and red ?—Yes, black and red.

6972. Have you ever heard any objections made to having two dark colours ?—I do not wish to advocate black and red.

6973. I merely mentioned it, because it has been objected that when two such dark colours are selected they are very likely to be mistaken. Now, speaking of seamen being crimped, if you were told that the system was still in existence, that the English seamen were very much in the hands of the crimps, and that there was a difficulty to break through it, do you think that would be incorrect ?—From information which I receive from week to week, as to the working of the system of shipping offices, I find that the deserters are reduced to almost a nominal number, that is, of seamen once boarding ships and not leaving with the vessels, I think it is checked a great deal with regard to British vessels. Of course, seamen are not followed when paid off, and we do not know into whose hands they get ; but I speak more particularly of the shipping of seamen.

6974. (*Sir F. Smith.*) Is it left to the master of a vessel to decide whether to take the north or south passage, or does the owner prescribe the course to America ?—Generally, I should say, it is left to the discretion of the master.

6975. Have you any reason to suppose that the north passage would be more frequently taken if there were a harbour of refuge on the north coast of Ireland ?—No, except that I fancy the knowledge that there was a harbour in the narrow waters between the two channels, that a vessel could go easily into and out of, would give greater confidence to the master, instead of knowing, as he does now, that if he meets with wind from the north or west, he must put back or go into Belfast Lough.

6976. Has it ever come under discussion among you, whether a harbour of refuge is necessary at the Land's End ?—No.

6977. Nor in the Bristol Channel ?—Nor in the Bristol Channel.

6978. (*Mr. Lindsay.*) I think I understood you to say that the primary object of harbours of refuge was the saving of life ?—Yes, the saving of life.

6979. Then you mean not merely the lives of the crews in ships, but the lives of all passengers going foreign or going along the coast, which now amount to a very great number annually. I presume you include every one going on the sea ?—Of course.

6980. Would you not consider it unjust in the extreme to tax one class of the community to save the lives of the whole ? Would it not be fair, if the whole are interested, as almost the whole are, occasionally obliged to go from port to port, if not to foreign stations ; would it not be just that they should pay as well as the shipowners ?—Certainly ; I am quite of opinion it would be most unjust to tax one class only.

6981. You think that for constructions in which all are interested all should contribute ?—In point of fact the interest which the shipowner has in the question is so small that too much reliance should not be placed on it. The public generally are more interested in this question than the shipowner.

6982. You consider the primary object the saving of life ?—Just so.

6983. As to the saving of insurance, if harbours of refuge led to a reduction of premiums to some extent is not the competition between the English and foreign shipowners so very great that the public would also gain in that respect ? Would not the consequence be, that if premiums of insurance were reduced, freights would also be reduced, and the public would consequently gain the full amount of reduction ?—I endeavoured to state so in my answers to Captain Sulivan.

6984. I want it more clearly.—I am quite sure the shipowner will not gain in the slightest degree. The competition is such, that if the shipowner saved 5 per cent., it would go directly into the hands of the public in the shape of reduction of freight.

6985. Do not various nations light their own shores ? Does not America ?—America does.

6986. Does France ?—France does.

6987. Do you not think it the duty of highly civilized nations to light their own shores and warn strangers of danger ?—The same principle which applies to harbours of refuge applies to lights. If they are for the public good and used by every class, they should be paid for by the community.

6988. You would also include the benefit of foreigners frequenting our shores ?—Yes, it is a great benefit.

6989. A great benefit to the world at large and to all having connection with England ?—That I say as my own opinion, not as the opinion of the association.

6990. (*Chairman.*) You are probably aware that the chief defence of the country, as respects the navy, must be drawn from its maritime population ?—I am.

6991. And that that maritime population bears a very small proportion to the population from which the army is recruited ?—Quite so.

6992. Therefore, it necessarily follows that the proportion of men drawn from the maritime population for the defence of the country must be very much larger than that drawn for the army ?—Pro rata.

6993. Pro rata ?—Quite so.

6994. And therefore that this burden of personal service, whether voluntary or to a certain extent compulsory, falls far more severely on the seafaring population than on the remainder of the population of the country ?—It does.

6995. Do you consider that forms a claim upon the country for something in the shape of protection to their lives and property, which should be granted to them, and to those connected with them, free of all expense whatever ?—Looking at it in a national point of view, I think it does give them a claim for greater protection.

6996. And therefore that is a substantial reason why no passing tolls should be collected from them ? —It might make one reason, but I should not base my conclusions altogether on that. We have been looking more to the direct question, and not so much to the point of view in which you have now put it.

6997. You are probably aware that Wick is a great rendezvous for fishermen on the north coast of Scotland ?—Yes.

6998. Should you consider that these fishermen, amounting to 6,000 or 7,000, who for a period of twelve weeks annually go out to the fishing grounds every night, have also some claim on the country for protection to their lives and property upon the same ground as that which I have just stated ?—I should almost have said more so.

6999. And do you consider that the mercantile and commercial men of this port, which is the second port of the kingdom, would object to see a considerable expenditure in the north of Scotland for that especial purpose ?—I should hardly like to commit the great error of a great expenditure at one place, with the harbours which we have seen constructed, and which are of little value. I think we should rather encourage a moderate expenditure generally diffused than any large work for particular localities.

7000. (*Capt. Sulivan.*) I wish to ask one question with respect to America. You say that America does not charge for lights. Have you any harbour tolls in America which makes up for the tax paid for lights in this country?—I do not think there is any charge of the same nature. They have local harbour charges, but no general tax for the support of lights.

7001. For instance, take a sailing ship of 1,000 tons, what taxation has she to pay in New York?—I shall be very glad to furnish you with that.

7002. I wish it particularly.—I shall be very happy to furnish you with the expenses of ships in foreign ports.

7003. The same with regard to France. Do you know any port in France where a vessel does not pay very heavy dues, much more than the charge at Liverpool? I am unable to answer the question, but I shall be very glad to furnish the Commissioners with information on these or on any other points on which they may desire information.

Mr. Charles Langton examined.

Mr. Charles Langton.

7004. (*Chairman.*) What is your occupation?—I am an insurance broker.

7005. How long have you been connected with the port of Liverpool?—Between ten and eleven years.

7006. Have you turned your attention at all to this question of harbours of refuge?—We have had the question before our association incidentally on the occasion of an application for the support of the association from Wick. It was either Wick or Aberdeen, I forget which. They requested our co-operation, but we took no steps beyond giving publicity to the memorial which they wished to be signed.

7007. Can you afford to the Commissioners any opinion as to how the question is viewed by the underwriters of Liverpool?—Generally, I think they consider it would be very advantageous to the protection of their interests, and likewise for the protection of life and property. Naturally, what protects life and property would be a protection to the interests of an underwriter.

7008. And do you think that the establishment of a harbour of refuge, say on the north coast of Ireland, would have any marked effect on the rate of insurance in Liverpool?—Perhaps not immediately; it would be very difficult to say what effect harbours of refuge would have on premiums of insurance. They are already very low, and I do not think, in the way business is carried on, harbours of refuge would have the effect in the same measure as is thought by many.

7009. Have you underwritten ships returning from the Baltic late in the year?—Yes.

7010. Now how do you think a harbour of refuge in the neighbourhood of Wick would affect the Baltic trade homeward bound to Liverpool?—You will hardly expect me to say whether Wick or Aberdeen is the better port. We are not very competent to deal with a subject of that kind; therefore the general feeling which we have is that we consider it would be advantageous, and we observe it is very necessary in the fall of the year that there should be some safe place there for homeward bound ships from the Baltic.

7011. (*Sir F. Smith.*) Have you by any chance examined the Admiralty wreck chart from 1852 to 1856 inclusive?—I cannot say that I have examined it closely.

7012. Will you just cast your eye over it? You will perceive that the chart shows for five years the losses from various causes, and the collisions which have happened on the coast; having looked at that chart, and having been connected with the business of an underwriter at Liverpool for ten years, I think you say?—Yes.

7013. Have you, of your own knowledge, any information to offer as respects any wrecks which have happened during that period on the coast of England?—I have naturally, in the course of my business, become acquainted with vessels wrecked in which I have been a sufferer myself. By this chart I clearly observe that a large proportion of wrecks occur on the east coast. That arises, I suppose, principally from the nature of the trade.

7014. There is a total want of a harbour of refuge?—I believe so.

7015. Have you insured for that coast?—No, chiefly here.

7016. You have confined your business chiefly to the trade from Liverpool?—We do not confine our business to any particular place, but the trade from this port is that which comes particularly under our notice.

7017. Should you make any difference in insurance to vessels going north about or south about from Liverpool to America?—No.

7018. None whatever?—No.

7019. Should you consider it desirable to have a harbour of refuge on the north coast of Ireland, say at the Skerries?—I cannot state whether the Skerries or any other place would be most desirable. I have heard Mr. Graves' evidence, which I think, in the main, agrees with the common impression, and certainly as far as his evidence as regards ships leaving this port.

7020. Do you, as an underwriter, consider that a great proportion of the losses arises from the state in which crews are embarked and leave port?—We have suffered from that cause, and I think it was one of the causes to which they ascribe the loss of the *Tayleur*. She left at once, but now all the passenger ships remain, I believe, in the river a day or two rather as a safeguard.

7021. The Commissioners heard in another part of their inquiry, and at another port, that masters of ships were desired by the owners to make the voyage and avoid all ports. Would that circumstance, if it came to your knowledge, induce you to put a higher premium on the ship if you insured?—No, I do not think so. It would never probably reach the ears of an underwriter, and all prudent underwriters consider the owners of the vessels and the masters in them. It is a common saying "you very often vouch the master instead of the ship."

7022. You say that you have had several losses in ten years?—Yes.

7023. Where they on the coast of England, Ireland, and Scotland?—On all.

7024. On our own coast?—Off one port on the coast of Ireland mainly; a great number in the St. George's channel.

7025. What part?—The Blackwater bank has been very fatal to us here, in losses of both life and property; and I may mention that in the year 1855, a sub-committee was appointed of our association, for the purpose of considering the lights in the channel, more especially in reference to lights on the Blackwater bank and Sand Badrig.

7026. Supposing it were left to a committee of underwriters, and you as chairman of that committee, to select points on the west of Ireland for harbours of refuge, where the greatest amount of property and life might be saved, what point should you indicate as being most desirable to form such a harbour?—I think I may state just as a general impression that the Blackwater and Arklow banks have been those most dangerous to vessels leaving this port; and to vessels coming in, perhaps Cardigan and Caernarvon bays.

7027. There have been many wrecks in Caernarvon Bay?—The wrecks have mostly taken place, I think, close in under the Stack, in thick weather very often.

7028. Do you hold the opinion that the Consolidated Fund should be the only fund from which money should be drawn for the construction of these harbours of refuge?—Perhaps that is a question not

LIVERPOOL.

Mr. Charles Langton.

20 Sept. 1858.

Sir F. Smith.

for me to discuss. I would rather not enter into that subject if it is agreeable to you.

7029. You have no expectation that harbours of refuge would reduce premiums?—I am not sure that they would much influence premiums of insurance.

7030. Not essentially?—No, because premiums are so low; it would be a long time before there would be any effect produced.

7031. May I ask whether the great majority of losses are on our own coast or foreign coasts, or on the intermediate passage?—I cannot answer that question.

7032. Can you get the information?—I might up to a certain extent, but I am not sure that you could not get it from your own records already complete, from which the wreck chart is framed.

7033. (*Mr. Lindsay.*) Are you a shipowner also?—I am partly, but I have no management of ships.

7034. Only an owner to a small extent?—Only to a small extent.

7035. You are therefore the more likely to give an impartial opinion. Now tell me whether the tax for harbours of refuge ought to be borne by the Consolidated Fund or by the shipowners?—I do not think my opinion will carry very much weight, and I feel I am not very competent to give an opinion.

7036. I think, Mr. Langton, it would carry weight, and therefore I ask the question.—On the whole, I am inclined to think it should be a national undertaking, and that the public indirectly would get the benefit of it.

7037. Reference was made to the Pentland Firth. I want your opinion on one point, because it is a question upon which there is considerable difference in the evidence. Do you charge extra premiums of insurance on ships going through the Pentland Firth?—No.

7038. Do you insure many ships going to the Baltic?—At one time there was a great trade from here, but now it goes chiefly to the eastward. There is less insurance from the east coast, and a saving of time in the voyage.

7039. You have had severe losses by ships getting on the Blackwater bank; do you know what was the state of the weather?—Very often in fine weather.

7040. Clear weather?—Yes, clear weather.

7041. Was it in making the land?—No, outward-bound vessels.

7042. Is it the state of the current? Can you account for it all?—From information, I fancy it is the state of the current, and perhaps some other causes—insufficient care on the part of shipmasters, neglect of the lead, and other things.

7043. Do you think a harbour of refuge would tend in any way to prevent such losses as those to which you have been referring?—For outward bound vessels, it is rather a point of seamanship—rather a point for sailors—but I do not know any great advantage from a harbour of refuge in that immediate locality.

7044. What is your opinion of the lighting of St. George's Channel; do you think the north channel sufficiently lighted?—In 1855 we entered into this subject—our committee did—upon the application for support from gentlemen who wished a light to be placed on Sand Badrig. It was brought before Parliament, and memorials were sent to have a light. The representations were so strong, that we went into that at the time, and took the evidence of many seafaring men at this port, and of Lieutenant Lord, and of Captain Rarey, who is connected with the Cunard boats, and the evidence of the whole of those gentlemen tended to show that no alteration was desirable up channel. We considered the question of a fair-way light. Mr. Herbert was down at the time, and it was made the subject of a memorial to the Board of Trade, who laid it before the Trinity Board, and I hold in my hand the answer from the Board of Trade, who thought it undesirable and rather impracticable.

7045. You have no objection to the lighting, then?—No, we tried to get a light on the Blackwater Bank, which has since been put up. We memorialised the Ballast Board of Dublin; and there is one point which strikes me, and perhaps, as I shall have no other opportunity, you will allow me to state, that we think another light in Cardigan Bay, somewhere out between the Bishops and Bardsey, would be desirable. It is a distance of about sixty miles, and those whom we have consulted deem that rather an extreme distance, more particularly as Sciborben Point stretches out, and we have had losses off there, and there is no very good guide to St. Tudwall's roads, which is a capital harbour of refuge itself.

7046. Did these wrecks to which you refer take place before the light was put on the Moneyweights?—Speaking from recollection, mainly, I think, before the light was put there.

7047. Is the north channel, in your opinion, sufficiently lighted?—I think it was the opinion of the committee that it was; in fact, that the lights up channel were very good indeed; in fact, the impression was that a multiplicity of lights is rather a disadvantage than an advantage.

7048. You said to Sir F. Smith that in insurance you make no difference whether a vessel take the north or south channel, and that you allow them to take any channel?—Yes.

7049. Then there is no extra risk in taking the north channel?—None whatever.

7050. Because it has been stated in evidence that if there were a harbour of refuge, a great many ships would take the north channel which do not take it now. You say that there is no prohibition, no restriction on them at any season or at any time?—None whatever.

7051. (*Capt. Sulivan.*) You say you make no difference in premiums on ships going through the north channel?—None.

7052. Have you any clause in your policies that if the ship goes through the Caledonian Canal the premiums shall be reduced?—On all late vessels coming from the Baltic there is a small return; but there is only a proportion of vessels which can come through the Caledonian Canal.

7053. But when vessels can come through there is a reduction, because they escape the dangers of the north passage?—It is a very common thing to make a return.

7054. Have you ever heard of a reduction of the premium of insurance on a ship which more than equalled the dues which she pays to go through the canal?—That I should say was really very possible and very common.

7055. Then, escaping the passage through Pentland Firth is considered to lessen the risk of loss?—No doubt.

7056. Speaking of the losses on the Blackwater bank, are you aware that losses generally occur on those shoals in thick weather from neglect of the lead; is that the result of your experience?—I should be disposed to say that it was.

7057. Are you aware that this danger can be guarded against, by a single cast of the lead?—No doubt.

7058. Do you ever make it a condition that the ship shall be provided with means of sounding?—One general safeguard lies in the respectability of the owners, and the parties with whom we deal. We cannot in the course of business make that stipulation.

7059. Have you ever heard it remarked that underwriters are not interested in reducing wrecks as others are, because if ships were perfectly safe underwriting would soon cease altogether?—No.

7060. But premiums of insurance come down with a reduction of losses?—The opinion of a great number of underwriters is very unfavourable to the present rates of premium.

7061. But I believe they are calculated on the average of losses?—I do not think there are any very accurate calculations for insurance.

Mr. Charles Langton.

20 Sept. 1858.

7062. What was the suggestion as to Cardigan Bay?—It was suggested that there should be a flash light on Sand Badrig ; it is called the Causeway.

7063. But in Cardigan Bay, near the port of Cardigan, have you ever heard any suggestion of a light? —No, never.

7064. Is Cardigan Bay generally avoided by merchant ships?—If there were a light they would make more boldly for the Welch coast, to avoid the tide.

7065. I think it has been stated that the set of the tide carries ships into Cardigan Bay ?—I believe so.

7066. Do you know any case in which parties interested in the Liverpool trade have applied for a light to the Trinity House or the Board of Trade?—No, I cannot say that I do.

7067. Do you know any reason why if they wish a light they do not make application to have it considered?—I cannot say. The only persons who have considered it are the committee of our association.

7068. Will you suggest to them to consider the subject again, and if they think it desirable to make an application ; I mean with regard to a light between the Bishops and Bardsey lights ?—Yes, I will bring it before them.

7069. You said that wrecks had taken place chiefly on the Blackwater bank before the light had been put there. The light has not been there sufficiently long to ascertain whether it has had any effect?—I do not recollect any late wrecks on the Blackwater bank. There was one the other day on the Arklow banks.

7070. Is it not frequently the case there that ships get on shore when the weather is not clear enough to see the light?—Yes.

7071. Is that light very little protection against a ship going on shore if she neglects the lead ?—I do not understand.

7072. In thick weather, the light cannot be relied on for carrying vessels off the bank if they neglect the lead?—No, certainly not.

7073. (*Mr. Lindsay.*) You said that you charge less premium of insurance on vessels going through the Caledonian Canal than upon the vessels going north-about?—Yes.

7074. Does that arise from the distance being shorter and the dangers less than those to which ships are exposed in the North Sea ?—It arises from the dangers being less.

7075. But would you make any difference in the premium of insurance on a vessel making her passage to the north of the Orkneys to what you would if she were going through Pentland Firth?—No ; we do not go so much into the minutiæ of distance as that.

7076. (*Chairman.*) I think you have a wreck chart there?—Yes.

7077. Does that wreck chart which your hold in your hand show total casualties 5,128 ?—Yes.

7078. Now, from your experience as an underwriter, what proportion of these casualties are you disposed to say would have been met by harbours of refuge; because out of the accidents which occur at sea, whether wrecks or otherwise, great numbers we know arise from neglect, carelessness, drunkenness, and other causes of that description which harbours of refuge would not meet at all?—To take them in their order, I should say that with regard to stranding, harbours of refuge would have been of very great use, as I perceive this number of vessels stranded is made up in a great part of vessels employed in the colliery trade on the east coast ; therefore, I conceive a harbour of refuge would be of great service to them, and diminish the losses. With regard to collisions, I am of opinion that harbours of refuge would not be of any very great service except in very thick weather, when captains would go into harbour rather than risk collision by keeping out supposing they had it handy. The same remark may apply to serious damage. On the whole it appears to me that harbours of refuge would be of very considerable advantage to vessels, more particularly in the case of stranding and partial damage.

7079. From your experience as an underwriter, even in the case of stranded vessels, do you not find accidents frequently occur from other causes not preventible by harbours of refuge ?—No doubt.

7080. Can you, for a period of one, two, or three years, furnish the Commissioners with any return which will show the proportion of casualties preventible by harbours of refuge, and cases clearly not so ?—I am afraid that would be a very difficult and a very laborious task for anyone to attempt. When I go back I will consult our books and secretary, and see if we can furnish any information of that kind, and if so, it will be at your service.

7081. Say, for a period of one year only ?—I will see.

7082. (*Mr. Lindsay.*) Having had great experience as an underwriter, have you had many losses off the Isle of Man?—I remember some few, but they are not very many.

7083. Have you formed any idea in your own mind as to the necessity of a harbour of refuge at the Isle of Man?—I cannot say that I have. My impression would be, that it is hardly needed there.

Mr. Alexander Coghill examined.

Mr. Alexander Coghill.

7084. (*Chairman.*) What is your occupation?—Shipagent and shipowner.

7085. How long have you been connected with the port of Liverpool in that capacity ?—I have been 20 years in business on my own account, 25 years altogether.

7086. And the shipping which you have owned, in what direction have they traded?—To the north-east of Scotland and to the Baltic.

7087. Have you any opinion to offer as to the advantage or necessity of a harbour of refuge on the north-east of Scotland or in the Pentland Firth ?—I came to speak especially of Wick, as I believe there is no part of Great Britain where a harbour of refuge is more requisite than at Wick, or on that coast at all events.

7088. Will you state your reason for that opinion ? —My reason, in the first place, is on account of the very great local trade, particularly in the fishing season, and likewise the passing trade. I have no doubt many ships coming from the Baltic to and from, would be saved if there were a harbour of refuge there.

7089. Is it a subject upon which you have conversed with masters of vessels, as one in which you have been interested?—Yes, I have, repeatedly.

7090. You have conversed with them ?—Repeatedly.

7091. And the opinion which you have formed is based upon their nautical experience and not upon any personal knowledge?—On their experience as well as my own personal knowledge.

7092. Have you ever been at sea?—Occasionally.

7093. (*Sir F. Smith.*) You speak of that coast and of Wick on account of your personal knowledge?—Yes.

7094. What do you mean by personal knowledge ? —I am a native of the place.

7095. Of what place ?—Of Wick.

7096. How long is it since you left Wick ?—Twenty-five years.

7097. But the fishing is very much altered in that time?—The number of boats is greater and they are larger.

7098. And the want of a harbour of refuge is greater?—Yes, very much greater.

7099. Have you any knowledge of the number of losses in recent years ?—I have no statistics. I only know that some few years ago there was a very serious loss of lives, and even this season vessels have been obliged to lay in the bay as much as 10 days owing to the want of room in the harbour.

LIVERPOOL.

Mr. Alexander Coghill.

20 Sept. 1858.

Sir F. Smith.

7100. Are you at all connected with the fishing?—No, I am connected with the shipping belonging to Wick.

7101. Do you make the fishing a subject of study?—Yes.

7102. Are you of opinion that many lives would be saved if there were a harbour of refuge there for the fishermen alone?—I am certain of it.

7103. Even if it were unfit for the passing trade it would be desirable as a national object to make Wick a harbour of refuge for the fishing boats?—I think it would.

7104. Are you at all aware that for a considerable portion of the fishing season vessels do not go out in consequence of a fear of bad weather coming on, which vessels would go out provided they had a harbour to run for in case of bad weather?—I know that vessels now are glad to get out if there is the least chance.

7105. Even as it is now?—I speak as to sailing vessels.

7106. My question was entirely confined to the fishing trade. I wanted to know whether you had reason to know that the fishing boats are deterred from going to sea, because in stress of weather they have no place of shelter?—I have often known a loss of life, because there was no safe harbour to run to.

7107. Then do you think that the catch of fish would be increased if they had a harbour to run to?—I think it highly probable.

7108. Do you think that a national object?—I do.

7109. Inasmuch as it would increase the amount of food for the poor and raise a hardy race of seamen for the navy?—I do.

7110. Do you know anything of the east coast of England?—Not particularly, I know more of the coast of Scotland.

7111. Do you know anything of the coast here?—No.

7112. (*Mr. Lindsay.*) Are you from Wick?—Yes.

7113. Are you interested in ships?—Merely as agent; I am agent for all the ships belonging to Wick.

7114. Then when you recommend it as a harbour of refuge, you recommend it as a national object and you include the passing trade, as well as the trade of the place?—I think if it is applicable for one it is applicable for both.

7115. Do you think Wick the best site for such a harbour?—That is my opinion.

7116. What are the most dangerous winds on that coast?—From north-east to south-east, I will take that range.

7117. Do you know Long Hope?—I know the position of it, I have not been there.

7118. Can a ship get in and find shelter there?—If south of Duncansby she would find a difficulty when she could get to Wick.

7119. But she could easily get there with a south-east wind. How far is it from Wick?—About 40 miles.

7120. Then if there is good shelter in the prevailing winds at Long Hope for the passing trade, why do you recommend Wick as the best site for a national harbour?—In the first place I consider that supposing a vessel were caught with an east gale off Wick bay, 20 miles off, and could not fetch Long Hope, she would be obliged to run for Cromarty. Many vessels have been lost in running there, when if they could have got into Wick they would have been in safety.

7121. Considering the passing trade, and presuming that there is a safe harbour at Long Hope, which in your opinion would be the best site, Wick, Fraserburgh, or Peterhead?—I think Wick still, because of its being so near the Pentland Firth.

7122. Is there not a large trade from the east coast of England to the Baltic and Archangel?—There is undoubtedly.

7123. If it rested between Peterhead and Wick, to which would you give the preference?—A harbour is desirable for Peterhead as well as Wick; but supposing there were only one, I should say Wick.

7124. That being the case, that there is a very large trade, and numbers of vessels frequenting the north from the east coast of Scotland and the north-east of England, why do you hold the opinion, that for the passing trade, Wick would be a better site than Peterhead?—Because, in the first place, for vessels bound westward it is more convenient to take Wick.

7125. But for vessels trading to Archangel and the Baltic?—In that case I should say it is quite as convenient as Peterhead, there is very little difference.

7126. Would it not be very much out of the track of such vessels?—I do not think it would; it might for some vessels, but generally I should say it was convenient.

7127. If there were to be but one harbour, I understand you would prefer Wick?—That is my opinion.

7128. At the same time you think there should also be a harbour at Peterhead?—Yes; because the trade is very extensive all the way from Inverness.

7129. You are now resident at Liverpool, have you formed any opinion as to a harbour of refuge in the north channel?—No; except one at the Skerries would be very useful.

7130. As to the Isle of Man?—Judging from the few wrecks I should say it was not called for.

7131. Have you any opinion as to the necessity of a harbour of refuge on the north-east coast of England?—No, I have not thought much on that point.

7132. (*Capt. Sulivan.*) From what you know of the Pentland Firth, do you think any vessel bound from the Baltic to the west, with the flood tide running and a gale from the south-east, would dare to enter the Firth?—I believe very few vessels would attempt it.

7133. Would any vessel run across that race to get to the Orkneys?—Comparatively few would attempt it.

7134. Would it be safe?—It would be rather a risk.

7135. Speaking of a harbour of refuge to be made as a national harbour, do you consider any port which is not situated in or what may be a dangerous lee-shore, and is merely a place for vessels stopping in foul winds, such as would justify an outlay of public money?—I do not understand.

7136. Do you consider any port which may be very useful for ships stopping, but where there is no danger of going on a lee shore, such as would justify the making it a harbour of refuge?—I do not think it would.

7137. Do you see a great distinction between a refuge harbour on a lee shore, that a vessel must go into if disabled, or be wrecked, and a harbour which is a good stopping point in foul winds, but from which vessels can go off and be in no peril of wreck?—I see that difference.

7138. Where a harbour is only wanted for stopping, will that justify an outlay of public money?—I do say it would in the case of Wick, where the local trade is very great.

7139. I am asking whether you think an outlay of public money on a port where a ship can get off on either tack is to be justified?—I should say not.

7140. Do you know Peterhead?—I do.

7141. Can you tell me any possible wind in which a ship could be caught on a lee shore near Peterhead or Fraserburgh?—I can suppose that with a north-east very heavy gale she could be driven on shore there.

7142. That is one point?—Yes.

7143. Could she not keep off on either tack?—Supposing she were a distance off she could weather it.

7144. Have you heard of any wrecks occurring there?—I think I have.

7145. Do you know whether those ships were driven on a lee shore or were shaving the land too

close, and so ran on the rock ?—I think I know cases of wrecks from vessels being driven ashore.

7146. If a harbour of refuge were made at Peterhead, would it not almost exclusively be used as a stopping harbour in foul winds, and not as a refuge harbour ?—I should think it would in a great measure.

7147. A stopping harbour, not a refuge harbour ?—It would be used for both, more or less.

7148. Allowing that the trade to Archangel and the north was large, and that it was a desirable point for the trade to go in cases of foul wind, would it not be a stopping harbour instead of a refuge harbour, on a shore which might be a lee shore, and vessels could not get off the land ?—Yes, I think it would.

7149. Do many vessels come through the Caledonian Canal instead of through the Pentland Firth ?—They do, many of them.

7150. Do you consider they escape great danger ?—They all prefer it—all the smaller vessels.

7151. And they pay less insurance ?—Yes, always about $\frac{1}{2}$ per cent. less.

Mr. Joseph Mandell examined.

7152. (*Chairman.*) Are you a shipowner ?—I am.

7153. How long have you been connected with the port of Liverpool ?—It is 37 years since I sailed from it.

7154. You are aware of the objects of this inquiry? —I am.

7155. Have you read the report of the Committee of the House of Commons ?—I have not.

7156. Have you any opinion to offer to the Commissioners as to the advantages or necessity of a harbour of refuge on the north coast of Ireland for the Liverpool trade ?—No, I think my opinion would not be of much importance as to that. I have not had time to consider and study the subject, and I would not like to give an opinion without having well considered it.

7157. As respects the subject of harbours of refuge generally, have you any opinion to offer to the Commissioners ?—In St. George's Channel, or as a general question, affecting the whole country ?

7158. As a general question.—I think harbours of refuge very desirable at points where experience has shown great losses have occurred, but that is all I can say at the moment.

7159. Would you consider it desirable that a passing toll should be paid ?—No, certainly not.

7160. State your reasons.—I think that the formation of harbours of refuge, having regard to the saving of life mainly, is a national question, and therefore the cost should be borne by the nation at large, as it would be an anomaly that a Liverpool shipowner, trading where losses are comparatively few, should contribute to the maintenance of harbours of refuge on the east coast of England where the losses are many. That would be one of my objections.

7161. (*Sir F. Smith.*) How would the shipowner in Liverpool contribute by a passing toll to a harbour of refuge on the east coast of England ?—There might be Liverpool vessels occasionally up the Baltic, going to the Baltic, going from the Havannas, going from America, going from the Brazils.

7162. They are occasionally ordered up the Baltic, and might contribute in that way ?—Yes.

7163. But it would be only for that one particular voyage ?—Only for that particular voyage.

7164. They would be mulcted then precisely in proportion to the possible advantage, and no more than vessels using the coast, which pay more because they use them more frequently ?—That is very true, but the vessels lost there are a very different class of vessels to the shipping sailing from Liverpool, for our vessels are very differently found and equipped. They are different in their original construction, and therefore they are not so liable to casualties as vessels on the east coast, which are colliers and differently found, of different construction, and altogether of inferior quality.

7165. Do you think it would be unjust that owners of vessels on that coast should contribute to the formation of harbours of refuge chiefly for their own trade ?—I think that vessels using the harbours of refuge, resorting to them in any case, should contribute, whether they belong to Liverpool or elsewhere ; but that we should pay any dues because we pass those ports, is not fair.

7166. Then you have not the same objection to a using, as to a passing toll ?—Certainly not. I should willingly contribute to the maintenance of a port which had afforded me protection.

7167. Would not that tend to increase the loss of life, inasmuch as masters, for the sake of the owners, would desire to keep the sea rather than pay harbour dues ?—No ; I should think not. I am of opinion, as a seaman, that there are three risks in attempting to enter a harbour of refuge to one in keeping the sea, with a good ship—inasmuch as a harbour of refuge must be a port to leeward on a lee shore, and there is also the further contingencies of wreck or accident in entering and of collision when you have entered the port to anchor in bad weather.

7168. Is there not also the risk of collision not entering a port or not having a port to enter ?—Very rarely.

7169. It has been given in evidence that there are sometimes 300 or 400 vessels off Flamborough Head, which have run for the first port, and that a great number of collisions do take place ?—In running to leeward for a port of refuge ; exactly. That is one of the risks which I have spoken of. When you have to take an anchorage among a great number of ships the collisions are many ; I have seen that in the Needles of the Isle of Wight.

7170. Do you know the English coast ?—Not further than the Thames.

7171. You have never been further ?—I have never been further, except to Hamburgh.

7172. Are you prepared to give your opinion whether a harbour of refuge is better on a salient point or in the bight of a bay ?—A harbour of refuse on a salient point would be easier to get out of than out of a bay after you had once entered it, but the point might be so shaped that it formed itself a protection, and obviated the necessity of a harbour of refuge.

7173. It might. Take Flamborough Head, for instance. Supposing you were given your choice at the Tees or at Filey, which should you prefer, in case you were running along that coast ; should you prefer to take refuge at the bottom of the bay, or on one of the horns of the bay ?—I am speaking without experience. I am speaking from my knowledge as a sailor. If I am asked which I should prefer, I would say, I would run for a port, where if I miss it I am not altogether on a lee shore, where I should have a little room to fetch to and anchor.

7174. Then I gather from your answer that you prefer a salient point to the bottom of a curve ?—I premised that I did not speak from experience of the localities, but as a sailor I should prefer to run for a port which was on a salient point than for one in a deep bay, where if I missed it I must certainly be wrecked.

7175. (*Mr. Lindsay.*) I understand you would prefer the harbour at the point for two reasons : first, because you could leave it with greater facility; and secondly, because if you missed it you would have some escape ?—Exactly so.

7176. Is there not another reason that ports so situated, as a rule, are more in the track of vessels, and therefore vessels in distress have less distance to run ?—I can imagine a case where that would not be any argument. I can imagine a vessel a little to the leeward of the point and not able to get to it.

LIVERPOOL.

Mr. Joseph Mandell.

20 Sept. 1858.

Mr. Lindsay.

7177. Then in such a case as that the harbour of refuge at the point would be of no value to her? —Certainly not.

7178. Then you speak only of harbours under your lee?—Certainly, there can be no other as a harbour of refuge.

7179. In that case, if the harbour of refuge were on a salient point there would be less distance to run than if it were in the bottom of a bay?—It may be less distance if you are to windward of the point, but it may be you cannot fetch it; and it may be that although nearer, the bay is a better protection.

7180. Then there may be cases in which it is more desirable to have a harbour of refuge in the bay than it would be to have it at the point, for the reasons you have stated?—There may be cases. I have stated to you the objection to the bay, in answer to which you say the salient point may be nearer than the depth of the bay, if the vessel were in the offing. But if the vessel were driving in within the point it may be she could not fetch into the point when she could fetch into the bay. I can hardly see the general object of the question.

7181. Your opinion on salient points would depend very materially on the line of coast, and the usual track of vessels?—Yes.

7182. I understood you to say that you objected to a passing toll for the construction and maintenance of harbours of refuge as unjust in principle, but you, as a shipowner, say you think it would be fair to charge vessels entering a harbour of refuge with dues?—Yes.

7183. Would not that have the effect of defeating, to a great extent, the object which this Commission has in view, namely, the saving of life and property? —No, I hardly think it would. If you mean by a harbour of refuge, a port to which a vessel would only resort as a last resource, then I do not think that any consideration would deter the captain from taking it. But if you mean by a harbour of refuge, a place at which a vessel could take refuge during a gale of wind from one point, and wait until there was a change to another point, that is a harbour of contingency.

7184. Do you think that in such cases as those the dues might prevent a vessel taking it?—Hardly. I suppose if the weather does moderate it might be an advantage to go into such a harbour. It might be worth while to go in at night to Kingstown with a southerly wind, and wait until the next morning, and start with the wind on the port. I give that instance to show that it might be to the advantage of a ship to go in rather than stand the sea.

7185. Do you mean dues rather to maintain than construct such harbours?—Certainly.

7186. Then it would be only a small due?—Only a small due.

7187. On what points of the coast do you think harbours of refuge would be most likely to prove of the greatest advantage in saving life and property?— Is it on this side you mean?

7188. Take this side first. Do you think a harbour of refuge necessary for the Isle of Man?— There are several. At any rate a contingent harbour which a vessel could take waiting for a wind would be of advantage occasionally for shipping here. It blows heavy, we will suppose from the south-west. If a vessel had the port of Douglas to take, and men could be properly instructed as to the advantage, and wait until the certain north-west wind which follows, she could then start from the weather side, and go right to sea.

7189. Then you think for the facilities of commerce, a harbour about Douglas would be of considerable advantage to the shipowners of Liverpool?—I think it would be of considerable advantage.

7190. Have you formed any opinion as to the north channel, looking at the natural harbours which we have there already?—If you speak as to Liverpool solely, I would point out that up from Liverpool to Solway Firth there is no harbour of refuge. If a vessel is blown off either St. Bee's Head or Newry, she cannot get back to Liverpool, and there is no port whatever. The port of Peel is a good port for small vessels when you get into it, but there is no protection for large shipping. It is quite an exposed coast. The port of Whitehaven is not sufficiently deep either.

7191. Speaking of the north channel for vessels bound to North America, do you think there is any necessity for a harbour of refuge there?—There are a great many ports of refuge in the north channel.

7192. Large ports?—Available ports.

7193. Then you think it is not so necessary there as in other places?—Certainly.

7194. A harbour of refuge is always of advantage, is it not?—Yes, relatively speaking.

7195. We will ask you whether you think a harbour of refuge at Port Rush would be of more benefit to the shipping of Liverpool than at Douglas. Say it lay between constructing a harbour of refuge at Douglas and at Port Rush, which would you prefer?— A port at Douglas would be of much more advantage than the other.

7196. As to St. George's channel, would you think it advisable to deepen the entrances to Carlingford and Waterford, so as to make those harbours of refuge accessible at all times of the tide?—Carlingford might be of some use. It is a deep bay, and if vessels get disabled and cannot fetch Kingstown, or the Skerries, the next best place, and cannot get round the point, there is no option. They either have to anchor or go ashore, and therefore that place might occasionally be an advantage.

7197. If it rested with you to expend a fixed sum on Waterford and Carlingford, which of those two points would you recommend?—The same expenditure.

7198. Which would you think of most advantage to the Liverpool shipping?—It is a very nice point to say.

7199. Do you think it would be of considerable advantage to the Liverpool shipping if both those harbours were made accessible at all times of tide?— It would be some advantage, but as to a considerable advantage I hardly think I should be justified in saying that I think it would be of considerable advantage to the trade of the country.

7200. I spoke of Liverpool because you wished to confine your remarks to Liverpool. You think, then, the improvement of those two harbours would be of general advantage?—I think so.

7201. Have you formed any opinion as to a harbour of refuge at the Land's End?—I do not think we have experienced any want of that. I only know of one Liverpool ship of any tonnage lost there. Our ships outward bound never go that side, and inward-bound ships keep close to the Irish coast. It might be the salvation of ship and crew, if Waterford were available. It seems to me that as to Carlingford and Strangford, an outward- bound Liverpool vessel has nothing to do with them, except in a continuance of southerly gales, other than as a place of stopping, which is better, I think, at the Skerries and Kingstown.

7202. (*Capt. Sulivan.*) Speaking of the relative advantages of a bay and a salient point, the more salient the point, the less the chance of getting on a lee shore? – Certainly.

7203. Take it that the point is at right angles, south and west, it is almost impossible that a vessel can get lost on a lee shore?—Certainly.

7204. Then, the great danger is when she is so embayed that she cannot weather on either tack?— Yes.

7205. And a harbour of refuge is most desirable within such points as a vessel cannot weather on either tack?—Yes.

7206. But, supposing the point so salient that there is very little risk of any vessel going ashore, though very desirable as a stopping place, do you think it would warrant the outlay of national money when the

vessel can go off on either tack and keep the sea?—No, I think not; as I said before, a harbour of refuge, as I understand it, is a harbour solely for the refuge of ships which are without the power to help themselves, and to spend money on them is not to be condemned. But would any one incur expenditure for what is a very questionable possibility.

7207. And in any point making a small angle with two coasts, that is, a very salient point, is it not almost impossible for a ship to require a harbour of refuge in the acceptation of the word as you use it?—Perhaps you will allow me to state a familiar instance. At the Bill of Portland you are aware the south-east wind blows into the east side, and the south-west wind blows into the west side; therefore, the Bill of Portland would afford a refuge in almost any wind as it stands, but either side may be improved for that purpose.

7208. I think it is almost a straight shore on either side. Is the south gale ordinarily a very dangerous gale?—Yes; I said south-east or south-west wind. The south point will almost afford any shelter.

7209. But suppose we take the south-west of Ireland or the north-east of Aberdeenshire, near Peterhead, supposing there were no natural harbours; would not the shores make such a point that a ship could scarcely fail to get off on one tack or the other, and would you think an outlay of public money on such a point for a harbour of refuge to be justified?—The south-west point of Ireland is very extensive; there are a great many bays, and in each of these bays there is a considerable in-draft. A vessel inside the mizen head could not get off.

7210. I meant merely to illustrate a salient point. I will take it that the coast forms a right angle, much passed by vessels, but where it is almost impossible for a vessel to get on a lee shore; do you think that would justify making it a stopping harbour, where life and property were not endangered?—If the local advantages were such as to justify the outlay, I should have no hesitation in adopting it, if there were local facilities. If an island were lying parallel with the coast, that would be a local facility for making a port, and that might justify making it safe by extending a pier or breakwater at either end.

7211. Because it could be done at a small outlay?—At a moderate outlay.

7212. But two straight coasts meeting at an angle where there was little chance of a vessel being caught?—No; it would be more a harbour of contingency to take advantage of than a harbour of refuge.

7213. As respects Douglas, would not a ship meeting a south-west gale find good anchorage at Ramsay now?—No, not for large ships. The sands are rather far to leeward; they would rather not run so far to leeward. If they ran west they would stop at Douglas Head; you could not induce them to go to Ramsay.

7214. The ship has always under her lee Ramsay Bay to bring up in?—She has.

7215. And Ramsay is an admirable place to meet a south-west wind when it blows?—No, it is not so desirable, I think, for if a ship runs into Ramsay Bay to bring Maughold's Head as a shelter from the south-east, it is difficult to fetch.

7216. I never spoke of south-east, I spoke of south-west. Are not south-west winds the prevailing winds?—Our winds generally range from south to south-east. In south-west winds Douglas at present gives no shelter, and a vessel might then go to Ramsay; but Ramsay is a very awkward place to get out of; it is somewhat awkward; it is 20 miles further, and no sailor likes to run to leeward. If his ship is not disabled he will not do so; he would run out to sea.

7217. The usual shift of wind would be a fair wind for a vessel running out of Ramsay and going on her voyage?—Yes.

7218. Then except ten miles difference, Ramsay is preferable to Douglas?—I think it is twenty miles.

7219. (*Chairman.*) You have a good observatory here?—Very good.

7220. I suppose you have meteorological observations for several years?—We have them registered for several years.

7221. If we wished a register of the prevailing winds we could easily obtain it?—Yes.

7222. Can you give us any information whether the winds observed at Liverpool give any clear indication of the winds in the Irish Channel? Is there any difference?—A considerable difference. Our wind at south-east or south-south-east is nearly south-west at Holyhead. I trust we shall remedy that. When we establish an electric telegraph at Holyhead we shall be able to have the winds there and compare with the winds of Liverpool.

Mr. WILLIAM CLARK examined.

7223. (*Chairman.*) What is your occupation?—Shipmaster.

7224. How long have you been at sea?—About 45 years.

7225. How many years have you been a master?—Upwards of 30 years.

7226. And what parts of the coast are you best acquainted with?—All through both channels, south and north.

7227. Are you acquainted with the roadstead inside the Skerries?—Yes.

7228. Have you seen it often in bad weather?—Very often.

7229. What wind brings in the heaviest sea in that roadstead?—North-west.

7230. Have you ever been at anchor at the Skerries in bad weather?—I have, in very bad weather.

7231. Many times?—Frequently.

7232. Have you ever passed through it in bad weather?—In bad weather I have passed through it both ways.

7233. And frequently?—Frequently,

7234. In what description of vessel?—Both sailing vessels and steam vessels.

7235. You know the two entrances to the Skerries, one of which is called the Broad Sound and the other the West Sound—you know them distinctly?—Distinctly.

7236. In a heavy north-west gale through which of those entrances does the heaviest sea come in?—Through the Broad Sound; it is only a roll, a swell; the sea does not break inside the Skerries.

7237. Have you ever passed out of the West Sound in bad weather?—Frequently.

7238. And have you then noticed the sea in the Broad Sound?—Yes.

7239. And you are sure it was much heavier in the Broad Sound?—There is more of a roll in the Broad Sound.

7240. Have you ever seen it break right across the Broad Sound?—Never.

7241. Have you ever seen it break across the West Sound?—Never.

7242. Supposing a breakwater was made for the purpose of enclosing the Skerries, which of the two sounds would you propose to shut up?—The Broad Sound.

7243. Will you state your reasons?—You would have an entrance at each end; there would be nothing to hurt you in it.

7244. And do you suppose if that were done that there would be no heavy sea through the West Sound to disturb the anchorage in a north-west gale?—None. I have been riding in it with seventy fathoms of cable out in a very heavy gale of wind.

7245. (*Capt. Sulivan.*) What are the winds in which you think vessels require refuge in the

LIVERPOOL.

Mr. Wm. Clark.

20 Sept. 1858.

Capt. Sulivan.

Skerries ?—Vessels bound in or out of channel ?

7246. For the homeward bound ?—For the homeward or outward bound ?

7247. For the homeward bound what wind is a dangerous one ?—The wind from the east ; but there is never any sea with it.

7248. With a north-east wind would there not be a heavy sea ?—It is quite sheltered.

7249. With an east or north-east wind would a vessel be in any danger if there was open sea to run back to, to the north-west ?—Yes.

7250. I think you misunderstand me. Would a vessel be in any danger of wreck in an easterly gale if there was the open sea to drive out to ?—She would be in no danger.

7251. Because there would be the open sea to heave to ?—Yes.

7252. But irrespective of the Skerries Road, would a vessel be in danger of wreck if she could not use the Skerries Roads ?—It is a very bad coast from Rathlin Island down to Lough Foyle.

7253. But could not a vessel always run out seaward and heave to ?—Certainly she could ; an easterly gale would be a fair wind.

7254. How would the outward-bound ship be ? What wind do you consider a dangerous one ?—North-west.

7255. Have you ever entered Lough Foyle with a north-west wind ?—Hundreds of times.

7256. With a sailing ship ?—And steamers.

7257. With a north-west wind can you fetch in close under the head ?—If she is close under the head she will fetch up as far as Greencastle, and fetch into safety.

7258. Then with a northerly gale, supposing a vessel caught off that bay between the Skerries and Lough Foyle, has she good refuge in Lough Foyle ?—She has if she can fetch round.

7259. But supposing she is to the north, within the line of the large bay with Lough Foyle under her lee, and a northerly gale, can she always go in safety into Lough Foyle ?—She can.

7260. And with a north-west wind she can fetch in if she is to windward ?—She can.

7261. With a westerly gale a vessel cannot get into Lough Foyle ?—But she will have smooth water off it.

7262. And she would also have smoother water at the bight of Culdaff ?—Yes.

7263. Suppose a vessel, caught a little to the leeward of Lough Foyle, so that she could not fetch it, with good lights and an open channel, could she not run back, and to the eastward ?—If she had sufficient offing she could.

7264. Suppose she were in mid-channel, between Islay and the coast of Ireland, she would be in no danger ?—None whatever.

7265. (*Sir F. Smith.*) Port Rush would be pretty nearly land-locked if you filled up the north channel ?—Of the Skerries, yes.

7266. You say it is sheltered from the north-east wind ?—Yes.

7267. (*Capt. Sulivan.*) The East Skerries give shelter from the north and north-east ?—Excellent shelter.

7268. Do ships use it in east and north-east winds ?—They do sometimes.

7269. You know where it is proposed to block up the Broad Sound ?—It would cause it to be as smooth as the docks of Liverpool.

7270. In north-west but not in north-east gales ?—The pier would bear away to give shelter.

7271. You see the Skerries on the chart. Now, if a breakwater were built as far as the Broad Sound—— ?—It would be the finest harbour on the coast.

7272. If a breakwater were built as far as the Broad Sound, it would still depend on the rocks, and you would not thereby have added to the safety of ships in north-east gales ?—It would make it smoother.

7273. But that anchorage in north-east gales is as good now as it would be if that wall were built, is it not ?—It would be smoother.

7274. (*Chairman.*) Are you acquainted with Lough Larne ?—Very well.

7275. What kind of harbour is that for the coasting trade ?—A very fine harbour.

7276. And is it much used for that purpose ?—It is frequented considerably. Ships can lay without anchor or cable there.

7277. Are you acquainted with Lough Strangford ?—I have been in Strangford two or three times.

7278. Are you acquainted with Lough Carlingford ?—I never was over Carlingford bar.

7279. Do you know Wexford ?—Very well.

7280. Or Waterford ?—And Waterford too.

7281. Tell me about Wexford. Supposing a good entrance could be made to the harbour of Wexford, do you consider that would be an advantage to ships passing ?—A very good harbour of refuge could be made to go into south bay.

7282. Supposing it were possible to make it, you think it would be of great service ?—I do.

7283. And for what class of ships ?—Any ships which can run over the South Shears.

7284. Therefore, you consider it would be useful to outward-bound ships, as well as coasters ?—I do.

7285. What is your opinion as to the advantage of Waterford as a harbour of refuge, from its site and position ?—Waterford cannot be run for, except at tide time.

7286. Why, from want of water ?—Yes, for want of water. There is not more than 12 feet of water at spring tides.

7287. But supposing it could be increased to 20 feet ?—It is a very clear harbour to run for. There is no difficulty whatever.

7288. Do you know the Bristol Channel ?—I am not thoroughly acquainted with the Bristol Channel.

7289. Do you Loughindall ?—I have passed it ; I was never in it.

7290. Do you know Lough Swilly ?—Yes.

7291. Is Lough Swilly easily taken ?—Any time, night or day, if you make the light out.

7292. And as respects the land there is no difficulty ?—It is quite bold from side to side, except the harbour.

7293. And there is plenty of room for working ?—Plenty of room for working.

(*Chairman.*) Is there any person present who wishes to tender further evidence with respect to this inquiry ?

No answer.

Sittings at Liverpool closed.

WATERFORD.

Thursday, 23rd September 1858.

PRESENT :

Admiral HOPE (Chairman).

Captain WASHINGTON.
Captain SULIVAN.
Captain VETCH.
Mr. COODE.
Mr. EVANS, Secretary.

Mr. JOHN FARRELL examined.

7294. (*Chairman.*) You are Secretary to the Harbour Commission ?—Yes.

7295. How long have you been connected with the port of Waterford in that capacity ?—Nine and a half years.

7296. Are you connected with the shipping interest of the port personally ?—No, rather otherwise ; it is not considered desirable that I should be.

7297. Have you read the report of the Committee of the House of Commons on the subject of harbours of refuge ?—I have.

7298. Will you be kind enough to state to the Commissioners any opinion which you may entertain as to the advantage or necessity of deepening this harbour for the purpose of rendering it a subsidiary harbour of refuge for the trade bound south of the Irish Channel ?—I think it would be very expedient and is most desirable.

7299. Will you state your reasons for that opinion ? —I should prefer handing in a professional report on the subject, a report made to the Harbour Commissioners by Mr. Lecky.

7300. That report, I presume, is from an engineer with reference to the practicability of deepening the harbour ?—It is. It alludes in a few sentences to that subject.

7301. Will you be good enough to lodge a copy of it with the secretary ?—Certainly.

7302. Can you personally give to the Commissioners any evidence as to the character of the shipping that are likely to frequent this port, or as to its increase in later years ?—There has been an increase of late years.

7303. Have you any report to offer to the Commissioners as to a vessel having been obliged to run for the harbour in distress, and stopping at the bay for want of water ?—Yes; there was one in 1854 ; and as to particulars I can give them to you if you please.

7304. Will you hand it in ?—A copy I suppose will do ?

7305. Yes. [*The document was handed in.*]

7306. Have you any report to make to us, with reference to a vessel which took a pilot outside the bar, and discharged him being afraid to come in ?—Yes. On the afternoon of the 15th of March 1857 there was a large ship six miles off the harbour. She stood a little in towards the harbour. The master thought there was not water enough, and he would not wait until the tide had flowed sufficiently but went on to Cork. The second day afterwards he got into Cork harbour. It was the ship *Hotspur*, if you will allow me to identify the instance by name.

7307. Are you able to furnish the Commissioners with any returns showing the increase of the shipping which frequents the harbour of Waterford ?—I can. I have brought the returns with me. There is an increase principally in consequence of the local steamers.

