That cutting down is subsequent to Captain Sherringham's survey of the harbour. You referred just now to the report of the Committee of the House of Commons, and you read a part of it in reference to Government grants for the improvement of harbours, and asked if there were any funds here which would be applicable towards repaying them. The harbour commissioners who levy funds in certain portions of the harbour do not receive the dues for the lower part of the harbour, where the bulk of the ships seeking shelter would bring up ; and of the number of vessels frequenting the harbour 19 are strangers to one Padstow ship. It is hardly fair, therefore, to expect the locality to stand the cost of what would be a public benefit. Captain Washington asked whether the Ketch buoy was under the direction of the harbour commissioners. It was under the direction of the association. The association and the commissioners are very different bodies. There is some confusion as to which of them the buoy was supplied to. The association was established in 1829, and the commissioners are only authorized by the act of 1844. The Ketch buoy was supplied to the voluntary association. I omitted to state that the cost of cutting down the point, which has been found of so much benefit, was very much less than 100*l*. I am desired by Captain Sherringham to say that there is one line in the plan which was not submitted to the House of Commons, and he will be very glad to make a remark upon it.

Mr. Silas Edward Martyn examined.

10,252. (*Chairman.*) This is your memorial ?—Yes.

10,253. Do you wish to read it to the Commissioners ?—If you will allow me.

Certainly.

The witness then read the following memorial :—

"The respectful suggestion of Silas E. Martyn, St. Minver, Cornwall, for the consideration of the gentlemen officers on the Royal Commission relative to the harbour of Padstow and its vicinity.

"1st. The necessity of a perpendicular building in the cove without the Boar Rock and first ring, as shown in section to an elevation of 24 feet ; the mason work by perch about 376*l*. The material to be quarried in excavation of a road to the outer capstan in line with the building (as dotted with red ink on the chart), so that a cable from the capstan to this spot may by a line be handed by apparatus to the ship running in, thereby to be secured before she be caught by either tide or flow.

"2d. The desideratum of a breakwater without the Doom Bar from the Trebetherick Bulwarks (well named some day when it prevented the sand from flowing into the harbour), taking the direction to the outer ring and building referred to, of the length of 440 fathoms or half a mile, as marked on the chart by red lines, leaving an entrance of 220 fathoms.

"3d. The accumulation of sand in this harbour being from the sea and roll from the west, it may be observed to be moving inwards at half flood close in with the bulwarks, to the bar, where, forming an eddy, it is deposited, as may be seen by the elevation of the bar southward.

"4th. It is presumed, should a breakwater be feasible and erected, that the sand from the westward will form on the back or north side to support the erection, and also on the inside or south have the effect to sluice the bar, make an open channel, and on the influx take the sand, and to deposit it in the open bay.

"Should my suggestions and corresponding evidence have weight in the balance with the sentiments of the gentlemen Commissioners in this important trust, to recommend and carry out the facilities in this harbour, or neighbouring roadstead at Pentere Mouls, it may be hailed, under the blessing of God, as "the one thing needful" to save lives and property, and prove a boon to generations yet unborn, and confer a lasting obligation on myself and friends.

"I beg to remain,

"Your obedient servant,

"Silas E. Martyn.

"St. Minver, Wadebridge."

10,254. Have you been present during the course of this inquiry ?—Yes.

10,255. Have you any statement to offer to the

PADSTOW.

Mr. S. E. Martyn.

28 Sept. 1858.

Chairman.

Commissioners in addition to what you have already read ?—I would refer to the building I have named. It would be in the cove at the end of Stepper Point, giving an opportunity of making a road at the end a whole cable's length from the front capstan, so that a vessel running in 40 fathoms, in proper tideway, if she could receive a line to make use of that distance further out would be hauled in in safety, because it would be 150 fathoms more to windward. At the extreme point the vessel would have a very narrow channel. If aided by a line from the house I propose, she would run up close to the west coast, and, supposing that building were there, a line might be handed so as to take a cable on board. That is the first suggestion. The second suggestion is, that of a breakwater outside the Doom Bar, and that would be the means of sluicing the point. I have seen the place now more than 60 years, and most days I am down on the Doom Bar fishing. I know the nature of the sand coming in. It settles on the Doom Bar, and raises the Doom Bar elevation to the south, whereas if a breakwater were erected there, where the red line appears on the map, the sand, instead of settling on the inside, would go outside, and give more room. I have been acquainted with the place a great many years, and I have seen a great many wrecks. Vessels struck with the sea tail away to the Doom Bar. There was the *William Pitt*, a vessel of 1,800 tons or 2,000 tons. She came in upon the bar, and came ashore, and 10 men were drowned. There was the *James Wilson*, I think, another large ship.

10,256. Have you any experience of harbour engineering personally ?—I cannot say that I have.

10,257. Have you had the opinion of anybody who has, upon the effect which your proposed breakwater would have ?—Yes ; a great number of people.

10,258. Of harbour engineers ?—I do not know about engineers. Some years ago, when the *Whiting* was stranded, a great deal was said about a breakwater on the Doom Bar, and the position in which I had put it on the map. It was then considered that if put there it would sluice the point off the bar. The *Whiting* is there now. She settled down on a point of rock.

10,259. I understand you have not had the opinion of any professional engineer as to the effect of your breakwater on the Doom Bar ?—Not any one that I can speak of at present ; but I have heard it spoken of at times by sundry people, and I believe it would have the effect which I have described.

10,260. (*Sir F. Smith.*) Are you a seafaring man ?—No.

10,261. What has induced you to turn your attention to the harbour of Padstow ?—For the sake of being of service to lives and property.

10,262. What has been your calling in life generally ?—A farmer.

10,263. On the coast ?—Yes.

10,264. Have you observed wrecks, and vessels in great peril ?—Yes ; many times.

10,265. Then it is a feeling of humanity which brings you forward ?—Yes.

10,266. And I understand your plan is, instead of cutting down Stepper Point, to put rings on the rocks further out ?—The building, I propose would be 150 fathoms to windward.

10,267. Then you give in this plan of a breakwater ?—Yes.

10,268. Have you any idea as to the probable cost of forming this breakwater ?—No.

10,269. You have not gone into that ?—No ; the breakwater would be a desideratum.

10,270. Have you any knowledge of any case at all similar to this where the effect you anticipate has been produced ?—No.

10,271. (*Capt. Washington.*) I understood you to say that the Ketch Point had grown out to that lately ?—No. I saw it at low water on Sunday. It was dead low water ; and I pointed out that I had never seen the bar open so far out within my remembrance as it was on Sunday.

10,272. I do not understand what you mean ?—The Ketch Bar was open considerably further out than the second capstan at low water.

10,273. I do not understand what you mean. Do you mean that the Ketch Point has gone south ?—No. I mean that I never saw the bar so far out at the entrance as I did on Sunday last.

10,274. Have you seen a plan for improving Padstow Harbour, which has been laid on the table to-day, and is, I believe, Captain Sherringham's plan? —I have seen it in your hand.

10,275. Have you examined it ?—No.

10,276. Have you any opinion to offer with respect to it ?—I do not think it would be adequate for what is intended.

10,277. Do you remember the plan of Mr. Thomas, in 1844 or 1845 ?—I have seen it.

10,278. Did he propose a breakwater from Trebethrick across the Doom Bar ?—Yes.

10,279. Do you think that would have answered ? I think all the sand would have come in to the westward.

10,280. All comes from the seaward ?—If you mark a stone of a cwt. you will find it has gone up channel 100 yards in the course of 12 months.

10,281. The strike of the sea is very heavy ?—Yes.

10,282. Suppose a breakwater were carried out, do you anticipate the Doom Bar would be thrown up against it ?—Yes ; after it was erected.

10,283. After it was erected is what I mean ?—Yes. My belief is that it would sluice out the sand, and the sand would come back on the breakwater, and the sand on the inside likewise would accumulate against the building, and ensure the depth on the north side.

10,284. And it would widen the entrance ?—Yes.

10,285. What to ?—That is my belief.

10,286. (*Capt. Vetch.*) You have been long resident here ?—Yes ; 64 years.

10,287. Then you have been frequently looking at the Doom Bar ?—Yes.

10,288. And Hoyle bay ?—Yes.

10,289. And you have been turning over in your mind how these things could be improved and mended ?—Yes.

10,290. Are you aware that a great deal of sand is thrown up into Hoyle bay ?—Yes ; but supposing the breakwater were there I think there would be a great deal more.

10,291. Do you find that the sand thrown up in Hoyle bay finds its way towards the harbour ?—No; we can generally see it moving at half flood.

10,292. What moves ?—The sand at half flood. It comes down, and moves away south, and settles on the south side of the bar. Over the bar it is all dead sand.

10,293. Then, on the other hand, the set of the ebb tide fills the bar the other way ?—Yes.

10,294. So one force drives the sand to the south and another force drives it to the north, and between the two it settles ?—Yes.

10,295. Your object, I think, is to throw out a pier from Trebethrick Point for the purpose of preventing the sand coming in and augmenting the height of the bar ?—Yes.

10,296. If that were done, then the incoming material would no longer do so, but the ebb tide would still continue to take away some portion of the bar ?—Yes.

10,297. And under these circumstances you expect the entrance would be very much improved ?—I think so.

10,298. I can only say your observations are very valuable ?—The building on the cove seems a feasible thing, in the first place.

10,299. Then, looking at the Doom Bar as a great interruption and interference with the harbour, and believing it has arisen from natural influences, you think the best way of correcting it would be to stop the inroad of sand from without ?—Yes.

10,300. It would then accumulate in front of Hoyle bay, instead of going to the bar ?—Yes.

10,301. (*Mr Coode.*) I understand your proposal to be to cut a road towards the outer end of Stepper Point, and give greater facilities for handing cables to vessels, to enable them to be hauled in and got into the channel ?—Yes.

10,302. Do you think that would be of any service in a dark night in a gale of wind ?—It might be.

10,303. Do not you think that to cut away Stepper Point would be better ?—I do not think that it was ever intended by Providence. It was put there as a breakwater.

10,304. And I understand that the sand is harder on the other side ?—The sand is harder on the outer side of the Doom Bar than on the inside.

10,305. Where would your breakwater point ?—Between the site of the breakwater piers and the north end of the Doom Bar.

10,306. The sand there is hard ?—When you come to those shoals all is safety further up. All running sand goes up into the channel, and settles in the eddy.

10,307. Then the sand within the line of your proposed work would be more solid than on the Doom Bar ?—Yes, and supposing the breakwater were made, that channel would deepen, and vessels could find their way, in the dark.

10,308. Has the depth of the sand been tried near the site of the works you propose ?—Yes.

10,309. It has been tried ?—Yes ; 25 years ago.

10,310. Do you know how deep they went before they met with the bottom ?—I believe 16 feet, or some such thing. Some holes they bored from the boat, and some on the bar.

10,311. Do you know what kind of bottom they found ?—No.

10,312. Do you know any one who can speak with confidence as to the borings ?—I should think Mr. John Treadwin.

10,313. You said that you never saw the Doom Bar so far out as you did on Sunday. Do you mean that you never saw the point of the Ketch so far to the north ?—I never saw it so far to the north.

10,314. Do you know whether it was in consequence of the low tide, or of an accumulation of sand ?—I was down on the rock on Friday, and it was a great deal out then, but it seemed further out on Sunday.

10,315. (*Capt. Sulivan.*) Do I understand you it is travelling sand ; that it travels over the whole flat of hard sand on the Doom Bar, and falls into the channel inside ?—Yes.

10,316. Do you consider it would be swept out by the ebb tide ?—It forms an eddy on the side of the east channel.

10,317. You do not quite understand me. The loose sand is always travelling over the flat hard sand?—Yes.

10,318. Then how do you account for it that the bank is not growing inside ? Isthat sand again carried out by the ebb tide, and so is always travelling ?—I suppose so.

10,319. Is that bank growing to the southward, to your knowledge ?—Sometimes it is further in, and sometimes it breaks away. I have seen it many times higher than it is at present. I have seen vessels strike there.

10,320. (*Chairman.*) May I ask what is your age?—79 years.

The Commissioners beg me to say to you that they appreciate the motives which have brought you here to give evidence to-day.

Captain William Lewis Sherringham, R.N., examined.

10,321. (*Chairman.*) You wish to tender evidence with respect to this inquiry ?—When I was examined before the Committee of the House, my plans did not embrace a portion of the sea wall or guide wall which appears before the Commissioners to-day, and although I always contemplated that addition, I think it might be relevant to the inquiry to state the reason that it should appear before the Commissioners. I believe that there are two objects in improving the harbour of Padstow; one to improve the entrance, and the second to improve the area of inner water, so that if a vessel ran into the harbour she should find sufficient water for her anchorage, which she has not now. To effect this I think it would be necessary to remove two middle sands ; one marked on the Horseshoe Bank and the other on the Middle Ground. It occurs to me that the readiest method of removing or helping to remove the Horseshoe Bank would be to form that continuation of sea wall which appears on the amended plan before you. That was my reason.

10,322. Is there anything further that you wish to offer to us ?—Yes. I think from the nature of some of the evidence that has been tendered here that it would be a desideratum to remove the Doom Bar, and I have heard that expression of opinion in a very general sense. I ought to state that in my opinion it would be a positive mischief to remove the Doom Bar, for I think it is evident at least, to every nautical and to every engineering mind that it is the only protection that Padstow has to rely on. The Doom Bar is the natural breakwater. I am not of opinion that the Doom Bar does undergo change ; but I am thoroughly persuaded that all sand of that description does undergo some change on the surface. But the absolute contour of the bank does not undergo any appreciable change whatever, and therefore my object in the construction of these guide walls is to confine the tide in the natural channel of the harbour, and to prevent any diversion of the back water. My reason for striking short to those small swashways on the east which are the termination of my wall was that when any great portion of ebb flows from those swashways, and finds its way into the channel, it is generally about the upper bollard, instead of being used as a useful agent for keeping the channel clear. And therefore I propose in this wall that it should have the effect, not only of preventing the return of the water from those swashways when it could be more usefully employed, but also of really projecting the tide over the opposite side, where there is already the natural scour for the ebb. I enter into no opinion as to the possibility, the facility, or the capability of building a wall at all ; but I see no reason why it should be impossible, for this reason ; I asked for borings to be made, which I think were made at a place marked on one of these plans ; we found at one of those borings, I think the upper one, a hard substance, whether indurated sand I am not prepared to say, at a boring of two feet. Now I apprehend that the Doom Bar is at present up to a certain extent a scouring power, and that is clearly manifested if you come to the narrow throttle, where there is deep water. Probably, as you have strengthened or narrowed that channel so you have found deep water just down to the town of Padstow. I therefore conclude from that throttle or narrow part there, that if you continue the scouring power there is every probability, by the assistance of those means, that without dredging you would deepen the middle of the Middle Sand, which would give valuable anchorage.

10,323. You have had many years experience of Padstow harbour ?—Not many years experience of Padstow ; I was one year only at Padstow.

10,234. (*Sir F. Smith.*) I believe, Captain Sherringham, you are the author of a project of cutting down Stepper Point ?—I believe I was the first who suggested it, and the section on the table is my original drawing.

10,325. Do you decide as to the exact distance to be cut down, or do you leave that an open question ?—I leave it an open question ; but this I am quite sure of, that exactly in the same amount as you reduce that point are you likely to get the true wind ; and I

PADSTOW.

Capt. W. L. Sherringham, R.N.

28 Sept. 1858.

Sir F. Smith.

believe, at all events, you will ensure the true wind sufficiently to put any ship in safety.

10,326. We have heard a proposition for forming a road along Stepper Point, so as to throw a hawser from the extreme end. Do you think there is any merit in that?—No doubt there is anything to prevent her from breaking off to leeward she is safe, whether she warps up or is towed up. The effect is the same. But I think the great problem is, whether that is a sufficient amount of improvement which a few shillings will do at any time.

10,327. The guide walls are proposed by you with a view of improving the present passage, or keeping it as clear as it now is?—It is to improve the present passage, to improve the upper reaches, and to use every means of draining off the flood tide.

10,328. Do you imagine that that would tend to deepen the water?—I think there is very little doubt of that. I believe very great advantage has been found in the Tees, where the water has been deepened considerably by that means.

10,329. Do you think the walls would tend to remove these two banks, or must you dredge them?—I think they ought to be dredged, for this reason; what would otherwise take two years might then be done in one.

10,330. No doubt there is great force in your observation that the Doom Bar is a natural protection, but do you not think that an equally good protection would be afforded by the breakwater proposed by the last witness?—No; I cannot say I do. There might be a breakwater to break the water, no doubt; but I do not see why you require that breakwater when there is an area of dry sand which is already one.

10,331. On the supposition that the Doom Bar can be removed, would you not have a larger area of anchorage?—No doubt.

10,332. Would not that be an improvement? If the breakwater were to get rid of the Doom Bar, would there not be a large and spacious harbour?—That may be questioned. In heavy north-westerly gales, and in any gales at an open port, I think it a very dangerous thing to bring the sea home to your entrance, and run for that entrance; and it will be a question how narrow you intend to make the channel. My impression is, that if you left open something like 25 fathoms for the entrance, and you really suppose you have removed the whole Doom Bar, and brought it to an available depth, you would have a very heavy sea in the basin.

10,333. Would not that objection apply to many other harbours of refuge or proposed harbours of refuge?—No doubt it would.

10,334. (*Mr Lindsay.*) You have had very considerable experience in surveys round the whole of this coast?—Yes.

10,335. It has been stated to us that the most dangerous part of the coast is from Land's End to Hartland Point. Do you believe that is the case?—Yes.

10,336. Say that a certain amount of public money were placed at your disposal, and the object in view was not the local traffic in any particular place, but the saving of life and property, and the giving facilities to commerce, in which the whole public, to whom the money belongs, would be interested, at what particular port within the line of coast I have named would you expend the money?—That is a wide question.

10,337. Allowing it to be a wide question, what do you say?—If you mean for the local trade——

10,338. No. If the public money were to be expended on public grounds?—If it is merely to be a refuge for distressed ships, and kept to that point only without having reference to any other, it would be difficult to point out any position in the channel between Hartland Point and the Land's End for a national harbour or sheltered roadstead. But I do think it very important that there should be large harbours upon the threshold of all the great channels, and therefore there is no doubt that if a harbour was constructed at St. Ives it might really be a very valuable roadstead; but I do not think that large ships, either coming down the Irish Sea or coming out of the Bristol Channel, would be likely to be found embayed anywhere between Hartland Point and the Land's End, where it would be necessary for them to use the roadstead. I believe that no man in his senses would allow himself, if he could possibly help it, to be caught down on that coast. But I do think that for merely local trade, whatever harbour you make at St. Ives,—I mention St. Ives because it is a matter of history that St. Ives is a site proposed,—I believe that whatever harbour, and however valuable a harbour, you make it, St. Ives, the value of which I will not dispute at all, for I think it will be very valuable, it will not in any way obviate the necessity of improving a harbour in the bottom of the bay where Padstow is now situated.

10,339. You mean for the local and coasting trade?—Yes.

10,340. Do I understand you to say that the only point between Hartland Point and the Land's End suitable for the construction of a national harbour for all purposes is St. Ives Bay? Is that your opinion?—Yes, I think so, inasmuch as it embraces a large area of deep water. I offer no opinion on engineering points at all. I think St. Ives will be a most valuable harbour.

10,341. Then do you think any expenditure at this place would make Padstow a harbour of refuge, in the sense which I mean; that is to say, a harbour to receive vessels of all sizes at all times of the tide?—No; I do not think you would ever make it a harbour for any ship of the line.

10,342. You are aware that my question is, to make it fit to receive vessels at all times of the tide. Would any amount of expenditure do that?—I am not prepared to say that it would. I am rather disposed to think that it would not.

10,343. Then the substance of your evidence I understand to be this, that for the sake of the locality and the coasting trade it is desirable that something should be done for the harbour of Padstow?—Most decidedly.

10,344. (*Capt. Washington.*) Following up the last question put to you, are you aware whether it was the opinion of the last hydrographer of the Admiralty, Sir F. Beaufort, that it is a most desirable harbour to improve?—I know it, because he made a minute, and that minute is published; and I know it also from himself, for he has frequently written to me in that semi-official style which you know, Captain Washington, is the usual mode of communication between the hydrographer and officers under his command, and which is no state secret. He has frequently written to me to this effect:—Dear Sherringham, sooner or later we must consider Padstow, and therefore, however necessary and desirable it may be to have the whole coast of Cornwall surveyed, it is my desire that you point your attention first to Padstow, and furnish me with a chart.

10,345. Was the plan now on the table the result of that desire on the part of Admiral Beaufort?—It was.

10,346. I observed that you laid great stress on a harbour of refuge being placed at the bottom of the bay. Is it your opinion, after years experience, that a harbour of refuge should be placed on a salient point or in the bight of a bay?—I can only repeat the evidence which I gave before the Committee of the House of Commons, that that harbour of refuge is most efficient which can meet the greatest number of casualties; and I understand by a harbour of refuge really that port where a distressed ship that is not able to keep the sea can with the greatest amount of ease run for safety. From that it appears evident that a harbour of refuge cannot be placed at the entrance of a bay, because if a ship once misses, which they will do, as you know as well as I do, after she passes it the run of the bay prevents her from hauling round, and she goes to leeward. The tides are very strong

round the end of a bay. They generally meet there, and run very rapidly, but as the bay opens they tend in, really to take the line of the coast; and therefore a ship not well conditioned is very likely to be brought under the influence of that indraft. If she is under the influence of that indraft, it appears manifest to my mind that she has a greater chance of making the harbour if it is at the bight of the bay than if it is at the point.

10,347. To return to the plan of Padstow Harbour, which was made in 1839, have you any reason to suppose that the Ketch Point has grown to the north, or has extended since that survey was made ?—I am quite satisfied that all those spots undergo changes, and I think that must be the experience of every hydrographic surveyor. There is an instance which has occurred to my mind at Poole. There is what is called a fair-way buoy there, and they are always shifting that buoy. I have known the shoal 100 fathoms inside the buoy. Sometimes it is really desirable to mark every point of shoal; and I have drawn the attention of pilots, and of commissioners of ports, to the fact, that it is most necessary to watch closely the scour of those points where we may conclude the sands are always undergoing change.

10,348. I would ask you further whether you consider it desirable to place a buoy on the Ketch or on the point ?—There can be no second opinion, on the point. The clearer a danger can be defined, the greater is the advantage to the vessels navigating; and whether your buoy stood or not, whether it is washed away, as the buoy here has been, or not, be the cost what it may, I should be very pleased to see those dangerous shoals properly marked. I am thoroughly persuaded that if the buoys laid at Portsmouth were removed, with all their local knowledge not three gentlemen at that table could find their way into Portsmouth Harbour.

10,349. Would you extend the same remark to Liverpool, the Thames, and all channels where it is necessary to lay many buoys to mark out the shoals ?—Under certain circumstances, in those channels where there are a number of steamers travelling there across the banks, it becomes a question whether you have greater advantage than disadvantage in buoying the channel; whether the advantage overrules the danger of steamers fouling, but as a general rule I should say, mark your channel.

10,350. You anticipate that these guiding walls would give a greater scour ?—Most assuredly. I do not think there can be a second opinion on the point.

10,351. Is there a large amount of back water in the harbour ?—A very large amount.

10,352. And applicable for scouring ?—As you have stated, there are 33 millions of cubic yards of tide passing in and out at every spring tide.

10,353. What is the rate of the ebb ? Have you measured it ?—Yes; the strongest tide I could record was $2\frac{3}{4}$ knots an hour.

10,354. Then a large amount of the ebb must escape over the Doom Bar ?—No doubt of it.

10,355. Can you mark the datum on which you took these soundings on the chart ?—You have it in the office. I think it was the stone pier of Mr. Treadwin's yard.

10,356. (*Capt. Sulivan.*) Suppose that from any engineering or other causes the walls could not be erected, do you think that for the passing trade it would be a very valuable improvement if the point were cut down as far as the upper capstan ?—No doubt of it.

10,357. Do you think it would make it so much safer that vessels not very well accustomed to the place would be induced to take it who do not enter it now ?—Yes, I think so.

10,358. Would a vessel be able to fetch up sufficiently to do away with the danger of being thrown on the Ketch ?—Yes; I think she might. There are very few channels wider than this. I know very few wider tidal harbours. Certainly not the Tyne, or the Wear, or any of those rivers. There are very few harbours with that depth and width of available water in the channel.

10,359. Do you know anything of the nature of the bar at Stepper Point ?—No doubt it is sand. It is natural. The moment the stream has got rid of the scour, and the tide slackens, it deposits.

10,360. And the stream meets the swell round the point ?—Yes; it meets a swell round the point.

10,361. If so, would it not silt up again if dredged ?—I have no doubt that nature would resume her work, but I believe it would take time to do it; and I think dredging, a very small operation, if necessary.

10,362. Would you advise that the west bank of the Doom Bar should be more buoyed ?—Yes; the whole channel up.

10,363. Have you any doubt of a buoy standing well inside the Ketch ?—There is no reason why it should not.

10,364. With reference to the depth of the bay, do I understand that observation to Padstow, because of the bight of the bay ?—I mean it generally. The question was put to me generally.

10,365. With reference to Padstow, do you think there is very little difference in the depth of the bays of Padstow and of St. Ives ?—Is not Padstow the centre point between Bude Bay and Cape Cornwall ?

10,366. But Trevose Head outside projects quite as much as the point of St. Ives, does it not ?—It depends on the way you draw your line.

10,367. Take your line from Hartland Point to the Three Stone Ore Point ?—But if you take St. Ives you may go into Padstow, for here is the point for St. Ives, and there is the point for Padstow.

10,368. Do I understand you to say that you consider Padstow to be in the depth of the bay ?—I do. Whether it is a deep bay or not is another question.

10,369. Suppose a breakwater at St. Ives projected south-east from the head, would there be any difficulty in vessels taking it in north-west and north gales ?—That is a question very difficult to answer. I believe there are no north-west gales which would bring a vessel home to the entrance of your harbour. I know nothing about the plan of St. Ives, because I did not see it. Show me the plan, and I will give you the best opinion I can on the effect. But I see no plan; and I would rather not enter into the discussion of a plan which I really do not know.

10,370. (*Mr. Coode.*) I know you take great interest in all that concerns the surveying service. Perhaps you will tell us whether you have seen a chart made prior to yours ?—Yes; by the late Lewis Morris; and surveys by W. Mackenzie.

10,371. What is the date of Mr. Morris's chart ?—I think it is 1786.

10,372. Do you consider him an accurate surveyor ?—I cannot say that he was an accurate surveyor. No; I should say decidedly not. I happened to go over the ground where there were no alterations, and I did not find him accurate. But I think the chart was very creditable for the means he had and the state the science was in at the time.

10,373. Did you find any material difference in the Doom Bar as laid down in your survey and in his chart ?—Not in the contour, but he did not show the depth over it. Although the figures do not appear, I sounded the Doom Bar with the same accuracy precisely that I did the channel.

10,374. Do I rightly understand from you that there is no material difference ?—I think not. You have the channel in the same place.

10,375. The idea of the removal of Stepper Point originated with you. Did you suggest the extent to which it should be carried ?—Yes; I marked it on this plan.

10,376. It was your own plan ?—Yes; you have my section.

10,377. Did you determine by the experience of others where the baffling winds ceased ?—I took the

PADSTOW.

Capt. W. L. Sherringham, R.N.

28 Sept. 1858.

Mr. Coode.

opinion of every person of local experience, as I was bound to do when I drew the section. The longitudinal section of Stepper Point does not carry cutting further in, because I thought that would place ships pretty nearly in safety. But I quite own the great advantage of taking it further in. I think it would be a great improvement.

10,378. You speak both from your own experience and from that of pilots and others whom you know ?—Every opinion I gathered; but having so frequently run in myself in small vessels, and under circumstances of heavy gales, I can speak of my own knowledge. I have heard the evidence, and it is quite true that running in in a heavy gale of wind in a heavy sea breaking over the Doom Bar there is some danger. The difficulty they talk of arises from a danger of nervousness preventing masters of ships from approaching the rocks off Stepper Point sufficiently near. But I am persuaded that if you have sufficient nerve to scrape those rocks, you may get considerably further up. These people do not do it; in fact they give Stepper Point the berth which they ought to hug, and they get into danger.

10,379. If that is the case, do you not think instructions should be laid down in all the public charts ?—Yes ; it is in the directions.

10,380. But do you not think that many men consult a chart who will not turn to directions ?—I am really afraid that, lay down what rule or law you will, most men will be guided by circumstances in running in, and will not stop to consult directions or a chart.

10,381. But as the object is to convey to all these people the information that they should hug the west shore as closely as possible, do not you think it would be better to put it on the face of the chart, so that every man should see what he ought to do ?—That cuts two ways. Exactly in proportion as you hug the rocks, you find the wind baffles you, and so the further off you can keep in safety the better the chance of having a true wind.

10,382. But I thought I understood you to say that you ought to hug so closely as just to scrape the rocks ?—No doubt.

10,383. Then if you ought to hug the rocks so closely as to scrape them, would it not be wise to put that instruction in the chart ?—There can be no doubt that so it is.

10,384. You consider Padstow harbour desirably situated with reference to the bay from Hartland Point to the Land's End ? Should you not think the bay to the east, where the "Mouls Island" is situated, equally well placed, supposing a harbour could be made there at a reasonable cost ?—No, I do not.

10,385. Will you state your objection to that bay ?—I think if a ship is running into a bay of that kind, although you throw out a breakwater, the breakwater will not prevent the run of the race. It may break it, but you will have to run on shore ; and I believe that if you drop your anchor, and she did not at once bring up, there would be nothing for you on an iron-bound coast. Therefore I should say, as a nautical man, that nothing is more dangerous than forming harbours on iron-bound coasts like that as safe places for ships to run for where there is no beach to save them.

10,386. Having heard in evidence that there is capital holding ground there, do you not think it possible to provide sheltered anchorage in Port Quin Bay ?—Suppose the anchor went down foul, what would be the use of good holding ground ? Suppose it did not drop on the peak ? These may be extreme cases, but they are cases in point.

10,387. Suppose a vessel running for Padstow harbour lets go her anchor, and it does not hold, would she go ashore on Gun Point ?—I think she would be quite safe.

10,388. Are there no rocks there ?—It is quite safe. The north-west wind would not drive her upon them.

10,389. With any wind north of north-west ?—I should be sorry to pledge my word to that.

10,390. Are not the rocks there as hard as they are at Port Quin Bay ?—No doubt ; but if she were on the rocks she would be perfectly safe. She would always be lashed alongside.

10,391. Suppose a wind from north-north-west and north, and high water, would a vessel be safe on the Gun Point ?—It is difficult to say if you put a ship on a rock where she will be safe. I do not understand the gist of the question. You ask whether she would be safe on the rocks, and I tell you she probably would.

10,392. Did you ever hear of vessels being lost on Gun Point ?—I never heard of any.

10,393. (*Chairman.*) Were you present during the examination of Horsewell, the Trinity pilot ?—Yes, I was.

10,394. Do you recollect that portion of his evidence which related to the buoy upon the Ketch, in which he stated that from the way in which the sea broke right across numerous strange vessels had mistaken the intention of the buoy, and passed on the wrong side of it ?—Yes.

10,395. Are you disposed to attach any importance to that evidence ?—None whatever ; for if a vessel entering a harbour does not know which side of the bay to go in I do not know what you can do for her. With a chart given, and a buoy laid down, I do not know how they could mistake which side to go. I should take it that pilots would rather have no buoys.

10,396. But aware, as you must be, of the comparative ignorance of some masters of vessels, and perfectly acquainted, as he must be, with the entrance to the port in bad weather, do you attach any importance to that opinion ?—I do not think I do. I heard his evidence, and I think it was very bad evidence ; but as to that particular point I do not attach any importance to it.

10,397. Are you well acquainted with Milford Haven ?—Yes ; but I have not surveyed it.

10,398. Are you acquainted with the land about Milford Haven ?—Yes.

10,399. What opinion have you as to the land ? Is it easy to make in thick weather with the wind from south-west ?—St. Anne's is the only point, and the island of Seakum ; but of course, in thick weather, all land is difficult to make. That land is very frequently capped and clouded ; but I do not think there is any more difficulty there than in any other part of the channel.

10,400. In the evidence which we have received, it has been stated that the land about Milford Haven is particularly difficult to make in thick weather, and that the excellent harbour inside is comparatively useless as a harbour of refuge, in consequence ; will you state what is your opinion ?—I do not think so. I speak with some experience. I surveyed these shoals. Milford Haven is a harbour I have frequently run for, and I never recollect a case in which I had any difficulty in making it. No ; I should say not much importance was to be ascribed to that testimony.

10,401. It was described to us as very difficult to run for ; do you attach any importance to that ?—No, I do not.

10,402. (*Capt. Sulivan.*) Suppose a buoy would stand on the Ketch, would it be a very simple way of guarding the entrance to add on the board—"Keep close round the point inside the buoy" ?—It is done now.

10,403. But it is merely "Keep close inside the point;" would not mistakes be obviated by adding merely "inside the buoy" ?—Do you not think that if you keep close round the point you must keep close round the buoy ?

10,404. Would not that addition obviate any possibility of mistake ?—Every additional notice which you

get on entering a harbour must be of use, whether there would be any particular use in that notice, that vessels were to keep to the west of the buoy, at the same time that they are told to keep close round the point, I do not know; it might be put on the board, but I think the less you give them to read the better.

(*Chairman.*) Is there any person present who wishes to tender further evidence with respect to this inquiry?

No answer.

Sitting at Padstow closed.

BIDEFORD.

Wednesday, 29th September 1858.

PRESENT:

Admiral HOPE (Chairman).

Sir FREDERIC SMITH.
Mr. LINDSAY.
Captain WASHINGTON.
Captain SULIVAN.
Captain VETCH.
Mr. COODE.

Mr. EVANS, Secretary.

Mr. WILLIAM YEO examined.

10,405. (*Chairman.*) In what way are you connected with the port of Bideford?—I am a shipowner and merchant.

10,406. Are you aware of the object of this inquiry?—I presume, to erect a harbour of refuge somewhere on the coast.

10,407. Will you now proceed to offer any statement which you wish to make relative to the subject of this inquiry?—Well, I think it is very desirable that a harbour of refuge, if one is to be made on this coast, should be near Hartland Point, because ships any way disabled or driven in generally keep in the latitude of Lundy Island or Hartland Point; consequently, if there were a harbour of refuge near Hartland Point, ships which were in a disabled state would immediately get into a place of safety.

10,408. Is there any particular site which you are prepared to recommend?—Ships coming up in heavy gales of wind from the south-west and west-south-west, which are the prevalent heavy gales, as soon as they make Hartland Point are round immediately, and the point forms almost a harbour of itself.

10,409. Are you prepared to name any particular part of the coast which you think most eligible?—I should think half a mile below Clovelly, or half way between Clovelly and Hartland Point. I think a pier should be carried off there which would form one point of the harbour.

10,410. Are you aware whether any plans or estimates have been framed for a breakwater at Clovelly?—There have been no estimates gone into, but there have been ideas thrown out as to the place where a breakwater should be constructed. No plans have been drawn up or estimates gone into.

10,411. Were you ever at sea yourself?—I was. I have crossed the western ocean forty-five times as master.

10,412. And for how many years were you at sea?—About 17 years.

10,413. And for how many of those years were you a master?—I was a master from 12 to 14 years.

10,414. What description of vessels did you command; of what size were they?—The last ship I had would carry about 1,000 tons.

10,415. And out of what port did you trade?—From the different ports of the Bristol Channel, and, in fact, from all the ports of the west of England, to America generally.

10,416. Ships outward-bound during the prevalence of westerly winds, that is, in winds from south-west to west-north-west, do they, in working down channel, keep either shore by preference?—They keep the south shore until they get to Hartland Point.

10,417. After they weather Hartland Point do they reach to the westward immediately?—Do you mean to the north-west?

10,418. Yes?—They do. Generally the wind comes south-west, and they cannot weather Hartland Point; they are driven up channel; but by keeping Lundy Island they keep the channel open, and are ready to take advantage of a change of wind.

10,419. And homeward-bound ships, what part of the land do they make?—They generally come in at the parallel of latitude of Lundy Island. They try to make Lundy or Hartland. If the wind is south-west they make the land above Hartland Point a mile or so; if north-west they try to make Lundy Island.

10,420. But always with a north-west wind they try to make Lundy Island; they do not go outside?—They never go on the other side unless they are obliged to go to the north of Lundy Island, but generally they go between Lundy Island and Hartland point.

10,421. Have you ever taken shelter under Lundy in strong south-west or west gales?—Yes; I was there in 1838 for three days; it was blowing very strong. The water is very deep there, and we dragged off considerably.

10,422. What do you call very deep for a ship of 1,000 tons?—We first brought up in fifteen fathoms of water, and then we could just see a glimmer of the light.

10,423. And while you lay in Lundy Roads did the wind back round to the north-west and blow hard?—No; it blew hard from the south-west and west-south-west, and then died away a calm; but all at once it went round to the east. We managed to get our anchors, but a ship which lay alongside of us could not; she went ashore and went to pieces. It was a ship belonging to Shields.

10,424. Then you have an objection to state to Lundy Island as a place of shelter?—Lundy Island is a place of shelter when you are well in; when you are close in you are protected from winds from the south-west round to north-west.

10,425. Did you state that a ship went ashore on Rat Island?—Not Rat Island. She went ashore on Lundy Island.

10,426. Is it a state of things which often happens, ships having a difficulty to get away?—If the wind shifts suddenly so that you cannot get your anchors.

10,427. And as it dies away to the south you cannot fetch out?—If the wind shifts the vessel goes ashore. The tide runs right in on the island.

10,428. You are well acquainted with the Bristol Channel, and the prevailing winds there?—Yes.

10,429. Are these sudden shifts of wind of common occurrence?—Yes. In the winter, very often it blows from the south-west, goes round to the west-south-west, and then flies round to the north-west.

BIDEFORD.

Mr. W. Yeo.

29 Sept. 1858.

Chairman.

10,430. And from the north-west does it die away, and an east wind come in ?—Yes.

10,431. Have ships in an east wind a chance of getting away ?—Not generally; only sometimes. We find that the wind backs round to the south-south-east and south-east, and then you are ashore.

10,432. With the wind south-east, can you get away from Lundy Island easily enough ?—Yes ; you can fetch away.

10,433. Do you know Milford Haven ?—Yes.

10,434. What sort of a place is Milford Haven to make in thick south-west weather ?—It is a very blind place ; it is generally very thick. I was there once with a ship so close in that we caught a glimmer of the light, and we rounded more from chance than from anything else. It blew so very heavily, and the weather was so thick, that we saw nothing until we were alongside the lighthouse. It is a very blind place to make with a wind from the south-west.

10,435. Then you are of opinion that there is a difficulty about the use of Milford Haven as a harbour of refuge, from the difficulty of making out the land ? —There is no doubt great difficulty. In fact a man, unless he knows well where he is, is in great danger in running for Milford.

10,436. Why ?—If you should happen to go a little to the east or the west in your calculations, you get in among swells and islands there. If you are a little to the east, you get embayed round at St. Gowan's Head. Sometimes, in thick dirty weather, you can get no observations, and you are bound to go by the log.

10,437. Do you know Penarth Roads ?—I do.

10,438. What kind of anchorage is that ?—The anchorage is very good in the roads, but it is very narrow for large ships. If a ship drives between Penarth Head and the grounds only a very little, she is ashore on the grounds.

10,439. But is it a place to lie in during any wind or weather, with good ground tackle ?—We do not hear of any damage ; but I myself prefer lying above Penarth Roads.

10,440. Could a harbour of refuge be made in that part of the Bristol Channel, where ships, if so disposed, could run in, drop their anchor, and lay in safety ?—I do not see any place below Penarth Roads. You must go to Penarth or the Holmes.

10,441. The holding ground all over the channel is, I presume, good ?—Not all over the channel ; it is rocky in some parts.

10,442. (*Sir F. Smith.*) Are you of opinion that harbours of refuge in general are necessary ?—Well, I think they are, in localities of this sort, where we have no harbour that a ship can run for from the Land's End to Penarth Roads ; not on the west coast.

10,443. You talk of the locality ; my question was general. Do you think that harbours of refuge are desirable for the navigation of our coasts ?—I think so.

10,444. You think they are needed for ships trading foreign ?—I think it is necessary there should be harbours of refuge in case of need, to prevent wrecks.

10,445. Are you aware that during the last five years an average of 800 souls a year have been lost in vessels along the coast ?—I am aware there are great losses ; I did not know the extent.

10,446. You think it desirable that the nation should do something to prevent that loss of life?—Yes.

10,447. Do you know the Scotch fisheries ?—I never was in the north.

10,448. Do you know anything of the north-east coast of England ?—No. My business has been confined entirely to the west of England.

10,449. Have you sailed foreign from the Severn ? —I have.

10,450. From what port ?—Bristol generally.

10,451. Have you been to America ?—Yes, many times.

10,452. What course would a vessel going from Bristol to America take down channel in favourable weather ?—We keep the south side.

10,453. Why ?—It is more clear of danger.

10,454. But have you not a rocky coast in case of adverse winds ?—Rocky, but bold on the south side. On the north side we have sands.

10,455. Can you favour the Commissioners with your opinion as to the value of St. Ives for a harbour of refuge for outward or inward bound ships ?—I do not see it would be any good to foreign-going ships whatever, because if you could fetch St. Ives the chances are you could fetch round the land, and with winds west-south-west you can fetch out along.

10,456. Supposing the wind at north-west ?—If ships have any offing, they will fetch round the land.

10,457. Do you mean round the Land's End ?—Yes.

10,458. Supposing they wished to take an opposite course ?—If you have an offing, the chances are you will fetch Hartland Point.

10,459. I am talking of outward-bound ships ?— They generally keep the Bristol Channel open.

10,460. Have you ever been into St. Ives Bay ?— Never ; I have been off it.

10,461. You do not know it ?—I think it would be of advantage to coasters.

10,462. What description of coasters do you mean ? —Do you mean vessels bound for Hayle ?—I think a harbour would be an advantage for all vessels, instead of running back to Hartland Point. It would be a means of saving life. There have been several wrecks down there.

10,463. You think that if a harbour were made at St. Ives for coasters, many lives might be saved ?— Yes.

10,464. Do you know Padstow ?—I have ships that go there, but I never was there myself.

10,465. Have you ever conversed with other shipowners about that harbour ?—I have conversed with my own masters with reference to going to Padstow, and I understand it is a place difficult of access.

10,466. If that access could be made more easy, do you think it would be desirable to do so ?—I should think so.

10,467. For the benefit of coasting vessels ?—Yes.

10,468. You mentioned Clovelly ?—Yes; I think the neighbourhood of Hartland Point, as near as you can get it, the proper place to carry off a pier.

10,469. There is no place, is there, in the bay, but Clovelly ?—No.

10,470. Can anything be done to improve Lundy Island as a place of refuge ?—No doubt it can be made a place of refuge ; but the only doubt is whether there is capacity enough for the number of ships which require protection. I have known three or four hundred ships leave Penarth Roads at one time, get thirty or forty miles towards Lundy Island, and all be driven back.

10,471. That makes a good case for a harbour of refuge at Lundy Island, if you can get one, does it not ?—Not a fortnight ago I saw 300 vessels leave Penarth Roads.

10,472. What became of them ?—They had a fair wind, and made their passage.

10,473. If they had had an adverse wind what would they have done ?—Probably they might have got ten or fifteen miles below Lundy Island, and then they would have been driven back to Penarth Roads.

10,474. Would they have hesitated to go to Lundy Island, if it had been capable of receiving them ?— Oh yes.

10,475. Do you doubt the capacity of Lundy Island ? —Yes. The tide sets right in on the island, and there is not sufficient room for a quantity of ships. Very often a great number of ships from all parts stop at Lundy Island. We have had several ships wrecked in this bay ; ships coming from Liverpool, and driven up this channel.

10,476. Then Lundy Island is available ?—Yes.

10,477. Supposing you had the disposal of the public money, and might apply it either to Lundy Island or Clovelly, to which would you give the preference, for the benefit of trade generally ?—I think I should give the preference to Clovelly, because at Clovelly you can form a harbour which will hold a whole fleet going

up this channel, or to the north, and you have a clean bottom of clay, and an anchorage of twelve fathoms into three fathoms off shore.

10,478. And Clovelly is protected from what winds? —West-north-west and west, east-north-east, north-west, and by north.

10,479. Would it be easy to get out of the harbour if it were so constructed as to have two entrances? —Yes.

10,480. You would desire a breakwater with entrances at each end, and not connected with the shore?—I should not go into matters of this kind, because I am not an engineer. I think if a pier were carried off, leaving entrances, you would have large ships go there. If there were only one entrance, and the wind off shore, they would not fetch that part, and would go to leeward.

10,481. In what depth would the pier have to be constructed?—From the race of Hartland Point to Baggy Point ten fathoms of water; at the outside twelve fathoms.

10,482. Have you ever lain in the Mumbles?—I had a ship there ten or twelve weeks since.

10,483. What do you think of the anchorage?—I was on board there myself. She was obliged to lay to until the whole land was open to the west. She was exposed to every wind except north and north-east.

10,484. Is it not a fact that great numbers of vessels anchor there?—A large number bound there anchor there.

10,485. Do you not think a breakwater constructed there as well as at Clovelly would be of use?—I do not think you can construct a harbour at the Mumbles safe for a ship to run for, because there is no great margin afforded.

10,486. Why so?—There are those sands, the Mixons and the Skerweathers, and the tide setting over the whole of these sands.

10,487. In point of fact, in stress of weather, if you were in command of a ship, you would rather take any other course than go to the Mumbles, even if there were a breakwater?—If it were blowing hard, and my ship were in difficulties, I would rather run up channel to Penarth Roads or the Holmes.

10,488. Can anything be done to improve Milford Haven by additional lights?—I do not think lights would do it, because they are obscured.

10,489. It is the foggy weather, then, which makes the difficulty?—Yes. There is no difficulty, if you can see the lights, because there is plenty of water, and it is a splendid harbour.

10,490. (*Mr. Lindsay.*) I think you said that the most dangerous winds are from the south-west, which generally chop round to the north-west, and blow very strong?—Yes.

10,491. And these are the most dangerous winds? —Yes; from south-west to north-west are the most dangerous winds.

10,492. And do the south-west winds very often back round to the north-west and blow very hard?— Yes; and in north-west winds from the Land's End to Hartland Point is a dead lee shore.

10,493. You stated that ships keep the south shore because it is clear?—They keep the south shore to Hartland Point, and then sheer off.

10,494. They do not come down towards Padstow Head?—They go down channel in the parallel of latitude 51°.

10,495. There is a large trade from the coal ports in the Bristol Channel up the English Channel?—There is a large coal trade all round.

10,496. What course do these ships steer?—They go between Lundy Island and the Longships down channel. And after that, they go right down to Longships.

10,497. Then if the wind chops from south-west to north-west these ships are caught on a dead lee shore?—Yes.

10,498. That being the case, and no harbours where they can find shelter between Hartland Point and Longships, would it not be desirable that some place should be constructed where they could find shelter in north-west gales?—Yes; I think it would be desirable for vessels which come down the coast from Hartland Point to the Land's End. These vessels are generally of a small class. If Padstow were made a good harbour, no doubt a great many of these vessels would find refuge there when the wind was at the north and north-west; but large ships always go off in the parallel of latitude 51° due west, and from that a little more south; they never think of keeping into the south coast.

10,499. You have known 300 vessels leave Penarth Roads in one tide. Do you know of any case where those vessels, after they had got out to the chops of the channel, had been obliged to put back?—Frequently I have known it.

10,500. Where did they run for?—Lundy Island or Penarth Roads; and a few that know the place will run to Milford Haven.

10,501. Would they be able to reach Milford Haven in a north-west gale at all?—No; in a north-west gale they are driven back to Penarth Roads.

10,502. Would it not be a great convenience if there were a harbour on the south coast that they could run for in north-west gales?—Yes.

10,503. What point between Hartland Point and the Land's End do you think most desirable as a harbour of refuge for such ships?—I think Padstow, if Padstow could be made available.

10,504. But if it were not easy to make it at all times with safety?—I should say the neighbourhood of Padstow, because it is half way to the Land's End.

10,505. But supposing it could not be made there, at what point would you make it?—St. Ives is a very good bay; but if ships were at all off St. Ives they could fetch round.

10,506. You recommend a harbour of refuge at Clovelly; and at the same time you say that under Hartland Point is already a good harbour during south-west and west winds?—Yes.

10,507. Why do you recommend the construction of a pier; is it to protect it from the north-west?— I think a pier should be carried off to protect it in north-west winds.

10,508. But in north-west winds could vessels not find good anchorage under Lundy Island?—The anchorage is not good under Lundy Island.

10,509. Is not the water smooth there in north-west gales?—If you get very close in you get an anchorage, but not a good anchorage. I have a vessel which lost both cables and anchor. The anchorage is not good; not like the anchorage at Clovelly, which goes out gradually. At Lundy Island it is of a shelvy nature. Very close into the rocks at Lundy Island there is good anchorage, I have been told, but I was never there myself.

10,510. Supposing, for instance, there were only one harbour of refuge to be made between the Land's End on the one side of the Channel and King's Road, and between Milford Haven and Penarth Roads on the other side of the Channel, and supposing it were left with you to decide where the public money should be spent in the construction of that one harbour, and you had to consider not merely the trade of the Bristol Channel but the trade of England generally, the trade frequenting the Irish Channel going to Liverpool and bound round the Land's End, and all the trade bound south,—taking all these points into consideration, at what place do you think the construction of a harbour of refuge would do most to save life and property? —I should say that harbour should be made near Hartland Point. I would say Lundy Island, if it were at all capable, as Hartland Point is, because vessels generally make Lundy Island with the wind at north-west; and if Lundy Island had the capacity which Clovelly has, I would make the harbour there directly; but, as I have stated, there is the tide setting down very fast, which would make a pier very expensive; and there are tremendous gusts off the high land, so that there would be a difficulty in getting into the harbour; and

BIDEFORD.

Mr. W. Yeo.

29 Sept. 1858.

Mr. Lindsay.

likewise for letting go anchors such a bottom is unfit. There is no difficulty, in my opinion, in bearing up to Clovelly Bay. I would carry a pier out at Clovelly, to protect from the north-west, giving an entrance to the north, and another pier in front. Then the whole bay would be a harbour. You would then have a sufficient harbour for all the ships which go into the channel, and a place which any ship could run for in stress of weather, whether disabled or not.

10,511. If it were left to yourself you would choose somewhere in the neighbourhood of Hartland Point ?—I would.

10,512. But with the wind coming round to the north-east would ships entering a harbour constructed in the way you propose not find a difficulty in getting out ?—You should have an entrance at the west, and then they would fetch out to the east, because you would have a large bay and deep water. You would have three or four miles of a bay.

10,513. But such a plan as you point out would be a very gigantic one, would it not, and a very expensive one too?—The expense would not be near so much as forming a harbour of refuge either at Lundy Island or the Mumbles, because you would not have to carry it such a distance, and it gradually deepens ; for a long way off you would be in 12 fathoms of water.

10,514. (*Capt. Sulivan.*) You said the wind chops very suddenly from the south-west to the north-west ; does it go sometimes round to the north-north-west, and then round to the north ?—Yes.

10,515. Would vessels which took refuge in south-west winds generally want to sail with the wind at north-north-west and north to reach round the land ?—Not with the wind north-north-west. It would be a heavy sea. They would not attempt it before it moderated. They would have the whole west coast under their lee.

10,516. But with the wind at north ?—They would go directly then.

10,517. Would Clovelly Bay be dead to leeward with north winds ?—Yes.

10,518. And that is a wind they would want to sail with ?—They would fetch out of the passage.

10,519. But supposing it were blowing hard ?—A vessel could not get out.

10,520. If a ship were lying at Lundy Island, and the wind dropped round to north-west and north, would it be easy to leave Lundy Island, and reach out to the westward ?—I do not know. They would get out if there were a passage.

10,521. I am speaking now of a wind drawing from south-west to north-west, and round to north, which would be a fair wind to enable a vessel to sail. Would she go easily out of Lundy Island with that wind, and round the point ?—She would get out very easily.

10,522. Much more easily than from a harbour anywhere in Clovelly Bay ?—Yes ; but it is much farther to windward.

10,523. Have you been in the coasting trade much ?—No ; I never was in the coasting trade.

10,524. Never, under any circumstances ?—No ; always to America.