7308. Can you furnish the Commissioners with an abstract of these returns showing the character and description of the shipping which frequents the port ? —I can.

7309. (*Capt. Washington.*) You stated that a report had been made by an engineer upon the bar of Waterford harbour ?—Yes.

7310. To whom was that report made ?—To the Harbour Commissioners.

7311. Was it made at their request ?—It was.

7312. Had they any intention at that time of undertaking the deepening of the harbour ?—I cannot answer as to what was their intention. No intention was expressed by resolution.

7313. How long ago ?—In 1856.

7314. Do you know whether any estimate was made for deepening the harbour ?—There was an estimate in the report.

7315. Did you say it was a printed paper ?—Yes.

7316. Is it a long report ?—Yes.

7317. Can you state precisely the proposal as to the depth and breadth of the Channel ?—I will read a few lines of the report.

"The length of the proposed cut is almost exactly 2,000 yards. I should propose a finished width of 400 yards, and the average depth of cutting may be taken at three feet. This would give a total of 800,000 cubic yards, or 1,200,000 tons. If we suppose the dredging vessel to be able to work on the average 46 hours per week during the six summer months, and to raise the very moderate quantity of 100 tons per hour, she would complete the work in 10 years ; and taking her average weekly expenses at 20*l.*, a tug-steamer 15*l.*, and barging and discharging at 15*l.*, making a total of 50*l.* per week, and 1,300*l.* per season, or 13,000*l.* for the entire work. This is, however, exclusive of contingencies, which, on work extended over so much time, cannot be estimated at less than 20 per cent., making a total of 16,000*l.*"

7318. Was a copy of that report given to the Select Committee of the House of Commons ?—I am not aware ; I think not. The Harbour Commissioners had a report referring to another plan prior to the last. It was a much cheaper one ; a proposal for cutting another channel.

7319. By whom ?—By Mr. Stephens.

7320. Who is Mr. Stephens ?—He is an inhabitant of Duncannon.

7321. What situation does he hold ?—He is harbour-master for the county of Wexford side.

7322. Can you state his proposal briefly ?—The Chairman asked me about the intention of the Board ; I said they had expressed their intention by resolution, but I find their intention was not expressed by resolution, but in a petition to the Lord Lieutenant.

7323. I will ask further, has it been the desire of the Harbour Commissioners or of the community of Waterford to have the bar deepened ?—It has.

7324. Has that wish been ever expressed at a public meeting by resolution in any other manner ?— It has been expressed as desirable and expedient.

7325. Please to answer the question. Has it been expressed at any public meeting by resolution or in any other public manner ?—No ; not at any public meeting, but at meetings of the Corporations of the Harbour Board and of the Chamber of Commerce.

7326. Has any memorial or petition ever been grounded upon it ?—There has.

7327. To whom was the memorial sent ?—I think to the Lord Lieutenant, I think that was in 1854. There were some proceedings subsequently, I think in 1855. The Admiralty was applied to in 1857.

7328. You stated that a second report had been made for deepening the channel by Mr. Stephens ?— Yes.

7329. What is the date of that report ?—The 4th September 1851. In point of date it was the first.

7330. In point of date Mr. Stephens' is the prior

WATERFORD.

Mr. J. Farrell.

23 Sept. 1858.

Capt. Washington.

report. Will you state the length, depth, breadth, and cost of such a channel as he proposed ?—I wish to remark that his proposal refers to the small shoal patch to the east; it is not a long cutting.

7331. Is Mr. Stephens present ?—Yes.

7332. Will he be a witness ?—Yes.

7333. Then we will leave it to him, if you please, to answer that question. What is the present amount of the harbour income ?—More than 6,000*l.*, including pilotage, ballast, and all.

7334 How much for tonnage ?—Perhaps 2,000*l.*

7335. 6,000*l.* total receipts, 2,000*l.* of which is tonnage duty ?—Yes.

7336. What is the whole expenditure ?—We have generally expended the full amount.

7337. Is the whole expended every year ?—It was not the last year or two.

7338. Is there any debt ?—No.

7339. Can the harbour fund contribute to the improvement of the bars ?—I do not think that the Commissioners can.

7340. Is it not of sufficient interest for the public of Waterford to contribute ?—I think not ; I think the depth of water at the bar is sufficient for the local trade of Waterford.

7341. (*Capt. Sulivan.*) Is the depth which it is proposed to increase only three feet beyond the present depth of the channel ?—An average of three feet.

7342. Do you know the maximum depth it will give in the channel ?—It will leave about 18 feet, but that is scarcely sufficient, we want more than that.

7343. Is that the extreme depth you think would be obtained for 16,000*l.*?—It proceeds on that calculation, but 18 feet is not sufficient.

7344. Have you any estimate of the cost of an increased depth ?—No, I have not.

7345. (*Capt. Vetch.*) Suppose this new cut to be effected and carried out to the extent of 19 feet, do you imagine that vessels passing the port, and not being able to proceed on their voyage, would enter the river for refuge ?—I think many would.

7346. Any number ?—Oh yes ; the number would be very largely increased.

7347. Do any vessels take refuge under present circumstances ?—They do.

7348. How many in the last 12 months ?—I can tell you the number for the year 1857. I will make out the number and furnish it to the Commissioners.

7349. You have mentioned the case of a vessel about to enter the harbour which proceeded afterwards to Cork. Was that vessel prevented entering by want of depth of water ?—I think that was the main obstacle.

7350. By this return I see that, during the year 1857, 221 vessels not bound for the harbour came in. Did they come in for shelter ?—A few of them would have come in because they were short of provisions or of coal.

7351. Those were small vessels ?—Twenty-three were upwards of 13 feet draft of water and 198 under 13 feet.

7352. And should you think, if the bar were deepened to the same depth as the rest of the channel, 21 feet, a great many more vessels would come in ?—I think there is no doubt of it.

7353. (*Mr. Coode.*) You say 23 vessels of 13 feet and upwards came in. Can you tell us the greatest draft of water of any of those vessels ?—About 17 or 18 feet probably.

7354. Have you the particulars for any year besides 1857 ?—No, I have not.

7355. Do you think you could furnish the Commissioners with a list of such vessels within a short period ?—Oh yes.

7356. Can you furnish a list for the last five years ?—It would take a long time to make out.

7357. Can you do so for three years without much trouble ?—Oh yes, that shall be done.

7358. You have made reference to the ship *Appleton* ?—No, to the *Hotspur*. The *Appleton* did come in.

7359. You made a reference to a vessel that put off on the 15th and that reached Cork on the 17th March ?—Yes ; she would not wait until the tide rose sufficiently.

7360. But had the bar been deepened, no doubt she would have come in ?—Yes.

7361. But she was only drawing between 15 and 17 feet ?—She knew it was deeper at Cork than at Waterford.

7362. Do you know whether any ship has got beyond Cork and put back again ?—I do not.

7363. Did you notice the sort of material to be dredged ?—I have samples here.

7364. Can you mark the positions in the map, from which they were taken ?—Yes ; but Mr. Stephens will tell you better than I can, he took them.

7365. Before you leave perhaps you will hand in the Minutes of the Harbour Board on Mr. Stephens' plan ?—Yes ; it was before the report of Mr. Lecky ; Mr. Stephens' was the only project before the board at the time.

Read by Secretary.

"QUAY COMMITTEE,

"*Monday, 8th September* 1851.

"The Board at its last Meeting referred to this Committee the duty of ascertaining the nature and material of the shoals, popularly but incorrectly known as 'the bar,' existing between Duncannon and Creden Head. Befitting the importance of the subject, and the greatness of the improvement to be effected by the deepening of a channel through these shoals,

"We have given to the Board's reference anxious and protracted consideration, and a majority of the Committee went to the bar on the 1st instant, for the advantage of personal superintendence.

"We commissioned Mr. Stephens of Duncannon to make borings into the shoals at the eastern and western sides of the river.

"Somewhat impeded by the roughness of the weather which has prevailed at frequent intervals, he has been able to carry on operations to such an extent —and to make borings in so many different spots—as to lead to the conclusion that a rocky bottom does not exist in any part of the shoals. He found their stratum to be gravel, shells, and mud, with a substratum of light blue clay or marl.

"By his communications, entered upon our minutes, it appears that he effected the boring of three holes in the shoal at the eastern side, remarked by Captain Frazer, outside the buoy. The depths of the holes bored there varied from $7\frac{1}{4}$ feet to $8\frac{1}{3}$ feet. In the shoals between the buoys three holes were also bored, their depth varying from 4 to 11 feet. Mr. Stephens' report of his operations is submitted to the Board's consideration. Specimens of the strata brought up by the boring apparatus are also presented.

"Having reported the nature of the mass composing the shoals, we have completed the inquiry referred to this Committee, but we ask to be allowed to notice a few of many considerations arising out of this most important subject.

"Should the Board determine upon proceeding to deepen a channel through the shoals, matter for grave consideration will arise as to the part to be selected for operations. Mr. Stephens recommends the cutting of a channel through that shoal to the eastward of the eastern buoy to which, as we have stated, Captain Frazer directed attention—recommends it as requiring less length of cutting, in order to get into deep water above and below it.

"We desire to be permitted to remark that many persons have intimated an opinion that a sailing course through that shoal would bring vessels too near the eastern land—which, in the winds most prevalent here is a lee shore with much sea-breaking—and would dangerously increase the difficulty of weathering Duncannon Strand.

"We would suggest that as the Chamber of Com-

merce called the Board's attention to this subject by a deputation of its members, and the Board, by its chairman, undertook that it would receive the most serious consideration of the Harbour Commissioners, the Chamber may be informed you have ascertained that no engineering difficulty is likely to prevent the deepening of a channel through the shoals, but that the Board is unable to provide the funds likely to be requisite for this most useful purpose.

"It may then become matter of consideration whether the Board and the Corporation of the Chamber of Commerce will unite in calling upon the Board of Public Works for a grant or an advance of money to carry out a work so beneficial to the maritime interest as the improvement of one of the few harbours of refuge on this coast. The Board of Works may be induced to make a survey of their own, or to undertake the work of themselves."

7366. Have you put in a copy of the report of Mr. Stephens to which you have made allusion ?—Mr. Stephens himself will produce it.

7367. Perhaps you can tell us whether any record of the soundings made at former periods, has been found ?—Yes.

7368. I understand that those records are of soundings in the old charts ?—There has been no alteration of the soundings within the last 50 years.

7369. Have you a chart showing the soundings within the last 20 years ?—There is such a chart.

7370. Of what date and by whom made ?—It was made for the Harbour Commissioners in 1855 by Mr. Sampson Carter and Mr. St. Leger.

7371. Will you put in that chart ?—Yes.

7372. Have you any accurate chart prior to that of Mr. Carter ?—Yes.

7373. Can you put that in ?—I will have a tracing made and give it to the Commissioners.

7374. Do you remember by whom it was made ?—I do not know.

7375. (*Chairman.*) Have you anything further in the shape of documentary evidence that you wish to tender to the Commissioners which throws light on the present inquiry ?—I do not recollect anything now, but if you will allow me, I will put in anything additional which may occur to me at a subsequent period.

7376. We shall be happy to receive at your convenience, if you will forward it to the Secretary, anything further in the shape of documentary evidence which you may desire to put in ?—Very well.

7377. (*Mr. Coode.*) Can you tell us to what standard these soundings referred ?—Low water of spring tides.

7378. Of ordinary spring tides ?—Yes.

7379. Were you speaking about the old soundings, and of your own knowledge ?—I cannot speak of my own knowledge, but the senior pilot will be ready to give information that the soundings are the same as they were 40 years ago.

Mr. Abraham Stephens examined.

7380. (*Chairman.*) You are the person who made the borings on which Mr. Lecky's report is founded ?—I first bored in 1851. Afterwards the Harbour Commissioners called on me to assist Mr. Lecky in his operations ; I brought him to the same ground, and he founded his report upon the borings which were made at that time.

7381. (*Capt. Vetch.*) You made your borings, I understand, in 1851 ?—Yes ; the 4th September 1851.

7382. And how long afterwards was this ?—I think three years afterwards.

7383. That would be in 1854. Can you point out on the chart whereabouts those borings were made ?—Yes ; very near the east buoy.

7384. And where were the other borings made ?—Between the east buoy and the middle buoy, and one near the west buoy.

7385. And to what depth did you carry your borings ?—I carried them to 11 feet.

7386. From the surface ?—Yes, 11 feet from the surface.

7387. What material did you find ?—I found the top surface encrusted with oysters, and underneath shell, sand, and gravel, and the lower stratum was blue clay.

7388. When you got down to 11 feet below the bed of the harbour you found blue clay ?—Yes, three or four feet of blue clay.

7389. And again at the middle buoy what were your borings ?—The same.

7390. Of the same description ?—Of the same description.

7391. And in none of your borings you came upon the rock ?—No ; in none.

7392. Did you make any borings higher up the river ?—No ; I did not ; merely a section across the bar, from east to west.

7393. Did you make any borings further down towards the sea ?—I varied them. I did not go in a direct line; I went round the temporary buoys off the bank on the east side near the east buoy. There were temporary buoys placed on the east bank in 1851, to mark where the borings were to be made for the Waterford Harbour Commissioners.

7394. I see a mark R for rock, but you found no rock ?—At that time Captain Frazer was of opinion from sounding with an iron-shod pole that that lump was rock ; I believe that was the cause of the Harbour Commissioners wishing me to make borings.

7395. Then having verified those borings of Captain Frazer you found no rock ?—I found no rock.

7396. And have you reason to believe that from the soundings of 17 feet above down to 18 feet below seawards the materials are of the same description ?—I found the ground on the Wexford side of the harbour somewhat softer—stiff mud.

7397. To make the harbour more accessible, to what extent would you recommend that dredging should be effected ?—The bank on the east side stands about 9 feet over the base of the water inside and outside of it. You will see that the soundings inside are 19 feet, and outside 18 feet, and on the lump only 8 or 9 feet.

7398. I want to know to what depth you would like the channel to be deepened ?—If that lump were removed there would be fully 20 feet at ordinary low water of spring tides.

7399. All away to sea ?—Yes ; all away to sea.

7400. South of that bank the water deepens and inside also ?—Yes.

7401. Will you cast your eyes on that chart (*produced*); you will see soundings 8 or 9 feet on the east bank, but going seawards 16 or 17 feet ?—That is west, but direct from the bank you will find 18 feet; I found outside the bank 18, 17, 17, 18, 22, and 24 ; inside the bank I found 18, 17, 19, and 20, in the direction in which I have drawn two pencil lines on the chart.

7402. Would not that opening you have now marked W. narrow the channel unless extended to a sufficient breadth. What depth do you propose to deepen it out to ?—At the time I made my report in 1851, I confined the breadth of my cutting to 300 feet ; Mr. Lecky's is three times that—900 feet.

7403. Whose ?—Mr. Lecky's, who afterwards made a report.

7404. (*Mr. Coode.*) Will you put in a copy of your report for the use of the Commissioners ?—I believe it is in.

7405. You say that you made borings, and found that the top surface was composed of oysters ?—Encrusted with oysters.

7406. Were they living or dead oysters ?—Living, principally.

WATERFORD.

Mr. Abraham Stephens.

23 Sept. 1858.

Mr. Coode.

7407. How did you ascertain that?—Our boats are constantly dredging there for oysters. They take up a number of dead oysters as well as living oysters.

7408. But living oysters are found on the ground?—Yes.

7409. Then from that you may safely infer that there is no accumulation ofsand, or other material?—Yes.

7410. How long have the boats been dredging for oysters?—As long as I can remember.

7411. Can you state any number of years?—At least 30 years.

7412. They have made a practice of dredging?—Yes; I have taken up oysters there myself.

7413. Through what thickness of sand did you penetrate before you reached the blue clay?—Two or three feet of sand, gravel, stones, and mud. Nothing that would shift at all.

7414. You say you penetrated two or three feet before you reached the clay?—Yes.

7415. Did you find much difficulty in penetrating there?—Two or three feet were as hard as the road outside.

7416. Have you had any experience of the system of dredging?—Never.

7417. Do you think it could be easily dredged?—I think it would be no difficult matter.

7418. Was the clay very stiff?—Very stiff, so much so, that it stuck like glue in the boring apparatus.

7419. Can you produce samples of the sand and clay?—No other samples than those you have.

7420. Have you any plan showing the exact spot on which you put the boring apparatus?—I have.

7421. Can you put it in?—That is the longitudinal section (*paper produced*).

7422. Is there any plan?—No; the longitudinal section shows the whole section of the bar from east to west.

7423. Can you furnish the Commissioners with a plan showing the exact positions in which your borings were taken?—I can.

7424. Will you furnish the Commissioners with such a plan, and mark on it plain letters to indicate the borings and corresponding letters on the samples you now produce?—Yes; this section shows the exact rise of the bank.

7425. Were these soundings taken by yourself or from a chart?—They were taken by myself.

7426. What low-water mark is that which is shown on the plan?—Low water of spring tides.

7427. Ordinary or extraordinary spring tides?—That was an extraordinary spring tide, the lowest for years.

7428. How much lower than ordinary?—I think 18 inches if not two feet. You will find by the time of the year, it was the month of September, when you have the lowest spring tides.

7429. Can you tell us the thickness of the upper bed of oysters?—They are not thick, they may be six inches.

7430. Not many layers?—No.

7431. What number of borings do I understand you to say you made in all?—I think I made fully six or eight.

7432. However, you will show on the plan the position of all the borings you made?—I will.

7433. Have you samples from every bore?—I have furnished Mr. Farrell, the secretary to the Waterford Harbour Commissioners, with samples.

7434. As you produce only two samples, are you prepared to say that those are a fair average result that you obtained from the bore holes?—I think so; it is seven years since I took them, and I have not seen them since; I am certain that one (*designating a sample*) is from the east side; the softer or finer sort is from the west side.

7435. Were you present during the whole time these borings were being made?—During the whole time.

7436. You found no difficulty in penetrating the gravel or sand, to induce you to believe that there would be any difficulty in getting the dredge to act upon it?—I am convinced that there is no difficulty in dredging.

7437. Will you be good enough to mark these samples A. and B., and to put corresponding letters on the place from which they were taken, upon the plan which you have undertaken to furnish to the Commissioners?—I will.

7438. (*Chairman.*) Have you any further remarks to tender to the Commissioners, relative to the engineering part of the question?—I offered some remarks in my report.

7439. Have you anything further to offer in addition to those remarks?—As to the improvement of the harbour?

7440. As respects the engineering question?—I think that by increasing the ebb tide, if that cut is made it would produce a greater scour, and would certainly deepen the harbour. I proposed in that report, that the cutting shall be placed on Duncannon Strand, commencing at the south side of fort, and extending southward along Duncannon Strand to Spit Buoy, so as to increase the current through the intended new cut.

7441. Nothing to the east?—I live in the neighbourhood of the bar, and frequently in my life time I have have seen vessels aground on it. I saw one of the steamers belonging to the port for several hours on that patch lately.

7442. Is there a heavy sea when the wind sets in?—When the wind is to the south.

7443. Is the sea such as would break up vessels if stranded on the bar?—I have frequently seen vessels lose their rudders although they got over it.

7444. Did you ever know a vessel that grounded become a total wreck?—I have seen them severely injured, become leaky, and obliged to run ashore.

7445. With a heavy sea and the wind right in, is the sea ever so heavy up to Duncannon fort as to prevent a boat crossing?—Do you mean an open boat?

7446. Yes, an open boat?—I do not think it is.

7447. In the heaviest weather you have seen boats crossing?—I have seen boats down there in all weathers.

7448. In heavy weather between Duncannon fort and Creden point, running a line to Broomhill point, is the sea such as to prevent open boats from crossing?—Sometimes.

7449. (*Capt. Washington.*) I think you said you had resided many years at Duncannon?—Yes.

7450. Were you acquainted with Captain Frazer, and were you present when he made that survey of the harbour?—Yes.

7451. Had you any conversation with him about the east shoal?—I think about the time we made the borings he left the neighbourhood. I met a son-in-law of his afterwards.

7452. Mr. Hoskyns?—Yes, it was.

7453. Did you ever point out to Mr. Hoskyns that what was marked as rock in Captain Frazer's chart was not rock?—I did.

7454. Do you remember his answer?—He said he was very glad to hear it.

7455. Can you tell us the nature of the rock on the land?—Broomhill is wholly composed of traprock. And between Broomhill and Priorhill, that is composed of rotten slate.

7456. Do the strata of slate project out towards low water?—The low water extends beyond it.

7457. Are the strata of slate visible outside high water mark?—Yes; for a considerable distance.

7458. That Prior shore is a very flat shore?—It is known by the name of Ballystraw flats.

7459. Of what is that flat composed?—Of sand.

7460. In the shoal in which you bored you stated you found some stones. What was the size of the largest stone that you found?—The size of a marble. There might have been much larger ones, but the apparatus would not bring them up.

7461. What was the diameter of your boring apparatus ?—Three inches.

7462. Then if it had happened that a boulder stone of two feet diameter was lying close to it, it would not have touched it ?—I should certainly have felt it.

7463. From your borings are you able to say that there is no chance of finding boulder stones ?—I think not.

7464. I think you stated that a steamer lay for some hours on that shore lately ?—Yes, three or four months ago.

7465. Was it foggy ?—I think it was thick at the time.

7466. Is there not a buoy to mark that shore ?—There is.

7467. Was there much wind ?—It was blowing hard from the south.

7468. Did the steamer damage her bottom at all at that time ?—I do not think she did.

7469. Then it is fair to assume that there are no stones or rocks thereabouts ?—I do not think there are any.

7470. Can a steamer lay on a shoal where there are rocks for a whole tide without injuring her bottom ?—If there had been any large boulder stones she would have been injured.

7471. As far as you know she was not injured ?—She proceeded to sea, and she was laden too.

7472. Do you believe that, if a channel were dredged through the bar, the ebb tide would tend to deepen it ?—I am persuaded that it would.

7473. What is the strength of the ebb tide hereabouts ?—I suppose two and a half knots an hour.

7474. Not more ?—Or three knots.

7475. Were the borings you made in 1851 the first that were made in Waterford bar ?—I never saw any others made.

7476. Did Sir William Cubitt make a report as to the improvement of Waterford harbour ?—He did.

7477. What was the date ?—About 20 years ago.

7478. At that time were any borings made known ?—No.

7479. Have you heard that any one has made a report as to the improvement of Waterford harbour ?—I have heard that Captain Washington did.

7480. But unfortunately he is not an engineer. Do you know of any engineer making a report?—No one but Mr. Lecky.

7481. Were you present when Mr. Lecky made his borings ?—I made the borings for him. I showed him the deepest sections.

7482. How many borings did you make ?—I think four or five.

7483. Were they different from those in 1851 ?—As near as I could I took them on the points where I had taken them in 1851.

7484. Can you make on the map the precise position ?—I may not be able to do that. But I came across a section of the bar as I had done previously.

7485. And the results were the same ?—They were. We found no difference or change in the soundings whatever.

7486. Had you anything to do with making the new cut up to Waterford ?—No ; it was before my time. I just remember the ford being made.

7487. When was it made ?—About 35 years ago.

7488. Within your knowledge has any system of dredging been employed in any part of Waterford harbour ?—I am not aware that there has been since.

7489. (*Capt. Sulivan.*) Do you know whether the ford has increased the depth of water since it was first cut ?—I am not aware ; I should think it must have been deepened by the action of the scour.

7490. Do you know the depth at which it was originally dredged ?—I do.

7491. At low water spring tides what was the depth ?—I think about seven feet.

7492. You have said you would recommend dredging the east side of the bar ?—Yes.

7493. You also said that in the centre between the buoys you found a much stiffer bottom ?—Yes.

7494. About two feet less water than the general portion of the east bar, with the exception of the bank ?—More than that.

7495. Which do you think could be deepened to 20 feet the cheapest—the centre channel, with the softer bottom, or the east channel, with less depth but with the addition of the banks ?—The centre I think would be a very extensive cut, the east side would be a very short one.

7496. I am not asking as to the length of the cut. Would the construction of the extra length and depth on the other side be more costly as compared with the softness of the centre ? Which can you cut to 20 feet the cheapest ?—I think I stated that to the north I found soft ground between the middle buoy and the west buoy, but beyond the lighthouse marks the ground is equally hard.

7497. At low water in a gale of wind when you have seen vessels strike there, what do you think was the lift of the sea ?—I dare say three or four feet.

7498. Supposing the channel were deepened to 20 feet at low water what draft of ship could attempt it with safety ?—I think vessels drawing 20 or 22 feet would get in at an hour's flood.

7499. If the depth of water—of low water at spring tides—was made 20 feet, could any vessel take it with safety, allowing for the lift, whose draft of water was 20 feet and upwards ?—I should think vessels of not more than 17 feet of water.

7500. How far out have you seen the sea break ?—I have constantly seen the sea breaking on those shoals.

7501. But in the channel ?—There is not much break there.

7502. Have you ever seen the sea break out at Credaa Head ?—I have seen it break outside Credan Road.

7503. Have you seen the sea break right across the harbour at Credan Head ?—Not right across the harbour.

7504. Taking the three fathom line have you seen it break at the 18 or 19 feet line ?—I have not noticed it break much there, the breakers are generally on the east side of the dotted line.

7505. Do not ships come in for refuge with south-east winds ?—Frequently.

7506. Would it not add greatly to their danger in taking the channel if you dredged closely along this blast or fault ?—The blast is considerably east of the channel.

7507. Would it not be more to leeward and less sea for vessels if the channel were dredged between the buoys ?—I think it would ; but the question is whether you could keep open the channel on account of the state of the tide from the fort.

7508. (*Capt. Vetch.*) How long have you known this bar ?—For the last 40 years.

7509. During that time have you seen or heard of any alteration in its depth ?—Never.

7510. Then, according to your belief, it remains just as it was ?—Yes, just as it was.

7511. Neither increased nor diminished ?—Neither increased nor diminished.

7512. Is there any improvement you would suggest for the navigation of the harbour ?—Yes. I would recommend the running out of a breakwater from the old fort at Passage to the Spit Perch, which would increase the scour of the ebb tide over the bar ; at present the first half of the power of the ebb tides is lost over the flats south of Passage. If stones were run out from the old fort they would double the force of the scour, and ultimately deepen the harbour.

7513. You would then suggest a breakwater from the old fort passing to the Perch buoy ?—Yes ; it would considerably improve the roadstead, and would shelter it from the south wind.

7514. (*Mr. Coode.*) Have you had occasion to measure the velocity of the tide over the bar ?—No, I never did.

7515. Do you know whether it has been done by any one ?—I am not aware that it has.

BIBLIOTECA DEL C.O.A.M.

WATERFORD.

Mr. Abraham Stephens.

23 Sept. 1858.

Mr. Coode.

7516. Suppose a cut were made more to the east, do you apprehend the tide would set more truly through that cut?—Yes; the direction of the ebb tide sets direct from Duncannon Fort over the east side of the bar.

7517. What is the direction of the tide?—The power of the first half of the ebb is lost by the tide running over Duncannon Strand; and it is only from half tide to low water that a scour is caused by the set of the tide running to the east side of the bar.

7518. Then do I understand you that about half of the ebb tide runs to the east side of the bar?—It does, from half ebb to low water.

7519. Does the strength of the current set that way?—It does.

7520. How does the flood tide run?—The strength of the flood tide runs from Credan Head towards Duncannon Strand.

7521. And does the whole flood continue to set in the same direction?—I dare say it shifts.

7522. But the general run is from Credan Head to Duncannon Strand?—Yes; to Ballystraw flat, that is the general set of the flood tide.

7523. Can you give us an idea of the velocity of that tide stream?—The ebb is the strongest.

7524. Much stronger than the flood?—Yes.

7525. Can you tell us nearly the strength of the ebb stream?—I think $2\frac{1}{2}$ or 3 knots an hour.

7526. That is your opinion?—Yes, it is my opinion, seeing the drift of the boats.

7527. Have you had frequent opportunities of seeing and forming an opinion of the strength of the ebb?—Yes.

7528. You said that you were present during Mr. Lecky's borings. Do you know whether he took samples and recorded them?—They are my samples.

7529. (*Chairman.*) Do I understand that you expect Mr. Lecky to be here in the latter part of the day?—No; it is almost impossible for him to be here to-day.

Captain W. Price examined.

Capt. W. Price.

7530. (*Chairman.*) You are Lloyd's surveyor?—Yes.

7531. And you were formerly harbour-master?—Yes.

7532. For how many years were you harbour master?—Three or four or five, something like that; I do not remember exactly.

7533. How long were you at sea?—Perhaps 35 years.

7534. And for how many years of that period were you in command of vessels?—For 25 or 30 years.

7535. And of what description of vessels were you chiefly in command?—Sailing, and steam.

7536. And what size?—Large and small.

7537. In the foreign or coasting trade?—In both foreign and coasting trade.

7538. Have you read the report of the Committee of the House of Commons on Harbours of Refuge?—No, I have not.

7539. You are aware of the nature of our present inquiry?—I am.

7540. Will you state to the Commissioners any opinion that you have to offer to them as to the advantage or necessity of improving Waterford harbour in order to make it a subsidiary harbour of refuge for the trade bound to the south of the Irish Channel, or to the trade homeward bound from the Irish Channel?—I have known many instances of captains telling me they would come here but for want of water; and I have known instances of ships lost for want of shelter. The first case that comes to my mind is a ship in which I was myself; she was three hours outside the bar for want of water, in distress; she was laden with mahogany; her sails were blown away; and she was making a great deal of water.

7541. Were you in command of that vessel?—No; I merely happened to be on board her. We came into harbour and grounded on the bar; she was making a great deal of water and her sails were gone.

7542. Can you call to mind other cases of a similar character?—There was the *Adriatic*, a very large ship, an American ship. Two or three winters ago she went into Duncannon harbour, and was lost. Two vessels were lost the same day belonging to the same owners; they were vessels of 1,300 or 1,400 tons belonging to Cork. The captain of one them told me he would have come to Waterford if there had been water. Then I remember a ship belonging to Messrs. Waring and Gilmour; she anchored outside because there was not water to come in; she had to slip her anchor, and went to sea afterwards leaving her anchors and cables there; that was a ship of about 900 tons, I forget the name of her, laden with cotton.

7543. Any other case?—I remember, not long since, an Austrian brig grounding on the bar when she went to pass through. I was myself in command of a steam boat, and I picked up a ship off the harbour, a Frenchman; I was obliged to remain outside because I could not find water, and in the night, having a ship in tow in heavy weather, it was extremely dangerous.

7544. Have you any dates from which you could make a return of the number of vessels that have run into Waterford harbour during the period that you were harbour master, vessels in distress?—No, I cannot; because my station was up here, and those vessels went down to Passage; I had to go down frequently to survey vessels damaged, but I cannot give the dates.

7545. Have you any opinion to offer to the Commissioners as to the advantage or otherwise which Waterford harbour would present if deepened for ships homeward bound?—Ships of a large draft of water could then come here which would not think of approaching now because of the bar. If they miss Cork, they must go to Milford Haven or take the chance of the Channel; when they could not come here I have known them obliged to hang to windward.

7546. And therefore the harbour might come into more extensive use as a port of call for orders?—Yes, Cork is a port of call for orders, and for ships in distress. If there were plenty of water large ships would come here.

7547. Have you any opinion to offer as to the advantages of Waterford to the trade out of the Bristol Channel?—In what way?

7548. As a harbour of refuge in heavy south-west gales?—It would be very desirable, for it is the only port if you go up the Channel where you can get on sand.

7549. Of your own knowledge, do you know of many vessels from the Bristol Channel having taken refuge at Waterford?—From St. George's Channel principally.

7550. But vessels from the Bristol Channel?—They do occasionally come here.

7551. Have you ever known of Clyde ships putting into Waterford harbour?—Yes, all ships get as far as outward bound from the Clyde or anywhere else; they would be glad to come here if there was water, for they do not like to run back.

7552. (*Capt. Washington.*) Then I understand you to say that all vessels from Liverpool to the Clyde bound for America south, pass within a few miles of Waterford harbour?—Yes, they must do it.

7553. Also homeward bound ships?—Yes, they must come along the coast.

7554. Is there any account kept of vessels which pass the Hook light?—No, I rather think not.

7555. Can the pilots give any notion of the number of vessels which pass?—No, I should think not.

7556. Have you charge of the pilots?—No.

7557. You are harbour-master?—Not now.

7558. Do you hold any situation at present?—I am surveyor to Lloyd's.

7559. Do all damaged vessels pass under your hands ?—Yes.

7560. Have many damaged vessels come to Waterford for repairs ?—A great many at different times damaged from collisions.

7561. Can you state the number in any particular year ?—No, I cannot do that.

7562. Are there all facilities at Waterford for the repair of vessels, both steamers and sailing vessels ?—We have a slip, but no dock.

7563. A patent slip ?—Yes.

7564. What sized vessels can it take up ?—500 or 600 tons.

7565. Do large vessels come ?—There are several 900 ton ships belonging to the port.

7566. Do you know the number of vessels belonging to the port and their tonnage ?—No.

7567. Do you know the number of arrivals and sailings ?—No.

7568. (*Capt. Sulivan.*) You spoke of the *Adriatic* being lost for want of water. About what size was she ?—A very large ship ; a 1,400 ton ship.

7569. Was she laden ?—Yes ; she was deeply laden.

7570. Did she draw as much as 18 feet of water ?—I should think she drew 18 feet of water.

7571. Have you come in during a heavy sea over Waterford bar ?—Yes.

7572. What draft of water would you venture to take over the bar, supposing the wind was blowing a south gale and the channel was deepened to 20 feet at low water ?—I think I would just allow four feet for the send of the sea. I think you ought to allow four feet for the send of the sea. Where there is a heavy sea, say 17 feet draft of water, a long ship would not make so much send.

7573. With 20 feet draft of water you would not not hesitate to run in a 17 feet ship ?—No, I would not.

7574. Are you aware of the dredging of the east side of the channel ?—I have heard of it.

7575. Supposing the wind were south-east would you take a 17 feet ship in ?—I think it would take me too far to leeward. If the wind were dead against me, I should not be able to go out.

7576. Do you consider it important that all harbours of refuge should be so constructed that, with a fair wind for ships to put back, the ordinary changes of wind would give a fair wind to go out again and to proceed to sea ?—Yes.

7577. Does Waterford possess that advantage ?—It does.

7578. Would you consider 20 feet depth in the channel at low water sufficient, considering the large amount of the American trade and the large class of vessels employed in that trade ?—It would be well to have it more for the large vessels they have now-a-days ; for ships deeply laden it would be better.

7579. Is the tide strong enough, supposing the channel were cut, for ships to back and fill out ?—Yes, particularly if constructed as Mr. Stephens described.

7580. From what you know of the state of the bar, could vessels back and fill out ?—Yes, unless it were blowing very strong and then they would not require to go to sea.

7581. Is the channel in all parts from the inside of the bar up to the Passage, wide enough for vessels taking refuge to bring up ?—Plenty.

7582. Should you fear ships being too crowded ?—No, for if they put in for refuge, they would run up to Passage where there is smooth water.

7583. Would the whole distance from Duncannon Passage afford them accommodation ?—Yes, there is very fine anchorage there.

7584. Within that area ?—Yes.

7585. Have you seen ships frequently at anchor there ?—I have not seen them frequently but I know there is room for a great many. There is a long space and the pier would encourage ships always to run up to Passage and Ballyhack where there is very great accommodation. You can run on the bank if you like, and I have known ships come in without anchors or cables run on the bank.

7586. From the run of the sea should you say it was dangerous for vessels broaching to ? Do you think that any sized vessel might run through that comparatively narrow channel in safety ?—Yes.

7587. The sea is regular ?—Yes? I have been running in with light ships and heavily laden ships too, very often.

7588. (*Capt. Vetch.*) Looking at the chart, I see there is a current running from Hook Point to the west ?—Yes.

7589. Are you aware of the strength of it ?—There is a great race there, two tides meet.

7590. What is the strength of the race ?—Two and and a half or three knots, something thereabouts.

7591. Did you find that sufficient to run down the wave ?—No, keeping round the Hook Tower, there is a great sea running there. So much broken water makes a terrible sea. It is cross water.

7592. Do you not think the run of the tide across the mouth of the bay has a great effect in reducing the sea ?—No, I do not think it has.

7593. (*Mr. Coode.*) You stated that you were not prepared to furnish particulars of vessels damaged. Do you think you could do so within a week or two ?—No, I have no date ; for a great many are towed away for repairs ; they send sometimes and take them away.

7594. Could you give us the name of any one who could afford that information ?—The Secretary to the Harbour Commissioners, because they take the pilotage in and out.

7595. As a practical seaman with a knowledge of this locality, give us your idea of the least breadth that the channel should be, always bearing in mind that the length is somewhere about 2,000 yards ?—If you haul one of those long ships you cannot always keep the course you want.

7596. I want to know from you, as a practical man, what is the minimum breadth of channel that should be dredged ?—To be laid athwart the harbour a ship should have not less than six times her length.

7597. Mr. Farrell said 400 yards ?—That is what I say too, but the wider the better ; that would be a very fair breadth. It is seldom such cases would occur, and in bringing up large ships perhaps you might anchor in the middle, and if you weigh you then get sternway.

7598. Do you consider 400 yards too much or too little ?—I should say I think about 1,200 feet.

7599. Do you apprehend it would be necessary to bring up in that channel ?—You might. You might meet another ship but I should think 1,200 feet or 1,400 feet enough.

7600. You say a greater depth than 20 feet would be desirable. Tell us what is the least depth there should be ?—Some large ships draw 24 feet of water, and if one of those came and could not keep out, she would want to come in. A ship of that size does not make much sand in the sea.

7601. I should like a direct answer ?—I should think 20 or 22 feet.

7602. You said just now that 20 feet would be more than sufficient ?—I should like 22 feet for the very large ships and steamboats.

7603. (*Chairman.*) As Lloyd's surveyor do you not keep regular books ?—No; my report is always sent away with the ship.

7604. (*Capt. Washington.*) In what part of the south coast of Ireland do most wrecks occur ?—I think this neighbourhood, between this and the Saltees, near Wexford.

7605. Are there many on Tramore Sand ?—Yes, a great many.

7606. Is it not notorious that there are more wrecks on Tramore Sand than on any other point ?—It is more dangerous, but I think there are more wrecks in this place.

7607. What place ?—About the coast of Wexford,

WATERFORD.

Capt. W. Price.

23 Sept. 1858.

Capt. Washington.

7608. How far is Tramore Sand from Wexford harbour?—Three or four miles, there is a wreck lying there now, a Norwegian.

7609. Will you consider your answer?—Which one?

7610. As to the wrecks at Tramore not being as many as at other places?—There are a vast number of wrecks there. I have seen four at one time—French vessels.

7611. Have you seen a similar number about the Saltees?—No, I do not go there.

7612. Do you know of any great loss of life in Tramore Bay?—Yes, the *Seahorse*.

7613. What was she?—She was a transport; that was a great many years ago, because there is a monument to the officers who were in her which gives the date. Last winter there were two men drowned.

7614. In the *Seahorse* how many lives were lost?—I know there were a great many, between 300 and 400.

7615. On the occasion of the wreck of the *Seahorse* as many as 300 or 400 lives were lost in Tramore Bay; do you know any other spot on the coast of Ireland where a greater loss of life has occurred from wreck?—No.

7616. You say that a great many wrecks occur east of Waterford?—A great many.

7617. Between Waterford harbour and the Saltees?—Some.

7618. What is the distance?—12 or 14 miles.

7619. Then within 12 or 14 miles to the east, and near to the west of Waterford harbour, the greatest number of wrecks occur of the total number which occur on the coast?—Yes.

7620. Are the approaches to Waterford well lighted?—Yes, very fair.

7621. And the channel well buoyed?—Yes.

7622. Would complaints of lives or buoys come before you?—I recollect asking and recommending that the Hook light should be coloured; you approved of the suggestion but it has not been done. It was done at Dungeness, and has very materially assisted vessels.

7623. Give us your reason why you would colour the Hook lighthouse?—Because when the atmosphere is thick, I have often seen the house and the cottage at the bottom when I could not see anything of the tower.

7624. Then to make it more clear you would recommend its being painted in alternate stripes or bands of black and white?—Yes; I recollect saying that to you, and you approved of it when you were here before. Dungeness was white at one time, and coloured for that very reason. I recollect writing to the secretary of the Ballast Board, and he said they could not make any change in it. He did not give any reason, and I told him that you had approved of it.

7625. You allude to the Ballast Board of Dublin?—Yes.

7626. Are all lights under the Ballast Board of Dublin?—Yes.

7627. Are no lights maintained by the Harbour Trust?—No; all are under the Ballast Board.

7628. Are they good?—Very good.

7629. Would you suggest any alteration in them?—No.

7630. You told us you had been a sailor for 25 years, and yet you spoke of a narrow channel of about a mile range requiring room for ships to anchor, why should they require to anchor at all?—They might get into collision. There might be a hundred reasons for wanting to anchor.

7631. Would any vessel anchor in a narrow channel if she could help it?—I have often seen it done coming out of Liverpool. Vessels are obliged to let go sometimes from fouling, and other ships on putting about. You can never tell when those circumstances may occur.

7632. You do not mean to say that as a general rule you want breadth for vessels to bring up in a channel?—No, I suppose not.

7633. Only under very special circumstances?—Yes.

7634. You are aware that widening the channel would be double the expense of making this out?—Of course; but ships generally run with a fair wind and do not require it.

7635. Is there a steam tug belonging to the harbour?—Yes, two.

7636. Do they go to the bar to look for ships?—No, they go when they are ordered.

7637. Is it likely that steam tugs would go down and wait outside the bar in the event of its being made a harbour of refuge?—I think decidedly they would.

7638. (*Capt. Sulivan.*) You never applied to the Board of Trade on the subject of colouring the Hook lighthouse?—Never; it was to the Ballast Board in Dublin, and the secretary threw cold water on it.

7639. Have you ever seen a lighthouse striped with red and white or black and white?—Yes, I do not know where, but I have seen it.

7640. A parti-coloured lighthouse would show better, would it not?—It would.

7641. How far out at low water have you ever seen the sea break across the harbour?—Somewhere about Credan Head; but that might be owing to the tidal stream.

7642. But I mean the curl of the sea from the wave meeting the shallow water. In what depth do you think the sea breaks in the heaviest gales at low water?—I think it runs out to Credan Head.

7643. Have you ever seen it break out beyond 22 feet?—I do not remember; I have often seen it break as far as Credan Head, and the pilots will be able to say how much further.

Captain BATHURST, R.N., examined.

Capt. Bathurst, R.N.

7644. (*Chairman.*) You are the inspector commanding the coast-guard of this district?—I am.

7645. And your station is at Tramore?—Yes.

7646. Have you any opinion to offer to the commissioners connected with their present inquiry?—With regard to the wrecks in Tramore Bay, I do not think they are caused so much by ships being driven on by stress of weather as by vessels running in mistaking the bay for Waterford harbour. I think the danger would be diminished if the two pillars on Brownstown were removed.

7647. For what are they mistaken?—They are mistaken for the Hook Tower.

6748. You have only been here one year I believe?—Yes; but I have seen the list of vessels wrecked for the last 10 or 12 years.

7649. Can you supply the Commissioners with a copy of that list at your convenience?—Certainly.

7650. Is not Tramore Bay the worst place for wrecks in the south of Ireland?—I think not. The worst place is at Wexford; I have to report all wrecks which occur in my district, and for one which I have to report the inspector commanding at Wexford has to report three. Tramore Bay runs in very deep, and persons not acquainted with the bay mistake it for the river. There are three pillars, one at West Point and two at Broomhill; seeing three pillars on one side and two on the other, they take it for granted that it is the entrance to a large river, and knowing that there is something on the East Point going into Waterford, they think the two pillars mark it, and they run in. There is a vessel on the beach at this moment which did exactly the thing I have been stating. At the time of the wreck of the *Seahorse*, in 1816, there was a martello tower very like the Hook, and I believe it is supposed she took it for the Hook and run in. About 1823 the martello tower was taken down and the two pillars put

up in its place, but the two pillars were nearly as bad.

7651. Does the return of wrecks of which you have told us show the circumstances of each wreck in any detail?—No, I cannot say that it does, but three and four vessels have been upon the beach at a time, and I am imformed that they each of them run in mistaking it for Waterford river.

7652. (*Capt. Washington.*) How long have you been stationed at Tramore?—eleven months.

7653. Were you ever on the south coast of Ireland before?—No.

7654. Then you have no personal experience on which you have your evidence?—Only the wreck charts with which we were supplied this morning by the Board of Trade.

7655. Can you produce a wreck chart?—I have it at Tramore. There all the wrecks are marked.

7656. You have stated that you believe those wrecks were caused by the three pillars on the west side?—I believe more wrecks are caused from vessels mistaking the coast than from being driven in.

7657. May I ask on what ground you found that that belief?—From the circumstances of each individual case that I have heard of.

7658. Have you had occasion to examine into the matter?—Yes.

7659. How many wrecks have you noted in the 11 months?—I have not noted more than four, but I have seen the circumstances under which the wrecks have occurred for the last 10 years.

7660. Have you that return?—I have the names of the vessels, the number of lives lost, and the number saved, but not all the details.

7661. But does it say whether mistaking Tramore for Waterford Bay is really the cause of the wrecks?—I drew the conclusion from what I have heard from masters of vessels whom I have examined, and from those who have been on the spot for some years.

7662. You quite understand that if it should be so every step would be taken for obviating that likewise?—I have no doubt in my own mind that it is so.

7663. Can you furnish the Commissioners at your leisure with any information bearing on that point?—I think I can.

7664. (*Capt. Sulivan.*) Can you state what number went in by mistake and what number by stress of weather?—Three out of four went in by mistake.

7665. Are you aware why the pillars were put there? Was it considered necessary to have the pillars for the local traffic?—They were put there after the dreadful loss of the *Seahorse*, they took down the Martello Tower and put two towers on Brownstown Head and three on the West Point.

7666. If there were no towers on Brownstown Head do you think any danger would arise unconnected with the mistake of Waterford, which is at present guarded against by the towers?—No, certainly not.

7667. Have you ever heard any reason for marking Brownstown Head?—Nothing further than that the bay should be well marked.

7668. Have you heard any reason why Brownstown Head should be marked more than it is by nature?—No.

7669. Would you have any fear of mistake if those two towers were entirely removed?—No; not if three towers were left on the west side, because Waterford harbour mark is on the east side instead of the west.

7670. Have you made any report of these circumstances?—I did three or four days ago to the Board of Trade.

7671. (*Capt. Vetch.*) I think the back strand of Tramore Bay is very extensive, is it not?—If you speak of the water it is about 1,000 acres.

7672. Does it often happen that by the narrow entrance there is a considerable run of tide?—A spring tide runs into the little village of Arkshaw.

7673. Is it not generally believed that the tide is the cause of bringing vessels in?—It is a small body of water. I do not think the influence of the tide is felt much out.

7674. But if a vessel were embayed it might have that effect?—No, I did not think so; because the wrecks are generally to the west. They would be drawn to the east if the tide had any effect.

7675. Where do the wrecks take place?—At any part of the strand.

7676. Do wrecks occur in the Rinna Shark Channel?—Yes, I knew of a vessel that run in there and struck.

7677. They are embanking the back strand, are they not?—No, the banking has not commenced.

Mr. Edmund Henry Alcock examined.

7678. (*Chairman.*) You are pilot master here?—Yes.

7679. How long have you been connected with the port of Waterford in that capacity?—Since 1851, seven and a half years now.

7680. Have you ever been to sea?—I have.

7681. For what number of years?—I suppose altogether 15.

7682. In what capacity?—I have commanded a ship of 590 tons.

7683. During the whole of that time?—No; I was in command of her when I gave up the sea in 1847.

7684. How long have you commanded vessels?—That one trip was my last; having more to do on shore and having seen enough of the trade, I gave up the sea.

7685. Will you state to the Commissioners any opinion you entertain, or will you state generally whether you concur in the opinion of the previous witness, Captain Bathurst?—I perfectly agree with him. I have frequently had visible proof myself of ships that entered the harbour in a sea that pilots could not attempt to face. I have seen the pilots leave the ships when they could not communicate to keep clear of the harbour altogether, even with a south-east wind; and I was an eye-witness of that case of the *Hotspur*. It is a matter of frequent occurrence that vessels come in and speak to pilot boats; and I have known ships wanting provisions that would not enter up, on account of the name which the bar has got, and they have employed the pilot boats to get off provisions, and have proceeded on their voyage afterwards.

7686. Have you anything further to state in addition to what has already been stated by Mr. Price?—I suppose it is perfectly needless for me to remark on the position of Waterford, you are as well acquainted as I am with its central position.

7687. What is the character of the pilot establishment here?—I, as pilot master, am stationed at Dunmore, and we have two cutters, two masters, 18 pilots, and two apprentices on that particular station, and always, day and night through the year, one cutter is under canvass, no matter how the wind is.

7688. Have you been successful in relieving vessels in distress by bringing them into the harbour?—Yes, there was the *Appleton*, she was lost, and not a soul saved. There was the wreck of the *Columbus*, she was lost on the Hook Point, it was impossible to face up harbour with a south-south-west wind. If you run to leeward under such circumstances there is nothing but certain destruction. The captain of the *Columbus* reached to the east and endeavoured to wear to the HookPoint. She struck, and the captain had to let go his anchor. I was in the pilot boat at the time. She became a wreck in the course of the night, and I believe 13 or 14 souls were lost. She was bound from New Orleans to Liverpool. That was on the 6th January 1852.

7689. Do ships bound to or from the Bristol Channel ever put into Waterford harbour?—In gales of south wind, if reaching up shore they lay to the west; and if there were safety here at all times of the tide they would come in, but with the bar ships rather avoid the harbour. They are afraid.

WATERFORD.

Mr. Edmund Henry Alcock.

23 Sept. 1858.

Chairman.

7690. Have you any opinion to offer as to the probability of Waterford becoming more extensively used as a port of call for orders in the event of a harbour of refuge being constructed?—From its central position, from its being the nearest in position to Liverpoool and the Clyde, and from its not being so far to leeward as Cork, the fair logical conclusion is, that Waterford will receive that attention to which, by her position, she is entitled when there is a safe anchorage for ships at all times of the tide, which there is not now.

7691. (*Capt. Washington.*) You mentioned that there were two pilot cutters?—Two on the outside station.

7692. How long have these pilot cutters been on the station?—Always, from time immemorial; at least, I believe since 1816; that was before my time.

7693. Where is their station?—Their station is at Dunmore. They always keep on the weather shoal. In westerly winds they prepare to command the harbour by going to windward.

7694. You spoke of the wreck of the *Columbus* of which you said you were an eye witness, had she a pilot on board?—No, she could not be boarded.

7695. How far in did she come?—When I saw her she was about half a mile or a mile to the south or south-south-west of Dunmore. I was in the pilot cutter, and instantly reached away towards her, but the sea was too heavy, and I was only able to witness the very awful scene that ensued.

7696. Do you remember what sail she was under when you saw her?—Under three close reefed topsails. She appeared to me as well as I could make out, as if reaching before making sail, but the captain said she would not weather the Hook.

7697. Did she make sail?—No. She appeared to me in the act of trying to set her mizen topsail, and could not do it.

7698. How did you say the wind was when she got on the bar?—It was about south-west. She was endeavouring to get out of the bay, but there was nothing but broken water all to leeward, and it was low water.

7699. How near was she ever to Dunmore?—Within a mile of Dunmore when I saw her.

7700. No nearer?—No; and she went ashore inside there.

7701. Do you mean just inside of the Hook?—Yes, not half a mile north of Hook Point.

7702. And how many lives were lost?—Thirteen.

7703. And the ship became a total wreck?—Yes; and next morning there was scarcely a vestage to be seen of her.

7704. Are there any means of saving life at Dunmore point?—Nothing, all is a matter of chance; and there is a fearful sea breaking in there.

7705. Is there not a coast-guard station?—Not nearer than Mather.

7706. What is the distance?—three or four miles.

(*Capt. Bathurst.*) There is a coast-guard station and rocket at Mather.

7707. (*Capt. Washington.*) Are the coast guard generally forward in saving life?

(*Mr. Alcock.*) Decidedly so.

7708. Do you know whether they came down on that occasion?—I know that rockets were firing on the shore, as well as on the ship, tar barrels were burning, every thing was done to save life. There is not a better hearted people in the world. I know the man well who saved the captain out of the sea.