10,525. Do coasting vessels anchor often at Clovelly with south-west winds ?—Yes ; a good many coasting vessels anchor there.

10,526. Do many anchor under Lundy Island ?—Oh yes.

10,527. Which is most used by the coasting trade in south-west winds ?—I really cannot tell you. I think a good deal depends upon the local knowledge of the masters. Those who are acquainted with this bay come into this bay. Parties not acquainted with it go into Lundy Island. All parties knowing the facilities of anchorage at Clovelly come to Clovelly. I know that the Pitt pilots like to stay near Lundy Island, because it is near for boarding ships going up to Bristol, and coasters which do not know the coast well very probably prefer Lundy Island. It depends on the wind. If it is a fine wind they can bear up there. They anchor at both places.

10,528. Do small vessels in south-west winds find shelter in the Mumbles ?—Oh yes, a good many vessels, in the summer time.

10,529. In the summer time only ?—In the winter time they do not like it, as many are lost. In a gale about twelve months ago a great many were lost. It is a very wild place at the Mumbles. It is the worst place we have in the channel, there is no doubt of it.

10,530. Do you consider that when a ship has got above Lundy Island she is comparatively safe ?—Not until she is well up channel. She is not safe until she has got up to Penarth Roads.

10,531. In south-west winds, do ships bring up under the lee of Minehead ?—You cannot bring up there in a heavy gale of wind.

10,532. (*Mr. Coode.*) You spoke of the race of Lundy Island; do you know the rate at which the tide runs there ?—Four or five or five or six knots an hour.

13,533. Is that the rate of the race off Rat Island ?—Yes.

10,534. Do you know the race of the White Horses ?—No; I never was there. I always keep to the south.

10,535. Is there a strong run of tide off Hartland Point ?—Towards the point there is. The shoal rocks send the tide over to Lundy Island.

10,536. At what rate ?—Very fast.

10,537. Is it as strong as at Lundy Island, or stronger ?—About the same. It runs in between the two, comes right against the rocks, and shoots across towards Lundy Island.

10,538. Is there any danger of a ship being drawn into Clovelly Bay by the strong in-draught ?—With the wind north-west at the bottom of the bay there is little tide.

10,539. I spoke of the tide across the outer part of the bay ?—No. When the tide sets strong up, the eddy sets down, so that there is no tide in the bay, in fact, but an eddy tide.

10,540. Have you ever brought up off Clovelly yourself ?—Yes.

10,541. Did you find the holding ground good ?—I have had ships riding off there in very strong breezes.

10,542. Have you seen the material brought up on the anchor off Clovelly ?—Yes.

10,543. What is it ?—Blue clay.

10,544. Are there many fishermen employed at Clovelly ?—A good many.

10,545. Can you tell us how many ?—I cannot.

10,546. Is there frequent loss of life among the fishermen ?—There has been great loss of life among them.

10,547. Have you any facts to state as to the loss of life among the Clovelly fishermen ?—I cannot give you the minute particulars, but I know there have been a great many of them lost.

10,548. (*Chairman.*) You have an extensive acquaintance with shipmasters and shipowners in this part of the world ?—Yes.

10,549. Do you think that their opinion on this subject is pretty much the same as yours ?—I have not had much conversation with them, but I daresay some of them would be very happy to state their opinion. In fact, I had no idea myself that I should have been called before you gentlemen to give anything like evidence, or perhaps I should have been better prepared. None of those present knew until yesterday that anybody was coming here to go into this matter.

10,550. You could not be better prepared, with your long experience ?—We had no time to make any arrangement as to what was going to be done. In fact it appears that no one was here this morning to meet you gentlemen. We were not aware how matters were going. That will prove to you that I have not posted up my evidence, but what I have given is from experience and facts.

10,551. (*Mr. Lindsay.*) I see by the chart that at Hartland Point there is good shelter in west, south, and south-west winds. Going ten miles farther, I find at Lundy Island shelter from north-west winds. Going

across to the Mumbles I find shelter in opposite winds from the east. At Penarth Roads there is good shelter, and up to King's Road. You admit that there is good shelter at all these places. Do you think that any expenditure of public money at any places above Lundy Island, which includes Hartland Point, would to any considerable extent be the means of saving life and property; for these are the main objects which we have in view?—I do not think there would be any great service in saving life above Baggy Point.

10,552. I am speaking above Hartland Point. Do I understand you to say that no expenditure of public money would tend to save life and property?—I do not think it would above Morte Point, because you have got the land alongside.

10,553. I speak of the whole water from Caldy Island to Hartland Point?—I do not think anything is wanted above Morte Point.

10,554. I include Hartland Point?—I think there should be a harbour somewhere below Morte Point.

10,555. For the saving of life and property?—Thousands of lives and millions of property have been lost on or about this coast.

10,556. From your great experience of this locality, can you name any particular case where a harbour at Clovelly would have saved life and property?—There was an American ship went ashore not many months since, called the *Warden*. No doubt she would have been saved.

10,557. Where was she from?—Swansea.

10,558. Where was she bound to?—Portland in America.

10,559. How was the wind?—From the west.

10,560. Where was she lost?—Behind Baggy Point, on the sands.

10,561. How would a harbour at Clovelly have saved her, because, with the wind from the west, she could either have found shelter under Lundy Island or Hartland Point?—No. The wind was in towards the north-west, and when she reached over to the bay she was pretty well in. At Clovelly she reached out again, but was embayed, and struck; whereas if there had been a harbour at Clovelly she could have got in.

10,562. Did the ship become a total wreck?—Yes.

10,563. And were all hands lost?—No; the master and one or two more were saved; but with these exceptions all hands were lost.

10,564. Do you recollect any other instance in which a harbour at Clovelly would have saved life and property?—There are many instances.

10,565. Do you recollect any others at this minute?—We had two ships ashore at one time some years since, both from Liverpool.

10,566. Can you obtain a return at your convenience of the vessels which have been lost during the last five years, which in your opinion would have been saved if there had been a harbour of refuge at Clovelly, stating the names of the ships, when and where they were lost, and how they were lost, to the best of your knowledge?—I can get the particulars of vessels which have been lost here within the last twenty years.

Well, if you will make out a return with these details, and send it to our secretary, we shall be much obliged to you.

10,567. (*Mr. Coode.*) Do you know the number of lives that were lost when the American ship was wrecked?—No, I do not.

Mr. Joshua Williams examined.

10,568. (*Chairman.*) What is your occupation?—I am a shipowner.

10,569. Have you been at sea?—Yes.

10,570. For what number of years?—Between forty and fifty.

10,571. And for what number of years were you a master or in command of vessels?—For forty years.

10,572. What description of vessels did you chiefly command?—From 100 to 800 tons.

10,573. In the coasting or the foreign trade?—In the foreign trade.

10,574. In what trade were the ships chiefly employed which you commanded?—In the American trade and as transports.

10,575. Sailing out of what port?—Out of this port.

10,576. You are aware of the objects of this inquiry?—Yes; I presume respecting a harbour of refuge.

10,577. Will you state to the Commissioners your opinion as to the advantage or necessity of a harbour of refuge in this part of the Bristol Channel?—I think it would be a very desirable thing, for a great number of lives have been lost in this bay; from two to three hundred lives within my recollection.

10,578. And where would you place it?—I should say Clovelly.

10,579. Will you state to the Commissioners the reasons why you entertain that opinion?—In the first place, it is a very eligible place to make a harbour of refuge in. There is the best anchorage in the world there. You can go three or more miles off and not get more than eleven fathoms of water. You could shoot a marble at low water into three fathoms.

10,580. Do you consider that the most preferable point of the coast at which to place a harbour of refuge?—Yes, I do. When it blows strong from the south-west, after you round Hartland Point you are in the harbour itself. It is smooth water.

10,581. Is it much made use of at present?—Yes; I have been riding there in heavy gales of wind myself.

10,582. From what direction do the north winds blow?—West-south-west and west.

10,583. And if the winds back round to the north-west, what happens then?—I can ride there; there is a roadstead.

10,584. Do you know Milford Haven?—Yes.

10,585. You heard the evidence of the previous witness; do you agree with it?—It is a very blind harbour; you can see nothing of the harbour when you have come to it.

10,586. Do you know Penarth Roads?—Yes.

10,587. Is there good anchorage there for all vessels?—You must lay a long way out with a large ship. Small ships lay in the road. All the ground is ploughed up, so that you cannot depend on your anchor holding.

10,588. (*Mr. Lindsay.*) Do you concur generally in the evidence given by Mr. Yeo?—Yes.

10,589. Are there no points on which you differ from him?—No. I have been laying many times in Clovelly and many times in Lundy Roads. In Lundy Roads there is no holding ground.

10,590. Is the holding ground bad at Lundy Island?—I know it is, because I have been riding there or driving.

10,591. Is it owing to the great depth of water?—The ground is bad. When you are in 13 fathoms the best anchors will not hold. They drag about a mile, and then you get a sandbank, which is good holding ground, but there is a very heavy sea.

10,592. Is it your opinion that it is unadvisable to spend any of the public money in attempting to make a harbour at Lundy Island?—Yes. Running up with a west or south-west or a west-south-west wind a vessel can never get there. When the wind goes round it would blow the topmast off. I have been there myself when I could not carry a bit of canvas. If you could fetch into the roads it would be very well.

10,593. Looking to the general trade of the country, do you think it advisable to construct a harbour of refuge at St. Ives?—I am not much acquainted with St. Ives. It is very shallow water. It is a shoal bay, and very near the Land's End. Unless there was very heavy weather a ship could fetch round.

10,594. Then you think St. Ives is so near the

BIDEFORD.

Mr. Joshua Williams.

29 Sept. 1858.

Mr. Lindsay.

Land's End that a harbour of refuge there would not be of any great advantage?—A great many ships coming out of Liverpool and the North Channel get into Lundy Roads.

10,595. Do you think a harbour at Padstow would be of any value?—No. Padstow is a very bad harbour to enter, and when you get in you have a blowing wind from the high land. Then there is the Doom Bar. There is no room to wear, and you are right on the angle of it.

10,596. Is there any information you would like to give beyond that stated by Mr. Yeo?—I think he was asked if he had any recollection of vessels being lost on this coast. There was the *Weasel* sloop, commanded by the Hon. Captain Gray. She was lost, and not a soul was saved.

10,597. How long ago was that?—13 years ago. The ship was in the bay; she missed stays, and went ashore.

10,598. How was the wind?—At north-west.

10,599. At what part of the bay did she go ashore?—Off Baggy Rocks.

10,600. Are many ships lost on Baggy Rocks during north-west gales?—Not many. I have seen ships anchor there when the wind was blowing north-east.

10,601. You say that in your time you know that 300 lives have been lost in the bay?—Not many years ago 37 fishermen were lost because they could not get into the pier at Clovelly.

10,602. Were they not able to get over Barnstaple Bar?—No. They made for the pier at Clovelly; it was low water; they were afraid to beach the boats; 37 lives were lost, besides all the boats.

10,603. When you say you have known 300 lives lost in your day, do you mean fishermen or seamen?—Particularly seamen, from wrecks in the bay.

10,604. Is it because ships get embayed, cannot fetch out, and have no place to run for?—Yes. The life-boat has saved a great number of men here.

10,605. (*Capt. Washington.*) When was it that these 37 fishermen were lost?—I think about 20 years ago.

10,606. About 20 years ago?—20 or 22 years ago.

(*Mr. John Dunsford.*)—It occurred in 1822.

10,607. Do you remember it yourself, Mr. Williams?—Yes, I do, perfectly.

10,608. Did it create a great sensation in the neighbourhood?—Yes, it did, for the ship was stationed at Appledore.

10,609. Are you referring to the fishermen or to the loss of the *Weasel*?—To the *Weasel*.

10,610. When the fishermen were lost was anything done towards improving the bay or harbour?—No, nothing was done. The bay belongs to Sir J. H. Williams, and I believe he always opposed making any improvement.

10,611. Improvement of what?—Of the pier.

10,612. Is Clovelly pier dry at low water?—Yes.

10,613. If a vessel is caught in a gale how does she steer?—She must keep out or beach.

10,614. What number of fishing boats belong to Clovelly?—I think from 50 to 60.

10,615. You said that from 200 to 300 lives were lost in Barnstaple Bay, within your recollection?—Yes.

10,616. Within your own recollection?—Yes.

10,617. Is there any return of these wrecks to be found anywhere?—Yes; in the National Lifeboat Institution.

10,618. Are there any lifeboats stationed in the bay?—There are three.

10,619. How long have lifeboats been stationed here?—I should think we have had lifeboats here for the last 40 years.

10,620. Have they been the means of saving life?—Yes, a great number. I have taken out 40 men.

10,621. You have saved 40 yourself?—Yes; in the lifeboat.

10,622. You yourself have been personally present at the saving of 40 lives?—Yes; perhaps one or two more or less.

10,623. I hope you have received a medal or some other acknowledgment?—Yes; two or three medals.

10,624. Are the lifeboats in good order?—Yes.

10,625. And there are the means of launching them?—Yes; everything complete.

10,626. You have said the *Weasel* was lost off Baggy Point?—Yes.

10,627. Any merchant vessel?—Yes; an American vessel was lost there not many months ago.

10,628. Any others?—Yes, a good many.

10,629. If a breakwater were placed in Morte Bay, would it be the means of saving life?—Yes. There is Baggy Wall dry at spring tides, and half a mile across the point.

10,630. Do you mean that a breakwater at the point or at Clovelly would be the means of saving life?—Yes.

10,631. Which?—At Clovelly. If I had the building of one, that is the locality I should fix upon to build it.

10,632. Rather than at Morte Bay?—Oh yes.

10,633. Why?—There is a great deal more sea there than at Clovelly, and a farther run up the channel.

10,634. Mort Bay is not naturally so well sheltered as Clovelly?—No; nothing like it.

10,635. Are you acquainted with the coast of South Wales?—Yes; from there up to Penarth Roads.

10,636. Do you know whether Caldy Road affords any place for shelter?—Vessels frequently bring up at Caldy, but there is little room and not much water.

10,637. Have you often been at Swansea?—Yes.

10,638. Have you ever seen many vessels lying in the Mumbles?—Yes; small vessels.

10,639. State what number?—I have seen 300 sail in among the flats at a time, during the prevalence of west winds in winter, which is frequently the case; but large vessels have to keep the west land open, and then they strike at low water.

10,640. Would it be an advantage to large ships to have shelter outside them?—Yes; but there are not the means of making the Mumbles fit for large vessels. It is shallow water.

10,641. Have you frequently seen as many as 300 vessels anchored in Swansea Bay?—Yes.

10,642. Then in fact vessels do go there continually?—All vessels from ports further up try to get down to the Mumbles.

10,643. Do you know if there is any other bay in the Bristol Channel where you have seen so many vessels?—Yes; I should say Penarth Roads.

10,644. Is Penarth Road entirely sheltered by the outlying roads?—Penarth is sheltered from west winds.

10,645. Do you think it advisable to place a breakwater anywhere to improve Penarth Road?—I do not think it would be much improvement to it as it is.

10,646. Is it necessary towards saving life or property?—No; I should say not. When you get up there you are safe.

10,647. When you get up there you reckon your ship in safety?—Much more so there than off Lundy Island.

10,648. Have no wrecks occurred in Penarth Road?—I have known ships go ashore, and I have seen many at flood tide strike heavily.

10,649. Of the 300 vessels you have seen lying in Swansea Bay, did any sustain damage?—Yes; small vessels only lay on the flats, and they strike and sink.

10,650. Is there much loss of property?—There is the cost of repairing, but I never heard of one totally lost.

10,651. Do you think a detached breakwater placed outside the Mumbles Head so as to shelter both coasters and foreign ships would be a great advantage to the trade in the Bristol Channel?—It would be some advantage.

BIDEFORD.

Mr. Joshua Williams.

29 Sept. 1858.

10,652. Only some advantage ?—I do not think it would be a great advantage.

10,653. Will you point out any spot in the Bristol Channel where it would be of more advantage ?—Yes ; at Oxwich Bay, that is, between Worms Head and the Mumbles.

10,654. What number of vessels have you seen anchored there at one time ?—I have seen 30 there at a time.

10,655. Do you think 30 vessels more deserving of consideration than 300 ?—No ; but if there was a breakwater there it would draw more vessels.

10,656. Is there any large trading place or town connected with Oxwich Bay ?—No, none at all.

10,657. Is it not more likely that vessels would go to a place where there is great traffic ?—Yes ; but coasters frequently bring up in Oxwich Bay, but not in the winter time. Only in the summer months they bring up there rather than go back to the Mumbles.

10,658. (*Capt. Sulivan*) Will you explain where this bay is ?—Between Worms Head and the Mumbles.

10,659. Is the anchorage in Oxwich Bay good ?—Yes.

10,660. Is it as well protected as the Mumbles ?—No.

10,661. Has it deeper water ?—Very little deeper. Perhaps there is three fathoms.

10,662. Is the holding ground good in Oxwich Bay? —Very good.

10,663. Have you anchored in both places ?—Yes.

10,664. From what you know of the two places, which do you think would be preferred if a breakwater were placed in the Mumbles and in Oxwich Bay ?—I think Oxwich, if the breakwater were carried out to a sufficient length.

10,665. Would a breakwater there of the same length as at the Mumbles make a better anchorage than at the Mumbles ?—Yes, I think it would.

10,666. (*Mr. Coode.*) Can you tell us the number of lives which were lost when the *Weasel* was wrecked ? —I think it was 130.

10,667. Are not three lifeboats an unusual number to have between Hartland Point and Morte Point ?—No.

10,668. How many life boats are there between Hartland Point and Morte Point ?—Three.

10,669. And the distance is about, what ?—About 20 miles.

10,670. Do you know any other part of the coast where we shall find three lifeboats within a space of 15 miles ?—No.

10,671. Nowhere we can find so many ?—We have got three. One is a large one in case of an emigrant ship coming ashore. The other two are for common purposes. The smaller are the better.

10,672. Do you know the reason why so many lifeboats are placed at this particular point of the coast ? —If a ship came ashore on the South Burrows the lifeboat could not get over from the north side ; if on the north side, the boat would not be able to get over from the south.

10,673. You account for the number of lifeboats by the difficulty of getting across the channel at the bar ?—Yes.

10,674. You were questioned with reference to a harbour in the vicinity of a town ; should you think a harbour of refuge better because it happened to be near a trading town ?—No.

10,675. It makes no difference, in your opinion ?— No. The object is to get a ship in safety ; to save life and property.

Mr. JOHN DUNSFORD examined.

Mr. John Dunsford.

10,676. (*Chairman.*) What is your occupation ?—I am a master mariner.

10,677. How long have you been at sea ?—Nearly 50 years.

10,678. And for what number of those years have you been in command of ships ?—About 38 years.

10,679. And what ships have you chiefly commanded ?—I have been in the foreign trade and the coasting trade ; the Mediterranean generally.

10,680. What sized vessels have you commanded ? —About 200 tons.

10,681. Sailing out of the Bristol Channel ?—Yes.

10,682. Outward-bound, how do you make the passage down with the wind westerly ?—We generally keep round to the south side.

10,683. And after passing Lundy Island you take your departure ?—It all depends upon the wind. We generally steer west with a fair wind, or reach to the north if we have a head wind.

10,684. And with the wind right up the channel below Lundy Island you do not think of working along the south shore, I suppose ?—No ; we work away, and we take the ship according to how the wind is.

10,685. You are aware of the objects of this inquiry ?—Yes.

10,686. Will you state to the Commissioners any opinion which you entertain upon the subject ?— I believe Clovelly Road one of the best places in the channel for a harbour of refuge.

10,687. Give us the reasons why ?—In the most common gales we find that the roadstead has the advantage of a tide always making to the windward, which is a great help for ships getting out of the bay.

10,688. Any other reason ?—That would save a great many lives. I have known many lost in this bay in my time, which would have been saved if there had been a harbour of refuge here.

10,689. Do you know the anchorage under Lundy Island ?—Yes.

10,690. What is it good for ?—The anchorage is not very good. It is all hard ground and deep water. If a ship drives away, and brings her anchor home she is off in deep water immediately.

10,691. In what winds do you find shelter under Lundy Island ?—West-south-west and south-west ; but with the wind north-west, it is right along the island.

10,692. Do you know the Mumbles ?—Yes.

10,693. What is your opinion about the Mumbles ? —It is a very good roadstead for small ships. There is no water there.

10,694. Do you know Penarth Road ?—Yes.

10,695. What is your opinion of Penarth Road ?— Penarth is very good for a small ship that lays in the road, but not for a large ship, because the navigation is very narrow.

10,696. Then is it difficult of access in blowing weather ?—Not at all, with the wind to the west.

10,697. Not from the narrowness of the entrance ? —It may be difficult to strangers, because the entrance is narrow.

10,698. Do you know Milford Haven ?—Yes ; it is a fine harbour.

10,699. Is it difficult to make ?—Yes, in thick weather, because half a point off you get on the Smalls.

10,700. How far down channel do you find good shelter if you are running up in stress of weather ?— Do you mean with the wind to the west ?

10,701. In a strong south-west gale, how far down channel do you find shelter ?—I should go into Clovelly Roads. I can lay there with the wind north-west.

10,702. (*Sir F. Smith.*) From what winds would you be sheltered in Clovelly Bay ?—All the way from south-east round to north-west.

10,703. And from what winds do you wish to be further protected in Clovelly Bay ?—I could not get protected.

10,704. If any protection were required, from what winds would that protection shelter you ; would it be from north-north-west to north and north-east ?— Yes ; if you are bound to the south, and had pro-

BIDEFORD.

Mr. John Dunsford.

29 Sept. 1858.

Sir F. Smith.

tection so as to get to the south in case of a shift of wind.

10,705. You could get to the south in case of a shift of wind?—Yes.

10,706. (*Mr. Lindsay.*) Have you to offer any opinion in regard to St. Ives Bay?—Yes.

10,707. Do you think if a harbour of refuge were formed there it would be the means of saving life and property?—It is a very shallow bay, and I think when ships get down to St. Ives they generally get round the land.

10,708. Therefore you think it not necessary?—No; there is a very good roadstead there as it is.

10,709. Do you think that if a harbour of refuge could be formed at Padstow, which ships could take with safety in heavy gales, it would be the means of saving life and property?—Yes, if it could be made a harbour of refuge. With the wind north-north-west a ship cannot get in. She is taken aback, and she will go on the Doom Bar sand.

10,710. Are many ships lost in that way?—Yes.

10,711. Looking to the great number of places where ships can find shelter in almost every wind above Lundy Island, do you think a harbour of refuge really necessary to save life and property?—Yes.

10,712. You think so?—I do think so.

10,713. Is it not more necessary between Hartland Point and the Land's End?—I should say above Hartland Point; about Clovelly Pier.

10,714. Then you think a harbour of refuge above Hartland Point would tend more to save life and property?—Yes, I do. Many lives are lost in this bay; we have had seven ships ashore at one time.

10,715. (*Capt. Washington.*) I think you said you have been fifty years at sea?—Yes.

10,716. Were you long enough at sea to have sailed during the last French war?—Yes; in the transport service.

10,717. Did you sail under convoy?—Yes.

10,718. Where did the convoys collect chiefly?—At Portsmouth.

10,719. But where did the West India ships from Bristol, Gloucester, and all the ports in the Bristol Channel collect?—Above, in the King's Road. We used to have a brig of war stationed there then.

10,720. Did any privateer come up the Bristol Channel?—I think there was one.

10,721. Did privateers go to Bideford Bay?—I don't think they would venture there.

10,722. In the event of another war, do you think there would be privateers in the Bristol Channel?—I should think there would.

10,723. Do you think the trade of the Bristol Channel would want protection?—It would want it here.

10,724. Where would you station vessels to protect the trade against privateers?—The Mumbles is one place; something ought to be done there.

10,725. Where else?—Penarth.

10,726. Where else?—The Holmes.

10,727. Where would be a good point for vessels to assemble sailing under convoy?—At King's Road.

10,728. Not lower down?—No. I do not know of any harbour suited for men-of-war.

10,729. You say not lower down, because there is no harbour at present where ships of war could lie?—Yes.

10,730. But supposing deep water harbours to be made,—one or two of them,—where would be the best place for the collection of convoys to protect the trade of the Bristol Channel?—At Clovelly.

10,731. Are you acquainted with the north shore of the Bristol Channel?—Yes.

10,732. Are you acquainted with Penarth Road?—Yes.

10,733. Is the shelter available there?—Yes; very good for small ships.

10,734. What number have you seen in Penarth Road?—I should think I have seen three hundred vessels there.

10,735. Are you acquainted with Swansea Bay?—Yes.

10,736. What number of vessels have you seen in Swansea Bay at one time?—I have seen a very large fleet there.

10,737. Coasters or foreign vessels?—Coasters.

10,738. Is there no trade from Cobrador to Swansea?—Yes, a very great trade.

10,739. Where do these ships lie?—Off in the channel.

10,740. Is there no protection for them?—No; not until they are lightened.

10,741. Then do ships go there constantly?—Yes.

17,742. And are obliged to be lightened before they get sheltered?—Yes.

10,743. Is the value of these vessels sufficient to make it worth while to give them a breakwater?—Certainly it is.

10,744. Supposing a detached breakwater were placed at Mumbles Head, to protect all vessels lying there, would it be worth while?—I think it would be paltry, because the harbour is surrounded by shoals. There are the Mixons, the Skerweather, and the Greenground in Swansea Bay.

10,745. The Mixons are immediately at the back?—Yes.

10,746. They could be of course washed by a breakwater?—I suppose so.

10,747. Do you know the nature of the Greenground?—Sand.

10,748. Do you know the distance from the Skerweather to Mumbles Head?—About three miles.

10,749. You understand a chart perfectly well?—Yes.

10,750. Taking that chart in your hand, will you measure the distance from Mumbles Head to the nearest point of the Skerweather Sand?—It is five miles, I expect.

10,751. It is seven and a half miles on that chart?—I did not know it was so much.

10,752. How does the most westerly part of the Skerweather Sand bear to Mumbles Head?—South.

10,753. For vessels bearing up in south-west gales for a harbour of refuge under the Mumbles, what would be the course in?—About north-east.

10,754. Then would the Skerweather Sand be at all in their way?—If they fell to leeward of the harbour it would.

10,755. If they fell seven miles to leeward it would?—Certainly.

10,756. Do you know Milford Haven?—It is one of the finest harbours in England.

10,757. There is no difficulty in taking it?—No.

10,758. You heard the last witness mention Oxwich Bay?—Yes.

10,759. What is your opinion of it?—It is a fine bay, better than the Mumbles, because there is deeper water there.

10,760. Have you ever anchored there?—Many times. There is a good deal of trade from this place to Oxwich for limestone.

10,761. Is it a convenient place?—Yes, in summer time.

10,762. Would it be a great accommodation to all vessels about Bideford to have shelter there?—Yes, it would.

10,763. (*Capt. Sulivan.*) Have you much trade from Bideford to Swansea for coals?—We go to Newport generally to get coals.

10,764. Have you as much trade to Swansea as to Oxwich?—They are small craft generally of 60 to 80 tons which go to Oxwich.

10,765. Have you as much tonnage to Swansea as to Oxwich? To which have you most trade from this port?—Oxwich Bay.

10,766. Which would you rather run for, as far as the outside dangers are concerned?—When I run, I generally run for Oxwich Point, and make the west land.

10,767. Then is it much safer to run for Oxwich direct than for the Mumbles?—Yes; because there are no dangers.

10,768. Is the land well marked?—Yes; it is a fine point.

10,769. And there are no outlying dangers?—No, none.

10,770. Would you have the same shelter from south-west winds and as much depth of water in Oxwich Bay as at the Mumbles?—A great deal more water; there are three fathoms at low water at Oxwich Bay.

10,771. Have vessels ever anchored in Oxwich Bay?—Merely to stop a tide; small vessels.

10,772. Is there any shelter under Oxwich Sands?—No.

10,773. You say you would rather have a harbour in Barnstaple Bay than round to the westward at Hartland?—Yes, I would.

10,774. If vessels belonging to the coasting trade, bearing round Hartland Point to the Land's End, are caught in heavy gales and on a lee shore, would it be safe for them to try to get back to Barnstaple Bay?—They would try to fetch up, but the danger is they get embayed in this bay, and so are lost.

10,775. In north-west gales could coasters depend upon weathering Hartland Point if they once got round?—If they could carry canvas.

10,776. Is it not a dead lee shore?—They would not fetch up any more than down.

10,777. Then for vessels in the coasting trade down round Hartland Point would it be of any use whatever?—No.

10,778. Do you know any other spot west of Hartland Point which you would recommend for a harbour of refuge for the coasting trade bound round the land?—No, I do not know of any.

10,779. Many vessels bound round the land are prevented rounding, and obliged to bear up in west or south-west gales, are they not?—Yes; I have known vessels bear up and get near Penarth.

10,780. Would they be protected if there were a harbour at St. Ives?—Yes, I suppose they would, if there were a breakwater there.

10,781. With the usual shift of the wind from the south-west to north-west and round to north, would vessels easily get out beyond the breakwater?—Yes, if they could carry canvas, because they would have the weather tide.

10,782. Supposing it were necessary to bear up, would you prefer a harbour at Clovelly, or above, or on a line with Lundy Island seeing that in south gales the shift of wind at Clovelly brings you on a lee shore, or a north wind calms off a weather shore, and is not a fair wind to sail?—I should prefer down at Clovelly.

10,783. (*Capt. Vetch.*) Considering the great amount of trade from Bristol going down to the Land's End, where do you consider in time of war a ship would be best stationed for the protection of that trade?—At Clovelly Roads.

10,784. Then any number of privateers might come up as far as Clovelly without molestation?—Yes.

10,785. (*Mr. Coode.*) You referred to one occasion when seven vessels were ashore in Clovelly Bay?—No; in our bay.

10,786. What bay?—Barnstaple Bay.

10,787. When did that happen?—In 1848, I think.

10,788. Were many lives lost?—Yes.

10,789. Do you recollect how many?—I recollect two French vessels were lost, and all hands perished.

10,790. Do you recollect how many lives were lost altogether on that occasion?—I should say 20 or more.

10,791. Were you in this locality at that time?—Yes.

10,792. Would those lives have been saved by a harbour at Clovelly?—Yes.

10,793. All of them?—Of course. The *Weasel* was caught in a gale of wind from the north-west; she endeavoured to weather Baggy Point, but missed stays and came ashore.

10,794. (*Capt. Sulivan.*) Are you aware that vessels coming up channel steering to the east are often driven to the south of their reckoning by the compasses being out?—Yes; that is the way so many vessels are lost in this bay.

10,795. Then vessels so situated in thick weather bearing between Hartland Point and Lundy Point find themselves suddenly on shore?—Yes, with bad steering. They do not consider that the ebb tide coming down takes them on the weather bow.

10,796. Are they often south of their reckoning?—They generally are south of their reckoning.

10,797. And do not see the lights of Lundy Island or by day make Lundy Island, owing to the thick weather?—Yes.

10,798. So they find themselves close in upon the shore?—Yes; they get embayed.

10,799. Would any harbour at Clovelly save one of these ships so embayed?—Yes.

10,800. Then off between Barnstaple Bay and Morte Bay they could fetch Clovelly?—Not off Morte Bay.

10,801. They could off Barnstaple Bay?—Yes; there is plenty of room to reach to the westward.

10,802. With west gales?—Yes.

10,803. Would they clear better to the north or fetch back to Clovelly?—With the wind north-north-west?

10,804. No; west?—They would haul to the wind, and endeavour to get out if they could.

10,805. But would they have more chance of weathering Morte Bay than of getting back to Clovelly?—They would not be able to weather Morte Point at all.

10,806. In thick weather and south-west gales would they not pass Lundy Island without seeing it in the night or by day?—I should think not, in fair weather.

10,807. (*Chairman.*) I think in the previous part of your evidence you stated that Milford Haven was a good harbour to take?—Yes; in clear weather.

10,808. What do you say to it in thick weather?—If it were thick I should not like to run for it.

10,809. You heard the evidence of the previous witnesses with respect to Milford Haven?—Yes.

10,810. Do you entirely concur with their evidence in that respect?—Yes.

Captain RICHARD YEO examined.

10,811. (*Chairman.*) What is your occupation?—I am the quay master of Bideford, or the harbour-master.

10,812. How long have you been connected with the port of Bideford?—This is my second year as quay master, but I have been master mariner for a number of years. I have been at sea 50 years and odd.

10,813. For what number of years have you commanded vessels?—Thirty years or more; 30 or 40 years in the coasting trade.

10,814. To what places have the vessels which you have commanded chiefly traded?—To the different ports in Ireland, Wales, and London.

10,815. Generally sailing out of the Bristol Channel?—Yes.

10,816. You have heard the evidence of the previous witnesses; do you agree generally with all that you have heard?—Yes.

10,817. Are there any points upon which you are disposed to differ from the witnesses whom we have had before us?—No.

10,818. Is there anything additional that you wish to offer of your own?—No; I cannot say there is anything. I should just go in the same way as they have.

10,819. (*Mr. Lindsay.*) You say you have been master of a ship, and employed in the London trade?—Yes.

10,820. Have you ever known vessels get down almost to the Land's End and be obliged to put back?—Yes; many times.

10,821. A great many times you have known ves-

BIDEFORD.

Captain Richard Yeo.

29 Sept. 1858.

Mr. Lindsay.

sels get down to Cape Cornwall and be obliged to put back ?—Yes.

10,822. Would a harbour be of advantage about St Ives Bay ?—Yes, for vessels which get down as far as that; but, generally, vessels coming down from Penarth with south-east winds come down fair until between Hartland Point and Lundy. They might get down with south-east winds, but with the wind south-west or south-south-west, blowing hard, they are obliged to bear up.

10,823. Have you ever anchored in St. Ives Bay ?—I have.

10,824. Is there not good anchorage in south-west winds sheltered from the land ?—Yes.

10,825. If there were a breakwater to shelter the bay from north and north-west winds, would it save life and property ?—That I cannot say ; but it would be a very fine thing to have a breakwater.

10,826. Supposing there were to be but one harbour, would you have it above Hartland Point or between Hartland Point and the Land's End ? At what place do you think it would do most good ?—From the experience which I have had we generally steer to Hartland Point, where we bring up in thick weather.

10,827. Then do I understand you to be of opinion that a harbour near Clovelly would be of more service than one farther down ?—Yes. There has been a great increase of shipping since I went to sea. Cardiff and Newport, and the ports in the Bristol Channel, have opened up a great trade.

10,828. At what part of the bay do most of the vessels work to the east ?—About Morte Bay.

10,829. So that during north-west winds they get embayed ?—Vessels get caught in the bay in north winds. Persons not acquainted with Barnstaple Bay get ashore either at Baggy Point or Morte Point, or some other place.

10,830. If a harbour were made at Clovelly they could not fetch into that harbour in north-west gales, could they ?—Oh, yes. If there was a place of refuge made at Clovelly you could go in at any time. When ships bear up and make for Hartland Point they get smooth water from 17 to 18 points off.

10,831. Then there is very good anchorage in Clovelly Bay at present ?—Yes, fine anchorage ; it could not be better.

10,832. If you have good shelter as it is, why do you recommend an expenditure upon it to make a harbour at all ?—It is not safe when the wind comes on from the north and north-north-east.

10,833. Would not vessels find good anchorage at Morte Bay in north-east winds ?—No ; the strength of the tide is very great in Morte Bay.

10,834. Is the tide stronger in Morte Bay than at Clovelly ?—No ; but there is a heavy ground western swell in Morte Bay ; vessels would be exposed very much more in Morte Bay than at Clovelly.

10,835. (*Capt. Sulivan.*) If you merely want refuge above Lundy Island would you not rather have such a harbour on the north shore, that when the wind came round you would be to windward, and able to run out with a fair wind, than on the south shore, where you would have to work out off a lee shore ?—I would prefer the south shore. Vessels on the north shore going back to get shelter would be running through dangerous sands. There are the Mixons, very dangerous in thick weather, and the operation of the tide is strong just above the Skerweather. If there was a harbour inside Hartland Point it would be an advantage to get in upon a winter's night ; when the wind came fair vessels might make their course. Even in Plymouth Sound they must wait till they get an opportunity ; they cannot get out at all times.

10,836. When the wind is fair, can they not go ?—Oh yes.

10,837. Have you ever anchored at Lundy Island ?—Not many times. I have been always very timid of anchoring at Lundy Island.

10,838. Have you ever been well in under the shore at Lundy Island ?—Yes.

10,839. Is the anchorage better there than out farther ?—I should think it was.

10,840. Have you held on well there ?—Yes.

10,841. If the wind come round to north, would you think that a fair wind to go from under Lundy Island ?—Yes.

10,842. (*Capt. Vetch.*) Do vessels frequently anchor in Morte Bay ?—When the wind is east they have no place.

10,843. Do they anchor there in good numbers ?—Yes, because of the wind off the back.

10,844. I want merely to know the fact, whether vessels in great numbers do or do not anchor in Morte Bay ?—When the wind is east, blowing strong, and they cannot get up the Bristol Channel ; but the ground swell round the head renders it impossible to anchor except with chain cables, and even then they generally part. It is all very well when there is no ground swell.

10,845. (*Mr. Coode.*) You spoke of having known many vessels running back from Cape Cornwall to Penarth Road. You said that as many vessels when caught farther down could not get to St. Ives, a harbour there would not be of much service. Should you not think, if caught off St. Ives, they would incur greater danger in running up than running for St. Ives ?—In the present state of St. Ives pier it is not very easy to make it. If you go into St. Ives, the sea will tear your vessel to pieces, and therefore it is they go higher up for shelter.

10,846. But assuming that proper shelter were given at St. Ives by means of a breakwater, should you not think it better to run there than to bear up for Penarth Road ?—I should certainly then.

10,847. Do you not think that vessels getting as far as Cape Cornwall, and having to bear up for Penarth, would incur greater danger than vessels just below Hartland getting up to Penarth ?—Would not the danger be greater in the one case than in the other ?—If a vessel were down as far as Cape Cornwall, of course she might not come back. Now there is no place of safety, but generally in going up and down we are overtaken by strong west winds, so that we cannot get so far to windward.

10,848. You have spoken of many vessels getting down to Cape Cornwall, and having to bear up ?—Yes, sometimes.

10,849. Do they not encounter a much heavier sea in the lower part of the channel ?—Yes.

10,850. And would there not be greater danger in running back from St. Ives ?—It would take a longer time. As to danger, I would come back to a good place of shelter, and lay comfortably, rather than go into a worse place.

10,851. Would the sea be heavier in the lower part of the channel ?—Yes ; it is a very heavy ground swell.

10,852. (*Capt. Washington.*) You spoke of Baggy Leap ?—I have not mentioned it, but I know the rock.

10,853. Is there anything to mark that ledge ?—People trading to Bideford and Appledore know the mark, but cannot point it out to a stranger.

10,854. Do many vessels anchor in Morte Bay ?—Yes ; in strong east winds.

10,855. Is there any beacon or buoy to mark Baggy Leap ?—No.

10,856. Would it be useful if the ledge were marked by a beacon or a buoy ?—I think that every place that is dangerous should be pointed out ; but there is this disadvantage in too many marks, that strangers would take one for another.

10,857. How far does the ledge extend off the land ?—Do you mean Baggy Leap ?

10,858. Yes ?—I think nearly a mile. I have been up and down many times inside it.

10,859. You do think there is any necessity for a mark on the point ?—No.

Mr. SAMUEL TURNER examined.

10,860. (*Chairman.*) What is your occupation ?—Master of a ship.

10,861. How long have you been at sea ?—Since I was a boy of ten years of age.

10,862. How long have you commanded a ship ?—I took one in 1821.

10,863. What size ?—From 150 to 200 tons.

10,864. In what trade have you been employed ?—In the Mediterranean, and the transport service in the early part of my life.

10,865. You have heard the evidence of the previous witnesses ?—I have.

10,866. Do you generally concur in that evidence ?—I do.

10,867. Is there any point on which you differ from it ?—No ; I cannot say that I differ from it, except as to Hartland Point. Too near Hartland Point would not be a safe place.

10,868. Is there any other point on which you are disposed to differ from the previous witnesses ?—No.

10,869. Is there anything you wish to add to what they have stated ?—No ; I perfectly agree with them.

10,870. (*Sir F. Smith.*) If public money was to be expended with a view to save life, by the formation of a harbour of refuge, would you spend that money rather at Padstow than at St. Ives ?—Neither at the one place nor the other.

10,871. Will you tell us your reasons why ?—Because I consider Padstow is not a safe place for any man to run to.

10,872. Could it not be made safe ?—I have many doubts of that.

10,873. Have you been in there ?—Yes, many times.

10,874. What is the danger ?—The Doom Bar, and the vessel being taken all aback.

10,875. Is that owing to the height of Stepper Point ?—Yes ; and the entrance is very narrow.

10,876. Supposing Stepper Point were lowered to prevent the baffling winds, would not that make it a safe harbour ?—I have my doubts.

10,877. Is not the opening to that harbour as large as the opening to harbours generally ?—No ; it is very narrow.

10,878. What is the width of it ?—I think at low water not more than 70 fathoms.

10,879. Is not that enough to go in with a fair wind ?—It is very scanty to go in with the sea over the Doom Bar.

10,880. Supposing Stepper Point were taken away ?—If it were taken away altogether it would be a narrow entrance then.

10,881. Supposing the outer portion of the Doom Bar sand were to be removed, would that alter your opinion ?—No ; I think two or three vessels have been stranded there.

10,882. Are you quite satisfied that an expenditure of public money would be unwise there ?—Yes.

10,883. Now with regard to St. Ives, do you hold the same opinion ?—I have been to St. Ives many times in a gale of wind.

10,884. Supposing that a breakwater of a mile in length were to be made there, would not that make it an admirable harbour ?—I have been obliged to leave my anchor behind, and run.

10,885. For the general trade, would not a harbour at St. Ives be an admirable harbour ?—I have my doubts. The tide runs very strong there.

10,886. Then your objection is not to its near position to the Land's End ?—Yes ; it is too near.

10,887. At what rate does the tide run at St. Ives ?—Five knots an hour.

10,888. Are you sure it runs more than four knots an hour ?—I am quite sure it does.

10,889. Is there any point along the south coast where you think a harbour could be made with advantage to the trade, for the saving of life and property ?—Nothing, except in this bay.

10,890. Nothing between Lundy Island and Hartland Point ?—There is no place but in this bay.

10,891. Clovelly is a very good harbour ?—It is a very desirable place, but many times I would have given anything in the world for a harbour of refuge to run in.

10,892. Have you any idea of what would be the cost of forming a harbour at Clovelly ?—I remember in my boyhood, I heard of the brethren of the Trinity House come down to Clovelly, and the only objection then to a harbour, or the present pier being enlarged, was on the score of Sir H. Williams, who was afraid the sailors would come on shore and destroy the plantations.

10,893. What is your opinion of Lundy Island ?—I have no opinion of Lundy Island. I have been there in all weathers, calms and storms, and the ground is not good.

10,894. Do you say the ground is not good ?—Close in it may be, but outside it is not good. You get off in 15 or 16 fathoms.

10,895. Do you think a breakwater in Morte Bay would be of any use ?—No, I think not.

10,896. If it were at Clovelly you would consider it would answer all purposes ?—If it were at Clovelly and at the Mumbles as well.

10,897. (*Mr. Coode.*) You said you have been many times at St. Ives in gales of wind ; what took you there ?—I was wind-bound.

10,898. Did you run for shelter, or were you there bound in for Hayle ?—We were trading to Hayle with a cargo of coals.

10,899. Did you ever run for refuge to St. Ives ?—No. I have been close to the Land's End, and obliged to go up channel to the Mumbles.

10,900. Would not you have been glad of a harbour of refuge at St. Ives on that occasion ?—I should have been afraid. The ground is not so good. It is not tough holding ground, but sandy shell.

10,901. Is the sand of any depth ?—I cannot say.

10,902. Did you ever drag your anchor in St. Ives Bay ?—No, never.

10,903. But you said you had been there in gales of wind ?—Yes. I left my anchor once, and had to run.

10,904. Are you able, from your experience, to speak of the holding ground there ?—Yes.

10,905. Is it good or bad ?—It does not hold ; in general I do not think it good.

Mr. JOSEPH COX examined.

10,906. (*Chairman.*) What is your occupation ?—A pilot.

10,907. How long have you been a pilot ?—From 28 to 30 years.

10,908. Where are you licensed for ?—I have no licence. There is no such thing as a licensed pilot in this harbour.

10,909. Have you been present during the course of this inquiry ?—Yes.

10,910. Do you generally concur with the evidence of the previous witnesses ?—Yes.

10,911. Is there any point upon which you are disposed to differ from them ?—No, not any particular point. I do not know much of the coast below Lundy Island. For the last 20 years I have been entirely at home. I am the agent for the Trinity House, keeping buoys, and also superintendent of pilots. As to any part of the bay, Lundy Roads, or any place about, I think I could give you as good an explanation as most people.

10,912. Is there anything you wish to offer to the Commissioners ?—I have seen some of the coasting traders go ashore off Lundy Island, and I have also seen a great many vessels coming up from the Land's End,

BIDEFORD.

Mr. Joseph Cox.

29 Sept. 1858.

Chairman.

coming foreign. Clearing Hartland Point the tide is on the weather bow, and the vessels drop into this bay. That is the way I have known many lost. I knew a ship named the *Ness*, of Bristol, from the West Indies; she was lost here. Another ship, the *Elizabeth*, came from the East Indias; she was lost. There was the *John Lilly*; she was lost in the same position. Another ship, the *Glenallen*, came up and cleared Hartland Point, though she had all gone but the two lower masts; she was lost in the same position. If there had been a harbour of refuge at Clovelly every one of these ships would have been saved and their cargoes. I knew another; the *Edward Albert* of Galway; she was lost in the same position.

10,913. Any more?—Yes. I could tell you of a great many more, if I could remember their names.

10,914. Then if you knew of a great many vessels that have been lost here, perhaps you will furnish a list to our secretary?—Yes, I will do that.

10,915. (*Mr. Lindsay.*) You have stated that a great number of vessels have been lost in this way? How do you make out that a harbour at Clovelly would have saved these vessels?—When they came round Hartland Point they went there before the wind.

10,916. How was the wind?—North-north-west. If they could have tacked up to Baggy they would have fetched Clovelly going back there.

10,917. Was it blowing strong when these ships were lost?—Yes.

10,918. Vessels that had gone ashore where you say would have been inevitably lost, would they not?—They endeavoured to run for the buoy, and went the wrong side.

10,919. Vessels that had got to the east side of the buoy with a north wind, if they had gone about, and stood west, would they not have been saved?—No, they could not have weathered Hartland Point

10,920. Not from the east shore with north winds?—No.

10,921. Did they try?—Yes. They stood for the west. With the next tack they would have got clear; but they bore up, and ran for the bar.

(*Chairman.*) Is there any person present who wishes to tender further evidence with respect to this inquiry?

No answer.

Sitting at Bideford closed.

SWANSEA.

Thursday, 30th September 1858.

PRESENT:

Admiral HOPE (Chairman).

Sir FREDERIC SMITH.
Mr. LINDSAY.
Captain WASHINGTON.
Captain SULIVAN.
Captain VETCH.
Mr. COODE.

Mr. EVANS, Secretary.

Mr. BENSON examined.

SWANSEA.

Mr. Benson.

30 Sept. 1858

10,922. (*Chairman.*) You are chairman of the Harbour Trust?—I am.

10,923. How long have you been connected with the port of Swansea in that capacity?—I think I have been in the Harbour Trust for upwards of 20 years (perhaps 25 years), and for above two (I am going on in my third year) as chairman of the Harbour Trust.

10,924. You are aware of the objects of this inquiry?—Yes.

10,925. Will you now proceed to make any statement which you would wish to bring under the consideration of the Commissioners?—I think it would be better that I should leave nautical points out of my statement, as the Commissioners will get that information much better from other witnesses. The first Act for the Harbour was passed in 1791, and further enlarged powers were given in 1854. I have the last tabular statement of the trade of the harbour up to the last return, which was in Christmas 1857, and by the return you will see that, taking 1851, the foreign trade was 60,000 tons, and the total tonnage 269,000 tons; in 1857 the foreign trade was 262,000 tons, and the total tonnage 537,000 tons; while the income, which was 4,000*l.* a year in 1851, is now about 26,000*l.* a year. The first float was opened in January 1852, and the floating accommodation of Swansea is now 11 acres. During the next year 21 acres of additional accommodation of extent of floating accommodation will be added to the port; also about two miles of river frontage will be made available for the trade. Perhaps I may make this remark, that all the Welsh ports being tidal harbours, the harbour of refuge is most important, because if vessels come to the ports at low water of neap tides they are not able to get in. They want some harbour to lie in until they can run to their respective ports; and I may also add, that, as the north wind would be generally a smooth-water wind, the winds from the south are those that make the heaviest sea, and therefore that a harbour of refuge is more necessary on the north coast than it can be on the south for vessels coming in. I also wish to remark, that no other port is so accessible at all times of the tide as the Mumbles. Its utility has been constantly shown by the number of vessels lying whenever the winds are from the west; and no doubt the number would be amazingly increased, if, by means of a breakwater, there was any protection from easterly winds, because the possibility of the wind veering from east to west and driving vessels ashore prevents vessels from venturing there which otherwise would. I would also remark, that the Mumbles is well lighted; and during the last year the Mumbles light and the Pier light, under the approval of the Trinity Board, were improved and new lights of the modern construction were adopted; and I believe that the Mumbles Lights are sufficient and can be seen as far as they ought to be seen, having reference to other lights at a distance. It will not be out of place to mention that there is telegraphic communication from Swansea to all parts, as well as railway communication to all parts and a cheap market for ships' stores, which is very important for a harbour of refuge, because taking Lundy Island there is only postal communication once a fortnight, and that subject to the state of wind and weather. At Lundy Island also there are no means of procuring provisions, and the Commissioners will be fully aware that with a coasting trade it is unusual to carry any stock; and if vessels are detained, as they often are at the Mumbles, probably most of them would have to return from Lundy Island to other ports to lay in other provisions. I do not know that

there is anything that I should wish to communicate, except that I omitted one point with respect to the trade of Swansea. Referring to the last return, the Commissioners will see that a large proportion of the trade is from copper ore, and to show the value of the trade I can only state that this town imports in copper and silver ore more than a million and a quarter annually. It often happens of silver ore there is 40,000*l.* and sometimes 70,000*l.* worth in one vessel. Perhaps there is nothing more that I have to state, as nautical gentlemen will give evidence, further than that I am requested on the part of the trustees, to state that we have requested the attendance of gentlemen who, from their official situation, are more thoroughly acquainted with the Channel.

10,926. Are you prepared with any detailed plan or estimate for a breakwater at the Mumbles ?—Mr. Abernethy, the engineer of the Harbour Trust, has been authorized to prepare everything which may be thought necessary for the information of the Commissioners.

10,927. I see that he is present ?—He is, and will be called before you.

10,928. (*Sir F. Smith.*) Have you any reason to believe that if a harbour of refuge were formed here the trade of this place would have been greatly increased ?—I do not know that the trade of the Mumbles would be increased by a harbour of refuge, but for the whole Channel it is most important. It is most important for all the ports in the Channel that a harbour should be formed here.

10,929. The great object which the House of Commons had, and upon which this Commission was appointed, was the saving of life ?—Yes.

10,930. Have you any reason to believe that a great amount of life would be saved on this coast if there had been a harbour of refuge at the Mumbles ?—I have every reason to believe so ; but statistical information, stating the number of wrecks and the loss of life, many of which would have been saved if there had been a harbour of refuge, will be handed in.

10,931. Will that statistical return be divided so as to show the number of lives which might have been saved from vessels coming to this port separate from the return of those lives which might have been saved from vessels going to another port ?—I have not seen the return, and therefore cannot answer ; but if that is not included, no doubt it can easily be inserted.

10,932. It is an important element, not only that we should know what lives might have been saved from vessels coming here, but from vessels trading to other ports in the Bristol Channel ?—I may mention that the vessels generally are driven on the mud, and there is not much loss of life. But the saving of life would be in vessels which are lost in the Channel, which if there had been a harbour of refuge would have come to the Mumbles and remained in safety.

10,933. Will you state from what winds you are protected already ?—The Mumbles is protected from west, and north, and south-west winds.

10,934. What further protection do you require ?—From east to south-east, I suppose, but I speak with some diffidence on that point.