7709. Have any other vessels been ashore in that immediate neighbourhood?—There was a steamer lost there years ago, the *Liverpool*, inside the Hook. The *Atlantic* got ashore on the back of the Hook, but was got off again. She lay about an hour.

7710. Seeing that it is the site of many wrecks, is it not desirable that it should be made a situation for life boats or rockets?—Decidedly, it would be an advantage there.

7711. (*Capt. Sulivan.*) Do you know the outer limits of the breakers on the bar. In the heaviest weather how far out does the sea break?—I have seen it break within half a mile of Credan Head.

7712. In the channel?—It is not a weighty sea, but a kind of spitting, curling, chopping sea. The water is so shallow that there is a very heavy send. It is just in the race of the tide.

7713. In what depth of water do you say that is?—18 or 20 feet.

7714. If the bar were deepened to 20 feet, do you think the sea would break through the channel?—The greater water in the tide way will tend to run the sea down. There would not be the same amount of broken water.

7715. Have you any experienced pilot here to be examined?—Yes; one of the most experienced pilots; and I have also brought the master of one of the cutters, Samuel Mitchell.

7716. (*Chairman.*) When vessels run in for refuge which is the part of the harbour that they lay in?—They go up the harbour.

7717. Simply for refuge I mean, not vessels bound for the port, but vessels who run in through stress of weather. Where do they generally anchor?—I have seen them anchor in all parts, but if in running up, the tide is at the flood, or the wind becomes light there is remarkably good anchorage inside Duncannon Fort. You can have as much as six, seven, and eight fathoms from Duncannon Fort up to Passage. From Passage to a mile above the anchorage is considered the safest. We have had some Australian ships there. The *Meander* anchored abreast of Parkwell; she was drawing 19 feet and lay there for the greater part of the winter.

7718. Then you would be disposed to say that all the way up from Duncannon Fort there is good anchorage for vessels to run into?—I do not know any better anchorage. There is first rate holding ground, and no sea to speak of.

7719. In the heaviest weather, blowing right in, have you ever seen the sea about Duncannon Point such that a four-oared boat could not cross it?—I have been there in a gale of wind, and I have seen boats drifting for salmon in full gales of wind.

7720. From Duncannon Fort outwards, drawing a line from Duncannon Point to Brownstown, can boats cross at all times?—In gales of wind from south-west they can come down on the weather shore, but you cannot expect them to round into the open sea.

7721. But my question has reference to this, to give an idea of the sea running up the harbour, say, from Woodsland to Beadey Bay, can boats get across?—May I ask whether you mean rowing or sailing boats?

7722. Rowing boats?—I am satisfied that there are times when rowing boats cannot pull across there, but that would be an exception.

7723. Have you any life boats?—None in this harbour. I applied for them myself, and the answer I received was that there was not sufficient loss of life in Waterford harbour, and that there were other places which had prior claims to ours.

7724. Perhaps the observation as to the prior claims might have had reference to the funds at the disposal of the society?—The secretary gave me to understand that the funds were limited.

7725. With reference to the evidence as to Tramore bay, what is your opinion as to that being the most dangerous part of the coast?—I am rather inclined to think that there is more loss on the Wexford coast, because if a vessel in a south-west wind is inside of Conibeg light, and cannot weather the Hook, she is sure to go ashore.

7726. Are you disposed to concur in the evidence of Captain Bathurst as to the necessity of removing the towers on Brownstown Point?—I never could understand the reason of it. If three towers were left on the west side it would be impossible to make a mistake. A man must see the three. But where there are two there is a possibility of a ship bringing the two into one, and causing them to have the appearance of only a single pillar, like the Hook, which is

only a single pillar ; especially, if you get sight of it for a moment, and then it is clouded by thick weather.

7727. Therefore, without doubt, you think they should be removed ?—In my opinion they are of no use at all, rather an injury than otherwise.

7728. (*Capt. Washington.*) Do you mean that you have thirty-five pilots ?—We keep the younger and fresher in the cutters. We keep the older men at the inshore stations.

7729. Do you make a distinction between sea pilots and shore pilots ?—We do not take the old men in the cutters.

7730. Then do I understand that you have 35 men in all ?—No.

7731. How many have you at Dunmore ?—Eighteen pilots, four apprentices, and two masters. We occasionally have more, but sometimes a pilot gets the offer to go as mate or master of a ship, and I never object when we can spare him with safety.

7732. You referred to the wreck of the *Columbus*. I should like to give you an opportunity of contradicting a rumour that she stood into Dunmore, under close reefed top sails, waited for a pilot, and not getting one drifted on to the bar ?—Assistance was sent to her immediately. The young pilots in the cutter could not board her. Anybody who had attempted it would have been lost.

7733. Then you are able from your own experience to contradict that rumour ?—Positively.

7734. You heard the opinions expressed as to colouring the Hook tower ?—That is with regard to the tower itself. It would make it more distinct and prominent. I think common sense shows that.

7735. The object is not so much variety of colour as to enable you in certain states of the atmosphere to see black objects before white objects become visible ?—I have seen on the American coast lights painted red and white longitudinally. I think the variety of colour draws attention sooner than when the light-house has only one colour.

7736. Are you not aware that there are lighthouses parti-coloured on the Irish coast ?—I believe that there are.

7737. Do you know the Maiden light tower ?—I cannot speak as to that.

7738. Are not the Maiden and other light towers coloured ?—I believe they are.

7739. Is the bouying of the harbour under your orders ?—Yes.

7740. Are they coloured differently ?—Yes ; port side all red and starboard all black.

7741. How long do you say the bouys have been coloured ?—As long as I have been pilot master.

7742. And I think you said you had pilot cutters cruising in Waterford harbour for many years ?—I believe 1816 was the first. I cannot give the date with accuracy, but within my memory there have always been cutters, and I recollect the harbour for the last 25 years.

7743. Do you know the cost of the whole of the pilotage ?—No, I do not ; the secretary can supply you with that.

7744. Does not the payment of the pilots pass through your hands ?—No.

7745. Is it a large amount ?—The pilots on any station average 4*l.* or 5*l.* a month, sometimes more, sometimes less.

7746. Are they considered to be well paid ?—They would like more if they could get it.

Mr. FARRELL was here re-called and examined.

7747. (*Chairman.*) Can you tell us how much is paid to the pilots ?—In the year ending the 31st March 1858 it was 3,768*l.* ; that included 256*l.* for pensions —that is, for the pensions of pilots and the widows of deceased pilots.

7748. And while the revenue of the harbour was 6,000*l.* the whole amount of pilotage was 3,768*l* ?—The revenue was more last year ; it was 9,000*l.* ; but that was beyond all precedent, and we do not expect a continuation of it.

7749. Then, whether the revenue be 6,000*l.* or 9,000*l.*, do you state that fully one-third or nearly one-half is laid out on your pilot establishment ?—Yes. It is illegal the way that it is going on. The pilot fund is too expensive. It is contrary to law and is not a proper distribution of expenditure.

7750. I only wanted to point out that the pilotage is on an extremely liberal scale ?—It is too liberal.

7751. That is your idea. There are two pilot cutters at sea, and 25 pilots ?—Rather more, 36 generally.

The examination of Mr. ALCOCK resumed.

7752. (*Capt. Washington.*) In all my experience I am not aware of any similar pilot establishment on so liberal a scale ?—I believe there was only one night during the last year when there was not one cutter under canvas, and that night she was forced to run. Of course where vessels are day and night under canvas that expense must be in accordance therewith.

7753. (*Capt. Sulivan.*) You say the buoying is under your superintendence ?—Yes.

7754. In the harbour ?—Yes.

7755. Including those on the bar ?—Yes.

7756. Are they maintained out of your funds ?—I never made particular inquiry.

7757. The Ballast Board of Dublin keep up the leading lights and they also keep up the buoys on the bar ?—No, they are kept up by the local Commissioners.

(*Chairman.*) Before we part with you, I have the pleasure of saying, that all the Commissioners concur in the opinion expressed by Captain Washington as to the creditable and admirable way in which the pilot establishment appears to be conducted.

The witness withdrew.

Mr. JOHN MURRAY examined.

7758. (*Chairman.*) What is your occupation ?—A pilot.

7759. How long have you been a pilot in Waterford ?—Since 1816.

7760. You have heard the evidence given by Mr. Alcock ?—Yes.

7761. Do you generally concur in it ?—I think he is perfectly right in all his remarks, in all he has said.

7762. Is there anything you wish to add to his evidence ?—In my opinion there ought to be 22 feet of water to enable ships of large size to come into the port. There was the *Malabar*, with 35 men on board and not a day's provisions. She was afraid to come in for want of water over the bar, and the captain asked me, as a favour, to come ashore and get him his provisions.

7763. (*Capt. Sulivan.*) You heard the evidence respecting those two towers on the point ?—I did.

7764. Do you know any reason why marks are required on that head to distinguish it. I mean the two towers ?—They are to mark the head on the east side of Tramore Bay. They are without any light, and I do not see how they can be mistaken for the Hook. If a man has his chart he sees where he is.

7765. Then would you object to their being removed ?—I would.

7766. You think them especially useful in thick weather when the West Point cannot be seen ?—Yes.

7767. If the tower on the Hook were painted in red

WATERFORD.

Mr. John Murray.

23 Sept. 1858.

Capt. Sulivan.

and white bands, do you think they would be sufficient to distinguish it at all times from those two towers, supposing those towers to be left?—I would prefer to see the Hook left as it is, white, for I have often seen it from the sea when I could not see land.

7768. If red bands were put, do you think it would be sufficient to prevent its being mistaken for Brownstown Head?

7769. From what you have heard of the wrecks in Tramore Bay have you reason to believe that the bay is often mistaken for Waterford from those two towers?—Yes; many a man I have heard say that he kept too close to the Waterford side of the harbour, got embayed and could not get out.

7770. If wrecks have occurred from mistaking the towers for the Hook why would you wish to continue them?—From mistaking the towers, wrecks are very rare. They are the same distance from one another and face to the sea, and they do not come into one until you are in the bay, and I rather think at the bottom of the bay.

7771. Then you are decidedly of opinion that it is better to keep the towers than to do away with them?—I am. It was shortly after the *Seahorse* was lost that they were erected there.

7772. (*Mr. Coode.*) What is the greatest number of vessels that you have known put into Waterford Harbour for shelter in a gale of wind?—200 sail and upwards.

7773. Upon what occasion was that?—A south-east and east-by-south wind.

7774. Is that a matter of common occurrence?—It is, and those ships haul away for Cork in consequence of the bar, there not being deep water.

7775. Is that within your own knowledge?—It is.

7776. You have boarded vessels where masters have told you that they were afraid to come in because of the want of water over the bar?—Yes.

7777. Do you know of any change in the depth of water?—Not within the last 40 years.

7778. Have you sounded?—I sounded when the buoy was laid down.

7779. When was that?—Within the last 30 years.

7780. Have you sounded since?—Yes, I have.

7781. Independently of bringing in vessels?—Yes, when I take out a heavy ship I take soundings.

7782. And you can say positively you have not known of any perceptible change within the last 30 years?—Not in the deep water channel.

7783. I speak of the bar?—I have seen ships strike drawing 18 feet.

7784. Have you armed the lead?—Yes.

7785. What did you bring up?—Shell, and sand and black mud come up on the anchor.

7786. Are you speaking now of cases where the anchor is dropped on the bar?—In gales we drop the pilot cutter's anchor there.

7787. And does mud come up?—Yes.

7788. What does it consist of?—Of black mud and some shells.

7789. Is it loose?—It is a little tough on the east side.

7790. How is it on the west side?—Not as much shells as on the east.

7791. Is there rock or stone in any part of the that bar?—No; not to my knowledge.

7792. You never saw any indication of rock or stone?—No, all small shingle.

7793. Does the anchor ever drag?—There is very good holding ground.

7794. You have never known an anchor to drag?—Never, unless in a very heavy gale; it might drag then.

7795. (*Chairman.*) You stated that you were desirous of keeping those two towers on Brownstown Head?—Yes.

7796. Is there any similarity in the appearance of Brownstown Head and the high land on the east side of Waterford Harbour?—I do not know what you mean.

7797. Does the land by Brownstown Head at all resemble the land on the east side of Waterford Harbour?—Yes, there is high land.

7798. Do they resemble one another?—They are very like, but then the land seems higher towards Waterford.

7799. And the entrance to Tramore Bay is so like Waterford Harbour that you think it is desirable to keep those marks to distinguish one from the other?—Yes, coming from the west you might mistake Tramore Bay from Waterford.

7800. That is a mistake which might be easily made by a stranger?—Of course.

7801. Therefore you think it very desirable that there should be some distinctive mark kept on Brownstown Head?—Of course.

7802. (*Capt. Washington.*) How far out is the indraft into Tramore Bay felt?—Between Brownstown Head and the three towers.

7803. It is felt as far as that?—The latter end of the west tide fetches into Tramore Bay.

7804. And you say from what you have seen that ships get in there in moderate but thick weather?—Yes.

7805. (*Capt. Sulivan.*) If the channel were deepened into Waterford, which would you prefer, a centre channel where the leading marks now are, or one to the east across the patch suggested by Mr. Stephens?—I should prefer the west channel, for generally when you are a cable's length from head of Cape Duncannon, the eddy current sends you up to the west, and if a vessel touches on the west shore there is not as much danger as there is on the other side.

7806. If the channel were made to the east it would not be straight, would it?—No.

7807. No leading lights or marks would be placed?—The present marks are very correct.

7808. But if the channel were to the east shore marks could not be put to carry you straight through the channel?—No.

7809. Therefore you would prefer the channel deepened in the present line of the leading marks?—Yes.

7810. Then you would prefer a channel to the west?—I should prefer in a heavy wind a channel to the west.

7811. That would take you right over the middle patch?—Yes, that is the course we run in a gale of wind.

7812. (*Capt. Vetch.*) Suppose the channel were cut through the banks, how wide would you require it to be?—About 400 yards, I should suppose.

7813. And to what depth do you think it ought to be carried?—I should like 20 feet at low water.

7814. Not less, but you would not object to a little more?—Three or four feet, of course, would be better.

7815. (*Mr. Coode.*) Will you tell us the least depth you would think necessary to ensure safety in bringing a vessel over the bar at all times?—From 20 to 22 feet.

7816. Then you think 22 feet would be enough at all times?—Yes.

7817. Was not your evidence to the effect that you would prefer a channel from Credan Head to Duncannon?—Yes.

7818. You have heard the evidence as to the state of the tides?—There is a draught from Credan Head to Dunmore bank near Bromhill shore. The first of the flood sets in along the Duncannon side. The first of the flood comes from Duncannon past Credan Head, meets the tide on the east shore, goes up to Passage to the west. If you are close to Credan the tide sets you along from the west side of the harbour.

7819. Does it take that course for the whole of the flood?—Not for the whole of the flood.

7820. For what time?—At least three hours; the bank keeps the tide off, but when the bank is covered it then sets in on the west shore.

7821. I do not quite understand your explanation as to the direction of the first of the flood?—If you

cross to Credan it goes in on the bank on the west side of the bar.

7822. Is it for half, three quarters, or for what period that it sets that way?—The latter end of the flood sets straight up to Duncannon.

7823. What is the greatest velocity of the flood stream at spring tides?—Two and a half to three knots an hour.

7824. How does the ebb come out?—At first the ebb comes over the bank from Passage to Lord Hill's place, inside the Hook about a mile or a mile and a half.

7825. Does the whole of the ebb continue to set in that direction?—Nearly so.

7826. At what period does it change?—The last quarter of the ebb sets towards Credan Head, or outside fair channel.

7827. And what is the greatest strength of the ebb tide?—About three knots, high spring tides with much freshet in the river.

7828. Then, considering the direction of the ebb, and the flood streams you would prefer a channel on the west side of the bar?—I would.

Mr. Samuel Mitchell examined.

Mr. S. Mitchell.

7829. (*Chairman.*) You are master of one of the pilot cutters?—Yes.

7830. How long have you been employed in that capacity?—Since 1851.

7831. And how long have you been connected with the port of Waterford?—20 years.

7832. You have heard the evidence of the two previous witnesses, the pilot master and Mr. Murray, the pilot?—Yes.

7833. Do you concur generally with the evidence they have given? is there any point on which you differ from them which you wish to state to the Commissioners?—Before I got on the pilot establishment I was employed in fishing large boats, 50 ton boats, from Saltees to Duncannon. We used to meet a great number of ships in that direction, all the ships going to Liverpool up Channel passed the Saltees. I have met ships in strong east winds short of provisions; at times I have met them disabled in strong winds, but the captains are always dubious about going into Waterford. I have often tried to get a few pounds out of them. They do not like to go in because there is not water enough, and they are afraid if once they get in that they will have a job to get out again.

7834. Have you anything further to offer to the Commissioners?—Yes, I boarded a ship dismasted, the *Lord Elgin*, from Benin to Liverpool, it was about 20 years ago. She made the Hook light; the captain thought there was not water enough, he let go the anchor and cut away the mast. A fisherman and a coast-guard boat from Dunmore boarded her.

7835. What became of the vessel?—She was towed up to Waterford by one of the screw boats.

7836. (*Capt. Sulivan*). Do you know what the pilotage is for ships of 20 feet draft of water?—For the winter half of the year 3*s.* a foot if you board her outside; that is, for all vessels of 12 feet 3*s.*, under 12 feet 2*s.* 6*d.*

7837. Do you know whether ships taking refuge have to pay anything besides pilotage?—Do you mean wind bound ships?

7838. Yes, wind bound ships?—Yes, they pay anchorage.

7839. Do you know how much?—Foreign vessels generally pay 5*s.* for anchorage.

7840. Do they pay any of the port dues?—I do not know.

7841. Does 3*s.* a foot take the ship into Passage?—Yes.

7842. What is paid for taking her out?—Not so much.

7843. How much?—I do not generally receive that; it is generally paid in Waterford for ships going out.

7844. (*Mr. Coode.*) Were you ever occupied in oyster dredging?—I have been trailing about the bar.

7845. Can you give us any idea of the nature of the ground on the bar?—It is very hard ground.

7846. Do the trawlers ever bring up boulders?—I never took any stone away.

7847. What have you brought up?—If the wind got light the nets would bring up mud; about the bar we used to get up oyster shells which cut the nets.

7848. You never brought up anything in the shape of stones?—Never; I have been towing a large net from Dunmore over the shoals, right out to the open Rhinehead and we never took any stones; I have been down there dozens and dozens of times.

7849. Have you a knowledge of the depth of water over the bar during the last 15 or 20 years? Do you know whether during the last 15 or 20 years any change has taken place?—I do not think there has been any change in it, not an inch.

Mr. Hassard examined.

Mr. Hassard.

7850. (*Chairman.*) You are Member for Waterford?—Yes.

7851. You wish to give evidence in relation to paragraph 13 in the report of the Committee of the House of Commons on Harbours of Refuge, with regard to the advantages of this port for the embarkation of troops?—I will merely add to that evidence that, if large vessels were able to get over the bar, it would be of great service. The *Abiona* is employed in the transport of troops to the East Indies; if she were able to get over the bar she would be able to go up to the bridge and lay alongside the trains of the Waterford and Limerick railway; she would find deep water alongside and cranes on the jetty head, and she would be able to discharge baggage or goods direct into trucks brought down to the quayside; and the lines with which that railway is connected give communication with Cork and Fermoy. There is another railway now being constructed through Mayo, and that line would be also brought into communication with the Temple House station depôt, with Curragh, and with Kilkenny; it is that information in illustration of the report of the Committee that I wish to give to you. Perhaps you will permit me to go to the question of saving life; when in London I applied to the Life Boat Committee, and they told me very liberally that they would be prepared to give us a life boat if a committee of Tramore would build a house and contribute a small sum, perhaps 20*l.*, to keep the boat in repair and exercise the crew; that committee has been formed, the secretary of it is in the room, the site for the life boat house has been determined upon, and I trust in a very short period to have an efficient life boat in Tramore Bay.

7852. (*Capt. Washington.*) I think that Captain Price told us that the secretary had replied that there were prior claims?—I do not know what Captain Price alluded to; I think he must refer to something much further back. I had a personal interview with the secretary of the institution in London, and I have told you the result of the application.

7853. And local funds have been obtained?—I rather think they have, but the secretary and treasurer is in the room.

7854. And I understand you to say that there is every facility in Waterford for embarking and disembarking troops at the railway station and for sending them all over Ireland?—Yes.

7855. (*Capt. Sulivan.*) You limited your remarks, I think, to the south of Ireland. Is not the Waterford and Limerick railway in connection with Dublin also?—Yes, with Dublin, and by Dublin with all the other stations in Ireland.

WATERFORD.

Mr. Hassard.

23 Sept. 1858.

7856. (*Capt. Vetch.*) You referred to a large transport ship?—Yes, the *Abiona*.

7857. What amount of water did she draw?—15 feet.

7858. If the bar were deepened to 22 feet?—She could come in at any time of the tide, for there is 33 feet of water at Waterford bridge.

7859. (*Mr. Coode.*) What depth of water is there alongside these quays at the railway?—I know it is about the deepest water in the river.

7860. Is it as deep as any other part of the river at that point?—I should say so.

7861. Can you tell me when the railway communication with Fermoy is likely to be completed?—I rather think in a year, or not exceeding a year and a half. I have been informed that the water alongside the jetty has been sounded, and that there is 20 feet at low water.

7862. And cranes will plumb from the railway trucks over into the vessels?—They are constructed for that purpose.

(*Chairman.*) Is there any person present who wishes to tender further evidence with respect to this inquiry?

No answer.

Sitting at Waterford closed.

WEXFORD.

Friday, 24th September 1858.

PRESENT:

Admiral HOPE (Chairman).

Captain WASHINGTON.
Captain SULIVAN.
Captain VETCH.
Mr. COODE.
Mr. EVANS, Secretary.

Mr. CHARLES ARTHUR WALKER examined.

WEXFORD.

Mr. Charles Arthur Walker.

24 Sept. 1858.

7863. (*Chairman.*) In what way are you connected with the port of Wexford?—I am one of the harbour commissioners under the Act of Parliament. I should first mention that, with regard to nautical knowledge, I have none, and with regard to the harbour, that is a matter on which I cannot speak, except so far as to give a general opinion.

7864. Have you any statement which you wish to make?—Well, the statement is simply this,—In consequence of the notice of this Commission, the Mayor and Town Council, and also the members of the Commission under the Act of Parliament for the harbour, appointed committees, and these committees met, took depositions, and agreed on what would be thought the most desirable for the port. We drew up, and the substance of the report is to show, in the first place, the importance, not merely to the locality, but to the trade of the nation at large, in having near the coast, where a great deal of danger exists, a refuge, even an auxiliary refuge, to a general harbour of refuge, where vessels, instead of having to go to a great distance might repair for refuge when they get near the Tuskar Rock. It would be a great convenience to have an auxiliary place of refuge, which would be easy of entrance and safe; and with that view, we feel that if the harbour of Wexford could be so improved and made available for that purpose, well and good. In the next place I wish to point out what the opinion, the general opinion of the people here, is as to Ballygeary being a safe place, and to give their reasons why that would be an advantageous place. In the first place, when a vessel is at the Tuskar Rock, she can run for that place by keeping the natural channel, which is deep water, and which runs into a deep place. There is for land shelter Ballyteigue. The lighthouse of the Tuskar Rock would act, in the words of one of the witnesses, as an approach to guide into that harbour, and if the entrance into that auxiliary harbour was properly lighted, no stranger could mistake its entrance. They give as an illustration, that many vessels have been saved, which, taking advantage of the natural advantages which that place possesses, sailed in and were saved, which, in all human probability, would have been lost had they run for one of the more distant shelters. There is also the advantage, that in any wind they can sail out of it again. The anchorage too is good, and no vessel drags unless she breaks her cable or by other accident. Large vessels have taken advantage of it and been saved. I think that is the general line, and I shall show the national advantages as well as the local ones if it is allowed. I shall show by evidence that more vessels, outward and homeward bound, pass close by Wexford than by any other point in the United Kingdom, except in the Downs. There is no harbour so advantageously placed. There is no harbour between Castle Haven and Waterford, available for that purpose, where vessels pass so near the coast, and if an auxiliary harbour were made there, not only would it materially serve the port, but it would be a national advantage by the saving of life and property.

7865. Will you proceed?—You will excuse me if my statement is rather rambling.

7866. Anything you wish to say we shall be happy to hear?—There are many reasons why you would obtain the object sought for. A harbour of refuge in the neighbourhood of the danger would be of much greater service than having to run a great distance, as back to Kingstown or running to Waterford, or keeping the open sea. Then there are a few things which I must incidentally mention, just to show that even in a national point of view it would be of use. It would serve our fisheries materially as a harbour of refuge, which would be near the fishing grounds, because the distance which the fishing boats have to go before they can get to the ground, and the bad accommodation which they have, both injures the vessels and prevents all but the larger class of boats which can remain out in a rough sea from going out. If there were a harbour, it would be available near the fishing ground, of course it would be a great encouragement to the fisheries, and in a national point of view it would be useful, as they form a very good nursery for the Royal Navy. There are a number of men at Wexford,—men and lads—who always prefer a seaman's life. I do not know that there is anything further that I need say.

7867. Among the evidence that you have tendered is there any engineering evidence?—No; the only engineer we can refer to is our county surveyor.

7868. I see a number of names here, are they all seafaring men?—They are all seafaring men.

7869. (*Chairman.*) I should like Mr. Farrell to be summoned.

(*Mr. Walker.*) By all means.

Mr. MARK DEVEREUX examined.

7870. (*Chairman.*) In what way are you connected with the port of Wexford ?—I am a pilot master.

7871. For how many years have you held that situation ?—For 26 years.

7872. You are well acquainted with the banks and the entrance of the harbour ?—Yes.

7873. Will you describe to the Commissioners what change has taken place in them since your knowledge of them ?—Of the outside banks ?

7874. Yes.—I am not aware that any changes have taken place.

7875. What is the nature of the bank marked on the chart Dogger Bank ?—Sand.

7876. There is another bank separate from the Dogger Bank by a small swashway, part of the Dogger Bank, I presume ; is that sand too ?—Yes.

7877. As to Hantoon Channel, has that always existed in its present state ?—It has always existed in its present state in my time, sometimes better, sometimes worse. It chokes up sometimes in bad weather. The east winds send in shingle, and so on.

7878. In the Hantoon Channel I see less depth of water. Is this the fact, and have you ever known it to be less ?—I have.

7878-*a*. What is the least depth of water you have ever known it ?—Five feet.

7879. What has been the greatest depth in the shallowest part of the channel within your recollection ?—Seven feet at low water.

7880. Has any change taken place in the channel up to the town, within your recollection ?—There has been a trifling change, not much.

7881. None of consequence ?—No.

7882. I see a channel here, which runs from Rostare Point to the embankment ; has that always remained in its present state, within your recollection ?—It has.

7883. Did you know the harbour before that embankment was made ?—I did.

7884. Describe to the Commissioners what change that embankment was made in the harbour, if any ?—Since the embankment was made, the shoals on the north side of the bar, out towards Dogger Bank, have increased very much.

7885. And the embankment on the south side, has that produced any change in the harbour ?—I don't know, except that the point is nearer to the fort. They are become much more shoaled, and extending towards the point.

7886. (*Capt. Washington.*) You have stated that the north part of the Dogger Bank has increased since the northern embankment ?—Yes, very much.

7887. State how you know that ?—By observation, and by information.

7888. Has that improved or made worse the approaches to the harbour ?—Why, I should say, it has made them worse.

7889. By what channel ?—By the north channel.

7890. The north channel is not in so good a state as formerly ?—Not near so good.

7891. Can you name any period at which it was better ?—About 1842 or 1843.

7892. When was the north embankment made ?—I can't say.

7893. Was it not in 1850 ?—I should say it was made before that.

7894. Was it made in 1845 ?—I should say it was commenced, at all events, if not finished.

7895. Did the Harbour Trustees receive any indemnity for taking away so much slob land from their harbour ?—I am not aware that they did, except that the Embankment Company were obliged to deposit a certain sum of money for any supposed injury which might occur.

7896. Do you think there has been any injury ?—Injuries have been done to the bar and the shoals of the harbour since the mudlands commenced.

7897. That is your opinion ?—Yes.

7898. You are not aware that the Harbour Embankment Company engaged to pay 20,000*l.* for the enclosure of this land ?—I was in London at the time.

7899. Were you not one of the witnesses at the time they obtained their Act ?—I was.

7900. Were you not aware of the nature of that Act ?—I think that was made a condition.

7901. You say that Rosslare Point has shoaled ?—I know that Raven's Point, on the spit, has gone out.

7902. Has Rosslare Point ?—I can't say ; I know that the Dogger Bank has increased, and come in towards the port. The sand is extending from the spit, all the time, for these many years back. I should say eight years, at all events.

7903. The Dogger Bank is extending to the south ?—Yes, very much.

7904. Has Hantoon Channel become deeper or shoaler ?—I can't say. There is no great difference now. Some part is deeper, but the approaches to it are just the same.

7905. Does the sea break away the sand beach near the North Ball ?—It does.

7906. Does it carry a quantity of sand into the channel ?—It does.

7907. When washed out is it deposited near Rostare ?—I don't think that a great deal went into the channel.

7908. Do you know what caused the sea to break in ?—The sand has been rather growing up these two years past.

7909. But what was the cause ?—Because the south tongue of the Dogger Bank does not extend so far south-west, so that there is more range coming in from the sea than at present.

7910. But you said that the Dogger Bank had shifted to the south ?—Yes.

7911. But before that, was the bank broken away ?—It was.

7912. Is the beach protected by grass ?—The outside beach.

7913. Yes ?—There is nothing there.

7914. Is there not grass on the top of the sand hills ?—Not at present. There was some bent grass.

7915. Then there was bent grass there formerly ?—Yes.

7916. What has become of it ?—It is washed away.

7917. Was it got for making baskets ?—No.

7918. The bent grass is never taken away ?—Very rarely, I have never seen it.

7919. Is the buoying of the channel under your orders ?—Partly.

7920. Is the channel properly buoyed up to the town ?—I should say it is.

7921. Black buoys on one side, and red on the other ?—Yes, there may be another added at Dundalk. There is a buoy, it is merely put on the stones, it is merely placed as a guide to prevent vessels going on that spot.

7922. How long has it been there ?—I should say two or three years.

7923. Is it to remain there ?—I think the harbour-master has so ordered.

7924. If it is to remain, is it not desirable that it should be coloured ?—Yes, certainly, if it is to remain. I should say it should be red.

7925. You mean black ?—Oh yes.

7926. How many pilots are there belonging to Wexford ?—We are 13 at present, 13 sea and 3 Hull pilots.

7927. Have you any vessel cruising in the offing ?—Yes.

7928. To put pilots on board ships ?—Yes.

7929. And you do so ?—Yes.

7930. (*Capt. Sulivan.*) Which channel do you allude to, round Ravenspit, or straight out to sea ?—Round Ravenspit.

7931. What water have you known in that channel ?—I have known 12 feet.

7932. At low water ?—No, high water.

WEXFORD.

Mr. Mark Devereux.

24 Sept. 1858.

Capt. Sulivan.

7933. What water, then, at dead low water ?—4½ or 5 feet.

7934. That is 10 feet at high water ?—Yes, 10 feet at high water.

7935. You have never known more than 12 feet ?—In the other channel.

7936. Then there is about 2 feet difference in these channels ?—There is.

7937. The channel which goes out straight in 1845 appears to have had only 4 or 5 feet of water in it; that was before the embankment, was it not ?—I can't say how long.

7938. The embankment was not made in 1845 ?—It may have been commenced.

7939. What water have you known in the channel ?—What channel ?

7940. The straight channel ?—In the channel direct out, 12 or 13 feet.

7941. Seven feet at low water ?—Yes, more.

7942. When was that, do you recollect ?—I can't exactly tell you the time.

7943. Tell us about the time,—in 1845 ?—In about 1840, I should say.

7944. But since 1845, when by this chart there appears to have been 5 feet only in that channel, are you aware whether any deeper water has been in it ?—No, I don't think there has.

7945. Is there now ?—It is dry.

7946. The eastern channel is quite dry, then ; it does not exist at low water ?—No.

7947. North-east, between that and Ravenspit, there was, in 1845, 7 feet of water at low water ; does that exist ?—Yes.

7948. Is there as much water as there was ?—No, less water.

7949. Is that the best of your north channels ?—Yes.

7950. With respect to the Hantoon Channel, since the dredging commenced, in July last, have you been able to take in vessels which you did not before ?—No.

7951. Have any larger vessels come in through the Hantoon Channel in the last two months than what you were in the habit of taking in before ?—No, not so large.

7952. Then the channel is not wider in consequence of the dredging ?—No.

7953. Do you think it is filling up ?—The work has commenced at the centre ; both the ends are left as they were.

7954. Exactly, there was a little narrow ridge thrown up ?—Yes, that is what I spoke of.

7955. Is that dredging away ?—No.

7956. Then there is no more width in that channel since the dredging began ?—No.

7957. (*Capt. Vetch.*) What is the rise and fall of the tide in the channel ?—Five or six feet.

7958. What is the rise and fall of the tide at Wexford ?—Six feet, I should say.

7959. Is there five or six feet fall at Rosslare Point ?—Yes.

7960. Then there is little difference between the rise of the tide there and at Wexford ?—Certainly.

7961. How long is the tide in running from Rosslare Point to Wexford ?—There is a difference of about three quarters of an hour.

7962. What is the present state of the Coal Channel to what it was 10 years ago, worse or better ?—I don't think there is any alteration in it, except it may be from the discharge of the lighters which have thrown stuff into the middle of the channel.

7963. That fills it up ?—I should say so.

7964. With regard to the North Channel, is that better than it was 10 years ago ?—In the main or middle channel of the North Channel there is a bed of mussels or oysters, but there has not been much variation for many years.

7965. How long have you been acquainted with this place ?—Since I was born.

7966. Did it ever occur to you that the sea had broken across the North Sands ?—Yes, I have seen it.

7967. You have seen it run across the North Sands ?—Yes, I have.

7968. Have you ever seen it in old times run across the sand hills near Rosslare Point ?—I have seen it.

7969. Has that been an uncommon circumstance or not ?—Not at all uncommon.

7970. (*Mr. Coode.*) You have stated that the Dogger Bank is sand, and that the accumulation in the channel is sand and shingle ?—Yes.

7971. How have you ascertained that this accumulation differs from that in the Bank ?—I should say that it goes out with the ebb tide towards the Dogger Bank.

7972. How have you ascertained that this material is different in the channel ?—By seeing it.

7973. In the bottom ?—By taking it up.

7974. How taking it up ?—In buckets ; in various ways when I was lying aground on it.

7975. You said that five feet was the least depth and seven feet the greatest ; has this change extended over long periods, or have they been frequent ?—Over long periods. As to Hantoon Channel it has been a long time ; it has been with large variations for 10 years.

7976. Then the change you speak of has extended over long periods of time ?—It has.

7977. Do you apprehend that the change you have spoken of in the North Channel has been greater since the embankment was formed ?—I should say much more.

7978. Towards the Ravenspit ?—Yes.

7979. Has that change been so marked that you are able to form an opinion whether it is due to the formation of this embankment or not ? Have you any opinion on the point at all ? Has the change been due or not to the formation of this embankment ?—I have no opinion to form whether the change is due or not to the formation of the mud bank, but I know that for the last 26 years, until three or four years ago, there was much better water, and not at all the accumulation of sand as at present.

7980. Then the change in the last few years has been much greater than at former periods ?—Yes, very much.

7981. Can you give the Commissioners any reason for that change ?—I cannot give you any reason further than that the force of the tide does not come sufficiently down from the town as it formerly did, and its reaches cause an eddy on that side more than formerly.

7982. Do you mean that there is a stronger tide through the Coal Channel than formerly ?—No, not much.

7983. I understood you to say there was a stronger tide ?— The tide is stronger through the Coal Channel, but the action is stronger in the lower channel.

7984. Then that is not as it used to be ?—It is not as it formerly was.

7985. How do you account for that ?—I do not know.

7986. Has not the operation of the tidal water been cut off by the construction of the north embankment ?—It has.

7987. Can you say whether that has affected it in any way ?—I should say it ought to have some tendency towards it.

7988. You say there has been no change in the main channel for many years ?—No.

7989. I think you said something about the accumulation of mussels and oysters ?—Yes, in the harbour.

7990. Not in the main channel ?—No.

7991. Down to what point ?—From Gall Bar down to about opposite the chimney of the engine house.

7992. The north engine house ?—Yes.

7993. And there has been an accumulation of mussels and shells within the last few years ?—Yes.

7994. When was your notice first directed to that accumulation ?—Four or five years ago.

7995. Then we may fairly conclude there is no accumulation of sand and shingle in that channel at any rate ?—I should say not.

7996. If I gather rightly what fell from you, you think no benefit has been derived from the dredging operations ?—There may be some in time ; at present there is no difference.

7997. No additional depth of water has been gained by the dredging operations up to the present period ?—None.

7998. Do you imagine that any additional depth may be gained if a different course were pursued ? I ask with a view to any suggestions which you may have to make ?—I have not the slightest doubt that if the dredger had worked continuously since it came here it would have made a very good channel.

7999. Could she have worked more frequently than she has ?—Yes.

8000. Do you mean that she has not been at work when she might have been ?—Yes.

8001. Can you give us an idea as to how often that has happened ?—For a week or a fortnight she did not work more than two days.

8002. When the weather permitted ?—I speak of the smoothness of the water.

8003. You think it might have worked a tide many times when it was lying idle ?—Undoubtedly.

8004. Can you give us any idea of how many days or how many times ?—I cannot say.

8005. State something approximate—give us an idea, because many and few are comparative terms ?—I cannot say.

8006. Has it been 5 days, or 10 days, or 20 days that the dredger has not worked when she might have done so ?—I think you may say 40.

8007. When she might have worked ?—Yes.

8008. Do you keep any record of the weather ?—I do.

8009. Can you, by reference to that record, give actual days that she has not worked when she might ?—I suppose I can.

8010. Will you make reference to that, and give us some idea from it of the actual number of days that she has not worked when she might ?—I will.

8011. Will you refer, and give us a statement within a few days of how often she has not worked ?—Yes.

8012. You must have had considerable experience of the harbour of Wexford ; can you offer any suggestion where we should place this dredger so that she would work to the best advantage ?—I think she was doing very well as far as she went ; but there was a loss of time when she didn't work, when the weather permitted her.

8013. You think she has worked in the right place, but that there have been many occasions when she might have worked and did not ?—Yes.

8014. Are you quite confident that this breach through the Ball is not owing to the removal of the bent grass ? Have you had opportunities of observing ?—I have resided on the spot for the last 26 years.

8015. You speak with some confidence. Have you ever seen people tearing up this bent grass ?—Yes.

8016. I believe it is generally used for thatching houses ?—Yes.

8017. Is the practice to cut it, or to tear it up by the roots ?—They generally cut it.

8018. Then if the roots remain they would act to preserve the sandbank ?—I should say better than if it were not cut.

8019. (*Chairman.*) In the report which I hold in my hand, I see it it stated that, with the exception of the Downs, a larger number of vessels pass by Wexford than any other port of the kingdom. Can you corroborate that statement from your own experience as a pilot ?—I should say there is.

8020. Can you furnish any return of vessels which pass ?—Yes.

8021. Will you point out to me Ballygeary Bay, or describe it. Is that correctly marked by Captain Washington on the chart produced. (*No.* 2049 *put into witness's hand*) ?—I have marked it.

8022. Are you acquainted with this report. Have you read the report of the Committees of the Town Council and Harbour of Refuge Commissioners ?—I have heard it read.

8023. In that report Ballygeary Bay is stated as an eligible site for a harbour of refuge. Do you concur in that opinion ?—I do.

8024. Will you now state to the Commissioners your reasons for doing so ?—In the first place it is a bay which nature has formed as a harbour. From the south and south-south-east to the north-north-east it is safe for any vessel to anchor. In the next place, you have good water for ships drawing 20 to 24 feet water to come in through the south channel, provided it were buoyed and lighted and beaconed to guide vessels through. The only difficulty is that the tides run very strong between there and the Tuskar. It is difficult to come in with a fair wind unless you have a very good guide. You must have a light to come in by night, and in the daytime you can come in very well. It is the turning point for all vessels bound for ports in the British Channel this side of England. They all make the Tuskar, and get a sight of it. Ships, both foreign and outward bound, generally meet contrary winds—some bound out, some bound up—where it is difficult to fetch a harbour of refuge, and they have to go to Kingstown, Holyhead, Liverpool, and various other places.

8025. Have you anything further to state ?—I should say it would be a great thing for our trade, and for fishermen generally, if they could get a harbour of refuge near their fishing ground. The whole day is taken up in getting to the fishing ground, and they are obliged to return into port as quick as they can. Foreign vessels, too, coming in, are obliged to stop in the bay and discharge a portion of their cargo before they can come in here.

8026. Has the bay ever been surveyed, or any plans formed with a view to a breakwater for the purpose of making Ballygeary Bay a harbour of call ?—I can't say there ever was. It was talked of some time ago. Mr. Brunel surveyed it several times. I had the honour of being with him.

8027. Do you know whether any plan exists, or whether the estimate was ever made ?—No ; I do not think there ever was.

8028. What objection is there to a vessel anchoring in South Bay. In a south-west wind, it appears to me, the protection is perfect ?—Perfect for a ship to come and anchor.

8029. In a south-west gale the protection in South Bay is perfect ?—Perfect.

8030. In a south-east gale would you say that protection is not so good, but still is good ?—There are instances of vessels riding out heavy gales in it.

8031. South-east gales ?—Yes ; the holding ground is excellent so long as the ground tackle will hold.

8032. From your description of the ground, and the nature of the bank, it appears to me that it ought to be considered very good indeed in south-east gales. Is it so ?—Yes.

8033. In a heavy north-east gale, I presume, there is a heavy sea in South Bay ?—There is a good run ; there must be on shoal water.

8034. Have you ever known a vessel ride out a heavy gale from the north-east in South Bay ?—Frequently.

8035. Then would you consider it sufficient, for the purpose of making this South Bay available as a harbour of refuge, that it should be properly buoyed and lighted without the expense of a breakwater ?—It would be a very excellent thing to have it buoyed, but I should prefer a breakwater with it.

8036. From what place would you propose to run this breakwater ?—I would come nearly as far as White House. I would not connect it with any portion of the mainland.

8037. Be good enough to mark on the chart where

WEXFORD.

Mr. Mark Devereux.

24 Sept. 1858.

Chairman.

you would place the breakwater ?—I have marked on the chart (No. 1772) where I would place the breakwater.

8038. At what distance from Greenore Point are the best fishing grounds ?—I should say from three to four miles.

8039. In what direction ?—Opposite to Wexford, between the Dogger Bank and the Hole Bay ; we generally obtain oysters between the Long Bank and the Dogger Bank, a little to the north and a little to the south of it.

8040. And was it to that fishery that you alluded when you told us of the advantage of a harbour of refuge ?—Yes.

8041. From your experience as a pilot——I have been a shipmaster for eight years, sailing out of Liverpool.

8042. Oblige me by hearing the question out. In your experience as a pilot, do you know of many vessels which have passed this port which would have liked to put into it if it were easier of access ?—I have heard of many and know of many, when I was a shipmaster myself, that have put into Kingstown and Holyhead. I have been bearing up from the Tuskar and lodged in Holyhead seven weeks wind-bound.

8043. Were you a pilot before you were pilot-master ?—No, I was a shipmaster.

8044. (*Capt. Washington.*) Do you know the number of vessels sailing in and out of Wexford annually ?—I have them down.

8045. Can you furnish a return ?—Not at present.

8046. But later ?—Yes.

8047. And what number of fishermen are there in the port?—I think there are 13 or 14 smacks of 22 tons.

8048. How many men to each smack ?—I should say six each. There are others besides.

8049. And the fishing ground is near to Wexford ? —North and south bays.

8050. Are the Long Bank and Holder's bed buoyed? —They are.

8051. How long have they been buoyed ?—Within two years.

8052. By whom ?—By the Ballast Board of Dublin.

8053. (*Capt. Sulivan.*) When you put back off the Tuskar how was the wind ?—South-south-west.

8054. The bay would have afforded just as much shelter as if there were a breakwater, would it not ? —I should prefer it if it were blowing from the north-east.

8055. South-west generally goes round to north-north-west ?—Lately they have gone much to the east.

8056. Do ships use the bay commonly with a south-west wind ?—They do.

8057. Does the sea break on the bank with an easterly gale ?—Yes, right along it.

8058. What wind would the breakwater be specially required for ?—From north-east to south-east.

8059. You would not close the south entrance ?—No.

8060. Then the south-east would come in just the same through the channel, would it not ?—I should not think it would.

8061. (*Mr. Coode.*) Referring to this occasion when you bore up to Holyhead and were wind-bound for seven weeks, what prevented you going into South Bay; you knew it very well ?—I knew it, but not so well.

8062. But what prevented you going in, was it solely the fear of the wind going round to north-east ?—Yes.

8063. That and that only ?—Yes.

8064. Do the tides flow strongly round Holder's Bed and Greenore ?—Yes.

8065. How much ?—Four knots.

8066. Do you not think that the current would be increased by a breakwater ?—I don't think it would be. We have not many obstacles. We have some rocks, but they are rather a protection than anything else if they were lighted sufficiently.

8067. Assuming that it is not thought desirable to incur any outlay to make a breakwater such as you have sketched, which outlay we will assume would be very large, can you suggest anything else which might be done to improve this bay ?—If a light ship were moored in the centre of the channel that would be sufficient. There is a beacon on Carrick Rock.

8068. Do you think a light wanted ?—Yes.

8069. Do you think it is wanted enough to justify the expense ?—I think it much wanted.

8070. Do you think more vessels would come if there were such a light ?—I do.

8071. Do vessels frequently bring up there for refuge ?—Very frequently.

8072. How many have you seen at a time ?—Six or seven.

8073. Is that a matter of common occurrence ?—Yes.

8074. How many times in the winter season, say on an average ?—50 times.

8075. Large vessels ?—Large and small, varying from 300 to 50 tons.

8076. I understand it is not commonly used by large vessels ?—Most of the larger vessels come to the port.

8077. I speak of vessels going to South Bay for refuge.—No, it is not.

8078. (*Chairman.*) Will you tell me from what quarter your heaviest gales of wind blow ?—We have latterly had the heaviest gales from the north-east. South-east and south-west were the heaviest gales we experienced before the last few years.

8079. How do they begin ? Do they begin from the south-west, go round to the north-east, and increase and blow hard ?—They do.

8080. And the south-east, how do they begin—generally with what kind of weather ?—With wet weather ; they generally back out towards the east.

8081. From south to east ?—Yes.

8082. After blowing hard do they generally veer round to north-east ?—They generally veer round to north-east.

8083. And blow hard ?—Yes.

8084. How do the south-east gales end ?—From north-east they work round to north-west and die out.

Mr. McCan examined.

Mr. McCan.

8085. (*Chairman.*) You are harbour-master of Wexford ?—I am.

8086. How long have you held that situation ?—Seven years.

8087. And how were you previously occupied ?—I have been master of a vessel. I have been in the foreign trade, and in the coasting mercantile business.

8088. How many years were you at sea ?—35 years. I was with Lord Nelson when he was killed.

8089. For how many years were you master of a vessel ?—I was master of a vessel at the time I was pressed illegally.

8090. That is irrelevant to our present inquiry. It will very much facilitate our business if witnesses will abstain from any remarks which are irrelevant. —That was just a mere remark made to show that at that time I was at sea.

8091. What was the class of vessels you generally commanded ?—Sailing vessels. I never commanded a steamer.

8092. Of what size ?—From 150 to 50 tons.

8093. And in what direction did you generally trade ?—Liverpool, Glasgow, Bristol—different ports on the coast.

8094. Have you seen this report of the committee appointed by the Town Council ?—No.

8095. There is in it a statement that, with the exception of the Downs, more trade passes by Wexford than any other part of the United Kingdom.

Should you be disposed to concur in that statement? —I should.

8096. Are you able to furnish the Commissioners with a return showing the number of vessels entering or leaving the port of Wexford for the last five years? —From 600 to 700 a year.

8097. Can you at your convenience furnish a detailed statement, showing the number and size of vessels, whether coasting or foreign?—I can, in the course of a little time.

8098. Will you be good enough to do so at your convenience, with any other remarks that may suggest themselves to you to forward the object of our inquiry?—I will.

8099. Is it the general opinion that if the access to this port was made better than it is, vessels would resort to it for the purpose of refuge, vessels not bound to the port?—I think they would.

8100. From stress of weather?—Yes, from necessity.

8101. State the ground upon which you have formed that opinion—At present they want no such thing, because there is no harbour to run for, in fact some of our own vessels are obliged to run from bad weather and easterly winds, and from there being no water on the bar sufficient to take them in.

8102. So that perhaps, I may say, that from the bar the port has got a bad character with vessels which don't belong to it?—It has.

8103. You have heard the evidence of the previous witness with respect to Ballygeary Bay?—I did not.

8104. What opinion have you to offer to the Commissioners as to this Ballygeary Bay being made a harbour of refuge?—I think it would be a most important thing for the trade and for foreigners also.

8105. But this bay is already so well protected by nature that it appears to me not to require much more. What is your opinion, will you say what you think about it?—It is very good for the south-westerly winds, and for winds shifting from south-west to north-west, though otherwise it is very much exposed.

8106. In a heavy south-west gale could vessels ride in safety in South Bay?—No, certainly not.

8107. Has it ever occurred in your experience that a vessel has ever gone ashore in a south-westerly gale?—Yes.

8108. Can you state the name of the vessel or about the time?—I can; it was a vessel belonging to Mr. Hawker, of Bristol, which was broken up.

8109. What size was she?—A brig of 260 tons.

8110. Did her cable part?—I don't know whether she dragged or whether her cable parted.

8111. Is the holding ground good?—Pretty good.

8112. Only pretty good?—Sand, you know.

8113. Have you ever seen the sea break along the bank with the wind from the north-west?—At high water a heavy sea flows in across the bank.

8114. Under such circumstances, would a four-oared gig live in the bay?—No, not in some gales.

8115. I speak of the wind blowing across the bank? —She must be a good smart boat to do it.

8116. When the tide falls the sea falls in the bay too?—The bank is always dry, it does not make any perceptible difference.

8117. As respects the fisheries, where is the best fishing ground?—In the south and north bay.

8118. (*Capt. Sulivan.*) How long have you been harbour-master?—Nearly seven years.

8119. Did you know Wexford much before the north embankment was made?—I have known it all my life.

8120. Is there any difference in the rise and fall of the tide since that embankment was made?—Yes, six or eight inches.

8121. Then a larger body of water comes to the quay than there did before the embankment?—I should say so.

8122. (*Chairman.*) From what direction do your heaviest gales blow?—The heaviest gale that we feel is east to south-east, and south-south-east, right in shore.

8123. How do shore gales commence, from what quarter do they begin to blow. Describe the weather previously?—Generally with thick weather. They commence from the east, go round to south-east and south-south-east, and increase as they go round.

8124. Or they go round from south?—They back round to east-south-east, and sometimes round to north-east.

8125. Do they frequently go round to north-east, and then blow hard?—They do.

8126. For how long?—Sometimes twenty-four hours, sometimes three or four days.

8127. How do easterly gales end?—Cease a little, and then become moderate. I have known them continue for a week. It is a very bad wind for the harbour, for the fishermen cannot get out to fish, which makes the people very distressed in consequence.

8128. There are embankments in your harbour; by whom were they made?—By the Harbour Embankment Company.

8129. Do you know if there is any gentleman present who can give evidence on the part of the Company; any gentleman connected with the Company?—I think Mr. Farrell will be very efficient evidence; he is the engineer.

The witness withdrew.

Mr. Walker stated that Mr. Redmond would give evidence with respect to the Harbour Embankment Company.

Mr. Martin Boen examined.

8130. (*Chairman.*) What is your occupation?—A pilot.

8131. How long have you been a pilot?—Seven years.

8132. What were you before you were a pilot?— A sailor.

8133. In what vessels were you chiefly employed? —In coasting vessels, sometimes foreign.

8134. Are you in the habit of going to meet vessels out at sea?—Yes.

8135. Within your knowledge, have many vessels passed the port without coming in, from the circumstance of the access not being easy? Has it frequently occurred that vessels have wished to come into the port from stress of weather?—Yes, many of them.

8136. During the last 12 months how many such cases have occurred within your own knowledge? —To the best of my knowledge, perhaps six or seven.