10,935. As a merchant, have you, from inquiry that you have made, made up your mind or heard what the weight of evidence is with regard to any port on the south side of the Channel ?—All the evidence that I have seen is in favour of the Mumbles.

10,936. But that is on this side ; I ask with regard to the opposite side—are you aware what is the general opinion of mariners trading here as to what part they should like for a harbour of refuge on the other side of the Channel ?—The general opinion is that there is no port there which would answer, especially on account of the winds generally coming from the south. Therefore, in point of fact, vessels could not make it, if a harbour were there when it was wanted.

Mr. William Lowther examined.

10,937. (*Chairman.*) Are you connected in any way with the port of Swansea or its neighbourhood ?—I am harbour-master at Neath.

10,938. Have you been at sea ?—Yes ; for a great many years.

10,939. For how many years, and also for how many years master of a vessel ?—I have been 35 years at sea ; 27 years master of a ship.

10,940. And what description of ships did you command generally ?—Only two vessels, about 220 tons.

10,941. Were you engaged in the foreign or the coasting trade ?—In the coasting trade.

10,942. Are you well acquainted with the Bristol Channel ?—I am well acquainted with the Bristol Channel.

10,943. Are you aware of the objects of this inquiry ?—I am.

10,944. Will you state to the Commissioners your opinion as to the advantage or necessity of a harbour of refuge being constructed at the Mumbles for the passing trade ?—I consider it would be of very great advantage to have a harbour of refuge at the Mumbles in preference to Lundy Island or Clovelly Bay, the ports which have been named to me.

10,945. And will you state your reasons for entertaining that opinion ?—Well, with regard to Lundy Island no man will deal with Lundy Island. I think Lundy Island will answer its purpose as it is. No ship will come in under Lundy Island and anchor there, having to keep in so close. The draught of water is so great that vessels are scarcely able to keep up when it is blowing hard. I have known ships driven out;—I have been driven out myself. It does very well to keep off and on, but not to anchor there, because with a sudden shift of wind the ships would all be on the shore ; there is such a heavy throw of the sea, and from the deep water, 20 fathoms, the chances are you would never get your anchor, and many vessels have left their anchors behind them.

10,946. Have you any reason to offer why a harbour of refuge should be on this side of the Channel rather than on the other ?—Because you so often reach the Mumbles or Skerwether Sands when you cannot get any further ; and if there were a harbour of refuge at the Mumbles, ships would always keep it rather than run the danger of keeping the sea, and going back to Penarth of a dark night.

10,947. Have you at any time seen a large number of vessels taking refuge at the Mumbles during the prevalence of westerly winds ?—I have known a great many, and a great many have got up their anchors and gone up Channel, because it was so wild a place that ships would not lay to the ground.

10,948. (*Sir F. Smith.*) What course do vessels trading from other parts of the Bristol Channel, bound foreign, generally take ?—If the wind allows them they just come down mid-channel.

10,949. And coming down mid-channel, supposing they get abreast of Padstow, below Lundy Island in fact, would they be likely to run for the Mumbles or for Clovelly Bay ?—Foreign bound ships always keep the sea unless they have a very severe time of it indeed, or get disabled.

10,950. They can take refuge under Lundy Island?—Yes.

10,951. Would they be disposed to go to Swansea ?—Yes, decidedly so; the distance would be so short.

10,952. They would prefer that to going to Clovelly ?—Clovelly is a place you can scarcely get to.

10,953. Supposing there were a harbour of refuge at both places, what would they do ?—You would take the Welsh side ; because, with a fair wind, you

SWANSEA.

Mr. W. Lowther.

30 Sept. 1858.

Sir F. Smith.

could get to sea, but with a sudden change of wind you would get ashore at Clovelly ; it is, in fact, embayed.

10,954. Do you think Clovelly too much embayed ?—It is too much embayed ; it is only one well acquainted with the place and with a small handy craft which will make for it.

10,955. What description of breakwater would you place at the Mumbles ? How far would you extend it ?—I have never given that a thought. I suppose the breakwater would make the place always accessible, so that, if ships could not get into the harbour of Swansea, they would be more sheltered outside until a proper time.

10,956. Do you know St. Ives and Padstow ?—I know them well.

10,957. Supposing it were possible to make as good a harbour at Padstow as at St. Ives, to which would you give the preference ?—Either one or the other would be very good. I think a small outlay of 20,000*l.* would answer the purposes of the coasting trade ; foreign ships would never deal with it.

10,958. You think that the foreign trade does not require a harbour at all ?—No.

10,959. Not even at Swansea ?—No ; but the coasting trade would desire it no doubt.

10,960. And you think that a small outlay at either Padstow or St. Ives would answer the purposes of the coasting trade very well ?—Yes.

10,961. Looking at Padstow, and supposing that 50,000*l.* were placed at your disposal to improve that harbour, how would you apply the money ?—I have never turned my attention to that.

10,962. What is the great objection to Padstow ?—The very narrow entrance between the sandbank and the mainland, and the eddy wind which blows out.

10,963. If the headland were cut down, would that remove the objection of the eddying wind ?—I think you would require to take the flood tide with you.

10,964. There is not the same objection to St. Ives ?—No ; there is plenty of room to make it in at St. Ives.

10,965. What is the holding ground at St. Ives ?—Very good.

10,966. To what wind is it exposed ?—South-west to south-south-east.

10,967. From all other winds it is protected ?—Yes.

10,968. (*Mr. Lindsay.*) Which are the most dangerous winds in this Channel ?—South-south-west and north-north-west.

10,969. Is it the case that the wind often chops round from south-west to north-west suddenly, and blows hard ?—Not so frequently now as formerly. Many years ago it used to do, so but it is not so frequent now. I do not know what is the cause.

10,970. Still it does do so sometimes ?—Yes.

10,971. And therefore that wind becomes a dangerous wind ?—Yes, it does.

10,972. You have good shelter in the Mumbles from the westerly winds ?—Yes.

10,973. And also from a north-west wind ?—Yes.

10,974. So in the prevailing and most dangerous winds no breakwater could improve it ?—It would, because the ships would not lie with the ground, they would lie further out.

10,975. Is a north-west wind out of the bight of the bay ?—Ships going up Channel would take the Mumbles, which do not take it now, because with the wind north-west they would have to lie in on the ground, they cannot lie afloat.

10,976. With a north-west wind blowing off the land, would a breakwater be of any use ?—Yes ; vessels would be safe then with the wind blowing from the north-west. I have often seen sudden changes of wind, and vessels caught there.

10,977. I am speaking of its blowing north-west, and I ask whether any breakwater could improve the protection you already have at the Mumbles from these winds ?—No ; it is perfectly safe.

10,978. Is it open to south-east ?—To south-south-east and east.

10,979. Does a heavy sea tumble into Swansea Bay during these winds ?—There is a great deal of ground sea.

10,980. What is the distance from the opposite shore ?—I should say some 27 miles ; but there are the Skerwether Sands between, which act as a breakwater though they are not sufficient.

10,981. But 27 miles is not very great to raise a heavy sea ?—Half the distance will give a very heavy sea.

10,982. But you say there are the sands which break the sea ?—Which break the sea partially.

10,983. Therefore in Swansea Bay you cannot have a very heavy sea ?—A heavy ground sea is thrown up, which makes ships very unsafe.

10,984. Is it dangerous for ships to lie there ?—Yes.

10,985. Have you known many ships drag their anchors ?—Yes.

10,986. And been lost ?—Become stranded vessels, and full of water.

10,987. During south-east winds ?—During winds from south-east and south.

10,988. Do you think that if a breakwater were formed so as to protect vessels during those winds, there would be many vessels run here, not for convenience but for shelter ?—It is the only shelter they have, and they come here in great numbers. I have had occasion to take shelter at the Mumbles repeatedly ; and hundreds of times I have had to go further up the Channel, and have dreaded the coast of a dark night.

10,989. Is it often the case that there is a great crowd of vessels lying in Penarth Roads ?—A great number. They lie smooth on the mud.

10,990. Does much damage arise to those vessels from the crowded state in which they lie in Penarth Roads ?—Yes, often.

10,991. I presume you would advocate a harbour at the Mumbles, so as to relieve Penarth Roads ?—So as to relieve Penarth from vessels outward-bound ; for the homeward bound it is nothing.

10,992. You think that a great many vessels which lie huddled up together at Penarth, would then come down to the Mumbles ?—They would come down here.

10,993. Because there would be more room, and because they would be nearer to sea ?—Of course they would ; decidedly so.

10,994. I may remind you that the first question to consider in the expenditure of public money is the saving of life first, and of property next. Now, do you really think, speaking as a man of great experience, that a harbour of refuge in this immediate neighbourhood would tend materially to the saving of life ?—It would be the greatest boon that was ever done for the Channel ; no doubt of it.

10,995. You have been 27 years master of a vessel, and consequently you know almost all that has taken place in shipping matters about here. Can you tell me any instance whereby life and property would have been saved if a harbour of refuge had been constructed at the Mumbles ?—This last winter several vessels got full of water and knocked in their sterns, and like that, if they were north-country built ships, they would get full of water and become one mass of wreck. There was a great deal of damage done at the time.

10,996. I more particularly ask you as to the loss of life. Can you tell me any case whereby the breakwater, if it had been made as proposed, would have saved life ?—I have no doubt of it.

10,997. Can you tell me any case ?—If ships are lying in on the ground, the tide flows rapidly, and ebbs rapidly, and the crew can take to the rigging and hold on until the ship gets dry. Our ships are built very strong on purpose to lie in with the ground ; but if they could lie afloat they would be able to proceed on their voyage, which they cannot now.

Many which go out to the Mumbles have to return to Swansea. I have charge of a tug, and I have repeatedly to send the tug off to bring vessels back to Swansea, because they are afraid to lie in the roads.

10,998. That is not an answer to my question. I want to know from your long experience of this coast what lives there would have been saved if there had been a breakwater here?—We do not often lose lives; but we lose ships.

10,999. Do you know any instances of life being lost?—I do not know that I do.

11,000. You do not know of any instances of loss of life in all your experience?—I do not know as to life. My first statement was as to the locality of the ground. Ships which go on shore on long shallow ground where they are soon dry, have means of saving life, when on an iron-bound coast they would be a complete wreck.

11,001. Then you do not lose many lives?—As it is we do not often lose lives.

11,002. Therefore, a breakwater would not tend much to save life?—No; only with regard to property.

11,003. With regard to property, I know that there is an immense traffic from here. Tell me any cases where property would have been saved?—Every ship that gets ashore would be saved provided there were a breakwater. In one winter the weather was bad, and there were a great many vessels came ashore.

11,004. In what winds?—With the wind west and south-south-west vessels often break adrift at the Mumbles, and are taken into Swansea. Many have broken adrift, when, happening to be tide time and having a pilot on board, they have taken Swansea Harbour.

11,005. Do you know anything about a bay which we sailed round this morning, called Oxwich?—I do.

11,006. What sort of anchorage is there at Oxwich:—Not so good as we have here, though deeper water.

11,007. But what is the nature of the ground?—Clay.

11,008. What is the nature of the ground here?—Clay.

11,009. Therefore, the holding ground in Oxwich Bay and Swansea Bay is much the same?—Yes.

11,010. Are there many shoals in Swansea Bay?—There are the Green Grounds.

11,011. What besides?—We do not mind any other shoals except the Blackwater Patch.

11,012. Never mind what you do not mind, I want to know what they are; tell me what shoals you have in Swansea Bay?—The Green Grounds is the shoal which we particularly notice, because of the rise and fall of the water. We do not mind it at neap tides.

11,013. What water is there on the Green Grounds at high water of spring tides?—Seven or eight feet.

11,014. Has any ship been lost on the Green Grounds?—I have never known any lost; I have known them strike.

11,015. There has been no loss of life there?—No; no loss of life.

11,016. What other shoals are there?—The Blackwater Bank.

11,017. What is its position?—To the east of the bay; it would not be in the traffic from the Mumbles Head—it is outside the traffic. The Green Grounds is the only thing in dead low water that we notice.

11,018. Supposing that a breakwater were formed at the Mumbles, I presume you would require it to be carried in an easterly or a south-easterly direction from the Mumbles Head?—I should like to see an opening between the breakwater and the Mumbles Head.

11,019. If there were a breakwater, for what reason would you prefer an opening?—For ships to go through there sometimes.

11,020. But in carrying out a breakwater would it not leave a very narrow passage between the end of the breakwater and these Green Grounds?—Oh no!

11,021. Would it not interfere with navigating the Channel?—Not at all; we have always such accommodation here. If there were no wind, a tug might take a ship to sea if she wished to go.

11,022. What shoals have you in Oxwich Bay?—Only one shoal that I know of, and that is not generally known. I know of it because the revenue cutter struck upon it off the Three Heads.

11,023. What part of the bay?—Far up the bay.

11,024. Out of the way of ships entering?—Yes.

11,025. Oxwich Bay is pretty clear of shoals?—Yes.

11,026. Is it a bolder shore than at the Mumbles?—It is a bolder shore.

11,027. Supposing a pier of half a mile were made? From where?

11,028. I am just giving you an instance. Supposing a breakwater were made of half a mile in length, and put down off the Mumbles Head, or off Oxwich Head, in which bay would you have the greatest area of water of three fathoms and upwards?—I can hardly say; I think there is very little water in Oxwich Bay at three fathoms; I think there is very little room in Oxwich Bay at three fathoms.

11,029. Do I understand you to say that, with a breakwater of half a mile in length, there would be a larger area of water of three fathoms, and clearer ground at the Mumbles than as Oxwich Bay?—There would be much more room.

11,030. More area of three fathoms and upwards?—Much more room considerably; there can be no question of it.

11,031. Would you be surprised, if, upon measurement, you found that that was not so?—I should be surprised, certainly.

11,032. What ports do you say you have traded to?—All the ports in the Bristol Channel.

11,033. From the Land's End?—From the Land's End, upwards; all the ports in the Bristol Channel.

11,034. What course do Swansea ships take?—Between Hartland and Lundy Island west-south-west, until they round the land. If they go the other channel they go west.

11,035. You steer between Hartland and Lundy Island along the south shore?—Yes, keeping a good offing.

11,036. And round the Long Ships?—Yes.

11,037. Is that the course which all ships bound south take?—No, except they are bound foreign. Most vessels steer west-north-west course, so as to get the land from the starboard, and as the wind is, they vary their course a point or two.

11,038. Is it the case, that, by far the larger portion of the trade in the Bristol Channel is in ships going south?—Yes, decidedly.

11,039. Consequently, their course is along the south shore, keeping a good offing?—Yes, west and west-south-west.

11,040. Do you think that a harbour of refuge at St. Ives Bay would be of much value, looking at it in a national point of view, for the saving of life and property, for the facilities of trade, and not considering the Bristol Channel only, but the ships of England and the trade of England?—It would be very desirable indeed.

11,041. Have you known in your experience many ships which have got down to the Chops of the Channel, and had to put back again?—I have, hundreds of times; when if there had been a harbour of refuge at St. Ives the ships could have taken it, but they could not go there because it was bad shelter.

11,042. Then I understand you to say that had there been a harbour of refuge at St. Ives Bay, where vessels could have found shelter in north-west winds, they would have gone there?—Yes.

11,043. Is that the case with many ships?—I have

SWANSEA.

Mr. W. Lowther.

30 Sept. 1858.

Mr. Lindsay.

seen 200 ships at anchor in Widemouth Bay, with the danger of losing their anchors.

11,044. Do many ships put back ?—Yes, a great many.

11,045. Where do they run to ?—To the Mumbles principally.

11,046. Do they not take shelter behind Lundy Island ?—Not in the winter time. Lundy Island is only a stopping place for a tide or two.

11,047. They are afraid of Lundy Island ?—Decidedly ; many times captains, who have run there, get up their anchors and go back to the Mumbles.

11,048. Are they obliged to put back all the way to the Mumbles ?—Yes. I have known vessels to be so far down as Mount's Bay, and yet have to put back.

11,049. Do you think that many ships founder in putting back ?—Many.

11,050. Consequently for want of shelter a great many vessels are lost, and a great deal of property ?—No doubt of it.

11,051. That is your opinion ?—There is no doubt of it.

11,052. From your great experience, treating the matter calmly and impartially, and throwing aside all consideration of Swansea or anywhere else, supposing that the Government were resolved to spend a certain amount of money, and that that money was to be spent only at one place, and to be spent between the limits of the Land's End to the south, and St. David's Head to the north (from Milford Haven to Chepstow on one side and Bristol to the Land's End on the other), and taking into consideration that as it is national money it ought to be spent for the benefit of the nation ; that is, in saving the lives of English seamen, whether they belong to the Bristol Channel or not, and English property, whether belonging to the Bristol Channel or any other ports in this country, at what particular point, supposing there was only one port, would you spend it—at St. Ives, Clovelly, Lundy Island, Swansea, or at what other place ?—That is a very large question to answer.

11,053. It is, and a very important one ; and unless you can answer it conscientiously, I would rather not have you answer ?—I think if a few thousands were laid out at St. Ives it would answer its purpose, and be very desirable to have such a place as that ; and likewise it is very necessary we should have such a place as the Mumbles for another harbour of refuge, where of course a much larger amount of money would be laid out ; but small amounts laid out along the coast would be a great benefit, instead of laying out the whole at one place. I would rather lay out half at the Mumbles and half at St. Ives Bay. It often happens that ships cannot get the length of St. Ives, and are driven back again, when they might get to Padstow, supposing Padstow were accessible, but now they have to drive all up here without perhaps a strip of canvass with the prevalent south-west winds and heavy gales.

11,054. Then, in your opinion, a sum of money such as I have referred to would be better divided amongst more places than one ?—It should be divided certainly.

11,055. And do I understand that you would have it spent at two ports, at St. Ives and at Swansea ?—Yes.

11,056. Supposing, however, the Government did not adopt the views which you hold, and they said the sum was to be spent at one point, at which would you rather spend the whole ?—I can hardly say ; I should look at home, of course. There is a large trade going to Liverpool ; they all come up with the wind north-north-west round the Nash Sands. I know that a month ago there were 300 sail at the Mumbles, principally from Cardiff and Newport, and they had to lie there two or three days, and then went to sea. More than half the trade is round the Land's End and the Bristol Channel.

11,057. You gave us in answer to a previous question that the great bulk of the trade from the Bristol Channel went south ?—There is a large trade going each way, I can hardly say which is the most.

11,058. Do you wish to correct your answer, and now say that you are hardly prepared to say that the larger proportion of the trade is going south ?—Yes. I cannot say which is the larger of the two.

11,059. You said also that vessels caught in westerly gales were obliged to put back, that a great number of ships you believe foundered, and consequently that many lives were lost ?—Yes.

11,060. You gave in reply to another question, that you did not think if a harbour of refuge were constructed at the Mumbles, that it would be the means of saving life ?—Yes, because of the locality, a ship may be lost and the lives saved ; a ship will not break up. The lives get ashore before the flood takes the ship again. That is owing to the position of the bay, and the great rise of the water. The ship will not break up, for she will be dry. When a ship falls on an iron-bound shore, there is no saving life, because she goes to pieces immediately.

11,061. Consequently, above Lundy Island there are facilities for saving life in the great rise of tide, and the sandy beach, which do not exist on the coast between Cape Cornwall and Hartland Point ?—Yes.

11,062. But you are not prepared to answer where, if one harbour of refuge only was to be made, you would have it made ?—I should rather put it in two places decidedly.

11,063. About Clovelly, what is your opinion about Clovelly candidly ; are there many ships which go there to take shelter ?—None whatever, scarcely at any time.

11,064. Are many ships lost in Barnstaple Bay ?—A few.

11,065. But vessels keep the Channel open unless they are bound in ?—I have known vessels bound to Barnstaple come to Swansea Pier and Swansea Dock.

11,066. During westerly winds ?—Yes.

11,067. Do they prefer coming in ?—Yes. I have known a timber ship last winter come in.

11,068. Did she come to seek shelter in a westerly wind ?—She could not get over Bideford Bar, there was so much sea. There is no stopping at Lundy Island with vessels in a winter's night. Clovelly is a place embayed, so that if a breakwater were made few ships would take it.

11,069. Do you think that if there was shelter at Clovelly from north-west winds large ships would take it ?—No large ships would take it. They would rather come up Channel ; they would be so embayed when they were in.

11,070. Lundy Island affords shelter from west and north-west and south-west winds as it is ; but, supposing that a breakwater were put there to protect ships when the wind chopped round to north-east and east, what would be the effect of that ?—I do not think that ships would even take it then.

11,071. You do not think that ships would even take it then ?—No ; because there is very great danger in a vessel bringing up, the water shelves in very close. She must keep smart canvass to shoot in and take occasion to let go an anchor only half a cable's length from the breakwater.

11,072. She would be on the breakwater before she could be brought up ?—There would be much danger of that.

11,073. Then you think a breakwater at Lundy Island would do more injury than good ?—With a breakwater Lundy Island would be much less use than it is at the present time.

11,074. And there is a difficulty in getting away from Lundy Island when the wind is fair ?—Ships cannot get away. Unless they leave their cables and anchors they cannot do it.

11,075. (*Capt. Washington.*) I think you said you are well acquainted with the trade of the Bristol Channel ?—I am with all parts. I may have forgotten a little, any nice point.

11,076. Can you give the Commissioners some

notion of the proportion of trade from the north shore and the south shore ?—There is considerably more trade from the north shore.

11,077. As much as three to one ?—More than that I should think.

11,078. Do you think it would be more than three to one ?—I think it would be more.

11,079. Well, let us suppose that outward-bound vessels are leaving Bristol, Cardiff, and Newport, how far down do they reach in a tide ?—It depends on the wind ; what wind will you have?

11,080. Suppose it were a wind in which a vessel might start ?—Often with a westerly wind, which is a fair wind, she might get as far as the Nash light.

11,081. As far as the Nash light ?—With a light wind. With strong winds she would get further.

11,082. Supposing she were taken back, where would she run for ?—They often go back to Kings Road. If there is not a pilot on board the captain will stand to sea until he has no canvass left. All Bristol ships, however, keep pilots on board until they are clear of Lundy Island ; they are bound to do it.

11,083. What is the greatest number of vessels which you have seen anchored at the Mumbles at any one time ?—A good many times I have seen 200 or 300 sail of vessels there.

11,084. Where you there in September 1856 ?—Yes.

11,085. In that south-east gale did any vessels go ashore in the bay there ?—Yes. I think they did.

11,086. Do you remember the circumstances of 27 vessels going ashore in September 1856 ?—I believe so ; but vessels are often run ashore. If they were not so strongly built they would all get full of water and all become wrecks. I believe you are aware that all ships about here are built strong purposely to bear to lie aground.

11,087. They are built on purpose ?—Yes.

11,088. Is it not the case that if there was a more sheltered place to lie in, that extra strength and extra expense would be unnecessary ?—That is the case certainly.

11,089. Do 200 or 300 vessels lie in the Mumbles exposed to great risk ?—They are, indeed, exposed to great risk. I never allow a vessel of mine to go at all to the Mumbles. I prefer their coming back either into Swansea or back to Neath. I never allow any ship to start to go there. I consider that foreign ships lying there during the winter run more risk than they do in all their passage previous.

11,090. You think that they incur more risk than during the whole of the voyage from South America? —No doubt of it in the winter season.

11,091. Are the ships very valuable ?—They are very valuable.

11,092. Do you know the value of any one of them ?—I know they are worth between 30,000*l.* and 40,000*l.*, ship and cargo.

11,093. Did they ever bring silver ore from South America ?—Yes ; but that is in larger ships.

11,094. What is the value of ships bringing silver ore ?—70,000*l.*

11,095. And for want of shelter these ships are exposed to great risk ?—Yes.

11,096. You have been asked a question about Oxwich Bay. Is it frequented much ?—Very seldom. Reaching in on the latter part of the ebb tide you may stop there until the flood.

11,097. Are there limestone quarries there ?—Yes.

11,098. Do many vessels go there for limestone ?—All along the coast up to Worms Head they go for limestone. In fact, where they ship limestone most is in there within the point.

11,099. If Oxwich Bay afforded good shelter would it not be frequented ?—It would be frequented, but not so much as the Mumbles. I think the Mumbles shelters a great number of ships really bound to the ports of the neighbourhood, to Neath, Port Talbot, Porthcawl, and other places. In the night time ships cannot take their harbours, and are obliged to wait for the day tide ; of course, they will not stop down at Oxwich when they can come and lie off at the Mumbles. Looking at trade, I should think the Mumbles very desirable in preference to any other place.

11,100. It was stated in evidence yesterday before us that nearly 9-10ths of the trade of the Bristol Channel pass through Lundy Race to the south of Lundy Island, and to the south of Hartland Point ?—I should say that no ships bound to Liverpool and the Irish Channel take that course, but only ships bound down Channel, and many ships bound down Channel go between Hartland Point and Lundy Island. A foreigner will go to the north of the island and go down that way.

11,101. Would ships starting from Penarth Roads with a north wind try to hug the weather shore ?—Yes, they would keep close to the shore. If it came on to blow they would run to the north of Lundy Island. Those who are well acquainted with the place would go south of the island, but those not well acquainted with it would go to the north.

11,102. Do you say that there is more trade from Bristol to Liverpool, the Clyde, and so on, than bound south ?—Not from Bristol.

11,103. Well, from the Channel generally ?—Yes, there is a very large trade from the Channel to those parts.

11,104. Taking the whole of the wants of the trade into consideration, where would be the best place for a refuge harbour in the Bristol Channel ?—I believe the Mumbles would be the best place, because it is such a good stopping point. Ships bound upwards always get to their ports in one tide—the flood tide—which is a great advantage in the winter time.

11,105. Have you known vessels between Hartland Point and the Land's End obliged to take refuge ?—Yes, many.

11,106. Where did they run for ?—Padstow or St. Ives. If they cannot take them some run across and take Milford Haven.

11,107. Is Milford Haven a good harbour to take ? —Not with the wind south-south-east. Bell Roads are the best. I have known vessels drive up there, when they thought they could get shelter, but drive considerably to leeward. There is a good deal of wisdom in the maxim that, if a man makes up his mind to run he should run at once.

11,108. Do you think the neighbourhood of the Skerwether Sand any objection to placing a breakwater in Swansea Bay ?—I think not, but I think a light ship would be very serviceable at any time.

11,109. Even in its present state ?—Yes; even at the present time.

11,110. Are not the Nash lights near at hand ?—Yes; but there is great difficulty in making them out.

11,111. Is not the Bristol Channel well buoyed and lighted ?—At the time I knew it there were neither lights nor buoys in it; and we have a great dread in going up Channel, even now, of a dark night. There is a difficulty for strangers not well acquainted with it.

11,112. (*Capt. Sulivan.*) You said that the worst winds in the Mumbles Road were those from south-south-east to west ?—From south-south-east to west-south-west.

11,113. Can vessels of any draught of water, foreign-going, get shelter under the head of the Mumbles now with these winds ?—No.

11,114. From what you know of Oxwich Bay, can vessels of the same draught get shelter within the head of that bay ?—I think not with those winds.

11,115. I am speaking of winds from west-south-west or south-west. Do you know Oxwich Bay ?—I do. I have been at anchor there many times.

11,116. Can you get further in with a deep ship than at the Mumbles ?—You can.

11,117. Therefore, naturally there is more protection under the Head in Oxwich Bay than at the Mumbles in a south-west wind ?—There is no protection to the wind at south-west in either of those bays.

11,118. Can you get in further ?—From south-west

SWANSEA.

Mr. W. Lowther.

30 Sept. 1858.

Capt. Sulivan.

to south-south-west there are two points of the compass different.

11,119. Can you get in further in Oxwich Bay with a deep ship?—Yes, but still it would not be safe.

11,120. Would you then be more safe from the greater protection of the point by anchoring at Oxwich than at the Mumbles?—I do not think you would.

11,121. Would you not be further inside?—You cannot go sufficiently far enough in to get shelter.

11,122. With a ship drawing 16 to 18 feet of water what bearing must she be in at the Mumbles Head?—I believe she must keep the westerly land just open.

11,123. And it is not safe for any foreign-going ships to go further in?—She might at neap tides, but not at spring tides; but the Mixons break the sea more than at Oxwich.

11,124. Then all vessels of that draught of water would require the protection of a breakwater at the Mumbles, extending the whole way outside where they could anchor?—I do not know that they would require a breakwater so very far out as that, because if they got within the breakwater the sea would be smooth. With very high spring tides and with low water they would not injure if they took the ground, if by chance they might take the ground.

11,125. You do not quite understand my question. Take a south-south-west gale or a south-west gale, a ship would require the breakwater between her and the winds. She would be deriving no shelter from the point?—No, not much; but the Mixons are a a kind of breakwater.

11,126. But could she get anywhere under the shelter of the point itself?—No.

11,127. In Oxwich Bay, if the water is deeper and the ship can get in further, can she not be partly sheltered by the point and partly by the breakwater?—Yes, but Oxwich would scarcely accommodate many vessels. You might bring up one or two, and could accommodate them; you could only accommodate very few, because the water deepens all at once.

11,128. Do you know the Outer Grounds?—No, I do not.

11,129. The Outer Grounds in Swansea Bay, which are two shoals marked in the chart?—Are there two marked in the chart? I have not noticed them.

11,130. There are the Green Grounds and the Outer Grounds?—Yes; the Green Grounds I know; we are obliged to pay attention to them.

11,131. If a breakwater were extended to the east of the Mumbles Point, would it be narrowing the passage very much for vessels to enter between the Mumbles and the Green Grounds?—I think not, because it is only at dead low water that the Green Grounds are of any consequence. The moment there is one hour's tide you never give the Green Grounds a thought; the Green Grounds are not noticed after one hour's flood.

11,132. But at low water?—At low water of spring tides we are obliged to keep clear of them.

11,133. With the wind at south-east, have you much protection from the sea in Swansea Bay by means of the Skerwether Sands?—We do not get so much sea as we should if we had not the Skerwether and the banks above.

11,134. Your vessels from Neath are ordered not to put into the Mumbles on their outward passage?—Yes; it is a standing order that they shall not put into the Mumbles unless they are obliged to put back.

11,135. What are the vessels which lie at the Mumbles?—They are driven out of Swansea Harbour to wait for the wind to get to the west.

11,136. Would they leave when a gale was blowing outside to make it dangerous?—If it were protected with a breakwater.

11,137. But at present?—Foreign-going ships will go if steamers haul them out.

11,138. Do many vessels put back after going some way on their voyage?—Some ships, if they can get hold of Milford, take hold of Milford.

11,139. Are the vessels which take shelter at the Mumbles generally those which have proceeded a short way on their voyage and put back, or are they direct from the harbour to the Mumbles Road, waiting for the wind to the westward?—They go direct to refuge when the wind is blowing against them.

11,140. If vessels have gone any distance at all before meeting with bad weather, would not Oxwich Bay be as good as the Mumbles?—I think not. It is exposed much more to the south-east and east than in the bay up here, and should they be caught they would stand a chance of getting full of water.

11,141. I suppose, if a harbour were made it would give protection against those winds?—I think you can hardly give protection with half-a-mile of breakwater there.

11,142. Why if it is a deeper bay, should not the breakwater give protection quite as well as at a point where there is less water inside it?—If the expense is not valued you might go further out at the Mumbles, where the water is deeper. There is no room to move about in that small space of deep water at Oxwich Bay.

11,143. Look at the chart, and take the space from the point of Oxwich into the bay to the three-fathom line, and then take the Mumbles Bay into the three-fathom line, and tell me which has the largest space?—I tell you a great proportion of the vessels lie aground at the Mumbles, but it would not do to lie aground at Oxwich.

11,144. I understood you to say that a harbour was wanted that ships might not have to lie aground?—Yes.

11,145. Supposing three fathoms to be a safe depth for vessels to anchor, look at these two lines on the chart, and tell me which has the largest space of water with three fathoms?—Looking to this, I think there is more space inside Oxwich Bay.

11,146. Looking to the line to the east, what is the deepest mark on the chart?—Seven and eight fathoms.

11,147. Look at the east of the Mumbles in the same line, what is the depth—is it not nine fathoms there?—Yes; still there is not that protection in east and south-east gales which there is at the Mumbles.

11,148. Can you tell any instances of these homeward bound valuable ships being lost after they had entered the Mumbles Roads—ships, I mean, bringing home the silver and copper ore?—I have known a vessel go ashore.

11,149. Have you known any case where there was loss of life?—No loss of life.

11,150. Nor destruction of their cargo?—Neither one nor the other; only ships go ashore, and their bottoms being good they lie there for a tide, and are got off by lightening.

11,151. You are not aware of any cargo or life being lost in one of those homeward-bound valuable ships?—No, not in the bay; but I must tell you that the risk is very great.

11,152. Will you look at the chart of Lundy Island, and show me where you allude to the 20 fathoms of water Look at tbe bank eastward of Lundy Island, and show me where this deep water is?—I thought there might be 15 or 20 fathoms of water, but I see there is not so much, but you must go very close in to get anchorage there.

11,153. You see that for a mile off there is good anchorage?—A mile looks nothing by sea.

11,154. If a harbour were constructed anywhere, must not vessels going in haul round much closer than a mile?—I do not know, with such a sea, that they would. I do not know that they would do so at Lundy Island, but if they can see something to steer for they will.

11,155. But supposing vessels were to haul round close under the land, would they not find much shallower anchorage than you said?—I do not think

any ship would come to the shoal water so close in. I had an opportunity of spending a night on the island last summer. I went all round the island with the Trinity Board, and I can only say, with all my experience, I was surprised to see how close the men took us in; but still there is such a roll of the sea that though Lundy Island may answer very well for ships under canvass to sail forward and back, waiting for the wind to change, or to pick up a pilot, I am sure they never think of coming to anchor there.

11,156. From what you saw, do you think that if vessels which are caught with south-west and west winds chose to draw round where there is seven and ten fathoms of water—do you not think they might use it as it is, as a natural harbour of refuge?—They do not do it.

11,157. I do not ask whether they do do it?—I never attempted it, and I know no one who has.

11,158. You see there is shallower water than you thought there was?—Looking at the chart I see there is.

11,159. Do the winds go round from south-west, north-west, and north?—Sometimes the wind backs round the other way.

11,160. As the wind comes to north, can a vessel run out under the south end of Lundy Island, and go on her voyage?—With a sudden shift of wind by night I do not think they would. I have known ships chance Lundy Island in a summer gale, but no ships will take Lundy Island to remain to ride there in the winter season; none whatever.

11,161. You said that Clovelly was in a deep bay?—Yes.

11,162. With the wind drawing round in the way described, do you not think it would be very difficult for ships to get out of Clovelly, if a harbour were provided there, and they wanted to go on their voyage?—They would go up Channel.

11,163. I am speaking of outward-bound ships?—No.

11,164. They would be embayed?—Yes.

11,165. Do you think it desirable to place a harbour of refuge where, with the prevalent change of the winds, the vessel would be on a lee shore? Would it be desirable for a ship to have that difficulty?—I have scarcely ever known of an accident happening there.

11,166. Would it be desirable to have a harbour of refuge in such a bay that when the wind became favourable the vessels would be unable to get out? Would that be a desirable thing?—No, it would not.

11,167. Do you consider that if a harbour of refuge were necessary, it would be most desirable to have it on the side where it would be a fair wind to enter with the wind driving the ships back, and when the wind went round to north-west it would be a weather shore to proceed on the voyage?—I think so.

11,168. And do you think it desirable to keep that rule in view as much as as possible when selecting places for harbours of refuge?—I should say that was a matter of engineering skill.

11,169. (*Capt. Vetch.*) You know Penarth Roads very well?—I do.

11,170. Do you consider that a good roadstead?—Good to be taken in on the mud; but not the outer road.

11,171. Is it very much frequented?—It is very much frequented.

11,172. What course do vessels take frequenting Penarth Roads and going round Cape Clear?—West or west by north till they get to Ilfracombe.

11,173. If they reach Lundy Island and are met by adverse winds what do they do?—Some fetch Milford or run back to the Mumbles. Some small craft take Ilfracombe.

11,174. And take refuge under Lundy Island?—Not in the winter months. Not one ship out of a thousand. You must take into account winter months and summer months.

11,175. Do vessels leaving Swansea, bound round the Land's End, leave Lundy Island to the south?—Sometimes they go to the south and sometimes to the north.

11,176. Does it depend upon the tide?—It does depend upon the tide.

11,177. You do not think Lundy Island good shelter in adverse winds?—None whatever; it only answers the purpose for stopping a few hours.

11,178. Looking to the advantage of the trade, and supposing that a single harbour only was to be made, where would you propose to place it?—My opinion would be at the Mumbles because of the great trade here.

11,179. Do you think that by a breakwater at the Mumbles a greater amount of trade would be protected than anywhere else?—Yes, than anywhere else. It would protect a good deal of trade going up Channel.

11,180. Supposing two were to be constructed, where would you place the other?—I should like to go down to St. Ives. With a harbour at St. Ives, and another at the Mumbles, there would be two at the extreme ends.

11,181. Do you know Padstow very well?—I do.

11,182. Do you think it possible to make a harbour there?—I cannot say; but I think they might improve it by laying out 20,000*l*. It would be only ships caught about there that would take it sometimes.

11,183. (*Mr. Coode.*) You spoke of many ships being damaged last winter can you tell us the proportion of those which ran for shelter and the proportion of those belonging to the trade of the port?—I cannot tell. The greater portion had been laden at the port, and were gone out, waiting for a wind.

11,184. Can you furnish such an account?—I was not prepared for the question. I cannot say to what vessels the greatest amount of damage was done.

11,185. Perhaps you can prepare such a return?—The Custom House can; but I do not know that I can.

11,186. Have you ever known the case of a cargo of silver ore being lost?—Never.

11,187. You said that you had anchored in Oxwich Bay?—Yes; stopping a tide.

11,188. Did you ever run there for shelter?—Never; I have never known vessels take shelter at Oxwich Bay. They only stop a tide there in summer time, but not in the winter time.

11,189. But do you think that one harbour would suffice to meet the wants of the Bristol Channel? I am not asking you as to the position, but whether one harbour would be sufficient?—I should like to have two, if I could have them.

11,190. Viewing it upon the broad principle of necessity, do you think one would suffice?—I do think a harbour of refuge at the Mumbles would do.

11,191. Do you think a harbour at the Mumbles would suffice for those vessels which are driven back from the Land's End?—Yes.

11,192. Do you think it would suffice for them?—Yes; where there was no other harbour to the west. If there was a harbour at St. Ives, they would take that, and no doubt that harbour would be very desirable.

11,193. Do you say that large ships would not take Clovelly; can you tell me why?—Men not accustomed to narrow waters, do not like to deal with so close a shore.

11,194. Is not the Mumbles narrow?—Clovelly is very different. You can always take the Mumbles, except in a violent wind.

11,195. But in the view of saving life?—If a man does not know what to do with a ship, he will take any place. But nobody would go to lie windbound. A man would say, I would rather keep to sea as long as I can, because, as soon as the weather moderates I can get on my voyage.

11,196. You are speaking of ships windbound. I am asking you as to ships requiring refuge; would

SWANSEA.

Mr. W. Lowther.

30 Sept. 1858.

Mr. Coode.

there be any difficulty in taking Clovelly ?—Men will run everywhere, because when a man requires refuge he looks out for the best creek or the best beach that he can see.

11,197. You say, that the trade of the north shore is about three to one that of the south shore. Do not vessels require refuge after they have put to sea ?—Yes ; after they have put to sea.

11,198. (*Chairman.*) You are well acquainted with Milford Haven ?—Yes.

11,199. And the land in its neighbourhood ?—I am not so well acquainted with that.

11,200. What style of place is Milford Haven to make in dirty weather with the wind from south-west? —We generally make it bold, having two lights and a bold land.

11,201. Then you do not call it a difficult place to make in thick weather ?—In thick weather, if it is very thick, we rather run, because of the strong tides, and we do not like to run across tides.

11,202. Then, though the harbour is very good there are certain impediments in the taking of Milford Haven which diminsh its value ?—Not only that, but also in leaving you do not like leaving when the wind is dying away. You are hurled about with a strong tide from the islands.

11,203. Suppose a foreign ship in distress, not very well acquainted with the Bristol Channel, in a heavy south-west gale running up, is there any place beyound the Flat Homes, where she could drop her anchor in safety and hold on ?—Scarcely in safety until she got up to King's Road.

11,204. Why ?—Because the tide is so strong it makes a heavy sea, and it is bad holding ground with the sand. The Trinity Board do not allow any ship to bring up below the light ship; they compel the pilots to run the ships to King's Road.

11,205. Therefore there is no portion of the Channel between the Flat Holmes and King's Road to be viewed as refuge ?—I am speaking from my own personal knowledge. I happened to go with the tug to bring a Bristol ship down. After we were half way down the wind became adverse, and I wanted the pilot to anchor, but he said no, he should lose his license if he were to, he must go back to King's Road. The ship was bound to Swansea ; and that circumstance came within my own knowledge. I am aware that there are some large American ships which anchor about the Spit, but they do not ride there easily ; it is no place to ride in safety.

11,206. (*Capt. Sulivan.*) I think you said that the Mumbles light is maintained by the Harbour Trust ? —I think it is.

11,207. Is there a small toll levied on it for shipping ?—Not now ; they formerly did so, but it was illegal.

11,208. Is it paid for out of the harbour dues ?—It is paid for from the harbour dues.

11,209. You said that a light on the Skerwether Sands would be very valuable ?—It would be very valuable.

11,210. You are aware that all light ships lead to a small toll on shipping ?—I am aware of it.

11,211. Do you think that the trade of Swansea would object to pay the small toll necessary if a light vessel was placed on the Skerwether Sands ?—I should say that they would be very glad to pay it.

11,212. Has any application been made to the Trinity House, or to the Board of Trade, upon the subject ?—I think not.

11,213. But do you think that the general feeling of the trade is that a light vessel is necessary ?—I should think so.

11,214. Do vessels making for the shore in south-west gales meet with thick weather ?—Sometimes we get it very thick.

11,215. Then it is so common to have thick weather with south and south-west gales that a vessel might be on the Skerwether Sands before she made the Mumbles or the Nash light ?—Yes ; because they are eight miles apart.

11,216. When vessels run back for the Mumbles, what part of the land do they generally make ?— They generally make the Welsh land below the Head. If the wind is south-south-west they make the Head, if north-west they make the Welsh land.

Mr. William Llewellyn Powell examined.

Mr. W. L. Powell.

11,217. (*Chairman.*) You are a seafaring man, I think ?—I have been to sea all my life until the last 10 years.

11,218. And how many years were you in command of a vessel ?—I was in command from 1819 to 1852.

11,219. In what trade were the vessels in which you commanded principally employed ?—Principally in the Mediterranean, but since that in the Channel here.

11,220. You are aware of the objects of this inquiry ?—I am.

11,221. Will you now state to the Commissioners any opinion which you may entertain as to the advantage or necessity of a harbour of refuge being formed at the Mumbles ?—I am decidedly of opinion that the Mumbles is the proper place to choose for a harbour of refuge, and for this reason ;—the prevailing gales in the Bristol Channel are from the south-west to the west-south-west ; those do the most damage ; and the reason I prefer the Mumbles is, that as the wind generally backs round to the north-west, the ship is ready to take her departure for sea when the wind falls round, as it generally does, to northward. You are then prepared, being on the weather side of the channel, to go out to sea ; whereas, if you had to start from the other side, you would be down upon a lee shore. That is one of my reasons. Another reason is that vessels starting from Penarth are very often caught down here. If the wind is south-west they do not like the roadstead, and run back to Penarth, and even up to King's Road.

11,222. (*Mr. Lindsay.*) Have you been long connected with this quarter ?—Yes ; in command of a vessel going out of Falmouth for upwards of 20 years, and generally knocking about Oxwich Bay, the Mumbles, and Cowes.

11,223. Looking to the saving of life and property, at what point of the Bristol Channel do you think a harbour of refuge ought to be made ?—I am decidedly of opinion that the Mumbles is the place.

11,224. In your long experience, do you know of any case of loss of life which would have been saved by a harbour such as is proposed ?—I recollect an instance of a ship laden with timber coming ashore by Carenth Sands, which if there had been a harbour of refuge she would not, and the crew would have been saved, whereas they were all lost.

11,225. How was the wind ?—The wind was blowing hard from the south-west.

11,226. Could she not have found shelter in the Mumbles Bay as it is now ?—She let go her anchor and it parted, it is understood, but the crew being lost it could not be ascertained. The hull afterwards came ashore, and from the manner in which it was destroyed it would seem that both anchors had been let go, and that they had sawn the stem in two. One side came ashore, and the other was in pieces.

11,227. Please to be distinct upon this point, and tell us how a harbour of refuge could have saved that ship ?—She would have brought up in the Mumbles, where she did bring up ; but for want of protection her anchors parted.

11,228. What was her draught of water ?—14 or 15 feet of water.

11,229. And you are decidedly of opinion that if there had been a harbour of refuge as proposed, that ship, with all the lives that were lost, would have been saved ?—I believe so.

11,230. How long ago was that?—12 years ago.

11,231. Do you know of any other instance?—There was a little Irish sloop, the *Hook*; she came ashore, and two men were lost. I believe that if there had been a refuge she would not have come ashore.

11,232. Any other instance?—No; in fact I have not paid attention to the subject, I was merely answering from my recollection.

11,233. What is your opinion of Lundy Island as a roadstead?—A very bad one. I do not think any vessels will bring up there unless it is moderately fine weather. The gusts come down so hard from the shore that vessels drag their anchors and often leave them behind.

11,234. What is your opinion of Clovelly?—I am surprised that the idea of Clovelly is entertained for a moment, because it is upon the English side of the channel.

11,235. Do you think a harbour at St. Ives would be of much value to the trade of England?—I do not know much about St. Ives. I have been there once or twice, but I would rather not give an opinion upon it.

11,236. Have you often been into Milford Haven?—Yes, often.

11,237. Is it difficult to make?—The difficulty is making St. Ann's lights, but when once you have made them, you can run in at all times.

11,238. In thick weather?—Yes; I found no difficulty. It is one of the finest harbours in England.

11,239. When once in?—Yes; when once in. The circumstances may be peculiar. The land clouds in with haze from the north, but if you have seen the land in good time, there is no difficulty.

11,240. In cruising about the Channel, have you seen many ships putting back that have got down as far as the Chops of the Channel?—No; generally speaking, they clap on the larboard tack, and go into Milford Haven. If the wind is north-west, they fetch down, and go round the Long Ships.

11,241. If they have sufficient offing with the wind north-west, they fetch round the land?—Yes, they fetch round the land.

11,242. (*Capt. Sulivan.*) Do you know Oxwich Bay?—Very well indeed.

11,243. As it is at present, can large vessels get shelter with the wind more round to the south than they can at the Mumbles?—You can, certainly. There is no doubt of it; but there is an objection to Oxwich Bay, which perhaps you will allow me to state;—I have been lying in Oxwich Bay for nearly two months at a time, with the wind at west-south-west; it is all very well if the vessel is of light draught, but if the wind is south, they generally get under weigh, and run to the Mumbles. The reason is, that after you have left Oxwich, you find the sea invariably calmer. As you run up, you invariably find the sea calmer, until at last it is only a high wind billow.

11,244. With a southerly gale?—With a south-south-west gale.

11,245. That is south true?—I am speaking of south-south-west true.

11,246. Have you more protection under the Mumbles Head in a south-west gale, than under Oxwich Head?—No, decidedly not; but for the reason I tell you, that the sea is more heavy round Oxwich Head than round the Mumbles Head.

11,247. Supposing a breakwater to be run from the east of Oxwich Bay, and another in the same direction and of the same length, east of the Mumbles; which would enclose the greater space of more than three fathoms water?—Oxwich Bay, decidedly.

11,248. How many times as much?—Than three fathoms?

11,249. I am speaking of three fathoms outwards?—But the space enclosed in Oxwich Bay would be hardly worth your noticing, unless you carried a breakwater to the eastward.

11,250. But a similar breakwater at the Mumbles would be no use at all?—In my opinion, it would, if you were to run it due east.

11,251. Then, supposing for the same sum of money you might run a breakwater from Oxwich Bay, and from the Mumbles Bay in an easterly direction, you think there would be less shelter, in proportion to the sum laid out, at Oxwich Bay?—Do you mean to run a breakwater from due east?

11,252. I mean a breakwater of a given length, to shelter from southerly gales in whatever line it would be necessary to shelter from southerly gales. I ask, then, with a breakwater of the same length would the water be a fathom deeper in the line from the Mumbles than it would be in the line from Oxwich Head? If you run a breakwater from either of those two Heads of the same length, and at the same expense, would not there be much less depth and space afforded at the Mumbles than at Oxwich Bay?—Certainly.

11,253. Then to carry one further out, to a greater extent and deeper water at the Mumbles to be of equal depth and extent with a harbour at Oxwich, it would require a larger amount of money, would it not?—I do not think it would. That is an engineering question, upon which I am not competent to give you an answer, but I think it would cost a great deal more for Oxwich Bay.

11,254. Do you know the depth of water east of the two heads?—I cannot immediately call my mind to it.

11,255. If the chart shows nine fathoms east of the Mumbles, and seven and eight east of Oxwich Head, have you reason to doubt it?—Nine fathoms from Oxwich, and seven fathoms from the Mumbles is it not.

11,256. I am reading from the chart, if the chart shows nine fathoms east of the Mumbles, and seven and eight east of Oxwich Head, have you reason to doubt its accuracy?—None whatever, but that must be some distance off from the Mumbles Head.

11,257. (*Chairman.*) You have stated that Milford Haven is an easy place to take in bad weather, do you mean in a thick south-westerly gale?—I have stated that I never found any difficulty in going there.

11,258. Do you suppose that others not so well acquainted with the place would find difficulty or not?—Vessels coming in from sea would find difficulty, I have no doubt, but they generally run from the Channel, having a point of departure to start from; but no doubt running in for the intricate navigation about St. Ann's Head, they would find it difficult.

11,259. Is there any anchorage between the Flat Holmes and King's Road which may be considered a safe place to bring up in in heavy weather?—I do not like to answer that question, because I have not had sufficient experience above the Holmes. There is one observation which I wish to make. If a breakwater were made at the Mumbles it would make the flats perfectly safe, on which ships could run. It would be a perfectly dry harbour; you would have the flats on which vessels could run perfectly dry, and they would be saved from the damage which they now receive in southerly winds.

11,260. (*Capt. Sulivan.*) In a statement which has been handed in I see one witness says "I have observed that running for the Mumbles in a heavy gale there is no high sea. As the roadstead is protected the sea becomes calm, until at the anchorage it is not more than a high wind billow?"—That is a fact.

11,261. That being the case, do you consider that it lessens the necessity for a breakwater or not;—as the sea becomes calm and less dangerous, do you give that as a reason for running from Oxwich to the Mumbles?—I do not quite understand.

11,262. You say that as you approach the Mumbles, the sea becomes calm until it is only a high wind billow; is that a reason for or against making a

SWANSEA.

Mr. W. L. Powell.

30 Sept. 1858.

Capt. Sulivan.

breakwater there to give additional shelter?—I do not think it is an argument either for or against making a breakwater. It shows the facility for making a harbour there.

11,263. Which shows the most necessity for protection, the fact of the heavy sea coming in a bad wind, or from natural causes the sea going down until it is nothing but a high wind billow?—I do not think it does away with the necessity; I only mention it to show the facility with which a breakwater could be made.

11,264. The less the sea, the easier the breakwater can be made?—Yes, the less the sea, the easier the works can be carried out. At present the difficulty is the strong ebb tide. Ships roll about and break adrift.

Mr. JAMES ABERNETHY examined.

Mr. J. Abernethy.

11,265. (*Chairman.*) In what way are you connected with the port of Swansea?—Since 1847 I have been engineer-in-chief of the Port of Swansea.

11,266. Are you prepared with any plan or estimates showing the mode in which a breakwater may be constructed at the Mumbles?—I am.

11,267. Will you now lay before the Commissioners any plans, and make any statement in reference to them which you like to offer?—The first plan which I will produce before the Commissioners is a plan which was made out for the Select Committee of the House of Commons. That plan, as you will observe, shows a breakwater of some 1500 yards in length, enclosing a considerable space of deep water anchorage. Upon further consideration of the matter, and upon reference more particularly to the soundings recently taken by Capt. Aldridge, I am of opinion that if a breakwater was constructed at the Mumbles, it should be projected further seaward than is shown on the plan which I submitted to the House of Commons. I have therefore prepared another plan, showing the position of the breakwater and the extension of the area enclosed, which I now beg to hand in. The green shows the position of the breakwater, and the red shows it considerably further to leeward.

11,268. Is there any further statement which you wish to make relative to these proposed breakwaters?—The principle of both is the same, but I think it is desirable, if a harbour of refuge is to be constructed at any one point, such as the Mumbles, for the whole trade of the Bristol Channel, taking into account the great increase of that trade, particularly of the Welsh ports on the north coast,—I think it desirable to have a more extensive plan than that which I proposed to the House of Commons. The amount of the acreage is shown in a tabular statement at the corner of the plan.

11,269. What would be the expense of the breakwater which is shown upon the plan in red?—Constructed upon the same principle and in the same mode as I proposed to construct the former breakwater, viz., by a mound of copper slag, creosoted timber, and rubble, I estimate that breakwater at 650,000*l.*

11,270. And the inner portion, how much would that cost?—The green, do you mean?

11,271. The inner portion of the red?—That is the cost of the whole of the breakwater shown on the plan.

11,272. The question which I now ask, is how much would the inner portion of the red, divided by the two entrances, cost?—The inner portion I should estimate at 350,000*l.*, including a small patch connecting the Cherrystone Rocks with the mainland.

11,273. And in the average, how many vessels per acre do you calculate it would shelter?—I have found it difficult to arrive at any distinct number of vessels anchoring in a roadstead; I should suggest two and a half acres to each vessel, and I think that would render it perfectly safe.

11,274. (*Sir F. Smith.*) I heard your evidence given before the Committee of the House of Commons, and very interesting evidence it was. Have you at all changed your principle of construction to what you then stated to the Committee?—I have not; and I should mention that probably hereafter, when the Commissioners visit the northern ports, they will see a breakwater constructed upon a limited scale upon that principle, and I shall submit to them drawings and a model to show one on a more extended scale. They are not fully prepared at present, but they will be handed in to the Commissioners.

11,275. When will they be prepared?—In a fortnight or three weeks. When the Commissioners visit Northumberland there is a breakwater constructed upon that plan there, which I should like them to see.

11,276. I understand that we shall see at Swansea the mode of preparing the blocks?—Yes, I have some upon the ground.

11,277. Can you describe in some detail your system of construction?—There are two modes which I will state generally. The first is, to tip a rubble or copper slag mound in the usual way, say to the level of 12 feet below low-water level, where the disturbing action of the wave ceases. Within and above the rubble mound there is a timber framework, extending to the height of about 10 feet above high water of the highest spring tides. These frames are generally about eight to 10 feet apart; and behind or within the frames, both seaward and landward, there are half logs of creosoted timber. The whole space within, landwards and seawards, is faced by being packed close either with rubble stone or copper slag. You have then a breakwater, in some respects similar to the breakwater at Holyhead in its present state; but with this advantage, that the quantity of material being confined within the timber face work it is considerably lessened; and as creosoted timber is, in my opinion, of great durability, you would have an efficient breakwater for a long period of time, which could be constructed much more rapidly and much more easily than a rubble mound, with a stone superstructure, and at considerably less cost; and if it should be determined afterwards, as the Government may have funds at its disposal to complete a permanent structure for future generations, you have the staging for the whole length of the breakwater, and the means of depositing or setting a permanent stone face work on both sides, imbedding the first-constructed breakwater within it.

11,278. Making the first work a core, is that what you mean?—Yes, making a core of the first structure.

11,279. Then your view is in making it a permanent structure, (which you do not expect this to be,) to make a facing to the core, which you now propose to construct?—Yes; but as it is of great importance to the shipping interest that the shelter to be afforded should be afforded within the shortest possible space of time, I think this mode of construction has obvious advantages. It is not more expensive than the usual mode of constructing a timber platform for the mere purpose of depositing the material.

11,280. In fact, you think a platform or framework necessary, whether you applied it as a means of construction or as the means of making a more permanent work?—I do. It would form an efficient breakwater for half a century at least. It would therefore afford shelter for shipping, and you might carry on the permanent structure from time to time, as funds at the disposal of the Government may permit.

11,281. Your object is for the purpose of despatch?—For the sake of despatch.

11,282. Then you consider this a case of great imminence?—I do. My attention was first called to the subject in this way:—At Blythe, in Northumberland, it was proposed to make docks, and before the necessary works could be commenced it was necessary to protect the harbour entrance by a

breakwater of upwards of 4,000 feet. It was manifestly impossible that any company could construct a permanent stone breakwater of that length. It would have been an unproductive work, commercially speaking, and therefore it occurred to me that I could construct a breakwater of the character I have described rapidly and economically, and also one that would last at least half a century; we might then be able to commence our dock works, &c.; if the revenue arising from these works should hereafter enable us to construct a more permanent work, we could do so *pari passu*, with the increase of trade.

11,283. What is the economy of material which you estimate would be made, as compared with the allowing stones to form themselves *en masse*?—Without comparative drawings I cannot show you that.

11,284. Do you not know what is the comparative sectional area?—It would be considerably less.

11,285. Would it be considerably less than one half?—You have put it high; it would be a saving in the cost of the timber, considering the more permanent character of that wooden structure.

11,286. The wooden structure becomes eventually part of your structure, and with reference to the first cost, it would be less by your estimate?—It would.

11,287. Do you know what proportion?—I shall be prepared to go minutely into these details when I produce the plans before the Commissioners. The breakwater at Blythe of 4,000 feet has cost 28,000*l.*

11,288. Is the material copper slag?—Copper slag and mountain limestone combined.

11,289. Do you consider copper slag more economical than stonework?—Yes; it can be furnished in any quantity, carried out and deposited on the site of the breakwater.

11,290. Do you not propose to use your wooden structure in the first place?—Not in the first place. I should deposit a portion of copper slag, using the wooden structure for the upper part of the breakwater.

11,291. Your only object, by your increased plan, is to include a large area?—Yes.

11,292. No other advantage? Do you get upon less soundings by your new plan?—The soundings are somewhat increased.

11,293. (*Mr. Lindsay.*) I will not trouble you at any length, but just one question, Mr. Abernethy. What breakwater was that to which you referred as being 4,000 feet in length, and having cost 28,000*l.*?—Blythe.

11,294. What is the depth?—Only two feet at the extreme end of it. Of course it is only to a limited extent an example of what would be required at the Mumbles; where, of course, I should have to provide for additional depth. That will be chiefly done by the rubble mound. At Blythe there is no rubble mound required. The rubble is entirely encased within the timber. The principal addition in this case would be rubble in addition to a wooden superstructure.

11,295. What is the depth at Blythe?—Only two feet below low water.

11,296. What is the rise and fall of the tide there?—13 feet.

11,297. Then the cost has been about 7*l.* per foot. What would a stone breakwater, constructed at the same place, have cost?—If I had had to construct a stone breakwater, I do not think I could have done it for less than 60,000*l.* or 70,000*l.*

11,298. Then the cost is less than one half considerably; and instead of completing the work in two years it would probably have taken six.—The last witness made a remark which struck me that if the breakwater were formed certain banks would become dry to protect the harbour; did you notice that?—I did; and I do not agree with him. At present the tide passes over the Mixon shoal. In constructing the breakwater I propose to leave an opening between the mainland and the north end of the breakwater for the free ingress and egress of the tide, so as not at present to interfere with the Mixon Shoal, because if the tide is arrested we have a right to expect the Green Grounds and the Mixon Shoal would materially increase.

11,299. There is such a great extent of shoal water that I will ask whether you can say that this bay is silting up or not?—From all the information I can obtain I think it is not.

11,300. How many years do you go back?—As far as 1847.

11,301-2. Have you no correct charts of older date than that?—Captain Denham's is the only chart I have any confidence in; and now the Commissioners have the advantage of Captain Aldridge's, which will show any alteration. My impression is there is no alteration.

(*Capt. Washington.*) Captain Denham's chart was in 1831.

11,303. (*Mr. Lindsay.*) Has there been any shoaling since 1831?—I am not able to give precise information, but from information from parties on the spot there does not appear to have been any shoaling.

11,304. What course does the tide take in this bay?—One portion goes off the Mumbles Point and comes round the bay. There is a constant circular motion that defines the low-water mark, and as long as that is not interfered with I believe the soundings will not materially vary, but any work which would tend to interfere with the flow of the tide would inevitably tend to fill up the roadstead.

11,305. Then, if the proposed breakwater were connected with the mainland, the inevitable consequence would be that the bay would silt up?—I think it would.

11,306. But do you not think that the throwing out of this breakwater would have a tendency to cause the bay to fill up?—No, I think not. I think there would be a more rapid tide round the Mumbles Point than at present.

11,307. But would not the inner breakwater prevent the tide sweeping out the sand in a circular course?—I think not.

11,308. Would not the tide be caught within the breakwater?—I think not.

11,309. Nor within the outer breakwater?—I think not.

11,310. Then the tendency would not be to fill up?—No.

11,311. Would the effect be to deepen the water?—No; I do not think it would materially affect it one way or the other.

11,312. (*Capt. Sulivan.*) You have said, Mr. Abernethy, that your estimate is 650,000*l.*?—Yes.

11,313. But that is for a breakwater which is only to last for 50 years?—Yes.

11,314. Will you state to the Commissioners the probable additional cost of the two stone walls hereafter to enclose that breakwater so as to make it permanent?—I should estimate the cost of the two walls at 250,000*l.* additional.

11,315. I think you said your piles would go 12 feet below low water and 10 feet above high water?—Yes.

11,316. What is the rise and fall of the tide?—About 30 feet.

11,317. That would give 52 feet for the walls?—Extending from the rubble mound to the summit.

11,318. Would they require foundations in the rubble?—They would.

11,319. Then there would be 52 feet of masonry?—There would.

11,320. Of what thickness do you think it would be necessary to make the containing walls?—Taking the seaward face, I should propose to carry the walls upon the top of the rubble mound by blocks built on land prepared for one or two years before they were used of twenty to twenty-five tons in weight each.

11,321. I do not wish to go into detail?—I should make these lower blocks at least 20 feet in thickness. The top portions of the wall, say 10 feet.

11,322. A medium of 15 feet?—A medium of 15

SWANSEA.

Mr. J. Abernethy.

30 Sept. 1858.

Capt. Sulivan.

feet. The outer wall 52 feet, besides foundations, and a medium of 15 feet.

11,323. And allowing also for the cost of the inner walls, do you think those walls could be constructed for 250,000*l.* ?—I do.

11,324. What is the size of this copper slag ?—Generally it is of small size, but I should mix the copper slag and the mountain limestone together. The copper slag is obtained of the smelters, and it is, generally speaking, of small size ; it is very heavy, very angular, and lies at a steep slope.

11,325. Then the large material necessary to be put with it you intend to take from the mountain limestone ?—Yes, from the mountain limestone.

11,326. Have you ever seen piles of wood embedded in a harbour breakwater of that kind ?—Of course at Holyhead it is so.

11,327. Is it the case that the stones rapidly wear away those piles at the edge of the mound where the sea moves the stones ?—I have no doubt of it ; but in this case I do not propose to carry the rubble mound higher than 12 feet below low-water mark, where the disturbing action of the sea is not felt, but at Holyhead it is carried higher ; there the material is disturbed and the piles wear by the action of the sea on the rubble.

11,328. Are you aware that the material has been carried over the slope to a much lower distance than 12 feet by the action of the sea ?—I think it very probable that the upper portion is carried by the back draught of the sea beyond the 12 feet, but that is the action of the sea above that level.

11,329. Will you please to mention the whole length of your structure ?—About 2,300 yards.

11,330. Then instead of 650,000*l.* for a temporary breakwater, we must take 900,000*l.* for a permanent structure ?—You may.

11,331. You stated something which I did not quite understand as to the difference of depth. Do you mean that the breakwater is moved out to a greater depth, or that the difference of the depth in the bay has obliged you to move your breakwater further out ?—It is moved to a greater depth—to six fathoms.

11,332. You said that it was moved out in consequence of the depth discovered by Captain Aldridge's soundings. Was your first drawn breakwater in not so great depth as you thought ?—It is so ; I found that Captain Denham's and Captain Aldridge's soundings did not agree.

11,333. Then there was less extent of water than you supposed when you first drew your plan ?—Yes.

11,334. Then is it not certain that taking both these charts to be correct, that there has been a decrease of water to the eastward of the Mumbles Head ?—Comparing some of the soundings of Captain Aldridge with Captain Denham, I find that some are less and some greater.

11,335. But you have had to move your breakwater out because there is less depth than you first supposed, does that show a less depth now than there was in the former chart ?—At some points the depth seems rather increased.

11,336. But if, on the average, the depth had increased, would you have considered it necessary to remove your breakwater ?—I should have removed it independent of the variation of the charts, because I think the area is not sufficient, treating it as a harbour of refuge for the whole Bristol Channel, and that a greater area is required for the trade.

11,337. Taking the depth at the corner, is it a fact that the depth is one fathom less by Captain Aldridge than as laid down by Captain Denham's chart ; I allude to a kind of hole eastward of the Mumbles Head; in Captain Denham's chart is there not 4½ and 5 fathoms eastward of the Mumbles Head, when by the recent chart it appears that hole has filled up, and there is the shoal water ? — There appears close to the Mumbles Point a difference of a fathom. Then immediately within the point, Captain Aldridge's soundings are fully as deep as Captain Denham's. At one point the bay appears to have shoaled, but, as I have stated, at another to have deepened.

11,338. Is not the depth supposed to be shown on your inner breakwater eight, nine, and nine fathoms according to your first plan, and does not the survey now show eight, seven, and six fathoms ? Is there not a decrease under the line of your first breakwater of a fathom ?—Not for the whole length.

11,339. No, but in that part ?—Along that part there is.

11,340. Which is the deepest part of the whole ?—It is about the deepest part of the whole ; but still I cannot imagine any general decrease.

11,341. With reference to the shoal known as the Inner Green Grounds that reaches almost to the edge of your breakwater, I see there are only 2¼ and 2¾ round the end, and very shoal water immediately inside. Do you think that would be a safe passage for a large ship to take in a heavy sea when the wind might throw her off to leeward ?—I might mention that this is not intended for a passage.

11,342. I see immediately to leeward two and three fathoms only, and a narrow opening to windward, but supposing the entrance should be passed by a ship in a heavy sea, or that it should be too narrow a passage for a large ship to take, do you think that the end of your breakwater is at all in a safe place for large ships to enter ?—Seeing that after a vessel passes this entrance there is a distance of 1,200 yards from the tail of the Green Grounds, I think there is plenty of time for a vessel to come to anchor under any circumstances.

11,343. That is not my question. I am asking if a vessel should miss the entrance, being disabled, would it be safe, in its present position, to run to leeward and to enter at the east end of your breakwater ?—It would not.

11,344. Will you be kind enough to look at that chart about where the line of your proposed breakwater will be, and also to the space between it and the three fathom line in the old chart, and also to an imaginary space which would be enclosed by a circular breakwater in Oxwich Bay, and then tell me which would contain the greatest space of water at three fathoms ?—Undoubtedly the chart shows that a larger space would be enclosed at Oxwich Bay.

11,345. Would the breakwater not be in water of less depth ?—In the same depth I imagine.

11,346. Then, for the saving of life and property, would the same money spent upon a breakwater at Oxwich Bay give a larger area of protection than at the Mumbles ?—In south-west winds that would be the case ; but I think, in looking at the chart, you will see that Oxwich Bay is completely open to the south-east, and the Mumbles Bay is protected by the Skerwether Sands. Therefore, I think the comparison in favour of the Mumbles.

11,347. Setting aside that point, merely in reference to a breakwater of equal length in that depth (whether it would afford protection or not, being a different question), I ask you whether a breakwater would or would not give a greater area of anchorage ground if run off from Oxwich Head, than if run off from the Mumbles Head ? — Undoubtedly it would be a larger area of deep-water anchorage ground ; but there is a very large proportion of ships which require refuge in the Bristol Channel of a small class, and there is an immense range of shallow water and beaching ground in Swansea Bay, which, as far as I know, they would not find in Oxwich Bay.

11,348. If small vessels can lie afloat instead of running the risk of grounding on their anchors, is it not very desirable that small as well as large vessels should lie afloat if possible ?—It is so.

11,349. If the Mumbles Road was protected against the action of all sea, would any great number of small vessels beach in preference to anchoring ?—I cannot say.

(*Capt. Vetch.*) I doubt whether this is the proper time or occasion to go into the minutiæ of

Mr. Abernethy's plans. Of course it must require a great deal of time in going through these details, and I think we should be losing time to do it at this moment.

11,350. (*Mr. Coode.*) The cost of your breakwater, according to the red plan is 900,000*l.* ?—It is.

11,351. And the length is 2,370 yards ?—Yes; about 8,000 feet.

11,352. Will you put in evidence the cost per lineal foot of that breakwater?—About 112*l.* per foot.

11,353. And the cost of your breakwater at Blythe, was about 7*l.* per foot ?—Yes; but of course there is no comparison between the constructions; the one not 20 feet in height altogether, and the other a deep water breakwater.

11,354. I should have asked you questions as to the details of your construction, but perhaps it will save time if you furnish us with the sections, as you propose ?—I will.

11,355. I will ask a general question as to the width at the top of the rubble mound, which you form ?—That is a matter of minute detail.

11,356. What do you propose to be the height of the work—10 feet above high water of spring tides ?—Yes; at the highest spring tides.

11,357. Is that the height of the timber structure ?—Yes; to the top of the timber structure.

11,358. What height do you propose for the horizontal portion of the timber framing?—Do you mean the portion which is embedded in the rubble mound ?

11,359. I speak of the horizontal portion of the timber framing ?—I assume 15 feet below low water at spring tides, but that is no part of the superstructure.

11,360. Of course not of the masonry superstructure ?—No, what I call the timber superstructure.

11,361. Then are we to understand that the timber commences at the top of the rubble mound ?—A portion, part being carried to the bottom of the rubble mound. Some portion commences at the top, some at the bottom.

11,362. Do your piles all commence at the bottom, or are they put in as standards ?—That will depend upon local circumstances. I would rather furnish you with these details hereafter.

11,363. Having given an estimate of the total cost, I thought you might be able to tell us the length of your piles ?—Quite so; but I would prefer giving you the drawings.

11,364. Do you propose to use mortar or cement below the level of low water ?—No.

11,365. Do you propose to use mortar or cement above the level of low water ?—No, not at all.

11,366. Are you aware of the cost per lineal foot of the breakwater at Portland ?—I have heard it stated, but I am not aware of the cost.

11,367. Have you the means at hand for giving the cost per pile of those piles which are to go to the bottom ?—No.

11,368. You spoke of there being a considerable saving in point of time, will you tell us within what period you propose to construct this work ?—That would require some consideration. I am not prepared to define the time. I have no doubt that when I furnish detailed drawings to the Commissioners, I can state the time within which it may be estimated the work will be finished.

11,369. With regard to the rubble mound which you propose to form, is it to be composed entirely of slag, or of slag and limestone blocks mixed ?—The larger portion of mountain limestone, and the smaller portion of copper slag. The smallest in point of size of copper slag, and the large blocks of mountain limestone.

11,370. In about what proportion, in point of quantity, would you use the two ?—That is a detail which requires some consideration. It depends so much upon the supply which can be obtained of one or the other. There may be some difficulties in getting a supply.

11,371. Will you give an explanatory statement to the Commissioners of the mode in which you intend to proceed in order to construct your breakwater ?—I will; and I should like to consult the authorities at the copper works before going into these details.

11,372. You will not only give a section, but a statement as to the time, and a more complete estimate as to the cost ?—Yes.

11,373. Perhaps you will separate the time within which you would propose to complete the first portion of the work, and the time within which you would propose to complete the second portion which you spoke of, that is, the masonry walls ?—Quite so; I will separate the one from the other.

11,374. (*Capt. Vetch.*) Supposing the outline of your plan were approved, I suppose you would like the greatest possible amount of time for maturing all the details, and not to be restricted to the minutest particulars?—No doubt. I find in my engineering practice that I am constantly obliged materially to change my plans, and the mode of executing the works.

Mr. John Stribley examined.

11,375. (*Chairman.*) Are you a shipowner ?—Yes.

11,376. Where do you reside?—At Padstow, in Cornwall.

11,377. Have you been long connected with the port of Padstow?—Yes.

11,378. And for what period have you been connected with the port of Padstow?—I was born and sailed out there in my boyhood, and I have gone to and fro there at intervals.

11,379. How long have you been at sea?—About twenty-two years.

11,380. And during that period, for how many years in command of vessels?—For fifteen years.

11,381. You are acquainted with the object of this inquiry?—Yes.

11,382. Will you state to the Commissioners your opinion as to the advantage or necessity of making the Mumbles a harbour of refuge?—My opinion is, that it is the best place in the Bristol Channel for a harbour of refuge. From my experience of the Channel, many times coming up I have wished to get to a refuge. If large vessels could bring up there, they would not have to go to Penarth or King's Road; and very often they get a certain eddy ebb by the ebb tide which hangs to the south, and stretches the flood tide against the weather bow, so that they could get into the Mumbles when they cannot get anywhere else. But knowing that there is no safe anchorage there, they put about, and the flood tide takes them up almost as much as they gain on the ebb.

11,383. And therefore, for an outward-bound ship working down Channel with a westerly wind, it would be a very great advantage?—It would be a very great advantage. There is no calculating the advantages it would be to outward-bound ships.

11,384. Would it be any advantage to the homeward-bound ships?—Yes, I think so.

11,385. In what respect?—Most homeward bound vessels make the north of Lundy Island. If dirty weather springs up, there is no harbour to run to, and no doubt many would seek a harbour if there were one, instead of passing a dirty night in the Channel.

11,386. That is, homeward-bound ships ?—Yes, homeward-bound ships.

11,387. After taking your departure from Hartland Point, do you keep either shore by preference?—No; we generally keep mid-channel going outward bound. We seldom go to the south of Lundy Island, except it is to take advantage of the wind.

11,388. You of course have a good knowledge of

SWANSEA.

Mr. J. Stribley.

30 Sept. 1858.

Chairman.

the Channel between the Flat Holmes and King's Road ?—Yes.

11,389. Is that a place where you would run a vessel up ?—Yes, as good a place as any part of the Bristol Channel.

11,390. Between the Flat Holmes and King's Road, is there any place where a ship can run up and drop her anchor in safety, and ride, supposing she has good ground tackle ?—Not a place in a heavy gale of wind, because bringing up she might carry away something, but when she has brought up she will ride pretty well, because the holding ground is good.

11,391. What is your opinion of Penarth Roads ?—It is quite a safe place, though it is filling up very fast. There is not so much water there as there used to be.

11,392. Is it an easy place for a stranger to make at night ?—It is not particularly easy to a stranger, because the tides are so strong. Strangers are not thoroughly acquainted with them.

11,393. Therefore you would say that it is not a very good place for a stranger to run to—for a stranger who went by the chart ?—No ; not at all a good place, unless he were well acquainted with the charts, or had a pilot on board.

11,394. Is there heavy weather sometimes, so that pilots do not succeed in getting on board ships ?—Generally there are pilots to lead a ship, but I have gone up at night and not seen any one.

11,395. Do you know Milford Haven ?—Yes.

11,396. You have heard the evidence of the previous witnesses ?—No, I have not.

11,397. Well, what is your opinion of Milford Haven as a place for a vessel to run in from sea in dirty weather ?—The harbour of itself there is none better. To a ship that has not made the land it is not particularly safe to run for in foggy weather, though the harbour is so fine that no harbour can be better.

11,398. If you were in a ship which had been without observation for three or four days you would not like to run for Milford in foggy weather ?—I should not like to run for it ; by no means.

11,399. (*Mr Lindsay.*) Have you known many ships put back which have got down as far as the chops of the Channel ?—Yes, many. I have myself been obliged to put back after I got inside the Longships.

11,400. Where did you run to up to Penarth ?—I did.

11,401. Why did you not anchor at Lundy Island?—Because it is not a desirable place to anchor. In the first place, there is very bad holding ground ; the water is deep, and many times an anchor there will drag. I would rather keep at sea.

11,402. Why did you not anchor at Clovelly ? there is shelter there in westerly gales, is there not ?—Yes, but if the wind comes round north-west it is very poor shelter with iron-bound cliffs.

11,403. You do not consider there is any safe place until you get to Penarth Roads ?—No ; there is no safer place in the Channel than Penarth Roads.

11,404. But if there had been a roadstead further down Channel between Hartland Point and the Land's End, would you have gone there ?—Decidedly I would have gone to the first port which was a safe one.

11,405. In your experience, do you think there is great loss in vessels which are obliged to put back ?—Yes, a great many are lost, especially running up the Channel and up to the Mumbles, the tide is so strong.

11,406. In that case, do you think that a harbour at St. Ives would be the means of saving life and property ?—I have little doubt that it would ; but I have doubts whether it is a place for the position. Vessels, when they get there, are not generally close to the land, and very few vessels you will find embayed in St. Ives Bay, unless a few of the coasting vessels are caught there when the wind chops round to the north-west suddenly.

11,407. Supposing there was only one harbour to be made along the whole line of coast, do you think that a harbour at the Mumbles would be the means of saving life and property more than at any other place ?—I should think it would.

11,408. Do you know in your experience of any ships or lives being lost which would have been saved if there had been such a harbour ?—Oh yes, many. I have known a man, one of my own relatives, founder in the Mumbles, running in, in consequence of the shoal water, and all hands drowned.

11,409. Will you name the case ?—Yes; it was the *Friendship*, and I had some relations on board of her.

11,410. Were all hands lost ?—Yes.

11,411. All hands were lost ; when was that ?—In 1833.

11,412. How was the wind ?—From the south.

11,413. Where was she lost ?—I think off the Mumbles head. She brought up to her anchor, and the sea was so very heavy she foundered at her anchors.

11,414. The sea was so heavy that she foundered at her anchors. Now can you give me the particulars of any other case you recollect at this moment ?—No ; I cannot say more than that a few of the coasting vessels had some lives lost. I was not aware that I was going to be examined.

11,415. I simply ask, if you recollect any other instance ?—I do not know of any other particular instance I can mention, so as to name the ship.

11,416. I asked the question because you, as a seafaring man, when you hear of a great disaster at sea, such as loss of life and property, it naturally makes a considerable impression on your mind ?—Oh yes ; it makes an impression, but we cannot always go into these things, unless we have them down in the log.

11,417. Do you remember any other case beyond the one you have mentioned ?—I remember men being drowned because they could not get into the Mumbles, and vessels being lost, but I cannot say any particular vessel.

11,418. (*Capt. Vetch.*) Do you know Penarth Roads ?—Yes.

11,419. Is there very good anchorage there ?—Yes, very good anchorage there.

11,420. Is it extensive ?—Well, not extensive ; not deep water anchorage. There is plenty of safe anchorage on the mud to lie aground.

11,421. Is it sufficient for the vessels which frequent it ?—No ; I do not think that it is. Ships are often getting foul of one another, not being able to lie in deep water.

11,422. The ships are rather crowded there, are they not ?—Yes.

11,423. Are vessels obliged to go up to Penarth ?—Yes ; I have had ships bound to Swansea obliged to run for Penarth.

11,424. Have vessels going down Channel ever been forced up to Penarth Roads ?—Yes ; very frequently. I have been myself.

11,425. If there were a harbour at the Mumbles you would not have been under that necessity ?—Very frequently with the wind from south-west we are obliged to run back to King's Road, and there lie wind bound for a month.

11,426. If there were a breakwater at the Mumbles, would it relieve Penarth Roads of its crowded state ?—I think it would relieve Penarth of one half of the large ships lying there.

11,427. Have you ever taken shelter under Lundy Island ?—Yes ; and been at anchor there.

11,428. What is the inconvenience of Lundy Island ?—The anchorage is small, and the water is deep. You have to anchor so close into the shore to get anything like a reasonable holding, and the gusts come off the land when the wind grows heavy, the anchor is sure to come home. Anchors hold no time, and very frequently ships are driven to sea.

11,429. Do you think it would be any advantage to have moorings laid down at Lundy Island ?—It would

be an advantage, but not for vessels resorting there in westerly gales.

11,430. But still it would save a vessel now and then ?—Yes, now and then.

11,431. Therefore you think that Lundy Island should be placed in the best possible position for saving those vessels ?—Yes ; I think the moorings would be a very great advantage. A ship could get away from moorings before she could get her anchor. Till you are round you are almost under the height of the cliff.

11,432. (*Mr Coode.*) You said that Penarth Roads were silting up ; do you speak of your own knowledge ?—I speak of my own knowledge. There is not the same space of depth of water as there was 20 years ago.

11,433. How long have you known it ?—For the last twenty years.

11,434. Has it been silting up the whole of that time ?—Yes ; I think so.

11,435. To what extent has it been silting up ?—Some places that I know have lessened six feet.

11,436. You feel confident as to that ?—Yes ; I feel quite confident.

11,437. You said that you were afraid of running to Clovelly, lest the wind should come round to north-west ;—if shelter were provided at Clovelly against that wind, should you have the same dread ?—No ; of course if there were shelter I should run for it.

11,438. Then if that objection were done away with, you would have no hesitation in running for Clovelly ?—No ; but very few vessels get on that track. The large ships generally go to the north of Lundy Island ; when it falls out, that if they are at the north of Lundy Island in a north-west gale, they are in a fair way to run up.

11,439. Are you aware of the proportion of life lost in large foreign going ships, and in coasting vessels ?—I cannot say as to that fact. I have some idea.

11,440. As a native of Padstow, and having a knowledge of the Bristol Channel, where, should you say, a harbour was most required for the saving of life first ?—In what district ?

11,441. Take from the Land's End upwards—draw a line from the Land's End to St. David's Head—what site would you name that should save live to the greatest extent ?—I suppose that you are aware that, being a native of Padstow, I may perhaps speak in a prejudiced way for my own place, if I said my own place was the place.

11,442. I should like to ask you the question, setting aside any prejudice which you may have for Padstow ?—Of course, as far as I know practically as to the saving of life, from St. Ives to Hartland Point, most of the loss of life occurs, and taking into consideration its position, Padstow would be the best position, because it is in the depth of the bay.

11,443. Do you think that Padstow could be improved, so as to make it an efficient harbour of refuge ?—As to its being efficient, I think it could be so improved that you could make a harbour of refuge of it as it is. Seeing that there is 18 feet of water at low water, by spending a small amount to make a true wind in, vessels could run in as it now is. To make it efficient for a great number of ships, probably not. But I may also observe that where you have one large ship embayed you have 50 small ones.

11,444. And out of the 50 small ones, a great many lives are lost ?—I have seen many myself lost, and I have saved many myself.

11,445. The great difficulty at Padstow is the want of a true wind to get in, is it not ?—It is.

11,446. And if that difficulty were removed, many lives would be saved ?—Yes ; I have not the least doubt of it. Ten vessels the other day were driven in from Pentire Point to Trevose Head.

11,447. And do you think every one of them would have been saved ?—Every one—and every ship, because I saw them running for the harbour myself, and I saw them go ashore ; I was in the life boat, and I went to pick up some.

11,448. Then, if I understand you rightly, you conscientiously believe that more lives would be saved at Padstow than at any other point along the shore ?—Yes ; I speak of my own knowledge.

11,449. You spoke of the *Friendship* being wrecked : can you tell us whether she was coming in the ordinary course of trade, or running back to the Mumbles for shelter ?—Running back for shelter.

11,450. Had she had a cargo on board?—Yes, coals.

11,451. Where was she bound to ?—Swansea.

11,452. Do you recollect how far down she had got ?—We were down at Lundy Island. I was a boy at the time. I was in the fleet at the time when we ran back to Penarth.

11,453. Do you know how many lives were lost ?—Eight or nine, I suppose, judging from the size of the vessel.

11,454. Do you know Port Quin Bay near Padstow ?—Yes.

11,455. Do you think that if a harbour of refuge were made there, much life and property might be saved ?—No doubt of it.

11,456. Is not its position very nearly identical with that of Padstow ?—Of course the position would not make any material difference.

11,457. Do you apprehend that if there were a harbour of refuge made in Port Quin Bay, there would be any danger of its sanding up ?—I should think there would be.

11,458. Do you know the shores of that bay ?—Yes.

11,459. Is there much sand within ? Are there any coves along the shore filled with sand ?—Yes ; they are all filled with sand.

11,460. Do you mean to say that all the coves within Port Quin Bay are filled with sand ?—In the ledges between the rocks the sand accumulates along the shore.

11,461. Is there any extent of sandy beach within Port Quin ?—Yes.

11,462. Any great extent ?—No, not any great extent.

11,463. (*Sir F. Smith.*) I have before me a statement of yours, and in the last paragraph I find you say, " With respect to Lundy Island and Clovelly ; I know both places well ; the former could not be made a harbour of refuge except at a great cost, and if made would not be a useful one ;"—that is your opinion ?—Yes.

11,464. You say nothing as regards Clovelly ; I presume your opinion as to Clovelly is the same ?—I do not consider Clovelly at all so good as Lundy Island. When vessels get so far down, few get embayed in Clovelly, and if they get out they can get into Lundy Island.

11,465. And when you say that you think Lundy Island not a useful harbour you think Clovelly not a useful harbour too ?—Yes.

11,466. What course do vessels generally take from the upper part of the Bristol Channel going outwards ?—It is so long ago since I steered one that I have forgotten ; we generally make the north end of Lundy Island.

11,467. Then if the Commissioners have been told that the practice is to keep to the south of Lundy Island, and along the south coast, that is not correct ?—As far as my practical experience, unless there is some advantage of wind, it is not so. If there was a fair wind I should not take that course.

11,468. Have you ever been to Milford Haven ?—Yes, many times.

11,469. Do you think it a difficult place to make in thick foggy weather ?—There is no difficulty only returning from sea.

11,470. (*Capt. Sulivan.*) You know the first capstan house at Padstow ?—Yes.

11,471. It is well inside the end of the Ketch ?—Yes.

11,472. Suppose the point were got rid of so that you could shoot in as far as that first capstan, would you have got rid of the danger ?—Decidedly. We have cut down a small portion of the point, and we

SWANSEA.

Mr. J. Stribley.

30 Sept. 1858.

Capt. Sulivan.

find that a great advantage to vessels; but that is only a very small portion. If it were cut down level, so as to give a true wind to the capstan house, no doubt any vessel could run in and anchor in safety, and anchor at low water.

11,473. I think you said that you were one of the Harbour Commissioners at Padstow. Can you tell us the extent to which the point has been reduced?—About 100 yards from the outer point.

11,474. How much further can you now carry the true wind than before the excavation was made?—I think about a good cable's length. Any vessel of moderate size can enter in safety.

11,475. Then the effect of cutting down the point for about 100 yards has been to enable vessels to carry a true wind a cable's length further in?—Yes, so that whether it is low water or not, a small vessel can get inside the harbour, and anchor in safety.

11,476. A small vessel can now get in, and an additional quantity of the point is required to be removed for large vessels?—Yes.

Captain Crewe Read, R.N., examined.

Capt. C. Read, R.N.

11,477. (*Chairman.*) You are Inspecting Commander of the Coast Guard at Swansea?—Yes.

11,478. How long have you held the appointment?—For two years.

11,479. You have been present during this inquiry?—Yes.

11,480. Will you be kind enough to furnish the Commissioners with any opinion which you may have formed upon the subject?—I was requested by the Harbour Commissioners some time ago to give my opinion, and I made a little draught of what my opinion was. It is still the same, and perhaps if you will allow me I had better read it.

11,481. Certainly?—"I am opinion, that supposing the several difficulties can be overcome which present themselves at present from the shoalness of water, strength of tide, heaviness of the sea, and being open east-south-east and south-west, from whence heavy gales frequently blow. This position is the one which would be the most accessible and advantageous in the Bristol Channel. In working down Channel the severity of the gale is felt most when you get down to the Nash (on either side), a few miles lower down, and you could then fetch in to the Mumbles, during the ebb about 18 feet, from mid-channel, the same distance dead beat to get so far as Morte Point, if intending to try for shelter in Clovelly Roads, with a lee shore from the point to the anchorage of about 12 feet. I have known numbers of vessels run back to Penarth Roads from abreast of the Mumbles, because of no other safe anchorage and unable to contend longer with foul wind, &c. [September 12th, 1858, nearly 500 sail left Lundy Roads, Penarth, having been three weeks and upwards at anchor there. [I have seen several hundred sail weigh from Penarth Roads, 'East and West Mud Banks,' having been wind-bound for many weeks. Occasional slants would have taken them from the Mumbles during that time, and many would also have reached so far down Channel as to have been in a position to have taken advantage of them, had that roadstead been safe and commodious, and, above all things, possessing the confidence of their masters. The most considerable trade is from the Welsh ports, and, the greater part by means of small vessels, and despatch being of so much consequence to the trader, the great temptation which now exists to remain wind-bound in the upper part of the Channel would be taken away were such confidence given to the masters of vessels that at the Mumbles they would be as safe or safer, and from thence could take advantage of a favourable change of weather, which frequently happens, lasting but a short interval. During a foul wind, if fresh, the Mumbles Roads now are crowded, and much risk and many casualties have occurred there by collisions, parting from anchors, taking the ground heavily on tide ebbing, striking the ground in deep water from the heavy cross sea which comes into the bay, especially on the ebb. The Mumbles possesses a very important advantage in being near to a railway station and telegraph (electric) station at Swansea; also a coast-guard signal station for vessels wishing to be reported in shipping lists, or for the information of those concerned. A good town near where every kind of store can be readily obtained, provisions, good water in the neighbourhood, which could be brought to the spot. The nature of the ground also is good holding. It is most admirably adapted, in point of position, for a naval station, the only want being a safe anchorage in bad weather. Not only in reference to the present organisation of the coast-guard and regular naval coast volunteer services, so far as making them more available on an emergency as a national guard and coast defence, but also in carrying out fully and more effectually the whole duties now devolving upon them." Since writing this, about three days ago, I received a report from the officer at Penarth, stating that, on September the 12th, there were nearly 500 sail which got under sail, having been upwards of three weeks waiting for a slant of wind.

11,482. Does anything further occur to you to state, besides what you have written?—I think not, I can think of nothing else.

11,483. (*Sir F. Smith.*) You think that the vessels which assemble in Penarth Roads are vessels from the north ports of the Bristol Channel?—Yes; from Newport, Bristol, Gloucester, and Chepstow.

11,484. They must be a very short time out from their ports to take refuge at the Mumbles?—They are obliged to go out to allow others to come in. I have known great inconvenience in consequence of vessels not going out. They would rather sometimes pay demurrage than go out.

11,485. Then in point of fact, they congregate in Penarth, because they cannot stay at their ports of departure?—I have known also great numbers which have gone from the Mumbles and Neath, and all parts, having nowhere to anchor. I have known several go back from abreast of Lundy Island.

11,486. If they could have got back to the Mumbles, they would have preferred that to Penarth?—Yes; small vessels.

11,487. If they had to go round the Land's End, they would have kept a more southerly course?—I suppose they would.

11,488. Then they would be much more likely to desire a port on the coasts of Cornwall or Devonshire than in Wales. Would not such a port be more in their track?—I suppose so.

11,489. (*Mr. Lindsay.*) I see in the statement handed in, one of the reasons given for recommending the construction of a harbour of refuge at the Mumbles is, that it would be a suitable place for a naval station. Do you think it would be the best site for a naval station in the Bristol Channel, or between this and the Land's End?—Yes.

11,490. For all purposes do you think so?—Yes; the other side you could not get at all near in winter time, there is so much sea, and no distinctness in the land; it is so difficult to make.

11,491. Looking to the great objects which we should have in view in the formation of a naval station, do you think the Mumbles a better point than St. Ives, Padstow, or Clovelly?—I do not know Padstow or Clovelly.

11,492. Speaking only of sites, do you think the Mumbles better than either of these places I have named?—I think it would be very far better than Clovelly.

11,493. Do you think it would be better than St. Ives?—I do not know St. Ives.

11,494. Do you know the site of St. Ives?—Yes; I know the site.

11,495. Do you think it would be better than St. Ives?—When I speak of a naval station, of course, I have reference to the particular protection of Wales and the Welsh ports. I do not know that a naval station at Padstow would be applicable to Wales.

11,496. Then you are speaking of a naval station, as far as regards the coast of Wales?—Yes.

11,497. This is an important question, if I can get an impartial answer from you. Supposing that there was only one point in the whole range of coast between the Land's End right up to Bristol, and from Penarth Roads right down to Milford Haven on the other side, where the public money was to be expended, (the object of expending that public money being the saving of life and property, and the facilities of commerce and making a rendezvous for ships of war in time of war,) at what point do you think now it would be best to expend that money?—I do not think that either place would answer the end required.

11,498. You think not?—I think not.

11,499. You think it would be better to have harbours at two points?—Yes, at two points.

11,500. And what two points would you recommend?—The Mumbles and St. Ives.

11,501. (*Capt. Washington.*) You spoke of a station for defence in time of war; is it probable that war would be carried on by means of steam privateers?—I should think so.

11,502. Would ships laden with copper and silver ore, and 300 vessels on the beach, offer a tempting prey?—Very much so.

11,503. Do you know any means by which those vessels can be protected, unless there is a place for the vessels to lie in?—I think scarcely any shore capable of defence, unless you have a floating defence in conjunction with what you can have on land.

11,504. Could a vessel of war lie at the Mumbles without being driven from her anchorage?—I should think not.

11,505. Would a steam vessel of war stationed at the Mumbles be a sufficient defence for the Welsh ports?—I should think so.

11,506. Do you know the proportion of trade from South Wales and that of the coast of Cornwall or Devonshire?—No, I do not.

11,507. Is the trade of the coast of Cornwall or Devonshire very much less than that of South Wales?—I should think the trade of South Wales was very much greater.

11,508. In time of war would vessels require convoy?—I cannot say; steamers have made such an alteration, they ought to be able to defend themselves.

11,509. Do you expect merchant vessels and coasters to defend themselves?—Not coasters.

11,510. Would the Mumbles be a good station for convoys of vessels to assemble?—I think none could be better for the purpose of convoying the copper ore vessels, the silver ore vessels, and the large vessels.

11,511. Is it your opinion that a sheltered roadstead at the Mumbles would be the means of relieving Penarth Roads to a great extent?—It is.

11,512. (*Capt. Sulivan.*) I think the reasons you gave for a harbour being constructed at the Mumbles rest chiefly on the advantage of the trade bound down, being able to get in with the tide, and save going back to Penarth?—Yes.

11,513. Taking that and all the reasons you have given in favour of the Mumbles, do you consider those reasons would apply to any place in the neighbourhood of the Mumbles; any place which was almost the exact spot of the Mumbles Road, supposing that place were selected for the harbour?—Every thing must be taken into consideration—the duration of the tide. Vessels coming down Channel must think of the tide.

11,514. Do you mean that those reasons are in favour of some safe harbour somewhere in or exactly at the Mumbles Point?—I think, perhaps, the neighbourhood of the Mumbles.

11,515. Supposing there were any point where the same outlay of money would obtain a larger area and a larger outside space, beyond the three fathom line if it could be sheltered, would that be better or worse?—Naturally better, supposing what you said about the ground is correct. Taking into account the duration of the ebb tide, you cannot work up against the ebb flood.

11,516. I am taking all that and all the objects you may have in view into consideration, and supposing that a harbour equally safe and of larger area could be obtained near the Mumbles, though not at the Mumbles, would you consider it better or worse?—Yes; but always supposing that provisions and water and conveniences, which are at the Mumbles, could be procured there.

11,517. Exactly, all other things being equal?—Yes.

11,518. With respect to a naval station, supposing a port to the westward of Swansea, should you consider a few miles further down the Channel equally good as the Mumbles in the direction the enemy would be likely to come, supposing he were to come up Channel?—I think that an enemy knowing that there was a naval station a few miles to the west of the Mumbles would avoid it by keeping on the other side.

11,519. If there were good anchorage would ships go there without naval protection?—Yes.

11,520. Supposing you were going to station ships to defend the Bristol Channel against an enemy, do you not consider a most important point for watching the Channel would be at Lundy Island?—Yes, I should certainly have a cruiser cruising about in the neighbourhood of Lundy Island.

11,521. In connection with a signal station?—Yes.

11,522. Considering that Milford protects to a certain extent Swansea, would you next have a good naval station at the south entrance of the Channel to cover that line of coast?—That would be gained by the cruisers at Lundy Island.

11,523. With Milford on the north, do you not know there should be a naval station on the south side to protect that side still more?—Yes, perhaps in the neighbourhood of St. Ives.

11,524. Then with a naval station at Milford and another at St. Ives, and a cruiser at Lundy Island, you would consider the general trade of the Bristol Channel pretty well protected?—I do not think Swansea would be looked after.

11,525. Swansea I particularly alluded to. Would not these valuable cargoes which come to Swansea be sufficiently guarded from the enemy and steam privateers?—I think not.

11,526. If vessels can lie in the Mumbles Road, and enemies' vessels came there, cannot we have a vessel there to protect them?—No; I think a privateer can come in under steam, when a vessel would not be able to lie at anchor there, when she would not be safe.

11,527. Do you think, from what you know of French vessels, that they would easily come in and destroy the ships here?—I consider they could fire shot and shell, and do a great deal of damage, when it was not safe for an English vessel to lie at anchor.

11,528. If she could do that, could not an English vessel be coasting about at the same time?—I am speaking of the possibility. I am taking into consideration the risk which all vessels are running, particularly men-of-war; and I am looking at a place where they would be liable to part from their anchors, or be obliged to keep the steam up.

11,529. Is it not very different with a steam man-of-war, which can steam out at any time, to protect merchant vessels; if merchant vessels can lie there, cannot steam men-of-war lie there too, with equal

SWANSEA.

Capt. C. Read, R.N.

30 Sept. 1858.

Capt. Sulivan.

safety?—The merchant vessel is there from necessity. She is obliged to lie there waiting for water to come into Swansea; she has to lie there sometimes for days, sometimes for weeks, with a valuable cargo, before she can come in.

11,530. But if she can lie there with safety, is there anything to prevent an English man-of-war lying there for her protection too?—No, of course not.

11,531. (*Capt. Vetch.*) Which is considered the port of the greatest trade on the north side of the Bristol Channel?—The greatest trade is, I think, from Cardiff.

11,532. Which is the next port of importance?—Swansea.

11,533. And the third port?—Newport.

11,534. Do you know Penarth?—Yes.

11,535. Is it more than sufficient to give accommodation for vessels arriving and sailing from Newport and Cardiff?—No; Penarth Roads is not sufficient, but the east and west mud banks are very desirable places where vessels can lie?—They can lie there with perfect safety, from the nature of the mud.

11,536. But you mentioned that you had heard of vessels being obliged to go out of the docks at Newport, and which could not find accommodation at Penarth?—No; because there is always a nasty sea, and they would not run the risk of lying too close. The traders are on the increase, and there is more difficulty in picking up a berth. I have known vessels sunk on Cardiff Sands.

11,537. Do vessels in Penarth Roads get in collision with one another from the insufficiency of space?—Yes; because they cannot get down Channel.

11,538. Does it happen that vessels from Swansea go down Channel, and are sometimes under the necessity of putting back to Penarth Road?—I am not quite certain about Swansea vessels, though I think I have seen Swansea vessels go back to Penarth roads. When I speak of Swansea vessels, I mean vessels which have loaded at Swansea.

11,539. Does it ever happen that they go down Channel, and are obliged to put back to Penarth?—If a vessel gets as far as Lundy Island, there are no hopes of her coming back again, unless she lose some spars or sails.

11,540. Then if Penarth Roads were relieved of ships belonging to Swansea, it would be a great accommodation to the trade further up?—I think so.

11,541. And if the trade of Swansea got protection for its own vessels, it would be a great benefit to the trade of that port?—Undoubtedly.

Mr. JAMES RICHARDSON examined.

Mr. James Richardson.

11,542. (*Chairman.*) You are Chairman of the Swansea Mercantile Marine Surveying Association?—I am.

11,543. How long have you been connected with the port of Swansea in that capacity?—In that capacity simply for about 12 or 15 months.

11,544. And with Swansea otherwise?—And with Swansea for the last 30 years.

11,545. As a shipowner?—As a shipowner 15 years.

11,546. You are aware of the objects of this inquiry?—I am.

11,547. Will you now make any statement which you may wish to offer relative to the advantage or necessity of a harbour of refuge at the Mumbles?—I can only speak as a shipowner. I am not acquainted with nautical affairs, but having resided here so long, and being the owner of a large class of shipping, I must confess that when my vessels have arrived in the Mumbles Roads, I have been always in a great deal of fear for them. The Mumbles, as it is at present, is a very open roadstead, and when large vessels do come up, as they frequently do, with strong south-west winds, they are obliged to bring up so far out in consequence of the heavy sea there, that they do not derive much protection from the Head, or from the Nash Sands outside. I think if there were a breakwater, it would cause very great protection to shipping of that class which are bound in here with exceedingly valuable cargoes, and would prevent many calamities which at present happen. I myself (in 1852 I think it was) lost a vessel in Swansea Bay. She was called the *Harriet*, of 500 tons. She drove from her anchors in the Mumbles Roads. Of course she had no other refuge but the beach, because, being low water in Swansea Harbour, and it being a dry harbour, she could not get in. She therefore had to take the beach; and the gales of wind continuing for some days afterwards, she became a total wreck on Swansea beach. That is rather an extraordinary instance, inasmuch as she would not have become a total wreck had it not been for the terrific hurricane which happened a few days after she came to the ground. Another vessel of mine (in 1856 I think it was), called the *Richardson*, was coming in from Coquimbo with a valuable cargo of copper ore; immediately she came to the roadstead, with a strong wind from the west, she brought up with one bower anchor; after paying out 70 fathoms it parted; another anchor was paid out 80 fathoms before the anchor held. She was nearly on the tail of the Green Grounds; but though unfortunately she went on shore, we ultimately got her off by means of four steamers. Another vessel, the *Minnow*, (in 1852, I think that was when vessels were riding very dangerously indeed in Mumbles Road,) I watched her for several hours with great anxiety. At last I found that she had slipped from her anchors. She drove round the sands. I immediately went out with two steamboats, and got her into the piers, and saved her. These are all matters which make me feel, as a shipowner, not only that ships but that the lives of the crew are imperilled by the Mumbles as it is. In the case of the *Minnow*, she actually picked up her anchors in 10 fathoms water, low water, or rather the cable was in 10 feet at low water. Had the cable parted, the vessel would have been lost, and I have not the slightest doubt every soul would have perished. These are strong reasons for additional protection at the Mumbles, not only for vessels trading to Swansea only, but trading to the Channel. Our tides are exceedingly strong up to the parallel of the Mumbles, and the navigation is extremely dangerous. Bound down the Channel, we all know the anxiety of captains to put to sea, and sometimes they incautiously put to sea from Penarth Roads or King's Roads, and, as is frequently the case, meet with adverse winds and strong gales when abreast of the Mumbles, or perhaps it may be a little further down, and then they have no resource but to go back to King's Road, or Penarth Roads, or proceed on their voyage, if possible, under very disadvantageous prospects; but if a place situated like the Mumbles were made so that they would have some place of refuge without being obliged to go back through that dangerous navigation it would be a great advantage. I think in every possible respect the locality of the Mumbles Road is the best that there is on the Bristol Channel for the general trade, and I must say the flats afford a very great accommodation for vessels of a smaller class. I can confirm what has been already said, that the small class of shipping appear to me to prefer to run in on the mud, and if they did so when the harbour was made, they would leave greater accommodation in deep water for the larger class of vessels.

11,548. Do you think that if a harbour such as is contemplated could be constructed at the Mumbles, it would be useful as a place of call for orders?—I do not imagine that it would.

11,549. (*Mr. Lindsay.*) Mr. Richardson, I know you are a very large shipowner. Are those ships which come from Coquimbo and other places—your

large ships I mean—are they able to go right into Swansea, or must they deliver a portion of their cargo in the bay?—They generally wait for the spring tides. It is a very bad place for delivering a cargo in the bay. The cargo may be wetted, and it is very awkward sometimes to get lighters alongside.

11,550. Then your vessels are obliged to wait in the bay at times for a considerable period?—They are obliged to wait a considerable period.

11,551. Therefore during that period you feel considerable anxiety?—I do.

11,552. What is the longest time which you have had a ship lying there?—She may lie there 10 or 12 days.

11,553. Have you had one lying there 10 or 12 days?—Yes, if she comes late enough to lose the tide.

11,554. How was the wind when the first vessel to which you alluded was totally lost?—It was a little to the southward of south-west, I think.

11,555. And if there had been a harbour of refuge at the Mumbles that ship would have been saved?—They all would have been perfectly safe.