8137. What description of vessels were they?— All sorts; all rigs.

8138. Coasting, or foreign?—Foreign and coasting too.

8139. What is the greatest draught of water that you can remember a vessel coming in with at low water, with a gale blowing from the east?— 20 feet; from that to 25 feet.

8140. At low water?—Yes.

8141. But I mean Wexford Harbour, not the bay? —From six to seven feet.

8142. Vessels from six to seven feet can come in in any weather?—Yes.

8143. Have you made any use of Hantoon Channel? —It is the one that we make most use of; it is the safest bar.

8144. Do you mean by the safest bar, that there is much less sea?—Yes.

8145. How far east must the wind be in order to give facility for getting into Hantoon Channel?—

WEXFORD.

Mr. Martin Boen.

4 Sept. 1858.

Chairman.

The wind east-north-east is right out of Hantoon Channel.

8146. Can you get in with the wind at south-east?—Yes, well.

8147. Can you get in with the wind at east-south-east?—Yes, as far as east-and-by-south.

8148. Have you ever known vessels get ashore on Rosslare Point?—Yes, I have.

8149. Was that in bad weather?—Yes; but most times in bad weather. The want of water does that.

8150. Does that happen frequently?—No, not very often.

8151. Have you ever been at anchor with a vessel in South Bay?—Yes.

8152. What kind of anchorage is it?—Very good.

8153. Can you lie there in a heavy south-east gale in safety?—No; not with the wind so far out as that, and a heavy gale, with the wind at south-south-east.

8154. But if the vessel were well found in ground tackle, should you fear running for South Bay?—No; we have rode out many gales there.

8155. Is the ground good?—There is very good anchorage at three fathoms.

8156. What is the nature of the bottom?—Sand, and deep marl below.

8157. Wnen a vessel purchases her anchor in South Bay, there is very heavy heaving there, is there not?—Yes.

8158. Have you known many vessels part from their anchors in South Bay?—Not a great many.

8159. Have you ever known a vessel drive in South Bay?—Never; so long as she holds, she will burst before she will drive.

8160. With the wind at north-east, have you ever rode out a gale in South Bay?—I have.

8161. When was that?—Two years next month; I was there five nights in a very heavy breeze.

8162. How many anchors had you down?—Two.

8163. And what cable to each?—50 fathoms to one, and 45 to the other.

8164. And were all her masts on end?—She was schooner rigged; we had our topmasts up.

8165. What yards had you crossed?—Two topsail yards and the foreyard.

8166. Have you ever run into South Bay at night, in bad weather?—Yes, often.

8167. Does it want any additional facility in lighting?—Yes, if there were lights at night it would be better. Many are afraid of running into the bay as it is.

8168. (*Capt. Washington.*) Where would you place the light?—In the middle of South Shear, if I could.

8169. Not at the south end of the long bank, or thereabouts?—Yes.

8170. Then you would have a floating light?—Yes; inside Holder's Bed.

8171. Is it a common practice for timber ships to lie every winter in South Bay?—Yes.

8172. Sometimes for a fortnight?—Yes, and longer.

8173. Did you ever know a timber ship to lie there a month?—No; but I have known them lie there 20 days.

8174. Without driving from her anchors?—Yes.

8175. Surely that must be a good harbour of refuge?—The finest place in the world for a pier.

8176. (*Capt. Sulivan.*) Would you place a light inside or outside of Holder's Bed?—Inside altogether, in the bay.

8177. At the edge of Holder's Bed?—Yes; it would be better than outside, because a man who made the Tuskar could see it.

8178. And the bearing of the Tuskar would take him right through?—Yes.

8179. What water do you carry through the south channel?—Six or seven fathoms.

8180. I speak of the south or Hantoon Channel, what water do you carry through that?—Eleven feet must be a good tide; we had more than that at the deep water.

8181. Have you sounded since the dredging began?—Yes.

8182. And before?—Yes, and before.

8183. Are you aware that last year there were said to be only ten feet there?—I am.

8184. And only five feet at low water?—Yes.

8185. I think now you say you draw six feet?—Yes, and seven feet.

8186. What would you take a vessel through with now?—With a good spring tide, eleven feet.

8187. Then you think that depth of water has been attained since last year by dredging?—I do.

8188. One foot?—Yes.

8189. Since the dredging began do you find the channel safer for bringing vessels through?—No doubt it did a great deal while working.

8190. Do you bring your vessels in with a foul wind, backing and falling with the tide?—We do.

8191. What breadth can you carry through?—The narrowest point is 35 fathoms from the main to the shore.

8192. Do you know the little flat, off the point?—I do.

8193. If that were dredged away, would it help you greatly in rounding the point closely?—Of course it would.

8194. Would any work upon the other channel be so good as upon Hantoon Channel?—No, Hantoon Channel is the safest.

8195. And would you prefer that all the work at Wexford should be in reference to deepening the Hantoon Channel?—Yes; to deepening the Hantoon Channel.

8196. Do you know the west sandbank of that middle bank? You know, the sort of island formed on the Dogger Bank—between the washway and the west end of Dogger—is the sand on the west bank increasing?—It is closing.

8197. Do you mean that the channel is closing?—Yes; in a few years it will be closed up altogether.

8198. You think the second or Dogger channel will close?—I do.

8199. Does the tide strike the south, or does it go out to the east?—At low water there is a great tide coming in—the tide is going south. It does not come in dry until nearly low water, then it strikes right through.

8200. Do you mean through the east channel?—Yes.

8201. Before the ebb itself sets under the Dogger Bank?—Yes, the ebb does.

8202. You know the bank above, where the black buoy is; would any deepening there assist pilots much in bringing ships up?—It would; we must have very fine weather to be there.

8203. No; I speak of Gall Bar, right in the harbour?—Of course it would.

8204. You have only the same depth that you have in Hantoon Channel?—Not quite so much.

8205. Whatever depth is taken down in Hantoon channel, would it be a great assistance to reduce Gall Bar to the same depth to get large vessels up?—Yes, it would.

8206. Do you know much of the rise and fall of the tide at Wexford?—Yes.

8207. And across the Cuts?—Yes.

8208. Do you think that the tide rises higher than before the embankment was made?—I do not think the embankment does any harm at all; it is all owing to the wind; some tides only rise to $2\frac{1}{2}$ feet.

8209. But still, putting that aside, do you think there is any more rise and fall at Wexford now than when you first knew the town?—No; I do not think there is.

8210. (*Capt. Vetch.*) You find South Bay a safe place to bring up in?—Yes, it is a very fine bay.

8211. You have not got enough of shelter there?—No, not exactly.

8212. Will you show me where you would like to

have the necessary shelter ? Where would you place that protection ?—At Ballygeary.

8213. You would like to have a breakwater more to the north, opposite the bay ?—Yes.

8214. Do you understand this chart ?—No.

8215. (*Mr. Coode.*) Did you hear the evidence of Mr. Devereux as to the practice of letting the dredger remain idle when she might have worked ?—No.

8216. You have been constantly about here ; do you think she has worked every day when the weather permitted ?—I can say that there were days when she might have been at work when she was not.

8217. Can you give an idea of the number of those days ?—Not approximately.

8218. Do you think 20 days ?—Very likely it might be 20.

8219. Do you think there have been 10 days when she might have worked and has not ?—Yes.

8220. Can you speak as to 20 days ?—No.

8221. But you feel satisfied as to 10 ?—I dare say I may safely say 10.

8222. You stated that you did not believe there had been any change in the rise of the tide in consequence of this embankment ; do you think there has been any change by the silting up of the channel, and the accumulation of material, since the formation of the embankment ?—No.

8223. Do we understand that you would put this light vessel in the middle of the channel, between Holder's Bed and the shore ?—Yes.

8224. In what line ?—Between Holder's Bed and Greenore Point.

8225. You would place it in that line in the middle of the channel ?—Yes.

8226. And you think if it were there, a stranger with an ordinary chart could run in at all times ?—I am sure of it.

8227. (*Chairman.*) You stated in a previous part of your evidence that timber ships lay in the South Bay during the winter ?—Yes.

8228. What number of vessels have you seen lying there at one time ?—I have seen three or four together.

8229. Do they ride out north-east gales ?—Yes.

8230. Did you ever know one of them go ashore ?—I did, once.

8231. During the experience of how many years ?—It was nearly 30 years ago.

8232. Then, during the last 30 years' experience, how many of these timber ships, which you have seen lying in South Bay for a month together during the winter, have you known go ashore in a north-east gale ?—I have not known any other go ashore within the last 30 years.

8233. You stated you preferred Hantoon Channel to the other ; will you give your reasons ?—In the first place, we never have half as much sea ; and the ship is sure to be safe if she did go ashore, which she would not be the other way.

8234. If the ship went ashore in a heavy south-east gale in the Hantoon Channel, would she be safe on the beach ?—She would ; she would be sure to come off again with lightening.

8235. And life would be saved ?—Yes.

8236. Which are your heaviest gales in—from which quarter ?—South-south-west in winter time.

8237. (*Capt. Sulivan.*) With a south-east gale in the South Shear, and the tide running out, is not there a heavy race ?—There is a good current out—it makes a nasty sea.

8238. Would that be a good place for a light ship to anchor ?—Yes, inside the shoal.

8239. But you said you would have it in mid-channel ?—I would.

8240. Would not that be in the strength of the race ?—Further in there is less tide.

8241. If it were under Culver's Shoal, or on the outside under Holder's Bed, on one end or the other, coming in, would not that be as well as the middle ?—Yes.

8242. And the light ship would be more sheltered, would she not ?—Yes, she would.

8243. (*Mr. Coode.*) Had you any particular reason when you said just now you would prefer to have the light ship moored in mid-channel ?—I think it would be the best place for the vessel to run for.

8244. Do you not think it would be just as well on one side as the other, so that it is laid down on the chart ?—Yes, it would, if men only knew on which side it was.

Mr. W. Clarke examined.

8245. (*Chairman.*) What is your occupation ?—Shipmaster.

8246. How long have you been at sea ?—45 years.

8247. How long have you been master of a vessel ?—Upwards of 30 years.

8248. And what description of vessel have you commanded ?—Sailing and steam.

8249. How long have you been in command of a steam vessel ?—25 years.

8250. And previous to that in what trade were the sailing vessels which you have commanded ?—Generally in the coasting trade.

8251. Have you ever come into Wexford Harbour with the wind blowing hard ?—I have.

8252. Which channel do you use ?—The Hantoon Channel.

8253. Do you prefer it to the other ?—Yes.

8254. Will you state your reasons ?—If the wind is east you cannot approach the other channel at all.

8255. Why can't you approach it ?—The sea is so heavy, it breaks all across.

8256. Hantoon Channel is protected by the Dogger Bank ?—By the Dogger Bank quite.

8257. Have you ever been at anchor in South Bay ?—I have.

8258. In bad weather ?—In bad weather, blowing very heavy.

8259. How was the wind ?—West-south-west.

8260. Have you ever rode out a south-east gale in South Bay ?—No.

8261. Have you ever been anchored in South Bay in a north-east gale ?—Never.

8262. Have you ever run into South Bay at night ?—No, I have not.

8263. Have you ever run in, in bad weather ?—Yes, in a strong breeze from the south-west, running round to south-south-west.

8264. Have you done so without difficulty ?—Yes.

8265. Would it be improved by a light ?—It would be a great improvement on a dark night.

8266. (*Capt. Washington.*) Are you well acquainted with the Hantoon Channel ?—Pretty well.

8267. Do you pass in by it often ?—Yes.

8268. How often ?—In bad weather we have always to take that channel ; with the wind from the east you can't approach the North Channel.

8269. Are you trading constantly to Wexford ?—Yes, for nearly five years.

8270. In command of a steamer ?—Yes.

8271. How often does she come into the harbour ?—Once a-week.

8272. Do you take the Hantoon Channel or the North Channel oftenest ?—Generally the Hantoon Channel in the winter season.

8273. Are you aware that the dredging vessel has been employed in the channel ?—I am quite aware of it.

8274. Has it done any good ?—I think it has improved the channel.

8275. To any considerable extent ?—I think it is considerably deeper than what it was previous to the dredging commencing.

8276. How long do you say you have known the Hantoon Channel ?—Nearly five years.

WEXFORD.

Mr. W. Clarke.

24 Sept. 1858.

Capt. Washington.

8277. Do you think the dredger is dredging at the right place?—Yes, at the right place. She commenced at the entrance, on the shoal which runs across from the point of the Dogger Bank.

8278. You have heard it stated by Mr. Devereux that, in his opinion, 40 days she might have worked when she did not?—She might have been working a considerable time when she was not.

8279. Do you know what prevented her?—I cannot say.

8280. Which channel do you think it most desirable to improve as an entrance to Wexford Harbour?—The Hantoon Channel.

8281. Would it be desirable to make the Dogger Bank grow up above high water, to make an island of it?—That would be a noble entrance.

8282. Do you think that is the best means of sheltering Hantoon Channel?—Yes.

8283. Would you rather see that done than any attempt to improve the East Channel?—It is a much safer channel, and always will be, even if there is no improvement. You cannot approach the North Channel with a wind south-south-east, running to north-east.

8284. Then it is your decided opinion that Hantoon Channel is the one to improve?—I would say so.

8285. (*Capt. Sulivan.*) You say that the dredge might have worked some days when it did not. Do you mean by the smoothness of the water you found coming in?—I mean by the smooth water coming in and out.

8286. Do you know that a small lift in the sea is a sore obstacle to the dredger working?—I am quite aware of that.

8287. And you think that on these occasions there was no lift in the sea?—There was no lift whatever when I went out and in.

8288. What water does your vessel draw?—11 feet or 11½ feet; but she has never drawn that when coming into the harbour of Wexford.

8289. When you were coming to Wexford Harbour to what depth have you ventured to load your vessel?—10 feet.

8290. Have you ventured to load her deeper since the dredger commenced?—I have not frequented the Hantoon Channel since the dredger began; generally we have taken the North Channel.

8291. From what you know of the channel, would you venture to load your vessel deeper than you did last year?—No, not more than 10 feet, and that at spring tides.

8292. Is there more water in the other channel?—I do not think there is any difference in still water, when the water is smooth.

8293. (*Capt. Vetch.*) How long have you known the harbour of Wexford?—Nearly five years.

8294. Do you find the banks southward of the mouth of the bar shifting?—They have shifted considerably.

8295. Sometimes the deepest entrance is the North Channel, is it not; sometimes the east, and sometimes the Hantoon?—I never use but two, the North Channel and the Hantoon.

8296. If these channels are of a shifting character you cannot reckon on the channel remaining open?—Hantoon filled up considerably before the dredger came. Previous to 1853 it was a very good channel, and a very safe one, a good bar and a safe bar.

8297. And now it is better?—It is better now.

8298. Do you not think that having been better and become worse, it may do so again?—I have no doubt. There is no accounting for those shifting sands.

8299. All seawards to Raven's Point is shifting sand?—The south-south-west spit of the Dogger Bank has extended very much to the south in my time, which of course gives more shelter to the Hantoon Channel, coming in with a heavy breeze from the south-east or an east wind.

8300. Then if you were to spend 20,000*l.* anywhere to make a good channel, would you have any confidence that it would remain so?—It would depend a good deal on how your improvement was effected. If the Dogger Bank were secure, so that the tide could have a fair run through, no doubt a strong tide would keep it secure.

8301. Is the DoggerBank covered at high water?—Yes, it is covered at high water.

8302. Then you think it is of great importance that the Dogger Bank should be made fast, particularly at high water?—I do.

8303. (*Mr. Coode.*) You have said that the Hantoon Channel has become worse since 1853, and that recently it has become better. Do you attribute that to the dredging or to natural causes?—To the dredging.

8304. I think you said there was little tide through the Hantoon Channel?—Not with an ebb tide, but a strong north stream runs through.

8305. What is the strength of the ebb tide?—It is a mere drain. It does not run by the second buoy on Hantoon Bar. It does not run more than a knot.

8306. In the opposite direction what do you think is its greatest strengh?—I dare say a flood runs in at the rate of 11 knots.

8307. You seem to think that considerable improvement might be made by judicious operations. Have you any suggestions to offer as to the best mode of improvement?—If the Dogger Bank could be piled off I think it would be a great improvement to bank it from the sea side.

8308. Is there anything else which you would propose to do?—No; I can't say there is.

8309. Then you consider the great and only improvement would be to secure the Dogger Bank, and on the west side to make it permanent?—Yes, that is on the east side of the channel.

8310. Have you observed many vessels taking shelter in South Bay?—Yes, a good many.

8311. Have you seen them riding there in a gale of wind as you have gone in and out?—In some heavy breezes.

8312. In gales of wind?—I never saw them in a gale of wind. I have passed in a gale of wind when I could not make the bay, and had to run to Waterford.

8313. In what direction was the wind?—About east. The heaviest gale of wind was last winter.

8314. Suppose you had felt it necessary to come to Wexford, which would have been the best way in on that occasion?—The North Shear was the best way, but it was not prudent for any vessel to run to Wexford on that day.

8315. Was it high water or low water when you passed?—It was high water when we passed the Tuskar Rock, about eight o'clock in the morning.

8316. Did you notice the state of the sea?—Wexford Bay was all broken that day, throughout the South Bay all the way from Greenore Point to the Black Water.

8317. You ran to Waterford; had you any difficulty?—I had smooth water all round the Saltees.

8318. Do you think any additional shelter much wanted in this neighbourhood?—I think it is much wanted.

8319. Have you known many vessels want shelter here, and not being able to get it, run elsewhere?—I think many of those which run to Holyhead and Kingstown would come here. I have known ships even put back to Liverpool.

8320. You have known instances of vessels putting back to Liverpool?—Several.

8321. Were they large vessels?—Yes, large vessels; if there had been a harbour of refuge in South Bay there would have been no difficulty in coming in.

8322. What is the largest vessel you have ever known obliged to put back to Holyhead or Liverpool?—From 800 to 1,500 tons.

8323. Is it a common occurrence for vessels of that size to have to bear up?—It is.

8324. Does it happen every winter?—Yes, every winter.

8325. Do you speak of facts which came within your own knowledge?—Of facts within my own knowledge. I have been myself a fortnight between Holyhead and the Tuskar.

8326. Had you to bear up?—I was sometimes losing ground, sometimes gaining.

8327. Was that since the new harbour was made at Holyhead?—Before.

8328. Would you make for Holyhead now?—It is bad for a ship to wear round with a north-west wind.

8329. Have you seen it since the extension was made?—Yes.

8330. When were you there last?—I have not been there for three years.

8331. Do you know that it is carried more towards the north-east?—I do. I have seen it every week, as I pass. That will not enable a ship to fetch in running the near point of the harbour.

8332. Can you find shelter there now with the wind at north-west? Have you good shelter outside the Platters?—Yes; under the lee of the breakwater.

8333. You are aware the breakwater is extended?—Yes, it slopes in on Church Bay.

8334. I think you said there was no shelter from the north-west?—That was before the breakwater was carried out to the Platters.

8335. Then you would not hesitate now to run for Holyhead in a north-west gale?—No; there is good anchorage, quite sheltered. I have seen a good many vessels there myself, outside the Platters.

8336. Did you hear the evidence as regards the advisability of having a light in South Bay?—It would be very desirable to have a light vessel inside Holder's Bed.

8337. Where should you think it most desirable to place a light ship?—At the south-east tail of Holder's Bed.

8338. In what depth of water would you place her?—Six or seven fathoms.

8339. You think that would be the best position?—Yes, it would be far away from the Tuskar, right in. I have run in many dark nights myself. It would be a great service, for a ship can't run in without some guide.

8340. Do you think that if a light were placed there many more vessels would run in?—I think they would with heavy gales from the south-west.

8341. (*Chairman.*) You stated just now that in a heavy south-west gale vessels generally took refuge in this South Bay?—For outward-bound ships it would be a very good thing instead of running for Holyhead or Kingstown.

8342. But the shelter from west or south-west would not be more perfect by a breakwater?—No; it is quite sheltered from those winds. The breakwater would be in case of a sudden shifting of the wind.

8343. Would that breakwater tempt vessels to make use of the harbour?—It would.

8344. On the occasion which you mentioned, about two years ago, when you ran for Waterford in a heavy easterly gale, did you take notice whether any vessels were anchored in South Bay?—No vessel could anchor in South Bay then.

8345. But as a fact, were there any?—None whatever; it was all broken water.

8346. (*Capt. Sulivan.*) You are aware that if a light vessel were placed here there would be a passing toll?—There is a toll on all vessels.

8347. You think the trade would find it to their advantage, and would not object to the toll which they would have to pay?—I don't think they would object; the toll on lights is very small.

8348. Do you think, if a light vessel were placed there, outward-bound vessels would run for it boldly from the Tuskar? Do you think an ordinary master would consider it a safe channel, and that it is merely because there is no light that they don't use it?—Unless they had some knowledge previously I don't think they would.

8349. Do you know in what month the timber ships lie in that bay?—More lie in summer; in the fall of the year they make a second voyage.

8350. What is the second voyage time?—About this time vessels arrive from North America.

8351. Are there some every year about this time?—Oh yes.

8352. And after this?—And after this.

8353. How many have you seen lying here at a time?—I never saw more than two or three timber ships here at once in my time.

8354. Have you ever known any of them lost during the five years that you have been on the coast?—No.

8355. (*Mr. Coode.*) Should you have any fear of a light vessel dragging from her moorings if she were placed at the south-east corner of Holden's Bed?—There would be no danger; she would be sheltered from the gales from the south-east.

8356. In what direction do these south-west gales turn?—They sometimes back in towards the east, and sometimes out towards the north-west.

8357. Have you noticed which way they usually turn?—No, sometimes one way, sometimes another.

8358. If the light were placed as suggested would a master hesitate to run for the bay if he had a chart?—There would be no difficulty. I have run in with the bearings of the Tuskar on a dark night.

8359. (*Chairman.*) Are you acquainted with the nature of the coast from Greenore Point up to Wexford?—Yes.

8360. In a gale from the north-east, if a vessel went on shore, would life be saved?—Life would be most likely to be saved; I will not say as to property.

8361. What is the nature of the beach?—I believe marl.

8362. All round South Bay, is it rather steep?—It has a middling descent.

Mr. Devereux re-examined.

8363. (*Chairman.*) You are acquainted both with Greenore Point and Rosslare Point; do you know what is the character of the beach?—Shingle.

8364. Is it rather steep?—It shoals out. If a vessel parted with her anchors, what chance would there be of saving life?—I think life would be saved invariably.

8365. And property?—In a great measure property too.

8366. (*Capt. Sulivan.*) Do pilot boats ever keep outside the harbour?—No, except there is anything to induce them.

8367. If a light vessel were placed there, would there be any chance of a strange vessel finding a pilot?—There is no protection to pilot boats in easterly winds to lie out there.

Mr. Edmund Roach examined.

8368. (*Chairman.*) What is your occupation?—A master mariner.

8369. For how many years have you been so?—26.

8370. And of those 26, how many as master?—From 16 to 18.

8371. What vessels have you chiefly commanded, sailing or steam?—Sailing chiefly.

8372. What is the vessel which you command at present?—A steamer.

8373. Running where?—From Liverpool to Wexford.

8374. In what trade have the vessels you have commanded been chiefly employed?—East Indies, West Indies, North America, and United States trade.

WEXFORD.

Mr. Edmund Roach.

24 Sept. 1858.

Chairman.

8375. Have you been present during this inquiry ?—Part of the time.

8376. Have you heard the evidence of the previous witnesses ?—Part of it.

8377. Do you generally concur in that evidence ?—In what I have heard of it.

8378. Is there any point on which you are disposed to differ ?—No.

8379. Have you ever been at anchor in South Bay in heavy weather ?—No, not in very heavy weather.

8380. (*Capt. Washington.*) You command a steamer trading to Liverpool ?—Between Liverpool and Wexford.

8381. What is her name ?—The *Troubador*.

8382. Of what draught of water ?—Ten feet when laden, but we never exceed nine.

8383. What channel do you take ?—The North Channel.

8384. In winter ?—No, the Hantoon Channel. There is too much sea over the North Bar.

8385. Did you come in on Tuesday last, when it was blowing hard ?—It was blowing middling on that occasion.

8386. If one of the two channels were to be improved, which should you prefer ?—I think the North Channel too, but the Hantoon Channel is safest.

8387. But if there be only merely enough for one, which should you say ?—I should say Hantoon Channel.

8388. Have you seen the dredger at work ?—I have.

8389. Has the Hantoon Channel improved since it has been at work ?—I think, from what I have heard, that she can do much good ; but as she has not been working where the sand is, she can't have done much good.

8390. It has been stated that she might have worked many days when she has not ; do you concur in that ?—I do, in part. I have known many fine days when she has not worked.

8391. Do you know the reason why ?—I heard that when she got lighters they were not fit ; that was what was reported to me when I made inquiry.

8392. What lighters do you allude to ?—The iron barges; they say they were too high for the side of the dredger and required alteration, which hindered them some time.

8393. Are the alterations made ?—I don't know.

8394. (*Capt. Vetch.*) How long have you known the port of Wexford ?—From childhood.

8395. And during that time have you seen great alterations take place on the bar outside Rosslare Point ?—I have seen Hantoon Channel with better water.

8396. Sometimes one channel better, sometimes another ?—Yes.

8397. A considerable degree of change takes place in these channels ?—Yes, after a gale of wind.

8398. Suppose you improve any one, could you depend with any confidence on its remaining so ?—No, unless you pile off the outside of one of the banks.

8399. Can you suggest any plan of improving the entrance to that harbour ; any mode which you think would answer ?—Yes.

8400. What would you recommend ?—I would recommend the Dogger Bank being piled.

8401. Made an island of ?—Yes ; the land raised so that the water shall not get over, and we should have a free set of the tide then.

8402. (*Mr. Coode.*) Will you be kind enough to mark on the chart the extent to which the line of piling should go ?—I have now marked it on the chart (1772).

8403. Do you fix on this point from your knowledge of the set of the tide ?—Yes.

8404. And you apprehend that one line of piling would suffice ?—It would.

8405. (*Chairman.*) What is your worst weather in the Irish Channel ?—In winter months, south-west gales.

8406. How do they begin ?—They commence from the west and come back round to the south.

8407. And when you have heavy weather from south-west how does it begin ?—Sometimes they come in with windy weather and a little rain ; they then commence from south-east and back out to east.

8408. They come round to east ?—Yes.

8409. Do they ever come round to north-east and blow hard ?—Sometimes I have seen them fly round to south-west.

8410. They generally go to south-west when the gale breaks ?—Yes, they moderate and come down to north.

8411. Does a heavy south-east gale ever back round to north-east ?—Very seldom.

8412. You prefer the Hantoon Channel in bad weather ?—We have to take it because the ground is safer. If we get on the North Bar, we could not save property or life ; there is hard sand, which will not give.

8413. Have you any other reason for preferring Hantoon Channel ?—None but that.

8414. Hantoon Channel is available to sailing vessels with the wind how far round to the east ?—East-north-east is right out of it.

Mr. Martin Boen re-examined.

Mr Martin Boen.

8415. (*Chairman.*) You know the beach from Greenore Point round to Rosslare Point ?—Yes.

8416. What is the character of it ?—Very good.

8417. In a north-east gale, if a vessel went ashore, would life and property be saved ?—Yes.

8418. And the cargo and the vessel ?—It is likely they would be saved too.

8419. Have you ever known life lost in Ballygeary Bay, on the occasion of a shipwreck ?—No ; I never did.

Mr. James Barry Farrell examined.

Mr. James Barry Farrell.

8420. (*Chairman.*) In what way are you connected with the port of Wexford ?—I am employed by the Admiralty.

8421. In what capacity ?—As engineer.

8422. How many years have you been connected with the port in that capacity ?—About four.

8423. (*Capt. Vetch.*) What works are going on at present ?—Merely dredging.

8424. Will you inform us when the dredging commenced ?—In the first week in July.

8425. How many tons a day are you able to raise ?—We have been able to raise very little, in consequence of not having sufficient flats to take away the material dredged.

8426. How much do you suppose has been raised ?—About 8,000 tons.

8427. Have you made any considerable impression on the bar ?—We have.

8428. Can vessels of a greater draught of water come in now ?—Vessels of the same draught of water come in with greater ease than before we commenced.

8429. Not of greater draught ?—No, not of greater draught than when Hantoon Channel was good.

8430. To what do you attribute that ?—Because there was an obstruction in Hantoon Channel before we commenced, which we have got away.

8431. Then this is quite a preliminary business to the main work ?—Quite a preliminary business. I am quite satisfied we shall have a very good channel through Hantoon,—a very good one indeed.

8432. From your knowledge of Wexford Harbour, and the changes you have seen take place, can you

repose any great confidence in the channel, when made good by artificial means, remaining so?—Not without assisting works.

8433. What kind of assisting works would you propose?—I should propose to pile the Dogger Bank in the direction of the ebb and flood tides, in a north-easterly course and along the eastern side of Hantoon Channel, to confine their currents and prevent their strength being wasted in passing, as they now do, through the swatchways of the outer sands. Until that is prevented, you can't count with any certainty on a fair channel being preserved through Hantoon for any length of time.

8434. Having raised the Dogger Bank to the height you propose, do you think you might count on Hantoon Channel being preserved open for any length of time?—I do. I have no doubt in my own mind that by extending that plan you would also get a very fine north entrance too.

8435. Would not such a work on the Dogger Bank produce again the former outlet to the sea in an easterly direction?—Decidedly, in a north-easterly direction.

8436. Then such a work would give two channels—Hantoon and an eastern channel?—A north-eastern channel.

8437. Then in that order of events would it not be advisable to make the Dogger Bank stationary?—I would do it if I had the power.

8438. Have you any work, Mr. Farrell, that you would put in hand to accompany these works?—I should improve the present sailing course within, and extend that improvement as the trade required it.

8439. I am speaking of the outside?—I would confine the works to the present entrance in the way I have stated.

8440. Do you mean the Hantoon Channel?—To Hantoon and the north-eastern channel.

8441. But in your work do you consider it necessary to keep both open?—Decidedly.

8442. That is with respect to the navigation outside Rosslare Point. What would you do inside?—I would improve the present sailing course, particularly at the Gull Bar. I would deepen that to the same depth I got at Hantoon.

8443. What depth do you think that would be?—I think it might be 11 feet; whatever depth you get at Hantoon, you ought to get the equivalent at Gull Bar.

8444. Do you mean high water?—I am speaking always of low water.

8445. Ten feet below low water you expect in the Hantoon Channel, and you propose to carry the North Channel to Wexford to the same depth?—I do.

8446. Did it ever occur to you that the Coal Channel should be made use of in leading to Wexford Bar?—It did. I have given it a great deal of consideration.

8447. What is the depth of the Coal Channel; can you tell us?—It varies from 12 feet to 36 feet at low water.

8448. What is the general depth of the river from the quay at Wexford upwards?—It varies. You have 15 feet and 26 feet. You have 12 feet, and you have higher up as much as 60 feet.

8449. Then do you not think it is a subject of some importance for the navigation from Rosslare to Wexford and from Wexford up the river, that you should avail yourself of those deep channels which are already provided?—Looking at it simply as an engineering question, with reference to obtaining a strong tidal current to bear on the entrance of the harbour, I certainly do; if you make a cut carrying the depth at the quays into Coal Channel, the increased momentum of the tides would be of importance outside, but I think it would be attended with serious disadvantages and should not be undertaken. With regard to the entrance of the harbour, I think if you did that, you would certainly alter the present state of things outside, but you would be doing what might be very prejudicial to the trade; you would have to wait and watch what further effect might ensue, and then perhaps have to make new arrangements altogether, supposing it to be successful, and that is very doubtful. If you direct the weight of the tide out through Coal Channel, it will pass by the Channel of Hantoon, create an eddy at its entrance, where deposit would take place, and close it up altogether. Nature is endeavouring to maintain it, and as all evidence is strongly in its favour with regard to life and property, I think it ought to be maintained and improved.

8450. Then you think Hantoon Channel is the place upon which all other measures should turn?—I think every endeavour should be made to maintain and improve Hantoon Channel.

8451. Are you aware that nearly 30 years ago the main channel to Wexford was nearly due east?—Yes.

8452. And there were leading marks and beacons, showing it to possess then a greater depth of water than it has ever since?—Yes.

8453. Then if these things have changed and become as they now are, do you see any reason why they should not change and become the same again?—The opening of that Eastern Channel was merely a change from a former state of things; and old pilots—intelligent men—have told me it was an exceedingly dangerous one, and that its use was attended with loss of life. It went out at right angles to the set of the tides outside, which is always productive of danger, and most likely to close it shortly again, if it were again to break open.

8454. Then the whole proposition tends to this, that natural causes have closed the East Channel, and if natural causes to the same amount close the Hantoon Channel, all the work that you may make dependent on that must become necessarily nugatory?—No, by no means entirely nugatory. I think that in piling the Dogger Bank you are following nature's channel. The deep channel you alluded to is now a *cul de sac*. The proposed piling would lead it out in a north-east direction, very nearly coinciding with that of the ebb and flood tides, and so render it always available and very useful. If ever it was an object to close Hantoon Channel, it would be the easiest thing possible to continue piling across it. It is outside the harbour that nature requires to be watched most closely, to ascertain where the time tidal currents are endeavouring to make their best channels, and in order to aid them I propose to pile the Dogger Bank and prevent the sand being washed from it through its present numerous swatchways into the navigation channel.

8455. Do you think that among these shifting sands you can make a permanent work with piles?—I think so, with screws on piles of timber. They would also form a very good shelter.

8456. Then you think piling a necessary adjunct to the improvement of the harbour?—I think it absolutely necessary.

8457. Then by commencing one work before the other, you don't think you place both in jeopardy?—Vessels last year were stopped so frequently that the Admiralty Commissioners urged me to do something. The only speedy remedy for the evil was dredging. In obedience to the orders of the Admiralty Commissioners, a steam dredger was obtained, and put to work with the least possible delay in Hantoon Channel, where the obstruction existed.

8458. As a temporary expedient?—Yes. I may mention that when the island called the Dogger Bank was covered with bent grass, there was a good entrance into Wexford.

8459. Can you furnish the Commissioners with a plan of what the Dogger Bank was then?—I have no document showing the state of things then.

8460. What is the distance from Rosslare up to Wexford Gull Bar by the North Channel?—I think about four miles.

8461. What is the distance along the Coal Channel by the face of the proposed embankment,—how many miles?—It may be something shorter, but I would

WEXFORD.

Mr. James Barry Farrell.

24 Sept. 1858.

Capt. Vetch.

recommend some improvement in the curves of the present sailing course, by which a very good line may be had, and which is as short as going by the Coal Channel, and would carry the tide more directly out by the mouth of the harbour.

8462. Is it not a natural fact, that in a curved channel the current clings to the concave shore, and scours and deepens it ?—Certainly.

8463. And wherever the current runs concavely that current will deepen the channel ?—Certainly.

8464. From these premises it must follow, that the Coal Channel, if connected with the upper deep channel, ought to be more permanent than the North Channel ? — I don't think it would, if the North Channel were properly improved and deepened. You will have the same current on the concave side of that channel as you would on the concave side in the Coal Channel.

8465. By using the Coal Channel, would it present the means of constructing a roadway, tramways, quays, &c., with deep water alongside from Wexford, to Rosslare Point ? Could you have that accommodation on the North Channel ?—That is a different question ; of course you could have more convenient works on the Coal Channel.

8466. Is it not a question for an engineer to consider ?—I don't think you would ever have works of that kind on the Coal Channel.

8467. Not if there were funds to do it with ?—It is possible of course to do it.

8468. (*Mr. Coode.*) I believe the dredging operations are entirely under your superintendence ?—Entirely in my charge.

8469. Can you tell us the depth you have gained in Hantoon Channel ?—About 18 inches.

8470. Do you mean absolute gain ?—Yes.

8471. How long have these new barges been at work ?—Within three weeks they have come here, or a shorter time.

8472. But you commenced operations in July last ? —Yes, in July last.

8473. Had you any special reason for commencing operations before a proper supply of barges came ?— I should have commenced with anything I could meet with to clear the harbour.

8474. To meet an exigency ?—Yes, to meet an exigency.

8475. What was the exigency ?—A shoal lying somewhat south of the buoy outside the point of the fort, crossing the entrance diagonally, and leaving but a very narrow gut. Vessels were constantly caught upon it. I have seen small oyster boats lying there myself, and to get that away was a great object.

8476. And you considered the immediate removal of that shoal was essential to the trade of Wexford ?— Very essential.

8477. It was for that reason you commenced operations with what you considered an insufficient supply of proper barges ?—Yes ; and I may mention, I recommended the Admiralty Commissioners to send three large hopper barges here as soon as the dredger arrived ; but some parties connected with the town called at the Admiralty, and persuaded them that we could get proper barges here. It was then thought desirable to try here ; every effort by advertisement and otherwise was made, but in vain. I was ultimately obliged to purchase three inferior boats in Waterford.

8478. Did you take any measures to secure the improved barges at the earliest possible period ?—The moment I got the proper order from the Admiralty.

8479. There was no delay on your part ?—No delay whatever.

8480. You considered these barges necessary ?— Yes, absolutely necessary.

8481. Have you heard the evidence with regard to the number of days that the dredger might have worked and did not ?—I have.

8482. Do you agree in that evidence ?—There were some, not several, days when she did not work, when the weather would have permitted her to work. A diary is kept of every day's work done, and sent in to me once a week, and every day that she did not work is satisfactorily accounted for. For instance, a large barge which we took down here, the Commissioners' ballast lighter, an unwieldy boat, swept across the dredger and carried away the shoot, so that we were obliged to have a new shoot made ; that disarranged us and delayed us for a day, but it is set down in the diary returned to me.

8483. Then every effort was made to expedite the dredging operation by every reasonable means that you could adopt ?—Every effort. I am sorry to see the jealousy which there appears to be with regard to the improvement.

8484. Have you any doubt that it is the proper course to pursue to direct your attention solely, at present to deepening Hantoon Channel ?— None whatever.

8485. At the same time you propose a line of piling on the Dogger Bank ?—I think that essential.

8486. To what length would you extend it on the Wexford side of the Dogger Bank ?—I think two miles would be ultimately useful, but it might be done in sections.

8487. What do you consider essential, at any rate ? What is the least amount ?—To shoal up the south-east channel, which has broken out through the Dogger Bank, and the swatchways which rob Hantoon Channel of so much scour.

8488. What length is required to do that ?—That would be three quarters of a mile.

8489. Have you ever made any estimate of the expense of that ?—Yes.

8490. Can you give me an idea of the cost ?—I should say about 30,000*l.* would do it.

8491. Have you ever turned your attention to stone banks in lieu of piling ?—It would be uncommonly expensive.

8492. Do you think they would be more expensive than piling ?—Oh yes, from the difficulty of getting the stone.

8493. Have you taken into account the delay in piling ?—Yes, and I don't think stones would be as good as piling, unless they were laid on a good foundation. The scour that would be created by confining the currents to one channel would undermine any wall that may not be sufficiently founded, and the stones would thus slip into the channel.

8494. Do you not think an embankment might be placed there ?—Not of stones, it would be so enormously expensive.

8495. But it would be less liable to be washed away? —If properly done, no doubt, but it would cost a very large sum.

8496. Have you made any comparative estimate ?— No, but it is almost self-evident. In the first place you have no stones within a reasonable distance, and in the next place getting a foundation would be expensive.

8497. I am not speaking of building, but merely of dropping stone material in ?—I think that would take a very large quantity of stone, and would create an obstruction in the present channel ; the foot of your slope would tail into it.

8498. Presuming that could be guarded against, have you any other objection to offer beyond the cost of an embankment ?—Cost certainly would be a main objection.

8499. Assuming that it were decided to adopt a stone embankment, where would you go for material? —The nearest place would be to take it from Wexford.

8500. What distance from the site of the works ?— Four miles and a half.

8501. What is the material ?—Quartz.

8502. Have you had occasion to quarry any of the rock ?—Yes.

8503. And at what price per cubic yard could it be acquired ?—About a shilling.

8504. And how far would the quarries be from the point where you would get it into the barges ?—

There are quarries where you could get it near the shore.

8505. At what distance?—I dare say there are quarries where you could get it within a quarter of a mile of the shore.

8506. You were asked, with reference to the expediency of improving the Coal Channel as compared with the maintenance of the present channel. I understood your objection to the improvement of the Coal Channel lay in the opinion that the tide setting into the Coal Channel, would cause an eddy likely to fill up the Hantoon Channel?—That is one objection.

8507. Is that simply your own opinion, or have you taken the opinion of persons who know the locality? —It is my own opinion; and I have heard others express their fear of it.

8508. You stated that was one objection; have you any other?—On consulting the pilots I find that they would rather have the present sailing course than the Coal Channel. The pilot who brought the Commissioners up in the tug-boat gave that answer.

8509. Then, if the approach to Wexford by the Coal Channel could be made and maintained with the same depth as now exists in the main channel, they would still use the main channel in preference to the Coal Channel?—I think sailing vessels would.

8510. How long had the Hantoon Channel remained in the condition in which you found it, when you commenced dredging operations?—It had been so the entire winter.

8511. Had there been any material change within the few years previous?—Nothing, that I am aware of. Nothing material; only the obstruction which I have pointed out.

8512. There were great complaints of the want of water, in consequence of that obstruction?—Yes.

8513. Have these complaints been removed?—To a great extent; but we want to do something to make it as perfect as I wish it for the winter.

8514. Do you hope to accomplish that before winter sets in?—A fortnight's good weather will enable me to do it.

8515. What depth of water would you get in a fortnight's operations?—I think I could get two feet in the Point of Rosslare.

8516. Having already gained 18 inches, you think you could gain three feet?—Yes.

8517. Then you desire so to regulate your operations that the tide should come in and do all that nature should have done?—We thought that the most expeditious way that we could do it.

8518. If I rightly understood the principle on which you propose to work, it will be to follow nature rather than to take her by storm?—Exactly; and the whole must be done very cautiously.

8519. Then you wish to aid natural operations which you find are going on?—Precisely.

8520. But if you had the means you would, simultaneously with these natural operations, construct a line of piling across the channel lately opened through Dogger Bank?——

8521. (*Chairman.*) If I understand rightly the nature of the operation in which you are engaged, your object is first, to deepen the Hantoon Channel; secondly, to pile round the Dogger Bank, so as to form it or part of it eventually into an island?—Precisely so.

8522. And you further believe that in pursuing these operations you will preserve if not improve the north-east channel?—Yes.

8523. Suppose, with the experience you have of the port, that you had unlimited command of pecuniary means, is that the course you would be disposed to adopt?—It is.

8524. And you believe that by that, both these channels would be preserved?—I have little doubt of it.

8525. And with reference to the interior of Wexford Harbour, putting again the same question and assuming the same data, that your command of means is unlimited, what measure would you still propose for the improvement of the harbour, carrying out the present line of sailing channel?—I would improve the present sailing channel.

8526. You are acquainted with the Clyde?—I know the circumstance to which you would allude.

8527. Would you consider that if the same course were pursued with the Wexford Harbour as has been pursued with the Clyde, that is, of embankment on either side of the channel, that you would improve it?—It would be valuable, on this condition, that you did not interfere with the quantity of water which entered the harbour.

8528. Then in the river, supposing the embankment were made on each side, do you think that would interfere with the quantity of water thrown in by the tide?—Not if so made that the tide might pass through it, constructed, for instance, in sections overlapping each other, with immediate openings for the free ingress and egress of the water, and using the embankments merely as guides for the currents out to sea in a proper direction.

8529. Then, in such a case, the land within the embankment would not be used for agricultural purposes?—I would not embank an inch more; at least, the lines, according to the Admiralty plans of 1845 or 1846, are the utmost to which I would go.

8530. Are the lines shown on the chart before me? —No, but I can draw them for you. At the time when these lines were fixed and assented to by the Admiralty, it was proposed to deepen the river up to Enniscorthy, as an equivalent for the water that would be cut off by the embankments.

8531. Suppose the embankment you have drawn were carried out, would the value of the land enclosed be available as a contribution?—It belongs at present to the Harbour Embankment Company, all within these lines.

8532. Therefore no more funds for the improvement of the harbour can be drawn from that source? —Not from the land within the harbour.

8533. And why would you preserve so large a sheet of water as is drawn within the lines of this embankment?—Because every foot of water that comes in at the neap tides is the least that is necessary to preserve the entrance.

8534. By the entrance you mean the entrance to the harbour outside?—Yes; if you decrease the effective quantity of water that enters the harbour, you will proportionately decrease the sectional area of its entrance.

8535. As respects the entrance, are the circumstances entirely different from those of the Clyde?— They are; Wexford is peculiarly dependant on the quantity of tidal water. It was the shape of the harbour that did it so much harm; the lines of embankment were laid out to correct that shape as much as possible.

8536. (*Capt. Washington.*) To continue the Chairman's question respecting the embankment, are you of opinion that the outer south embankment should be carried out on the line proposed?—I think it would be useful.

8537. Do you think it would be for the benefit of the harbour?—I do.

8538. Is there not fear from a north opening being made, and part of the south embankment, that the tide is overbalancing the tide from the usual sailing course?—I do not think there is any fear of that. The late survey made by Captain Frazer shows that no such effect has been produced; the effect of the tide has been to improve the north course. The deep waters have gone in further into the harbour, as shown on the chart made in 1856, than we find it on the chart of 1845.

8539. I wish to get your opinion on the subject?— My opinion is clearly that no damage has been done by the construction of the present embankments. I consider the clear proof of that to be, that on comparing the two charts, I find at the mouth of the harbour quite as much, if not more, water in depth

WEXFORD.

Mr. James Barry Farrell.

24 Sept. 1858.

Capt. Washington.

than before the embankments were made. If the scour were decreased by the quantity of water stated to have been shut off, the first place where we should find evidence of it would be at the entrance, where the sectional area would have been reduced. But it is not reduced; on the contrary, I find it 61 feet instead of 57 feet.

8540. Then do I understand that the sectional area is rather increased than decreased? — It is shown to be greater than before the embankment was made.

8541. By whom were these two charts made? Both of them by Captain Fraser, the Admiralty surveyor; a gentleman entirely independent of Wexford?—Yes.

8542. And I can have no doubt of the accuracy of the charts?—None at all. I think a great deal of injury has been produced by the bursting in of the sea south of Rosslare Point. It swept sand into the Coal Channel, which must have been carried out; and as shortly after that, injury to the Hantoon Channel began to appear, I have every reason to believe that it must have been carried out and lodged there.

8543. That which was thrown into the Coal Channel?—Yes.

8544. Do you know any case of the burrows being broken through?—I think the people must be in the habit of tearing the bent grass up, because the bent mats are common.

8545. Do you know where there is any bent grass besides at Rosslare?—Nowhere in this immediate neighbourhood, except that protected by the Wexford Harbour Embankment Company.

8546. Have you any reason to believe that bent grass is imported?—No, I have not. I know that if the bent grass were preserved, you would have the sand banks preserved also.

8547. Do you think it desirable that strict orders should be given, if possible, to prevent the bent grass being taken away?—Decidedly.

8548. Are you aware who is owner of the soil?—I am not aware if their Act gives that burrow to the Embankment Company.

8549. But if it did, they would be willing that orders should be issued?—I think they would preserve it, if it belonged to them.

8550. You were asked whether the land reclaimed would yield anything for the improvement of the harbour; has any sum been derived from that source?—The Harbour Embankment Company are charged with 20,000*l.*, of which they paid a portion.

8551. Do you know what portion they have paid?—I believe they have paid 10,000*l.*, if not more. I should mention that after the north embankment was made, I had very accurate tidal observations taken to test the result, and found an additional rise of tide equal to one-eighth of the whole range of tide. I did the same with greater accuracy by means of a self-registering tide-gauge after the south embankment was made, but found no increase of rise. I traced the cause: the progress of the tide was accelerated, but the increased action of the river appeared to have depressed the tidal wave at Wexford. We have this from the returns on the self-registering tidal gauge.

8552. How long has that self-registering tidal gauge been in use?—Three years.

8553. And observations of it are carefully taken and recorded?—They are.

8554. To return to the use of the dredger in the Hantoon Channel; is it not a fact that representations were made by a member for the city to the Admiralty, and by several leading merchants of Wexford, that until a short time ago this was all but a sealed harbour?—Such representations were made.

8555. Was it not in consequence of these representations that the dredger was immediately put to work in the Hantoon Channel?—It was.

8556. Did not a great deal of delay arise in consequence of the foundering of one on the passage?—Yes; we lost the first one that was made, but immediately afterwards the contractors commenced and finished another in three months.

8557. Then the foundered dredger was replaced in three months?—Yes, the contractors sent it over here from Liverpool as soon as they possibly could. Several matters required to be done after its arrival, owing to the incomplete state in which it was sent over, but we used the greatest diligence, though we could not prevent delay.

8558. Is that dredger in perfect order now?—It is.

8559. Have you found it to be so?—Yes.

8560. Are the barges reported to be fit?—Yes.

8561. It has been reported that the hopper barges were so high that they could not be loaded from the shoot?—That is quite a mistake. All they required was to have the shoot raised higher than for ordinary barges.

8562. Did you convey three of the Commissioners to-day to examine the channel?—I did.

8563. Did you convey them outside the bay?—Yes, I did, into the South Bay.

8564. Are you aware that the delay in sending the barges was caused by the Embankment Company not paying up their settlement?—I am not aware of that.

8565. Of the 10,000*l.* how much has been laid out in plant—in the hopper barges, the dredger, and other barges?—7,270*l.*

8566. Having only 10,000*l.* to expend, would you consider it prudent, as an engineer, or would you recommend the Admiralty, to lay out more than 8,000*l.* in plant?—Certainly not.

8567. Or would you recommend the works to be commenced with little prospect of the money being paid up?—I think it was better to wait.

8568. You said you were not aware of the Harbour Embankment Company having refused to pay up their settlement?—I am not aware.

8569. With respect to the Coal Channel, you did not tell us the cost of making such a cut?—About 27,000*l.* was the estimate.

8570. For the whole?—Yes, for the cut into the Coal Channel.

8571. Are any funds available for that purpose?—I am not aware of any.

8572. Is there any probability of any funds being obtained for such a purpose?—I don't see any.

8573. Do you know the income of the Wexford Harbour Commission?—I believe it is about 2,000*l.* a year.

8574. Is any part of that sum available for improvements in the harbour?—I believe not.

8575. Do the harbour trustees contribute any thing out of their funds towards the improvements now going on under your charge?—Nothing.

8576. Have you anything to suggest yourself, as engineer, for the better and more rapid improvement of the harbour?—I think it would be a waste of money to attempt making this port a harbour of refuge to any great extent, and that the money which would be required for such an experiment as I understand has been proposed in the South Bay, would be much better spent in improving the present entrances into the harbour.

8577. Have you ever formed any design for a harbour of refuge on this coast?—Yes.

8578. Where do you mean?—Carnsore Point. I think if a harbour of refuge is to be made, that is the place, but it would cost a very large sum of money.

8579. Can you tell the Commissioners how much, in round numbers?—I don't think that less than half a million would do.

8580. Do you think that the wrecks on or about the coast call for a harbour of refuge?—The wrecks certainly call for it.

8581. Are the wrecks frequent at Carnsore Point?—Frequent in the neighbourhood.

8582. Is a register kept of them?—I think there is, by Mr. Sparrow.

8583. Who is Mr. Sparrow?—He is one of the Harbour Commissioners. When I spoke of a waste of money, I used it comparatively with the value of a sum of money spent at the mouth of the harbour. There is the list of wrecks up to 1845.

8584. I dare say that list can be continued up to the present time?—Yes; I don't think there has been a single winter, during the 18 years that I have been here, in which sad wrecks have not occurred.

8585. (*Capt. Sulivan.*) If the work of piling the Dogger Bank succeeded, would it make Wexford more of a harbour of refuge than at present?—If the piling succeeded and was continued as the Dogger Bank extended itself to the south, as it would, and if the channels and banks outside were well buoyed, and perhaps lighted. I think the South Bay, having the Dogger Bank as a great natural breakwater to protect it, would thus be made as good a refuge harbour as its natural circumstances would admit.

8586. Have the set of the currents from the entrance taken that line that reduces the points? Is that set as favourable for a preventing work at the bank, so as to throw on the present channel the ebb tide from the entrance? My object is to know whether there has been any great working away of the points from the present state of the currents from the entrance?—No, there is not; there are sometimes temporary changes.

8587. Neither in the set of the currents nor the line which it makes is there the least waste at the point?—The point is just now at the deep water.

8588. If you cut into the Coal Channel, will not the North Channel silt up?—If you carry the depth of water at the quay through the cut to join the deep water in Coal Channel, no doubt the North Channel will become shoal.