11,556. (*Capt. Sulivan.*) Have you known any life lost in your own time within the last 20 years in any of those over-sea ships arriving here from South America with copper ore?—I do not of my own personal knowledge, but I have heard of lives being lost.

11,557. Recently, within the last 20 years?—Not recently.

11,558. Has the trade of Swansea increased within the last eight years?—Very much.

11,559. Have you known, during those eight years, any vessel in which there has been loss of life in Swansea Bay?—I cannot remember any at present, but I think I have heard of a considerable loss of life further up the Channel. If there was a sort of half-way house provided to turn into, instead of going through that difficult and dangerous navigation, many lives must have been saved.

11,560. You are alluding to outward-bound ships having to put back to that roadstead?—Both those who have necessarily to put back, and likewise vessels bound up channel which do not like to take the Mumbles, and therefore go up to Penarth and King's Road.

11,561. My question referred more specifically to that class of vessels which you own?—I have not known, of my own personal knowledge, of any lives being lost on those occasions.

Mr. JOHN ROSSER examined.

11,562. What situation do you hold here?—Deputy harbour-master.

11,563. For how many years have you held that situation?—Nearly three years.

11,564. Have you been present during the course of this inquiry?—Yes.

11,565. And you have heard the evidence which has been given by the previous witnesses?—Yes.

11,566. Do you concur generally in that evidence?—In some points.

11,567. And in what points do you disagree from what you have heard?—As to the protection you have here. The Skerwether Sands bearing south seven miles distant, the roadstead is protected from south right round to west. With a south-east wind there are eight miles drift, but it is not a heavy sea, and generally speaking, vessels driving from half-flood to half-ebb meet no injury if they go ashore. If it is low water they very seldom beat in. Ships which go in from half flood to half ebb will never hurt.

11,568. Is there any other point upon which you are disposed to differ from the previous witnesses?—The great advantage is, that it would tend to relieve Penarth Roads. A ship from the tail of the Skerwether Sands always works down to the Mumbles Head, and there are frequently 200 or 300 vessels lying here aground and afloat.

11,569. You are well acquainted with the Bristol Channel?—Yes.

11,570. And as you prefer the Mumbles as a site for a harbour of refuge, give me your reason why you prefer it?—Take the Bristol Channel between Hartland Point and the Holmes. In the first place you can always get into the Mumbles with the tide going out of Penarth Roads, unless the wind should be north, when you can proceed on your passage. In an average tide vessels can make from Penarth Roads down to the tail of the Skerwether Sands, and make Swansea Bay. There is nothing to pick up a ship after she gets round the tail of the Skerwether Sands.

11,571. Do the coasting trade round the Land's End and to Ireland keep the north shore, if they can, in westerly winds?—A ship generally works the first tide to the Mumbles, and from there she gets 15 miles round the light ship just into Carmarthen Bay. She works down to above Caldy, and then works away in that course.

11,572. (*Mr. Lindsay.*) Where does a ship like to sight the land when she is running back for the Mumbles?—To the westward.

11,573. Whereabouts?—Between Oxwich Bay and the Mixons. There is a bold shore there.

11,574. Do they like to sight that point because it is bolder and clearer?—Yes.

11,575. How is the land about Oxwich Point?—It is the worst point to contend with. It stands off ragged.

11,576. Do you mean that there are some shoals running out from the point?—There are.

11,577. To what distance does the point run off ragged?—To a quarter of a mile. Oxwich Point is a very flat point and dangerous.

11,578. You stated that you have known 300 ships at anchor at the Mumbles?—Not altogether at anchor, aground and afloat I said.

11,579. You said that should a breakwater be constructed as suggested by Mr. Abernethy, 700 sail of vessels might lie within it in safety, afloat and aground; how much room would you have for vessels afloat?—At low water I should say for 200, by shortening their cables at low water.

11,580. I ask the question because by the plan I see there would be 330 acres of three fathoms of water and upwards, would that hold 200 vessels afloat?—Well, generally speaking it would; there is a good mile distance between the lower part of the Green Grounds and the Mumbles Head, and you will find better than three fathoms there.

11,581. Consequently if this breakwater were carried out a great number of vessels could lie afloat—200 of the usual class of ships?—Oh yes; and if they can lie aground they like it better than afloat.

11,582. Do you think there is any necessity, as a nautical man, to have a harbour of refuge to protect vessels at the Mumbles while lying aground?—In many cases they prefer lying afloat, but where the anchorage is much crowded they prefer lying aground, because at half-tide they are dry.

11,583. Then if the anchorage was crowded you would prefer lying aground?—Yes, I should.

11,584. (*Capt. Washington.*) How long have you been acquainted with Swansea Bay?—I have been to sea for 20 years.

11,585. Trading to Swansea?—For 15 years a master trading from Swansea.

11,586. Frequently anchoring in the Mumbles?—Yes, frequently.

11,587. Have you reason to suppose that the bay has silted up?—Very little; I know that we have more water in the harbour than ever we had.

11,588. Do you know the nature of the Green Grounds?—Partly boulder stones and partly large black round pebbles.

SWANSEA.

Mr. J. Rosser.

30 Sept. 1858.

Capt. Washington.

11,589. Can they be picked up without any difficulty ?—Yes, I should say so.

11,590. Do you know the nature of the Outer Green Grounds ?—Similar ; but I have not taken much notice of them. The lowest depth on the Outer Green Grounds is three fathoms.

11,591. You do not think there would be any difficulty in picking the stones up, and dredging the shoal away ?—I should not think there would.

11,592. Has dredging been used here much ?—It has a little, but nothing to speak of.

11,593. Has any benefit arisen from it wherever it has been used ?—Oh yes ; between the dock head and the pier entrance there is much more water.

11,594. De you think that two dredgers instead of one could be applied to Swansea bar with advantage ?—Yes, I do not see why they should not.

11,595. And get away the oyster bed ?—Yes, we might have a little more tumbling sea, but we have capital anchorage all the way up, and it would then be better. It is such holding ground that I have never known a ship drive with westerly winds.

11,596. Is there good holding ground further up to the east ?—Yes.

11,597. From what wind do you want to be sheltered ?—South and by east, along to south-west.

11,598. How is the tide ?—The tide always sets out nine hours close under the point at the head.

11,599. Are all dangers marked by buoys ?—There are buoys on the Green Grounds and the Mixons.

11,600. Have you a bell-buoy ?—Yes, on the Mixons.

11,601. Is it useful ?—Not very ; we seldom hear it when to windward of it.

11,602. It is not a powerful gong ?—No ; with an east wind and a light draught off the land you hear it, but not with a strong south gale.

11,603. Is that the time of fogs ?—We have fogs, generally speaking, when the wind is off the land, and there is not much danger.

11,604. Do you know the amount of accommodation in the docks ?—11 or 12 acres, and we shall soon have more.

11,605. Is there every facility for repairing damage to ships at Swansea ?—Yes.

11,606. Large lifting cranes ?—Yes.

11,607. And a patent slip which will take up a ship 200 feet long ?—Yes.

11,608. (*Capt. Sulivan.*) You say that the bay is not silted up much ?—I will not say positively, but nothing to speak of.

11,609. Will you say whether, within your own knowledge, the deep water at the back of the Mumbles has decreased ?—It may a little, but nothing to speak of. I will not be positive as to an inch or two ; a foot perhaps.

11,610. Can vessels go in without grounding near the Mumbles Head as far as they could when you first knew this place ?—Yes.

11,611. They can ?—Yes.

11,612. Do you know anything of the coast below Hartland Point ?—Yes; I am very well acquainted with it.

11,613. You said, I think, that you would prefer the Mumbles to any place before you got to Hartland Point ?—This side of Hartland Point, I would.

11,614. Supposing you had to choose a place, including the coast on the other side of Hartland Point, where do you think would be the best place to provide refuge for vessels bound south, bound round the land ?—Certainly I should give it in favour of Padstow and New Quay.

11,615. Do you know New Quay ?—No ; but I have been to Padstow at different times.

11,616. Do you think if the entrance to Padstow were improved it would be very valuable ?—Yes.

11,617. Did you hear what the previous witness said ?—I heard part of the evidence.

11,618. Is the principal difficulty at Padstow the eddying winds ?—With a square-rigged vessel there is great difficulty.

11,619. If a true wind were carried 200 or 250 yards further in than vessels can carry it now, would that obviate the difficulty of rounding the head ?—It would make a wonderful difference in the harbour.

11,620. (*Chairman.*) Then I understand you to say that you are decidedly in favour of Padstow as a harbour, on the other side of Hartland Point ?—Padstow or New Quay, or somewhere in that direction.

11,621. Speaking of Padstow, especially, do you think it would be a good place for ships to run for in stress of weather, if the point were cut down ?—Yes.

11,622. (*Sir F. Smith.*) Do you prefer it to St. Ives ?—Yes.

11,623. Tell me why ?—Vessels generally come in best round the Long Ships ; and, generally, running with a south wind, give the shore a good berth. If they can get up above Hartland Point they are all right. If they get an offing they get round the Land's End, or back into St. Ives Bay.

11,624. Supposing an outward-bound vessel got as far as St. Ives, and met with adverse winds, what would she do ?—A foreign vessel would keep to sea, and, if the wind were north-west, it would be a fair wind out of the Channel, between the Scilly Islands and the Long Ships.

11,625. But going to America ?—If they meet with adverse winds when bound for America, they never come back here, they put into Falmouth.

11,626. So you think St. Ives would be of no use ?—It would be of use as well as Padstow, like any other harbour of refuge.

11,627. (*Mr. Lindsay.*) Do you mean that if the improvement named was made in Padstow it would be used by all vessels, or do you look only to the coasters ?—I think it would be good for all vessels, supposing there were sufficient room and sufficient water.

Mr. JAMES WATT examined.

Mr. J. Watt.

11,628. (*Chairman.*) You command the tender the *Adder* ?—I do.

11,629. Are you well acquainted with the Bristol Channel ?—Yes.

11,630. What number of years have you known it ?—I have known it for the last 28 years ; but previous to the last six months I was five and a half years continually cruising up and down both sides of it.

11,631. Have you been present during the course of this inquiry ?—Yes.

11,632. And you have heard the evidence which has been given ?—Yes.

11,633. And you are aware of the objects of the inquiry ?—I am.

11,634. Now give us your opinion upon the subject? —I am very well aware that a harbour of refuge is very necessary in the Bristol Channel, very necessary indeed in the Bristol Channel. For five and a half years I have been cruising and sailing with coasters up and down, and from Penarth Roads down to Lundy Island. I have seen most vessels put back to the west of Lundy Island, and the west of Hartland Point; and I have generally seen them run for the Mumbles or Milford Haven, if they could fetch it ; and I believe the reason they run for the Mumbles, more than any other place, is in consequence of being small vessels, and good ground when they get round the point of the inner harbour, they put them on to the stiff mud. That is the only reason which I can assign for vessels using the Mumbles more than any other place.

11,635. Well, above the Flat Holmes, between that and King's Road, what is your opinion ?—I am not acquainted with that. My district did not go any further than Penarth Road.

11,636. Tell me what kind of a place is Penarth Road to run for at night by a stranger ?—Very good, you make the Holmes and steer south-south-west. You cannot go wrong in that direction.

11,637. Do you know Milford Haven ?—Very well.

11,638. You have heard the opinion given, that it is a bad place to make in thick weather ?—I do not hold with its being a bad place to make, I think it is very good to make if you can see the lights at all, and they are very good lights, not over high. You can see St. Ann's light further than any of the lights in the Channel, even in hazy weather.

11,639. But for a ship coming in from sea, having had no observations for three or four days, with thick south-westerly weather ?—If she misses Lundy Island, my advice would be not to try.

11,640. Why ?—Unless a vessel knows her position, I would not advise her to run for that harbour ; for although the harbour is good, and the water is good, the entrance is not over wide.

11,641. What do you say about Padstow ?—I was there once, and I hope I shall never go there again.

11,642. Will you tell me, as you were there only once, whether any special circumstance induces you to say you hope you will never go there again ?—From the locality of the place, from the accommodation it gives when you are in, and from the narrowness of the entrance. There is no room to accommodate but a few coasters, it won't hold above a dozen ; and there is a very dangerous bar on the east—the Doom Bar ; a very dangerous sand, where a great many men have lost their lives, as I see by the gravestones in the churchyard at Padstow. The entrance is remarkably narrow, and very baffling winds.

11,643. And what do you say about Lundy Island? Lundy Island is very well as a shelter from the wind at south-west to north and by east.

11,644. But with reference to the evidence as to the necessity of anchoring vessels very close in, and the difficulty of getting away upon a shift of wind, what do you say about that?—A square rigged vessel in 13 fathoms of water, particularly with a strong north-north-west or west-north-west wind, would never get out there.

11,645. What would she do ?—She would come on the island. I have had occasion myself to get a boat ahead ; but I anchored nearer in, not in 12 but in 9 fathom of water.

11,646. Do you know Clovelly ?—Yes.

11,647. What do you say about Clovelly ?—I am inclined to think it is too far embayed. All along the coast from Hartland Point there is a nasty off tide, and at all times a heavy swell flows in. There may be a harbour of refuge made in Clovelly, but I do not think that many people would attempt it in thick weather. It is a very bad place to make. The land is very high. I have been along the coast, and I could not see anything down to the water's edge.

11,648. (*Sir F. Smith.*) Are you an Ayrshire man? —I am a Banffshire man. I have been there once or twice since I left it. I think I should know it again if I saw it, but I do know the coast from John-o'-Groats' House to the Land's End.

11,649. Have you any opinion as to Peterhead as a harbour of refuge ?—Not at present.

11,650. May I ask you another question about St. Ives ?—I have never landed there, but I know the bay very well.

11,651. Do you think that a harbour of refuge constructed there would be more likely to save life and property ?—Occasionally life is lost. It has been lost latterly, but that may not happen for years again I really should not like to offer any opinion.

11,652. (*Capt. Sulivan.*) Is your vessel a sailing vessel or a steamer ?—A sailing vessel.

11,653. Did you ever go into Oxwich Bay ?—Very frequently.

11,654. What do you think of it as an anchorage in its present state as compared with the Mumbles in its present state ?—The Mumbles is much better ; it lays away two points more off the west. There is shelter in Oxwich Bay in 2½ fathoms of water, but the moment the flood makes, a heavy swell comes round, and it is most puffy and rotten ground.

11,655. Besides the bearing of the point, can you go much farther into the depth of the bay than you can at the Mumbles ?—Two points.

11,656. That is the bearing, I mean without grounding ?—No, I can come nearer the Mumbles Point. I have rode in the Mumbles four winters' gales of winds ; and frequently I have left Oxwich Bay and ran along to the Mumbles in gales of wind from west and west south-west.

11,657. (*Mr. Coode.*) You say you know Penarth Roads very well ?—Yes.

11,658. Did you hear the evidence given by a former witness as to its silting up ?—I did not.

11,659. Have you reason to believe that any change is going on in the depth of water there ?—I did not see any difference during the four years I was there, but what has happened lately I do not know.

11,660. How long is it since you were there ?—About 10 months.

11,661. Do you think that there are many others of the same opinion as yourself as to Padstow ?—I have heard many say that a smart, free, and fast vessel will go in very well, but for square sails it is no good.

11,662. You say you have seen the graves in the churchyard of the seamen who have been lost on the Doom Bar. Should you not think that was a reason for improving the entrance to the harbour ?—That remains for your judgment to say. I merely spoke of the dangerous state of the harbour at present.

11,663. You said that no man would go there who could help it ; I presume you were in that position when you went?—They get good frieghts for going to Padstow ; they get more for Padstow than New Quay.

11,664. Then you think that the wrecks are not wrecks of vessels which trade to Padstow, but vessels running in for shelter in gales of wind ?—Not so ; vessels will not run in in gales of wind ; if they can get to any other place they will not go there.

Mr. Joseph Hood Simpson examined.

Mr. J. H. Simpson

11,605. (*Chairman.*) In what capacity are you connected with the port of Swansea ?—The managing agent of Sir W. Hall and Co., of Sunderland, who have a fleet of vessels trading to this port.

11,666. What description of vessels are they generally ?—Vessels generally of 400 or 500 tons trading to Cuba and Chili for silver and copper ore.

11,667. Have you been present during the course of this inquiry ?—I have.

11,668. And are you aware of its object ?—I am.

11,669. Do you concur generally in the statements of the previous witnesses ?—In most of the evidence.

11,670. Are there any points upon which you differ from them, and state to the Commissioners what they are, if any ?—I have only heard Mr. Rosser say that small vessels prefer lying aground to lying afloat. I am rather of a different opinion from him. I should rather have a vessel lie afloat. I think, if a breakwater could be so constructed so as to keep all vessels afloat in the Mumbles roadstead, it would be much more preferable for them to lie afloat than to lie on the ground.

11,671. Is there any other point to which you wish to draw our attention ?—Nothing particular just at present.

11,672. Have you ever suffered any inconvenience from vessels having such indifferent anchorage while waiting to go into the harbour ?—I should also state that I have made about 20 voyages to the West Indies. I have experienced rough weather off the Mumbles, especially in winter time, and with large vessels I found it very heavy riding sometimes.

SWANSEA.

Mr. J. H. Simpson.

30 Sept. 1858.

Chairman.

11,673. Have you ever witnessed vessels part from their anchors?—Yes, I have.

11,674. And has any loss of life ensued in consequence, within your knowledge?—I have heard of such things, but not to my own knowledge.

11,675. Has the firm with which you are connected suffered any pecuniary loss from the circumstance of the anchorage of the Mumbles being so indifferent?—I cannot answer as to that.

Mr. GEORGE GRANT FRANCIS examined.

Mr. G. G. Francis.

11,676. (*Chairman.*) In what capacity are you connected with the port of Swansea?—I am a merchant here connected with the steam coal trade, and also one of the Executive Committee of the Mercantile Marine Association.

11,677. And for what number of years have you been connected with Swansea?—All my life. I was formerly in the Harbour Trust, and Mayor of Swansea. I have held various appointments also. For several years I acted as secretary of the New Swansea Docks, and I was one of the early promoters of it.

11,678. Is there any information which you can furnish us with respect to the statistics of the port?—I have a few statistics, but they are not quite so complete as I could wish, from the difficulty of getting the last returns of the Board of Trade; but I have a few which I can furnish to the Commissioners, and I think in the course of their inquiry one of the Commissioners asked for some information as to the loss of wrecks between given lines in the Bristol Channel. I have taken the best scale I can get—the Wreck Chart issued by Parliament for 1852, 1853, 1854, 1855, and 1856. From Hartland Point across Lundy Island to Caldy Point the total loss in the Channel appears to be 75, from Ilfracombe to the Mumbles 46 below, and therefore 29 above it. Those which are marked with a cross and severely damaged 78, 39 below Ilfracombe and the Mumbles, and 39 above it. Those marked as collisions and severely damaged are 7 in the gross, 4 below Ilfracombe and the Mumbles, and 3 above it. Collisions and total loss marked with black figures of 8, one above and 7 below. I have also taken the trade of the Bristol Channel, and I find that for the last year it claimed 65,213 vessels; that the coal from the five ports of Gloucester, Bristol, Newport, Cardiff, and Swansea exported was 3,362,000 tons, out of the gross total of 5,000,000 tons; and taking those five ports it must be remembered that Gloucester and Bristol are small exporting ports, and therefore there must be something about 3,000,000 of tons exported from the three Welsh ports of Newport, Cardiff, and Swansea. I find also that nearly one-sixth of the ships and one-tenth of the entire tonnage of the United Kingdom are given by the ports of the Bristol Channel. (*Vide Appendix.*) I thought that important in dealing with the question of probable traffic, and I have appended a plan for the purpose of showing that with the enormous coal fields of the South Wales Basin (which is comparatively only just opened), that as internal facilities are increased so will the traffic over the waters of the Bristol Channel increase, as it has already increased to an enormous extent. When attention was drawn to the importance of having some place of refuge for vessels in the Bristol Channel, I was selected to go as a delegate from Swansea to the eastern ports, to consult with them as to the best course, and to see whether we could agree which really eastern, was the best place. Having been so requested, I went to the English ports, and I found that with almost every official person with whom I communicated there was a similarity of opinion with that of persons in this locality in favour of the Mumbles. Having prepared a petition to Parliament from Swansea, it was adopted, as well as others of a similar spirit, by the Harbour Trustees and the Marine Association. I was anxious to have the accord of the Bristol Channel ports. I found at first a common desire among all, but as soon as it was found a Commission was to issue, a difference arose as to where the place should be. I said distinctly, as I was authorized to say, that we at Swansea did not look at it as a local question. It did so happen that the Mumbles roadstead was near Swansea, but I was authorized to say that if Cardiff, Newport, or Gloucester would satisfy us that Clovelly, Lundy Island, or any other place would be of more benefit if a sum of public money were expended upon it, we would honestly and anxiously go heart and hand to have that one place improved for the common good of all. I had the advantage of consulting gentlemen who, from their official position, were not swayed by prejudice, and I found nearly all in favour of the improvement of the Mumbles roadstead, but when I came to mix with merchants and other individuals having a local interest, then not unnaturally I found out a difference of opinion; the fear being, that if this roadstead were improved, although it might benefit the Channel at large, that Swansea would be benefited in a much larger proportion. The petition was prepared and signed at Newport, when at some sudden and hasty meetings it was determined to go for another place than the Mumbles. Bristol, Gloucester, Newport, and Cardiff joined in opinion that Clovelly was the best place. I found petitions to that effect were sent, but I now learn, that having made inquiry and having discovered that Clovelly is not a desirable place, they have shifted from Clovelly, and now desire some other place. Having also attended a harbour meeting at which a petition was adopted, it appears to me, that there is no difference whatever as to the desirability for the general traffic, that the Mumbles Roadstead is, above all others, the best locality judicious for an outlay of the public money. To show the enormous amount of the tonnage and the value of the exports and imports from this district, I may say that something more than 3,000,000 tons of coal are exported from the three ports of Newport, Cardiff, and Swansea alone; that the copper ore brought in foreign and home bottoms must in value be more than 3,000,000*l.* sterling per annum; that the silver ore brought in foreign and home bottoms must be something like half a million; and the development of the coal trade, which is already a great one, must tend to largely increase that trade. It must be remembered, that the Marquis of Bute created a dock out of a mud bank at Cardiff, and has gone on increasing the facilities for trade at that port. Probably some of the Commissioners will have an opportunity of seeing these things for themselves. I recollect what this port was not long ago, and the growth of its trade has been something almost incredible. I may mention that my firm, who have shipped this month between 3,000 and 4,000 tons, have been obliged to refuse large contracts for want of facilities to execute them. Looking to that, and not to the local interest, and believing that other facilities would tend to diffuse equally large supplies over the whole world, I think we are entitled to claim the aid and assistance of Parliament, to have a harbour of refuge for this Channel at the Mumbles, if anywhere. But if it should be found that some other place is better, we shall not be anxious, because the Mumbles is here, to have that selected. We do want, however, one harbour which shall suffice for the whole channel, whether near or far off. I may mention also, that not being a sailor, but taking great interest in these matters, I ventured to lay before those gentlemen in the eastern part of the Channel this important item connected with the Mumbles; that if Government intended to create defences to which the trade must look for protection in time of war, there were great facilities for the erection of batteries, and it was said that Government had determined upon the Mumbles for the site of such defences, and had ordered their construction. (*See Appendix.*) The Mumbles also affords a lighthouse, and is situated in

a thoroughly well-known locality. Another point of considerable importance to the merchant is, that if he has a ship damaged, and brought to a harbour of refuge, requiring repairs, there should be facilities for the rapid supply of such articles as may be necessary. The supply here of anchors and spars, and everything required by a ship, is most ample ; and I venture to submit to you, that this is a point which does affect the question of Clovelly, a little village on the abrupt side of a hill difficult of access, and Lundy Island, where there is no access at all. For ships that may occasionally in times of pressure require supplies and repairs, it is of the utmost consequence that they should have them promptly. They cannot have them at Lundy Island, because there are no slips or docks, or gridirons to repair ships upon, or stores to obtain supplies from. (*See Appendix.*) As to whether this mode of constructing a harbour of refuge, or another mode, is the best, is nothing to me ; but looking at the question at large as a citizen, as to which would be the most prudent and the best, I feel that the Mumbles is the most proper place for the outlay of the national funds. The question of water again is, we know, to shipping, of the greatest importance, and any deficiency of such a supply must be a difficulty for any locality. With regard to the advantage of the Mumbles as a place for ships to loose from easily, I heard what has been stated by some of the witnesses illustrated in a curious manner, and some years ago I took the trouble to ascertain all the facts. Two ships belonging to the same owner, laden with the same cargo, namely, coals, bound for the Island of Cuba, and of the same tonnage, curiously enough left the two roadsteads of Penarth and the Mumbles at the same time. You will notice that they were two vessels belonging to the same owner, going to the same place, laden with the same description of cargo, and of the same tonnage, and leaving at the same time those two roadsteads of Penarth and the Mumbles. The one which left the Mumbles roadstead reached Cuba, brought back a cargo, and found the other had only got down as far as the Mumbles. She had frequently tried to get away from Penarth, but by the state of the winds had been prevented. There she was when her fellow ship had carried her cargo to Cuba, and returned back again. As gentlemen are looking to the facilities of Penarth as compared with the Mumbles, I think that is a fact of some value. I only regret that I have not got the letter challenging anyone to contradict the points of the case as I have stated it.

11,679. Perhaps you will allow me to stop you for a moment to ask if you can, at your convenience, send a copy of the letter ?—I am sorry to take up the time of the Commissioners with so long a statement.

11,680. Pray do not misunderstand me. I only stop you to ask you to send a copy of the letter to the Commissioners ?—Yes. (*Vide Appendix.*) I hope I may not be out of order in referring to the suggestion for carrying a harbour of refuge down to a place further westward, Oxwich Bay. Probably the Commissioners are not acquainted with the interior difficulties of the country. I can assure them that there are great difficulties. There is a ridge of mountain, and the access to the coast is over a private road, through very difficult ground ; I mention that, in order that the difficulty of access may have such weight with the Commissioners as it is worth. From what has been said on the commercial aspect of this question, it is worthy of consideration in that way, because it is very fair to suppose that the cost of supply would be increased, if carried over a country of considerable difficulty. I have a number of statistics in reference to general matters, but I would rather not trouble you with little points. If there are any questions which you wish to put to me, I shall be very happy to answer them.

11,681. Any of these statistical returns, if you wish, you can leave with the secretary, and then they will come under our consideration ?—I shall be very happy to do so.

11,682. Perhaps it will be more convenient for you to take a little time to put them in a shape that will render them more easy of reference ?—I should desire that they should be correct, and to put them in as simple a form as possible to be read.

11,683. Is there any remark which you would like to make upon the evidence you have heard ? You have heard the whole of the evidence, is there any further remark you would like to make upon it ?—As I remarked, not being a seaman, I do not wish to touch upon the nautical question, but I can only repeat my opinion from long experience, having been connected with nearly all the railways proposed for this part of the country, and its dock accommodation, I think it is of vast importance to the whole of the Welsh ports that a harbour of refuge should be made at the Mumbles. There was one question at an early period of the inquiry which I heard, in relation to an additional light, but that touches more upon the nautical necessity, though I believe, speaking from my knowledge of the opinions here, there would be no objection whatever—if the nautical opinion was, that a floating light would be advantageous,—there would be no objection whatever on the part of the shipping interest to contributing, when that light is put up ; still, that is a matter of nautical knowledge, and it is not for me to say whether it should be put up or not.

11,684. (*Mr. Lindsay.*) You have made a statement which has been to me exceedingly interesting, and from which I have derived great instruction. You referred to certain vessels lost in certain districts of the Bristol Channel ; do you think it possible for you to send, among these returns which you have promised to send, a statement showing how many vessels which have been wrecked would have been saved if there had been a harbour of refuge at the Mumbles; do you think it possible to get that information ?—I can only say, that if, taking one or two persons most skilled in the neighbourhood, with such local knowledge as I may have, I can at all gain an approximation to the truth, I shall be happy to give the information to the Commissioners ; but if, in the absence of Parliamentary returns, I find that it is impracticable, I should not like to send any statement upon which the Commissioners could not depend.

11,685. You may be able to collect the facts from local information ?—Yes.

11,686. And will you endeavour to do so ?—I will endeavour to do so.

11,687. When you desired to have the opinion of all the parties interested in the trade of the Bristol Channel, did you confine your inquiry to sites above Lundy Island, or did you take into consideration sites still further down Channel, being of benefit for the saving of life and property ?—We discussed that question on several occasions, but we came to the same conclusion, which was, that we should confine ourselves to the Bristol Channel proper, or so much of it as lies above Hartland Point and Caldy. In this locality we have determined to confine ourselves to the Bristol Channel, strictly speaking. I recollect that it was very largely and fully talked over with Mr. Clegrann at the canal navigation office ; we had the charts out, and after a long conversation it was determined that the legitimate course was to confine our consideration to where vessels came from or went to. That was thought to be the principle upon which we ought to proceed, and upon that our conversation was confined to the Channel above Hartland Point.

11,688. You did not arrive at any conclusion as to the necessity of a harbour of refuge below Hartland Point ?—We considered the bulk of the trade was from the Bristol Channel proper. To deal with the Land's End was a question so wide from us, that we thought we had better limit our efforts to information which should apply east of Hartland Point.

11,689. (*Capt. Washington.*) As I see you are familiar with statistics, do you think it possible to

BIBLIOTECA DEL C.O.A.M.

SWANSEA.

Mr. G. G. Francis.

30 Sept. 1858.

Capt. Washington.

obtain a return, or an approximate return, of vessels which go to the north, and those which go to the south of Lundy Island ;—those which pass between Lundy Island and the Welsh coast, and those which pass between Lundy Island and Hartland Point ?—I do not see where I could obtain that return, because it depends on the state of the wind. If I wanted information there would be no difficulty in getting it, if it were not so wide a subject ; but I shall be exceedingly happy to take a note of the question, and see if I can succeed at all in supplying that which you require.

11,690. One important item for you to consider, in compiling such a return, will perhaps be the number of vessels trading to Liverpool, the Clyde, Ireland, and north about ?—If there is any possibility of arriving at a satisfactory conclusion, I shall certainly attend to your request.

11,691. Do you think that the trade of Swansea would be disposed to contribute towards the expense of a breakwater at the Mumbles ?—You are alluding to a passing toll.

11,692. No ?—Then in what way ?

11,693. To contribute in any manner ?—In what way would it be levied ?

11,694. Through the Harbour Trust; are there any funds available ?—They have no funds for such a purpose ; they are bound to expend their funds on particular objects named in their Act of Parliament.

11,695. What is the revenue of the Harbour Trust ? —26,000*l.* a year.

11,696. Is there no margin out of which something could be devoted to so useful a purpose as erecting a breakwater at the Mumbles ?—We have so many large works going on now in the harbour for its general improvement, we must presume that the available income is entirely absorbed.

11,697. Perhaps you are aware that on the Tyne they are contributing very largely ; in fact, that from their own funds they are erecting very large breakwater piers ?—The question may be answered, indirectly, by our having considered the question in reference to a passing toll.

11,698. I said nothing about a passing toll ?—I will say nothing then about a passing toll ; but I may venture, on the part of the local trade, to say, that what other ports may do Swansea will do. If Bristol, Gloucester, Cardiff, and Newport will all do something towards it, I should imagine that Swansea would not be backward in public spirit in doing what her neighbours wished to effect.

11,699. (*Capt. Sulivan.*) Will you be kind enough to explain some objection which you made to some returns of the Board of Trade ?—Not objections to the returns ; but that I was unable to obtain them. To my great mortification there was a large blue book to which I wished to refer, and there was not one in Swansea, and our member regretted that his copy had been sent off to a friend and not returned.

11,700. I thought you meant you had applied to the Board of Trade for returns and could not get them ?—No ; I never applied.

11,701. With reference to the supplying ships, do you or do you not believe that an outlay by Government of 900,000*l.*, when made in any place, even if there was not a house in it before, if by that outlay large numbers of shipping would be brought there,—do you not believe that men and capital would be found to go there and supply the wants which would spring up ?—That opens a wide question, which may admit of discussion. We do find, that where large sums are expended the neighbourhood soon contains a large population ; but I do not think that applies entirely to a harbour of refuge, which may have a large number of ships in the month of March and none in July ; and, unless there was a continual demand, I think prices would range very high.

11,702. (*Capt. Vetch.*) Assuming that the breakwater would be very useful in a national point of view—supposing that it would be equally beneficial to the trade of the port ;—do you not think it a fair proposition that the trade of the port should assist in the execution of the works ?—I think, speaking for myself only, that if it can be shown that any large increase and benefit would arise to the locality, and were certain to accrue by the outlay of money in that way, and in reference to what others are doing, then it is fair to call upon those who are likely to derive the great benefit and advantage, to contribute to that advantage. I believe it is not generally considered at most of the large ports, that if anything is done, they will be expected to contribute.

11,703. Supposing this proposed outlay by Parliament were held out with conditions of the kind to which I have referred, namely, that local parties should contribute,—what do you say ? — Then I can only repeat, that my belief is, Swansea would act quite as liberally as any other port in the kingdom.

Commander George Manly Aldridge, R.N., examined.

Commander G. M. Aldridge, R.N.

11,704. (*Chairman.*) You are in command of the surveying vessel here ?—I am.

11,705. How long have you been employed on this part of the coast ?—Seventeen years in the deep sea surveys of the Irish Sea, and the various ports of the Bristol and Irish Channels.

11,706. You have been present during the course of this inquiry ?—Yes, I have.

11,707. And you are aware of its objects ?—I am.

11,708. Will you now proceed to give your opinion on the different ports which you have heard mentioned ?—I would not wish to waste the time of the Commissioners ; I will, therefore, as briefly as I can, state my opinion as to the necessity of a harbour of refuge at the Mumbles. I do not know any more desirable spot in the Bristol Channel for a harbour of refuge. I have been engaged in surveying for several years, and I have seen the necessity for shelter for the immense mass of trade which there is in the Channel. During my stay this summer I have known numbers of vessels lay in the Outer Green Gounds in south winds and blowing strong, severely exposed to loss entirely of vessel and cargo. I have seen a vessel also which has been obliged to anchor in the Green Grounds to take a cargo in there, and been unable to do so, from there being too much sea. I have seen the risk incurred. If a southerly gale had come on, the vessel might have touched. It was impossible for her to make sail or beat off the shore when there was not sufficient water, even at the time of high water, to enter the harbour of Swansea. Therefore there was nothing for her but to run ashore, and, in all probability, if she had broken from her anchors she would have been lost.

11,709. Taking the general question of the outward bound trade—the foreign trade—do you view the Mumbles as a port upon which it would be most desirable to expend public money, in order to save time in the passage when they meet with bad weather, and also to save wear and tear ?—I do, for several reasons. The outward-bound trade from Bristol, Cardiff, Newport, and so forth, generally encounter southerly gales before they can reach Lundy, generally below Swansea or near Swansea. Vessels leaving Bristol, and the other ports, always leave their ports about the time of high water. From Bristol they might reach the Mumbles in one tide. From Cardiff they are sure to be down, and Newport also ; therefore if caught below the Mumbles, the Mumbles is the nearest place to make, provided a harbour of refuge were built there.

11,710. And when the weather breaks are you disposed to say, taking a general view of the most prevalent winds, that the Mumbles is the best point of departure ?—I think it is.

11,711. Taking the inward-bound trade, is it an easy place to run for in bad weather, when a ship is coming in from sea and has had no observation for three or four days? Should you consider Swansea as easy or easier to make than any other port?—It is certainly not an easy place to make, if you have had no observations; but provided you are sure that your vessel has passed the Worms Head, there is no difficulty in making Swansea.

11,712. Is there anything in the character of the soundings which renders it easy to be done?—The soundings are always a guide, but they run in even depths in the right course.

11,713. There is nothing sufficient to guide a vessel until she reaches into bay?—No, I think not.

11,714. (*Mr. Lindsay.*) You surveyed the Mumbles Bay. Have you surveyed Oxwich Bay?—No.

11,715. Then you cannot speak on that point?—No, I cannot.

11,716. (*Capt. Washington.*) You have just completed the survey of Swansea Bay?—I have.

11,717. Have you had occasion to compare it with any former survey?—I have.

11,718. With whose?—With the Admiralty Survey, made in 1831 or 1832 (it bears the date of 1832) by Captain Denham.

11,719. Is there anything that arises out of the survey which renders it unadvisable to erect a breakwater in Swansea Bay?—No.

11,720. Do you know the nature of the Inner Green Grounds?—Yes; large and small boulder stones and oysters.

11,721. Would there be any difficulty in picking up the stones, and dredging away the oyster banks?—I think there would be no difficulty. The other day, when they let the dredger drive, they brought up a dredger full of boulder stones.

11,722. Is that the general character of the other shoals of Swansea Bay?—Yes; they are all composed of stones or boulders.

11,723. Then they are not accumulations of sand?—They are not.

11,724. If they were dredged away, there is no reason to suppose they would return?—None.

11,725. In preparing a harbour of refuge, is it not advisable to use the dredger very liberally?—I think it is.

11,726. If a depth of water is gained, does it signify in what manner it is gained?—I believe not.

11,727. You would recommend the use of the dredger also?—I should.

11,728. As a seaman of 30 years or so, have you any doubt that a harbour could be constructed in Swansea Bay to take in large vessels?—I feel satisfied it can be done, and that it would confer the greatest boon that could be conferred on the whole trade of the channel. Since I have been here I have seen over a hundred vessels at anchor at the same time, and holding on in a south breeze at great risk. Some of them had nothing to trust to but their anchors, and had their anchors parted they must have been wrecked.

11,729. Do you consider that it would also, besides being a refuge harbour, be a great assistance to the trade of Cardiff and Newport?—I am fully satisfied that it would.

11,730. Have you seen any rich foreign ships laden with ore lying exposed in Swansea Bay?—Several; and on many occasions.

11,731. Considering, then, the value of the trade to this port, and that assistance would be afforded to Newport and Cardiff, are you of opinion that it has a claim on some public funds to shelter the bay?—I do decidedly. I do not think that money could be better laid out than at this place.

11,732. (*Capt. Sulivan.*) Supposing it were possible to find a place in the neighbourhood of the Mumbles in which a larger area of good anchorage could be made safe without dredging, would you consider it preferable to the Mumbles?—Certainly not. The Mumbles itself and the natural formation of the bay offer great advantages, I think, for forming quays and erecting stores. The Mumbles has great advantage over any other place I have seen in the neighbourhood.

11,733. You see no reason to think that a difference in the charts renders it unadvisable to lay out money in Swansea Bay. I see that the three fathom line is further out in your chart than in Captain Denham's?—It is.

11,734. Is the four fathom line also further out in your chart than in Captain Denham's?—I have not marked the four fathom line.

11,735. Is the five fathom line further out in your chart than in Captain Denham's?—They do not agree, but it is right I should mention that the survey at the time it was made, though no doubt accurate according to the means employed, was like others made at that time when they had not the facilities of obtaining a number of soundings, nor of running over the ground with the same certainty I can do now with a steamer and a staff, examining every part.

11,736. I am not alluding to any superiority in your survey over Captain Denham's, I merely ask do you find less water in the Bay?—Very nearly, in some places, they agree; in others there is a difference. In many places I have shoals which do not appear on Captain Denham's chart. But they are on blank spaces, showing that Captain Denham had not made soundings there.

11,737. I allude to the clear ground under the Mumbles Head. On Mr. Anderson's chart it appears to be 9, 8, and 7 fathoms. I take Captain Denham's chart, and there is 8, 8, and 7?—I have not compared the two, nor have I seen Mr. Anderson's.

11,738. From a comparison of Captain Denham's and your own, can you say that there is no decrease in the depth of water in the Mumbles Roads?—I have not compared them sufficiently to be able to state positively; I have not the elements by which I can compare. Where there is a shoal which is not put on Captain Denham's chart, it does not come under any of his soundings.

11,739. (*Capt. Vetch.*) Do you attribute the discrepancy in the surveys to the change of depth or to the want of attention in the former survey?—I cannot state, because I am unaware to what zero Captain Denham reduced his soundings. What was his standard?

11,740. But allowing for the increased accuracy and precision of charts in later years, might the difference arise in that way?—I do not think there can be any accumulation, because there is no deposit to speak of in the water. There is no sand—no sandy deposit. The water is nearly clear in the bay, unless it is disturbed by strong winds, and holds very little deposit in suspension.

11,741. Then you assume that the difference is more likely to arise from the want of precision in the former survey than from any change of depth?—I do.

Mr. Matthew Jones examined.

11,742. (*Chairman.*) What has been your occupation?—For the last eight years master of a steamer in the Channel.

11,743. For how many years have you been at sea?—17 years.

11,744. And in command of a vessel for how many years?—A master of a ship for eight years.

11,745. Have you been present during this inquiry?—Most part of the time.

11,746. And you are aware of the object of it?—Quite so.

11,747. Is there anything you wish to offer in addition to the statements you have heard made by the different witnesses?—I think it is almost a mere

SWANSEA.

Mr. M. Jones.

30 Sept. 1858.

Chairman.

recapitulation of what you have heard, what I might wish to say in the matter. There is nothing but three places named as eligible, and I should wish to give my opinion in favour of the Mumbles as much more preferable to the three named. In the first place, vessels getting under weigh at Penarth in the ebb tide get down a certain distance, they often get aslant from the south and get down to Ilfracombe; the wind then comes more up, and if there were a harbour of refuge they would fetch here, and be in a better position to loose than if they ran back to their old anchorage, because after a continuation of westerly winds the wind generally flies out to north-west, and if they are at the Mumbles it is a fair position to get to sea. If they were at Penarth they would be wind-bound of course.

11,748. And of your own knowledge you are able to tell us of large numbers of vessels being congregated at the Mumbles, when the wind blows up the Channel?—Oh yes.

11,749. You have seen that often?—Yes; and at Penarth too.

11,750. And to a greater extent at the Mumbles, than any other place in the Channel?—No, Penarth; I have seen more there after west gales.

11,751. Does it arise from the Mumbles not being safe anchorage at present?—I have no doubt Penarth is a more safe anchorage than the Mumbles at present.

11,752. (*Mr. Lindsay.*) Where do you trade to?—From Bristol down to Swansea and all ports.

11,753. Is your trade confined within the Bristol Channel, properly so called?—Yes.

11,754. You do not go to the west of Lundy Island?—No.

(*Chairman.*) Mr. Benson, there was a paper which you wished to tender in evidence.

(*Mr. Benson.*) It is a report of Capt. Claxton. It corroborates very much what Mr. Francis states as to the two vessels which belonged to the same owner, and left at the same time Penarth and the Mumbles for Cuba. It also shows that a breakwater was proposed at Swansea at that time, and as it may be of use, if you will allow me I will put it in.

(*Chairman.*) If the Comptroller of the Customs is present, perhaps he will also put in his return as to the trade of the port.

(*Mayor.*) I will hand it over and guarantee its accuracy.

(*Mr. Benson.*) There is another paper referring to the trade of Swansea Harbour in 1857 which I wish to put in.

(*Chairman.*) Then do I understand you to say that, as one of the parties interested in this inquiry, you are satisfied with the extent of the evidence which has been tendered, because you have more witnesses. The Commissioners are satisfied that they have obtained all the information which they require; therefore if you are satisfied we will not prolong the inquiry.

(*Mr. Benson.*) The evidence of the witnesses which have not been called would be to the same effect.

(*Chairman.*) Are there any other parties interested in this inquiry who wish to tender any further evidence on the subject?

No answer.

Sitting at Swansea closed.

CARDIFF.

Friday, 1st October 1858.

PRESENT:

Admiral Hope (Chairman).

Mr. Lindsay.
Captain Washington.
Captain Sulivan.
Captain Vetch.
Mr. Coode.
Mr. Evans, Secretary.

Mr. J. Croft Williams examined.

CARDIFF.

Mr. J. C. Williams.

1 Oct. 1858.

11,755. (*Chairman.*) Are you the Mayor of Cardiff?—I am.

11,756. Will you now proceed to make any statement which you may wish relative to the subject of the inquiry?—On behalf of the town of Cardiff, I may state that when we received a notice intimating that there were three classes of evidence which the Commissioners wished to have laid before them, namely, that of mercantile men, that of shipowners, and that of shipmasters and other seafaring men, we thought you would not receive any engineering evidence as to the capabilities of any port or ports. That is the reason we have no engineering evidence to tender. Perhaps I may also be allowed to state, with respect to the Bristol Channel, that the trade of the Bristol Channel altogether in the year 1856 as made up from the the returns to the Board of Trade, shows that one-sixth of the number of vessels frequenting the ports of England belong to the Bristol Channel, and that the tonnage of those vessels is one-tenth of the whole tonnage. The returns show that 398,540 vessels entered and cleared from the ports of the United Kingdom, and that the total tonnage was 52,119,977 tons. Taking the whole trade of the Bristol Channel, it shows a gross tonnage of 5,666,336 tons, and a proportionate number of vessels. This statement shows the extent of the traffic in the Bristol Channel, and we thought that in conjunction with the fact that a Royal Commission was to be sent down, it would show the necessity of harbours of refuge being formed in the Bristol Channel. I may also state for the four ports of Bristol, Gloucester, Newport, and Cardiff, the returns show that in the whole year 1856 the number of vessels entered and cleared from these four ports amounted to 37,897, their tonnage being 3,763,306 tons. I believe that the trade of Newport and Cardiff alone will show that 23,653 vessels with a tonnage of 2,545,287 tons entered and cleared from those ports. The trade of Cardiff alone for the last year showed the gross number of vessels to be 9,343, of which 3,087 were foreign, and 6,256 coastwise. I shall put in returns of the trade in the year 1835, in the year 1840, in the year 1845, in the year 1850, and in the year 1855, and for the last two years which will show the gradual increase of the trade. In the year 1835 the number of foreign vessels was only 195. In the year 1857, as I have stated, the number of foreign vessels was 3,087. In 1835, the number of coasting vessels was 2,586, it is now 6,256; showing a gradual increase of the trade of the port of Cardiff, and it is now increasing in a much greater ratio. I need scarcely mention to you the great extent of the coal and iron fields, and the increase of the population. Our imports are in-

creasing annually both as to green timber, and almost all other articles. I shall put before you the number of vessels which have entered inwards for the purpose of showing the amount of the import trade, and that return will show a greater increase than in the coasting trade. I may also be allowed to state that the foreign trade of Cardiff is one-third more than that of the coasting trade; and if we deduct 1,053 vessels which left for ports in Ireland, it will show that the largest number of vessels that have made for the English coast have come here. I think that all the vessels bound for Cork even, have made either the mid-channel or the English coast. You will have before you mercantile men, shipmasters, who have spent the larger portion of their life in the Bristol Channel, and who have been constantly up and down it; pilots who have weathered and buffeted the seas about here during the whole of their time, and they will give you the benefit of their experience, from which you must form your own conclusions. But I think you will find from their evidence that most of them are in favour of the English coast. I am happy to say that the same class of evidence which will be put before you, the evidence of men who have spent the greatest part of their lives in the Bristol Channel, will show not one tittle difference of opinion, and that they will declare that the best and most efficient harbour of refuge in the Bristol Channel would be in Lundy Island. I will now put in a statement of the export trade. In 1845 there were only 31 vessels. In 1857 the number was 165, being an increase of more than five to one. The tonnage in the former year was 1,020 tons, and in the latter it amounted to 2,358 tons, entered inwards and coastwise. There are a great many vessels coming in with iron ore, brought in from the south part of Devonshire. All these vessels must come up on the English shore. I will now just bring under your notice what may appear to be almost fabulous. The export from Cardiff of coal alone in one year amounted to 1,442,938 tons, whilst in the year 1831 there was not a single ton sent foreign. In 1857 the number of tons sent foreign was 912,000. I am not aware that I am able now to put in any further evidence with regard to the statistics of trade, but if I have omitted anything, perhaps I shall hereafter be allowed to supply it.

11,757. Certainly.—Perhaps I may add from my own evidence, that I have no doubt all vessels make Nash Point coming up the Channel. After a long continuance of westerly winds, a great number of vessels are in Penarth Harbour. At a quarter past one o'clock on Sunday fortnight, I reckoned, standing in the same spot, 194 vessels, which left Penarth Harbour. Out of that number not one came to the Welsh shore. Every one of them went to the English shore. Afterwards, later in the day, there were some 45 or 50 vessels, and not one of them came to the Welsh shore. Every one of them hugged the land, and went down to the English shore.

CARDIFF.

Mr. J. C. Williams.

Oct. 1858

11,758. You have no further statement to offer with respect to the subject of our inquiry?—I will merely put in a return of the trade of the port of Cardiff, officially obtained from the Customs. We thought it would be a more official and correct statement, if we obtained a return from the Custom House than if we obtained it from the different merchants.

11,759. (*Mr. Lindsay.*) Do I understand you, Mr. Williams, to say, on the part of the inhabitants of Cardiff, that they consider a harbour of refuge necessary in the Bristol Channel for the saving of life and property?—We do.

11,760. Did I understand you further to say, on the part of the inhabitants of Cardiff, that they consider Lundy Island to be the most suitable place for a harbour of refuge?—The whole evidence which will be put before you, and the general opinion of every person I have spoken to in the town is in favour of a harbour of refuge at Lundy Island.

11,761. Considering the necessity for a harbour of refuge and the site for a harbour of refuge, do you confine yourself to the Bristol Channel proper, that is to say, from Hartland Point upwards, or do you take into consideration any site below that?—We considered the Bristol Channel alone. The evidence which will be given before you to day, will have reference to what we call the Bristol Channel proper, from a little below Hartland Point upwards.

11,762. (*Mr. Coode.*) What was the direction of the wind upon the occasion you spoke of, when the vessels made for the south shore?—I was standing by the sea shore, and the wind was coming from the east, and the wind had so shifted that the vessels which were formerly wind bound at Penarth, were able to go down Channel.

(*Chairman.*) Before calling the next witness, I wish to make one observation with respect to a remark of the Mayor, relative to our having requested only the evidence of mercantile men generally, that is to say, of shipowners, shipmasters, and other seafaring men, and our not having required engineering evidence. The character of the evidence which we intimated our wish to obtain was the evidence to be had only on the spot, and which is not of an expensive character; but if we had called upon the port to give us engineering evidence, we should have put the port to considerable expense. Whenever we want engineering evidence we shall summon engineers before us; but that will not preclude any party who has had detailed plans and estimates of a breakwater prepared from laying those plans and estimates before us. It is left for the port to judge whether they will bring engineers before us or not, and that is completely covered by the terms of our notice, where we say that we shall be prepared to receive further evidence, in addition, which it may be thought fit to offer. Therefore any port wishing to bring forward engineering evidence is perfectly at liberty to do so.

Mr. Samuel Humphrey examined.

11,763. (*Chairman.*) You are connected, I believe, with the port of Newport?—Yes.

11,764. You are aware of the objects of the inquiry?—Yes, I am.

11,765. Have you read the report of the Select Committee of the House of Commons upon Harbours of Refuge?—I have not read the whole of it, but I was up there during a considerable part of the time when the evidence was taken in relation to the Bristol Channel.

11,766. Will you favour the Commissioners with any opinion which you may entertain relative to the advantage or necessity of establishing a harbour of refuge at any point in the Bristol Channel?—I am not able to give a decided opinion myself, but from what I have collected from those parties who go up and down the Bristol Channel, bound foreign or coastwise, I believe that the most desirable place for the service of the whole trade would be Lundy Island.

Mr. S. Humphrey.

11,767. And can you state any special reasons which your informants have given you for the selection of that site?—From its being an island from which vessels can at all times loose with a change of wind; and likewise from there being deep water on the coast of the island, large vessels are able to run there as a place of safety without being endangered by going towards the shore.

11,768. Do you think Lundy Island equally useful to the coasting as to the foreign trade?—I think it would be so generally. But there are other gentlemen connected with the port who will be better able to speak to that point.

11,769. Are they seafaring men?—Yes, seafaring men.

11,770. I omitted to ask whether you had ever been a seafaring man yourself?—No, never.

11,771. Are you aware whether any estimate or plan has ever been formed of a breakwater at Lundy Island?—No, I am not.

CARDIFF.

Mr. S. Humphrey.

1 Oct. 1858.

Chairman.

11,772. You are not aware of that ?—No.

11,773. (*Mr. Lindsay.*) Have you any nautical gentlemen from Newport able to speak to that ?—Yes.