8589. And in time may close up?—Yes.

8590. Directly the current of the South Channel is increased, will not the certain consequence be to throw the water across the Ravenspit?—There is no doubt of it.

8591. Would not the effect be to throw a large mass of sand into the present north-east and east channels?—No doubt of it.

8592. Do you think also it would have the effect of prolonging the point of Fort Point east, and so across Hantoon Channel?—I have not any doubt of that.

8593. Do you think the present set of the channel should be as little interfered with as possible, except between the banks?—Certainly.

8594. Will you explain how you consider that this embankment, joining the two shoals, will throw a greater body of water into the Hantoon Channel, except by sweeping away the banks near that embankment?—A considerable portion of the tidal currents setting both north and south is at present diverted through the swatchways in the Dogger Bank; the effect of the proposed piling would be, to prevent this diversion—this waste, as I may term it—and to guide the whole of the stream into Hantoon Channel.

8595. Would you not fear its opening a new channel?—No; the tides passing along the present sailing course within the harbour would join the north and south currents outside fairly.

8596. Does your ebb sweep by Hantoon seaward, and is there little or no tide on the ebb?—I know we have a very strong tide. We find it very hard to keep the barges at work. We have had strong tides since we commenced dredging.

8597. Does the force spend itself now from Hantoon Channel to the south?—A considerable portion.

8598. Is there no decided contraction of its current seaward, or how?—The north current comes down by the North Bay, and a portion goes off in a south-east direction. Much of the ebb tide always runs out through these banks, wasting its strength.

8599. Do the south-east gales throw up a quantity of sand on the west side of the Dogger Bank?—Yes.

8600. Would there not be some fear of the bank being increased when an island was formed there?—No. I think the constant current there, north and south, would tend to carry the sand off, and would have the effect of carrying it round to the south end of the Dogger Bank, and there lodge it. Some portion of it, if carried to the north, would be caught by the main channel tide, and I think the Dogger Bank would be very largely increased indeed.

8601. When that bank extended beyond the extent of the piling, would you not fear that it would bring sand round the end of it into the channel?—If it brought any, the current, confined by guiding lines between the banks and Rosslare Point, would always keep the sand in suspension and carry it out to sea.

8602. One of the witnesses states that the swashways were closing up?—I have not seen it, but I should not be much surprised if it were so, because soon after we commenced our dredging operations the bank began to show on the west side of the Dogger Bank, near the swashway, showing that we had brought a better tide into the Hantoon Channel, and diminished the run in the swashway.

8603. And if the course of the swashways close up, might not an island be formed without piling?—I don't think you could ever permanently form it without piling. I surveyed the Dogger Bank in 1855; it was considerably higher than it is at present. I was then anxious to take advantage of what nature was doing. It was considerably over high water, but it has been diminished since, and the tides run more over it.

8604. You said a single row of piles would be sufficient?—A single line, not a single row.

8605. Can you give us any idea of what the breadth of piling would be?—I would make it six feet, from out to it, with three rows of piles.

8606. Would you place them longitudinally?—I would place them herring-bone, very near, and filling up the back. I think the best thing for backing would be bags filled with sand.

8607. The estimate you have given for it includes all that expense?—Yes.

8608. And do you think that any contractor would be found to undertake a work of that kind?—Not here, perhaps, but the patentees of the screw pile would probably take the contract.

8609. Is there any difficulty in putting down screw piles so close in such a place?—We do not want sustaining powers; with screws of large diameter you can drive a timber pile into sand deeper than about fifteen feet without splitting it; but it can be easily screwed down.

8610. Don't you want to go deeper than fifteen feet?—I would go deeper throughout the channel; unless it is done well, and permanently, it is better not done at all.

8611. (*Capt. Vetch.*) Do you know when this chart was made?—In 1856.

8612. Did you see Captain Fraser's previous chart?—Yes.

8613. Do you think that if the piles were driven in that bank they would remain permanent?—I do.

8614. Are you aware that the present state of the Dogger Bank is very different from that which Captain Fraser found in his first soundings:—that the bank is now where was formerly the main channel?—It was so. I discovered it first myself. It was on my report that Captain Fraser was sent here.

8615. Considering that the bank has shifted so much, that from being on the south side it has gone into, and filled up what was then the main channel, do you think the present position of the Dogger Bank likely to be maintained more fixed than previously, and that anything which human nature can drive in, in the way of piles, will stop its future movement?—I do.

8616. Are you aware that this part of the bank has formerly extended very much to the south?—I am.

8617. Then these great changes having taken place, do you conceive that by means of piling you can fix the banks?—I do.

8618. And to spend a 100,000*l.* on it, would you be bold enough to propose such a thing?—An island once

WEXFORD.

Mr. James Barry Farrell.

24 Sept. 1858.

Capt. Vetch.

existed there, and would be there now had it been properly preserved. There is a letter in the Report of the Tidal Harbours Commission, 1846, referring to that island when it was covered with bent grass. I conceive that by the assistance of piling, planting, and encouraging the growth of bent grass and preserving it, the island may be re-created, and be as likely to become permanent as when it existed in its natural and unprotected state. If you look at the chart of 1856 you will find the Dogger Bank pretty much in the same position as it occupied in 1845. It appears to be a nucleus collecting sand that shifts round it. On McKenzie's chart you will find it marked dry where it is now so, and so marked by Frayor in both his charts. You will also find it tailing, as it now does, much to southward, with Hantoon Channel between it and Rosslare, and that chart of McKenzie's is between 80 and 90 years old.

8619. You consider then that the present is the normal position of the Dogger Bank, that it has driven north, and that you can fix it by means of piling ?—Yes, its normal position.

8620. You have mentioned that dredging the Coal Channel would cost 27,000*l.* ; at what did you estimate the cost of the other channel ?—I think it was 13,000*l.*

8621. The same depth of water ?—The same depth that it is proposed to carry through the new cut, 11 feet depth.

8622. (*Mr. Coode.*) What induced you to turn your attention to Carnsore Point ?—I examined the whole coast when the question was started.

8623. And you think more wrecks would be prevented by a harbour at Carnsore Point than nearer Wexford ?—There is material for making a harbour of granite formation.

8624. Then you were induced to prefer that site rather on account of the material than from any other cause ?—Yes ; and there is far deeper water in shore. There are 300 acres, varying from three to ten fathoms.

8625. Did you ever make any design of a harbour there ?—I did.

8626. And an estimate ?—Yes; I did not put it forward because I saw the expense would be so great that it was almost useless to propose it, but you can get 10 fathoms of water.

8627. Can you tell us anything of the origin of the material of which this Dogger Bank is formed ; does it come from seaward or landward ?—Its origin may perhaps be derived from both.

8628. What is the nature ?—Quartz sand.

8629. Are the outer banks composed of material of the same character ?—I believe so.

8630. You never tried them ?—No ; I think the same operation assisted to create both.

8631. Are there any shells on the Dogger Bank ?—Fine sand, very little shell.

8632. You spoke of the relative sectional area of the entrance to the harbour at two different periods, can you give us the exact number of superficial feet ?—I think in 1845 the area contained between high and low water levels was 14,000. You can easily calculate what it is now.

8633. You have not compared them ?—No.

8634. Can you furnish the Commissioners with the superficial area of the channel in 1845 and now ?—Yes.

8635. You gave us the quantity removed by the dredger since July, was it 8,000 tons or 8,000 cubic yards ?—8,000 tons.

8636. What can you remove per day ?—The average work is 112 tons per hour.

8637. Can you keep that up throughout the day ?—It might be done in extremely fine weather and with other very favourable circumstances.

8638. If the weather permitted, how much could you remove in a month ?—If we had fine weather with these barges I think we could remove 1,000 tons a day, assuming the dredger to work without interruption for ten hours each day.

8639. Then, in the course of a fortnight, with good working weather, you could remove as much material as you have dredged since last July ?—Very nearly.

8640. I think you said you intended to give two feet additional water before winter ?—No, to lower the present obstruction by about two feet.

8641. Would not that be tantamount to giving an additional two feet throughout the entire channel ?—Very nearly so, but certainly where the great obstruction lay.

8642. What quantity should you have to remove in the channel then ?—Oh, considerably less than 10,000 tons, I should think.

8643. (*Chairman.*) I think you mentioned about 30,000*l.* for the line of piling which you proposed to make. Suppose now the Government made a grant of 10,000*l.* for that object, would you be able, by doing a portion of it, to test its ultimate success ?—It would tell for itself as it went on. It may be executed in sections, and one section would tell pretty nearly correctly what may be expected from the next, and you may stop or proceed as it was found useful or otherwise.

8644. And without injury to the entrance to the harbour ?—No injury whatever would be done.

8645. Then the proposal for piling the Dogger Bank is not any new proposal of yours ?—It is one I made in 1846.

8646. In your report on Wexford Harbour you state that to be, in your opinion, one of the best modes of improving it ?—Yes, I do.

8647. And that with a view of improving Hantoon Channel as well, as probably the north-east channel also ?—Yes, certainly.

8648. You said you thought that there was some feeling of jealousy respecting the works ?—The evidence of the master pilot, coupled with some matters that came previously under my observation, created that opinion ; but as his statements were corrected by subsequent witnesses, further remark is perhaps unnecessary.

8649. Recurring to the evidence which we have had given to us that the dredger might have worked for forty fine days when she did not work, are you in a position to furnish us with a diary showing what she has been doing on every day since she has been here ?—I am.

8650. Be good enough to do so, then ; but is that statement the fact, or directly contrary to fact ?—What ?

8651. That the dredger lost forty fine days when she might have worked ?—It is directly contrary to fact.

8652. (*Capt. Sulivan.*) On whom does it depend to decide the days when the dredger shall work ?—On myself.

8653. Daily ?—The men in charge have orders to go out, if it is possible to go out, and their report comes in to me every day.

8654. Upon the days when they made objections to going out on account of the lift of the sea, were you satisfied as to the state of the sea outside the bar? —I was.

8655. Have you reason to suppose that they might have frequently gone out to work when they were absent ?—On the contrary, I think they were most anxious to go out—most anxious.

8656. Supposing operations were commenced, would you put in the centre portion of the work to enclose the swashway at once ?—I think that would be best.

8657. Might that not have the effect of adding to the banks right and left, as well as closing the bank immediately behind it ?—No ; I think the effect would simply be to direct the current in its proper course, and carry any sand which might be in suspension away with it, and that it would deepen the inner channel.

8658. Might it not also have the effect of continuing the deposit on those banks which are already formed ?—No doubt it would.

8659. From the piling not being extended round them ?—I have no doubt that if the two operations of dredging and piling were carried on, in a very short time you would have that bank dry.

8660. And that there would be no injurious effects on the present banks until you had time to embank them ?—No.

8661. (*Capt. Vetch.*) Do I understand you to say that the tide-making comes through the north mouth and runs out again at the south mouth ?—There is a true tidal current north and south.

8662. Suppose the tide rising to about half tide, do you inform us that the tide is then running in at the north entrance, and out at the South Channel ?—It runs into the hhrbour.

8663. Not through the Hantoon Channel ?—It does not pass by the entrance to the harbour and run through the Hantoon Cbannel.

8664. Does the ebb tide run through the Hantoon Channel ?—The ebb tide runs out over here, and the in flood tide runs over there.

8665. So that they do not interfere with one another ?—Any tide running southwards is partly diverted through the swashway.

8666. Do they meet ?—The flood tide runs up and they meet in the north channel.

8667. And do they then take a joint direction instead of running, as I imagine you intended to describe ?—They take this course (*marking in pencil on the chart*).

8668. (*Mr. Coode.*) At what cost per lineal yard have you estimated this line of piling of which you have spoken ?—At 40*l.* per yard.

8669. What is the shortest length which you think would be of service ?—The shortest length would be of about half a mile.

8670. At what distance apart would you place the piles transversely ?—I would put them herring-bone way. The extreme distance between them I should suppose to be six feet transversely.

8671. You propose three lines of piles ?—At distances between the two outer lines of about six feet.

8672. About six feet, including the thickness of the piles ?—Yes.

8673. And at what distance would you put them transversely ?—About the same.

8674. And to about what depth do you propose to screw them ?—I should be inclined to screw them down below the depth of the channel which goes out to the north-east.

8675. What height would the top be ?—Five feet over high water.

8676. Would you have any cross or diagonal planking ?—Yes, and other ties.

8677. Have you ever had occasion to use screw piles ? Are you aware of the rate at which the Screw Pile Company charge them ?—I have been in communication with the company upon the matter.

8678. And do you base your calculation on the result of that communication ?—Partly. I do think they charge extravagant prices for their patent.

8679. (*Capt. Washington*). I observe that in your report of 1846 you state that one of the greatest means of improvement which could be made in Wexford Harbour would be removing the bridge and causeway of Wexford. That was in 1846. Has any step been taken in that matter ? Has it been done ? —A great many steps have been taken. The contract for building a bridge higher up has been signed, and the timber has been ordered for it.

8680. When will the works probably be commenced ?—As soon as the timber is received. We have been expecting it for some time past.

8681. Will they be commenced as early as the spring ?—I hope so.

8682. And in the course of how many years is the old bridge to be taken away ?— The contractors are bound to complete the new bridge in 1860 ; the old one cannot be removed until the other is available.

8683. In 1846 was not an Act obtained to improve the river up to Enniscorthy ?—That was part of the plan for improving Wexford Harbour, and for which the original Act was obtained.

8684. Has anything been done towards it ?—The Embankment Company were relieved from that in 1852, and a company was subsequently formed by the merchants of Enniscorthy and others to carry it out. The Earl of Portsmouth takes a great interest in the matter, and Mr. Dargan has intimated that he is disposed to take a contract and do the work.

8685. Does there seem any probability that the work will be carried out ?—I think it very probable it will.

8686. Will it be useful in the improvement of Wexford Harbour ?—It will be a very useful adjunct. I do not know anything which would be more useful.

Mr. John Edward Redmond examined.

8687. (*Chairman.*) You are connected with the Wexford Harbour Embankment Company ?—I am.

8688. Have you been present during this inquiry ? —I have.

8689. Have you any observations to offer as to the effect which the embankments produce on the harbour, whether injurious or otherwise ?—With regard to the harbour, I was the person who originated the Harbour Embankment Company. At that time the Company had Mr. Farrell as engineer, and among other suggestions made by them was piling outside the banks at sea. I am decidedly of opinion that the original entrance to the town was on the Coal Channel ; that has been the original entrance, and that the present, which we call the Town Channel, is fictitious and false. The reason I state so is, that the soundings in the Coal Channel are excessive, and not to be accounted for on any other principle, and it must have been a considerable number of years ago connected with the Slaney. The Slaney, about six or eight miles up the river, is of considerable depth. I live six or eight miles up the river, and opposite my own house there are twenty-eight feet at low water ; and from history we find that, at the period of Cromwell, the frigates of the English Parliament entered the harbour, and lay at Wexford ; putting that and the soundings together, it seems clear that there was a great main original channel, and that the Coal Channel must have been connected with the Town Channel. From the soundings which the Company caused to be made in the slob in the centre, it appeared there was no bottom, which was the reason why we could not construct any form of embankment without vast expense, and it is therefore not improbable that through the soft part of that slime was the original entrance. It has been suggested by Captain Vetch that that could be excavated at a small cost. I think the plan which he has submitted, connected with that and the bar, would considerably improve the east channel without interfering with the Hantoon Channel. I am a shipowner. I have been a shipowner for upwards of thirty years, and the owner of steam-boats twenty-six years, and have had frequent means of communicating with seafaring men. I think an entrance could be made without interfering with the easy entrance of the Hantoon Channel, and that the mouth of the harbour could be contracted in the same way as on Mr. Farrell's plan, towards the east and north-east. From the experience which I have had of similar works, I do not think the cost would be excessive, and that a small grant would be sufficient, in addition to the funds which I think would be available ; indeed, the locality ought to produce them.

8690. Supposing that the line of embankment marked on the plan in a concave form to the south were adopted and made, would any more funds be

WEXFORD.

Mr. John E. Redmond.

24 Sept. 1858.

Chairman.

available from the Midlands—anything in addition to the 20,000*l.*?—No; nothing in addition to the 20,000*l.*

8691. In the view which you take do you contemplate the Coal Channel principally?—Yes; to make that the leading channel, with 18 feet of water at low water.

8692. What effect would that have on the present sailing channel?—I do not think any. There is nothing in the Slaney in the shape of deposit or silt. Boatways have been opened by the fishermen, and they have not filled up. We also commenced, on the part of the Harbour Embankment Company, to open a cut from the coal into the main channel. There was some interference which prevented its being completed. It cost a few pounds, and it has remained open ever since.

8693. And therefore, supposing your plan to be carried into effect, you think that you would possess all the advantages from the present sailing channel, and also have this deep-water channel for large vessels?—I take it so.

8694. As a shipowner, I would ask you whether the narrowness of the channel would be of any importance, considering the use which is now made of tugs?—I am altogether an owner of steam vessels, and of course, as to that, it would suit us very well, and for sailing vessels it is equal in size to the entrances to other harbours, and I do not see much against it.

8695. And would there be any possibility of making the slob land available for the purpose of providing funds towards the improvement?—I think not. The flats are all sand, and I do not think that they could be enclosed with profit or utility.

8696. I think you stated that you thought local funds would be available. From what source would they be derived?—I think we ought to help ourselves when we are asking other people to help us. The income of the quays is from 1,500*l.* to 1,800*l.* a year, and I do not see why the Quay Commissioners could not appropriate half that for the interest towards the improvement of the harbour. I do not remember any improvement to the quays. I have sometimes acted with the Commissioners, but I have generally been in a minority; they have received from 1,100*l.* to 1,800*l.* a year, and reduced the debt lately.

8697. And supposing that the improvements which you contemplate were carried into effect, would the trade of the port be increased, and consequently the revenue of the port improved?—I have no doubt of it. My steamer, which is one of 800 tons, sails once every week. If a steamer were to sail every day it is evident what the income would increase to. In the autumn of 1856 I sailed a small steamer to South Wales in connection with the South Wales line of railway, but the expenses of the port and the difficulty of entering the harbour, expenses one way or another, would not let it pay, though I showed there was a trade.

8698. I think it was stated by Captain Washington, during his examination of one of the witnesses, that the original contribution of the Harbour Embankment Company was 20,000*l.*, and that they have only paid 10,000*l.* Would there be any difficulty in getting the other 10,000*l.* Is the rest forthcoming?—If the Admiralty perform their part of the agreement. We paid 5,000*l.* in 1854, and 5,000*l.* in 1855. I know that for some successive years we paid our contributions, which were secured on the reclamation of the land on the north side, and up to this time we have no certificate from the Admiralty that we have embanked to their satisfaction on the south side. I hope that in the course of the autumn we shall get the necessary certificate, and then we may get sufficient funds for our operations. Perhaps I may also mention that the Admiralty withhold their consent to embanking 4,000 acres. There are 4,000 acres unembanked still; there are, in fact, 4,000 acres of land still untouched, inasmuch as the Admiralty withhold their assent to the enclosure, and as the whole 10,000*l.* was a contribution for unreclaimed land, that will, of course, materially affect the question.

8699. But you have no reason to suppose that the assent of the Admiralty will be withheld ultimately?—I believe the communication from the Admiralty was to the effect that until the flow of the tides outside the bar was ascertained they did not wish to receive any more plans.

8700. You have stated your opinion that if the channel were deepened to 18 feet up to the quay the trade of the port would be considerably increased; will you inform us generally the grounds for that opinion?—In the first place, the situation of the county and town of Wexford is nearest to the English coast, and if there was equal facility of ingress and egress it must be the means of communication with the south parts of Ireland and between the Scotch and English coasts; because we have plenty of evidence that all perishable articles are conveyed by the shortest sea passage if it can be safely done, and through the instrumentality of steam, by means of the lines of railway, which we hope to extend to the centre of Ireland, I do not see why it should not be the principal export place for the south-east part of Ireland. The land in the neighbourhood is extremely productive. The people are industrious. The fishery is only half developed, and I should hope with those improvements the trade of the port would not only be increased by a per-centage, but that it would be considerably more than that.

8701. (*Capt. Sulivan.*) You say that the channel is to be dredged to 18 feet. Would you consider the trade of the port to depend on a corresponding depth outside?—I think if you were to get 18 feet in the channel, you would get 18 feet all through, as long as the currents were directed in a proper manner.

8702. How would you direct the currents?—At the entrance.

8703. How?—By the bank outside. In 1800 there were 16 feet of water, and at that time there was only a single bar.

8704. We have heard of inclosing this bank in one, and making it an island, leaving two channels, the East and the Hantoon Channel. Do you think that would have the effect of obtaining 18 feet of water in both?—I am afraid not, but you have not that as it is.

8705. You would get more depth, you suppose?—I am afraid the shape of the east entrance is too much to the north. I should suggest a stone embankment to the north. I should be afraid that if you make an enclosure or island you would force the current into the shoal water in the North Bay, which is not our object.

8706. Can you see any way by which any piling could overcome the difficulty of the water getting more to the north than at present?—The prevalence of easterly winds is to force the entrance to the north, and unless you put a protection to the other edge, I am afraid it would be forced up as I said, but of course that is an engineering question.

8707. Still, the embanking the two islands would deepen the channel in the harbour, would it not?—You would shut up the little swashway, which I consider does no good but harm.

8708. But if the Coal Channel were deepened you would think that comparatively useless without an equivalent outlay to deepen the water outside?—I think it would have a considerable effect towards deepening the outside without anything else.

8709. Explain the reasons why you think so?—You would put the volume in a single direction.

8710. Would it not have the effect of striking more to the north?—I think it would take a little off the north point.

8711. Would not all which was taken off that point be thrown on the banks?—No; the sooner you have protection there the sooner you would have a complete current leading up through the Coal Channel.

8712. You have heard the witnesses speak of the value of the Hantoon Channel, more especially from

its protection from the sea; do you adopt that view?—Decidedly.

8713. Would it not be losing a valuable mode of safety to close that channel?—I do not propose to close the Hantoon Channel.

8714. But if the result was to deepen and make one channel to the eastward, would not the effect in some measure be to close the Hantoon Channel?—If you could secure 18 feet at low water, through the Coal Channel, it would be infinitely preferable, in my opinion, to six or seven feet in the Hantoon Channel; and you can hardly put it at more than seven feet.

8715. You proposed this morning, I thought, to stop up the Hantoon Channel?—Being ignorant of Mr. Farrell's views, I thought it better to propose something.

8716. (*Capt. Vetch.*) You are of opinion that if the deep Coal Channel were connected with the deep channel above Gull Bar, the connection of the water above and below would be the means of more permanently providing a deep channel to the sea?—I think it would secure us a fixed entrance.

8717. Supposing a channel were made near the proposed south embankment, in prolongation of the Coal Channel, would that be a great facility to navigation and to the land?—I think it would be a considerable object to have the south embankment made, and that it would reduce the expense of the cut if both were constructed together; and it would afford a convenient place for material removed inside the Gull Point.

8718. Is it not a fact that small craft in hazy weather get on the bank?—Yes, and even steamers.

8719. With that Coal Channel improved and extended into the deep water above the Gull Bar, would they then do so?—No; because there would be a continuous landmark.

8720. And the shore could be converted into quays or jetties?—Certainly.

8721. Would you prefer, on the whole, a deep channel along the south embankment, or the north and shallow channel?—I do not think there can be a second opinion on the subject.

8722. You are aware that the Dogger Bank is now in what was the middle of the fairway?—Still, the section of the obstruction at present is nearly the same as in 1846.

8723. Nearly the same with respect to depth, but different in position?—Very little; but as to the section of the obstructions, it is just the same as it was in 1846; it is only altered in place.

8724. You propose a breakwater on the north side?—Yes; inside the Raven's Spit.

8725. Where would you get your stone?—There is a great facility for getting stone.

8726. At what cost per ton?—You can quarry stone at 6*d.* per ton.

8727. And conveyed for how much per ton?—I think, with the aid of the tug boat, you could convey the stone for another 6*d.*

8728. And if your breakwater were run out from Raven's Point, it would give facilities to vessels entering?—No doubt.

8729. And would confine and guide the main channel to the sea?—I think it would have the effect of a kind of guide to the channel towards the north, on the north side; but that would not affect Mr. Farrell's idea of a breakwater on the south or east.

8730. (*Mr. Coode.*) Be good enough to point out the line where the borings were made when no bottom was found; the line which you assume was the line of the original Coal Channel?—It was somewhere in the line of the proposed embankment. I objected to the certain expense of the embankment.

8731. Was it on the line marked?—I think it was a little more to the north, which was the line proposed under the Act of Parliament. This line is somewhat inside, to the south of the Act of Parliament line.

8732. Then do I understand you to say, that the line shown here is the line sanctioned by the Act?—No; that line is a little to the south.

8733. When is it likely that will be completed?—We must first get the consent of the Admiralty.

8734. Have you applied to the Admiralty for their consent?—Yes; in 1856.

8735. And you have not yet obtained it?—Yes; we said the plans were prepared and everything necessary, but they said that until the harbour question was settled they did not wish to give their assent.

8736. Are you prepared to say that the line of embankment proposed will be carried out?—I am only a single individual, but at that time——

8737. Have you any reason to doubt that this embankment will be carried out at once?—I cannot give a positive answer to that question. I should do all that I could to get it carried out.

8738. What is the probable cost?—Something less than 40,000*l.*

8739. By whom was the estimate made?—By our engineer.

8740. Of what material was it proposed to form that embankment?—Clay, and faced with stone.

8741. You say the cost of the stone is 6*d.* per ton. Is that put on board of the barges, or at the quarry?—At the quarry; but that would be at the edge of the navigation.

8742. Has any stone been so carried to the embankment already made?—Hundreds of thousands of tons.

8743. Can you tell us the cost per ton of that which has been conveyed?—It was delivered at 1*s.* 6*d.* or 1*s.* 8*d.* a ton; but if a considerable work had to be executed it would be cheaper. The contractor would have his own plant ready.

8744. You spoke of a channel being opened by the fishermen?—There are three or four of them.

8745. You spoke of one which had remained open and become wider?—The present entrance at Peger was opened, as I am informed, by the fishermen some years ago. It is 18 feet at low water, and perhaps 100 yards wider.

8746. Is that deeper or wider than the one which you first mentioned?—Yes; that was only for a cot to go through. We opened one to the mainland. We opened it to 6 feet breadth and a foot depth. It is now 8 or 9 feet deep, and 60 or 70 feet wide. There is another in the passage of the Knob, which connects the Coal with the Town Channel. It was opened by the fishermen for the facility of communicating between the two channels. That also has remained open.

8747. You spoke of a single entrance in 1800?—At that time I believe it was so. According to the survey the sand banks have risen, but the charts will show that.

8748. What was the direction of the channel?—A direct east course from the Fort, upon which point you may refer to Captain Vetch's report.

8749. Have you any estimate of your proposed breakwater?—Yes, 40,000*l.*

8750. By whom was it made?—By myself and an engineer.

8751. Of what is the breakwater to be made?—Of stones.

8752. Can you procure stones of a large size? Can you procure stones of five tons weight each?—I have not seen them so big as that.

8753. Of a ton or two tons weight?—Not in any quantity. Our object is to get the stone handy, and we must get small stones.

8754. Do you think they are fit to form a breakwater?—Not to face it.

8755. (*Chairman.*) You spoke of maps and charts which show what the channel was in former days?—There is a county map of 1800.

8756. Is there anything prior to that in existence?—There is a very ancient map in the British Museum. I was asking our engineer to-day about it. He saw it, and he believes it is 500 years old.

8757. Has the embankment already carried out

WEXFORD.

Mr. John E. Redmond.

24 Sept. 1858.

Chairman.

been sufficiently remunerative to induce capitalists to proceed ?—Taken in the aggregate I think it has not, but when we commenced to enclose it we had a considerable expense for the Act of Parliament, and preliminary expenses, not connected with the work. The contribution to the Admiralty has added much to the expense.

8758. Is there a fair prospect of its affording remuneration without these expenses ?—There are persons in negotiation to get new subscribers.

8759. As far as the persons locally concerned, there would be no obstruction to the work being carried out ?—I can see no impediment at all.

Mr. William Coglar examined.

Mr W. Coglar.

8760. (*Chairman.*) You are collector of customs at this port ?—Yes.

8761. How long have you held that appointment ?—Nearly three years.

8762. Can you give a return of the number and tonnage of vessels and the arrivals and sailings for the past year ?—Yes.

8763. Can it be carried back for a considerable number of years in the form of an abstract ?—It can.

8764. If it will not be involving too great labour can you give it from 1845 downwards ?—Yes.

Mr. Richard Adams examined.

Mr. R. Adams.

8765. (*Chairman.*) You are one of the Harbour Commissioners ?—Yes.

8766. Can you give us an account for the last year of the harbour revenue ?—I can procure it for you.

8767. And would it be any inconvenience to you to give it for the last 10 years, from 1845 downwards? —Not the least.

8768. Will you supply it at your own convenience to our Secretary ?—Certainly.

(*Chairman.*) Is there any person present who wishes to tender further evidence with respect to this inquiry ?

No answer.

Sitting at Wexford closed.

ST. IVES.

Monday, 27th September 1858.

PRESENT :

Admiral Hope (Chairman).

Sir Frederic Smith.	Captain Vetch.
Mr. Lindsay.	Captain Sulivan.
Captain Washington.	Mr. Coode.

Mr. Evans, Secretary.

Mr. Tremearne, Agent to Lloyd's, examined.

ST. IVES.

Mr. Tremearne.

27 Sept. 1858.

8769. (*Chairman.*) What is your name ?—John Newman Tremearne.

8770. What is your connection with the port of St. Ives ?—I am agent to Lloyd's and consul to Sweden and Norway. I hold also other offices.

8771. And for what period have you been connected with the port of St. Ives ?—From childhood. I was born here, and have lived here ever since.

8772. Will you proceed with your statement ?—I first of all hand to the Commissioners a chart of St. Ives Bay, with the depths of water, as taken by Captain Williams ; also a chart taken 70 years ago, showing the depths then ; also one taken in 1814, as far as I can gather ; also one taken 50 years ago, showing the depth of water then ; and a chart of the port of St. Ives.

8773. Have you anything to hand in derived from your own knowledge and experience ?—I next hand in a paper, showing the number of registered vessels and boats belonging to the port of St. Ives. The vessels registered amount to 13,118 tons. There are 44 registered drift boats from 15 to 30 tons ; 76 under that tonnage ; 250 pilchard seine boats ; while a large number of drift boats come here from other places during the pilchard, herring, and mackerel seasons. The next paper I bring under your notice relates to the damage vessels have sustained, more particularly in 1857. On the 27th May, 1857, upwards of 100 vessels came for shelter from a tremendous south-east gale ; 33 only ventured to enter the harbour, and had the wind shifted to north or north-west, very great damage and loss of life must have occurred. The next paper shows the trade of Bristol, and of the Welsh ports. The total tonnage of coasting and foreign vessels entered inwards and outwards at Bristol, Cardiff, Newport, Swansea, Neath, &c., is roughly estimated at 4,707,000 tons, and a great amount of this must pass the Land's End. I have one paper to hand to the Commissioners, more as a curiosity than otherwise. It is an estimate for a breakwater 80 years ago (4,000*l.*), and shows that at that period there was an idea of such an erection. My last paper is an estimate of the mackerel and fish taken in St. Ives during the last two years, their value, &c.

8774. Do you wish to make any further statement ? —No, I don't know that I do. I have given these statistics to enable the Commissioners to judge what St. Ives is.

8775. Do you wish to make any further statement ? —No.

8776. (*Sir F. Smith.*) Have you reason to believe that if a harbour of refuge were constructed a great number of vessels would come in ?—Most assuredly.

8777. How far is a vessel protected in stress of weather ?—We have no shelter except our pier, which is so small that it yields little accommodation.

8778. You have at the bottom of the bay sands which, if a vessel should take them, would save her ? —Yes, we can beach a vessel.

8779. Do you, as Lloyd's agent and consul for Norway and Sweden, know any cases in which vessels bound up and down the Channel would be desirous of coming in here ? — I have frequently known vessels coming from Norway remain until they considered the weather favourable in Falmouth ; when favourable they have come round.

ST. IVES.

Mr. Tremearne.

27 Sept. 1858.

8780. What would they do if a harbour were formed here?—They would not go to Falmouth at all.

8781. And that would expedite their passage?—Yes; I have sometimes known them at Falmouth for two or even three weeks, with a wind at north-west.

8782. (*Mr. Lindsay.*) How many vessels have you known wind-bound in this bay at one time?—I have shown a large number so late as 1857.

8783. I want to know from you, so as to have it in evidence, the number of vessels you have seen here at one time?—It is all in that paper.

8784. Well, I now see that on the 27th of May, 1857, 110 vessels came to an anchor in a heavy gale from south-east?—Yes.

8785. Had the wind suddenly shifted to north and north-north-west great damage to life and property would have occurred?—Yes.

8786. Now, are you aware, of your own knowledge, if many vessels would take shelter here if protected from the northward and northward and westward?—We have often seen 100 sail off here, and frequently I have heard masters say, if a harbour were here they would come in; many have been driven to sea and lost.

8787. You speak of this from long experience as Lloyd's agent?—Yes. There is often a difficulty in weathering the Land's End, and masters say that had there been a harbour here they could have gone round days before.

8788. Do you know, of your own knowledge, of any loss to life and property that has taken place, and which would have been prevented by the formation of a harbour?—Yes, by the reports of masters; they say they have been obliged to stand to sea, when otherwise they might have taken shelter, had there been a port at St. Ives they could have come to. If they had come in, and the wind had suddenly shifted to the north-west, they would have had to encounter such a tremendous sea that their vessels would not lie in safety.

8789. Confining your remarks to the immediate neighbourhood, can you mention any particular instances where life or property would have been saved?—Two wrecks occurred about three years ago: the *Concord* and the *Swift* sank, and one of them remains here now.

8790. How was the wind when those vessels were lost?—North-north-west.

Mr. Quick examined.

Mr. Quick.

8791. (*Chairman.*) What is your name?—James Stevens Quick.

8792. What is your occupation?—I am the harbour master of St. Ives.

8793. How long have you held that appointment?—Coming on for six years.

8794. What was your previous occupation?—That of a seafaring man.

8795. How long?—I have been to sea from an apprentice.

8796. Have you ever commanded a vessel?—For eight years.

8797. What description of vessel have you chiefly commanded, sailing or steam?—Sailing, and not steam.

8798. In what trade was your vessel chiefly employed?—Both in the coasting and foreign trade.

8799. Are you aware of the objects of this inquiry?—I am.

8800. Will you give the Commissioners any opinion you may entertain as to the advantage or necessity of a harbour of refuge at St. Ives?—The harbour cannot give accommodation to wind-bound vessels.

8801. Do you refer to vessels bound for any particular port, or wind-bound vessels generally?—Wind-bound vessels. They can come in, in a south-east wind, and lie on a sandy beach, but if the wind veers round to north, north-east, or north-north-west, they would be wrecked. In such cases there is a tremendous sea.

8802. Do you consider this the most advantageous point for a harbour of refuge for vessels running down the Bristol Channel?—I do. There is, comparatively, safety until you come to the Mumbles.

8803. What is your opinion of Padstow?—We dread running in there with a wind in; there is no place where a man can run to take shelter.

8804. (*Sir F. Smith.*) You have sailed a good deal up and down the coast?—I have.

8805. Do you know Lundy Island?—Yes.

8806. What is your opinion of it?—Lundy Island affords good protection, but the wind is liable to cast in there, and the water is very deep only a little way off the island, so that I have always held off the island.

8807. Do you know Clovelly Bay?—I do not; but I should think it would be too high up for a majority of vessels, because coasters could run for Penarth. Large vessels chiefly keep mid-channel, and Penarth Roads is good to run to for large vessels.

8808. What state of the wind and what position of a vessel would render it desirable to have St. Ives as a port of refuge?—We want shelter from the north-east, and for vessels going up channel; we are well sheltered from all points of the compass except from north-east to east.

8809. I am speaking of vessels that might encounter severe gales, either homeward or outward bound; what wind makes it desirable for them to come in here?—Any vessel caught this side of the land, coming home or going out, would be glad to take shelter here in St. Ives.

8810. There is no better holding ground than in this harbour?—None better.

8811. From what point of the shore would you project a breakwater?—If it were a point of economy I should go on from the present pier; if this is to be a naval station, I should go from the Head.

8812. Why?—It would give more space and a greater depth of water, but would cost more.

8813. Should you be disposed to leave an opening between the Head and the beginning of the breakwater, or close it up entirely?—I should close it up entirely, because of the tremendous tide.

8814. At what rate does the tide run here?—I should think four knots an hour at spring tides. I am not sure, but I think so.

8815. How far should the breakwater be carried outward to make it a useful harbour of refuge for national purposes?—From a quarter of a mile to half a mile would make it a naval station and give a large area.

8816. (*Mr. Lindsay.*) Is it the case that the wind often chops round from south-west to north-west?—Very often, and that makes St. Ives Bay so dangerous.

8817. What is your most dangerous wind?—From north-north-west to north-north-east is the most dangerous wind for vessels entering the Bristol Channel.

8818. Would the shore between St. Ives Head and Hartland Point be a dead lee shore in north-west winds, and consequently make it the most dangerous part of the entrance to the Bristol Channel during gales from that quarter?—Yes.

8819. From Hartland Point to the Land's End, is there any port where a ship can find shelter in that most dangerous of gales, one from the north-north-west to north-west?—None.

8820. What description of shore is it between the Land's End and Hartland Point; is it a rocky and dangerous shore?—There is Padstow Sound. From Godrevy Head to Padstow it is a bold rocky coast, and there is no place where a ship could take shelter.

8821. Have you ever run to Padstow in a gale?—No; I should have great hesitation in running there with a vessel of 300 tons, because of the "dumb puffs" which come round the hill; unless your anchor

ST. IVES.

Mr. Quick.

27 Sept. 1858.

Mr. Lindsay.

is ready to let go at once, you are on the sand. The anchorage also is short ; you cannot have much scope. The Doom Bank is a very dangerous bank.

8822. What would you do in such a gale ?—I would not run for St. Ives in such a gale ; I would get round the land if I could. But if I could not get round the land I should run in on Kidney Sands, for a chance of saving my life, if nothing else.

8823. Do you know Milford Haven ?—I do.

8824. What do you think of it ?—It is a magnificent shelter in all winds, even in south-west gales.

8825. Having Milford Haven to run to in south-west gales, do you think, for the preservation of life and property, a harbour is necessary on the other side of the channel during north-west gales ?—I should think it is, for we do not like very well to run to Milford. It is situated so that if you miss it you are on shore.

8826. Do you know, from your own experience here, if many vessels are lost in this immediate neighbourhood, and if so whether they would have been saved by such a harbour of refuge as you described to Sir F. Smith ?—Just as I went to sea, I think four were lost on Kidney Sands, to the westward of Hayle Bar. They became total wrecks. One was a Frenchman, and got off again. The lives were saved.

8827. Any others ?—The *Concord* and *Swift* were lost there three years ago, and the remains of the *Concord* are here now with a buoy upon them.

8828. Were any lives lost then ?—One man was lost, belonging to the *Concord*.

8829. How was the wind when those two ships were lost ?—North-north-east, I believe, but I did not take particular notice.

8830. With a breakwater here, would they have been saved ?—Certainly, they were close in on the back of the pier.

8831. Perhaps it is only a matter of opinion, but you may know from your own knowledge, or have heard, whether it is the case that a great number of ships would take shelter in westerly winds, but are afraid of the wind chopping round to the north-west and north-north-west, and therefore will not come in here ?—I believe that, because the north country clubs all hinder their vessels from coming in here.

8832. The north country clubs do not allow their vessels to come in here ; why ?—The north country clubs will not allow their vessels to come into the pier at all.

8833. The pier and the bay are different things ; there is often no water at the pier. But are you sure they have any instructions as far as the bay is concerned ?—I don't know exactly. I have reasons to believe they have instructions to keep out of it as much as possible.

8834. And you think many vessels have kept out to sea and been often lost ?—I have no doubt of it in the least.

8835. Lloyd's agent has given a report of the number of vessels which have put into St. Ives in distress, and I find that this year, up to the present time, 20 vessels have been in harbour disabled or seriously damaged ; is that the case ?—I cannot say so from my own recollection ; four were here disabled in the last breeze.

8836. I want to have a little talk with you, as an old sailor, about the other ports ; what kind of anchorage is there under Lundy Island ?—I cannot exactly say now ; I know the water is very deep ; I never was laying there in a gale of wind.

8837. Is there anchorage ground to the eastward of it or south-eastward ?—It is to the eastward. The Pill smacks lie under the island.

8838. Consequently ships are protected there from the most dangerous of winds, north to north-north-west ?—If the wind is from the eastward they do not require shelter.

8839. Is there any anchorage on the other side of Lundy Island, eastward of it ?—The Pill smacks sometimes anchor there.

8840. Speaking to you as a practical man, do you think a harbour of refuge necessary above Lundy Island ? Do you think it would be the means of saving many ships and lives ?—Lundy Island cannot compare in my opinion with Penarth.

8841. I see there are several natural harbours : above Hartland Point you may find shelter in Barnstaple Bay, Clovelly Bay, Penarth Roads, or King Road ; is it therefore your opinion, if Government money is to be expended in a harbour of refuge, that it should be laid out at Lundy or above Lundy ?—I should think no money lost, for the reasons I have given.

8842. Have you ever been in Swansea Bay ?—Yes.

8843. What kind of anchorage did you get there ?—Some shoal water and rocks.

8844. Is there a large area of water ?—Yes, but shoal water.

8845. Have you known many ships to anchor there ?—Yes ; but if we seek shelter we make away to the Mumbles (being chiefly wind-bound ships), and there get on the mud until the tide flows again.

8846. We don't want any information about ships lying on the mud, do any ships find shelter in Penrith Roads ?—Yes, but they must lie rather open.

8847. Is there a heavy sea at the Mumbles ?—Not a very heavy sea. A south-south-east sea is the heaviest.

8848. Do you know anything of King Road ?—A little.

8849. Is there good anchorage there ?—There is ; chiefly mud.

8850. What sort of anchorage is there in Penrith Roads ?—Mud.

8851. Swansea ?—Swansea is all mud in going in.

8852. Do you think that a harbour at St. Ives would be of much benefit to ships generally, as well to those frequenting the Bristol Channel as to ships bound up the Irish Channel to Liverpool ? Petitions have come to us from Waterford ; other petitioners allege that a harbour here would be useful to vessels trading round the Land's End, and that, in their opinion, a harbour of refuge would be useful to those employed in going up the Irish Channel, and would be also available for vessels going to Liverpool ; is that so ?—Yes, exactly ; vessels caught by north-west gales and getting disabled would find good shelter in St. Ives, if a harbour were here ; ships bound to Liverpool and Ireland from Falmouth and Bristol, and all vessels coming down the English Channel and going up the Irish Channel would be protected.

8853. Have you had many ships put into St. Ives Bay as it is now ; I mean vessels not bound to other ports in the Bristol Channel, as their final port of destination ?—I don't keep an account, as we make no charge.

8854–5. Have you ever seen many large ships here ?—Not many large ships.

8856. (*Capt. Sulivan.*) Then there is no place at present about here where you can take refuge ?—You must either weather the land at the Land's End or go on shore.

8857. Would a harbour of refuge at St. Ives be available for all the vessels we have referred to ?—I should say so.

8858. There is a very large coal trade, I believe, carried on between Wales and Falmouth and Plymouth, and with the ports east of those places ?—There is, very large.

8859. Those vessels don't venture to anchor here in south-west gales, because the wind might chop round to the north-west ?—They do not.

8860. If a harbour of refuge were made they might all come in safely ?—As a port of stoppage, in addition to a harbour of refuge, it would be very favourable to them.

8861. Do you know what number of seine boats you have here ?—I cannot exactly say.

8862. About how many ?—About 250.

8863. What is the time of year when they are principally employed ?—They begin at the latter part of August and continue through September, October, and November ; a part of that time they are exposed

to some of the worst weather we have, to the equinoctial gales.

8864. Would a breakwater benefit them?—They would be enabled to do more in the fishing way if they could lie under one.

8865. A breakwater would, then, be an advantage to the fishery?—No doubt of it.

8866. How many men and boats are employed at this season?—About 80 men are employed now; there are four concerns or partnerships, and each takes its turn; there are eight men in each seine boat.

8867. Would an opening make it worse or better for the entrance of vessels in north-east gales?—I think they would go round to leeward and haul in, for the tide makes out here very strongly at half-flood.

8868. You spoke just now of the rate of the tide; how do you judge it?—From the appearance of the tide, and other reasons, I think it runs four knots an hour, but vessels would have no difficulty in fetching round the lee side and hauling into good anchorage.

8869. (*Capt. Vetch.*) Do you find your holding-ground good?—So good that it breaks anchors.

8870. What kind of bottom is it?—Blue mud on the surface; in some spots it is not altogether so good, but it was too good for my anchor at one time.

8871. Does it shoal gradually: is there an even bottom?—There is only one pool; it is a deep one and close to the head; it is quite clear of rocks and any number of vessels could take shelter in it.

8872. Suppose, under present circumstances, vessels were waiting for a wind and it veered round to the north, what would happen?—We consider our bay dangerous then and wrecks would happen. Vessels could not get out.

8873. Is there any place up channel where they could find refuge in such a gale?—They could find refuge in the Mumbles or Penarth Roads.

8874. What do you say to Padstow?—I could not recommend any vessel to run there in a north wind.

8875. What is the cause of that?—There is room to get in, but the "dumb puffs" are off that land.

8876. Is the passage when you get past the entrance narrow or wide?—Narrow.

8877. The sand bank at Doom Bar is a very dangerous sand, I believe?—It is a quicksand, and a vessel would soon be lost upon it.

8878. Are vessels lost there?—I don't know that vessels are lost there every winter, but occasionally they get upon it.

8879. Is there any other port on the south coast preferable to St. Ives Bay, as a harbour of refuge?—My opinion is there is not; you may say that I belong here, and am partial, but I never saw any bay equal to it.

8880. (*Mr. Coode.*) You said there was a four-knot tide in the bay; where does that occur?—Close by the Head.

8881. Supposing the chart only makes that tide one knot an hour?—No, that would be quite incorrect; I say it is much stronger than that.

8882. Have you ever measured a current of tide?—I have, but not here.

8883. And you think decidedly it is more than one knot an hour?—I am certain of it; the strongest tide runs close round the Head.

8884. You spoke of the puffs off the land at Padstow; supposing that land to be lowered, should you have any hesitation in running for Padstow then?—No, if with a fair wind.

8885. What is your objection to Milford Haven?—Generally speaking, because if you don't strike it exactly—if you make the least mistake in the world—you are ashore.

8886. Have you ever known a vessel drag her anchor in St. Ives Bay?—I have.

8887. How many?—Not many, I don't think any within the last ten years, but I have known vessels drag their anchors.

8888. What became of them?—Let go another anchor and brought up. I never knew one to go on shore from dragging her anchor.

8889. What is the greatest number of vessels you ever knew bring up here for shelter?—I don't know; I keep no accounts.

8890. Is it a fact that only 80 men belong to 250 boats?—There are eight to each seine boat, twelve to each tow boat, and two to each follower, that makes 88. Seiners have always found shelter in the pier, though they have lost boats sometimes. I have known seine boats capsized in the pier, though that don't often happen.

8891. Supposing it were decided to make a harbour of refuge further up the channel, what is the most eligible point?—I have never been to Clovelly, but have been off Bideford and other places. I cannot form an opinion as to the best site for a harbour of refuge above Lundy. I have been to Portishead, perhaps twenty times; a great number of vessels used to go there, they find good riding; I never knew any bad riding; I consider it a good natural anchorage.

8892. (*Capt. Washington.*) What number of pilots belong to the place?—We have no licensed pilots at all.

8893. How many act as pilots?—Sometimes three times as many as at other times. I suppose thirty or forty are in the employ now.

8894. Perhaps the bay is so safe that pilots are not requisite?—I don't know that. There never were any proper pilots here; but they don't go fishing at all, they give their time entirely to hobbling.

8895. How far do they take vessels?—They have gone to Cardiff with vessels, and I consider them competent to do so.

8896. Have you much foggy weather in this part of the channel?—We have not had much fog this summer; we have more fog in the spring and fall of the year than in winter.

8897. You know that a light vessel has been placed on the Stones, and a lighthouse is in course of erection on Godrevy Island, do you think those rocks require a bell on them?—I suppose it would be a great deal better if we could have a bell upon them, but no one asked about it. I was with the Trinity boat when here, and know there is a monster buoy to put on the rocks; it is waiting in Hayle Creek to go out.

8898. Should you think it an advantage to have a bell on it?—I should.

8899. Do you know the fog bell off Liverpool?—I am acquainted with Liverpool, and have been there many times, but not lately. I have found the bell there useful in foggy weather. There is one in Swansea Bay, but none other that I know of.

8900. How far do the channel pilots come down?—The Lundy Island and Bristol pilots come down in our bay sometimes. Distance money begins at Lundy Island; fishermen are paid by agreement, they charge according to agreement, and not so much a foot. Norwegians are the only ones who pay so much a foot going over Hayle Bar.

8901. What is the depth of water at Hayle Bar?—We can take 17 feet at high-water springs over Hayle Bar.

8902. Have you measured the tide round the Head?—I have not.

8903. Have you any boats here that can pull against it?—We have some smart pulling boats here, and they can pull against the tide. I remember Captain Williams making a survey of the bay. I was not with him at all, and I don't know what rate he found the tides to run. I saw a chart of his on board the Trinity yacht.

8904. (*Mr. Lindsay*). What is the depth of water in St. Ives Bay?—13½ fathoms in Pool Merran; that is the deepest water in the bay; about a quarter of a mile off is the deepest water in the bay.

8905. What is the best anchorage in the bay during a westerly wind?—Seven fathoms.

8906. In what description of ground?—Clay and blue mud; to my knowledge it is all clear of rocks.

ST. IVES.

Mr. Quich.

27 Sept. 1858.

Mr. Lindsay.

8907. What is your opinion about the lighthouse on Godrevy ; will it keep ships clear of the Stones ?—I think it will, but in my opinion in most cases it is a dangerous thing to put a light inside the danger ; you should put the light on the danger or outside it.

8908. Do you think it would have been much better if the light could have been erected on the Stones ?—No doubt of it.

8909. If a lighthouse could have been put upon this headland (*pointing to a chart*)—this entrance to the bay, St. Ives Head—would it have been of much service in warning ships of the danger of the Stones ?—That was my evidence before the Trinity Brethren ; it would have warned ships of the danger of the Stones better than a light on Godrevy Head.

8910. You have said that pilots belonging to this place take vessels up to Cardiff ?—Yes, they do.

8911. Are they allowed to do so until they come into the district of the Lundy Island pilots ?—The Bristol pilots come on board and claim their pilotage, and the others are out of charge directly.

8912. (*Capt. Sulivan.*) Were you here when petitions went from St. Ives and Hayle in favour of Godrevy ?—Yes.

8913. Do you know that some hundreds of persons belonging to the port signed the petitions in favour of the light ?—They did.

8914. Where was the light to be placed, according to their petition ?—On the Stones. I don't know exactly, but I believe that the petition went for the Stones.

8915. Do you mean to say that the six petitions asking for a light in St. Ives Bay selected the Stones ?—I don't know that they did ask for any particular spot.

8916. Did you see the petitions ?—I did.

8917. Do you or do you not know that all the petitions asked for Godrevy Island or Godrevy Head ? I don't know.

8918. Did they say on Godrevy Island or on some other place near ?—I don't know that they did mention any light outside the Stones.

8919. Is not the light in the best place now, and where all the trade petitioned it to be ?—I don't know that.

8920. Is there not a very good passage inside the Stones ?—Very good.

8921. Do you find the steamers use it ?—Yes.

8922. If the light were on the outer edge of the Stones, would any steamer come through the inner channel on a dark night ?—I suppose they would, but that depends entirely upon the wind.

8923. How would steamers, coming from a distance, manage the inner passage if the light were on the outer edge of the Stones ?—They would come in and make the island.

8924. Is it commonly the case that steamers make the passage ?—Very commonly.

8925. Where the light now is, on the island, will it not make it far safer at night for vessels taking the passage ?—Exactly.

8926. And will not a large buoy outside the Stones mark them ?—On light nights.

8927. Then, for the coasting trade, the present light is best : is it for the advantage of Hayle, St. Ives, and neighbouring ports to have the light where it is ?—Yes.

8928. Would any coaster, after making a light on St. Ives Head, venture to steer up that passage ?—The light is better for coming through the passage by night.

8929. Are you aware of the difference in cost between erecting it on the island and on the outer Stones ? are you aware that whereas the light now will cost 8,000*l.*, the cost of an outer one would be 50,000*l.* ?—I suppose it would.

8930. If the present light will light the passage well, do you think it justifiable to expend 50,000*l.* or 60,000*l.*, when for 8,000*l.* it is comparatively safe ?—I should not do so myself.

8931. Are you aware that the buoy now at Hayle is peculiarly constructed,—that it will float perfectly upright in a sea ? Supposing that buoy safely moored, would it not be advantageous ?—Yes.

8932. (*Mr. Lindsay.*) Supposing it fixed, could it ring a bell ? does not a bell beacon require to oscillate a great deal in order to secure the ringing ?—If the beacon does not move the bell will not ring.

8933. Just so ; the steadier the beacon the better, independent of the bell ?—Exactly.

8934. And therefore, should it prove very steady, it is of no use to put a bell upon it ?—Not if it is steady, but I should not think it would be very steady.

8935. Is it deep water close to the island ?—Yes.

8936. A vessel from abroad would, I presume, make St. Ives Head (supposing a light on it) quicker than Godrevy Island ?—It is the leading mark for St. Ives Bay, and, warning vessels of the danger of the Stones, it would keep them outside.

8937. Do you think it wise to encourage vessels to take that passage other than coasters and steamers ?—I would not encourage it at all ; it would be unwise for foreigners to attempt it.

8938. (*Capt. Sulivan.*) Is it likely that strange vessels would attempt the passage ?—It is not likely, but we have seen vessels attempt it.

Mr. William Jennings examined.

Mr. W. Jennings.

8939. (*Chairman.*) What has been your occupation ?—A fisherman and pilot.

8940. How long have you been occupied in that capacity ?—For the last 20 years.

8941. And always with the port of St. Ives ?—Yes.

8942. For what district of the coast do you hold a licence ?—I have no licence.

8943. You are aware of the objects of this inquiry ?—Yes.

8944. State your opinion, if you have any, of the advantage or necessity of a harbour of refuge at St. Ives to the trade passing down the Bristol Channel ?—I think no place more requisite than this is, in various ways ; for vessels coming from Wales often come down off the point of the Land's End, and in consequence of the weather cannot get round the Land's End. The wind blowing hard south and west they are driven back again ; then, if there was a harbour of refuge at St. Ives, they would come here. The consequence is, with the prevalent north and west winds, they must run up the Channel, and if the wind flies round they have no other alternative but to go ashore.

8945. From what quarter do you have the heaviest winds ?—South-west are very heavy winds, and they generally fly round to the north-west ; then it comes in, wind and sea altogether, and makes a regular wreck of vessels who go ashore. Nothing hard by can stand it.

8946. How do your south-west gales generally begin ?—Generally with moderate weather first, and so get on with rain.

8947. In what direction do they begin to blow ?—From the south first ; they pass on to the south-west, then to the west, then it generally blows and rains hard, and then comes round to the north and north-north-west.

8948. (*Sir F. Smith.*) I suppose the vessels trading up and down the Irish Channel would find great use in having a harbour of refuge here ?—There is no question about it.

8949. Would a vessel with the wind strong from the north-west, if she was far off shore, be unable to run round to Falmouth ?—If she was five or six leagues off she could.

8950. Do not those vessels keep mid-channel ?—No ; they come in here along the shore.

8951. Do you know any of the ports between this and Bristol ?—Yes, I know them all.

8952. What do you think of Padstow ?—It is no place at all.

8953. Why not ?—Because no man in England can make that a harbour.

8954. What do you think of Clovelly ?—Clovelly is no better.

8955. Why not ?—You cannot lay there.

8956. What if a breakwater where thrown out ?—No.

8957. Is there not water enough ?—It is shallow water, five or six fathoms.

8958. Is there any large area ?—Not very good.

8959. Not so good as here ?—No.

8960. Is the holding ground very good here ?—None better.

8961. Are you of opinion that a gap between the piers would be useful or not ?—It would not be useful at all.

8962. Would it be more harm than good ?— Yes, more harm than good.

8963. Does the harbour of St. Ives silt up at all ?—No.

8964. Has any change in the depth of water taken place for many years ?—No ; none at all.

8965. Do you know the Mumbles ?—Yes.

8966. What would be the effect of a breakwater there ?—Why you would have to go three or four miles with a breakwater there.

8967. Would you have to go a long way at a great expense to make anything efficient ?—You should.

8968. With regard to Lundy Island, what do you think ?—I have not much opinion of that.

8969. Why not ?—It is a bold rock and you must go close in along shore.

8970. Give us the extent of the anchorage ?—Not more than half a mile.

8971. Could not you have a large fleet of vessels laying off Lundy Island ?—No, it is no place for it at all.

8972. (*Mr. Lindsay.*) There is a place called Church Bay ?—That is what we call Harleen Bay.

8973. Church Bay we have it on the chart ; what point do you mean ?—Harleen Point.

8974. That is the place. Have you ever been at anchor there ?—Yes.

8975. Is it good anchorage ?—No, it is loose sand and sunken rock.

8976. Is there good shelter there from south-west winds ?—Oh, yes ; from south-west winds there is shelter beneath Harleen Point.

8977. Have you often piloted ships above Lundy Island ?—No ; but I have been to Lundy Island often.

8978. You have been there often ?—Yes.

8979. With all respect to your opinion, might not a good harbour be made at the Mumbles and at Clovelly ?—If you do not care for expense. I can understand you.

8980. Do you think such harbours are necessary for the saving of life and property ?—No, I do not ; because, if you can go to the Mumbles you can go to King's Road.

8981. That is to say, if the wind is strong from the north-west you can find good shelter at the Mumbles, and if south-west you can anchor at Clovelly now ?—Yes.

8982. Or in either of these winds vessels can get into the Newport Roads ?—Yes.

8983. And if they cannot get to King's Road there is good anchorage in Newport Roads ?—Very good.

8984. Well sheltered ?—Yes, from westerly winds.

8985. And north-west also ?—Yes.

8986. At King's Road vessels are sheltered from all winds, are they not ?—No, they are exposed to north-west winds.

8987. Have you known many wrecks take place at Lundy Island ?—I have heard of many frequently.

8988. Have you known of many, of your own knowledge ?—No, not of my own knowledge particularly ; but I have heard of them. I have no knowledge of the causes of those wrecks except that they go down to the Land's End and draw back, and are obligated to go ashore there.

8989. Do you mean to say that a number of vessels are lost above Lundy Islaud which have been driven back from the Land's End ?—There are often such cases ; they are not uncommon—it is a common case.

8990. Is that during westerly gales ?—Yes ; I have been and talked to them, and afterwards I have heard they were gone ashore.

8991. Why did they not come in here ?—Because the harbour would not answer properly.

8992. But the bay is sheltered from westerly winds, and there is good anchorage ?—It would not do to come in and trust to the wind going round to the north.

8993. I understand you to say that vessels have been wrecked above Lundy Island which have been driven back from the chops of the Channel, and afraid to come into St. Ives in case the wind should go round to the north-west ?—Yes.

8994. Then is it your opinion that if there had been a harbour that would protect ships in St. Ives Bay during north-west winds, those ships would have come in, and if they had come in, been saved ?—There is no question of it.

8995. You think there is no question of it ?—No question of it at all.

8996. You know the coast. Now, do you think a harbour of refuge at St. Ives of much value to ships going up the Irish Channel, bound to Liverpool, and also those outward-bound ?—I do not think it can be valued.

8997. How do you mean ?—No price would be too great for it. So many lives and property are lost that it could not be valued at all.

8998. Can you tell us any particular instance where life and property would have been saved if there had been a harbour of refuge at St. Ives ?—There were two vessels last winter, the *Conqueror* and the *Swift* —the *Cape* also might have been saved ; she went ashore on Pengelly Point—and many more if I had got the names of them. I could enumerate scores in my time that have gone ashore that might have been prevented if there had been a harbour at St. Ives protecting ships from north-west winds.

8999. Have you known any instance of ships that have put back because they were afraid to take St. Ives ?—Yes, there was one Frenchman ; she came from Newfoundland ; I was aboard her myself. The captain would not agree to come in with us for that reason. I told him if he kept to the west the chances were he would round Milford, but instead of that he kept to the east, and next day he was on shore at Bude Bay, and all hands were lost.

9000. What do you think of another light being put on the small island ?—I think it does best as it is, on Godrevy Head.

9001. If it were possible to have erected a lighthouse on the outer Stones, do you think such a lighthouse would have been as valuable as on Godrevy Island ?—If it could be erected there with safety, I should say on the Stones was best.

9002. You think it would have been better if the lighthouse could have been erected there ; but, say one costs 6,000*l.* on the island, and another on the Stones would cost 50,000*l.*, taking into consideration the question of cost, do you still think it would be better erected on the Stones ?—I do not think money of any value.

9003. 40,000*l.* has no weight in your opinion of the position of a lighthouse ?—No.

9004. Have you often taken vessels up to Newport and Cardiff, and those places ?—No, I never did.

9005. (*Capt. Washington.*) How long have you acted as a pilot ?—About 20 years.

9006. You say you do not take vessels up as far as Cardiff, how far do you take them ?—I am a pilot for our own place.

9007. Do you mean pilot for the bay ?—Yes, in and out.

9008. Being only a pilot for the bay you are acquainted with this part of the coast through trading up and down and fishing ?—Yes.

ST. IVES.

Mr. W. Jennings.

27 Sept. 1858.

Capt. Washington.

9009. You have given a decided opinion as to the difficulty of making a harbour of refuge at Padstow, have you ever been there ?—Yes.

9010. In gales of wind ?—I have run in there in very strong weather.

9011. The wind, in what quarter ?—With the wind west. In a north-westerly wind you have no chance whatever.

9012. You are speaking of a sailing vessel or a steamer ?—A sailing vessel.

9013. Could you take it with the wind at south-westerly ?—The Doom Bar Sand would prevent you; the wind at north-westerly is two casts out and one in.

9014. What is the course into Padstow ?—South south-east, and you have to enter close under the point.

9015. You enter under Stepper Head ?—Yes.

9016. Would not the wind at south-south-east carry you on the Doom Bar ?—No.

9017. With a south-west wind would you venture to take the harbour ?—Yes, in fine weather.

9018. Not in heavy weather ?—Not very well.

9019. Would you with the wind at west ?—You cannot with a small vessel, you would have to work in.

9020. Could she not fetch in ?—No, because the wind comes round the point.

9021. With the wind west in the channel, how is the wind in Padstow ?—South-west.

9022. Is Stepper Head high ?—Very high.

9023. Do you think it might be cut down level ?—It might be possible.

9024. If fifty yards were cut down could you take Padstow safely ?—I do not know that you could.

9025. Is there any buoy or beacon on the north-west edge of the Doom Bar Sand ?—No.

9026. When where you there last ?—fifteen months back.

9027. In a north-west gale would you venture to take Padstow ?—No, not if I could get anywhere else. I could not insure my life or property.

9028. Is there any wind in which you would venture to take Padstow ?—North-east, but not a gale of wind.

9029. I speak of a gale of wind ?—I should not like to have anything to do with it in a gale of wind.

9030. Where would you go in a north-east gale ?—I must come down to St. Ives or go round the Land's End.

9031. Is there no stopping place where you could get in for shelter ?—No.

9032. In a south-west gale, is there no stopping place along the channel on the south side, where you could get shelter between St. Ives and King's Road ?—You can anchor at Lundy Road.

9033. I mean on the main land. What do you think of Bideford Bay ?—You cannot come to anchor there.

9034. You say that the south-west wind chops round to the north-west ?—Yes.

9035. Is it of common occurrence that the south-west wind chops round to the north-west without any warning ?—Very possibly. Sometimes we have some intimation, but most commonly there is no warning at all scarcely.

9036. Do the great bulk of vessels come down the north side of the channel, or the south side ?—From Lundy do you mean ?

9037. Yes ?—They come through the Race.

9038. What do you mean by the Race ?—The Race between Lundy and Hartland Point.

9039. Do vessels from Newport and Cardiff come that way ?—Yes.

9040. Why do they come over on the east instead of keeping north ?—They are nearer the Land's End, and make a shorter distance of it.

9041. You say you are well acquainted with St. Ives Bay; is there much fog there ?—We have fog at intervals in the spring and about the fall.

9042. Much the same as at Swansea ?—I think there is more up there than we have here.

9043. You have heard what the last witness said about having a bell on the beacon on the Stones. Do you think it desirable ?—I think it would be very desirable to have a bell, such as they have at Liverpool Bar.

9044. Have you been at Liverpool lately ?—Yes.

9045. How lately ?—Three or four years ago.

9046. Do you know the Bell-buoy ?—Yes.

9047. Is it of great use ?—Yes, the bell is put in a triangle. You hear the sound a long way off.

9048. Is there any difficulty in ringing it, or does it ring commonly with the least motion ?—Yes, it gives a very loud sound; sometimes you hear only a tink.

9049. You are pretty good engineers down here ?—I know nothing of engineering.

9050. Some of your neighbours profess to do so; you have Harvey's foundry here, have you not ?—Yes.

9051. Are not the Cornish engineers celebrated all over the world ?—I believe so.

9052. Do you think that it would be quite beyond their skill to attach a simple wheel to that buoy to make it ring in all weathers ?—I think if I was half a mechanic I could do that.

9053. As an honest sailor, you think it very desirable ?—I do.

9054. You think it necessary ?—I do.

9055. (*Capt. Sulivan*). Do you know any bell-buoy where the thing on which it is hung is fixed, or are they made purposely to oscillate ?—The Liverpool buoy is across the tide, and is in one perpetual motion from the sea.

9056. Are all bell-buoys made that way ?—All that I know of.

9057. With respect to Godrevy Light, you say that you think nothing of the expense ?—No.

9058. I think you said, at the same time, you did not believe, from the nature of the Stones, that the lighthouse would stand upon it ?—I do.

9059. Supposing that the expense of the light-house had to be paid by the trade of the coast, and that all those who were acquainted with the coast, and especially those who knew this port, had approved the light,—would you, knowing that they had approved it, recommend that 50,000*l.* should be spent on a lighthouse on the Stones in preference to 8,000*l.* on a lighthouse on Godrevy Island?—I do not think money is to be valued at all in such a case.

9060. Do you think that the local trade would prefer a light outside, and the channel left dark; or do you think they would prefer a light on the island, to light that inner channel, and a large beacon on the Stones?—I have passed that inner channel without a light. Our object is to make the east land, so that we make the nearest point; and it is of great consequence that we should be certain where Godrevy Island is. I have been coming in scores of times at night, raining and blowing hard, and my object always was to make the east land, and follow it along. We always were prevented going near enough, in consequence of being afraid of the Stones.

9061. But now will you not steer to the island with the light, and come through safely ?—Of course.

9062. You have known some vessels wrecked near the Stones without being heard of, even in fine weather?—Yes.

9063. Do you think they were lost because in trying the inner passage at night they missed it?—No doubt.

9064. Will not that be guarded against by the light where it is ?—Of course.

9065. Have you not known of wrecks in fine weather in daylight, through vessels rounding the Stones too close outside?—Yes.

9066. Will not that be guarded against by that beacon buoy?—Of course.

9067. And do you not think that the beacon will be seen before vessels get on the Stones?—It ought to be.

9068. Then, for the local trade, do you not think the light more beneficial where it is, by lighting the inner channel, than if it were put on the Stones?—I think it best where it is in that respect.

9069. Do you know anything of petitions that went up from here about it?—I heard of no such thing.

9070. Do you know that all those petitions asked for the light to be put on Godrevy Island, or on Godrevy Head?—I am not aware.

9071. (*Capt. Vetch.*) You say you are very well acquainted with the whole coast of Cornwall?—Yes.

9072. Within the distance between Hartland Point and Cape Cornwall, which do you consider the most eligible place for a harbour of refuge?—Unquestionably St. Ives Bay. There is no place like it.

9073. What is the danger that St. Ives Bay is now open to?—North-north-west and north-east winds.

9074. Then vessels coming down channel, and not being able to put to sea, might find shelter in St. Ives from westerly winds?—Yes.

9075. But the danger arises from the wind veering round to the north, and then vessels would be caught on the lee shore ?—It is all open.

9076. Have you known any wrecks arise from that circumstance?—Yes, many.

9077. Is the anchorage ground in St. Ives Bay good?—None better.

9078. Then what is required to make it a perfect harbour?—A breakwater from the Head.

9079. Do you think such a harbour necessary for the safety of the many foreign vessels and vessels coming from abroad ?—Yes.

9080. They could take it with great safety and assurance?—Oftentimes vessels coming into the Channel get this far bound to Liverpool and Bristol. If there was shelter they would come in, but being none, they know they cannot have it, and they are obliged to draw away again in gales from the north and east.

9081. Do you know any other place between Hartland Point and Godrevy Head, which would answer as well?—None in any respect.

9082. And would your breakwater protect as many vessels as are likely to take shelter ?—We have many vessels running for shelter—sometimes as many as 130.

9083. The question you were asked was, whether, supposing the breakwater was made in the way proposed, it would then shelter any number of vessels likely to take shelter ?—Oh yes ; there is no question at all about it.

9084. (*Mr. Coode.*) You have been asked some questions with reference to a harbour of refuge between St. Ives and Hartland Point ; but suppose that district was provided for, do you think any other harbour is required to the east or north-east ?—I do not know any other place more proper than our own.

9085. But, suppose you are provided for, are there any harbours wanted further up ?—Supposing a place could be made, of course it would be no disadvantage.

9086. Suppose you were caught half-way down with a westerly gale, would a harbour of refuge at St. Ives do any good ?—No.

9087. What would you do ?—Go back again.

9088. Where, under such circumstances?—If it were only possible I do not think you could do a more providential thing than to provide a harbour.

9089. Supposing a harbour made at St. Ives, and one that satisfied the wants of all the coast between Hartland and the Land's End. If you were then caught half-way from South Wales to the Land's End, where would you prefer to have another ?—I do not know.

9090. Supposing there were a harbour in Clovelly Bay, would you like to run to that ?—It is the danger of running back. Vessels have often foundered in the Race going back.

9091. Is that so dangerous ?—Yes.

9092. Have you known vessels founder there ?—Yes, many.

9093. Large or small ?—Large and small too.

9094. But can you mention the name of any one ?—We have heard often of vessels being foundered in the Race.

9095. You say you should not, in a question of such importance, regard money. If there were a harbour of refuge in the upper part of the Channel to save life, would you regard money in that ?—Not at all.

9096. Then if a harbour could be made in Clovelly Bay, what would you say to that ?—I do not think there is water to do it.

9097. Have you anchored there ?—Yes.

9098. In what depth of water?—Four or five fathoms.

9099. Do you not get seven fathoms close into Clovelly ?—Not close in. Half a mile off.

9100. Within half a mile you would be in seven fathoms of water ?—I do not think you would.

9101. Is it not enough ? you know it is possible to have too much water ; I suppose you would rather have six than sixty fathoms ?—Yes.

9102. Then six fathoms are sufficient for any vessel seeking shelter there or elsewhere, are they not ?—It is little enough.

9103. What size vessel would require more than six fathoms ?—We have vessels drawing 24 feet, and supposing a gale of wind there is a great send.

9104. But supposing a harbour of refuge made, should you hesitate to anchor a vessel drawing 24 feet in six fathoms of water ?—No.

9105. You have known vessels that could not get up to Lundy Island, and have been obliged to put back ; does it happen to large as well as to small vessels ?—Yes.

9106. Do coasting vessels hug the land more than larger ones ?—Yes.

9107. And get caught and want shelter ?—Yes.

9108. And you are convinced they can get shelter better at St. Ives than anywhere else ?—I am quite convinced of that.

9109. You do not think there is any possibility of making a harbour at Clovelly ?—I do not know how there can be.

9110. Do you know why it could not be made there ?—They would have to go so far off to make it.

9111. Is your opinion grounded on the depth of water there ?—Just so.

9112. Do you know any place on the coast of Wales that you would prefer for a harbour of refuge—any place that you would select ?—I do not know any.

9113. Can you not mention any ?—There are harbours formed by nature, as they are.

9114. Do you think they are sufficient ?—I think so.

9115. As a pilot and a man of considerable experience, you do not think harbours of refuge are wanted on the coast of South Wales ?—I do not say not wanted.

9116. But you think there are natural and good harbours there now ?—Yes, there are.

9117. (*Capt. Washington*). With reference to the last question, supposing a refuge harbour made in St. Ives Bay, and all these, and you had all the shelter you wanted there—then go along the whole of the rest of the coast of the Bristol Channel—where would you place the next harbour, if another had to be made ?—I should go above Lundy Island, above Hartland Point.

9118. Whereabouts, in Bideford Bay ?—Bideford Bay is a small bay and very shallow water ; I do not know where you could make a harbour there.

9119. Go up the coast ?—There is no place at Coombe.

9120. Where else ?—The next place to Coombe is called Lynnouth.

9121. Would that do ?—No ; the next place is Minehead. You might make improvements at Minehead, but it is close to King's Road.

9122. Come down the other side ?—There is Penarth Road.

9123. That is a very good road now ?—Yes.

ST. IVES.

Mr. W. Jennings.

27 Sept. 1858.

Capt. Washington.

9124. What water is there there ?—Two or three fathoms.

9125. Which do you mean ; two or three fathoms? —Three fathoms.

9126. Is that at low water ?—Yes.

9127. But you have just now said that you would not consider six fathoms enough at Clovelly ?—But I was supposing a vessel would ride there with the send.

9128. And would they ride with a send in Penarth Road ?—It is good for the accommodation of vessels to and fro.

9129. Of what depth ?—Of all sizes.

9130. In what winds ?—Winds to north-north-west.

9131. The vessels are where from ?—All parts of the coast and foreign.

9132. But vessels bound to Cardiff, Newport, or Gloucester ?—They are only windbound.

9133. From where ?—Perhaps the same coast.

9134. Would they get the length of Lundy Island? —Yes ; and drive back again.

9135. Would they not anchor off Lundy Island ?— No ; for fear of the wind dropping round to the north.

9136. What is the distance from Lundy Island to Penarth ?—Eighteen leagues.

9137. Do you think they would rather run back to Penarth than anchor under Lundy Island ?—They do sometimes.

9138. You have known them to do so ?—Yes.

9139. Come down the north-west and tell me where, besides Penarth, is a good place for a harbour of refuge ?—There is no place.

9140. Why not in the Mumbles ?—It is a common place of anchorage.

9141. I thought you said there was no place for anchorage ?—Yes, at the Mumbles.

9142. Is it much frequented ?—Yes.

9143. It is now much frequented ?—Yes.

9144. What is the depth of water now ?—Vessels are dry at low water.

9145. Is there no protection ?—Not for large shipping.

9145*a*. Do you say, that being much frequented, it is a convenient place to run for?—It is a good outlet.

9146. From Cardiff, Gloucester, or Newport ?— Yes ; they drop down here, and take the opportunity of going to the westward.

9147. How many vessels have you seen laying at the Mumbles at one time ?—From 100 to 200 sail.

9148. In what wind ?—Wind up south and west.

9149. But blowing hard ?—Yes ; blowing hard.

9150. And from a 100 to 200 sail can ride now at the Mumbles ?—They do.

9151. Do they ride very heavy ?—Not with the wind that way.

9152. How long can they stay there ?—Until there is an opportunity to go to the westward.

9153. If the wind is south ?—If the wind is south-west.

9154. Further round ?—No ; south-east and south-south-east the wind is all in.

9155. Then must go ?—They must, or go ashore.

9156. Seeing that you have got a harbour like that, all exposed to the chances of the wind going round to the south-east, would you not give them some refuge if you could do it ?—No, none at all.

9157. If there were a detached breakwater off the shelter, would you think it desirable ?—Of course it would be desirable, but you must go a terrible length. The water is shoal and the tide is strong.

9158. And it would cost a terrible lot of money ?— Yes.

9159. Should you care about the money. Do you not think that the saving of sailors' lives is worth any money ?—That is the way I look at it.

9160. I think you said at the beginning of your evidence that you thought no cost too great for a refuge harbour in St. Ives Bay ?—Yes.

9161. Would you not apply the same reason to the Mumbles ?—Certainly I would.

9162. It is within your own knowledge that from 100 to 200 vessels are anchored there constantly ?— It is.

Mr. NATHANIEL PAYNTER examined.

Mr. Nathaniel Paynter.

9163. (*Chairman.*) What is your occupation ?—A fisherman.

9164. Do you belong to St. Ives ?—Yes.

9165. Have you been occupied as pilot to take charge of ships ?—Occasionally.

9166. Have you heard the evidence of the previous witnesses ?—Yes.

9167. And do you generally concur with them ?— In many points.

9168. Are there any points in which you differ from them ?—None materially, but if a harbour could be made at Padstow, I should prefer its being there.

9169. You would prefer it at Padstow to its being here ?—No ; by no means. I should prefer it at Padstow to its being made up the channel further.

9170. You would prefer a harbour at Padstow to a harbour further up channel ?—It would be an advantage to vessels down the channel. They might fetch it when they could not otherwise save themselves.

9171. Is there any other point in which you differ from the last witness ?—No ; I do not think that there is.

9172. (*Sir F. Smith.*) You are not a native of St. Ives ?—Yes.

9173. Have you passed your life here ?—Yes.

9174. Have you not been in Ireland ?—Occasionally, a few times.

9175. What is the distance from St. Ives to Padstow ?—About eight leagues.

9176. Would not that be very close to have two harbours of refuge ?—You could not have harbours of refuge too plenty on this coast, there is so much danger.

9177 Is there so much danger as to justify having two harbours ?—As to that, if you had one here, of course that is much better than anywhere else, as the former witness has told you.

9178. You prefer St. Ives, but from a neighbourly feeling you would like to give Padstow a turn also ? —If possible.

9179. But you have no doubt that if it could be made for the same money this would be the best of the two ?—There is no doubt about it.

9180. (*Mr. Lindsay.*) Say that the site for a harbour at Padstow was quite as good as the site at St. Ives,—say that they had a natural bay equally as good as the bay here, will you tell me the reason why you should prefer it here to having it at Padstow ? —It is more convenient ; it is a shorter passage round the land ; you can round the land in less time ; you can do it in one tide from this ; you cannot do so from Padstow.

9181. Is there any other reason ?—Yes; the reason is that it is much better to run for this ; there is so little water about the entrance to Padstow Harbour.

9182. But speaking as if there were the same facilities that there are here, is there any other reason why you would prefer the site here to Padstow ?—I do not know that there is.

9183. The most dangers are between St. Ives Head and Hartland Point. A vessel caught in a gale of wind cannot fetch St. Ives when she could fetch Padstow, say in a north-west gale ?—It is dangerous to attempt Padstow in a north-west wind, for the reason the former witness has given you.

9184. But supposing Padstow Bay was as good as St. Ives Bay ?—It is not so good.

9185. I know it is not so good, but I am speaking

of the site. Then it is your opinion that you can fetch, as a general rule, the one site as easily as the other ?—Where from ?

9186. Vessels caught in a gale in the usual track? —Padstow would be further to leeward. If you reach Padstow you could also reach St. Ives.

9187. Would you have any hesitation in running a vessel of 300 tons for Padstow in a north-west gale ? —Yes.

9188. You would think you were running a great risk in so doing ?—Yes.

9189. Would that arise from the baffling wind you would have to encounter at the entrance of the harbour, or from the narrow space of the anchorage ?—Yes ; and the sea breaks heavy outside the harbour.

9190. What anchorage have you inside the passage ? —Very narrow.

9191. Is the holding ground good ?—It is sand.

9192. (*Capt. Washington.*) I think you said that some refuge was desirable at Padstow. If a large harbour cannot be made, can you point out how the present harbour may be improved for vessels ?—It would be a very difficult job to do.

9193. But it would be desirable if you could improve the present harbour ?—Yes.

9194. What then would you recommend ?—I do see where you could improve it.

9195. Did you not say that it was the best site after St. Ives ?—For one advantage, for its being further down channel.

9196. Further down channel than St. Ives ?—Than any other place above it.

9197. Still you would not recommend anything to be done there ?—None compared to this.

9198. We will suppose the harbour in St. Ives Bay made and completely built, will you be good enough to tell us where is the next place a harbour of refuge should be ?—I cannot say where it should be.

9199. Why did you mention Padstow ?—In preference to any other place above, because, as I said before, it is not so far to go back, and is nearer the Land's End.

9200. Would not Lundy Island answer as well ?—It would be a difficult matter that also.

9201. What would be a difficult matter ?—Lundy Island.

9202. Do you mean that it would be difficult to improve Lundy Island ?—The roadstead is open from south to north-north-east. Both sides of the island would be exposed.

9203. But if engineers could build a breakwater to protect from those winds, can you say where you think that harbour would be best ?—I should prefer Padstow to either Clovelly or Lundy Island if possible, but I do not see how it could be done, on account of the shallow water outside.

9204. (*Capt. Vetch.*) Then between St. Ives and Bristol you think Padstow would be the best site for a harbour ?—If there was a possibility of its being made.

9205. I will come to that presently. That is the best site, supposing it can be made ?—Yes, I should prefer its being there.

9206. Do you think there is any probability or possibility of making Padstow a good harbour ?—I doubt its being done.

9207. But supposing you had plenty of money, how do you think you could form it ?—I do not know. I should not like to undertake that task.

9208. Do you think you could remove the Doom Bar ?—It would be a very heavy task.

9209. Is it quick-sand or hard sand ?—It is a hard sand.

9210. Between Hartland Point and King's Road is there any other place you would recommend on this side ?—No.

9211. And on the north side of the channel does any place occur to you as particularly useful as a harbour of refuge between Newport and Milford Haven ?—There is a pretty good roadstead at Penarth.

9212. What depth of water have you ?—A great part of it dry at low water. You anchor in different depths, according to the size of vessels.

9213. Does a considerable current pass through there ?—Yes.

9214. At what rate ?—Five miles an hour sometimes.

9215. Have you ever considered the Mumbles might be useful ?—It is very useful for coasting vessels.

9216. Then you think money laid out there would be well applied ?—It would be of advantage to coasting vessels.

9217. (*Mr. Coode.*) You spoke of a heavy sea breaking outside Padstow Harbour, do you mean outside Stepper Point ?—Yes.

9218. Do you say that it is so objectionable that you would not run for Padstow for shelter within the Doom Bar ?—Yes, for some vessels.

9219. What size, what tonnage ?—60, 80, or 100, and so on.

9220. If it were possible to give shelter within the Doom Bar, you think the heavy sea outside a great objection ?—It would be dangerous.

9221. You would not like to run for it ?—I should not like to run for it at all.

9222. Have you ever had occasion to run for Padstow Harbour ?—Not in heavy weather.

9223. Then how do you know of this heavy sea ?—In passing it coming down channel, and hearing others say so.

9224. But you have seen it passing down channel ? —Yes.

9225. You have seen it yourself ?—Yes.

9226. How far does the heavy sea extend ?—Half a mile or three quarters of a mile out.

9227. From where ?—Padstow.

9228. Mention some point ?—Padstow Point.

9229. Do you mean Stepper Point ?—Yes.

9230. Half a mile outside Stepper Point ?—Yes.

9231. Supposing it were decided to construct a harbour of refuge on the east side of a line drawn from Milford Haven to Hartland Point, do you think you could suggest any site eligible for such a harbour ?—No.

9232. Have you traded much in that part ?—I have been to that part.

9233. Often ?—Yes.

9234. And you do not know of any point eligible for the site of a harbour on that channel ?—No.

9235. Supposing St. Ives Bay were at Padstow, and that Padstow was in fact another St. Ives Bay, which would you prefer for a harbour then ?—I should prefer this.

9236. Even if the bay were equally good at Padstow ?—Yes.

9237. Why ?—From the advantage of being near the Lands' End.

9238. You think that would decidedly weigh in favour of St. Ives Bay, even if the Bay of Padstow were equally good ?—Yes.

Mr. Richard Andrews examined.

9239. (*Chairman.*) What is your occupation ?—A sailor most part of my time.

9240. And what now ?—Nothing.

9241. How many years have you been at sea ?—About thirty-five years.

9242. And of that time how long in command of vessels ?—Twenty-four years a master in Harvey & Co.'s employ.

9243. In what description of vessel, sailing or steam ?—Sailing vessels.

9244. In whose employ did you say ?—Messrs. Harvey & Co., at Hayle.

9245. What size vessels did you command ?—Vessels from 100, 120 to 150 and 160 tons.

9246. And trading chiefly in what direction ?—Chiefly from Wales to Hayle, and round the Land's End to Plymouth, and to Ireland, Scotland, and Liverpool.

9247. Have you been present during this inquiry ? —Yes.

ST. IVES.

Mr. Richard Andrews.

27 Sept. 1858.

Chairman.

9248. And are you aware of its object ?—Yes.

9249. Will you state any opinion which you may entertain as to the advantage or necessity of a harbour of refuge at St. Ives ?—If it had been here for the last twenty years I should not have had so many thrashings, and many a poor fellow would have saved his life. Many a time I have run up in a gale of wind trying to come into this place. Many a time I have tried, but neither I nor any man could venture in, and those who have ventured I have known to be lost.

9250. And when vessels are afraid to come in, is it on account of the wind flying round to the north-west ? How was the wind at those times ?—South-west or west-south-west.

9251. And when they bore up, under such circumstances, to get up channel, where did they find refuge ?—They generally ran for Lundy Island. They try to make Lundy Island. They are always afraid to run to Milford Haven ; they are afraid of thick weather there; it is a good harbour, but a bad place to run for.

9252. How do you mean it is a bad place to run for ?—It is a blind place to make. It is generally very thick on that land with the wind south and west.

9253. You say theyrun for Lundy Island, but do they not anchor under Lundy Island ?—It is a bad place to anchor ; it might do for small vessels close under Lundy Island. When the wind is very strong vessels drag their anchors and pull them right into deep water.

9254. After you pass Lundy Island, where do you find good shelter in a south-west wind ?—Going up along, small vessels run for the Mumbles, other times for Penarth.

9255. That is for small vessels, but for large ships ?—There are few large vessels run to the Mumbles. It is a very shallow place for vessels to anchor.

9256. Therefore, with the exception of Swansea-bound vessels, no large vessels, I suppose, take shelter there ?—Very few large vessels.

9257. The next place is Penarth ; that, of course, is very good ?—From Barry Island right up to Penarth.

9258. Will that do in any weather, in any wind ?—They generally bring up there better. If the weather is very bad indeed they run up for King's Road.

9259. But with the wind blowing south-south-east, or even east, can ships lay in Penarth Road ?—The sands are enough shelter ; it is not a heavy sea that comes down that way.

9260. Can you tell me, when ships are making a passage down channel from Bristol, whether they keep on the north or south shore by preference ?—They generally come to the south of Lundy Island, because it is smooth water, and it is rocky on the north.

9261. And from Lundy Island to the Land's End, do they keep along the south shore ?—They generally go clear for the south.

9262. But working down ?—Beating down, we see them frequently come to the south shore, beating within a mile of the south shore.

9263. With winds from the west, is there any preference for the north or the south shore ?—They bear for the north when it is thick, and make a stretch to westward, for it is fair with the wind to the west, and they keep off with a view to catch the north-west wind.

9264. And so try to weather the Land's End and get down ?—Yes.

9265. Vessels homeward bound which have to work up channel, do they keep either side by preference ?—They keep as they find the wind generally.

9266. With the wind right down channel ?—We generally keep in on the south shore, and get the advantage of the tide.

9267. But vessels bound from foreign parts, not likely to be acquainted with the tide, do they keep on the south shore ?—They generally watch the motion of coasters, and where we go in they follow.

9268. (*Sir F. Smith.*) Have you navigated the Irish Channel ?—Yes.

9269. Do you know anything of the Isle of Man ?—I have been there many times.

9270. At what port of the Isle of Man should you, as the commander of a small vessel, wish that a harbour should be made ?—I have been generally to Peel when I was fishing, but I have been down to Douglas, and that is the best harbour.

9271. You think that preferable to Ramsey ?—I think it is.

9272. Have you ever been to the north of Ireland?—Never.

9273. (*Mr. Lindsay.*) You stated that you had heard the evidence of the other witnesses ?—Yes.

9274. Do you agree with what those gentlemen have said ?—With some of them.

9275. Wherein do you differ ?—A little as to the tide. The tide is not so strong going round St. Ives Head.

9276. What is the strength ?—Two and half knots an hour, it never exceeds three knots an hour with the strongest tide.

9277. Is there any other point in which you differ?—Not particularly.

9278. Is there anything you would like to add beyond what the Commissioners have already heard ?—I should like to talk a little about Padstow, for I have run in there in a gale of wind.

9279. How was the wind blowing ?—With the wind north-north-west, with that to north-north-east.

9280. Did you consider you were running a great risk in taking Padstow ?—Not with the wind north-north-east.

9281. Is there much difficulty when you get inside?—I do not consider it is anything but a dry harbour.

9282. You think there is no water ?—There is no water at low water. I have seen the little *Express* in there and not room enough to swing her.

9283. Do you mean between the Doom Bar and the land ?—Yes.

9284. Then you think there is great danger in running for Padstow ?—I would not attempt to take it if I could avoid it in any way.

9285. Does the fact of vessels keeping down on this side from Hartland Point arise from the great proportion of them being engaged in the trade between the ports of Swansea, Newport, and Cardiff, and the north of Europe, and consequently keep this side of the land as being nearer to their destination ?—Yes.

9286. Then they would steer to sight the land near the Land's End all the way ? Do they keep the coast in sight ?—Yes.

9287. All the way down ?—Yes.

9288. Do they steer between the Longships and Scilly Islands ?—Yes.

9289. Is there anything further you wish to add, any points which strike you that have not been stated by the other witnesses ?—Not that I know of. This is the proper place to put a breakwater. No doubt, if a breakwater had been put it would have saved hundreds of lives every year.

9290. Say that you had to make it ; from what point would you carry the breakwater ?—To make it an extensive place, I should put it from St. Ives Head.

9291. But for merchant ships what do you say ?—You might go where you began it before, but I should still prefer it from St. Ives Head.

9292. Do you think the breakwater shown there by the red line would be of great value to the passing trade ?—You should not, under any circumstances, go inside where the old breakwater was.

9293. If the breakwater was formed, would you prefer that it should run out from the land, or that it should be detached with a passage ?—I should like it attached to the land.

9294. (*Capt. Washington.*) Following up the last question, would you say why you wish to have the pier connected with the shore instead of detached ?—I fancy there would be a good deal of room to heave

in ; no vessel, I think, would try to pass so close to the land, though you might find the packets do it.

9295. Against what wind do vessels want shelter ?—The bay is open from north-north-west to north-east.

9296. Further round than north-east, is not it ?—We do not care when we have the wind from east-north-east.

9297. Which throws the heaviest sea into the bay?—North-north-west and north generally ; north-north-west is dead on the shore.

9298. You think a passage between the breakwater and the land would be of no good ?—It would be too much sea. Vessels would sooner go round the end of the breakwater. It might be a longer passage, but it would be smooth water.

9299. Supposing a breakwater at St. Ives ; St. Ives, no doubt, is the first place in your opinion ?—Yes.

9300. Would you have a second harbour or not, because there is a good deal of trade up and down the channel ?—Oh, yes, there is a good deal of trade.

9301. Do those vessels want a shelter ?—If they could get a shelter it would be a very good thing for them. I do not say the exact place or the number. It is a great distance down here. We consider a vessel safe when she has got above Lundy Island.

9302. You consider a vessel safe above Lundy Island ?—Generally, we are so well acquainted with the coast.

9303. But if you have a south-westerly gale, you want shelter, do you not ?—Yes.

9304. Where would you run for it ?—With a small vessel we generally run for the Mumbles, unless it is a dark night, when we keep up to Penarth.

9305. If it blows harder you go higher up ?—Yes.

9306. Why do you prefer the Mumbles ?—It is better for the wind to come down again.

9307. South-west wind chops generally to north-west, does it not ?—Yes, and the Mumbles is quite smooth.

9308. And a very good outlet ?—Yes.

9309. The best in the Bristol Channel ?—Yes.

9310. You have a good many ships to Gloucester ?—Yes.

9311. Do they generally go north or south about ?—Generally south-about.

9312. There is no trade northward for Liverpool and the Clyde ?—Not large vessels.

9313. But coasting vessels ?—Yes, a good many coasting vessels.

9314. You have said that they come to the southward of Lundy Island ; do any of them pass St. Ives ?—They are not bound that way, but they must keep it in sight.

9315. And hug the weather shore ?—Yes.

9316. Those who trade from Bristol, Gloucester, and Newport do the same thing, and of course those from Swansea ?—Yes.

9317. Are they not five of the greatest ports in the Bristol Channel ?—More vessels come to go round Lundy Island than go round the north coast.

9318. In what proportion ?—More than two to one.

9319. Are you sure ?—Yes, three to one.

9320. They would be provided for by a refuge at St. Ives, but what would those do who hug the north shore ?—They generally make for Milford.

9321. Do they fetch as far as Milford ?—They go to the Mumbles.

9322. Have you heard that that is often the case ?—Hundreds of times.

9323. How many vessels have you seen riding at the Mumbles ?—I have seen 300 vessels riding there at once.

9324. How was the wind ?—West and west-south-west.

9325. Why do not those vessels anchor under Lundy Island ?—We do not consider that a place to anchor in.

9326. Is it not good shelter ?—Yes, but if the wind chops round to north or east, you are ashore.

9327. That is not so at the Mumbles ; you know you are quite safe there from all winds ?—Yes.

9328. If the wind is north-west, how are you at the Mumbles ?—When it comes north-north-west, then it generally begins to come open.

9329. But north-north-west round to south-east ?—About south, then it is open on the south side.

9330. The whole of the east is exposed ?—Yes.

9331. Vessels which get shelter from the south-west, and when the wind veers to north-west, it would be a fair wind down channel, would it not ?—Yes, but sometimes it flies out, and I have known vessels get foul, and do considerable damage, and obliged to put for Ilfracombe.

9332. Do wrecks commonly occur on Lundy Island ?—I have known many.

9333. Have you known Lee Rock ?—There is a little rock about a cable's length from the island.

9334. Are you acquainted with Bideford or Barnstaple Bay ?—I have been there hundreds of times.

9335. Then you know Clovelly ?—Yes.

9336. Do you think that a better site for a refuge harbour ?—It is a long way better than Lundy Island.

9337. It would be better than Lundy Island ?—Yes, a long way.

9338. Do vessels go to Clovelly with a south-west gale ?—Yes.

9339. Supposing the wind shifted to north-west ?—They must keep in; they would have to build a breakwater.

9340. Would not a north-west be a fair wind down round the Land's End, supposing the vessel was at Lundy Island ?—No.

9341. What is the course ?—South by west and by south.

9342. Would a vessel loose with a north-west wind laying along Lundy Island?—No, she would hold on ; she would not weather the land unless the weather was fine.

9343. When would a vessel loose from Clovelly ?—It would be rather worse at Clovelly, because it is 12 miles further in.

9344. Would the difficulty be getting round Hartland point ?—Yes, there is a nasty sea, which is called the Race. When it is blowing north we have a tremendous sea off Hartland Point.

9345. Then, with the wind shifting to the north-west it is not a fair wind from Lundy or Clovelly ?—No.

9346. But it would be from Penarth ?—No, that would be right up the Bristol Channel.

9347. Do you say that if you wanted to go round the Land's End you would not loose from Lundy or Clovelly ?—I would if the wind were as high as west-north-west, but you ought not to try with a north-west wind.

9348. Could you get to the Mumbles ?—Yes.

9349. How many vessels have you seen at the Mumbles at one time ?—The Mumbles is just open to the west. I have seen 150 commonly, and sometimes 300 vessels there. The inner harbour ebbs dry at low water.

9350. So do all the harbours on this coast, do they not ?—Yes, most of them.

9351. (*Capt. Sulivan.*) Do you mean that the anchorage is usually taken by 300 vessels at the Mumbles ?—Yes ; and 250 out of the 300 have to ground also.

9352. Then the anchorage is not fit for refuge at all times of the tide ?—Not if vessels will not lay aground.

9353. Then if the port were protected from the south by a breakwater it would be still unfit for a vessel to go in to lay afloat ?—Not for large vessels ; moreover the anchorage is not good. I have known vessels drive from their anchors on the Green Grounds, and been wrecked there.

9354. With the wind off the land ?—Yes.

9355. Yet they could not hold with the wind off shore ?—They generally lie open. Off the Mumbles they are obliged to keep far out on account of the water, and because of the number of vessels in there. They are very exposed to westerly gales.

ST. IVES.

Mr. Richard Andrews.

27 Sept. 1858.

Capt. Sulivan.

9356. How far out must you carry a breakwater to shelter vessels in southerly gales, and to make a harbour where large ships could anchor ?—If you put a breakwater out a mile or a mile and a half you might put in a vessel.

9357. But the rocks would not there be very far from the end of your breakwater ?—Yes, you would be too close to the Skerweather Sands.

9358. What water would this long mile or mile and a half of breakwater have to be made in ?—In some places eight or nine fathoms.

9359. And then the end of the breakwater would be close to patches of sand for vessels entering ?—Yes ; it would make it very bad.

9360. (*Capt. Vetch.*) You are well acquainted with the Bristol Channel ?—Yes, I ought to be.

9361. Then, looking to the south side from Gurnard's Head to Hartland Point, if you had to choose where money could be best spent in providing for the safety of lives and property, where should you say ?—I should put a harbour here in preference to any other place I ever saw, and I have been to all the harbours about here.

9362. In St. Ives Bay ?—Yes.

9363. Then between Hartland Point and Bristol, where would you say ?—If I was bound to put one I should put it at Clovelly.

9364. In preference to Morte Bay ?—Yes ; that is the place where vessels generally anchor when the wind is east and south-east, and they cannot get up the Bristol Channel.

9365. Then you think Clovelly the next best place between Hartland Point and King's Road ?—Yes ; I think so.

9366. Then, coming down the north coast of the Channel, where do you think the best refuge could be made for vessels navigating that shore ?—The north side.

9367. Along the north shore ?—Milford is one good harbour when you can find it out. There is no harbour that a man can run to.

9368. Between Milford and Newport where would you put a harbour for the protection of life and property ; supposing money were offered to you, where would you choose to put your refuge ?—If I was bound to put it that side, I should put it in the Mumbles. That would be a great good to coasting vessels.

9369. And you do not think the shelter under Lundy Island would effect that object ?—I cannot look at Lundy with any propriety at all, because the anchorage is not good ; the ground falls away into deep water. I have seen vessels go away with three anchors out.

9370. Then from your answer it appears that St. Ives and the Mumbles are the two best sites for the protection of life and property ?—These are the best places, in my opinion.

9371. (*Mr. Coode.*) Did I understand you to say that you prefer the Mumbles to Clovelly ?—On that side.

9372. But supposing a harbour of refuge were to be made somewhere eastward of a line drawn from Milford Haven to Hartland Point, what spot would you select ?—I suppose the Mumbles.

9373. You say the Mumbles for the north side ?—Yes ; for the north side.

9374. Supposing that breakwater built, where, taking the upper part of the Bristol Channel, is the best site either on the north or on the south ?—I should then say the Mumbles. I should not give it more than the length of a mile. The very large vessels would not come there.

9375. You prefer the Mumbles to Lundy Island or Penarth?—Penarth, I do not see what you can do there, you can anchor down as far as Barry Island is now.

9376. You think the Mumbles the best place ?—Yes.

9377. Might not a vessel loose easier from Lundy than from any other point ?—It would depend upon the wind.

9378. But with a north-west wind ?—Yes, a north-west wind ; but a wind coming in north-east, you are bound to go very near under the island, because the deep water falls away and then you have no chance.

9379. Supposing there was a breakwater at Lundy Island, your objection would be that it is bad holding ground ?—It is very bad holding ground.

9380. Do you think it expedient to make a harbour there ?—I do not.

9381. Being there, should you not like to take shelter ?—I should if I could.

9382. You would run to Lundy Island in preference to any other ?—I have been there a week at a stretch with sails reefed and everything ready for shipping.

9383. You spoke of vessels which ran back for Lundy Island, do vessels ever founder in running there ?—I have heard of vessels going up channel that we never hear of more.

9384. Are many lives so lost, do you think ?—A good many.

9385. Supposing a breakwater were made at Lundy Island and moorings laid down, should you not think that a desirable arrangement ?—Not in my opinion.

9386. But if you ran for it, where would you like the shelter ?—A quarter of a mile off you get ten fathoms of water.

9387. How far from Lundy Island?—Not a mile.

9388. You say you know the Isle of Man. You spoke of Douglas, have you ever been in Douglas ?—No, I have been fishing there four or five seasons.

9389. Were you ever in Ramsey Bay ?—No ; I have passed it.

9390. Do you know for what port vessels generally run ?—I have seen them running for Ramsey. I know very little about it, because I have never been in there.

9391. How many vessels have you ever seen at Lundy Island taking shelter at any one time ?—I have seen 20 sail, generally small vessels.

9392. You spoke of vessels keeping the south shore of the Bristol Channel. Is it one reason for doing so that there is deeper water ?—Yes.

9393. And it is not encumbered with sandbanks ?—You are not troubled at all with that until you get a long way up, but it is weather bound.

9394. You can keep close in on the south side without fear?—Yes, very close ; there is only one place, the Mort Stone, and they have got a buoy on that.

9395. You said that if a breakwater was to be made at St. Ives, we ought not, under any circumstances, to go inside the old breakwater ?—Not inside the piece of rock called Mering's Point.

9396. That was the point you alluded to when you spoke of the old breakwater ?—Yes.

Mr. Richard Stevens examined.

Mr. Richard Stevens.

9397. (*Chairman.*) What has been your occupation ?—I have been brought up to the sea.

9398. How long were you at sea ?—About 40 years.

9399. How long have you been master of a vessel?—About 30 years.

9400. And in what trade have the vessels which you have commanded been chiefly employed ?—Sometimes foreign, and sometimes coasting. I served my time in the trade here.

9401. How long have you been connected with the port of St. Ives ?—I was born here.

9402. Have you held any situation here ?—No.

9403. What is the size of the vessels that you have chiefly commanded ?—From 140 to 180 tons.

9404. You are aware of the objects of this inquiry?—Yes.

9405. State any opinion which you may entertain as to the advantage or necessity of a harbour of refuge at St. Ives ?—We need very much a harbour

ST. IVES.

Mr. Richard Stevens.

27 Sept. 1858.

of refuge at this place. At this place we have very sudden gales from the north-west and north-north-east, and there is no place of shelter in this channel from the Land's End to Lundy Island.

9406. From what direction are your heaviest winds?—From north-north-west to north, that is the worst wind.

9407. In making your passage up and down the Bristol Channel, do you keep to either shore by preference?—We generally keep to the south of Lundy Island.

9408. Is there any reason why you keep to the south of Lundy Island?—There is no reason except that it is a straighter course and a shorter distance.

9409. Vessels out and homeward bound, foreign, do they keep to either shore by preference?—At times; they generally keep to the north coming down from Penarth, but in general they come down here to the south, and very often coasters in fine weather pass up channel, I suppose to take advantage of the tides.

9410. You have heard the evidence of the previous witnesses?—Yes.

9411. Do you generally concur in that evidence?—Yes, I think, in most points.

Mr. WILLIAM VEALE examined.

Mr. W. Veale.

9412. (*Chairman.*) What is your occupation?—In the seafaring line; brought up to the sea.

9413. How many years have you been at sea?—Near upon fifty years.

9414. How many of those years have you been master of a vessel?—Thirty-four years.

9415. What were the size and description of vessels that you chiefly commanded?—From 120 to 140 or 150 tons.

9416. In what trade were they chiefly employed?—Always in the coasting trade.

9417. Up and down the Bristol Channel?—Up and down the Bristol Channel, and all parts of this coast.

9418. You are aware of the objects of this inquiry?—Yes.

9419. You have heard the evidence of the previous witnesses?—Yes.

9420. Do you generally concur in that evidence, or are there points upon which you differ?—No, I cannot say there are many points that I differ in. I do say St. Ives is the best place. My reason is, that it would be for the benefit of the whole of the Irish, English, and Bristol Channels. It would be a harbour of refuge for the whole channel, in my opinion.

9421. Do you know the Mumbles?—Very well.

9422. What is your opinion of the Mumbles as a place of refuge?—I have laid in the Mumbles some hundreds of times from time to time.