11,774. Then I will not trouble you on that point. The Mayor of Cardiff having put in statistics of both the ports of Cardiff and Newport, if you have a return for 1856 for all ports in the Channel, each of them separate, be kind enough to put it in evidence ?—The sum total is the same, 5,677,183 tons for the Channel, both inwards and outwards. That for Newport during that period was 912,000 tons, being nearly one-sixth of the whole. The return shows each of the towns separated, both inwards and outwards.

11,775. (*Capt. Washington.*) Is that a Custom House return ?—It is compiled from the Board of Trade returns.

11,776. Does it apply only to loaded vessels ?—To vessels which come to Newport and go out.

11,777. But only to vessels in cargo. It does not include vessels in ballast ?—I do not know whether it includes vessels in ballast or not. It may include the vessels entered, but not the tonnage of the ballast.

11,778. But do not vessels in ballast require a harbour of refuge ?—Certainly.

11,779. Then really for the purposes of this inquiry we may almost double that tonnage ?—No, not so much as that.

11,780. Can you obtain the proportion of the vessels in ballast to the vessels in cargo ?—I can ascertain it for you.

11,781. You will see the object with which I ask for this information. It is most important in getting a return, that the vessels in ballast as well as those that are loaded should be included ; otherwise it would be hardly a correct return of the vessels in the Bristol Channel.

The witness, after a conference with some persons interested, said—I am informed that it does include vessels in ballast.

(*Capt. Washington.*) For all the ports ?

(*Mr. Robert Galley.*) For Newport the return includes vessels in ballast as well as loaded, but for the other ports it only includes loaded vessels.

11,782. (*Capt. Vetch to Mr. Humphrey.*) I should like to have your definition of the limits of the Bristol Channel. On the south shore, from what point do you take it ?—From Hartland Point.

11,783. Then on the north shore ?—Down to Milford Haven. In fact any part about there.

11,784. Then I understand from your definition of the Bristol Channel that it is bounded by a line drawn from Hartland Point to Milford Haven ?—I believe so.

11,785. (*Chairman.*) Have you any personal interest in the shipping of Newport ?—None. I do not know whether I may state that hearing an account of the evidence at Swansea of the value of the cargoes in the ships bound there, it would seem to me to be a very large estimate. But these vessels with copper ore are not coming up the Channel for any port, but are going direct to Swansea. This shows that these vessels are not going there calling for orders, but that that is their port.

Mr. JAMES N. KNAPP examined.

Mr. J. N. Knapp.

11,786. (*Chairman.*) In what way are you connected with the port of Newport ?—I am a shipowner. I have, in the former part of my life, been a seafaring man. I have been 17 years at sea, and seven years master of a ship. I have for many years represented the corporation at the Harbour Commissioners. I have been a pilot commissioner, and for the last 13 years I have been in business as a shipbroker at Newport. Almost every day of my life I am in communication with shipmasters in the foreign and in the coasting trade, and also with pilots ; and many times I have been up and down the Bristol Channel as master and mate.

11,787. And when you were at sea what description of vessels did you chiefly command ?—Foreign-going vessels.

11,788. And what size ?—From 300 to 600 tons register.

11,789. You are aware of the objects of this inquiry ?—I am.

11,790. Will you now proceed to offer any statement which you may have to make relative to the advantage or necessity of a harbour of refuge for the trade of the Bristol Channel ?—I am of opinion from my own personal observation and experience that a harbour of refuge is necessary. I have known several cases of loss of life in the Channel which I think would not have taken place if there had been a harbour of refuge at a proper place. With regard to the position in which I consider a harbour of refuge to be most desirable for the general purposes of the Channel, I greatly prefer Lundy Island, and for this reason, because it is in the principal track of inward and outward bound vessels, of coasting vessels as well as of foreign vessels. The Commissioners are aware that for a great portion of the year the wind in the Channel and on the coast prevails from the west, and going down the Channel with a westerly wind shipmasters naturally keep to windward, they keep on the coast of England. They would naturally do so, even if there were no particular shoals or dangers on the coast of Wales ; for a man in charge of a ship with a head wind aims to keep to windward generally, and it is customary, almost invariably the custom, for vessels leaving Newport, Cardiff, and Bristol if they proceed as far as the Nash light to reach after that towards the English shore ; and vessels bound for Ireland, for instance the great body of the Irish traders, not only sight Lundy Island but go close to Lundy Island before shaping their course for the Irish coast.

11,791. Is there anything else which you would wish to offer ?—Not anything more. I can give reasons for preferring Lundy Island to either the Mumbles or any place which I have heard named for the general purposes of the trade of the Bristol Channel.

11,792. We shall be glad to hear them.—My reason is that the Mumbles is situated in a bay surrounded by shoals, so that even if a harbour of refuge were made there no proper person, no sensible shipmaster would venture to run for such a place in the dark with a heavy-loaded ship, especially if she were disabled ; because, supposing he were to miss the entrance and drive to leeward there would be nothing but certain death and destruction to life and property. There is no remedy in such a case as that I have put ; but if you have a harbour of refuge at a point short of the Mumbles you have room to drive up ; and that is why I certainly prefer Lundy Island to any other place. All up the Channel there is plenty of room until you get to the Holmes, and there is excellent anchorage before the Holmes and the Tail of the Spit ; there is room for 1,000 sail of ships which could lie in perfect safety above the Holmes. As regards vessels seeking refuge at the Mumbles, I have never known any except small craft bound round the land. If there had been a place of refuge in Lundy Island they would have gone there, for you can generally reach Lundy Island when you get into the Mumbles.

11,793. Do I understand you to say, that above the Holmes there is anchorage so good that in heavy weather from the west with good ground tackle you can lie there in safety ?—Decidedly. Every day in the year there are ships of a large class lying there. All ships leaving Newport get out and anchor there to avoid the expense of dock duties and to keep their crew. In fact it is a common practice. I have seen a dozen vessels lying at anchor above the Holmes at one time.

11,794. What is the character of the ground ?—It is a clay bottom.

11,795. Is it good holding ground ?—Yes. I have

never known a vessel drag there unless her anchor got foul. I have never known any accident there.

11,796. It has been stated that the Trinity House will not allow vessels to bring up between the Holmes and King's Road?—That is a mistake. Parties invariably bring their vessels up there. It is a common every-day practice to bring vessels up there. There is not a better anchorage in the Channel than there is above the Holmes in westerly wind.

11,797. Then I understand you to say, that the Bristol Channel above the Holmes is a very good harbour of refuge?—Yes; it is.

11,798. In any wind or in any weather?—If you anchor there I have known the wind chop round to the east, but I never knew a ship drive ashore.

11,799. Are the tides very strong?—They are.

11,800. And does the weather tide make an uneasy sea for a ship to ride in?—Not under the Holmes.

11,801. As respects Lundy Island, taking it as it at present exists, what is your opinion of it as a place of shelter?—As it is now, a great many ships of the largest size anchor at Lundy Island bound out. They get out that far with westerly winds and bring up. At the same time, it is not a desirable anchorage owing to the sudden shifts of wind. Shipmasters do not like to bring up there; they frequently prefer to run back to Penarth.

11,802. If a vessel is anchored at Lundy Island and the wind changes to the east, is there any difficulty in getting away?—The holding ground at Lundy Island is very good indeed, and therefore it is very difficult sometimes to get your anchor. There is that danger, no doubt, if the wind should chop round suddenly.

11,803. I understand you to say, that vessels making their passage down the Bristol Channel with westerly winds keep the English shore in preference?—Invariably.

11,804. For what reason?—To keep to windward, and avoid the dangerous shoals on the Welsh coast. There are the Nash Sands, and the Skerwether Sands, and many others. Men keep away from them from the natural abhorrence which seamen have for things of that kind.

11,805. Then I understand you to say that down to Hartland Point the south shore is a clean shore?—It is a clean shore.

11,806. Is there any reason from the run of the tides to render one shore preferable to the other?—I conceive there is. I cannot speak positively, but from the nature of the two shores I should think the tide makes down on the south.

11,807. Is there anything like the tide and half tide in the Bristol Channel that there is in the English Channel?—I do not understand exactly with regard to the tides.

11,808. When a ship takes her departure from below Hartland Point would she keep down the south shore, or stretch across towards Ireland?—Where bound?

11,809. Outward-bound.—Of course she goes towards Cape Clear, there is plenty of room there.

11,810. Therefore the outward-bound trade, taking their departure from Hartland Point reach away north and west?—North-west and if the wind is to the south.

11,811. Bound round to the Land's End do they keep down the south shore?—Oh yes, if the weather is not too heavy.

11,812. Do you know Milford Haven?—I do.

11,813. Running in from the sea, expecting to make Milford Haven, after having had no observation for three or four days in thick weather, what kind of land is it to make?—I have never run for it myself. I should think it was good clear high land.

11,814. You would think it a good place to run for?—Yes; I should think so.

11,815. But you never have run for it?—No. I have been inside the Smalls up past the land there, more than once.

11,816. (*Mr. Lindsay.*) What do you say are the prevailing winds in the Channel?—South-west.

11,817. South-west?—Yes, southerly and westerly.

11,818. Is it the case that all the shipmasters with whom you have come in contact prefer Lundy Island as a site for a harbour of refuge?—I have never heard a place named in comparison with Lundy Island. When the Mumbles has been brought up, it has been condemned out and out from its very position.

11,819. Does the wind generally chop round from south-west to north-west?—That is the most common course.

11,820. Therefore south-west and north-west winds are the most dangerous?—Sometimes they go direct north-east and east, and blow furiously from the eastward.

11,821. Do you mean shifting round from south-west?—Yes; I have known it do so in the Channel. I do not know that I ever experienced it anywhere else.

11,822. And then you say when the wind gets round to north-east and east it blows strong?—Yes; very strong.

11,823. At Lundy Island, as you are aware, and as you have stated, there is good shelter with the wind west, south-west, and north-west; therefore, for the prevailing winds you have already shelter at Lundy Island?—There is shelter, but at the same time it is not perfect.

11,824. You stated that it was an excellent anchorage, and that that made the difficulty of getting the anchor after it was down?—There is good anchorage there.

11,825. But could any breakwater which could be constructed at Lundy Island make the anchorage better in west, south-west, and north-west winds than it is now, because it is itself a breakwater to these winds?—The island lies north and south, but the wind is a very uncertain thing. When the south wind springs up it sometimes goes round the compass, and when it gets at south-west it generally flies to north-west.

11,826. Would the construction of any breakwater at Lundy Island make the anchorage better than it is now during these winds?—I think it would.

11,827. How?—If it were to run out to a breakwater from the easterly end of the island in a semicircular form.

11,828. Would that improve the shelter during westerly winds?—No, the wind from the west is right off the land.

11,829. Then during these winds the breakwater would not make the shelter better?—No.

11,830. Then you want a breakwater to protect the ships when the wind comes round to the eastward or north-east?—Yes.

11,831. Have you considered how such a breakwater can be made and the effects of such a breakwater?—No.

11,832. How would you make a breakwater at Lundy Island?—I would run off a pier from the Gull Rock in an easterly direction, then I should leave a sufficient opening; then I should run a pier or breakwater from the breakwater round towards Rat Island.

11,833. Would you run a breakwater in an easterly direction, leaving a passage of a quarter of a mile, carry the breakwater round in the direction of Rat Island, and leave a passage between Rat Island and the main breakwater?—I have not gone into the engineering points. I have not given that so much attention as I have the necessity of having a harbour of refuge there.

11,834. I need not state to you as a nautical man, that there are other considerations, commercial considerations, besides affording a safe shelter. Now when the wind chops round to the eastward, which is the wind you fear, and from which you only require protection, how would ships get out of the harbour it formed as you propose?—There would be an entrance both ways. If the wind went to the north and east ships would go out south, and if it went to the south they would go out at the north.

11,835. Supposing the wind to be due east, could

CARDIFF.

Mr. J. N. Knapp.

1 Oct. 1858.

Mr. Lindsay.

they weather the pier at Gull Rock or Rat Island ?—The weather must be very heavy indeed if a ship could not make sail with eight points on her beam.

11,836. Look at the chart and see whether the construction of a pier at the Gull Rock and Rat Island would not completely embay ships in easterly winds ?—With the wind on a beam surely they could fetch out.

11,837. You know they would have to lay up many points to weather the Gull Rock on the one hand and Rat Island on the other ?—I cannot see but that a vessel would fetch out either way. If you give a good pull to your sails, what is there to prevent you from going out ?

11,838. Would the breakwater which you purpose to run out from the Gull Rock about a quarter of a mile not go out about 14 fathoms of water ?—Not so far as that, I should say.

11,839. You would propose a breakwater of a quarter of a mile, you would run it along depths of 14, 15, or 10 fathoms at the shallowest part, and would require another breakwater to make it complete about another mile and a quarter in length, so that you would have to make a breakwater and pier of full a mile and a half to provide what you consider a safe anchorage at Lundy Island ?—I will not say that ; I have not gone into the exact measurement. I run that breakwater out with my finger without any consideration at all. My opinion is, that a breakwater to be of any service should be a mile in length, and carried off from the Gull Rock so as to give protection for small vessels. I do not think you would require to carry it out a quarter of a mile. There are a great many small ships now which find shelter under the point in north winds.

11,840. Then the breakwater as proposed by you would leave little more than half a mile between the shore and the breakwater ?—I think it could run off much further than that.

11,841. But the further you run off the breakwater the deeper the water into which it would run, and the larger the breakwater you would require. Now have you any idea at all as to the cost of what you propose ?—I am not prepared to go into that. But one mile off the island there are shoal banks not with 14 or 15 fathoms of water, but with 10 or 11 fathoms.

11,842. About a mile and a quarter due east there is a small bank with only 6½ fathoms, but that is only a patch. The depth on it ranges from seven to eight fathoms, but I would have you to notice that you would require a much more extended breakwater than that which you have named, and I wish to ask whether you have considered the cost of all this ?—It would be an expensive matter, I should say.

11,843. Do you think 1,000,000*l.* could do it ?—I am not prepared to give any figure.

11,844. Do you think 1,500,000*l.* would do it ?—It would depend on how you did it. Could you not do it with convict labour ?

11,845. But do you not think, from your own great experience, that when the people of Newport recommend unanimously one particular site, they ought to have taken into consideration, first, the facilities for construction, and secondly, what would be the cost ?—The matter of expense has been frequently named, and no doubt a breakwater at Lundy Island would be an expensive matter.

11,846. Have the people of Newport had any estimate made of what they would like ?—No ; they have not.

11,847. As you have good anchorage during the prevailing winds at Lundy Island, looking also to the fact that anchorage during westerly winds could be obtained under Hartland Point along that bight, looking also to the good shelter at the Mumbles, looking too at the magnificient roadstead here, and considering also that there is above, the Holmes, a place where vessels can anchor at all times, and in all weathers, protected from all winds, do you really think that the construction of a harbour of refuge within the limits of the Bristol Channel proper would do much to save life and property ?—I do.

11,848. Can you, from your own experience, tell me any instance where a harbour of refuge would have saved life and property ?—I can.

11,849. Well, then, repeat it.—Two years ago an American ship, the *Warden*, sailed from Newport with iron. She got as far as Lundy Island. The weather became heavy from the west. She was driven ashore in Barnstaple Bay ; three or four of her crew were drowned, and she became a total wreck.

11,850. How would a harbour of refuge at Lundy Island have saved her ?—If she had got so far, she would have reached in and got to anchor.

11,851. But Lundy Island is a harbour of refuge at present in westerly winds ; is it not ?—It is not a harbour of refuge ; from the nature of the case it is exposed. It is not a place where a man likes to run in and drop anchor ; he might just get his anchor down when the wind would veer round to the north. He would rather keep his vessel under weigh.

11,852. You stated just now that no expenditure of money would make Lundy Island better than it is now during westerly winds ?—As long as the wind remains due west.

11,853. You mentioned an American ship which was lost. How could a harbour at Lundy Island have saved that American ship ?—I think she would have made it, and been safely anchored, instead of being kept at sea, getting disabled and driven ashore.

11,854. Do you think the captain of her was afraid to go in and anchor there for fear of the wind chopping round ?—Very likely he was. I should consider that was the reason.

11,855. Do you remember any other instance, at the moment, where a harbour of refuge at Lundy Island would have saved life and property ?—No ; I do not.

11,856. Have you turned over in your mind the desirability of having a harbour of refuge somewhere between Hartland Point and the Land's End ?—I have thought of it, and I do think a harbour there might be of great benefit to coasting vessels, but for the general purposes of the Bristol Channel I think not.

11,857. Then do you think that a harbour between Hartland Point and the Land's End would not be of much service to ships frequenting the Bristol Channel ?—I think not, if there was no place at Lundy Island.

11,858. Then do you think a harbour along that line of coast would be of much value to the general trade of the country ?—I do not think it would be of much value to the general trade. There are the Scilly Islands if you are caught at the Land's End with easterly winds. There might be circumstances when a harbour of refuge at St. Ives or Padstow would be very useful, but generally I do not think so, especially ships coming in from the Western ocean in a disabled state. I do not think they are likely to run for St. Ives or the Land's End. It is too narrow a point. If they could have the range from the coast of Ireland to the coast of Cornwall, and put into Lundy Island, it would be preferred.

11,859. You mentioned the Scilly Islands, do you therefore say there is a good anchorage there ? Are you aware whether that is the case ?—A great many vessels go in now in easterly winds.

11,860. American vessels ?—No ; more coasting vessels.

11,861. Among a large cluster of small islands, is the navigation considered dangerous ?—It is by strangers—by strangers more than those who are acquainted with the place.

11,862. Therefore in distress you think strangers would be afraid to run for it ?—Yes.

11,863. Then it is taken only by coasters ?—By coasters ; and some foreign Mediterranean ships go in.

11,864. Do you know whether many ships have put back after they have got as far down as the Chops of the Channel ?—It is very seldom that if vessels get as far as the Chop of the Channel they come back to the

Bristol Channel, unless there are reasons. But very often vessels get caught west of Lundy Island; if a vessel gets her cargo shifted she is obliged to run back to Penarth or King's Road, whereas, if there were a harbour at Lundy Island, she would go in and restore her cargo, and often thereby prevent damage.

11,865. Has any American ship ever taken refuge at the Mumbles ?—I never heard of any one in my life.

11,866. Supposing that a harbour were constructed at the Mumbles, to give six or seven fathoms of water at low water of spring tides, do you think that many large vessels would avail themselves of it ?—No ; it is too dangerous to run for. You have the Mixons just to the westward, with the Skerweather and Nash Sands, with a deep bay, all to leeward. A stranger would not run for it by night, and would be very careful how he ran for it by daylight during the last period of the year. I think myself that it would be very little used.

11,867. You think it would be very little used by large ships ?—It would not be used by large ships ; and the smaller class of ships, such as go there now, might avail themselves of it.

11,868. That is, small ships ? — Yes, small ships would take the ground, and are bound round the land.

11,869. (*Capt. Washington.*) I think I understood you to state that the greater part of the trade from Newport, Cardiff, and Swansea goes over to the English coast, and goes down the Channel ?—Yes.

11,870. Does it pass the north or the south of Lundy Island ?—All vessels bound west, and those round the Land's End go to the south. The Irish traders go to the north.

11,871. Does that include American ships ?—Yes, bound for Boston, Canada, the East Indies, the West Indies, and the Mediterranean.

11,872. Do ships bound for Canada, Boston, and New York go north or south of Lundy Island ?—I consider they go south, if they have a pilot, he is generally landed at Ilfracombe or about Lundy Island, and if the winds are favourable they stretch down the south shore.

11,873. Are the prevailing winds to the south ?—Yes.

11,874. I think you stated that the south-west winds commonly chop round to the north-west ; would a ship under these circumstances, rather be on the leeward or the weather shore ?—On the weather shore. But the wind does not chop suddenly. There is ample time to get to windward far enough.

11,875. You mentioned an American ship having been lost in Barnstaple Bay. Do you recollect where she was bound to ?—I think she was bound to Cuba.

11,876. Supposing a vessel was opposite the north of Lundy Island, would she be embayed ?—She might have to drive up again.

11,877. Would you as a sailor prefer passing to the southward of Lundy Island ?—I would, because the shore is better. With a fair wind I would certainly go to the south, if I were bound to the west.

11,878. Do you know the proportion of ships which pass either to the north or the south of Lundy Island ? —I cannot tell.

11,879. Are there any means of obtaining that information ?—It might be obtained from the Bristol pilots.

11,880. They would know ?—I should say so.

11,881. How far do the Bristol pilots go ?—They are paid to Lundy Island ; if there is a heading wind, they get out at Ilfracombe; the Newport pilots generally get out at Ilfracombe.

11,882. That is the first place ?—Yes ; it is the only place to land. They would rather get rid of the pilot there than chance having him out all night at Lundy Island.

11,883. Supposing you were caught below Hartland Point in a westerly gale, where would you run for ? —I would run back to King's Road and Penarth. I have known the same ship run back two or three times before she could get her passage.

11,884. What, all that distance ?—Yes.

11,885. Nearly 100 miles ?—Yes.

11,886. But supposing it were possible to construct a breakwater at the Mumbles, would not vessels rather run there than to Penarth or King's Road ?—No ; I do not think they would. There are a great many dangers with the strong tide which sets there.

11,887. Do you know Kingstown Harbour ?—Near Dublin, in the Irish sea ?

11,888. Yes. Is Kingstown Harbour commonly resorted to ?—Yes ; vessels bound from Cumberland, and some of the vessels occasionally put in there.

11,889. Do you know the distance from the Mumbles Head to the Skerweather Sand ?—It is six or eight miles I should think.

11,890. It is seven and a half miles. Now, bearing up in a south-west gale, what would be the course to the Mumbles ?—From where ?

11,891. Say mid-channel, for a vessel caught between Hartland Point and the Land's End ?—They would sight Lundy Island, and shape a course to the Mumbles about north-east.

11,892. How do the Skerweather Sands lie to the Mumbles ?—South-south-east.

11,893. There is a passage there of seven miles ?—Yes, a passage, but on a lee shore. It is no place to bring up to anchor, or for vessels struck in a south-west wind.

11,894. We were speaking upon the supposition of a breakwater being erected at the Mumbles?—To run to what distance ?

11,895. I said a vessel meeting a contrary gale half way between Hartland Point and the Land's End, where would she run for, and you, if I understood you, said Penarth or King's Road. Now, supposing there were a breakwater at the Mumbles, why should she not run to get under the lee of that breakwater ? —I consider it a very dangerous point to run for, because if a man misses the entrance and does not get in, his ship runs ashore.

11,896. I think you said the entrance would be seven miles wide ?—The entrance ought to be, but I do not know, if a breakwater were constructed to protect vessels from south-west winds, how much that would occupy.

11,897. You have suggested a mile breakwater. Let us suppose it were made to cover, to the greatest advantage, Swansea bay, what would be the difficulty of running there to get that shelter ?—If a breakwater were run south, due south, for a mile, it would be easy enough to run round and get to anchor. But what is to be done with the ship, if the wind chops to the north.

11,898. I suppose she would get her anchor, and sail with a fair wind ?—She would have no chance.

11,899. You do not think she could do it ?—No.

11,900. (*Capt. Sulivan.*) Do you consider it very desirable that a harbour of refuge should be in such a position that if a vessel in thick weather runs for the entrance and misses it, she can haul off and run seaward ?—I do, if she can haul off in safety.

11,901. Do you think that very desirable in any harbour of refuge ?—Yes.

11,902. If a vessel were running into the Mumbles, a little to the south-east of the breakwater, could she weather these shoals and save herself ?—Not the Skerweather Sands.

11,903. With a westerly wind and tide ?—I don't think she could.

11,904. Where would she go?—She would go ashore on the Skerweather Sands, or in the bight of the bay.

11,905. Supposing it were necessary to construct a harbour of refuge somewhere near Swansea Bay on the north coast, and putting aside all consideration of Lundy Island as the best position ; and supposing you had the choice of putting a breakwater at Swansea Bay or at Oxwich Bay, which is seven miles to windward, with no shoal near the entrance, so that a vessel missing would have seven miles more to weather the Skerweather Sands, where would you rather run for ?—Oxwich Bay, by all means.

CARDIFF.

Mr. J. N. Knapp.

1 Oct. 1858.

Capt. Sulivan.

11,906. Before leaving Swansea Bay, will you tell me whether the Cardiff trade would consider it very desirable to have a light on the Skerweather Sand ?—I should think it very desirable to put a light on that sand.

11,907. The Nash light is 10 or 12 miles to the east ?—Yes.

11,908. In thick weather is it very easy to run in between the Nash light and the Mumbles, without seeing either of these lights ?—Yes, it is quite possible.

11,909. Would not a vessel doing so go right upon the Skerweather Sands ?—Yes, she would.

11,910. Do you know any shoal like that without any light vessel upon it ?—I cannot call one to mind.

11,911. Do you think the trade of Cardiff would consider it worth the small toll which is levied for all light vessels, or would they object to have a light placed on it because of the toll ?—I do not think they would object. It is certainly a very dangerous place.

11,912. You say that vessels keep along the south shore generally ?—Yes.

11,913. You say that, owing to the wind prevailing from the south, they keep the weather shore ?—It is a better shore, the weather shore.

11,914. As the wind draws round, is it customary to stand to the northward ?—As the wind holds they must stand across the Channel, of course.

11,915. Do you know whether vessels find the wind too baffling under Lundy Island to haul close in?—Yes, with strong west winds. For close to the island the puffs come off.

11,916. Would that add to the difficult of hauling inside a breakwater placed off that island ?—There would be that difficulty.

11,917. Would they be liable to be thrown to leeward of the breakwater ?—I do not think it would be experienced to that extent. Under high land baffling winds cannot be avoided.

11,918. Do you know if vessels are afraid to haul round close under Lundy Island ?—I cannot call to mind many vessels under Lundy Island bound up.

11,919. I speak of vessels which put back in south-west and west gales, I presume they would round the south end of the island. In hauling round it, do you know whether they would find a difficulty from the form of the coast and not fetch the anchorage ?—It might be so.

11,920. Do you think that a small light on Rat Island would assist ?—I am not speaking of a sea light but of a small light to mark that island, to enable vessels to haul into shallower water to anchor ?—Yes.

11,921. Do you consider that if a harbour were made there it would be more necessary to keep to windward of the breakwater ?—Yes.

11,922. Supposing the expense prevented the construction of a harbour, would it obviate the difficulty of going in too close to the anchorage if large buoys were put to warp to and slip from when vessels made sail ?—Yes, certainly.

11,923. Would it be more advantageous than disadvantageous to have buoys in the way of coming to anchor ?—It would be decidedly an advantage if you could run and moor to the buoys so as to be able to slip away.

11,924. Do you think that a small light on Rat Island, and mooring buoys such as I have described, would make Lundy Island a better place of refuge than it is at present ?—Yes.

11,925. Do you know anything of Padstow ?—I do not from personal experience.

11,926. Do you know St. Ives Bay ?—Not from my own observation, I have never been there.

11,927. Have you ever been in trade round the land ?—I have been round several times.

11,928. Would it be a great point if a vessel were unable to get round the land but were able to take St. Ives to have a refuge at St. Ives where she could go instead of driving back to the Bristol Channel ?—Yes, I believe that.

11,929. More especially for the coasting trade ?—Yes.

11,930. Is there a large coal trade round the land ?—Yes, there is, from Cardiff and Newport.

11,931. And of copper ore back ?—Yes, but the coal is the principal trade.

11,932. Do you know Barnstaple bay and Clovelly road ?—Yes, I have been at Clovelly.

11,933. Supposing a harbour were made at Clovelly, if the wind shifted to the north-west being in the depth of the bay, would it not be difficult to get out ?—They would be embayed, and with heavy weather they could not start, but in ordinary weather they would tack and get out.

11,934. Do gales generally blow equally strong from the north-west when the wind comes round from the south ?—Yes.

11,935. Do you think that one point is desirable with regard to all harbours of refuge that ships should be able to go to sea as the wind draws round ?—That would be the case with Lundy Island.

11,936. With Lundy Island of course, and would it not be the same as to Oxwich bay ?—It would be an easy matter enough to get out of Oxwich bay.

11,937. Would a ship to windward be able to make a reach down Channel ?—With north winds she would.

11,938. Or north-west winds ?—Yes, north or north-west winds.

11,939. Supposing a breakwater were made at Lundy island as you propose, do you consider that if any demand arose for anchors, cables, sails, and stores for numerous vessels which put back there for refuge, that men of capital would be found to keep these articles at Lundy Island ?—There is no mistake about that, I should like to have the chance myself.

11,940. And do you consider it at all a strong point in favour of a harbour of refuge, that it should be near a place where supplies can now be found, or do you consider that if a place or harbour of refuge were established in an entirely new place the trade would follow the harbour and ships ?—The trade will follow the ships.

11,941. (*Capt. Vetch.*) With respect to Penarth, do you consider it a very good anchorage ?—It is very much cut up. For a heavy ship I prefer the east of the Holmes to Penarth.

11,942. Do collisions ever take place at Penarth ?—They do, owing to the great number of vessels lying there.

11,943. You have not room enough for the trade ?—No.

11,944. Does it ever happen that ships bound down the Channel are obliged to come back to the Mumbles ?—They come back to Penarth ; I never heard of a vessel of large size putting into the Mumbles.

11,945. Does it ever happen that a vessel from Swansea has gone down, and meeting adverse winds has been obliged to put back as far as Penarth roads ?—I think so. I have a notion in my mind that I know cases of that kind.

11,946. But as Penarth Roadstead is too small for the present number of vessels, there is great inconvenience, is there not ?—They will not come back if they can help it, and a Swansea man can come back to the Mumbles when a stranger cannot.

11,947. Supposing they cannot get shelter there, do they ever come back to Penarth ?—Yes, they are bound to come back.

11,948. (*Mr. Coode.*) Will you be good enough to mark on chart 1180, the position above the Holmes where ships can anchor in the manner you have described ?—I have done so.

11,949. The line which you have marked embraces the area within which ships generally bring up ?—I have marked it in a rough manner.

11,950. Have you ever anchored at Lundy Island ?—I have never had occasion to anchor there.

11,951. How do you know that vessels are in the habit of leaving their anchors there ?—I heard yesterday that a man found an anchor come up with his own.

He found his anchor rather hard, and when it came up there was another anchor fastened to it.

11,952. You spoke of the heavy puffs coming out of the high land of Lundy Island, and being felt only within a certain distance. How far off must a ship anchor to be free from the influence of these puffs?—I did not say "heavy" puffs; but as you approach the island the wind begins to baffle, and sometimes it veers several points.

11,953. Within what distance must you come to meet with these puffs?—Within a quarter of a mile.

11,954. They will not extend beyond that?—I do not think they will extend beyond a quarter of a mile.

11,955. Have you been dodging about there?—I have myself.

11,956. Then you speak of that fact from your own knowledge?—Yes, I do.

11,957. (*Chairman.*) Until to-day your attention has not been drawn to the facilities of Oxwich Bay as a harbour?—I have not heard it mentioned before.

11,958. Does it alter your opinion as to Lundy Island being the best site?—It does not—not for the general purposes of the Channel.

11,959. Now with reference to the business which you said you would be glad to undertake at Lundy Island. If a good harbour of refuge were there, would there be any material difference in the charges made for materials at Lundy Island and the charges made at Cardiff?—I think that matter would remedy itself unless a man obtained a monopoly.

11,960. You think that competition at Lundy Island would be sufficient to bring the charges down to the same or pretty much the same rate as at Cardiff?—I suppose there always may be some difference between a place of that kind and a place where there is open competition, but I presume that with boats and tugs no man will be able to charge an extreme or exorbitant price.

11,961. But would not the position of Lundy Island render it necessary to make some different charge on various articles?—It might. At the same time you would have house rent very cheap which might compensate for the position.

11,962. So that upon the whole you are disposed to say as a man in business, there really would not be any material difference in the prices charged at Lundy Island and the prices charged at Cardiff or Swansea?—I do not suppose there would be. I suppose that a telegraph would be laid down immediately. If a vessel got dismasted she might send to Swansea, and any articles required might be sent down in a pilot boat or tug boat, if she would rather do that than purchase the articles in the Island.

11,963. And that would not materially increase the price?—I should not think it would, not materially; but a person would be willing to pay more to have things on the spot than have to get them elsewhere. It would not materially affect the price I consider.

11,964. (*Mr. Lindsay.*) You mentioned your being at Clovelly, but you did not express any opinion as to its suitableness as a site for a harbour of refuge?—I think that a very excellent harbour might be made there, and that it might be rendered valuable for many purposes, but at the same time I do not think it would be equal in point of position to Lundy Island. The arguments in favour of Lundy Island preponderate.

11,965. But if it rested between Clovelly and the Mumbles which place would you prefer?—Clovelly, by all means. There you have a fine bay, and the water shoals gradually.

11,966. And if you had the choice between Clovelly and Oxwich Bay which would you choose?—Why, Clovelly. I would still give the preference to Clovelly. There is one thing, I have never been into Oxwich Bay, but the thing is narrow to my eye.

11,967. I understand you to say that you would give the preference to Lundy Island over Clovelly, and to Clovelly over the other places?—I do.

11,968. (*Capt. Washington.*) Do many vessels come up here which receive damage?—Yes; to Cardiff and Newport.

11,969. Are there both at Cardiff and Newport facilities for doing repairs, a patent slip and graving dock?—There are graving docks but no patent slip. There is a gridiron at Cardiff, and one is in the course of construction at Newport.

11,970. And they have been found useful?—Yes.

11,971. I think you said you would be glad of the chance of sending supplies to Lundy Island. Would you be equally glad to have the chance of placing a dock there?—That is not the same thing. The ship would be temporarily repaired, and then come up to one of these ports.

11,972. Have you ever been at Lundy Island?—I have never been ashore there.

11,973. Are you aware that the sides of that island are precipitate?—Not precipitate.

11,974. Is there any flat land on the shore?—I do not think there is much.

11,975. You were asked by Capt. Sulivan whether warping buoys for mooring to, would be advantageous?—I think he asked me about mooring buoys.

11,976. (*Capt. Sulivan.*) I meant buoys sufficiently strong to warp to, and to slip from?—I understood buoys sufficiently strong to moor ships to. But merely to assist a ship in getting her anchor, I do not think that is much of an object. If buoys could be put down to moor ships to, I think it would be an advantage.

11,977. (*Capt. Washington.*) Would mooring buoys be very useful in Lundy roads?—Very useful.

11,978. How many pairs would you put there? would you put 20 pairs?—I should think that would be more than is required.

11,979. Would 20 pairs be a great assistance to the trade at Lundy Island?—I should think they would be more than is required.

11,980. Well, say 10 pairs. Do I understand you to say that to slip from the shore it is very difficult to get your anchor? Slipping from the mooring would be a very simple affair, would it not?—Yes.

11,981. Then 10 pairs of mooring buoys would be a great benefit?—Yes; it would be a great assistance as far as that goes.

11,982. Your last answer to Capt. Sulivan was very distinct, that the trade would follow the ships?—Yes; that is my opinion.

11,983. Supposing, then, that there was a harbour in Oxwich Bay, do you think the trade of Swansea would flit to Oxwich Bay?—No; what I understood by the trade, was the ordinary supply to ships. I do not say that if you establish a harbour at Oxwich, the trade of Swansea would go there, after docks, and warehouses, and all other facilities have been provided at Swansea.

11,984. You only meant that supplies would follow the ships?—Yes; supplies was what I referred to.

11,985. (*Capt. Sulivan.*) Do we understand that your remark only refers to those supplies which would be necessary for vessels taking refuge?—Yes.

11,986. And nothing else?—Yes.

11,987. Supposing a harbour were made at Oxwich enclosing a larger area than at the Mumbles, do you think there would be the least difficulty in obtaining from Swansea or some other port supplies of anchors or cables, when vessels coming back have need of them?—There would be no difficulty. But I do not wish to be understood as speaking in favour of Oxwich.

11,988. I quite understand you. We are supposing that Oxwich is better than Swansea. But I will now ask you, would you prefer Oxwich, which is seven miles more to windward of the shoals and clear ground, to the Mumbles?—I should prefer Oxwich.

11,989. But your answer has no bearing at all upon Lundy Island?—Just so.

11,990. You say that you prefer Clovelly; but leaving out Clovelly or Oxwich Bay, or any place, if with equal facilities of making a harbour, you had the choice of putting one on the south side near Barn-

CARDIFF.

Mr. J. N. Knapp.

1 Oct. 1858.

Capt. Sulivan.

staple Bay, or on the north side near Oxwich Bay, having on the north side the advantage of the weather shore, when the wind was round to the north-west, and a fair wind to go down Channel, and on the other side having a lee shore, on which side would you put the harbour, all other things being equal ?—I think the south shore is the weather shore the greater part of the year.

11,991. Is a harbour of refuge wanted more on the lee shore or weather shore in the prevailing winds ?—A harbour of refuge is wanted on a lee shore.

11,992. With a south-west wind prevailing would ships want to go into a harbour of refuge on the south shore, or would they prefer a port where, when the wind changed, it would be a fair wind out of port, and to windward to reach down the Channel ?—I think they would prefer to go on the weather shore.

11,993. (*Chairman.*) Do ships ever call for orders at the Mumbles ?—Very seldom. I have ascertained, and find it very difficult in chartering a ship to get a provision inserted that she shall call at the Mumbles for orders. They do not mind her calling at Penarth. And I have had it from some of the principal merchants that they have experienced the same difficulty.

11,994. Can you state the reason for that ?—The danger on bearing up off the Mumbles, surrounded as it is by shoals to the west and to the east.

11,995. And supposing a good harbour of refuge at the Mumbles, would the difficulty still continue to the same extent as at present ?—Pretty much the same. I do not think a harbour of refuge could be constructed at Swansea to gain the confidence of the public ; that is my own opinion.

11,996. Are you at all acquainted with the road-stead of the Mumbles ?—I have never anchored there, but I have been there, and I know the place very well.

11,997. Can you state whether Swansea Bay has silted up ?—Not from my own observation, but I have understood that it has silted up.

11,998. You have understood so, but not from your own experience ?—Yes.

11,999. Did the corporation of Newport petition in favour of a harbour at Clovelly and Bideford Bay, as best adapted for the general interests of the ports in the Bristol Channel ?—I believe they did, but I believe that was rather hastily considered ; and when Lundy Island was mentioned the expense of construction was considered ; and therefore when it was first brought before the corporation of Newport, Clovelly was urged.

12,000. I think you stated in a previous part of your evidence that the opinion of everybody you had talked to was in favour of Lundy Island ?—No, I will not say everybody. I have never heard anyone speak in favour of the Mumbles. I have heard several gentlemen speak in favour of Bideford ; they prefer Clovelly because they are at home there, and that gives the basis of their judgment.

12,001. You think the idea of Lundy Island as a harbour of refuge is rather damaged by the idea of the great expense it would involve ?—That is the only argument which I ever heard against Lundy Island as a place of refuge for the purposes of the Channel.

12,002. And putting that aside, it would be the general opinion that it is the best site ?—Yes, decidedly.

12,003. (*Capt. Sulivan.*) Would not Clovelly have exactly the same objection as the Mumbles, that if a ship missed it in a westerly gale she would get to leeward in Mort Bay, and would go ashore ?—Not to the same extent.

12,004. Not to the same extent ?—No.

12,005. (*Capt. Washington.*) We have heard it stated that two ships started together bound to Cuba. That they started from Penarth together. That one was able to reach into the Mumbles and that the other put back to Penarth ; that the one made her voyage to Cuba, and came back and found the other at Penarth or the Mumbles ?—I have never heard it in that shape exactly. I recollect reading in Adam Smith's "Wealth of Nations," that one vessel made a voyage to the West Indies and came back before another had got on her voyage. But that was merely for want of perseverance.

12,006. The shoals and the tides had nothing to do with it ; it was merely the want of perseverance ?—Just so.

12,007. (*Capt. Sulivan.*) The story we have heard is that one vessel sailed from the Mumbles and that the other sailed from Penarth, that they were driven back, the one to Penarth and the other to the Mumbles, and that the Mumbles ship being able to loose with a slant of wind, when the Penarth ship was windbound, the Mumbles ship was able to make her voyage and return and found the Penarth ship had only reached the Mumbles. But supposing a harbour were constructed would that make the least difference ?—Certainly not. A harbour would make no difference so far as the voyage is concerned.

Mr. Wm. C. Webb examined.

Mr. W. C. Webb.

12,008. (*Chairman.*) In what way are you connected with the port of Newport ?—I am a ship-owner, a pilot commissioner, and I have been in the coal trade for 20 years.

12,009. Were you ever at sea ?—As a boy, for about two years.

12,010. You are aware of the objects of this inquiry ?—Yes.

12,011. Will you now proceed to state any opinion which you may entertain as to the advantage or necessity of a harbour of refuge in the Bristol Channel, and where in your judgment would be the most eligible site ?—I have had considerable experience in the trade of the Bristol, the North, and the English Channels, and I think it most desirable that a harbour of refuge should be formed in the Channel ; and after giving the matter great consideration, I think Lundy Island would be a most desirable place; nearly all ships make that a starting point, and returning home bound for this Channel they always round for Lundy Island, that is the rule. They try to make Lundy Island because it is a bold clear open place; men are not at all timid in making for it, because if they happen to miss there is plenty of room to come up Channel. Most vessels take it going down Channel, all vessels which make a quick passage, and which make the best passage. I have had a good deal of experience in the north trade, and I have always found that when vessels have kept to the south side they have made a better passage to Liverpool than if they had kept the coast, and I have laid it down as a rule to my captains that when they have left Penarth they are to get away to the south, and I have always found they made a better passage. Assuming that when they were returning they made the point, I have recommended them to try to stretch across to Lundy Island or in that direction; and where I have had ships bound foreign, where I have had heavy ships, I have started from the tail of the Spit above the Holmes. I have always calculated that with moderate weather ships will get away from Lundy Island. I have never had but two come back ; one of them was dismasted and the other with a cargo of iron had her cargo shifted. By forming a harbour of refuge there, ships would have greater advantages than in any other part of the Channel; they would have a long drift and a bold shore, if they missed the harbour of refuge, which would sometimes be the case I suppose in thick weather.

12,012. What became of the vessels in the two instances which you have named ?—One of them anchored in Penarth outer roads ; the ship carried 900 tons, and her mast was put in there. The other anchored at the Spit, was brought up to Newport, and sent to Bristol to be repaired.

12,013. And what was the state of the vessel whose

cargo shifted ?—She lost a good deal of her bulwarks, and stern, and her jib-boom, and things of that sort.

12,014. From your knowledge of the Bristol Channel in running in heavy weather from the south-west, should you have any hesitation as to the safety of the ship if you anchored on the tail of the Spit ?—I have had ships of 1,500 or 1,600 tons with one of the heavy gales from the south-east shifting round to the north-west riding there with a single anchor.

12,015. What sort of a cable had she ?—A chain cable.

12,016. What quantity of cable had she out ?—I never fear when my ship is there ; it is the best of holding ground, I never knew a vessel start her anchor there.

12,017. Then you are disposed to say that it is a capital natural harbour of refuge ?—It is a good holding ground ; I have never known any accident happen, because at half tides ships are sheltered by the sands in a great measure.

12,018. Do you know anything of Milford Haven ?—I do ; I know something of that haven.

12,019. Have you ever had occasion to run for it in thick weather from the sea ?—Yes ; I have had occasion to miss it and pass by.

12,020. Give us your opinion as to what sort of a place it is for a ship to make which runs in from the sea after having had no observation for a few days, and in thick weather ?—I should hardly risk it, because there are so many rocks in the neighbourhood of it and at the entrance of the harbour. There is the Cross Rock, and even those who are best acquainted with it, have been known to strike upon it.

12,021. (*Mr. Lindsay.*) Have any of your ships ever had occasion to take shelter at the Mumbles ?—Some small coasters have done so occasional, but very rarely, because I have always endeavoured to make them avoid it. I object to taking shelter at the Mumbles.

12,022. If a harbour of refuge were constructed at the Mumbles, so as to give seven fathoms of water within the breakwater, would you restrict your large ships from running for it when in distress ?—I would.

12,023. Why would you do so ?—Because they are surrounded with so many dangers and shoals, that if they miss there is nothing for them but going ashore.

12,024. Is it your opinion, as a large shipowner, that if a harbour of refuge is to be made in the Bristol Channel, Lundy Island is the best site for such harbour ?—I think it is.

12,025. Taking into consideration the cost ?—I suppose that is for some one else to consider.

12,026. Do you think that a harbour of refuge at Clovelly would be of great advantage to you as a shipowner ?—I believe it would be of great advantage.

12,027. More than one at the Mumbles ?—Decidedly ; there is a better outlet.

12,028. Do you know Oxwich Bay ?—No ; I should not like to speak as to Oxwich Bay.

12,029. Should you think a harbour of refuge at St. Ives would be of advantage to the shipping frequenting the Channel ?—As I have said before, when a ship gets moderate weather at Lundy Island, she generally wishes good-bye to the coast.

12,030. Did you hear the evidence of Mr. Knapp ?—I did.

12,031. Do you agree generally in the evidence which he gave ?—I do, generally.

12,032. Is there any point in which you differ from him ?—No ; but I hardly know what to make of those buoys in Lundy Roads ; how you are to moor to them in bad weather. It is a very good refuge place to run for, but I am afraid it is too much to say that you can get in, drop your anchor, and moor your ship to a buoy.

12,033. Then you think the mooring buoys would be of very little value, simply because of the heavy weather ?—Yes ; we don't want ships to go in there in fine weather ; they don't want to go in except to idle away their time, and we don't wish to encourage them to do that.

12,034. Do you think that a light on Rat Island would be an advantage ?—Do you mean after a harbour of refuge was formed ?

12,035. No ; supposing that no harbour of refuge was formed ?—It would be even now of advantage, because of the variable winds ; vessels want to know how to go to it.

12,036. You have no doubt given this question great consideration, considering that you are a shipowner ; do you really think that a harbour of refuge from Lundy Island upwards would do much to save life and property ?—I think it would at Lundy Island, and for this reason, the best of reasons. I am consul for Norway and Sweden ; and a Swedish brigantine, laden with coals, went down to Lundy Island, to the windward of Lundy Island; the ship sprang a leak and came back here, thinking she could come to the Spit or to Newport, and she sunk, and there she lies between the Holmes ; whereas if there had been a harbour of refuge at Lundy Island she would have gone in there and have been saved.

12,037. (*Capt. Sulivan.*) Were the lives lost ?—The lives of the persons were saved in a boat, and they were landed at the Holmes.

12,038. If the ship could not keep afloat under the Holmes, could she have kept afloat under Lundy Island ?—Perhaps she would have had some assistance, and perhaps there would have been some beach to put her upon at Lundy Island.

12,039. Do you think it desirable that a harbour of refuge should have a clean beach at the bottom of the bay, in addition to a good anchorage ?—It would be desirable if it could be had.

12,040. Which do you think the most dangerous bight to run for in thick weather, Swansea Bay or Carmarthen Bay ?—Swansea Bay, because it is the worst of the lot, in consequence of its being surrounded by so many dangers.

12,041. Can you find a more dangerous place for a ship to run to for shelter in a south-west gale ?—No, I cannot.

12,042. You have heard Mr. Knapp's opinion as to the necessary supplies being always likely to be obtained whether in a town now existing or in a new one ?—Yes.

12,043. Do you concur in that evidence ?—Quite so ; there is no difficulty at all at Lundy Island. Plenty of people would be glad to have the chance of supplying the stores.

12,044. Have you, in your experience, known any case in which a vessel having passed Lundy has afterwards been lost with any destruction of life ?—The vessel I just mentioned was lost.

12,045. But you told me, also, that no lives were lost. Do you know any vessel a portion of the crew of which was lost after she had put back for refuge in the upper part of the Channel ?—I have known vessels driven up to King's Road and above the Shoots and lost there.

12,046. Were any lives lost in these ships ?—Yes, I think lives were lost.

12,047. But with respect to vessels from Newport, which might have used a harbour of refuge if there had been one there, having been driven back and wrecked, have you known a portion of the crew lost by the wreck afterwards ?—I cannot call any instance to my memory just at this moment.

12,048. (*Chairman.*) Supposing there were a harbour of refuge at Lundy Island, what is your opinion as to the necessity of there being another also between Hartland Point and the Land's End ?—Not if there were a harbour of refuge at Lundy Island, because ships would not start from Lundy Island unless it was a moderate day, and if it was a moderate day they would get clear of everything.

12,049. Are there not a considerable number of traders round the Land's End which keep close in to the coast ?—Probably coasters.

CARDIFF.

Mr. W. C. Webb.

1 Oct. 1858.

Chairman.

12,050. Is not the coasting trade very considerable ?—It is considerable in the Channel.

12,051. Do you think anything is necessary for the saving of life in addition to a harbour of refuge at Lundy Island ?—I think it would be desirable if anything could be done.

12,052. Where would be the most eligible site in your opinion between Lundy Island and the Land's End?—I should not like to speak to that, because I am not well acquainted with the place, but I think somewhere in the neighbourhood of Padstow.

12,053. Although you are not able to speak from your local knowledge of any precise site, do you think a harbour somewhere about there would be useful ?—Yes; because as the south-west winds generally fly to the north-west, coasters cannot clear the Land's End, they cannot get up to Lundy Island; and if a place not of so much magnitude as the other could be made, I think it would be very desirable for the coasting trade.

Mr. Jenkin Jones examined.

Mr. J. Jones.

12,054. (*Chairman.*) Are you a seafaring man ?—Yes.

12,055. How long have you been at sea ?—40 years

12,056. And of these 40 years, how many years were you in command of vessels ?—37 or 38 years.

12,057. And what description of vessels, generally speaking, did you command ?—The first I commanded was a schooner, then a brig, then a barque, then a ship. I have commanded large schooners.

12,058. What sized vessels have they been which you have chiefly commanded ?—I have now a schooner of 120 tons; the first was 100 tons; the brig was 210 tons.

12,059. What is the size of the largest vessel you ever commanded ?—540 tons.

12,060. And in what trade were you chiefly employed ?—In the American trade.

12,061. Have you been present during the course of the inquiry ?—No, not the whole of it.

12,062. You know the objects of it ?—Yes.

12,063. Will you give any opinion which you may entertain as to the necessity of a harbour of refuge for the Bristol Channel; and where you think it should be placed ?—I have had a good deal of experience in going up and down this Channel; and frequently I have got down to Lundy Island and have been obliged to turn back. I have been down and come back, and gone down again, and I have anchored under Lundy Island for six days, during which time there was great uneasiness here as to what had become of the ship. I have frequently dodged under Lundy Island both with east and west winds. I was under Lundy Island with it blowing a heavy gale from the west when the masts were cut away. I have laid there with the wind from the east the whole night. I have not frequently run back, but I have often spent a day under Lundy Island and anchored there.

12,064. Therefore, in your experience, you have found Lundy Island a most useful place of shelter ?—Yes, it is the only place of shelter. On one occasion I was nearly down to the Land's End and had shifted my cargo; I came back to the Mumbles, where we generally anchor our ships, and I was never there afterwards, not with a vessel wind bound. I loaded a vessel at Swansea four years ago, and came to the outer road and lay there; she drove from her anchors, got foul of another vessel, and I had to pay for the damage. A chain anchor of 35lbs. did not hold at all.

12,065. Have you ever anchored above the Holmes in heavy weather ?—No. I have anchored in the bay up there, but I am very little acquainted with the Holmes.

12,066. Do you know Milford Haven ?—Yes.

12,067. Have you ever run for it in bad weather ?—Yes, I have.

12,068. And when you run for it, did you know its exact position ?—Well, we did, or we should not have attempted it.

12,069. (*Mr. Lindsay.*) You said that you anchored to the west of Lundy Island ?—No, I did not. I said I had laid there.

12,070. Is there any anchorage to the west of Lundy Island ?—I have never seen a vessel at anchor there.

12,071. If a harbour of refuge were to be constructed in the Bristol Channel what site would you consider the most advantageous ?—I should say Lundy Island, taking all winds into consideration. Lundy Island is a place you can start from whether you are bound for the west or round for the north. It is certainly the best and most advantageous place in the Channel.

12,072. Does the wind ever chop round from the north-west to the east ?—Sometimes. I have come from forty to fifty times from America, and I have had occasion to notice that the wind will fly out from the north-west sometimes to the east, but not as often from the south-west. The south-west is the dangerous wind in the Bristol Channel.

12,073. Have you found good shelter under Lundy Island ?—Yes.

12,074. With the water smooth ?—Yes, close in. There is a roll coming in but no sea that would break. There are rollers there.