9423. Is it good shelter for vessels?—For only small coasting vessels, but for large vessels it is not so well. Large vessels are obliged to lay off, and they ride about half a mile from the Mumbles Head. There it is open, but inside them the water is shoal to the north-west, so that it is dry at low water. The anchorage is good, and sheltered from all winds, except south and south-easterly winds.

9424. Do you know Penarth Roads?—Very well.

9425. Is the anchorage there good?—Very good.

9426. And ships can lay there in any weather and in any wind?—Penarth Roads is calculated for ships to ride in any kind of weather.

9427. And with the wind from any direction?—Yes, with the wind from any direction.

9428. What are the objections to Lundy Island as an anchorage?—LundyIsland may do to stop a tide in, just like that, but it is not safe to stay longer. I have laid two or three days at a stretch, but when I lay there I was afraid to run up the channel.

9429. (*Capt. Washington.*) I think you said that you had often been lying at the Mumbles?—Yes.

9430. What is the greatest number of vessels you have ever seen there at one time?—200 or 300 sail perhaps. I think more than that. I have counted them at times. I have counted 200 to 300, but I have seen more.

9431. To what parts were those vessels chiefly bound?—To all parts of the world; to all parts; to westward, and some of them bound foreign.

9432. In what wind do you run to the Mumbles for shelter?—From south-west and west.

9433. Why do they not run to Penarth?—They might, but they would rather stop there than go to Penarth to encounter the danger of the sand on both sides of the channel. You have got the Culver Sands, the Gore Sands, and the Skerweather Sands.

9434. What is the distance of the Skerweather Sands from the Mumbles Head?—About nine miles.

9435. Did you hear the witness state that if a breakwater were put out it would run from Swansea Bay to the Skerweather Sands?—No.

9436. Did you hear that stated?—No.

9437. But you say that a mile breakwater will not come out nine miles?—Of course not.

9438. Do many large ships go there?—No, not frequently, except those coming from Swansea, and bound into Swansea.

9439. Is there a great deal of copper ore brought from South America into Swansea?—A great deal.

9440. How much water do the vessels which bring the copper ore usually draw?—Twenty feet and over.

4441. And they anchor a half mile east of the Mumbles?—Yes.

9442. Have you seen many of those large vessels lying there?—I have seen many lying there. We count 12 or 20 lying in that situation; but because the place is narrow, some are obliged to go further off the head into the open sea, that might have wished to go if there had been room.

9443. Is it judicious to lie at the Mumbles in case of a south-east wind?—It is; but you do not feel the south-east wind so much as when the wind is from the westward.

9444. You spoke of 200 or 300 sail lying there, do they ground generally?—They always ground.

9445. Does any damage arise from grounding?—Sometimes, when the wind is from south-east, but the ground is very good.

9446. Do you know the nature of the Green Grounds?—I know them very well.

9447. Are they hard?—Yes; they are rock.

9448. Do you think they are oyster banks?—No; they are rocks.

9449. Are they extensive?—Pretty well; there is a buoy on each.

9450. Supposing they could be removed, would that be a good thing?—They always keep up at high water.

9451. Your belief is, that the distance from the Skerweather Sands to the Mumbles Head is nine miles. The real distance is seven miles. My reason for saying so is, that the last witness was mistaken; he said that a mile breakwater would reach to the Skerweather Sands; it is really seven miles. In what direction does the Skerweather Sand extend?—In an east direction from the Mumbles Head.

9452. Do you think there would be any difficulty in a vessel seeking shelter in Swansea Bay if a breakwater were extended a mile from the Mumbles Head?—No.

9453. Would there be breadth enough?—Plenty of breadth for all vessels coming up channel.

9454. (*Capt. Vetch.*) On the south shore of the Bristol Channel what place would you recommend for a harbour of refuge to save life and property?—I should say you cannot have a more proper place than St. Ives.

9455. And on the north shore, which is the best

ST. IVES.

Mr. W. Veale.

27 Sept. 1858.

place for a harbour of refuge ?—I do not know any place on the north shore where a harbour of refuge could be built, except the Mumbles.

9456. That is the best place, in your opinion ?—That is the only place that I can see that could be made one.

Mr. THOMAS DANIEL examined.

Capt. Vetch.

Mr. T. Daniel.

9457. (*Chairman.*) What is your occupation ?—I have been shipmaster these 30 years.

9458. In what trade have the vessels been employed which you have commanded ?—In the coasting for some years, and for the last 20 years and better, or I may say 18 years, I have been trading here with ships of 500 tons or thereabouts to America.

9459. To America only ?—And other places.

9460. Have you been present in the course of this inquiry ?—Yes.

9461. You are aware of the objects of this inquiry? —Yes.

9462. Do you generally concur in the evidence of the previous witnesses ?—Yes.

9463. Do any points occur in which you differ from them ?—Two or three, scarcely worthy of notice. Captain Quick was wrong about the bay being clear of rocks, because there is the Carrick Down. About the tide, I do not think he was far out of the way, for close into the rocks I think it does run five knots an hour, but vessels have no business to come, I should say, nearer than a mile, or a mile and a half.

9464. Are there any other points you would mention in which you differ from the previous witnesses? —No, I do not know of anything in particular.

9465. Did the vessel of 500 tons which you commanded sail out of this port ?—Yes, for 18 years, once every year, and sometimes twice.

9466. Have you been up the Bristol Channel ?—Yes.

9467. Do you prefer one shore more than another ?—We generally keep the south shore ; we have better water and a bolder shore.

9468. Do you know Milford Haven ?—Yes ; but it is a place I do not like to meddle with running back. I never like to run unless I can make it before the weather sets in thick.

9469. What is your reason ?—When the weather is thick it is always a difficult place to make. If you can make out the Crow Rock before you steer for the harbour you are all right.

9470. You say it is a place generally difficult to make ?—It is generally difficult to make out.

9471. Do you know Swansea ?—It is many years since I have been there, but I have traded there.

9472. Have you any opinion as to the Mumbles as a place of shelter ?—I have been there when 200 or 300 vessels have been on the ground. Shipping in the deep roads are exposed to the sea along the shore, and then there is a drift down from the Green Grounds, so that you might pick up with a heavy sea and might be lost.

9473. Do you know Penarth Roads ?—Yes, I know about them all.

9474. What kind of anchorage is there at Penarth Roads ?—Similar to the Mumbles. With north-west or south of west, then it would be more open ; but outside the ships have to lay exposed to the drift of the channel, between the Holmes and Penarth ; but inside, all the small shipping, such as navigate these parts, are in on the mud and are in safety. I have been up, with a ship drawing 18 feet of water, off Laing Point inside, and I have found the ground there in low water.

9475. Can shipping lie there in any weather ?—They are exposed a little, but there is not a heavy sea like there is down here.

9476. They are exposed in the wind from what direction ?—Anything the south of west they are more open.

9477. But under no circumstances are they hurt?—If they have good ground tackle they can all ride out and generally do.

9478. Do you know of any accident ?—No, none in particular to the heavy ships lying out in the Roads.

9479. (*Capt. Washington.*) What is your opinion of Lundy Island as an anchorage ?—It does not please me; I have never admired it myself. I have been many times lying under the island, but I never thought of bringing up. I was waiting for the weather to clear to go up channel, having no pilot on board. I have run for King's Road with a vessel drawing 16 or 17 feet of water, without a pilot. I have run for Bridgewater with some ships, and there lay moored.

9480. With what draught of water can you go into Bridgewater ?—Drawing 16 feet aft.

9481. Can you go with a ship of that size up to Burnham ?—Yes, up to Burnham.

9482. Then is Burnham one of the best harbours thereabouts ?—It is the best in Bridgewater River, unless you get up to Pill.

9483. Would that be a place of refuge in a gale of wind ?—No ; I have been there since with a ship of 600 tons.

9484. Where, to Burnham ?—Yes.

9485. Have you ever been into Bideford ?—I have been, but I know very little about that place.

9486. Do you know Clovelly ?—I have seen it, but I do not know a great deal about it.

9487. You said you would not anchor under Lundy Island ?—I never did in my life.

9488. Why not ?—I dreaded the shifting of the winds. If the wind is north-west I would not attempt it.

9489. Is King's Road always a safe place to run for ?—Yes.

9490. In any weather ?—Yes, in any weather.

9491. Is the Bristol Channel generally well lighted and buoyed ?—Yes.

9492. Is there any part of it in which you think a light or a buoy necessary ?—I have not been for many years, and I have not taken notice ; but if I had known that I was to be examined I should. I might have been up occasionally during the last seven or eight years to take charge of ships.

9493. Did you say that you have seen 300 vessels lying at the Mumbles ?—I have said that I had seen them myself.

9494. But of large ships ?—Very few. It is the large ships that lie outside, remaining until the wind is fair to go down channel.

9495. (*Capt. Vetch.*) You are well acquainted with the navigation of the Bristol Channel ?—Yes.

9496. In your opinion, between King's Road and the Land's End on the south shore, what place is most adapted to save life and property by the construction of a harbour of refuge ?—St. Ives, for certain reasons.

9497. I do not want any reasons ; I only ask you which is the best place for saving life ?—St. Ives.

9498. Then I am going to ask you the same question as to the north shore. From your knowledge of the Bristol Channel, which place, in your opinion, on the north shore would be the best place for the construction of a harbour of refuge ?—I am not so well acquainted with the north shore. I know a little about it, but I do not know any place equal to St. Ives Bay.

9499. Suppose that were disposed of, and the Government were willing to aid in the formation of a harbour of refuge at St. Ives, then considering the safety of life and property, what is the best site for a harbour of refuge on the north side of the Channel ?—Well, Padstow is a place that would take a great deal to improve it.

9500. I am speaking of the north shore ?—If there were a little improvement, perhaps Caldy, with a breakwater turning in from the east probably.

9501. Do you think protection at Caldy of more advantage than at the Mumbles ?—No, I thought you were alluding to the places from Milford Haven.

9502. No, I was speaking of the whole distance from Milford Haven to Penarth Roads ?—By running a breakwater out from the Mumbles Head so as to stop the sea, by running a breakwater out a mile, or a mile and a half—if it were a mile it would leave a greater opening between the Skerweather Sands and the point of the breakwater, which I think very necessary—you would shelter all the shipping which now lie exposed.

9503. Then, taking into consideration all circumstances, you think the Mumbles the place where a harbour of refuge would save most life and property on the north shore ?—I believe so.

Mr. Charles Sharp examined.

9504. (*Chairman.*) What has been your occupation ?—Shipmaster.

9505. And for how many years at sea ?—Eighteen years.

9506. And how many years a shipmaster ?—Eight years.

9507. What description of vessels have you principally commanded, sailing or steam ?—Sailing.

9508. And in what trade have the vessels which you have commanded chiefly been employed ?—In the United States, Mediterranean, and coasting trade.

9509. You are aware of the object of this inquiry ?—Yes.

9510. Have you heard the evidence of all the witnesses ?—Not all of them.

9511. How long have you been in the room ?—An hour.

9512. Do you concur generally in the evidence which has been given ?—In some.

9513. State any points in which you differ from the previous witnesses ?—Well, in the year 1853 I was in command of a ship, which in October left for Quebec, laden with a cargo of railway iron. I was in company with five large American ships, all of an average from 900 to 1,400 tons. The whole of us left Penarth roads together. It came blowing very sharp from the west ; we got as far as Lundy Roads, and there brought up. After three or four days we went back to Penarth. After three or four more, then, the wind blowing north-west, I tried to get under weigh. The windlass was fractured, and in purchasing I lost the windlass, but I got here with the wind blowing smartly, and, after seeing our agent, I proceeded on my voyage. At the time I was 50 miles west the American ships were still lying in Penarth Roads.

9514. Have you anything further to state ?—Nothing further.

9515. Do you know Milford Haven ?—I never was there.

9516. Do you know the land there ?—No ; I have been merely running for it in a strong south-west gale, when I fetched the Mumbles, and hauled off.

9517. Why did you haul off ?—The weather was very thick. We generally find it so. Close along the land it is more enveloped there than it is here.

9518. Do you know the opinion which generally prevails among ship masters with respect to Milford Haven ?—In some cases.

9519. Are you disposed to think that they would agree with you ?—Yes ; that is the general opinion, I believe.

9520. You know the Mumbles ?—I have been there.

9521. What is your opinion of the Mumbles ?—I think, if you could make it any place at all, it would be a very good place.

9522. Is it a good place to start from after a south-west gale ?—It is not very good with a north-west wind, because you cannot come down the Race, and you cannot get round Hartland Point.

9523. Do you know Penarth Roads ?—I have been there.

9524. What do you think of Penarth Roads. Is it a place where a well-found ship can run in safety in any wind ?—I believe so.

9525. Then is it perfectly safe for a ship in any wind or any weather ?—I have always found it so.

9526. Do you ever anchor under Lundy Island ?—Yes.

9527. What is your opinion of the anchorage ?—I found it bad enough.

9528. (*Capt. Washington.*) Do I understand you to say, that in a north-west strong breeze, there is a difficulty in loosing from the Mumbles, and weathering Hartland ?—There is not any difficulty in loosing, but there is in weathering Hartland.

9529. Would there be any difficulty in a north-west wind in starting from the Mumbles and weathering Hartland Point ?—I am of opinion there is very great difficulty if it is blowing hard at the time, and especially when you come down about the Race, and take the flood on the weather bow.

9530. What Race ?—We call it the Race off Lundy, between Hartland and Lundy Island.

9531. Is there no chance of passing to the north of Lundy Island ?—None whatever ; you may do it in very fine weather.

9532. You were speaking of the flood tide ?—It is a matter of impossibility to do it then.

9533. At what rate does the Race run between Lundy Island and Hartland ?—Between $2\frac{1}{2}$ and $3\frac{1}{2}$ knots an hour.

9534. No stronger ?—It may be 4 knots at the top of spring tides.

9535. Is there a strong race off the south of Lundy Island, close in ?—I have always observed, that hauling off, you are generally in the middle of the Race.

9536. Does it extend the whole way across ?—Yes; from Hartland to Lundy Island.

9537. What is the distance ?—We call it nine miles.

9538. Does that cause a very heavy sea ?—It does with the westerly winds and an ebb tide coming down. It is a very heavy sea.

9539. Would that affect a refuge harbour ?—I do not know that it would affect a harbour in Barnstaple Bay.

9540. Would any shipmaster like to run through the trough of the sea if he could avoid it ?—No.

9541. Do most vessels prefer coming south of Lundy Island ?—Those going up to Penarth, not all that come to the south.

9542. By passing to the north of Lundy Island would you not avoid this Race ?—You avoid it, but you fall into broken water, on the White Horses, and often ships get injured about there.

9543. What number of vessels have you seen lying at the Mumbles at one time ?—I have seen from 100 to 150. I have been riding inside and outside with a foreign ship, and outside with a coaster.

9544. When you were lying outside did you want any shelter ?—Yes, certainly, and at many other parts we should like shelter if we could get it.

9545. Just so, but can you name any other place where it is more particularly wanted than at the Mumbles ?—We want harbours in several places, provided we can get them. A harbour would not be any objection, even in Lundy Roads ; provided you could put it there, it would be of use.

9546. But where would it be more useful than at the Mumbles after St. Ives ?—The question is, what trade, whether the general trade, or the coasting trade.

9547. The general trade ?—As to the general trade, more pass through the Race than to the north.

9548. You think so ?—Yes, ships from Cardiff, bound to the United States, take advantage of the tides, but it depends entirely how the wind is.

9549. (*Capt. Vetch.*) You are well acquainted with the navigation of the Bristol Channel ?—Well,

ST. IVES.

Mr. C. Sharp.

27 Sept. 1858.

Capt. Vetch.

I have been up and down several times with large and small ships.

9550. Taking the south shore of the Bristol Channel from King's Road down to St. Ives, where do you think would be the most proper place to put a harbour of refuge, with a view to save and protect life and property?—We might say Clovelly is as good a place as any.

9551. I am asking you which you think is the best place?—If you mean to guard against north-west winds many would prefer Lundy Roads, if it could possibly be put there.

9552. Do you prefer it to any other place?—Yes.

9553. But you allow that the anchorage is good there?—It is sand.

9554. Supposing you had a sum of money to lay out upon a harbour of refuge upon the south shore of the Channel, where would you lay it out?—If I understand aright money would be no consideration in the matter.

9555. Where would you apply that money?—I should prefer Lundy Island to any other place, provided it could be made, because you could get under weigh with north-west winds.

9556. You would consider Lundy Island the best place?—I should, provided a harbour of refuge could be made there.

9557. That is not exactly an answer to the question. I have put the question to you as to the south shore?—Do you mean from the Land's End up.

9558. From the Land's End to King's Road?—St. Ives.

9559. Then, taking the north shore from Tenby to Penarth, where would you put a harbour of refuge?—At the Mumbles, if it could be made.

(*Chairman.*) Is there any other point upon which, Mr. Tremearne, you wish particularly to call witnesses in addition to those who have now been examined. We have examined all the witnesses whose names have been given in?

(*Mr. Tremearne.*) No; there is Mr. Harvey, if you would like to examine him.

We do not think it necessary. But who is Mr. Harvey?—He is the proprietor of Harvey's Foundry, and would state that steamers could be repaired here.

We think that, a description of evidence not relevant to the purposes of our inquiry. Are there any parties present who would wish to tender any further evidence with respect to this inquiry?

No answer.

Sitting at St. Ives closed.

PADSTOW.

Tuesday, 28th September 1858.

PRESENT:

Admiral Hope (Chairman).

Sir Frederic Smith.
Mr. Lindsay.
Captain Washington.

Captain Sulivan.
Captain Vetch.
Mr. Coode.

Mr. Evans, Secretary.

Mr. John Eger Byrant examined.

PADSTOW.

Mr. John Eger Byrant.

28 Sept. 1858.

9560. (*Chairman.*) You wish to put the document you held in your hand in evidence?—Yes, on behalf of the Harbour Commissioners.

9561. In what way are you connected with the port of Padstow?—I am receiver of wrecks for the port and district, and commissioner of the harbour.

9562. Will you read the statement which you have handed in?—We have two plans to append to the memorial.

9563. Will you put those plans in evidence?—Yes; they are the charts of the coast. (*The witness read the following document.*)

"The port of Padstow having been reported by the Harbours of Refuge Committee of the House of Commons as deserving consideration for improvement as a harbour of refuge, the commissioners of the port of Padstow beg respectively to lay before Her Majesty's Commissioners the following statement:

"The extensive coasting trade passing and number of vessels lost on the north coast of Cornwall render the formation of a harbour of refuge at Padstow highly desirable, that being the most central position between Hartland Point and Cape Cornwall. (*See* plan No. 1. annexed.)

"That Padstow offers very great facilities for improvement, and being made a harbour accessible at all times of tide, with from 18 to 20 feet of water at low water at the entrance, and certainly an equal depth within the harbour.

"It is proposed to deepen the entrance to the harbour by dredging away the small bank off Stepper Point, which at present reduces the depth of water in the channel from 20 feet to 17 feet at low water spring tides, and also to lower the bluff of Stepper Point, and so give a true wind in, in gales at north-west, and obviate the baffling winds to which vessels are now exposed, and which is the great difficulty vessels have to encounter in entering the harbour.

"The aforegoing suggestions are offered on the authority of Captain Washington; and of the desirability of lowering the bluff of Stepper Point there is full proof; for the removal of a small portion of the point a few years since has enabled vessels to run up the channel a considerable distance further than heretofore before they lose the true wind.

"It is further proposed to use the hard stone arising from cutting down the bluff of Stepper Point in constructing guide walls for the tide within the harbour, as shown in plan No. 2. annexed, with a view to deepen and widen the present channel.

"The tide now running out of the harbour at about three knots an hour, spring tides, is found sufficient to keep the channel clear of sand, and give 20 to 27 feet of water at low water; and it is presumed by contracting the scour of ebb tide by guide walls, as proposed, a good and secure anchorage would be formed within the harbour upwards of a mile long, and from two to three hundred fathoms wide, and with from 14 to 24 feet of water at low water.

"That Padstow is the only place on the north coast of Cornwall which has sufficient back water to form a scour, and keep a harbour, when made, clear of sand and silt, to the accumulation of which this coast is so subject.

"That Padstow is very favourably situated for giving shelter to vessels endangered in Bude Bay, the most dangerous part of the coast from Hartland to Cape Cornwall.

" The improvement of this harbour, so as to make it a harbour of refuge, would be of incalculable value to the coasting trade, can be effected at a comparatively moderate cost and within a short time, and it is supposed that the accompanying estimate of 40,000*l.* for the whole work will be amply sufficient; and we would also respectfully submit for the consideration of the Commissioners that the value of the improvements suggested in the foregoing statements are such as to carry with them a progressive and considerable improvement as the works are proceeded with.

" Sections of the bluff of Stepper to be removed, and calculation of the cost of same and the guide walls, are annexed hereto.

" By order,

" Sam[l] Pollard,

" Clerk to the Padstow Har-

" bour Commissioners."

9564. You wish also to hand in another paper; what is it?—It is a statement of the trade of the port, the number of losses by wrecks, and the number of vessels frequenting it.

9565. Is there any other statement that you wish to offer to the Commissioners relative to the subject of this inquiry?—In looking at the report of the Harbour Refuge Committee, we notice that the port of Padstow is placed in a somewhat antagonistic position to St. Ives; but Padstow, as we hold, is not a rival to St. Ives. Padstow commands a space of coast which St. Ives does not, and the coasting trade frequenting this part particularly requires shelter. The improvements which we suggest would be amply sufficient for the coasting trade, which would be altogether unprovided for if there were ever so good a harbour at St. Ives. The winds we are the most subject to, and which are the most dangerous, are the north-west, and they usually come after south-west gales. We get a south-west breeze, and generally the wind falls round to north-west; and then coasting vessels which are obliged to travel near the shore to make their course are caught on a lee shore; and we hold that 9 out of 10 of the numerous vessels scattered up and down the coast which hug the shore would not fetch St. Ives, and unless refuge be provided hereabouts they must come on shore.

9566. Is there any thing further which you wish to state to the Commissioners?—I wish to draw attention to the model now in the room, which shows what we propose doing at the point perhaps better than any explanation I could give. (*The witness went to the model, and pointed out.*) That is the model of Stepper Point at low water; that is the Doom Bar sand. The scale is 26 feet to the inch. It has always been found that vessels taking the harbour with an ebb tide are obliged to hug the shore pretty close. When they get to the cliff the wind baffles over it. It has been suggested by many others, and by Captain Washington, that by lowering this bluff you would give vessels a true wind further on. Some years ago, the Padstow Harbour Refuge Association for the Preservation of Life and Property subscribed a sum of money, and cut down the point a little, and it was found afterwards that before meeting the baffling winds vessels could reach in 60 or 70 fathoms further than before. They were then in a much safer position. We found that when vessels get as far as Blouter Rock they have the true wind again. We propose that the point should be lowered in a slanting direction, something like the model; and we presume that we should have the true wind in with the wind at north-west; the most dangerous wind that we have on the coast.

9567. Does that finish your statement?—That finishes the statement which I wish to make.

9568. Has any estimate been taken of the expense of the improvements which are suggested?—Yes; there is a detailed estimate. The expense of the whole will be 40,000*l.*, for taking down the point, and forming the dead wall with the stuff arising from the excavations.

9569. (*Sir F. Smith.*) What is the total depth of this cutting?—The extreme is about 100 feet.

9570. That is the extreme depth?—That is the extreme depth; but the apex of the cone cut down is 136 feet from high-water mark.

9571. I am talking of the material to be removed. What is the length of that cutting?—600 feet.

9572. Can you tell me what the rock is?—It is various; trap rock and hard slate.

9573. Where is the trap rock situated?—It seems to be a kind of back-bone running through the cliff, and the slate is facing the harbour.

9574. Do you know at what price per yard that could be quarried?—We calculate 10*d.* a yard.

9575. Does that include the removal of the bank?—No; it includes putting the stuff in waggons.

9576. What number of vessels are there belonging to this port?—About 700.

9577. What is their average tonnage?—They run from 60 to 500 tons.

9578. In what trade are they engaged?—The coasting and foreign trade.

9579. With what foreign ports do they generally trade?—With North America and the Mediterranean.

9580. With what goods?—The larger class is in the timber trade to North America.

9581. From this port?—From this port and other ports.

9582. And the other class generally to the Mediterranean?—Yes.

9583. Have you any fishing boats?—Not many.

9584. Are those you have, engaged in pilchard fishing?—No.

9585. What fishing then?—Hook and line fishing off the coast.

9586. What number of men are employed in that trade?—Perhaps 50 or 60.

9587. Have many wrecks occurred on your coast?—Very many.

9588. Among the class of vessels which could enter your harbour if it were improved?—No; no vessel has been wrecked within the last 15 years that could not enter the harbour.

9589. Do you imagine that by forming guide walls you would be able to increase the scour, and keep your harbour clear?—Yes; we find that the tide between Doom Bar and Stepper Point keeps this channel clear, and we know that not one third of the tide is confined to the channel.

9590. Have you any streams tributary to this port?—Several.

9591. Are they of great volume?—Two are of considerable volume, and some of lesser magnitude.

9592. And where do they enter?—They enter at Wade Bridge.

9593. What is the total extent of the anchorage you would provide by your improvements in length and in breadth?—Well, I suppose it would be a mile long, and would average 230 fathoms wide.

9594. And the total depth at low water would be what?—It would shoal. At the beginning we should have 27 feet, which we now have, in fact, at low-water spring tides; and it would run up to the end of the mile to 14 feet, gradually shoaling all the way up.

9595. Supposing that the government decided upon improving Padstow Harbour, what other port is there between Padstow and the Bristol Channel which might be improved?—Nothing between Padstow and the Bristol Channel.

9596. Do you know Clovelly?—Yes.

9597. Do you think that Clovelly could be made a subsidiary or auxiliary port?—It is capable of being made a harbour, there is no question of it.

9598. And if it were would it not be very conveniently placed for the trade of the coast as a harbour of refuge for vessels encountering adverse winds?—No; I think Lundy Island would be a better place.

9599. Do you kno wany thing about Lundy Island personally?—I have passed it, but I never landed there.

PADSTOW.

Mr. John Eger Byrant.

28 Sept. 1858.

Sir F. Smith.

9600. Do you know anything of the soundings ?—No.

9601. You know nothing of them as a sailor ?—Nothing whatever.

9602. With regard to the opposite coast of the Bristol Channel, have you any information which enables you to advise the Commissioners as to a port on that side ?—No.

9603. (*Mr. Lindsay.*) What kind of sand is that Doom Bar ; is it shifting sand ?—Shell sand.

9604. Is it quick sand ?—Not particularly quick ; it will scour when disturbed.

9605. When the tide flows does it rise with the tide ?—Yes.

9606. To what depth ?—The upper part of the harbour is the sand that does not sink away.

9607. As to the lower part, do you know the extent to which that will sink ?—There was a little vessel on the lower part of the Doom Bar all last winter. She went down four or five feet, and there she stayed. She was got off in the spring of the year.

9608. Are vessels which get on that bank usually got off ?—Very rarely ; there is a very heavy sea on the bar, and they usually bring up.

9609. I see by the memorial that you propose to build guide walls along the whole range of the bank on one side. Have you had any engineering opinion as to the possibility of building walls on that bank ?—Captain Sherringham favoured us with the plans for those walls.

9610. And you would construct them on a bank which, as it appears to me, is a shifting bank ?—No ; we propose throwing out the rubbish on the edge of the bank, and keeping on till we find the bottom. Mr. Calver was here some little time ago, and he thought there would be no difficulty in finding the bottom, if we pitched out enough.

9611. You say you intend to deepen your channel, or roadstead, I will rather call it, to 24 feet at low water. Is that at Stepper Point and Hawkers Cove?—No. You will see that the calculation is based on this assumption,—we presume all these sands will scour out when the tide is confined by walls.

9612. You think that when the tide is confined by walls this sheet of water before the town, where it is now marked four, five, and six feet, will scour out to 24 feet ?—There are 14 feet now.

9613. But look at the numbers on the chart ?—We presume that if we got as powerful a scour at the Middle Bank as we now have abreast of Hawkers Cove we should have the same depth of water.

9614. But do I understand you to say that the formation of these tide walls will give so great a scour as to remove that Middle Bank, which is now dry, and even give a depth of 24 feet at low water ?—Yes.

9615. Twenty-feet at low water ?—Yes, 24 feet at low water.

9616. It is a surprising thing to me ; but allowing such to be the fact, your anchorage will be about the point past Hawkers Cove ; that will be your best anchorage ?—Yes; we have calculated that the anchorage abreast of Hawkers Cove will be much improved.

9617. You think the scour will remove the westmost point of this Doom Bank ?—Quite so.

9618. What is the width between the main land and the Doom Bank ?—800 fathoms.

9619. Would there not be great risk in running in in heavy weather of tailing on the Doom Bank ?—Yes, there will be that risk ; but it is calculated that if we increase the quantity of ebb tide in the channel we shall have a much wider channel.

9620. Would you like running in in a heavy north-west gale with a bank like that on your lee ?—I should not like it, but I should have that or nothing. I should have that or the shore.

9621. Do you not think you would be running a great risk ?—I have seen 15 vessels come in with a heavy north-west gale ; none of them were damaged. All were in the ebb tide, but we had to help them to the capstan houses, although not much.

9622. Has this bank not been changing since you knew this place ?—Nothing material.

9623. Is the water shoaling or deepening ?—Much about the same.

9624. To what length of time back do you speak ?—15 years.

9625. Has there been no change in 15 years ?—No material change.

9626. Does that apply to the Middle Bank and to the Horseshoe Bank ?—The Horseshoe Bank, I think, is drawing a little nearer to shore than it is marked.

9627. Do I understand you to say that the cost of removing Stepper Point, and building these guide walls, and deepening the channel, will not exceed 40,000*l.* altogether ?—Quite so.

9628. Then you ask for that on the ground of making it a harbour of refuge for the coasting trade?—Yes.

9629. Do I understand you to come forward and propose Padstow as a national harbour of refuge for all vessels of all sizes and descriptions ?—We go upon the principle of the harbour being open to vessels of all sizes not drawing more than 20 feet of water.

9630. Therefore, do you think that a harbour here would be of more value to the coasting trade, to vessels frequenting this particular part of the coast, than to passing vessels generally going foreign ?—As a general rule, vessels going foreign keep an offing sufficient to keep up or down with the wind north-west, but coasting vessels keep within the line of embayment, and if the wind is north-west they have no choice, they must come to the shore.

9631. Then they could fetch into here, but not into St. Ives Bay ?—Quite so.

9632. But that is not so with regard to passing vessels generally, because they keep more in the offing ?—They would be able to fetch St. Ives when coasting vessels could not.

9633. You ask for this harbour for coasters ?—Yes.

9634. (*Capt. Sulivan.*) What is the strength of the tide in the ebb in the channel ?—From two to three knots an hour.

9635. Is there any difference when it is flowing over the Doom Bar and when it is confined to the narrow channel, and the Doom Bar is dry ; does its strength increase ?—Yes, it increases a knot when the Doom Bar dries.

9636. Supposing this plan were carried out, would it greatly increase the strength of the ebb ?—We find the present rate of three knots will scour the channel out with the sand coming down. We should take care not to get the ebb stronger than three knots, by not narrowing too much the channel. We would not increase the force of the ebb tide running out.

9637. If you could have a channel to the west of Doom Bar you would have the tide throughout the same as it is when the Doom Bar is dry ?—No, not quite so much, I think, because we should have a wider channel.

9638. Have you any fear that what would be carried out would be drifted to the mouth, and make another bar ?—None whatever ; there is always a west swell rolling.

9639. Have you had the estimate of 40,000*l.* from an engineer ?—Yes ; from a surveyor.

9640. Do you think it likely that a contract would be taken in this neighbourhood to complete that work for 40,000*l.* ?—I think so.

9641. Do you think that in the neighbourhood any guarantee would be given to complete the work, if 40,000*l.* were voted, if it should not prove sufficient?—I am not prepared to answer that question.

9642. In sweeping out the up-channel by your plan the channel is not altered much in the scour until it gets down to Gun Point. Do you intend to effect it by deepening, or do you suppose that the Horseshoe Bank will be carried away altogether ?—The Horseshoe Bank is to go too. We find that the tide now, before the Doom Bar gets dry, is sufficiently strong to keep the channel clear, and that there is an immense

amount of back water coming up at two knots. We conclude that if we raise guide walls, and stop that which comes out at two knots, and make it come out at three knots, we shall have our guide walls clear of sand, because we find that three knots will keep the sand clear.

9643. Does that always keep the channel clear at the mouth which is now a bar?—That is if composed of rubble and sand.

9644. If three knots will scour sufficiently, how do you account for this bar forming exactly inside the point?—That is not composed entirely of sand.

9645. Do you think you would have a bar formed at Stepper Point from the sand swept out from the middle of the channel?—No; we feel quite satisfied that it would not.

9646. How do you account for its not having swept away this outside bar?—We consider that it is because it is not altogether composed of sand; it is composed of slate, shingle, and so forth.

9647. Have you had it bored?—No. Captain Washington said it could be removed for 500*l.*, and suggested that it should be done.

9648. By dredging?—Yes.

9649. What is your plan for removing the material when you have cut down Stepper Point?—Taking it all by rail to Hawkers Cove, and then making the east embankment by lighters and the west by rails.

9650. (*Capt. Vetch.*) Looking at the coast of Cornwall from Hartland Point down to Cape Cornwall, in a national point of view, where would you place a harbour of refuge if the Government were willing to advance the money?—I should place it at Padstow.

9651. In a national point of view, you would wish to have a harbour of refuge at Padstow?—Yes; I think the centre of the channel would be the better place.

9652. But if the local circumstances of Padstow were not equal to afford refuge for vessels of all classes, would you still consider Padstow a proper place?—If there were engineering difficulties in the way of Padstow I would go to the nearest point to Padstow.

9653. Then you think that there are engineering difficulties in the way of converting Padstow into a harbour of refuge?—I think there is no difficulty as to 20 feet depth of water in the channel.

9654. How long have you been acquainted with this port?—25 years.

9655. During that time how many vessels have you seen get aground on Doom Bar?—I can hardly tell you.

9656. How many have you seen during the last five years?—Three, I think.

9657. And what became of those vessels?—One was got off, and two were lost.

9658. Where were those two vessels lost?—The one that was got off touched on the outer part of Doom Bar, one went on the middle of the bar, and the other went on Trevethrick, and was lost.

9659. And the mode of improving the channel is the construction of two walls on the sides of it?—Yes.

9660. Tell us of what material those walls will be composed?—Of the material cut from Stepper Point; that is, of trap rock and hard slate. We take the whole slate there by rail, and thus the west wall will be continued by lengthening the rail.

9661. The whole way?—Yes.

9662. To what height would you carry that wall above high-water mark?—The high water of neap tides.

9663. And upon what are the rails to be carried out?—I suppose on the stuff of the embankment.

9664. But if you only carry your wall to high water of neap tides, at spring tides the embankment will be under water, and you will be obliged to suspend work?—While we were hindered by the tide on the west side we should go on with the east wall.

9665. Have you computed what is the sectional area, and what is the number of cubic yards required for your embankment?—We calculate that the wall will be 24 feet from the base to the apex.

9666. Twenty-four feet in height from the base; and what width of base?—Five feet slope to one foot rise.

9667. Five feet horizontal to one foot perpendicular?—Yes.

9668. And have you computed the number of cubic yards to be contained in the wall from one end to the other?—Yes. I have not the calculation with me, but I can furnish you with it.

9669. How many cubic yards would be contained in it?—Between 400,000 and 500,000.

9670. Then you do not speak exactly?—From 400,000 to 500,000.

9671. What is the bottom on which your wall will rest?—We found a clay bottom and rocks.

9672. You have sounded?—We have sounded.

9673. Then on the east shore from the Doom Bar up towards Rock what will be the length of the wall?—1,200 fathoms.

9674. And of what material will that be composed?—The material cut from Stepper Point.

9675. The same material in the same sectional area?—No; we conclude we shall have to line to 1,200 fathoms first from low water down to the deep, to secure it.

9676. Do you intend to line it with masonry?—No, with rubble.

9677. But to face it?—We find that if we put in rubble on a sand bank it will stay there. We have put it in in the upper part of the river, and we find that the scour deepens the channel, but the rubble remains. We propose doing this on the same principle.

9678. Do you consider the channel of the same nature at the upper part near Wadebridge as it is at the Doom Bar?—It is all the same.

9679. Above Wadebridge you could build an embankment; could you build one on the Doom Bar?—We would not build an embankment on the Doom Bar, but we would face the bar by a wall 50 feet long and 20 feet thick.

9680. Will you furnish the Commissioners with drawings of the sections for that proposed work?—I will get them for you.

9681. And any statement you can procure of the quantity of material and of the cost?—Yes.

9682. What are your best winds for coming into this harbour?—North-east round to north and by west.

9683. And can you get out with a north-east wind?—You can beat out.

9684. Have you room for beating out?—Oh yes; plenty of room for coasting vessels to beat out at high water.

9685. Then you consider, in a national point of view, that between Cape Cornwall and Hartland Point Padstow is best adapted for a harbour of refuge for the general trade of the country?—The neighbourhood of Padstow.

9686. (*Mr. Coode.*) You have given the cubic quantity in one wall; you have not given the cubic quantity in the other? You stated that there were from 400,000 to 500,000 in one guide wall?—The east guide wall we calculate will contain 336,000 cubic yards.

9687. And the other, how much?—We should be removing from the cutting of Stepper Point 500,000 cubic yards more than would make the west guide wall, and put in behind it; we should have abundance to spare to make another guide wall.

9688. And now what will be the total quantity of excavation at Stepper Point, according to your proposal?—430,000 cubic yards.

9689. I thought you stated you would require between 400,000 and 500,000 cubic yards for the west guide wall alone?—In excavations we find that the rubble increases in volume very considerably.

9690. In what proportion?—We find in working quarries that it very nearly doubles.

PADSTOW.

Mr. John D. Byrant.

28 Sept. 1858.

Mr. Coode.

9691. Then you imagine you will not have to remove moreth an 400,000 cubic yards from Stepper Point ?—Quite so.

9692. Did you make an estimate of the cost ?—Our surveyor did, and I checked it after him.

9693. He went over it carefully ?—Yes.

9694. Have you ever bored along the line of those walls, or has any one done so ?—Borings have been taken within the last week.

9695. What did you find ?—We bored down the sand till we got to some hard substance, and we presumed that we had reached the bottom.

9696. In every case except where it is marked "no bottom" on the plan ?—Yes; we presume we got to the clay, or to something harder than sand.

9697. You do not think you were stopped owing to the friction of the boring tools, and that it was still sand ?—No.

9698. Did the boring tools stop suddenly ?—Yes.

9699. They were not brought up gradually ?—No; you can very easily tell the difference. In boring the tool goes easily through sand.

9700. Have you ever sounded on rock ? Has the apparatus ever given indications that you have met with rock ? Do you know that it gives a different sensation ?—The depths given are those at which we came to a substance which we presume to be hard bottom.

9701. How do you propose to get the material for the east guide wall ?—We propose to take it to Hawkers Cove, and thence across in lighters.

9702. Do you know the price per cubic yard for the wall, including excavating the material, taking it from Stepper Point, and carrying it across to Hawkers Cove ?—7*d.* per yard.

9703. And that is the whole cost of excavating ?—No; of the carriage. The excavation is 10*d.* and the carrying 7*d.* per yard.

9704. Do you think it can be done for that, with all the contingencies of wind and weather ?—Yes; and the reason of my opinion is that similar works are going on at that price.

9705. Where are they carried on ?—From Rock to Wadebridge.

9706. Do not you think there would be greater interruption in works between Padstow and Stepper Point than between Rock and Wadebridge, which is sheltered all the way ?—There would be a little more difficulty, but the material would be carried in larger quantities, and therefore cheaper. In rough weather we should be under the shelter of the Doom Bar until the tide rose.

9707. Is that a heavy sea which sets in towards Hawkers Cove ?—Yes.

9708. For how many months in the year could you carry on an embankment across there at the level of high water at neap tides ?—All the summer.

9709. Do you think that the effect of the guide wall would not be to scour the light material down and the rails with it ?—We would provide for that by keeping a good wall of stuff outside.

9710. Is there any allowance for that in the estimate ?—We have calculated the quantity at three times the price we were told it would be carried for.

9711. We were told that it would cost 10*d.* a ton a mile ?—No; it will cost 3*d.* a ton a mile. We were told at Mr. Brunel's office in London that it would be carried at 1*d.* a ton a mile.

9712. Did the gentlemen in Mr. Brunel's office know anything of Padstow ?—No; they told us that rubble could be carried at 1*d.* a ton a mile, and we have trebled it in consideration of the locality.

9713. Then are we to understand that, except in those cases where no bottom was found, you found a hard bottom in your borings, of rock or some hard substance ?—Yes.

9714. To what additional distance have vessels been able to get in, by the excavations which have been made at Stepper Point ?—From 50 to 70 fathoms.

9715. And what length of the point must be cut away to give a true wind for any given length in ?—Less, very considerably.

9716. Can you tell the Commissioners to what extent, longitudinally, that point has been cut away ?—About 50 feet.

9717. That has given a true wind for an additional distance of from 50 to 70 fathoms ?—Yes.

9718. You spoke of cutting away to Clowter Rock, where vessels will have the true wind again; is that so now ?—Yes; they have now a true wind when they get to Clowter Rock.

9719. For what reason do you suppose that they have a true wind there ?—We calculate that they will have a true wind there.

9720. Have you ever taken the opinion of pilots and of practical men upon that point ?—Yes.

9721. Do they concur in that idea, that an excavation to the extent of your model will give a true wind, as far as will be necessary?—Yes.

9722. Can you give a list or statement of the number of vessels that have been obliged to run for Padstow, such as have had no alternative, and that have been lost or wrecked ? You stated that vessels within a certain line of coast must run for Padstow; perhaps you will give a statement of the number of vessels caught within that line; that will be a material point in the evidence ?—Will a statement of the vessels lost answer that purpose ?

9723. No; that statement will be merely a list of the vessels lost in the district. My question is as to the number caught within a certain line which had no alternative but to run for Padstow ?—I can give it to you.

9724. Please to give it to us at your convenience, and state at the same time the number of lives which have been lost ?—Yes.

9725. Have you any authentic charts prior to the date of Captain Sherringham's survey ?—None that I am aware of.

9726. You stated that the bank was to be 24 feet high; what width at the top have you calculated ?—Nothing.

9727. Nothing ?—Just width enough to carry the rail.

9728. I thought you must have something to carry the rail ?—Five or six feet or 10 feet will be sufficient. We have calculated to carry the wall a little higher, because the winter sea will break it down.

9729. You have calculated to carry the bank sufficiently high at the apex to allow the sea to break it down ?—I beg your pardon. You will have to make the pier lower. If it is calculated that the wall will settle four or five feet, we must carry it four or five feet above the level of high water.

9730. But I understand you to say that you would carry the wall out to nothing, and so allow the sea to break it down to a width sufficient to carry the rail ? I understood you to ask what it would be when finished.

9731. No; what is the top width that you propose ?—Perhaps the width of two lines of rails.

9732. What would suffice for that?—20 feet, may be.

9733. You were asked a question with reference to the chance of this stuff finding the bottom, and you said Mr. Calver was of opinion that if you put in sufficient it would find the bottom. I suppose you agree with him ?—Yes.

9734. What do you imagine would be the cubic contents ?—The side of the slope would be 50 feet and the thickness from 50 to 100 feet above low-water mark. We presume that the average depth will be 17 feet, and if we get a slope of 50 feet we shall keep the sand quite clear.

9735. Is not the sand pretty lively at flood tide ?—The top is, but the bulk is not. We calculated that it would come down to the bottom.

9736. You anticipate getting a clear 24 feet ?—17 feet at low water on the east side.

9737. And on the west side ?—On the west we shall have 24 feet.

9738. Can you give us also a list of those vessels

which have actually been driven on the end of the Doom Bar by the baffling winds, and the number of lives lost in these vessels ?—Yes.

9739. (*Sir F. Smith.*) Can you provide the Commissioners with sections of these proposed walls ?—Yes.

9740. (*Capt. Vetch.*) You have given an account of these two walls on either side. Are those the whole of the works besides cutting off Stepper Point, or do you propose to dredge also ?—We propose to dredge the little piece off Stepper Point, which Captain Washington estimates might be done for 500*l*.

9741. Any dredging inside ?—We propose to have a cradle with long legs just to move the sand; not to dredge, but to keep the sand in motion.

9742. No dredging ?—No dredging.

9743. No lifting ?—No lifting.

9744. But you propose to put such appliances on these walls that you expect that the natural action of the scour will carry the sand out to the mouth ?—The natural action of the water has been found in Bristol to remove mud.

9745. And that portion of the work will cost nothing ?—Not much; we have clapped on 20 per cent. for contingencies.

9746. In addition to the walls, there are no engineering works ?—None, but to dredge the bit off Stepper Point.

Mr. John Treadwin examined.

Mr. J. Treadwin.

9747. (*Chairman.*) In what way are you connected with the port of Padstow ?—As shipowner, shipbuilder, and general merchant.

9748. How long have you been connected with the port of Padstow ?—35 years.

9749. You are aware of the object of this inquiry ?—Yes.

9750. Will you state your opinion as to the advantage or necessity of improving the port of Padstow, for the purpose of rendering it a subsidiary port of refuge for the passing trade ?—I consider, from the position of Padstow, and the present depth of water we have in it, that if it could be made more available for vessels coming in generally it would be a great advantage, particularly to the coasting trade.

9751. Is there anything further which occurs to you to state in addition to what has been already stated by the previous witnesses ?—The great consideration is the removal of the Doom Bar, and if we cannot remove it, to get it further from Stepper Point, so as to give a wider entrance to vessels coming in.

9752. Are there any local funds which would be available in aid of the improvement of the port ?—I think all the local funds have been expended already. They were small, and have been spent in getting the matter under the notice of Parliament.

9753. So that for the improvement of the harbour you would depend upon other funds ?—We depend entirely on some assistance further than we have got. I was the person whom the Board deputed to make inquiries. I made borings in the sands at low water.

9754. (*Mr. Lindsay.*) You are a shipowner ?—Yes.

9755. Do you know anything about nautical affairs? I was two years at sea. I have lived here 25 years.

9756. Do you know whether any nautical witnesses are coming here ?—Yes, I believe so.

Then I will not trouble you.

9757. (*Capt. Vetch.*) You have examined the Doom Bar pretty frequently ?—Yes.

9758. What is the nature of the sand ?—The sand taken up at a certain depth was a sort of clay.

9759. I am asking you what is the nature of the Doom Bar sand ?—It is shell; there is a very large proportion of shell in it.

9760. Is it not very light?—I should not say it was very light.

9761. Not light for sand ?—Well, yes.

9762. Is it the same sort of sand as that which we see drifted on the rocks ?—Rather different, of course, from drift sand.

9763. Where do you suppose that sand is drifted from ?—I do not know.

9764. You have known the Doom Bar for 25 years?—Yes; there has been very little change for the last 40 years.

9765. Is some portion of the sand taken away for manuring the land ?—They generally use the sand from the Horseshoe Bank for that.

9766. Do you consider that a better quality of sand for the purpose of manure ?—Yes.

9767. You took those borings with considerable pains ?—Yes; it took three or four days to get through with them on the Doom Bar, and two days to do the others. There was very short time of the tide that we had to do it in.

9768. You left your boring rods there, and went back again the next day, I suppose ?—Yes; but for those shorter distances we took them up.

9769. Are those less depths where you found a hard bottom ?—I do not know. We found rock at 14 feet depth.

9770. You are quite sure you got rock there ?—Oh yes.

9771. But coming to the 24 feet marked on the plan; what bottom did you get in the middle of the Doom Bar ?—What length do you mean from the point.

9772. Close to your wall ?—The point of the borer was rounded, and we imagined that we had come to some obstacle. It might be gravel or stone.

9773. At the 29 feet marked on the plan, did you find a bottom?—Yes; after working for an hour or an hour and a half we could not go any deeper.

9774. Might not that be owing to friction ?—No; we gradually went down to 29 feet. We imagined we could have gone further though, because the instrument was as perfect at 29 as at 26 feet.

9775. Then you are satisfied that the whole of that is one hard bottom ?—Yes.

9776. That is the conclusion you came to at the time ?—Yes.

9777. Can you tell us how the sand accumulated across the mouth ?—The large sheet of water goes in over the Doom Bar, and for about one third of the tide it is dry.

9778. Has there been much alteration in it since your time ?—We sometimes found the Doom Bar raised a little, and extended, as if it were going in towards Hawkers Cove, and sometimes it struck off a little, but there is not any very material change, in my recollection.

9779. Then what do you think will be the effect of these two walls in improving the Doom Bar ?—We think it will drive the point off to the bar.

9780. And widen the channel ?—Yes, and widen the channel.

9781. For what reasons ?—It confines the water in the space. Of all the water that flows the weightiest would go all along the east shore.

9782. If brought up to low-water mark it would not have that effect, would it ?—About half tide the rise and fall is very great. The neap tides half tide in would be level.

9783. No doubt you consider that this bar was formed by certain natural influences, and so preserved in the shape you now find it ?—There are many ideas about how it was formed at first, but I do not know; there we find it.

9784. But you are firmly of opinion that by the addition of these two walls such an improvement as has been described would be effected ?—There has been a guide wall in the river, and it has been found to drive the sand from it, and give a clear channel. What has happened further up to the quay we think would happen down here. When the wall was first put, the sand was close in, and we could not lay two

PADSTOW.

Mr. J. Treadwin.

28 Sept. 1858.

Capt. Vetch.

stones, and now the beach is open 200 feet outside. There is a gradual sinking towards the river.

9785. Supposing the entrance were narrowed, do you think there would be an equally deep channel with double the width ?—We imagine we should scour the sand, and find the channel deepened. There is depth there, if we could only get the sand clear from it.

9786. (*Mr. Coode.*) Do we understand you that the width of the channel about Stepper Point does not vary very much, but the principal variation is on the back of it ?—Not at Stepper Point. It is more particularly towards Hawkers Cove that there is an accumulation.

9787. Above Stepper Point, towardsHawkers Cove, does the width of the channel vary much ?—Not much.

9788. Is the chief variation at the bar ; does great sand accumulate at the bar ?—Yes; that is where it principally varies.

9789. You took charge of these boring operations? —I did.

9790. Will you cast your eyes over the chart, and see whether the figures are correct ?—I find a variation of half a foot in one place; the others are all correct.

9791. Are those depths from low-water mark downwards ? What is your standard ?—Sometimes three feet above low-water mark.

9792. What did you take for the standard of your borings ?—Three feet from low water mark.

9793. What kind of boring tools did you use ?—Two screw augurs and one or two pointed poles.

9794. Did you succeed in bringing up any material ?—I brought up some.

9795. Was it the same as on the surface ?—It seemed much finer.

9796. Is that one (*pointing to a sample*) ?—Yes ; this is from Horseshoe Bank and Brae.

9797. At what depth ?—One was 19 feet off Braehole.

9798. Can you leave that with the Commissioners ? —Yes.

9799. (*Chairman.*) Do the Harbour Commissioners receive any dues on vessels taking shelter at the lower part of the harbour ?—Not from a line drawn from St. Saviour's Point to Braehole.

9800. Have you read the report of the Committee of the House of Commons on Harbours of Refuge ?—I have read a part ; I cannot say I have read it all.

9801. Do you recollect the latter portion of it, in which is contained a recommendation of giving assistance to existing harbours by means of loans at a reduced rate of interest,—Government loans at a reduced rate of interest, repayable at the end of 50 years?—I did not take any notice of it.

9802. I will read you the passage:—"Your committee is therefore of opinion that it will be in every way consistent with sound policy to encourage local efforts for the improvement of such harbours, that is, of existing tidal harbours, by voting a moderate sum annually to be especially devoted to such harbours, on the same principle and under the same regulations as were applied to the large amount advanced for the purpose of drainage ; and looking to the great importance of the object intended, your committee recommend that such loans should be made at a rate of interest not exceeding 3 per cent. per annum, and made repayable by a sinking fund extending over a period of 50 years." Do you suppose that there are any local means available for the purpose of meeting the intentions of Government in that respect, or rather the recommendations of the Committee in that respect ?—I imagine there are not, except from vessels using this place for shelter.

9803. You imagine that there are no local funds, and there are no parties connected with the port who are prepared to come forward and meet this recommendation of the committee ?—I really cannot say. I should think if accommodation were given to vessels they would gladly pay for it, and this might very likely pay the interest on the advances.

9804. I allude to parties connected with the port, who would be willing to come forward, and by means of local efforts and local subscriptions be prepared to meet such a loan ?—I do not think there would be. At least I do not know that there would be. There have been local efforts made always.

9805. (*Sir F. Smith.*) What is the average revenue ?—Do you mean customs or port dues ?

9806. Port dues applicable to your own purposes ? —I think about 400*l.* a year.

9807. (*Capt. Washington.*) You are a shipbuilder as well as a shipowner ?—Yes.

9808. What is the largest ship that has been built here ?—The largest ship that has been built in the port is 600 tons register.

9809. Are many built ?—Yes, pretty many.

9810. Are many vessels repaired here ?—Yes.

9811. Are there facilities for repairing ships ?— Not ships of any large tonnage.

9812. Any patent slip or dock ?—No patent slip.

9813. And no dock ?—No dry dock.

9814. Is there a lifeboat belonging to the port ?— Yes.

9815. A good one ?—Yes ; supplied by the National Institution.

9816. Has it been tried ?—Yes.

9817. And proved a good one ?—Yes.

9818. Has it been tried by exercising, and has it saved the crew of any craft ?—It has saved a crew.

9819. Have you any buoy on the Ketch Point ?— There was one beacon and two moving buoys on Ketch Point. A beacon has been placed on Stepper Point.

9820. On the outer stones of Stepper Point ?—Yes.

9821. Is a buoy necessary there ?—No, I should not say it was.

9822. Do you consider a beacon or a buoy necessary on the Ketch Point ?—I do not know if there is very much occasion for it ; I do not think there is.

9823. Is the outer point of the Doom Bar a great danger or not ?—Yes.

9824. Is it not customary to mark all dangers by buoys or beacons ?—There are instructions for entering the port which are supposed to be known by every person.

9825. Has a master running for a harbour of refuge time to pull out instructions and see where danger lies ?—He generally looks to them before he is within six miles of the place.

9826. Will you say whether you consider a beacon buoy on that point necessary ?—It would be of service, but there would be great difficulty in keeping it there, and that is the reason it was discontinued.

9827. Was it kept by the local funds ?—Yes.

9828. And caused great expense, probably ?—I do not know.

9829. Supposing it were kept by a fund apart from the harbour, would you think then that it would be of service ?—It would be of some service.

9830. The last witness referred to a report made by me in 1851, in which I quoted the expense of dredging the bar at only 500*l.* Are you or are you not aware of it ?—No ; I am not aware of it.

9831. He did so state. Are you aware that it was one portion of the Doom Bar to which I referred ?—I did not hear the question asked at all.

9832. (*Capt. Sulivan.*) The former witness stated that there were 700 vessels belonging to the port, varying from 60 to 600 tons. Will you state what proportion of those continue to trade from the port, and what proportion are merely owned here, and are trading to other ports, and therefore not generally using the harbour ?—There are 200 vessels, I should think, owned in Padstow. The customs' authorities are the only people who can speak positively, but I should say 200 is the utmost number owned in the port of Padstow.

9833. To whom do the remaining 400 or 500 belong that belong to Padstow ?—I really do not know.

9834. Is it customary to build and own vessels here that do not trade to the port ?—Yes.

9835. And particularly large vessels?—They are the large vessels which are used in that way, and who trade to other ports.

9836. Of the 200 vessels which you know in the port of Padstow, what proportion do you think trades to other ports, and what proportion is engaged in the coasting trade?—Half of them, I should think, are coasters.

9837. That a hundred trade to the port of Padstow?—Yes; in and out every fortnight.

9838. (*Mr. Coode.*) You were asked a question as to a beacon at the Ketch. Do you think there would be any difficulty in keeping a beacon in position there?—I think there would be great difficulty.

9839. There is great probability of danger arising from its moving its position?—If it moves frequently, vessels are of course deceived.

9840. Were buoys placed here on two separate occasions?—Yes.

9841. How long have they been removed?—12 or 18 months; it may be two years.

9842. Who placed those buoys there?—I think they were given by the Admiralty, and afterwards kept by the local commissioners.

9843. The buoys are kept solely by the harbour board?—I spoke of the outer buoy on the Ketch.

9844. Do you think any improvement can be made in the mode of placing the buoy on that point?—I think the constant friction of the chain and the swerving of the buoy were the causes of its getting loose.

9845. Do you think it possible to place a beacon buoy so securely that the ordinary risk of its being removed would be done away?—I think you would have to replace them every 12 months.

9846. What would such a buoy cost?—I really do not know. One of the mooring buoys cost 20*l*. I suppose it would be made of iron.

9847. The Padstow Association was spoken of in the early part of your evidence. Are you a member?—Yes.

9848. What is its object?—They first cut a road leading to the extreme end of the point, and provided lines and capstans to assist vessels entering the harbour. It was found that the baffling winds came down on them, and they could not reach far enough to get into the harbour. The capstans were to enable them to get lines on board as soon as possible.

9849. Was that association formed with any other object than that of assisting vessels in distress?—Not that I am aware of.

9850. Whence were its funds derived?—It was chiefly supported by charges on vessels to whom assistance was given.

9851. How long has the association been established?—Perhaps 30 years; more than 25 years.

9852. Can you give any idea of the amount of money expended in carrying out the objects of the association?—I really do not know. I cannot say positively. The chairman is in the room. They are not very expensive.

9853. Do you know of any other local association formed specially to save life and property?—On this coast?

9854. Yes?—No, I do not.

9855. Then the formation of the society arose from the imperious necessity of something being done?—Yes.

9856. Was it solely owing to the loss of life in this place?—Yes.

9857. Was Captain Julian the originator of it?—Yes, I believe so. I was too young at the time to remember.

9858. Will any one give evidence to-day who can give us further information on this point?—Yes; Mr. Martin, the chairman.

Mr. Richard Blake Hellyer examined.

9859. (*Chairman.*) In what way are you connected with the port of Padstow?—I am sub-commissioner of pilotage.

9860. Are you a seafaring man?—No.

9861. How long have you been connected with the port of Padstow?—I have known it for 50 years.

9862. Are you aware of the object of this inquiry?—I am.

9863. Will you now state to the Commissioners your opinion as to the advantage or necessity of Padstow being so improved as to render it a subsidiary port of refuge to the passing trade?—The principal advantage would be the cutting down of the point. That is the first object. Afterwards those leaders which you have on the plan by which the Doom Bar can be carried away, I mean the point of the Doom Bar, so as to widen the entrance.

9864. Are the measures you have named necessary for the improvement of the port?—Yes.

9865. But my question refers rather to the advantage or necessity of improving it all. Can you give us any reasons why it should be done?—For saving life and property to a great extent. You could not do a greater benefit to the shipping interest which navigates this channel than by improving this harbour.

9866. Are you able to offer to the Commissioners any more detailed statement showing the reasons on which the opinion you have just given is grounded?—The north-west gale is the worst wind we can have on this coast, and we frequently find a great number of vessels embayed here, and they frequently go ashore near the east or west of this port. Some years since, before there was a lighthouse at Trevose Head, we had some vessels passing in the morning up channel, and those acquainted with the coast, if they saw a vessel so many miles off, could tell where she would go ashore in Bude Bay. They said she would either go ashore three or four miles to the east or to the west, according to the distance she was off when she passed this port. And some years ago 13 or 14 vessels which sailed from this place in the morning's tide got up to Bude Bay, when they were overtaken by a north-west wind. The seafaring people were very anxious about them, because it was known that they had not been gone long enough to get round Hartland Point, and if they did not come back to Padstow they must get ashore in Bude Bay. Many went and looked out for them in the afternoon. Fortunately all of them cleared the bay, and got in safe. The last vessel which got back was a brig belonging to Ilfracombe, and in Bude Bay the mate was washed overboard and drowned. If Padstow had not been so handy all those vessels must have been lost.

9867. What are your special duties as sub-commissioner of pilotage?—We see that the pilots do their duty.

9868. Are they licensed?—Yes.

9869. Licensed for the port?—Licensed for the port.

9870. Have you any reason to suppose that a considerable number of vessels abstain from taking shelter in this port in bad weather on account of the want of proper facilities for getting in?—Yes; many would run the risk of being wrecked rather than come to Padstow.

9871. Do you say that of your own knowledge?—Yes; I have known it. I have heard it expressed by captains. I have heard captains say, they keep off if they possibly can rather than run the risk. The danger is so great of entering the harbour.

9872. And are you able to state that this account will be confirmed by the pilots generally under your charge?—Yes.

9873. Do you know that vessels do not come in?—For many years I have heard it reported that captains of ships are afraid of the harbour; they will not come in unless they are compelled.

9874. Has any report to that effect at any time

PADSTOW.

Mr. R. B. Hellyer.

28 Sept. 1858.

Chairman.

been made to you by the pilots under your charge ?—No.

9875. What are your heaviest gales here?—North-west.

9876. (*Sir F. Smith.*) You stated that vessels would rather run any risk than come to Padstow ?—Many of them that know the place will come ; but I have heard that masters of vessels who do not know it will not come.

9877. And are you of opinion that the alterations proposed would change that feeling ?—I have no doubt of it whatever.

9878. You state that on one occasion 13 vessels left Padstow and returned at night ?—Yes.

9879. Might I ask at what time of tide they left Padstow ?—About six in the morning.

9880. What time of tide ?—The tide was on the ebb.

9881. And what time of tide was it when they returned ?—Half flood, I suppose, or more.

9882. What was the heaviest tonnage of any of those vessels ?—From 50 to 100 tons. They were coasters bound up channel.

9883. What was the state of the wind when they left the harbour ?—Fair from the south-west. When they got to Bude Bay it fell out to north-west.

9884. They were suddenly taken by a change of wind ?—Yes.

9885. No lives were lost ?—Yes; one man was washed overboard.

9886. Supposing the tide had been out, and it had been low water, could they have got in ?—No.

9887. And if unfortunately it had been low water they would have been lost ?—The channel narrows down to the mouth, so that they could not come in two abreast.

9888. Will they be able to do so when the improvements are made ?—Yes; four or five ; I hope 10.

9889. What will be the difference in the breadth of the channel ?—I hope 100 fathoms from what it is at present.

9890. Is it contemplated to widen the channel 100 fathoms ?—We hope the alterations will have that effect.

9891. Is that the opinion of those who are projecting these alterations ?—I do not know. That is my opinion.

9892. Have you conversed with those who have projected these alterations?—I never heard it positively stated so.

9893. If the tide had been out when those vessels came abreast of which you have spoken, what would have happened to them ?—They would have been stopped at the entrance, because of there not being room for them.

9894. And would lives have been lost ?—Perhaps every soul would have been lost.

9895. In what year and what month was that ?—Thirty years ago.

9896. Has nothing of the kind occurred since ?—I do not recollect. I believe vessels have sailed and come back again ; but I recollect that time well, the 13 having sailed in the morning and come back in the afternoon.

9897. Have you been a seafaring man ?—No.

9898. (*Mr. Lindsay.*) You say that vessels would rather run the risk of being wrecked than run for this harbour, the dangers are so great ?—I have heard many captains of vessels say they would do anything they could rather than come in.

9899. What danger do they dread so much ?—In entering the harbour the sea on Stepper Point breaks ; they are afraid to keep as close as they ought to keep ; and they go to leeward. Then they endeavour to get under the wind, to come in ; the breeze out takes them back, and if they are not prepared to let go the anchor they are on the sand.

9900. Do you mean on the Doom Bar ?—They are on the Doom Bar in one moment.

9901. Then, unless the Doom Bar were removed, there would still be that great danger ? — Danger would still exist.

9902. Then, unless the Doom Bar were removed, Padstow would still be a place where masters of ships would always avoid running for ?—Yes, they have a dread of it now.

9903. Would the alterations proposed remove the Doom Bar ?—No doubt of it.

9904. Would the alterations proposed remove that dangerous bank at Ketch, and the sand to the south of it ?—I have not the least doubt they would, because wherever you see an alteration take place in the river, which happens very often, it sweeps out everything down to the bottom ; and why should it not sweep out that ?

9905. Then the sum and substance of your opinion is, that to make this a harbour which vessels would not be afraid of running for it is necessary to cut away a considerable portion of Stepper Point, and to widen the bar ?—Yes ; but if we cannot have both, let us have the cutting away the point. Give us that. It would be an immense advantage.

9906. That would be the first point ; but even if that were cut away the dangers which masters so much dread would still remain ?—No ; because they would have the true wind.

9907. But still they would not have a channel more than sufficient for two to come in abreast ?—Two or three ; something of the sort. It would not be sufficient for 13 to get into safety at once, and come to anchor. I have frequently seen six get in, although they may run foul of one another when the weather is bad.

9908. Then when there are six running in, is there not a good chance for the whole six to go on the Doom Bar?—Perhaps those belonging to Padstow would know the coast, and let go their anchors.

9909. But if they got foul is it not almost certain that they would be driven on the Doom Bar ?—No; a Padstow man knows how to come in, and always will come in.

9910. But if they get foul, what then?—They let go the anchor. Strangers keep too far off, from want of knowledge how to enter the harbour. That is how many are lost.

9911. Have you given consideration to the question of a harbour along the whole line of coast ? Say that one harbour only is to be made between the Land's End and Hartland Point, which is considered the most dangerous part of the Channel, do you think that St. Ives or Padstow should be selected ?—If you go to St. Ives it will fill the bay with sand.

9912. That is your opinion ?—Yes, I am sure of it, and I will give the reason for my opinion. The ground at St. Ives is sand, just the same as on the coast ; a sandy bottom. In a north-west gale the sea breaks very heavily, and as it breaks it stirs up the sand, and the next sea takes it up again. St. Ives Bay is sand and water together. If you make a harbour there, sand will flow into that harbour, the sand will settle, and in the course of a very few years you will have sand and very little water in it.

9913. That is your opinion ?—Yes ; I judge from the bay round Trevose Head.

9914. Then are you aware that St. Ives Bay has been silting up for the last 50 years ?—No.

9915. Are you aware that St. Ives Bay has silted up at all during the last fifty years ?—I spoke of what I know of the bay round Trevose Head. When the sea breaks, sand rises.

9916. Are you aware whether St. Ives Bay has silted up for the last fifty or hundred years ?—No.

9917. Then what you have said is a mere supposition on your part ?—It is my opinion.

9918. But is it borne out by facts ?—It is my opinion.

9919. As a harbour of refuge, which would be the most dangerous to run for, St. Ives or Padstow ?—St. Ives.

9920. You think there would be more danger in running for St. Ives in a west gale ?—Yes ; with a wind from north-west.

9921. But if there were a breakwater there, would there be greater danger in running for St. Ives in a north-west gale than in running for Padstow ?—Yes ; after you have made a harbour, St. Ives is worse to enter than Padstow altogether.

9922. We have had your opinion about the silting up, and we do not require you to speak further on that point. Say that a harbour were made at St. Ives so as to protect ships from north-west and north gales, to which St. Ives is now open, would there be greater danger in running for such a harbour than in running for Padstow ?—If you will give me the north-west point from the point of your breakwater I will give you an answer.

9923. We will say that a breakwater is run out from St. Ives Head in such a line as to protect ships from north-west gales ?—To north-east or east by south to come into the bay.

9924. It must go to the east to protect ships in north-west and northerly gales ?—Then, if a ship rounds the entrance to the harbour, a north-west gale is right on her, and with such a gale no vessel, in my opinion, would be able to get up to the anchorage. Not only that, but in running for St. Ives, if only 20 or 30 fathoms from the entrance, the only wind to take her in would drive her to leeward.

9925. But would a vessel be required to beat up in a north-west gale ?—Yes, as soon as she was able.

9926. Would Padstow Harbour be the best in north-west gales ?—No doubt of it.

9927. That is your opinion ?—Yes.

9928. Then, in your opinion, there would be greater danger in running for St. Ives Bay than for Padstow ?—Yes.

9929. Tell us why ?—A ship to run for St. Ives must close haul on the wind. A ship coming to Padstow runs before the wind.

9930. Suppose, just as she is entering St. Ives Bay, she splits a sail or carries away a spar, how can she fetch up ?—She goes to leeward.

9931. Suppose she goes to Padstow ; how does she get there ?—Right before the wind.

9932. Would she not, under similar circumstances, be likely to strike on the Doom Bar ?—You are forgetting the supposition of part being removed. Give her 100 fathoms and she would come in.

9933. Supposing she carried away a sail or lost a spar coming into Padstow, where would she go ?—Right up the harbour.

9934. Would not the Doom Bar be under her lee ?—If she got a fair wind she would run.

9935. Would she, or would she not, have the Doom Bar under her lee in a north-west gale ; yes or no ?—Yes ; but I tell you, with water above the town we have 25 feet at low water, and you would only have to remove the sand.

9936. I do not want to hear your opinion about the water up at the town. There is only one more thing I will ask you. If you had to spend half a million of money, would you spend it on Padstow or St. Ives ?—On Padstow, because it is the finest harbour that can be.

9937. (*Capt. Washington*). Do I understand that you are a sailor ?—No ; I never was at sea.

9938. As you have displayed considerable nautical knowledge, I will ask you whether you would desire to place a buoy on Ketch Point ?—The Trinity Board put a buoy there, and could not keep it there. It did not last three months before it went away on the rocks.

9939. When did the Trinity Board place a buoy there ?—Some years ago.

9940. Are you quite sure it was the Trinity Board ?—Yes ; they presented it to us.

9941. To whom ?—To the Harbour Association.

9942. How long did it remain there ?—It broke away three or six months afterwards. The thing is, that the sea is so tremendous it lifts the buoy to the full extent of the cable, sends it spinning round, and away it goes with a whirl.

9943. Can you tell us whether it broke away in three or six months ?—All I can tell you is that it was always breaking away.

9944. I understand you to say that it was given to the Harbour Association. Are you aware that the Trinity Board change the mooring chains of their buoys every six months ?—I suppose they do.

9945. Suppose the mooring chains were changed every six months, do you think the buoy would be removed ?—No ; it would not stand.

9946. From your nautical knowledge can you tell us why ?—The sea is too heavy. There was a barrel once put on the rock.

9947. Who put the barrel there ?—The Harbour Association.

9948. Has the Harbour Association any funds ?—I believe they have 30*l.* in hand.

9949. Might it not be that the chains were not large enough ?—They sent the chains from the Trinity Board. The chains were changed, but they could never keep the buoy there.

9950. Do you know where the life vessel is moored ?—Yes ; but there is no deep water there. The Ketch is shallow water. The chain is pretty long. When the sea takes it, away it goes.

9951. I think you said you were sub-commissioner of pilots ?—Yes.

9952. How many men are under your charge ?—Six.

9953. Do they pass every examination ?—Yes.

9954. Before whom ?—Before the collector of customs, Mr. Norway, and myself.

9955. Is the collector of customs a sailor ?—No.

9956. Is Mr. Norway a sailor ?—Yes ; and we have generally had the commander of the coast guard.

9957. Is there any want of lights in this neighbourhood ?—Not at present. A light upon the point would be a good thing.

9958. Which point ?—Stepper Point.

9959. Have wrecks decreased since a light was placed on Trevose Head ?—Yes.

9960. Very materially ?—Yes.

9961. Is it a good light on Lundy Island ?—I understand that it is.

9962. Is the channel at the entrance of the harbour mud, clay, or sand ?—Clay, I think.

9963. Are you aware that a bar exists between St. Ives and Ketch Point ; a bar with only 16 feet of water on it ?—No.

9964. Well, it does exist. Would it be desirable to dredge away to the depth of 20 or 24 feet ?—It would.

9965. And you think it would remain open ?—Yes, because the back water would keep it open.

9966. Is there a large amount of back water there ?—Yes ; sometimes very large.

9967. Is there a large rise of tide ?—Yes ; about 23 feet ; from 20 to 23 feet at spring tides.

9968. I see it stated in a report that there are 32 millions of cubic yards of tide which come into and go out of the harbour of Padstow at every spring tide ?—I have not made the calculation.

9969. Have you any reason to doubt that statement ?—I cannot say.

9970. However, you know that a large quantity of water as far up as Wadebridge falls and empties at every spring tide ?—Yes.

9971. You say that the scour of the back water would keep the bar clear. Is not the scour about two or three knots an hour in the spring ebb ?—It is about that.

9972. Can boats pull in and out of the harbour at spring tides ?—Yes.

9973. Do you feel sure of that ?—I do not mean in a gale of wind.

9974. Take a gale, if you like ; can a boat pull out of the harbour at a spring flood ?—Yes.

9975. In a spring ebb can a boat pull out of the harbour and pull back against the ebb ?—Yes.

9976. You still think there is sufficient scour to keep down the bar if it were dredged away ?—Yes.

9977. (*Capt. Sulivan.*) You spoke of the difficulties

PADSTOW.

Mr. R. B. Hellyer.

28 Sept. 1858.

Capt. Sulivan.

of vessels getting on the bar if they were thrown off it, first in rounding the point?—Yes.

9978. Can you state how far from the point they now meet that difficulty?—Outside the edge of the Ketch sand.

9979. If, before meeting that difficulty, from the baffling winds, they could get within the edge of the Ketch sand, would the great danger be over?—Yes.

9980. Then, supposing that from want of funds, or from engineering difficulties, these walls were not made, but the point was cut down above, would that give all the security necessary to enable vessels which are now thrown aback to get sufficiently far up to get hold of the shore?—Yes.

9981. You would then have a true wind in?—Yes.

9982. Then if the channel alluded to by Captain Washington were dredged away, would that reduce the sea rolling round the point, and make it less dangerous for vessels coming round?—No.

9983. You do not understand the question. I ask you if the 15 feet bar were removed, and the channel dredged to 20 feet, whether there would not be less danger to vessels rounding the point?—Yes.

9984. And they would be less likely to be thrown towards the Ketch sand?—Yes.

9985. If the point were cut down, would the entrance be comparatively safe in all weathers in which vessels require to take refuge in the harbour?—Yes, I think so.

9986. (*Capt. Vetch.*) How long have you been acquainted with the Doom Bar?—50 years.

9987. Have you seen any alteration in that time?—It changes now and then; sometimes higher and sometimes lower.

9988. Does it fall materially?—Not much.

9989. As far as its form is concerned, it is pretty permanent, is it not?—It extends out and in. You must recollect the sand will come in shore when the wind is off the land.

9990. You have seen it sometimes higher and sometimes lower; but, speaking generally, is there any material difference?—No; it is just the same.

9991. In a period of years you have seen it pretty constantly?—Yes.

9992. Did you ever consider how the accumulation of sand could take place there?—It was thrown in upon the coast. All sand comes in at different times. In some of the bays I have known the sand swept completely out by north-west gales. When the wind gets to the south, and off the land, the sand comes in.

9993. Taking the general feature of the bar, is it materially different from what it was when you first recollect it?—It has altered now and then; now higher, and then flatter.

9994. Then its extent and position must be owing to natural influences?—Yes.

9995. The wind driving the sand in, perhaps, and the tide driving it out?—It is the fact that it is sometimes higher and sometimes lower.

9996. Nevertheless it seems fixed by nature in its present position?—Yes, it has been fixed in its present position.

9997. Do you think, supposing that natural influences have constructed this bar, that it will all be removed by the construction of these guide walls?—Part of it will, no doubt.

9998. You think by making these two rubble walls up to low-water mark you will get a good harbour, and the Doom Bar will be removed?—Every fathom which you remove from the bar is of great consequence to the harbour, there can be no doubt of it.

9999. And can you see any certainty that such an effect must follow their construction?—I have no doubt it will, because nothing but back water will operate upon the sand at all.

10,000. Would that materially increase the back water?—You would have a better scour.

10,001. But it would not increase the back water?—No; it would only throw it on a certain point, instead of its coming out over the Doom Bar. It would throw it on the point.

10,002. And you conceive that the quantity of water which now flows over the Doom Bar at the time of high water, being then thrown into the channel, would be sufficient to excavate this large channel, and to maintain it?—Yes, I have no doubt of it.

10,003. (*Mr. Coode.*) What do you consider the greatest improvement that can be made in Padstow Harbour?—Cutting down the point, and widening the entrance.

10,004. You speak of two; but of those two which should you prefer?—To cut the point down.

10,005. Are you aware of the extent to which it is proposed to remove the point?—I am.

10,006. Are you satisfied that it would be sufficient to give a true wind into the harbour?—Yes.

10,007. You are satisfied of that?—Yes.

10,008. Do you not think the baffling wind inside Stepper Point is the source of many casualties?—Yes.

10,009. And more particularly to strangers?—Yes, more particularly to strangers.

10,010. When you speak of the removal of the Doom Bar, do you mean the whole, or only a portion?—The outer edge.

10,011. To give greater breadth to the channel?—Yes, to give greater breadth to the channel.

10,012. Have you ever known vessels get foul of each other in attempting to get into the harbour?—I saw a brig once lost in consequence of a vessel lying at the rings. A vessel came in that lay at the capstan and ring on the rock, and got warped to the ring, and anchored there. A brig came up round to the point, and when she saw the sloop in the way she took the circuit of the bay, and came to anchor off Hayle bay; and there she rode very well until near low water; as the tide ebbed away the sea broke further out, and the consequence was that just before low water the sea broke directly on her; she parted both anchors, came round to Stepper Point off Hayle bay, and went ashore.

10,013. Were many lives lost?—They were all drowned but one.

10,014. Do you remember how many?—Six or seven.

10,015. What induced the brig to put about?—She could not come in.

10,016. You said she attempted to enter the harbour?—She did; and when she saw that one vessel in the roadway she fancied there was not room for her to go in, and bore away for Hayle bay; she did not go into the harbour. During high water she rode very well.

10,017. Was that a Padstow vessel?—No; she came from Ireland.

10,018. And you think that if the channel had been wider she would have come in?—She would have come in.

10,019. What do you consider is the least amount of additional breadth which should be given to the present channel?—I cannot tell exactly; it is impossible to say.

10,020. Referring to that buoy on the Ketch, does the mooring drag, or do the chains break?—The chain breaks.

10,021. Upon every occasion?—Upon every occasion.

10,022. Was it a mushroom anchor, or a mooring block?—A mushroom, I suppose. It was a square lump of iron.

10,023. Do you know anything of this Padstow association?—Yes.

10,024. Are you a member?—I am.

10,025. How long have you been one?—From the year 1829 or 1830; from the commencement.

10,026. You heard the evidence given by the last witness as to the object of the association?—Yes.

10,027. Was that a proper description?—Yes; to save life and property from shipwreck.

10,028. Can you tell us the number of lives which have been saved by the direct intervention of the association?—We have saved several vessels.

10,029. Can you give a return showing the number of lives that have been saved?—I dare say we can.

10,030. Are such associations common in the parts along this coast ?—No, not generally.

10,031. Do you know of any that has been established solely to save life and property ?—No, I do not.

10,032. No local association with the same object ?—No.

10,033. Can you state the amount of money expended by the association since its formation ?—I will find the particulars, and furnish them.

Mr. NICHOLAS HORSEWELL examined.

10,034. (*Chairman.*) What is your occupation ?—Fishing, and working about the quay.

10,035. And are you a pilot ?—Yes, I was.

10,036. A Trinity pilot ?—Yes.

10,037. What was the district for which you were licensed ?—For Padstow Harbour and within 10 leagues.

10,038. Have you been present during the course of this inquiry ?—No ; I have not been here all the time.

10,039. What have you to say to the Commissioners as to the advantages of improving this port ?—It is my opinion that all you cut away from the point will give a true wind in with the wind north-west.

10,040. And from your experience as a pilot do you consider that a much larger number of vessels would come here if the facilities of access were greater ?—That is a certainty.

10,041. Do you know from your own knowledge many vessels which have refused you as a pilot because they would not come in, thinking the port too difficult ?—I have known hundreds that have come in by themselves after having refused a pilot.

10,042. Have you known many vessels refuse a pilot because they would not come in ?—I have known many who have refused pilots that got on the Doom Bar and have been lost.

10,043. Therefore you would be disposed to say that if vessels were more careful in taking pilots fewer wrecks would occur on the bar ?—There would be less wrecks, to a certainty.

10,044. (*Mr. Lindsay.*) Do you think there is a great risk in running for the harbour now in heavy north-west gales ?—There is a risk attached to it, because in heavy north-west gales a pilot cannot get out.

10,045. Is there a heavy sea from Stepper Point across to the Ketch ?—A very heavy sea. I have seen a boat knocked over the stern of a ship there.

10,046. Just as the ship was rounding the point ?—She was over on the Ketch ; she did not come close enough to it.

10,047. Did she go ashore ?—A man was thrown down, and his thigh was broken.

10,048. Considering what you have seen, do you think there is great danger in taking the harbour ?—There is not so much sea if you come closer to the point.

10,049. The distance from the shore to the Ketch is 80 fathoms, is it not ?—She must have been half a mile from the point when the sea struck her.

10,050. Half a mile from Stepper Point. Do you mean in an easterly direction ?—East-south-east when the heavy sea struck her.

10,051. Then, unless the Doom Bar can be removed altogether, there will still be great danger in running for the harbour in a heavy north-west gale ?—If there could be any of it removed it would cause it to be much better, because the further you are off the truer you would carry the wind in.

10,052. You say that the wider the channel the less the danger ?—Yes.

10,053. But unless the Doom Bar were removed there would still be that dangerous bank under a ship's lee in a north-west gale ?—Yes.

10,054. Did you ever go to St. Ives ?—No.

10,055. Did you ever take a vessel into St. Ives ?—No ; that is not our district. I have been there a number of times.

10,056. Say that a harbour was formed at St. Ives to protect ships in north-west gales, would you have any hesitation in running for it ?—I would sooner run over here.

10,057. Do you think there would be less danger ?—Yes.

10,058. Even as Padstow is now, you think there would be less danger in running here than in running to St. Ives, if a breakwater were at St. Ives to protect ships in north-west gales ?—I would sooner run for here, particularly if the ship were any way disabled.

10,059. Tell me why you would prefer to take a disabled ship into Padstow ?—In the first place, in going to St. Ives you would have to haul up four points to get into the breakwater, and when you came in there would be the wind abaft the beam.

10,060. That is one reason ?—Yes ; and I have known a vessel carry away both topmasts, and have her starboard main braces hove in, and still she came in here with a heavy gale from north-west and west.

10,061. Into Padstow ?—Yes. She brought up with a very heavy sea ; but there happened to be a person on board who knew the place. She had a rope handed her from the capstan house, and she was safe in half an hour.

10,062. Was the wind north-west at the time ?—North-west and west. If she had attempted St. Ives as she was she would have been lost to a certainty.

10,063. She would not have found shelter as St. Ives is now ?—She would not have got safe in out of the sea.

10,064. Then if you were caught by a gale of wind, more particularly if you were in a disabled ship, is it your decided and conscientious opinion that you would rather run for Padstow, even with all the dangers described of the heavy sea which breaks across the entrance, than run for St. Ives ?—Yes.

10,065. (*Capt. Washington.*) Do you think it would be desirable for a buoy to be placed on the Ketch Point, if it could be held there ?—It would be of no service at all.

10,066. Why not ?—I know a Dublin steamer that came up one time to Trevose Head, and thought to go to the east of the buoy. As the buoy was placed there was nothing to be seen but broken water between the point and the buoy. The consequence was she went to the east, and the sea went clean over her paddle-boxes.

10,067. All because one vessel made a mistake in passing on one side of the buoy instead of the other, you think all other vessels ought to do without a buoy ?—I have known many make that mistake.

10,068. Are the shoals in the Bristol Channel buoyed ?—Generally they are.

10,069. Are you acquainted with the Bristol Channel ?—I think there are more buoys now than there used to be. I have not been there for 20 years.

10,070. How many buoys are there that you know of ?—There is one on the Scarweather Bank.

10,071. If buoys are useful on other shoals, why not on the Doom Bar ?—Because the sea breaks over Stepper Point, and there is white water from that to the buoy. Vessels consequently consider they must go to the east of the buoy, and they get into difficulties.

10,072. In north-west gales does the sea break right across the harbour ?—Right across.

10,073. Is there a shoal off Stepper Point ?—There is, about 80 or 100 fathoms off. That was caused by cutting away the point ; the rubbish got there.

10,074. Was the rubbish from the point thrown into the channel ?—There was some.

10,075. Where was the rest taken ?—Out to the back.

10,076. Do you remember the year when that point was cut down ?—I think twelve or fourteen years ago.

PADSTOW.

Mr. N. Horsewell.

28 Sept. 1858.

Capt. Washington.

10,077. What is the nature of the bottom in the channel ?—Blue clay.

10,078. (*Capt. Sulivan.*) Even if a buoy would not stand on the end of the Ketch, do you think it would be useful to vessels if the channel inside were marked by a buoy off Capstan bollard and Hawkers Cove, so as to show strangers the limits of the two bars ?—It would be of no service whatever.

10,079. No service whatever ?—Not inside, because the sea shows you where the bar is.

10,080. Do you think that to a perfect stranger entering the port, even if the sea outside caused a mistake, a buoy inside would not be useful ?—Of course they would not do much harm, except to fishermen.

10,081. Would a buoy ride a little inside the Ketch and up the channel ?—To a certainty it would.

10,082. If the point were cut away, should you have much confidence that it would have the effect of bringing larger ships in severe weather to the harbour ?—So much of the point as is cut away, so much would vessels get further in.

10,083. And would that greatly assist all vessels coming up out of the dangerous sea at the entrance ?—Certainly.

10,084. And if that alone were done, do you think it would be of great advantage to the port ?—It would be of very great advantage.

10,085. Have you traded round the coast before you were a pilot ?—Yes.

10,086. Do you know Port Quin Bay ?—Very well.

10,087. Do coasters bound round channel take refuge in that bay ?—Very seldom.

10,088. Is there good anchorage there ?—The anchorage is very good.

10,089. Do you know the passage between Sevensouls and the island ?—Very well.

10,090. Does it allow vessels to pass ?—It is sufficient for small vessels.

10,091. Do you know why coasters do not use it more, when it affords shelter ?—There is nothing but an iron bound cliff to the leeward, so that if anything is the matter with the anchor, and you let go, you are ashore.

10,092. If a breakwater were carried from Mouls Island to the south-east, so as to shut in that corner from the north and north-east winds, would it be safe anchorage then ?—It would be safer then than it is now.

10,093. Would the passage between Mouls Island and the Sevensouls being open cause such a sea to be thrown that the harbour would be unsafe ?—I think it would.

10,094. (*Mr. Coode.*) How far do you get inside Stepper Point before you are liable to meet those baffling winds ?—With the wind at north-west ?

10,095. Yes ; with the wind at north-west ?—If in an ebb tide, and you intend to bring up, lay on all the canvas you can, and the vessel will come in 200 fathoms.

10,096. Would that be as far as the lower capstan house ?—No ; to the middle capstan house.

10,097. How far up would the vessel be subject to baffling winds, or how far up would she have to go before she got the true wind ?—At 100 fathoms she would get the true wind.

10,098. Then it is only to the extent of 100 fathoms that they are subject to these baffling winds ?—Yes.

10,099. You were asked a question with respect to the bar outside the Ketch, and you said it was owing to the rubbish which was thrown over when the bar was cut away ; are you quite sure of that ?—There are two or three fathoms of water less than there used to be.

10,100. But do you know whether it is owing to that rubbish being thrown in ?—It is considered so.

10,101. It is considered so generally ?—Yes, generally.

10,102. Did you see how the material was disposed of ; what was done with it ?—I have seen it coming down the cliff.

10,103. And going in the harbour side ?—Yes; and a vessel came ashore laden with a cargo of limestone, and that went there.

10,104. But independent of the cargo of limestone, do you believe that rubbish was thrown there from the former excavation ?—I do not know what else it could be.

10,105. It is a supposition ; you do not know of your own knowledge that it is as you have stated ?—No.

10,106. Have you ever had occasion to drop a vessel's anchor there ?—A thousand times.

10,107. Just at that particular spot ?—Yes.

10,108. What sort of ground have you found ?—No, not at that particular spot. Vessels come further in than that.

10,109. But have you had occasion to drop an anchor on that particular spot ?—Never.

10,110. Do you know whether the bottom is of stones or clay ?—Clay all the way out.

10,111. Do you think it necessary to attempt to remove the Doom Bar altogether to get a good entrance to Padstow Harbour ?—If it could be partially removed it would be better.

10,112. But it is not essential to remove the whole? If the channel could be made 200 fathoms.

10,113. What is it now ?—80 or 90 fathoms.

10,114. Then it would be better ?—Yes. The further you are to leeward the sooner you get a true wind.

10,115. Then you would not only get greater breadth, but the wind would be still truer ?—The wind would be still truer.

Mr. Archibald Hutchings examined.

Mr. A. Hutchings.

10,116. (*Chairman.*) In what way are you connected with the Port of Padstow ?—I have been master of vessels for 24 or 25 years, generally trading to this port.

10,117. Are you a shipowner ?—Yes, partially.

10,118. How long have you been a master ?—18 years.

10,119. What description of vessels have you commanded ?—From a schooner to a smack.

10,120. Never steam vessels ?—I was master once of an old steamer, up and down the river.

10,121. Are you acquainted with the subject of the present inquiry?—I suppose I know a little about it.

10,122. Will you state any opinion you may have to offer as to the advantage or necessity of improving this port of Padstow, so as to make it a place of shelter for the passing trade ?—I will answer any questions you like to put to me.

10,123. You would prefer that to making your own statement ?—I am not much of a speech man, to say much ; I may say a word or two.

10,124. To what class of vessels do you suppose this port would be useful ?—To coasting more than to foreign-going ships, because coasters hug the land, and in a north-west gale are often caught.

10,125. Are you acquainted with St. Ives ?—Yes.

10,126. Supposing a harbour of refuge were made at St. Ives, do you think additional shelter would be required here ?—My belief is that 99 out of 100 would be ashore trying for St. Ives when they might get to Padstow with a fair wind, if the true wind were made with a better channel.

10,127. You have been in and out of Padstow very often ?—For 18 years.

10,128. Are there any real difficulties for men who know the place, on account of the baffling winds ?—Yes. If you could carry a true wind you would get in ; whereas now you are very often caught, and driven out again, or driven to leeward, and can not get in.

10,129. Therefore, I understand you to say that on entering the port you have frequently met baffling winds, and been driven to leeward, and obliged to

bear up from the port ?—Yes, and have got so far to leeward to get the true wind that I have been just caught on the Doom Bar, and there lay. Sometimes ships get out again all right, but not often.

10,130. Have you a pretty extensive acquaintance with the masters of coasting vessels in this neighbourhood ?—Yes.

10,131. Can you speak as to their opinion ?—Every one expresses an opinion in favour of a central point.

10,132. Can you state to me, of your own knowledge, what is the general feeling and wish on the part of masters of coasting vessels ?—Vessels get caught in a breeze, and have to put back to the Mumbles. If there were refuge here they would come in.

10,133. Do you know cases within your own knowledge of accidents that have taken place to vessels attempting to enter the port ?—I have seen many lost, and many persons drowned. I saw a schooner come on the Ketch, and all were drowned. Another, a Jerseyman, came on, and the crew were taken out, because she was further out.

10,134. (*Sir F. Smith.*) What is the largest sized vessel that will be able to come in when the port is altered as proposed ?—A vessel of 2,000 tons or upwards.

10,135. What will be the depth of water ?—24 or 25 feet.

10,136. Then it would depend on the depth of water. How much sand is there with 18 feet ?—18 inches.

10,137. Can you make the depth of water 28 feet ?—Yes; 30 feet.

10,138. Would that be enough for vessels drawing 24 feet of water, and coming in with a gale of wind?—Yes.

10 139. Do you think it would be quite safe ?—Yes.

10,140. Supposing there were a harbour at St. Ives and a harbour here, at what other points would you recommend them ?—I do not know any other point between Hartland Point and here.

10,141. What do you think of New Quay ?—That is no place ; the water is shallow, and there is a heavy sea.

10,142. What do you think of Clovelly ?—That is no place. Ships generally get up channel if they pass Hartland Point.

10,143. Vessels outward-bound would not be able to come here ?—They would always be able to go up channel.

10,144. Supposing outward-bound vessels were to have a place on the coast of Wales, where would you say it ought to be ? Do you know the Mumbles ?—Yes ; I have had many a thrashing there.

10,145. Have you seen many vessels lying in the Mumbles ?—Yes, I have seen a 100.

10,146. Would it not be a good thing to give them some protection ?—It would not do any harm.

10,147. To which place would you apply money, supposing you had your choice, the Mumbles or Lundy Island ?—I should say Lundy Island.

10,148. Where would you place the breakwater ?—That I do not know. It is a very handy roadstead if made safe.

10,149. Why do you like Lundy Island better than the Mumbles ?—At Lundy Island you can lay afloat, but at the Mumbles you are all aground. On this account also there is danger in knocking about.

10,150. (*Mr. Lindsay.*) I understood you to say that a number of vessels put back that have been out almost to the Land's End ?—Yes ; they put back as far as the Nab. I have heard that if there were a harbour they would not go up channel.

10,151. Say there were a harbour at St. Ives, from your knowledge and experience do you think you would prefer coming to this place to going to St. Ives?—Yes.

10,152. Why so ?—Because I should fall in with the land better.

10,153. How fall in with the land ?—Trevose Head is a very good landmark.

10,154. Would it be easier made ?—It is not so far in.

10,155. But if a lighthouse were on St. Ives Head would not that difficulty be obviated ?—In thick dirty weather I would not run for St. Ives.

10,156. Should you say it was more dangerous there than here ?—I should say it was.

10,157. What dangers are there besides the stones ?—The stones are very bad.

10,158. What other dangers are there ?—There is the three oar stone. It is the stones that are the principal danger.

10,159. Are there not dangers between Trevose and St. Ives ? There are some shoals marked on the chart ?—What danger can there be between Trevose Point and St. Ives Point ?

10,160. Then there are no shoals ; no dangers ?—You very seldom hear of any vessel striking on any shoal or rock.

10,161. But are there no rocks or shoals on which vessels may strike ?—There is one rock, but it is only dangerous at dead low water.

10,162. Do I understand you to say that if a harbour of refuge were made at St. Ives a very large number of vessels would get ashore ?—I said that before they got to St. Ives, in a gale of wind, they would either founder or go ashore.

10,163. Are you alluding to that port being off the Land's End ?—I am alluding to ships caught in a north-west gale.

10,164. Why are the dangers so very great in attempting to take St. Ives Bay ?—I did not say the danger was so very great getting in. It is not after you get in, but to get there.

10,165. That depends on the position. Say a vessel was caught in a north-west gale to the westward ?—How many vessels are caught there ? Where one is caught off St. Ives 50 are caught off Padstow.

10,166. Then vessels leaving the Bristol Channel have not much chance of being caught to the westward, in your opinion ?—They have a better chance of getting to Padstow than to St. Ives. This is the centre part, where the Irish vessels generally fall in.

10,167. But is not St. Ives more in the track of vessels leaving the Irish Channel than Padstow?—No.

10,168. Do you mean that Padstow is more in the track ?—Padstow is more in the track of vessels than any other port.

10,169. Of those leaving the Irish Channel ?—Of those leaving St. George's Channel and the Bristol Channel, and of great part of those leaving Waterford and Cork. A great many have fallen in here, and been wrecked, as I have known.

10,170. You say that if the harbour were improved a vessel of 2,000 tons could find shelter here ?—Yes, or perhaps 3,000 tons.

10,171. Then before they could take the harbour it would require to be widened materially. To what extent ?—200 fathoms.

10,172. Do you think 200 fathoms a safe roadstead ?—I do not give any opinion on the roadstead.

10,173. Supposing the entrance were widened, how many ships of 2,000 tons could find shelter here ?—They could go further up.

10,174. You have not considered how many could find shelter ?—If the sand were taken away there would be room enough for 500.

10,175. That is conditionally upon the removal of the Doom Bar ?—Certainly ; if that were removed it would throw more water up channel.

10,176. Your idea is that to make it a harbour of refuge you must remove the Doom Bar ?—It would be more for coasting than for foreign vessels. Where we get one large ship we get 50 small ones.

10,177. Do you think there is any necessity for a harbour of refuge above Lundy Island ?—No.

10,178. You do not think there is ? Why so ?—Because when you get up to Lundy Island you can get away somewhere or other. You can get to Penarth, or to the Mumbles, or to King's Road, or somewhere.

PADSTOW.

Mr. A. Hutchings.

28 Sept. 1858.

Mr. Lindsay.

10,179. Then you think a harbour above Lundy Island would not save life or property ?—It might save damage ; it would not save life and property.

10,180. Do you know Clovelly ?—Yes.

10,181. What should you think of that ?—I do not think much of Clovelly. There is very good holding ground.

10,182. Is there any difficulty in entering Clovelly ?—That would depend how the wind was.

10,183. Say the wind was from the west ?—With the wind from the west you would have a fair wind up channel.

10,184. In what wind now would you seek shelter at Clovelly ?—We can bring up there for shelter in west-north-west winds, but there is a nasty rolling sea.

10,185. A heavy sea rolls in there ?—Yes, a very heavy roll.

10,186. Then is it your opinion that if a harbour of refuge were made at Padstow this particular site would be sufficient for all the wants of the trade either of the Bristol Channel or elsewhere ?—I do not see any other in sight of it, unless you fill up the gap between the land and the Mouls Island.

10,187. Then it is your opinion, as a master of considerable experience, that one harbour of refuge is all that is necessary ?—I should say Padstow was the place to get to.

10,188. Quite so ; but you think one necessary between St. Ives and Hartland Point ; and you prefer Padstow ?—St. Ives is no place at all, in my opinion.

10,189. (*Capt. Washington.*) You are a seafaring man. How many years have you been at sea ?—About 24 years. Since I was a lad of 18 years of age.

10,190. You have heard what was said by the other witnesses with respect to the buoy or beacon on Ketch Point ?—I was not here to hear that.

10,191. Give us your own opinion whether it would be desirable for a buoy or beacon to be maintained on Ketch Point ?—I have known buoys there knocked away which had not stood long, since I was master of a vessel.

10,192. How long ago ?—Fourteen years ago.

10,193. That was the buoy maintained by Padstow ?—There was one on Ketch Point, and two in the channel.

10,194. Supposing one stood ; would not that be desirable ?—It would not bring a better channel or a truer wind.

10,195. (*Capt. Sulivan.*) You say that the vessels principally requiring refuge here are coasters ?—Yes.

10,196. Do most of those coasters know Padstow ?—Yes.

10,197. Do most of the coasters take refuge here, if they are to windward of Padstow ?—When it is safe to do so. That is not often, if it is not flood tide.

10,198. Supposing masters generally knew the place, do you consider that they could run for it in safety at present ?—No, except with a flood tide. The flood tide will bring them in in a north-west gale.

10,199. Have you ever run in in a gale of wind ?—I have come in when the hair stood on my head.

10,200. Did you ever hesitate to take the place, and keep off ?—We keep off until the flood tide.

10,201. Then for the whole coasting trade the harbour at present is sufficiently known to give them refuge ?—No ; as I said before, there are scores of vessels which go up channel, and are blown to pieces, because they will not come to Padstow, because it is not a safe place. I do not mean Padstow men.

10,202. Does a Padstow man run in, in all weathers ?—No ; not at the ebb tide.

10,203. Have you known many Padstow vessels lost ?—No; but many get into difficulties. They get on the Ketch, and get off again.

10,204. If the point were cut down, and there were a true wind as far as the upper capstan, would that enable vessels to run in which do not now ?—That is not far enough ; you ought to come to the valley.

10,205. If the vessel were brought as far as the upper capstan, would she be through the dangers of the entrance, and be able to drop her anchors in a place of safety ?—They might anchor, but it would not be far enough in.

10,206. But if they got to the upper capstan, would you consider them out of danger ?—I have known them, after they got to the capstan, get on the Doom Bar, and be lost.

10,207. To what point should you consider it necessary that the cutting down should be carried, in order to give a true wind in ?—To where there is a fall in the land.

10,208. Do you know the first bollard above the upper capstan ?—Yes.

10,209. Would that be far enough ?—I should say it would.

10,210. You would meet the steady wind there ?—Yes.

10,211. And you think if you could reach that you would get a fair wind over ?—Yes; if you get there you have a true wind to fetch up channel, and get right into the cove.

10,212. Do you know anything of the bar at the entrance, the 16 feet bar at the entrance, close to Stepper Point?—That is the Ketch, I suppose.

10,213. No. In the mouth of the channel, close inside Stepper Point, is there a bar with shallower water than the channel ?—I do not know much about that; I never met it coming in.

10,214. Did you ever sound there ?—No.

10,215. (*Mr. Coode.*) Have you traded much with the south of Wales; to and from ?—No.

10,216. More to Ireland ?—If you mean Newport and Cardiff, I have all my life traded there, and to other places down to Milford.

10,217. From what quarter do your heaviest gales blow ?—Generally from the north-west.

10,218. Which way do they generally first come on? —Generally by a dirty south-west wind, and then fall out to the north.

10,219. They begin at south-west, and then fall round to the north-west, do they ?—Yes.

10,220. There is a good deal of trade between Cornwall and South Wales, is there not ?—That is all the trade with the little vessels.

10,221. Suppose you were leaving Padstow, and half way across were caught in a gale from the south-west, what would you have to do ?—To run up channel.

10,222. Where should you run for under such circumstances ?—Coombe and Penarth.

10,223. Did you ever run into Caldy ?—I have been in, but not in a gale of wind.

10,224. Do any vessels run in there ?—Yes, but it is not a safe place.

10,225. Is not the holding ground good ?—Pretty good.

10,226. Why is it not safe ?—It is not safe in all winds.

10,227. Is it too much exposed ?—Yes.

10,228. Do you think that is a place which could be improved ?—No ; I do not think it could. Besides, there are not many vessels go there in bad weather.

10,229. Do you not think many might go there if shelter were afforded ?—No ; it is a nasty place to make in a gale of wind. With a north-west wind you cannot fetch it.

10,230. You said, I believe, that there was no shelter at the Mouls Island? Cannot shelter be made?—Yes; if the channel were filled up between the Mouls Island and the land.

10,231. And cannot vessels go into Port Quin Bay as easily as into Padstow ?—No; I would not go in.

10,232. But if shelter were provided there ?—It might hold a few ; but suppose it came on to blow from the east, how would you get out again?

10,233. I suppose it is sheltered from the north-west round to the north-east ?—Very little now.

10,234. But it would be, would it not, if you were to fill up between the Mouls Island and the land ?—Yes.

10,235. Is the holding ground good ?—Tolerably good.

10,236. You said there was good holding ground at Clovelly. Do vessels run there for shelter ?—No; only a few. Some that get caught.

10,237. If there were shelter provided, would many use it ?—No ; they would prefer Lundy Island.

10,238. If I rightly gathered your evidence in answer to a question about the channel, it was to this effect, that if there were a channel 200 fathoms wide at Padstow you could easily get in round the point, and there would be a large area of shelter ?—Yes; if you had a true wind.

10,239. Did you mean that it would be 200 fathoms across in reference to the place where vessels would get ?—I said 200 fathoms wide ; and if the point were cut down vessels could get into a place of safety.

10,240. But would they get into a place more than 200 fathoms in breadth ?—Certainly.

10,241. Do you mean that the channel would be 200 fathoms altogether, or 200 additional fathoms ?—Altogether.

10,242. Doubling the width of the present channel ?—And something better.

10,243. Are more lives lost from wrecks of large or small vessels on this coast ?—More by small vessels.

10,244. Can you give any instance of large vessels being lost ?—One got up to Boscastle, and there went ashore.

10,245. How long ago was that ?—10 or 12 years ago.

10,246. Was that the last occasion ?—I know of another.

10,247. How long ago ?—Eight or ten years ago.

10,248. Do you not know any case of the loss of a vessel within five or six years ?—I do not think I can name any later than that.

10,249. Then am I right in assuming that the loss of large vessels is not frequent ?—Not of large vessels.

10,250. You look to saving more lives and wrecks from small than from large vessels ?—A great many more.

Mr. Bryant re-examined.

10,251. (*Chairman.*) You wish to give some explanation of your evidence ?—I was asked a question as to the number of vessels belonging to the port of Padstow, and I said 700. I meant that more than 700 take refuge annually. The number registered is over 200. How many are owned out I do not know. There would be 700 taking refuge in the port. Captain Washington referred to an answer of mine as to the dredging away the spot at the entrance, which was misunderstood, if it is supposed that I referred to any part of the Doom Bar. I only referred to the spot which reduces the water from 20 feet inside to 16 feet over it, and the pilot who was examined supposes———

I cannot allow you to remark on a witness's evidence. You can correct your own evidence in any particular you please.

I was a party to cutting down the point. May I be allowed to state that ?

Yes.