12,075. And if a harbour of refuge were made at Lundy Island the object would be a protection from east wind?—We very seldom want shelter in east wind. I scarcely ever have sailed with an east wind, but generally when I have done so, I have beaten up.

12,076. Can you have good anchorage at Lundy Island during south-west and north-west winds?—Yes.

12,077. What protection, then, do you require ?—It is not a place that a stranger would like to take.

12,078. Why so ?—Why, a stranger does not know and cannot find out the anchorage.

12,079. Would a breakwater lead to improve the anchorage during westerly winds ?—Decidedly. Ships have great fear of going in now, lest the wind should chop round to the east.

12,080. If a breakwater were made, would it not increase the difficulty of ships being able to get away ?—I do not think it would. Any ship could get away in east winds.

12,081. But supposing there were a breakwater ?—It would depend upon whether there were one or two passages, but I think a ship could always get away.

12,082. Could ships get away with as much facility, even if a passage were left to the north and to the south, as they do now ?—I should think they would. The harbour is most convenient to go out. The tide is a great assistance there at any time.

12,083. Do you know the coast between Hartland Point and the Land's End ?—Not very well.

12,084. Is there any necessity for a harbour of refuge there ?—A good many ships have been lost in running for Padstow.

12,085. At what point of the coast do you think such a harbour would be most useful ?—I should think by the vessels being lost, whether running for Padstow or being driven in, Padstow would be better than St. Ives. A good many vessels are lost on these shores. I have seen a three-masted vessel strike there myself.

12,086. Have you ever been to St. Ives ?—No.

12,087. Would you consider St. Ives of much avail as a harbour of refuge ?—No. It is very rare that ships go down so far as that but that they get round the land.

12,088. Do you know Clovelly ?—Yes.

12,089. Do you think that a good site for a harbour of refuge ?—It is a sheltered place, and gives an offing to ships bound either westward or round the land, but in a north-west gale you could not take it.

12,090. Which do you prefer, Clovelly Bay or the Mumbles ?—I would give the preference to Clovelly Bay. I am not favourable to Swansea. I have had some trouble there with a ship. I am generally afraid to run for it.

12,091. If a harbour of refuge were constructed at

the Mumbles would that ease your mind in running for it?—No. I think it would make the matter more difficult because you would carry the breakwater eastward, and render the passage narrower between the breakwater and the sand.

12,092. Then it is the danger of the Mumbles that you fear as a nautical man?—There are dangers all round there.

12,093. Do you know Oxwich Bay?—Yes.

12,094. Have you ever anchored there?—No, but I have been there dodging the tides.

12,095. Taking Lundy Island, Clovelly Bay, and Oxwich Bay, which would be the best site for a harbour of refuge?—Lundy Island is the place to which I would give the preference in the Bristol Channel. When I have put back I have gone under Lundy Island and have remained there a day. I have had to stop the day under Lundy Island. But I never think of taking a ship to the Mumbles, because of the danger of going ashore. I have known a ship drive away from the Mumbles with two cables and anchors.

12,096. Is Lundy Island a point which homeward bound ships steer for?—Yes, always.

12,097. And do they always take their departure from Lundy Island?—Yes; and they always make for Lundy Island.

12,098. When bound for America, do they keep the mid-channel or the south shore?—They go right away on a north-west course.

12,099. You mean right down Channel?—Yes, that is the usual way.

12,100. (*Capt. Sulivan.*) You say that you have stood into Oxwich Bay for shelter?—Yes.

12,101. Have you ever been behind the Mumbles Point for shelter?—No.

12,102. Supposing nothing were done to either the Mumbles or Oxwich Bay, which would you prefer? which gives the most space outside the three-fathom line?—I should say there was better shelter in Oxwich Bay.

12,103. If you had to decide between Oxwich Bay and the Mumbles, putting aside all other places, and if they could be made equally available for the same coast, considering that there is clearer ground at Oxwich, and that it is seven miles more to the west of the shoals, which would you prefer to run for?—Oxwich Bay.

12,104. Do you think that every sailor unconnected with the port, would consider Oxwich Bay the best to run for?—I should say they would; every man in command of a ship would say so.

12,105. Could a ship missing the harbour of the Mumbles, get out of the bay again?—Do you mean if it were made a harbour of refuge?

12,106. Yes. Supposing that a harbour were constructed there, if a ship missed the entrance running down, and got to leeward, and then tried to haul off, could she get out of that bay again?—I do not think it would be possible to do so.

12,107. Do you think a harbour of refuge should be placed in a bay so dangerous?—I should say it ought not be there at all, to induce vessels to run for it.

12,108. (*Capt. Vetch.*) I think you mentioned that you had a vessel at the Mumbles, and that she drove from her anchor?—No; she met with considerable damage, we tore the ship's jib-boom away.

12,109. Do you not think that where the natural protection is defective, that is a place to apply artificial aid?—I do not think it is, if it is a place for a harbour of refuge; my idea of a harbour of refuge is a place where a person can run when he cannot make his voyage.

12,110. Should not artificial aid be applied to a place which is now to some extent a place of refuge, particularly when there is a great trade there; would you not prefer to make a harbour of refuge where nature has done so much of the business?—If I understand you rightly, you speak of a harbour for the general trade where ships can run back if they get below Lundy Island.

12,111. If there had been artificial protection at the Mumbles, your ship would not have been driven from her anchor, would she?—It would make but a rough shelter after all.

12,112. How many ships which have no business at Swansea at all come back there for shelter?—They do not go to the Mumbles.

12,113. Supposing it is too crowded at Penarth, do they not go down to the Mumbles?—They never do so.

12,114. We have had evidence that they do?—I have been 40 years at sea, and I have not known any ship go into the Mumbles for shelter.

12,115. But your ship went once?—I went once, but never afterwards. I was a young man at that time.

12,116. Is it not a fact that vessels from Penarth Roads do come back to the Mumbles occasionally?—Not vessels of any size, they never do.

12,117. But would it not be desirable if they could put in there?—If it were a place at all they certainly would go, but it is a very dangerous place at night to enter.

12,118. If we could make it a safe place, would it not be beneficial to the trade?—I do not see how it could be made a safe place at all. Running up you would have to go round the breakwater, and beat to the west, and how could you do that without masts or sails.

12,119. But supposing it can be done, and that it will save running back to Penarth Roads, would not that be a benefit to the trade?—It might be, but I do not think it could be done. I have known vessels lying under Lundy Island till daylight when they run for the Mumbles, and one or two of them got ashore.

12,120. But if money were spent to protect the shipping would it not be a good thing for that place?—Certainly, for the trade of that port, but not for the trade of the Bristol Channel.

12,121. You do not think the Mumbles could be made a harbour of refuge for the Bristol Channel in its present position?—No; nor would I recommend it as a harbour of refuge, but for the trade of the place itself.

12,122. If an equally good site could be found near, do you think that would be a benefit for the local trade and the passing trade?—The distance is so little between Cardiff Road and Swansea. To get away you must beat out, and then you must get back to Swansea; but if you get down to the westward as far as Lundy Island, a small change of wind sets you clear; but if the wind is south-east in Swansea Bay you cannot get out of it.

12,123. But is it not the fact, that ships do leave Cardiff road, go down Channel, and are obliged to put back again?—Very often.

12,124. And does not that happen at Swansea?—Occasionally, but not so often.

12,125. And do they not come back to Cardiff Roads?—Yes.

12,126. Would it not be a benefit to the trade if they did not come back so far?—Certainly, but if we get down to the Mumbles we have more room.

12,127. Is it not a fact that the other roadstead is too much crowded with vessels?—What roadstead?

12,128. Penarth?—Yes.

12,129. Is it not the case, particularly when vessels run back to Penarth, that they foul one another, and that damage is done because of its crowded state?—I believe that does happen, but not often.

12,130. Would not that be avoided if they could get down to the Mumbles, and not be obliged to put back again?—It might. But a vessel below the Mumbles would not run for the Mumbles at all.

12,131. Not in its present state. But if you had a breakwater as is proposed, would they not?—I do not know how that is to be done, because the difference is very small now between the sands and the tideway, and with the tide there is a very heavy run. I am not very well acquainted with Swansea. I have brought a ship from London, and was the pilot on board; until nearly high water we could not gather any way to windward. We anchored in seven or eight fathoms, and I was quite surprised at the safety with

CARDIFF.

Mr. J. Jones.

1 Oct. 1858.

Capt. Vetch.

which vessels took the ground. That was four years ago.

12,132. But if a breakwater were provided it would prove of some benefit, would it not?—Yes, but you cannot get ships to windward without its being high water.

12,133. (*Mr. Coode.*) As a sailor of 40 years' experience I should like to ask you whether if it rested with you to select a site for a harbour of refuge, you would not choose that which would be most likely to save life and property without any consideration of trade?—Yes, I would do it.

12,134. I believe the whole of your experience to be confined to the Bristol Channel?—A good deal, but not the whole of it. I have come here very often.

12,135. Speaking only of position, can you tell us at what point between Hartland Point and the Land's End a harbour of refuge would be most likely to save life and property?—I am not sufficiently acquainted with the shore to point out any particular part, but as far as I recollect, the greatest loss of life has been in the neighbourhood of Padstow and St. Ives.

12,136. Supposing the question lay between Padstow and St. Ives, which would you prefer?—I do not know, perhaps I should prefer the deepest bay, I would say Padstow. Having been mostly in the foreign trade we generally avoid that part of the coast.

12,137. Do the greatest number of shipwrecks happen with north-west gales?—Yes, with north-west gales.

12,138. Then, having reference to that fact, do you not think a harbour of refuge the furthest to the eastward the most favourable for the saving of life and property?—The furthest to the westward.

12,139. I am speaking of the coast between Hartland Point and the Land's End?—Certainly a harbour of refuge would be very useful in that deep bay in the neighbourhood of Padstow. Very few vessels get round Hartland Point when the weather is bad. Vessels which generally get lost are vessels which run for those places with which I am not acquainted.

Mr. GETTINGS examined.

Mr. Gettings.

12,140. (*Chairman.*) You are the harbour-master of Newport?—Yes.

12,141. For what number of years have you been connected with the harbour of Newport in that capacity?—For nearly 12 years.

12,142. Are you a seafaring man?—I am.

12,143. How long were you at sea?—For 30 years.

12,144. And how long were you in command of vessels?—For 24 or 25 years.

12,145. And in what trade were the vessels which you commanded chiefly occupied?—In the Mediterranean, the Brazilian, and the Newfoundland trades.

12,146. And what were the sizes of the vessels which you commanded?—They were of a small class, about 200 ton register.

12,147. I think you have already given evidence on this subject before a Committee of the House of Commons?—I have.

12,148. Will you now give us your opinion, refraining from repeating anything of which we are in possession from the evidence which you give before that committee?—You say that I must not repeat what I said there?

12,149. It may be a little difficult altogether to avoid repetition, but we wish you as much as possible not to repeat evidence of which we are already in possession. You wish to speak as to a harbour of refuge?—It is very much wanted indeed for the Channel. We constantly experience the want of it, and my opinion and the general opinion is, that the best site is Lundy Island. There is but one objection you can point out, and that is the depth of water. Lundy Island is a salient point which can be always reached and always left with perfect safety. I have heard the evidence and there is one point which I do not think any of my friends have touched upon, which is this, no man will dare to run in for the Mumbles however a harbour might be constructed; no seaman, I say, will run for that harbour of refuge on a dark night with a south-west gale, no man dare do it; it would be like completely running into the lion's mouth.

12,150. You say that no man dare run for the Mumbles in bad weather, will you state your reasons?—There is such a constant haze hanging over the Welsh coast with a south-west wind that even now vessels are often close in under the Mumbles Head before they can make it out. The holding ground also in the Mumbles is bad and vessels are often injured. It is very heavy riding there, it is very bad holding ground.

12,151. You have heard the evidence with respect to Milford Haven?—Yes.

12,152. Do you concur in it generally?—Milford is a very dangerous harbour to run for unless you know your position very, very correctly, because the tide is in strong, and in the dark there are many dangers. There would not be the same objection to Lundy Island, because you can at almost all times run.

12,153. As to the anchorage between the Hartland Point and King's Road, can a strange vessel run up and drop her anchor and lay in safety?—The holding ground is very good, but it is rough riding in a gale of wind. The tides are very strong. We have very few casualties above Hartland Point among the vessels which bring up, but I have known vessels break away and run ashore.

12,154. But have these instances been frequent?—No, they have not.

12,155. Have a large number of vessels anchored in that ground?—Oh dear yes, hundreds really.

12,156. Then arguing from experience, you would be disposed to say that you can ride there perfectly safe?—The anchorage is good.

12,157. If there are a large number of vessels which anchor there and the casualties are few, that is a proof that the anchorage is safe?—The anchorage is safe, no doubt of it. It is rough but safe.

12,158. Are you acquainted with the coast between Hartland Point and St. Ives Bay?—I have very frequently been up and down on the coast, in and out of Padstow, and I have also been into St. Ives.

12,159. Will you give your opinion as to a harbour of refuge there for the coasting trade, treating it as an entirely distinct question from a harbour of refuge for the Bristol Channel?—I have been driven into St. Ives by stress of weather by the wind north-east, when I could not get the Channel. I never was caught on the coast between Hartland Point and the Land's End, but it is dangerous. No doubt if a harbour were made, it would be the saving of ships and lives.

12,160. But you are not in possession of any local knowledge to enable you to give a very strong opinion as to the precise site?—No, but I should think St. Ives would be preferable.

12,161. Will you state your reason?—I think it is more accessible; I should think it preferable to Padstow, because it is more accessible.

12,162. (*Mr. Lindsay.*) Is it the case that many ships frequent the Bristol Channel, the masters of which are directed to come to Cardiff, Newport, or Swansea, for a load of coals?—I think a good deal of that is done with coasting vessels. With coasting vessels the masters generally have a liberty of that kind.

12,163. Are they at liberty to put in at either of the ports they can fetch with the greatest facility?—Yes.

12,164. Would a harbour of refuge tend to induce masters to run for a particular port more than another if the site of the harbour were at that port?—I have no doubt if there was a harbour of refuge at Swansea, it would induce many small coasters to run for Swansea.

12,165. Consequently a harbour of refuge at Swansea, would materially increase the trade at that port?—It would materially increase their trade.

12,166. And detract from the trade of Newport and

Cardiff?—It might only for a certain description of coal; people come to me who will not go to them.

12,167. Do you think that a feeling that a harbour of refuge might take away the coal trade from the ports of Newport and Cardiff and send it to Swansea has had any weight with the gentlemen interested in this place in recommending a harbour at Lundy Island in preference to the Mumbles?—I have said before that we produce a coal quite different from that at Swansea, and I do not see that it would affect us.

12,168. Is the coal entirely different?—Yes, it is entirely different.

12,169. What is the difference? Is it house coal or steam coal?—Most of the coal shipped at Swansea is steam coal. It is a different coal to that shipped here and at Newport.

12,170. (*Capt. Washington.*) You have stated the extreme difficulty of taking either Milford or the Mumbles?—Yes.

12,171. What place do ships run for?—Ships bound into the Channel run for Lundy Island.

12,172. Do they always run for Lundy Island?—Invariably.

12,173. Then at times there are a great number of ships anchored under Lundy Island?—Not a great many, but they do anchor there.

12,174. Then what do they do?—Vessels bound for Liverpool and up the Channel on a winter's night, generally lie out till daylight, and then they come up the Bristol Channel.

12,175. Do you know where they lie out?—Anywhere between Lundy Island and Morte Point.

12,176. In the south Channel?—Vessels above Lundy Island, if the night is coming on, generally lie out.

12,177. Do ships in the gales you speak of from the south-west ever run for Penarth Roads for refuge?—Oh, Yes; I have myself in a very heavy gale of wind had to run up Channel.

12,178. Do you speak of going to the Holmes or to Penarth?—The roadstead is more open, but you can anchor under the Holmes when a great number of ships are at Penarth.

12,179. Then do I understand you to say, that you cannot run for Penarth?—Constantly there are fleets of vessels there.

12,180. Are there fleets of vessels there by night as well as by day?—By night and day, but of course if you are bound westward, you keep as far down as you possibly can.

12,181. Are you personally acquainted with Swansea Bay?—Yes.

12,182. Have you laid at the Mumbles?—I have.

12,183. Lately?—Yes.

12,184. Can you tell us the distance between the Point and Cardiff Road?—A quarter of a mile.

12,185. And do you think they would run that quarter of a mile if you placed at the end of it a refuge harbour?—The large class of vessels invariably go above the Holmes.

12,186. What is the course?—They can go up north, and anchor under the Flat Holmes, or between the Holmes, whichever they please.

12,187. Do they ever pass to the north of the Flat Holmes?—Yes, frequently.

12,188. Do you know a rocky shoal that is marked by a buoy, and the distance that is from the Flat Holmes?—I suppose a quarter of a mile.

12,189. Do they pass between that shoal and the Holmes?—They pass to the north of the shoal.

12,190. Between that and the Flat Holmes?—between that and Latty Point.

12,191. What is the distance?—About a mile.

12,192. If they pass between the Holmes, what is the distance?—Two miles or two miles and a half.

12,193. And then all is clear?—Yes, all is clear.

12,194. Then if I understand you rightly, if the vessel runs to Penarth she runs through shoals a quarter of a mile apart; if she runs to the north of the Holmes, she has a channel a mile wide; if she runs between the Holmes, she runs through a channel two miles and a half wide. Can you tell us any place where there is a quarter of a mile or two miles to pass between a breakwater and a shoal?—I do not understand your question.

12,195. You have shown that vessels must pass through a channel of a quarter of a mile. You have stated that the difficulty of going to the Mumbles is that it is encumbered with shoals, with the Skerweather and others. Tell me the breadth of the channel between the Mumbles and the Skerweather?—I think it is about six miles, as near as may be.

12,196. Then in thick weather you would prefer to bear up and enter Cumberland Roads with only a quarter of a mile space, and you would not run to Swansea Bay where there is an entrance of six miles?—For this reason: in running to Cumberland Roads there is nothing to pick you up to leeward. Above the Nash light you keep a continuous sight of the land, but if you are running for the Mumbles you run across the tides and may come right in on the shoals.

12,197. You were speaking of misty or hazy weather; can you keep a continuous sight of land in that kind of weather?—You might approach so near that you could see it.

12,198. What land?—The land from Nash Point all the way up to the Holmes. It must be a very, very dark night indeed that you cannot make the land all the way up.

12,199. Where do you propose to make the land with a ship running in a south-west gale?—A ship would rather run up than run for Swansea Bay. She would run up east till she got to the foreland. She would make land to the east of Nash Point.

12,200. Suppose she did not make the land?—There is the possibility of anchorage. Some of the heavier ships anchor down between the Scilly Islands and Burry. Many ships have anchored there and rode out a gale of wind.

12,201. (*Capt. Sulivan.*) If you had got opposite Lundy Island in a ship from Cardiff, and it blew heavily from the south-west, and there was a harbour in Swansea Bay, but the weather was thick, and the sea was heavy, what would you do? Would you anchor under Lundy Island, or hang to windward toward the English shore, or run for Swansea Bay?—Some large vessels of 1,000 or 1,100 tons have been lost, and I believe I am right in saying that not one of such ships would go to the north shore.

12,202. That is, I think, not quite an answer to the question which I put. I say, supposing you were in command of a vessel which had to bear up, which should you consider it the safest thing to do—to anchor under Lundy Island, or the south shore, or risk running for the Mumbles?—I should stop short, and keep under the English land if I could. Anything would be preferable to going in there.

12,203. I suppose Lundy Island would be equally available for all the Swansea trade, as well as all the Cardiff trade?—I think it would.

12,204. The Swansea vessels would have gained a little on their voyage. They would be more to the westward?—That would depend on the wind.

12,205. In foul winds?—In foul winds they would be a little more to windward.

12,206. And if the wind went round to south-east they would stand a much better chance of getting away, than if they started from Swansea?—Yes, but in a north wind Swansea would have the better chance.

12,207. In what wind do vessels take refuge at the Mumbles?—Vessels take refuge at the Mumbles with a north-west wind, and they generally stop there till a change takes place.

12,208. But on the voyage, would vessels from Swansea Bay be as far to the west of Lundy Island, and require to put back as much as vessels from Cardiff?—I should think not, because if I put out and got away I should be more to the east. There would just be a difference of 60 miles.

12,209. Then a Swansea vessel would meet a south-west gale further to the west than a Cardiff vessel?—Of course.

CARDIFF.

Mr. Gettings.

1 Oct. 1858.

Capt. Sulivan.

12,210. It is quite as likely, then, that she would avail herself of a harbour of refuge at Lundy Island, as a Cardiff vessel ?—Yes.

12,211. Then supposing it were possible to make a harbour of refuge at Lundy Island, it would be equally available to the whole of the Bristol Channel ?—It would be more available to Swansea than to Cardiff.

12,212. If it were made at the Mumbles, do you consider that it would be principally available to the Swansea trade ?—I do.

12,213. Do you think that money should be expended for the benefit of the whole Channel, and not for the benefit of one place ?—I think it should be spent where it would be generally beneficial.

12,214. You were asked whether Swansea would not draw more trade in consequence of having a harbour of refuge. Do you think that the trade of Swansea will stand still because it has not a harbour of refuge ?—No, I should think not.

12,215. Do you know the Skerweather Sands ?—I have seen them. I have seen the sea breaking on them.

12,216. Do you think for the trade of the Bristol Channel, that a light vessel placed on the west extremity of these sands, would add to the safety of the navigation ?—I am certain it would.

12,217. Do you think that the trade would object to the small toll which is levied by the Trinity House for light vessels ?—No.

12,218. Are you aware of any parties interested having made application for a light to be placed on the Skerweather Sands ?—I never heard it mentioned.

12,219. Did you hear what was said about buoys at Lundy Island ?—Yes.

12,220. Supposing a vessel had to sail with the wind on shore, although moderate weather to start with, might she have a difficulty in heaving her anchor in time to clear the land ?—That is possible. These buoys you mention would be very serviceable.

12,221. Supposing buoys were put rather to the east, could they be in a position to run hawsers, so as to make sail slipping from the buoy after the anchor was got up, and if that could be done, do you think it would obviate some of the difficulties which exist under present circumstances ?—It would obviate almost entirely the difficulty. It would very materially obviate the difficulty to have buoys there that you could make fast to.

12,222. Do you think that a small harbour light on the island, to show how close you could round to, to fetch out a good anchorage, would at all assist vessels in making that refuge harbour ?—No doubt it would.

12,223. (*Capt. Vetch.*) You consider Lundy Island the best shelter ?—Yes.

12,224. How many vessels have you seen take shelter there at any one time ?—I have never seen many vessels there myself. I was interested in the inquiry some time ago.

12,225. How many do you believe take shelter there at a time ?—Some six, eight, or 10 may be there occasionally. I do not think there are many.

12,226. Did you ever observe at any time vessels to windward take shelter under the Mumbles ?—Yes, a great number of small vessels.

12,227. How many vessels have you seen taking shelter at the Mumbles at one time ?—I have seen 30 or 40, or as many as 50 small vessels lying on the shore.

12,228. Not more ?—No, I do not think I have seen more.

12,229. If these 50 vessels which have taken shelter at the Mumbles are wind bound, and cannot get shelter there, they must come to Penarth roads ?—Yes.

12,230. Is it not a fact that Penarth Road is very much crowded ?—It is very much crowded.

12,231. And to prevent that, as much as possible, vessels do not leave the docks until they are almost ready to sail ?—Yes.

12,232. If an artificial work could make the Mumbles a very good shelter, would not that be a benefit both to the trade of Swansea and also the trade here ?—My opinion is that if you were to construct a harbour of refuge at Swansea no large ship, during the night in a gale of wind, would dare to run for it. It is a very difficult place.

12,233. Supposing a talented engineer could show you what could be done ?—Engineers make very bad shipmasters, some of them.

12,234. Do you know what the Green Grounds are composed of ?—They are quite hard. I do not know exactly what they are composed of. They are hard grounds.

12,235. We are told that they consist of loose boulders and shells ?—I never was on them.

12,236. (*Mr. Coode.*) You told us that the holding ground at the Mumbles is very bad. Do you speak of your own knowledge ?—I have been at anchor there three or four times, and I know the anchorage is bad.

12,237. Is it bad holding ground ?—It is.

12,238. Have you known ships driven from their anchors ?—We have heard of them being driven by the wind off shore across the bay, and lost.

12,239. Is that a matter of common occurrence ?—I cannot say it is of common occurrence, but it has occurred.

12,240. Can you tell us any case within your own knowledge ?—I did not see the ship, but a vessel was driven out in that way.

12,241. Was any life lost ?—I rather think there was. I think the whole of the lives were lost.

12,242. Do you remember the name of the vessel ?—No ; but I remember the circumstance very well.

12,243. What way was the wind ?—About west-north-west.

12,244. In speaking of St. Ives and Padstow you said you preferred St. Ives because it was more accessible. Will you explain a little more clearly what you meant ?—We know that at present Padstow is very difficult of access unless the wind blows right into it. A ship cannot take it with safety, and I do not know what kind of improvement you can make so as to obviate that difficulty, unless you make a harbour of refuge outside of it altogether.

12,245. You spoke of the difficulty of getting in. Supposing a site equally accessible as St. Ives were close to Padstow, which should you prefer then, the site near Padstow or St. Ives ?—The more central the better. I think if there were a site half-way between Cape Cornwall and Lundy Island it would be better.

12,246. If you found two bays equally good in all respects, except that one was situated nearer Cape Cornwall, as St. Ives is, and the other nearer Padstow, which would you prefer ?—I should prefer the central one.

12,247. Why so ?—Suppose a ship were caught on a lee shore, if there were a harbour at St. Ives she would have to go all that distance to get to it, whereas in the other case she would only have to go half the distance.

12,248. Do you think a site at or near Padstow preferable to one at St. Ives, all other things being equal ?—I should think so.

12,249. (*Chairman.*) Have you ever heard of many vessels being ashore at the Mumbles when the wind changes to east or south-east ?—That is a common occurence with small vessels anchored on the shore. If it comes to blow hard they cannot get away.

Mr. Edward Hill examined.

Mr. E. Hill.

12,250. (*Chairman.*) In what capacity are you connected with the port of Cardiff ?—I am a partner in the firm of Hill and Son, shipbuilders, shipowners and merchants, interested in many vessels trading

from the port of Bristol to all parts of the world. I have some knowledge of the Channel, having navigated it for the last six years, and resorted to most of its ports.

12,251. You have been present during the course of this inquiry ?—Yes.

12,252. And you are aware of its objects ?—I am.

12,253. Will you make any statement which you wish to the Commissioners ?—I have for some time given the subject, as to the best position for a harbour of refuge, my attention, having an opportunity of obtaining information from captains of foreign-going vessels and coasting vessels, both one and the other, and I have come to the conclusion that the best site for a harbour of refuge is Lundy Island, because it is better for vessels wishing to enter the Channel in bad weather in a gale of wind, and it is also better for vessels going from the Channel; for instance, in strong south-west winds, supposing a harbour were constructed at Lundy Island which you could enter at all times without a pilot, when the wind changed you would be able to get out again. There are no sand-banks or rocks more than in the immediate neighbourhood of Lundy Island itself, and I think that vessels going out of the Channel, starting from Penarth or King's Road, get down beyond Lundy Island and are forced back again, and they generally come to King's Road or Penarth ; whereas if they could go to Lundy Island, when the wind chopped round they could start from Lundy Island and get a sufficient offing to make their voyage, but higher up the Channel they could not do so. I recollect a vessel of our own lying in King's Road eight weeks wind bound. She made four attempts to get to sea. Upon each occasion she got to Lundy Island ; and it is quite certain that if there had been a harbour there she would have got there the first time, if there had been safe holding ground, and with the next change of wind she would have got to sea and made her voyage.

12,254. Have you considered the question in this point of view, that the south-west gales generally come round to the north-west, and that at the Mumbles a vessel would be considerably more to windward ?—She would ; but Lundy Island is sufficiently to windward.

12,255. Do you know the coast between Hartland Point and the Land's End ?—I have been down it ; but I have not visited any of the ports.

12,256. Perhaps you know that there is a very strong opinion as to a harbour at Padstow for the coasting trade ?—I know there is a very strong opinion in favour of Padstow, but I rather imagine that St. Ives would be the best place. You might get into St. Ives when you might not get into Padstow.

12,257. You have heard the evidence as to the anchorage above the Holmes. Do you agree with it ?—Vessels do frequently anchor above the Holmes, and it is a safe anchorage. I do not recollect any accident. It is of very rare occurrence that even any serious damage is sustained.

12,258. Have you ever had occasion to run for the Swansea land in bad weather, so as to form an opinion as to its facility of access ?—I never ran for it in bad weather, but I have been there very frequently, and I found that it was always necessary to exercise great caution in navigating because of the outlying vessels. If I were caught in a strong gale of wind down Channel, I should not think of running for the Mumbles.

12,259. (*Mr. Lindsay.*) Do you lay any restriction on the masters of your ships, as to running to the Mumbles ?—No.

12,260. You do not restrict them ?—No.

12,261. If a harbour of refuge were constructed at the Mumbles, which was close to that particular coast where you are obliged to exercise great caution, do you think, as a shipowner, that you would have any objection to your ships going there ?—Do you mean close to.

12,262. You stated just now that a vessel of yours was detained for eight weeks, that she got as far as Lundy, and then had to go back again. She would be off the Mumbles in putting back ?—No ; she would be further down, more towards the English land.

12,263. If there had been a harbour at the Mumbles, would your vessel have put in there ?—No ; certainly not, in her case, because she was at Lundy Island when she was driven back.

12,264. But if there were a harbour of refuge at the Mumbles, would you have any objection to allow your ships to go there ?—I certainly should, because I consider it a very dangerous thing to do ; of course daylight she might.

12,265. Of course we are speaking of a harbour under the circumstances of gales of wind and thick weather ?—Precisely so.

12,266. Under such circumstances would you allow any of your masters to run for the Mumbles if a harbour were constructed there ?—I should say certainly not.

12,267. Then your orders would be that if they could not make their voyage, and had to run back, they were to run to King's Roads ?—We do not give our captains orders what they should do. The master of a vessel ought to be the best judge of the place to run for. But if he asked my opinion, I should say he would risk his life and the ship in running for the Mumbles.

12,268. Even if a harbour were constructed there ?—Unless you removed all the sand and oyster beds. If the sand could be removed then I think there could be no objection to the Mumbles.

12,269. (*Capt. Sulivan.*) The weather that vessels generally run back in, is, when the wind is from the west, round to south ?—Yes.

12,270. Are these winds generally accompanied by thick weather ?—I believe they are accompanied by rain.

12,271. If you were in a vessel under Lundy Island, or short of Lundy Island, which had to run back somewhere, and supposing that a harbour were in Swansea Bay, would you consider it safest to run up for the Holmes or for Swansea Bay, with the shoals that are there, and with the certainty that if she misses the harbour she must be lost ?—I should consider it by far the safest thing to run for the Holmes.

12,272. (*Mr. Coode.*) As a yachtsman and living in the neighbourhood, I presume you cruise frequently in the Bristol Channel ?—I do.

12,273. Will you tell us from your experience near which shore most vessels lay ?—The south shore. I mean more on the south shore, particularly near Lundy Island. They generally come between Lundy Island and the English land to the south.

12,274. Can you tell us the proportion in general terms ?—From what I have seen I should say four-fifths of them. I have no means of giving any definite information.

12,275. But in general terms you say about four-fifths ?—From what I have seen, I should fancy so.

12,276. (*Chairman.*) How do ships bound foreign generally make their passage during the prevalence of westerly winds ?—They would scarcely do so at all with the wind due west, but with a slant from the north-west they keep as near as they can to the north shore, and make a long reach on the other tack to weather Lundy Island at the south, but with a southerly wind they keep the south shore because it is a smooth water, and they keep as close as they can in order to weather Ireland.

12,277. With winds to the west do they take advantage of the tide ?—Large ships do not do so generally. We had not long ago a large ship starting for Australia. She was towed down below the Nash light. When they get below Lundy Island we consider their passage made. They always make out to sea.

12,278. Then with the larger and more valuable vessels, does the use of tugs make a difference ?—When passengers are on board, or there are any particular reasons we use tugs. Otherwise the large expense induces shipowners to wait for a favourable change of wind.

CARDIFF.

Mr. E. Hill.

1 Oct. 1858.

Chairman.

12,279. Then as a general rule they are not towed down, but wait for a change of wind ?—Yes.

12,280. (*Mr. Lindsay.*) As you are fond of yachting, which I am glad to hear, and as you have given considerable attention to this subject, I will ask you whether you know Breaksea Point ?—Yes ; I have heard of vessels being lost there.

12,281. Would a lighthouse be an advantage there ?—I think a lighthouse would be an advantage, but I do not think that ships have any business there with ordinary caution. I think most of the accidents arise from want of caution.

12,282. Do you think that, as there is a light on Nash Point, and only eight miles distant, another light is not necessary ?—I should say that the Channel generally is beautifully lighted.

12,283. Have you ever been to Clovelly Bay?—I have never been in there.

12,284. Do you know Oxwich Bay ?—I have not anchored there, but I have hung a tide there.

12,285. Would it be a better site for a harbour than the Mumbles ?—I should think it better than the Mumbles, because there are no sands.

12,286. Which is the better, that or Clovelly ?—I should be inclined to give the preference to Clovelly, because it is further down Channel, and if you get a little slant of wind, you are at sea at once, and it is better to run for.

12,287. You give a decided preference to Lundy Island over all other places ?—Certainly. In my opinion Lundy Island is the most suitable.

12,288. (*Capt. Sulivan.*) Do you think a light vessel on the Skerweather Shoal would conduce materially to the safety of vessels going up and down the Channel ?—I am almost of opinion myself that there are sufficient lights already in the Channel at the present time.

Mr. Thomas Steel examined.

Mr. T. Steel.

12,289. (*Chairman.*) What is your present occupation ?—I have retired from the sea but I have been a shipmaster for 16 years, and for the last five years a pilot for the port of Cardiff.

12,290. You have been present during this inquiry ?—Yes.

12,291. You have heard all the evidence that has been given on the subject ?—Very nearly all.

12,292. Does it occur to you to offer anything which we have not heard from the previous witnesses?—There may be a few things upon which I can throw a little light, but I do not know.

12,293. Will you now make any statement upon the points you have not heard ?—Yes ; as regards a harbour of refuge, it is my candid opinion that Lundy Island is the most preferable point that I have heard spoken of ; I prefer it to any other that I have heard mentioned during this examination. From my own experience in going up and down the Channel, I have always found Lundy Island the resort of all ships. It is the point always made for and kept from both shores. Let the wind be any way, we always endeavour to make for Lundy Island ; it is a central position to make way from either up or down.

12,294. Therefore you entertain a very decided opinion, that Lundy Island is the most proper place?—It is the most preferable place that has been pointed out.

12,295. Do you know the coast between Hartland Point and the Land's End ?—Yes.

12,296. Have you any opinion as to the best site there for a shelter for the coasting trade ?—I had on one occasion to go in a very heavy gale of wind for the harbour of Padstow—in a very terrific gale—with little or no canvass set, we had to make for there for our lives ; we did go into Padstow, but not keeping sufficiently clear of the Doom Bar, we got on the Doom Bar, but eventually we got off and into the harbour in safety ; after we got off the Doom Bar we saw a vessel sink a little up the harbour. A vessel sunk at the same time going from Cardiff with iron, bound for Newport.

12,297. Having had occasion to go to Padstow, do you think it could be made available ?—Most times you can get back, and anchor under Lundy Island.

12,298. Having had experience of the Channel, do you think Lundy Island is the place for a harbour of refuge ?—Most decidedly, because it is the centre part. There are two deep bights to contend with, but at Lundy Island you have the centre part, and you escape the two bights. There is the bight of St. Ives Bay and Bude Bay ; a great number of lives have been lost in St. Ives and Bude Bays, and if there had been a harbour of refuge at Padstow they might have escaped ; we cannot say for certain, of course ; but they would have endeavoured to make for Padstow, no doubt.

12,299. (*Mr. Lindsay.*) What is your cruizing ground ?—We go sometimes down to the Nash, and sometimes to Cardiff ; we are not pilots for that water, but we cruize down ; we even go to Morte Bay.

12,300. Are there a class of pilots for Bristol ?—Yes.

12,301. Where do they leave ?—Lundy Island is the end of their district.

12,302. Did you hear the evidence given as to the placing of mooring buoys in the usual anchorage at Lundy ?—I did.

12,303. As a sailor of considerable experience, do you think that would be of any advantage ?—Not without some portion of breakwater.

12,304. Not without a breakwater ?—With a breakwater it might be of some little service, but not else. I should think it would not be of much service without a portion of breakwater to defend it from the north-west winds.

12,305. Why ?—Because the western swell heaves in quite heavy ; there is a swell that rolls to that degree, that I have seen vessels roll with their gunwales under water.

12,306. Was that at Lundy Island ?—Yes ; and during that time mooring buoys would be of little service ; they would chafe and tear the ropes to pieces ; they would never be made use of without it was to assist the anchor, but not to ride by.

12,307. Do you think a harbour light on Rat Island would be of much value ?—A good fog light would be of value without any other thing ; without making it a harbour light ; a good fog light like that at the Stack, always down to the water's edge would be useful ; I have found it useful at the South Stack on many occasions running up.

12,308. Have you been often at the Mumbles ?—I have been there many times ; I never frequented it as a place of choice ; I never visited it for choice ; I merely went there to stop a tide ; I have never gone there to slip with a south wind.

12,309. If there were a harbour of refuge there should you have any hesitation in taking a ship there ?—With a large ship I should, because you cannot manage a large ship equally as well as you can a small one. I have not had large ships under my command so much as small ones.

12,310. What tonnage do you call a large ship ?—1,000 tons register. There are plenty of these ships coming in this Channel now. There are plenty of vessels of 1,000 and 1,400 tons, and you want some place for them as well as for the smaller ones.

12,311. With a harbour of refuge at the Mumbles, would you hesitate to run for it with a strong south-west gale ?—I would not attempt it ; no man with a reasonable conscience could attempt it.

12,312. Does that arise from the various shoals ?—It is a nasty dead coast to go down upon, fog and wet always lodge there, you are right down on the top of it before you can make it out, because of the high land in shore ; you cannot risk it to run down upon it.

12,313. Do you think a light on Breaksea Point would be of any value ?—No, I think not ; but if the

CARDIFF.

Mr. T. Steel.

1 Oct. 1858.

present light were a little improved, it would be of great service.

12,314. What do you mean ?—The lights are shut in, they ought to be more shown to the eastward, to carry you free of danger.

12,315. Do you think a more conspicuous buoy would be of service there ?—Yes, with a bell upon it.

12,316. Is it not the case that the tide sets in much upon that point ?—The flood tide does not set in upon it, the ebb does rather set in upon it.

12,317. Do you know the Skerweather Sands ?—Yes, I have been there, they are in the Mumbles Bay.

12,318. Do you think a light there would be of great value ?—The Mumbles light is a very fair light after the last improvement, and no man will endeavour to approach the land without seeing the Mumbles light.

12,319. You think the Mumbles light is sufficient to keep clear of the shoals ?—Yes, perfectly so, because you can approach them with your lead, and if you cannot fetch the light, you back off or what not.

12,320. (*Capt. Washington.*) You said that a fog light at Lundy Island would be a good thing ?—Yes.

12,321. Are the present lights often obscured by fogs ?—They are so high, I have often been under close-reefed canvass there, and did not see a bit of light until I was right under the land. I never saw a bit of the light until I saw the skare between the land and the light, running up from the Land's End under close-reefed topsails; I never saw the light, and I have not the slightest doubt that several vessels have been lost, because the lights are so high. A fog light about 10 feet above high-water mark would be of great service to the shipping.

12,322. Where would you recommend it to be placed ?—On the south end of the island, that is for approaching vessels both coming up and down.

12,323. Would Rat Island be a good place ?—I think it would.

12,324. Do you know a rock that lies off the south point of Lundy Island, with only nine feet of water over it ?—I have never known a vessel strike upon it, it must be very small. I know a rock at the mouth of the Mumbles Harbour. Vessels have been going over there for centuries, but a few years ago they found it out by a vessel striking upon it, and this rock may be of the same sort. It may be there and it may not ; there is a deal of broken water.

12,325. About a cable and a half from the south point of Lundy Island ?—Oh yes, I know that rock of course, and close round it you can see the sea ; it breaks up against it.

12,326. Notwithstanding that the Lundy Island lights are often obscured, you still think it a good point to run for ?—Yes, it is a bold shore, and when you get there you partly know by the disturbance of the water. There is a great disturbance of the water on the sand.

12,327. Do vessels from Penarth usually pass down tha south or the north channel ?—The south generally speaking, without it is the Irish trade and the Liverpool vessels, they of course go north.

12,328. We have heard that at Swansea there are frequently from 200 to 300 vessels lying in the bay ?—Which bay ?

12,329. Swansea Bay. Can you tell us where they come from ?—There are lots of little places like Port Talbot, out of which there are small vessels bound for Padstow and St. Ives. They merely go to the Mumbles to stop until the wind after the south wind shifts to the north-west, and there they are to windward which is an advantage to them.

12,330. These are the sort of vessels which can take the ground ?—Yes, and bear a bit of thumping.

12,331. And they get a good bit sometimes, don't they ?—I believe you, they do.

12,332. (*Capt. Sulivan.*) Do you know Oxwich Bay ?—I have been there to stop a tide but not to anchor.

12,333. If vessels could be sheltered from all winds which would be the safest to make, Oxwich Bay or the Mumbles, and which of them would vessels most readily run for ?—They would certainly take Oxwich Bay in preference.

12,334. Would it be much further from the sands to leeward ?—Certainly.

12,335. If a vessel missed in thick weather, could she haul off on the starboard tack ?—Yes.

12,336. Could she weather the Skerweather under the same circumstances ?—Not so well.

12,337. Could she weather the Skerweather ?—No.

12,338. Suppose it lay between these two points, do you think the coasting trade would prefer having the harbour in Oxwich Bay, or having it at the Mumbles? —Do you mean the small coasters ?

12,339. Yes; do you think they would consider Oxwich Bay a better place than the Mumbles ?—Yes.

12,340. One of the lights at Lundy Island is much lower than the other, is it not ?—Yes, much lower.

12,341. Still you think it is much too high for fog ? —It is still too high.

12,342. Vessels running from the westward would not see the light on Rat Island until they opened the south point, therefore a light there would not make it safe ?—They generally run for the mid-channel course ; no prudent man would run in unless he could make out the lights.

12,343. Would a small light on Rat Island be useful to vessels coming up between Hartland Point and Lundy ?—Yes.

12,344. Would it be an equally useful aid to vessels trying to pick up a good anchorage in Lundy Roads ?—Yes.

12,345. (*Mr. Coode.*) You say that you got on the Doom Bar, will you tell us under what circumstances that happened ?—The passage is so narrow at Padstow, that the ship not having sufficient way to shoot in, the eddying wind from the land caught the vessel ; she became unmanageable, and she dropped over on the Doom Bar.

12,346. How was the wind ?—West-north-west.

12,347. There are moorings fixed at the harbour to aid vessels in getting in ?—Yes, there are; but for all that, vessels get on the Doom Bar.

12,348. But for the eddying winds, you would have got to a safe anchorage ?—No doubt ; if the point were cut away to allow the wind to come true, it would be a great advantage.

12,349. Did the idea of cutting away the point suggest itself to you, or have you heard it spoken of ? —I have heard it spoken of. I was very glad to get there that time.

12,350. Having heard the suggestion for cutting down Stepper Point, you concur in the desirability of that suggestion being carried out ?—Yes.

12,351. (*Capt. Sulivan.*) Do you know the first capstan-house ?—I do.

12,352. If vessels with a west wind could fetch in as far as the first capstan-house, would that do ?—They would have good assistance then.

12,353. You think that would be sufficiently within the corner of the vessel to get over the difficulties ? —Ketching out on the corner is the principal difficulty, I believe.

Mr. JOHN LEWIS examined.

Mr. J. Lewis.

12,354. (*Chairman.*) In what way are you connected with the port of Newport ?—I am a retired master of a vessel.

12,355. For how many years were you at sea ?—For 42 years.

12,356. And of that period, for how many years were you in command of vessels ?—For 25 years.

12,357. What description of vessels were those which you principally commanded ?—Brigs.

CARDIFF.

Mr. J. Lewis.

1 Oct. 1858.

Chairman.

12,358. What was the size of the vessels which you chiefly commanded ?—About 200 tons.

12,359. In what trade were they employed ?—In the Mediterranean and the coasting trade.

12,360. You are aware of the objects of the inquiry ?—Yes.

12,361. And you have been present during the evidence we have received ?—Yes.

12,362. Do you generally concur in that evidence ?—Yes.

12,363. Is there any additional information which you wish to offer ?—I may pass a few remarks.

12,364. Will you be good enough to do so ?—If I am to give an opinion on a harbour of refuge, I should say Clovelly Bay or Lundy Island.

12,365. Have you any reasons to state, in addition to those you have heard, for your preference for these two places ?—I am aware that every ship from whatever part of the world she may come, always lies herself for Lundy Island if possible, and I am satisfied that in thick weather coming in the Channel the north stream is so powerful that if vessels get no observation often though going to the Bristol Channel they are driven up this channel, and I have known vessels even sailing out of the north channel driven into the Channel, the indraught is so great.

12,366. And, therefore, you are of opinion that Lundy Island is the best site for a harbour of refuge ?—Oh yes.

12,367. (*Mr. Lindsay.*) Do you know that coast well between Hartland Point and the Land's End ?—Yes ; the fact is I served my time out of Swansea. I have been 15 years in the coasting trade.

12,368. What is your opinion as to the necessity for a harbour of refuge, setting aside any harbour at Lundy Island or above Lundy Island ? What is your opinion as to the necessity for a harbour of refuge between Hartland Point and the Land's End ?—No further than that a harbour of refuge would be the means of saving life and property.

12,369. Do you think that for this purpose it is necessary ?—I do.

12,370. Are there many lives which would be saved by a harbour of refuge there ?—I think so.

12,371. What site do you prefer for that line of coast ?—Padstow. The wind which is direct in is the worst wind you can run for ; when you run in under the high land with the wind north-north-west, the wind comes right out, and your vessel goes right upon the Doom Bar.

12,372. Do you think that a harbour at St. Ives would be very valuable for the saving of life and property ?—No ; with the wind north-north-west a ship down there can very easily come up and make Padstow ; if below Hartland Point, with the wind north-north-west, she would fetch Padstow. But as to St. Ives she would never get there.

12,373. Now with the wind you are speaking of from north-north-west, what is the difficulty ?—It is the indraught. If she has her course to, the indraught draws her in.

12,374. When the wind blows from the south-west, does it not generally go round to the north-west and then blows strong from the north-north-west ?—Yes, ranging from the west-north-west to the north-north-west. The wind must be north-north-west for a ship which can carry canvas to come round Hartland Point. I was caught there myself in a gale of wind. We were close in. The people on the cliffs were expecting us to go ashore, but she was a small vessel. We saw the broken water, and if we had gone on Hartland Point, in a minute we should have gone to pieces ; that is the indraught. If there had been any canvas at all on her, she would have weathered Hartland.

12,375. (*Capt. Sulivan.*) Do you know the first capstan-house ?—Many years ago I was there.

12,376. At Padstow ?—Yes.

12,377. If you could give a true wind to vessels as far in as that, would it be a good entrance ?—It would give a good entrance, but you must cut away a great deal of the land.

12,378. If you cut away the land as far as the first capstan-house to give a true wind, would you do away with the danger ?—The only thing is the want of room, and the danger of going on the Doom Bar. Then even if a vessel went on the Doom Bar she might be saved, but there is now no chance of saving her.

12,379. Then do I understand you to say, that the great danger of loosing life would be overcome if a vessel could get as far as the first capstan-house ?—Certainly.

12,380. How many vessels could be sheltered if Padstow were a convenient place ?—Not a great number. I only consider it just a place of safety for vessels.

12,381. Not for a general harbour ?—No, it is too far to leeward ; no ships would go there ; they would sooner go back by half.

12,382. (*Mr. Coode.*) Have you ever known vessels lost on Breaksea Point ?—Yes.

12,383. More than one ?—Several.

12,384. How many ?—Perhaps six or seven.

12,385. Within what period ?—As far as I can recollect, within the last 20 years.

12,386. Do you think there is any special cause for vessels running ashore at that point ?—I think a light ship would do good, but not a lighthouse.

12,387. Why do you prefer a light ship to a lighthouse ?—Because the water is very shallow, and the land is very low, running over from the east shore ; if you do not see the Nash light, the Breaksea Point brings you up.

12,388. Is there any peculiarity in the tide there ?—Not at all.

12,389. Nothing but the shallowness of the water ?—Nothing.

12,390. Have you known many lives lost in the wrecks of which you have spoken ?—I cannot say. I do not think I ever heard of one.

Mr. Peter Williams examined.

Mr. P. Williams.

12,391. (*Chairman.*) How long have you been at sea ?—About 48 years.

12,392. For how many years were you the commander of a vessel ?—For 35 years.

12,393. What description of vessels did you chiefly command ?—They were generally in the coasting trade, from 200 to 210 tons burthen.

12,394. You have been present during the course of this inquiry ?—Yes.

12,395. You are aware of the object of it ?—Yes. It respects harbours of refuge.

12,396. Do you concur generally in the evidence of the previous witnesses ?—Yes.

12,397. Is there any point upon which you are disposed to differ from them ? Do you wish to state anything yourself ?—Nothing particular. In my opinion Lundy Island would be the best place for a harbour of refuge. That is my opinion.

12,398. Do you know the coast between Hartland Point and the Land's End ?—Yes.

12,399. Supposing a harbour were made at Lundy Island and there was another harbour to be made, where would you put the second refuge ?—Padstow is the best place. It can be made a good harbour at a little expense, and it would be central between the Long Ships and Lundy Island.

12,400. And you are decidedly of opinion that Padstow is the place for a second harbour of refuge ?—I think so. But I think there should be a harbour of refuge at Lundy Island.

12,401. (*Mr. Lindsay.*) Do you think that a harbour at St. Ives would tend to the safety of life and property ?—In coasting vessels it might, but not for large vessels. Large vessels generally keep away to the west, and keep clear.

12,402. (*Capt. Washington.*) I think you say

CARDIFF.

Mr. P. Williams.

1 Oct. 1858.

that you consider Padstow the best side for a harbour of refuge between Hartland Point and the Land's End ?—Yes.

12,403. Can you give us you reasons for that opinion ?—Very often vessels go down the Channel in the winter season, with the wind generally prevailing from south-south-west to north-west. These are generally the heaviest gales we experience upon the coast, and the vessels in going down with the wind to the south, starting from Swansea Roads, give the land as wide a berth as they can. But when there is a sudden shift of wind it sometimes catches them between Long Ships and Lundy Island. They are then down by Padstow, and if Padstow were improved it would be a good place to run into.

12,404. Would you recommend vessels to go for Padstow now ?—Not unless you were well acquainted with it. When the wind is north-west, with the eddy wind, you stand a chance of getting home ashore on the sand.

12,405. Then with these dangers would you recommend vessels to run for Padstow ?—Not unless it is improved.

12,406. How can it be improved ?--By running out an arm from the east side, which would carry the water right clear, because a good deal of backwater may be got, just as there is from Hayle.

12,407. But that would not prevent the eddy wind ?—No ; but it would make the entrance wider.

12,408. Have you known vessels lost there ?—Yes, several vessels have been lost there, and all hands.

12,409. And do you not think that more would be lost, if you were to recommend them to run for it ?—In its present state no vessel would run for it, if she could help it. Those that run for it cannot help themselves ; I recollect several vessels having been lost, with all hands.

12,410. How many vessels would it contain ?—If you mean only inside it would contain only a small number of ships.

12,411. Have you been there lately ?—Not very lately.

12,412. How long ago ?—Ten or 15 years.

12,413. To lie afloat ; how many vessels, if they could round the corner, could lie afloat ?—Very few.

12,414. Then vessels going there would have to take the ground ?—Yes. They would have to run higher up.

12,415. Then you would recommend the improvement of Padstow Harbour, although it would contain so few vessels ?—No one will run for Padstow, except in case of necessity to try to save the ship or life, and ten to one you cannot save ship or life now.

12,416. (*Capt. Sulivan.*) Do you know the first capstan-house at Padstow inside the point ?—Yes.

12,417. If the point were cut away, so as to carry a steady wind over the point, as far as the first capstan-house, would that do away with the greatest part of the danger ?—It would leave a good deal, unless you were to take away the whole of the point. With the wind north-west there is an eddy wind which comes down this little valley, and right out.

12,418. If vessels get above the first capstan-house before they meet that eddy wind, would they then be in safety ?—Oh yes ; in a great measure they would be in safety, because they would have ropes and all assistance.

12,419. You said that a harbour of refuge at St. Ives would be available for the coasting trade ?—Yes, for the coasting trade.

12,420. But not for large ships ?—Not for large ships.

12,421. Do large ships generally go in with the land ?—No, they do not.

12,422. Then the trade which is generally in danger is the coasting trade ?—Yes.

12,423. If Padstow were improved, and a small harbour were made at St. Ives, would it make the coast much better, and save a great deal of life and property ?—It would be very desirable to have harbours at both places, but I do not consider they would be harbours of refuge.

12,424. I am speaking only of the coasting trade round the land ?—Yes, I understand so.

12,425. Is it the men belonging to the coasting trade that perish on that coast ?—Mostly.

12,426. (*Capt. Vetch.*) Have you been at St. Ives lately ?—I have not been ashore, but I have been in the bay.

12,427. Do you recollect how many vessels you have seen lying at Hayle at one time ?—I should say from 15 to 20 sail.

12,428. There are steamboats trading to Hayle ?—Yes, two.

12,429. There are a good many vessels lying at St. Ives Harbour ?—Yes, but they are aground.

12,430. Do you not think that the trade would be benefitted by some protection ?—No doubt, for the same class of vessels.

12,431. When the wind comes round to the north suddenly, is it very dangerous ?—And it comes round very suddenly sometimes.

Mr. JOHN OWEN examined.

Mr. J. Owen.

12,432. (*Chairman.*) In what way are you connected with the port of Cardiff ?—I am agent for Lloyd's, and a shipowner.

12,433. Have you been present during the course of this inquiry ?—Yes.

12,434. And you are aware of its objects ?—Yes.

12,435. Do you concur generally in the evidence given by the preceding witnesses ?—Yes.

12,436. Are there any points in which you are disposed to differ from the witnesses who have preceded you ?—As to a lighthouse on Breaksea Point, I think there ought to be one.

12,437. Will you state your reasons for that opinion —There have been from 18 to 20 vessels wrecked there within the last 20 years.

12,438. Can you furnish the Commissioners, at your convenience, with a list of the vessels which have been wrecked at that point during that period ?—Yes.

12,439. Then be kind enough to do so, and forward it to our secretary. Are you able to give the Commissioners any information as to the proportion of the loss which has occurred among the shipping from negligence, or carelessness, or drunkenness, or not using the lead, or any thing of that kind, which cannot be prevented by a harbour of refuge ?—No, I cannot.

12,440. Have you any opinion as to the proportion of wrecks which occur from these causes ?—No, I have not.

12,441. (*Mr. Lindsay.*) Do you think that a harbour of refuge in the Bristol Channel would be the means of saving life and property to a considerable extent ?—I think it would.

12,442. At what spot would it tend most to do so ?—At Lundy Island.

12,443. Do you recollect any ships which would have been saved if there had been a harbour of refuge at Lundy Island.—No, I cannot say.

12,444. You do not recollect ?—No.

12,445. To return to Breaksea Point. When you are furnishing your return, will you endeavour if possible to show which of those vessels might have been saved by the construction of a harbour of refuge at Lundy Island ?—I will.

12,446. (*Capt. Washington.*) Can you account for Breaksea Point bringing up these vessels ?—For want of a light, for in thick weather you cannot see the Nash light.

12,447. What distance is it from the Nash light ?—Seven or eight miles.

12,448. Would a light vessel or a bell buoy be of much use in thick weather ?—I think a light vessel would be of use.

12,449. Can a light vessel be seen in thick weather ?—It could be seen before you got on Breaksea Point.

12,450. The light vessel might carry a gong perhaps, or you might have besides the light vessel a bell

CARDIFF.

Mr. J. Owen.

1 Oct. 1858.

Capt. Washington.

buoy ?—A bell buoy might be useful, but a light on the shore would answer the purpose better.

12,451. How far does the ledge project from the point ?—About three-quarters of a mile or a mile.

12,452. Is there a buoy on it now ?—Yes.

12,453. By whom was it placed there ?—By the Trinity Board.

12,454. Is it common for vessels running for Penarth to make land about the Nash ?—They generally keep the English side till they get up as far as Minehead.

12,455. And then strike across for what point ?—Towards Burry.

Mr. JOHN BATCHELOR examined.

Mr. J. Batchelor.

12,456. (*Chairman.*) In what way are you connected with the port of Cardiff ?—I am a merchant and shipowner.

12,457. For what number of years have you been resident here in that capacity ?—For about 15 years.

12,458. You have been present during the course of this inquiry ?—I have.

12,459. Do you generally concur in the evidence which has been given ?—I do.

12,460. Are there any points to which you wish to call the attention of the Commissioners, which have not been brought under their notice ?—Nothing, except to confirm the last witness as to the necessity of having a light to show the position of Breaksea Point.

12,461. The exact position of that light you leave to be decided by others ?—I know the fact which has been stated to be true, that a great number of vessels have been wrecked on Breaksea Point.

12,462. Have you any acquaintance with that part of the coast which lies between Hartland Point and the Land's End ?—None.

12,463. (*Mr. Lindsay.*) All points considered, at what part of the Bristol Channel do you think a harbour of refuge would tend most to save life and property ?—At Lundy Island.

12,464. Is that your decided opinion ?—Decidedly.

12,465. Then you give your decided preference to Lundy Island over Clovelly Bay ?—Most decidedly.

12,466. If a harbour of refuge were constructed at the Mumbles, would there be sufficient depth of water inside for the largest vessels to take it ?—Would you object to the masters of your ships running for that place in a south-west gale ?—Decidedly, in any state of the weather, I should object to any large ships of mine going to Swansea. For ships of 1,000 tons and upwards, I do not think it at all safe to attempt Swansea harbour.

12,467. (*Capt. Sulivan.*) Within your own immediate experience, have you had any vessel belonging to you, or for which you have been concerned, which after going beyond Lundy Island and putting back, has been lost with loss of life?—No, I do not think I could name any instance. I have known vessels which might have brought up under Lundy Island wrecked in Carmarthen Bay and elsewhere, but I am not aware of any lives having been lost.

12,468. (*Mr. Coode.*) You said that you would object to any large ship of yours going to Swansea in any state of weather ; would that objection hold good if a harbour were constructed there ?—Not to the same extent.

12,469. Would you still object ?—I should still object.

12,470. For what reason ?—Owing to the number of shoals in the immediate vicinity of the harbour and the openness of the harbour.

Mr. THOMAS THOMS examined.

Mr. T. Thoms.

12,471. (*Chairman.*) In what way are you connected with the port of Cardiff ?—As a shipbroker and coal shipper.

12,472. How long have you been resident here in these capacities ?—I have been resident in Cardiff for 21 years, and in business for the last 11 years.

12,473. Have you ever been at sea ?—No, not as a sailor.

12,474. Will you proceed now with any statement which you may wish to make ?—I know something of the Cornish coast between Lundy Island and Padstow, and there is one thing which has been overlooked or at least has not been spoken about, and that is with respect to vessels homeward bound. In my younger days I resided at Bude, between Lundy Island and Boscastle, and I have frequently seen vessels drive ashore between Lundy Island and Boscastle, which might have been saved if there had been a harbour of refuge at Lundy Island. I have known many vessels lost there ; I cannot tell their names, but I know that all hands were lost, which I believe would not have been lost if there had been a harbour of refuge at Lundy Island.

12,475. Where is Boscastle ?—Boscastle is about seven or eight miles on this side of Padstow, or about fifteen miles below Lundy Island. Bude is a bay just below Lundy Island.

12,476. I understand that you are well acquainted with the coast between the Land's End and Hartland Point ?—No, between Padstow and Hartland Point.

12,477. Supposing a harbour of refuge were constructed at Lundy Island, in your opinion would further shelter be required for the coasting trade between Padstow and the Land's End ?—For general purposes I should say the harbour ought to be at Lundy Island.

12,478. You mistake my question. I asked you, supposing a harbour to be constructed at Lundy Island, and it was contemplated to provide shelter for the coasting trade between Hartland Point and the Land's End, are you able to offer any opinion as to which would be the best place ?—You speak for the coasting trade?

12,479. The coasting trade, not foreign-going vessels ?—At a place called Manhook. I have heard some talk of making a harbour at Manhook, only some five miles below Bude.

12,480. (*Mr. Lindsay.*) How would a harbour of refuge have saved those vessels which were lost between Boscastle and Bude ?—For this reason, that vessels overtaken by a north-north-west gale find no place to run to up Channel, and cannot turn back. So some attempt to run for Padstow, and others will run for Bude. I saw myself an instance more particularly showing the necessity of a harbour of refuge at Lundy Island. I saw a vessel a long way off which made for Lundy Island, but seeing no place to get to, and not being able to get further up, she tried to make Padstow, and in making Padstow she got a little to the west and went ashore on the Doom Bar. This is not the only case ; nearly every winter you get one or two like it.

12,481. Would a vessel in the position you have described fetch Lundy Island in a north-north-west gale ?—A vessel not deeply embayed would do so, because if itwere not for the broken water they would make for it. From the distance we saw the ship I have mentioned I think she could have made Lundy Island. Another vessel went ashore a little above Bude which no doubt could have got to Lundy Island if there had been a harbour of refuge there.

12,482. What was the course the ship would require to steer for Lundy Island ?—Not being a nautical man I cannot tell you the exact course.

12,483. Where were the vessels ?—They were a long way off when they were first seen. There were hundreds of people on the cliffs looking on ; they were speaking then of Bideford or Clovelly, and saying that if there had been a harbour there it would have saved the ship.

12,484. Would a ship in a north-north-west gale in the position you have named off the coast between

Boscastle and Padstow have been able to weather Hartland Point to get to Clovelly ?—Yes, by the distance she was off. It all depends on the distance she is off the land.

CARDIFF.

Mr. T. Thoms.

1 Oct. 1858.

Mr. ANDREW HARVEY examined.

Mr. A. Harvey.

12,485. (*Chairman.*) Are you a seafaring man ?—Yes.

12,486. For how many years were you at sea ?—Since the year 1810.

12,487. And during that period how long were you in command of vessels ?—34 years to-morrow.

12,488. And what description of vessels have you chiefly commanded ?—From 60 to 562 tons.

12,489. In what trade were those vessels chiefly employed ?—All down the coast of England as many times as I have fingers and toes, all through the Baltic, but the Baltic trade was some time ago.

12,490. You wish to give an opinion as to the best place for a harbour of refuge between Hartland Point and St. Ives ?—Yes. I think you have had enough about Lundy Island.

12,491. Will you be kind enough to remember in giving your evidence, that we do not want you to cut jokes, but to give real information which will be of service to us ?—In the first place, I wish to give you to understand that I am a native of Padstow, and that I served my time out of this place, and that I made five voyages to Quebec. Three times out of five I have gone into Padstow at dead low water without a pilot, and with a ship of 286 tons register, drawing 17 feet of water. As to entering Padstow if you get the wind north-north-west blowing hard, in the present state of Stepper Point, you have two flows out and one in. With a north-west wind you have two flows in and one out. If it can be done when the wind is blowing hard, the flood tide carries us much further in. The moment a vessel is abreast of the outer capstan-house she is all right.

12,492. You speak of these flows as the real difficulties in the entrance of Padstow Harbour. Do you think that the proposal to cut down the hill will remove the inconvenience ?—I have no doubt it will to a certain extent.

12,493. Have you been at Padstow since the small improvements were made ?—I have not been there since last December.

12,494. You are aware that the rock has been cut down a little ?—When I say that I have not been there since December, I mean that I have been in and out in a steamer; I have every reason to believe, from my local knowledge, that if more of the point were cut away, a truer wind would be carried in. But what we want at Padstow is a breakwater from Brae Hill.

12,495. On the east side ?—From the east side to extend in a line with the outer capstans, say two-thirds of a mile, and I then believe the force of the ebb tide would take the sand out of the harbour.

12,496. Are you acquainted with Mr. Martyn ?—Yes.

12,497. Have you ever conferred with him upon this subject ?—I dare say in the course of conversation we have referred to it.

12,498. (*Capt. Sulivan.*) If the point were cut away to the outer capstan-house, so that vessels could shoot inside, would they get to a safe place in heavy weather ?—It is safe in if they can shoot Stepper Point, because the moment you get to the capstan-house you have smooth water.

12,499. Then if a ship had a steady wind as far as the outer capstan-house, she would be in safety ?—Yes.

12,500. (*Capt. Vetch.*) Supposing the affair of a baffling wind were got rid of, how many vessels of 300 tons burden would Padstow hold ?—They would warp as fast as they came in to an anchorage. You might lie there a dozen.

12,501. Do you mean a dozen small vessels ?—Yes.

12,502. Can you easily get out again with the wind blowing in ?—No, there is only 70 fathoms at low-water mark between Stepper Point and and the Doom Bar.

12,503. It would not be very accessible ?—It is frequently used for refuge now.

12,504. (*Mr. Lindsay.*) As you have volunteered your evidence, I want you to tell me, as a shipmaster of great experience, do you think a harbour of refuge would be of much value in saving life and property ?—Yes.

12,505. What site do you think the best ?—Lundy Island I believe, but if you come to the point of expense, I suppose we may say Clovelly.

12,506. You think that Lundy Island is the best side and would do the most good, and next to that Clovelly ?—Yes, in the Bristol Channel.

12,507. And after that would you say the Mumbles ?—No.

12,508. You would not like to run for the Mumbles ?—No, I should not like to run for the Mumbles.

(*Chairman.*) Is there any other person present who wishes to come forward and give any further evidence on the subject of this inquiry ?

No answer.

Sitting at Cardiff closed.

BRISTOL.

Saturday, 2d October 1858.

PRESENT:

Admiral HOPE (Chairman).

Mr. LINDSAY.
Captain WASHINGTON.
Captain SULIVAN.
Captain VETCH.
Mr. COODE.
Mr. EVANS, Secretary.

Mr. WILLIAM BRICE examined.

BRISTOL.

Mr. W. Brice.

2 Oct. 1858.

12,509. (*Chairman.*) You propose to open the proceedings on behalf of the Corporation of Bristol ?—Yes.

12,510. In what way are you connected with the City of Bristol ?—I am solicitor to the Corporation.

12,511. Be kind enough to make to the Commissioners any statement which you may wish on the part of the Corporation ?—I am directed to appear before you to communicate the views which the Corporation of Bristol hold on the subject of this inqury. Those views are embodied in a petition which was presented in the beginning of this year to the House of Commons, and I believe referred to the Select Committee appointed on the subject. One allegation in that petition is,—

"That your petitioners consider the position of such

BRISTOL.

Mr. W. Brice.

2 Oct. 1858.

Chairman.

island, and the facility of access and departure to and from the same, render it a most desirable situation for a harbour of refuge; and that advantages not possessed by other places exist at Lundy Island for the formation of a breakwater or pier, in the abundance of granite of which the island is formed, and in its peculiar adaptation for the employment of convict labour.

"That the island being nearly in mid-channel would, if in the possession of Government, form an unequalled protection in case of war to the whole of the British Channel.

"That Lundy Island being the westward termination of the Bristol Channel pilotage district, and having a first-class lighthouse erected upon it, is the point to which all vessels make upon entering the Bristol Channel in search of a pilot, and is the station selected by the pilots on the look-out for vessels."

These are shortly the views which the Corporation of Bristol, as representing the mercantile interest generally, hold with reference to the selection of a harbour of refuge in the Channel. It appears that the question at present is pretty well limited to Lundy Island and the Mumbles on the north, and Clovelly on the south. It is not the wish of the Corporation to detract from other places, but simply to place before the Commissioners their impression that under all the circumstances of the Bristol Channel, Lundy Island would be the most desirable place of the three for the erection of a harbour of refuge. Captain Drew, the haven master, has been already examined before the Select Committee at some length, and therefore I do not propose to touch upon the evidence further than to say that I will produce Captain Drew to-day to speak to anything which is not properly cleared up by the former evidence which he gave. Captain Drew stated that Lundy Island possessed, in his opinion, advantages over the other places. He considered that Lundy Island, being nearly in mid-channel, would be available in all states of the wind, that it had no lee shore, that vessels might leave to the north or to the south, that it was equally available to the coasting and to the foreign trade, and moreover, possessed on the spot an abundance of material in the shape of excellent granite for the formation of a pier or breakwater. He was questioned with respect to the expense, but upon that point he was not prepared to enter, nor am I prepared to give any estimate or plan. I shall simply endeavour to make out that Lundy Island is the best place, leaving it to you to exercise your discretion as to what is involved under the question of expense. I shall be prepared to support the views of Captain Drew. Captain Denham, when he surveyed the Channel in 1839, laid down the advantages of Lundy Island in these words:

"Lundy Island may be considered as a great natural breakwater, sheltering the mouth of the Bristol Channel from the prevailing winds, and affording a most eligible stopping-place for all vessels struggling to the westward. The great advantages which it offers for that purpose do not seem to have been hitherto duly appreciated, though there is no other anchorage for a loaded ship nearer than King's Road, in bearing up for which she would have to run 80 miles to leeward, and to pass through 25 miles of intricate (and in thick weather, of dangerous) navigation; whereas under the lee of this island she can hold her own, replenish her water, and proceed to sea without further pilotage the moment the wind changes or moderates. Here, also, the homeward-bound vessel is sure of obtaining a pilot for the Bristal Channel, or for any of the adjacent ports."

I think, with the authority of such a man as Captain Denham, acting in a survey of the Channel for the Admiralty, any observations which I could add would be feeble; but I shall produce before you, in support of the propositions which I have asserted, Mr. Poole, a merchant and member of the Town Council; Mr. King, Chairman of the Dock Committee; and two or three pilots. Mr. Poole, I should say, is a member of the well-known firm of Hall, Gilman, and Poole. I believe those gentlemen whom I have named will corroborate all that has been said with reference to the advantages of Lundy Island. I said before it was not the wish of the Corporation of Bristol to detract from the merits of other places; but it is impossible to close one's eyes to the fact, that if Clovelly were selected, that place lies in a bay, and with the wind from north-east to south-east a vessel would be embayed, and would have great difficulty in getting out. That has been stated already by Captain Drew. With regard to Swansea Bay or the Mumbles, it is surrounded by sands, and in thick weather it is difficult to approach. None of these objections apply to Lundy Island. It is an island of about 2,000 acres, and I apprehend there would be no difficulty made in furnishing any amount of ordinary supplies which might be necessary for any vessel that may touch there. There is abundance of fresh water at Lundy Island, and it is a matter of no small consideration that it possesses granite for a pier or a breakwater. I will not go into that, because it is touched upon in the evidence of Captain Drew, and, as I have said, we have not prepared plans and estimates. I think that I am bound, in the observations which I have to offer, to avoid, as far as possible, any repetition of points already alluded to in the evidence taken before the Select Committee. I think that I have trespassed as far as I ought, and I shall therefore content myself by repeating that I appear to-day to endeavour to prove to the Commissioners that Lundy Island is the most desirable point, not only for the interests of this port, but for the interests of the whole Bristol Channel. This view is supported by Gloucester, Newport, Cardiff, and Bridgewater. It is opposed by Swansea, and probably by Clovelly also; but it is for these places to make their case clear. On the part of the five ports I have named, I may state that there is no difference of opinion. We all concur in thinking that the advantages to which I have alluded belong to Lundy Island. We also think, with reference to its situation in mid-channel, that it is a most desirable point, in case of war, for the protection of the Channel generally. That is a question of importance in considering the site of a harbour of refuge, as may appear from the fact that one fifth of the ships, and one tenth of the whole tonnage, of Great Britain passes up and down the Bristol Channel. It is impossible to over estimate the importance of this inquiry, not only to Bristol, but to the trade and commerce of the country. We appear here with no selfish interests of our own. We have no interests to serve in the selection of Lundy Island except the selection of a spot which will be most convenient and most conducive to the public interests; and if the Commissioners should be of opinion that any other place possesses these advantages in a greater degree, we shall feel that we have performed our duty, and shall be perfectly satisfied if the exercise of their sounder discretion should consider any other place, either the Mumbles or Clovelly better than Lundy Island for the purposes of a harbour, of refuge. The first witness whom I shall tender will be Captain Drew.

12,512. Perhaps the Commissioners may wish to ask a question of yourself?—Oh, certainly.

12,513. I think you stated, Mr. Brice, that it was the opinion of the five places which you named, Bridgewater, Cardiff, Newport, Bristol, and Gloucester, that Lundy Island was the proper place? With the opinions of three of those places, Newport, Cardiff, and Bristol, we are personally acquainted. Have you any authority to speak on the part of the public corporations or the public authorities of Bridgewater and Gloucester?—We have received letters from the Town Council of Bridgewater, stating that they desired the selection of Lundy Island also. We have had interviews with parties belonging to Gloucester who entertain the same impression, and other parties we have heard from. We believe, therefore, that the opinion of the five places I have named is unanimous.

(*Mr. William Brown Clegran.*) I appear on the part of Gloucester.

(*Chairman.*) Do you wish to tender evidence on the part of Gloucester ?

(*Mr. Clegran.*) I am not prepared to tender evidence, but to make a statement as to what are the wishes of Gloucester.

(*Chairman.*) We will hear you presently.

Examination of Mr. BRICE continued.

12,514. (*Chairman.*) You stated that you had received letters from the Town Council at Bridgewater ?—Yes.

12,515. Have you any objection to put in copies of these letters as evidence ?—None at all.

12,516. (*Mr. Lindsay.*) You appear here on the part of the Corporation of Bristol ?—I do.

22,517. Did the Corporation of Bristol always hold the same views with regard to Lundy Island ?—I think the matter was first brought before the corporation in its corporate capacity at the beginning of this year, and I believe then there was no difference of opinion. The opinion was unanimous.

12,518. Was the opinion unanimous when the matter was first discussed ?—Yes, when first discussed before them.

12,519. I asked the question because a memorial was presented to the House of Commons in favour of Clovelly ?—I am perfectly aware that the Chamber of Commerce of Bristol petitioned in favour of Clovelly.

12,520. Will any one be here on the part of the Chamber of Commerce ?—I see the chairman and secretary present.

12,521. Then perhaps, if not now, hereafter they will state the views of the Chamber of Commerce as to the best site for a harbour of refuge ?—Yes.

Mr. JOHN DREW examined.

Mr. J. Drew.

12,522. (*Chairman.*) In what way are you connected with the port of Bristol ?—I am the haven master

12,523. Will you now proceed to make to the Commissioners any statement you wish, in addition to the evidence which we have already before us in an official form in the Report of the Select Committee of the House of Commons relative to the object of this inquiry ?—I have nothing additional to add to the evidence which I have already given before the Committee of the House of Commons, but I have witnesses to corroborate and strengthen that evidence.

12,524. There are no remarks you would wish to make to the Commissioners, in addition to that evidence ?—Nothing.

12,525. You are a seafaring man ?—Yes.

12,526. Are you personally acquainted with the Bristol Channel ?—I have been acquainted with the Bristol Channel ever since 1812.

12,527. Do outward-bound vessels in working down the Bristol Channel keep to either shore by preference ?—Are you speaking of vessels from ports in the Channel or from Bristol ?

12,528. From ports in the Channel and from Bristol,—from all the ports up the Channel ?—From Newport and Cardiff, if the wind is to the north, they keep the north shore ; on the contrary, if the wind is south, they keep on the south shore. The Bristol ships invariably take the south shore, unless the wind is too far north.

12,529. Where do they take their departure from ?—Lundy Island.

12,530. And with west winds—with the winds from west-south-west and west-north-west changing to the westward—they always attempt to work down the south shore towards the Land's End ?—If the wind is moderate they do. I have spent many days about the Channel and about Lundy Island, and I should have been very glad of refuge at Lundy Island. I have been obliged to bear up, and if the wind is west or west-north-west it is right up the Channel, and gives you no chance.

12,531. Between the Holmes and King's Road what is the nature of the anchorage ?—The anchorage under the Holmes is not very good. The vessels trading to Newport anchor there when the docks are full or the ships are outward bound ; but it is anything but a safe anchorage.

12,532. Supposing a ship running in a heavy wind from the west-south-west passing Lundy Island, and passing the Holmes, can she ride between the Holmes and King's Road in safety, with good ground tackle in bad weather ?—Vessels may ride there. There is good holding ground, but the tides are very strong.

12,533. Therefore ships ride there very uneasily ?—Yes, unless they know the Holmes and the shelter.

12,534. Did you ever know of accidents to ships there, such as parting from their anchors ?—I have known instances where anchors have parted, and where a ship has gone to King's Road, and run on the mud or gone to Newport.

12,535. Are these instances frequent ?—They are not.

12,536. Are you acquainted with Milford Haven ?—I have been there.

12,537. What kind of place is Milford Haven to make in dirty weather from south-west, when ships have run in from sea, and have had no observations for three or four days ?—Very bad. You would get into difficulties. If close in, there would be difficulty in weathering the swells.

12,538. I take advantage of having your opinion upon this point, because it has an important bearing upon our inquiry ?—I have found Milford, when running for it, an exceedingly blind place in heavy thick weather.

12,539. What is the objection to running for Swansea ?—I am there surrounded by sands—the Nixons, the Skerweather, the Outer Green Grounds, the two-fathomed bank called Hugo, and a variety of others.

12,540. As to Lundy Island, what is the character of the place for a ship making the land in thick weather ?—The generality of the trade will make Lundy Island ; if they pass to the north of it, they come up channel.

12,541. I wish to know your opinion of the land about Swansea ?—Do you mean from Oxwich Head to the Mumbles Head ?

12,542. Yes ; what kind of land is it to run for in thick weather ?—It is very awkward to run for.

12,543. Will you please to state your reasons ?—The difficulty is, that if you get in on a lee shore you will not easily get away from it.

12,544. Then there is no reason as respects fog or haze about that land more than any other ?—It would not be thicker there than at any other part of the Channel ; and I do not see why it should be so.

12,545. Precisely ; that is what I want to know ?—That is my opinion.

12,546. (*Mr. Lindsay.*) Then, from what you have stated of the Mumbles and the dangers which surround it, you think it is out of the question as a harbour of refuge ?—Certainly, when I can get such a place as Lundy Island.

12,547. Putting the Mumbles aside, after the opinion you have expressed, I wish to ask one question, whether you think a harbour constructed at Clovelly or at Lundy Island would tend most to save life and property. We will say nothing about convenience to commerce ; but at which of these points do you think the construction of a harbour of refuge would do most to save life and property ?—Do you mean losing sight of Lundy Island ?

12,548. No ; which do you say, Clovelly or Lundy Island ? Assuredly Lundy Island would be the best.

12,549. Then in your opinion a harbour of refuge at Lundy Island would do more to save life and property than if it were constructed at Clovelly ?—Certainly.

BRISTOL.

Mr. J. Drew.

2 Oct. 1858.

Mr. Lindsay.

12,550. Now, from your knowledge of the Bristol Channel, and your great experience, can you tell me of any lives or property which might have been saved if there had been a harbour of refuge at Lundy Island; take property first?—Two years ago, an American ship lost half her crew in Barnstaple Bay; she was a total wreck.

12,551. Do you recollect how the wind was?—She had been knocking about Lundy Island for some days, and had mistaken the lights.

12,552. Then it might have happened if there had been a harbour there?—No; she would have been in.

12,553. Had she been at anchor under Lundy Island?—No; under weigh.

12,554. Do you remember how the wind was?—No, I do not. I merely saw the case in the papers. The wind was west-north-west, and she could not weather the point.

12,555. Would anything which could be done at Lundy Island in the shape of building a harbour of refuge make the anchorage there better with the wind from the west than what it is now?—No.

12,556. The island shelters you from all west winds?—Yes.

12,557. Then the expenditure of money would not improve Lundy Island as a shelter during west winds?—We want a breakwater to the eastward.

12,558. How would the American ship have been saved by a breakwater to the eastward?—If there had been a breakwater there she would have gone in to anchor.

12,559. But I understood you to say that any expenditure of money would not improve the anchorage in westerly gales?—If a breakwater had been there she would have got to shelter. The fear and danger of Lundy Island is this,—in the winter you may be caught with an east wind if you anchor there.

12,560. Speaking to you as a nautical gentleman of considerable experience, what would be the effect of the construction of a breakwater at Lundy Island when the wind chopped round to the east, which is a fair wind to go down channel? Would ships be able to get away with as great facility as now?—Assuredly; they would be sheltered; they would be able to get their anchors. There would be two entrances, I suppose, a north and a south entrance, and ships would be able to haul out either one way or the other. I am not an engineer, but that is my opinion.

12,561. Have you turned over in your mind how it would be best to construct a breakwater? Of course you know nothing of engineering. Neither do I; but speaking to you as a nautical man, have you turned over in your mind how a breakwater can best be constructed to shelter ships at Lundy Island in an east wind?—No, I have not.

12,562. Have you turned over in your mind the question of expense?—It has never entered my mind.

12,563. Do you think the question of expense at all involved?—I consider it in a national sense, that it would be beneficial to the world.

12,564. But as we are so heavily taxed already, the question of expense should be a consideration to us all. Have you no idea of the expense of a break-water at Lundy Island within half a million?—I think I have heard 650,000*l.* stated for a breakwater at the south, and I suppose a 1,000,000*l.* would do the other.

12,565. What extent of anchorage would that give you?—A mile of anchorage. If you were to run a breakwater from that island and another at three quarters of a mile or a mile from the shore, I consider that would give shelter to a large fleet.

12,566. Then I understand you to say that you would have entrances north and south?—You would be embayed if there was only one entrance, and that one to the north.

12,567. Is it the case that many lives have been lost in Barnstaple Bay? Can you speak as to that of your own knowledge?—No; I do not know, of my own knowledge.

12,568. You know of no other but the case you have mentioned?—No; I do not recollect any o t h at the present moment.

12,569. I wish your opinion upon another point; do you know the coast between Hartland Point and the Land's End?—I have frequently passed that part.

12,570. Putting aside a harbour above Lundy Island, do you think a harbour of refuge somewhere between Hartland Point and the Land's End would tend to save life and property?—I should imagine that it would.

12,571. Is the prevailing wind south-west?—Not so much south as west-south-west.

12,572. At what point of the coast would you think it most desirable to construct such a harbour?—Shall I take a view of the Bristol Channel trade?

12,573. Take the trade generally, because if the public funds are to be spent in the construction of a harbour, we should always take into consideration the shipping of England?—As far as the Bristol Channel trade is concerned, I should say Padstow.

12,574. As far as the shipping of the world is concerned, what do you say?—St. Ives.

12,575. Padstow, in your opinion, would save life and property, and would be good for vessels frequenting the Bristol Channel, but St. Ives would be the better place for the trade generally?—Yes.

12,576. Do you know Oxwich Bay?—Yes.

12,577. What do you think of that?—You have the Helwick Sands outside, only four or five miles between.

12,578. Supposing it lay between Oxwich Bay, Clovelly, and the Mumbles, which site would you prefer?—Clovelly.

12,579. Supposing it lay between Oxwich Bay and the Mumbles, what then would you say?—I can hardly give an opinion; there are difficulties existing in both.

12,580. Would the dangers be so great and so many in running for Oxwich Bay during a gale of wind as in running for the Mumbles?—No, certainly not.

12,581. (*Capt. Washington.*) Have you heard any complaints of the difficulty of seeing the lights on Lundy Island?—Some time ago, nearly 12 months ago, they were making some alterations in the upper lights. We then had complaints from the pilots, but since the alterations have been made we have not had any.

12,582. Any complaints with reference to the fog?—No. We know that the high land of Lundy Island is capped frequently, and perhaps the lights are not easily seen.

12,583. Are the lights frequently obscured?—I was several years in command of a vessel, and I never experienced any difficulty in making them out.

12,584. I think you said that the trade of Bristol went to the north of Lundy Island?—The trade with a south wind bound round the western ocean would come to Lundy Island, and the trade to Ireland and the south would pass to the north.

12,585. And to America?—It would depend upon the wind. If the wind is north-east they would go to the north, if south-east they would go to the south, of Lundy Island.

12,586. (*Capt. Sulivan.*) During your knowledge of the trade of the Bristol Channel, do you know of any amount of loss of life above Lundy Island, which you would think would warrant a large expenditure of money to save it by a harbour at Lundy Island?—I know of but few lives lost; but a great saving to the trade would be this, they would have a fair starting place to the north, instead of running back up a dangerous channel of 80 miles.

12,587. Would the great value of Lundy Island to the upper part of the Bristol Channel be, its being a good weatherly stopping-place to prevent putting back, and ready to start with a slant of wind?—I think it would be a great advantage to shipping if there were a place of that kind.

12,588. Would it be a great advantage of Lundy Island that it would be a weather port to stop at and to start from?—That would be a great object.

12,589. In advocating Lundy Island have you that

object in view more than the saving of life and property ?—More property than life. Property may be lost when lives are not.

12,590. Do you know whether vessels find it difficult, or, from the dark appearance of the land, are afraid, to haul as close round that island, as is necessary to fetch a good anchorage ?—Men acquainted with Lundy Island find no difficulty.

12,591. Do you think a small harbour light on that island, to enable vessels to haul close round, and in thick weather a fog light, would be an advantage ?—I think so ; but it should be that description of light which will not interfere either with the revolving light or the standing light.

12,592. You spoke of the difficulty and danger of vessels at Lundy Island when the wind was round east ?—If the wind is east there is no chance of weathering it out.

12,593. Does the wind go round to the east from the north-west ?—Sudden changes of wind will take place in the winter months.

12,594. Does it not go round to the north-west and north before going to the east ?—It veers sometimes west-north-west, north-west, and north-east.

12,595. As it is at present can a vessel round the south side of the island and go on her voyage ?—Yes, she can go round the south end.

12,596. If a sudden change of wind to the east takes place, when ships are anchored at Lundy Island, does it come strong, or is it moderate at first?—I do not know whether I have the honour of addressing a nautical gentleman, but nautical gentlemen will tell you it is quite uncertain with sudden changes of wind.

12,597. But I am asking, within your own knowledge of the Bristol Channel, whether, when the wind veers from west to east, it comes on suddenly strong, or whether an east wind springs up gradually ?—It is calm when the wind is east, but the wind flies out from the south-west to the north-west first.

12,598. I am quite aware of that. Is the anchorage rather deep ?—Yes.

12,599. With the wind veering to the east, do vessels find a difficulty in getting up their anchors and making sail. The holding ground is good, and if the anchor has been lying some time there is a difficulty in purchasing it.

12,600. There is a difficulty in getting it up ?—Which way will you have the wind ?

12,601. Easterly ?—With anything east to east-north-east it is easy enough, but to the south of east you find some difficulty.

12,602. Do you think it would assist vessels anchoring there if a few buoys were put down near the position of the anchorage, not to take into as moorings, but to hold on to while they got up their anchors, and to make sail from the buoys instead of from their anchors ? Do you think that would be an advantage? —Certainly it would.

12,603. You spoke of Oxwich Bay as having sands near it. The Helwick sands run to the west, do they not ?—They run about west by north.

12,604. Do you know whether Oxwich Bay has a safe approach and deep water up to it ?—There are the Helwick sands coming west.

12,605. Coming in from sea is the ground clear up to Oxwich Bay ?—Yes ; up to the east of you.

12,606. If ships were running for a harbour constructed there, but in thick weather missed it and got to leeward, would they have much more chance of hauling off on the starboard tack than they would if the same thing occurred at the Mumbles ?—If they went so far in at the Mumbles it would be very difficult to haul out with the Skerweather and the Nash sands under their lee.

12,607. But would they have more chance of hauling off from Oxwich Bay on the starboard tack than if you made a harbour at the Mumbles ?—They would have a better chance at Oxwich. It is farther to the westward.

12,608. With respect to Clovelly, do you consider it an objection to any harbour of refuge there that when ships enter it during the prevailing gales which are foul for them, and when the wind shifts to a quarter which would be a fair wind to go to sea, they find themselves in the depth of a bay, and cannot get out ? —There is a difficulty in getting out of the bight of a bay.

12,609. Do you think that would be a disadvantage in selecting a position for a harbour of refuge ?—Certainly.

12,610. Do you know personally Padstow and that neighbourhood ?—No; I do not.

12,611. (*Capt. Vetch.*) I think you recommended Padstow as a proper place for a harbour of refuge ?—I think it would be a better place for the Bristol Channel trade than St. Ives, as vessels when they have not reached so far west will have a chance of going into Padstow.

12,612. Are you aware of how many vessels can be accommodated at Padstow;—No ; I know nothing of Padstow.

12,613. We have it in evidence that six vessels can be accommodated there ?—Nothing beyond that. I was only looking to the distance. A vessel may be able to reach Padstow when she cannot reach St. Ives. If we were down as far as St. Ives we might keep the sea.

12,614. I think you prefer Clovelly as a site for a harbour of refuge to the Mumbles ?—Yes ; I do.

12,615. Are you aware that any number of vessels collect at Clovelly to go down channel ?—They are only five miles from Hartland Point. They would never anchor there, but many vessels would be glad sometimes of shelter.

12,616. Are you aware that 200 or 300 vessels are often collected at the Mumbles waiting for a wind ?—Yes; and if a gale comes on from the south-south-east they drive on shore.

12,617. Being in such a defenceless situation, do you not think some shelter desirable ?—As far as the trade of Swansea is concerned, no doubt, but for the general trade of the Bristol Channel, I say Lundy Island is the place for anything of the kind.

12,618. (*Mr. Coode.*) Separating the two questions of life and property, I will ask you which you think the best site for a harbour of refuge in the Bristol Channel, having regard to life alone ?—I still think that Lundy Island is the spot above all others. I cannot have any other opinion as a nautical man who has known the Bristol Channel for many years. Lundy Island is the spot above all others.

12,619. That is your opinion, considering the saving of life alone ?—If there were a breakwater there ships would run for smooth water, and if in a gale of wind they could lay there till the weather moderated, and then make sail easily.

12,620. Have you ever anchored at Lundy Island ? —No.

12,621. You spoke of the holding ground ?—Yes. I am in daily communication with 75 of the pilots of the Bristol Channel.

12,622. Is there any difference among the pilots on that subject ?—I think not.

12,623. Do you know anything of the character of the granite at Lundy Island?—No, I do not.

12,624. With regard to the fresh water, shall we have evidence on that subject ?—There is evidence on that point.

12,625. Have you ever been in Padstow harbour ? —No.

12,626. Do you know it from the chart ?—Merely passing it coasting.

12,627. (*Capt. Sulivan.*) Do you think that if a light-ship were placed at the western end of the Skerweather Sands, it would be useful not only to the trade of Swansea, but add to the safety of the Bristol Channel ?—We have the Mumbles and the Nash lights. I think the more numerous the lights the greater the confusion. You cannot lose sight of the Nash light before you see the Mumbles light in fair weather.

12,628. It shows so far off the land ?—Yes.

BRISTOL.

Mr. J. Drew

2 Oct. 1858.

12,629. In thick foggy weather, do you think there is great danger of passing both lights without seeing them, and so possibly get on the sands?—Yes, certainly.

12,630. Do you know any sands so far off there without a light on them?—No, not in the Bristol Channel.

Mr. JAMES POOLE examined.

Capt. Sulivan.

Mr. J. Poole.

12,631. (*Chairman.*) In what way are you connected with the port of Bristol?—I am a merchant, a member of the Bristol Corporation, and a member of the Dock Committee, Deputy Chairman of the Taff Vale Railway, and a Director of the Cardiff and Abergavenny and the Cardiff and Plymouth Railways. I had intended to give evidence at Cardiff, but I was not at home when I received a communication on Thursday night, advising me of the Commissioners' meeting. If you will allow me I will, presently, impart a little matter connected with Cardiff.

12,632. I dare say you may have noticed, from our examination of previous witnesses, that we have not confined them simply to what may be the interests of Bristol only, but have sought to procure unbiassed evidence with reference to other places. You are aware of the objects of this inquiry?—Quite so.

12,633. Will you now proceed to make to the Commissioners any statement, as far as may be relative to the advantages or the necessity of a harbour of refuge in the Bristol Channel, for the passing trade?—I shall speak more as to the necessity for a harbour. With regard to Cardiff, we find great inconvenience arising from the fact of the overcrowded state of the roadstead at Penarth. When the wind is from the west, vessels come there from Gloucester, Chepstow, Newport, and Cardiff, and I have known a time when there have been from 400 to 500 vessels in the roadstead, and the docks being crowded with shipping at the same time, light vessels unable to get in, and laden vessels with no place to go to. We have been obliged to send and stop orders to the clerks; everything has been at a stand-still, and the trade has been put to great inconvenience. It has been represented that when the wind is scant, or when there is not a prospect of getting to sea, a number of vessels refuse to quit their anchorage, fearing that should they not make their voyage and have to come back they would find other vessels in their places, and no place to anchor. However, they will not go unless it is an east wind, which enables them with certainty to clear the land. We are told that if a harbour of refuge were made where they would have an opportunity of going away they would go there, and then instead of running back they would take advantage of that harbour, and we should not suffer inconvenience from the circumstances which I have stated.

12,634. Is there any further statement which you wish to make in addition?—I shall only say that from the evidence I have heard respecting the island of Lundy, I am satisfied that every person acquainted with the shipping trade will concur in recommending that place; but if you ask me questions, such as have been put to nautical gentlemen, I shall not be competent to answer them, because I am not a nautical man.

12,635. Are you directly connected with the shipping of this port?—Not the foreign shipping.

12,636. (*Capt. Vetch.*) You spoke of the crowded state of Penarth Roads and the danger and accidents which occur from that crowded state. Will you point out any mode in which it can be relieved?—I think we have been always given to understand that if a harbour of refuge was made somewhere by that place the roadstead by Penarth would be relieved, because masters now refuse to go to sea unless the wind is so fixed and determined that there is a certainty of their clearing the land.

12,637. Supposing Lundy Island were made a harbour of refuge, how many vessels would take shelter there?—I can only give a general answer to that question. I have heard, from the evidence, that there would be a mile of roadstead, and if there were a mile of shelter I should think that would shelter a large number of vessels; but if you ask me how many, I cannot answer the question.

12,638. I believe the number which do take shelter there now is very small?—At Lundy Island, at present, I should imagine they must be.

12,639. (*Chairman.*) Is any port used as a port of call for orders by the Bristol Channel trade?—I understand Falmouth and Cork.

12,640. Falmouth and Cork?—So I have understood.

Mr. DREW re-examined.

Mr. Drew.

12,641. (*Chairman.*) What I wish to ask you is this, whether tugs are made great use of to take large ships down channel as far as Lundy Island?—Not as far down as Lundy Island. They tow them as far as the Holmes, but occasionally below that. But with a current of wind and the flood tide they cannot tow.

12,642. Is the practice of using tugs with the larger and more valuable ships on the increase?—The trade from Bristol is generally towed to King's Road, to Newport, to Cardiff, and occasionally to the Holmes; but if the wind is fair they use their sails.

12,643. Would you anticipate that if a harbour of refuge were established at Lundy Island, it would become the practice always, in moderate weather or no wind, to tow vessels as far as Lundy Island, and leave them to take their departure thence?—Certainly, it would be an advantage if vessels were towed so far as they could take their chance of the first north wind which should blow.

(*Mr. Brice.*) Will you excuse me for suggesting the name of Mr. King, Chairman of the Dock Committee? I thought that as a member of the Town Council and of that body you might take his evidence as to both.

(*Chairman.*) Certainly.

Mr. RICHARD POOLE KING examined.

Mr. R. P. King.

12,644. (*Chairman.*) In what way are you connected with the port of Bristol?—I am Chairman of the Bristol Dock Committee, and have been a shipowner for the last 30 years.

12,645. Are you aware of the objects of this inquiry?—No, I am not quite aware whether, with a view to the convenience or advantage of shipping, or solely for the saving of life.

12,646. The primary object of the establishment of a harbour of refuge is, no doubt, first the saving of life. That is the first thing to be considered. After that comes the saving of property; and then, no doubt a very important consideration—the subsidiary purpose of their convenience to trade generally, as ports of call, or ports to which the shipping can proceed, and where, when they have made a certain portion of their passage, and are driven back by foul weather, they may put in, and therefore save the inconvenience and expense of running some 50 or 60 miles. I hope I have explained my meaning clearly?—Perfectly. I speak more of the convenience of the Bristol shipping, and being a Bristol shipowner, and from my experience, being a nautical man, I should say that Lundy Island is the most convenient place for the trade of Bristol as a port of refuge. There is scarcely a winter passes but vessels going as far as and even past Lundy Island, when the wind sets in strong from the north, are obliged to return to King's Road. If there were good anchorage at Lundy Island they would avoid coming back, and save running 80

BRISTOL.

Mr. R. P. King.

2 Oct. 1858.

miles. I think that would not only prevent great inconvenience, but would avoid great risk in going up and down the Channel. The Mumbles have been alluded to as a port to which vessels go, but from the experience which I have had I would rather return to King's Road than proceed to the Mumbles. It is so far to the north that if the wind hangs to the south you remain in there a much longer time than you do at King's Road.

12,647. Do you consider that the risk of which you speak of vessels running back through the Channel has any appreciable bearing on the rates of insurance ?—Well, we have had vessels that have gone up and down the Bristol Channel three or four times from not having a place at which to anchor at Lundy Island. We do consider the risk.

12,648. Altogether are you disposed to say that a harbour of refuge at Lundy Island would diminish the rates of insurance at this port ?—I think it would. I do not think the shipping generally would find Clovelly of the slightest use unless they had the misfortune to get into Barnstaple Bay. They would never avail themselves of Clovelly ; nor do I think they would ever avail themselves of a harbour of refuge in Swansea Bay.

12,649. Do you leave the captains of the larger and more valuable ships entirely at their own discretion with respect to taking refuge in bad weather, or do you give them instructions on the subject ?—I leave it entirely to their own discretion, but I think they would in a great measure be guided by the pilot unless they were past Lundy Island. I do not think either St. Ives or Padstow would be much valued by ships for shelter, for this reason, if they were so far to the west, they would proceed to sea ; they would not put back.

12,650. As a general rule, can you tell us what is the opinion of the captains of large ships as to keeping the sea, and trying to make their passage, and not taking shelter, or whether they would view it as a duty to their owners to take refuge in order perhaps to save the wear and tear to the ship, and probably damage to the cargo ?—I leave every captain to his own discretion. Some proceed to sea in any weather; others bear up, thinking it a more prudent course to get into harbour as soon as possible.

12,651. As you have probably considered the question of harbours of refuge generally, not merely as to the Bristol Channel, but with reference also to the east coast of England and to Scotland, do you consider that these harbours are more wanted for the coasting trade and the smaller description of vessels than for the larger and better found ships ?—I am hardly prepared to give an opinion, but I should think they were more required for coasting vessels than for large ships.

12,652. Perhaps you have not given attention to the subject ?—I have not been mixed up with coasting vessels. One point occurs to me ; life will be endangered often in running for these harbours of refuge.

12,653. Therefore, is the facility in running past Lundy Island, should vessels miss it, a great advantage in your estimation ?—So I consider.

12,654. Can you acquaint me whether the Chamber of Commerce was formerly in favour of Clovelly, and whether they changed their views in favour of Lundy Island ?—I was rather surprised when I heard that a petition had gone from Bristol from the Chamber of Commerce. I suppose it arose from one vessel in distress in Barnstaple Bay, in which case I can fancy a harbour of refuge at Clovelly would have been extremely desirable.

Mr. William Terrell examined.

Mr. W. Terrell

12,655. (*Chairman.*) Are you Chairman of the Chamber of Commerce ?—I am.

12,656. May I ask you is the Chamber of Commerce still in favour of Clovelly, or, if they have changed their view in favour of Lundy Island, will you state the reason ?—I can state briefly that the circumstance which induced the Chamber of Commerce to memorialize in favour of Clovelly was from hearing evidence from practical persons connected with the coasting trade and the trade of this port. In consequence of that they came to the conclusion that Clovelly would be an excellent harbour of refuge. That evidence struck them as being of such value that they tendered it to the Committee of the House of Commons, and one of the gentlemen was heard, Mr. Sanson, and other witnesses who are here present prepared to support the views which the Chamber of Commerce took, and to give much more practical reasons than I could give as to why they prefer Clovelly to any other place in the Bristol Channel. The claims of Lundy Island were not overlooked. We considered that if a given depth at Lundy Island could be inclosed, it would be one of the best possible protections of the Channel in time of war. Nevertheless, we think that the anchorage ground and other circumstances, which will be better stated by the witnesses present, are sufficient to justify Clovelly as a harbour of refuge. I was not chairman at the time this evidence was given, but I feel satisfied that whatever port was chosen by the Chamber of Commerce, was chosen upon good grounds, and that any place further down than Clovelly, whether at St. Ives or elsewhere, would be of little service at all to vessels coming up the Bristol Channel. If you will allow me I will now read the memorial :—

" To the Honourable the Commons of the United Kingdom of Great Britain and Ireland in Parliament assembled.

" The humble petition of the Bristol Chamber of Commerce,

" Showeth,

" That for many years past the expediency of constructing a harbour of refuge on the south coast of the Bristol Channel, for the purpose of saving life and property in ships navigating the Bristol and St. George's Channels, has been recognised, and every year, from the great increase of trade, particularly in vessels of large tonnage, the necessity for such protection as a harbour of refuge would afford has become more and more evident.

" That your petitioners are informed that the general question of harbours of refuge for the United Kingdom is now under the consideration of your honourable House.

" That, amongst other suggestions which were brought under the notice of the Committee appointed by your honourable House in the last Session of Parliament, was one for the construction of a harbour of refuge at Saint Ives, near the Land's End, in Cornwall.

" That your petitioners, as representing the trading, commercial, and shipping interests of the city and port of Bristol, are of opinion that St. Ives is by no means the best locality for the proposed harbour, but that the neighbourhood of Clovelly is beyond all comparison the most suitable in every respect for the trade of the Bristol Channel.

" That St. Ives is near to the Land's End, and much exposed, whilst Clovelly is about midway between Land's End and Kingroad, and sheltered by high lands.

" That Clovelly is opposite to Lundy Island, which is the point vessels make for on arrival, and at which pilots leave them when outward bound ; and it frequently happens that ships when to the westward of that island are overtaken by gales from the south-west to west-north-west, and having no harbour at hand are driven back to Penarth, or King's road, at great risk and peril, which might be avoided by such a place of refuge as that proposed.

" That Lundy Island and Hartland Point are landmarks for Clovelly, making it easy to run for, and the nature of the ground for anchorage (blue clay), and the water deepening to ten fathoms, would render it a perfectly safe harbour of refuge at a moderate

Chairman.

outlay, the materials for the purpose being close at hand in any quantity.

"Your petitioners therefore pray that they may be allowed to present witnesses before a Committee of your honourable House to substantiate the statements of this petition, and to prove the necessity of establishing a harbour of refuge at Clovelly.

"And your petitioners, as in duty bound, will ever pray, &c.

"Signed, on behalf of the Bristol Chamber of Commerce,

"MARK WHITWILL, Chairman."

12,657. Then I understood you to say that the Chamber of Commerce still adhere to that opinion?—We still hold to the opinion expressed in this memorial, and shall be prepared to bring forward evidence to support it. The witnesses tendered to the House of Commons are here. One witness was examined, and the other, Mr. Edwards, is connected with the shipping trade of the city, and also practically acquainted with the navigation of the Channel for many years.

Mr. JAMES HALL examined.

Mr. J. Hall.

12,658. (*Chairman.*) What is your occupation?—A Bristol Channel pilot.

12,659. How long have you been a pilot in the Bristol Channel?—Six years.

12,660. And previously, what was your occupation?—On board a steam packet in the Irish trade from Bristol to Dublin.

12,661. For how many years did you command that vessel?—I did not command her. I was a man before the mast, in the Dublin trade.

12,662. You are aware of the object of this inquiry?—Yes.

12,663. Will you state to the Commissioners any opinion which you may entertain as to the advantage or necessity of a harbour of refuge in the Bristol Channel for the passing trade?—A harbour of refuge at Lundy Island would be a great advantage to all vessels passing up and down the Bristol Channel. For instance, they cannot leave King's Road or Penarth with foul weather, because there is no place to anchor. They are afraid of returning again, and finding their places taken up. If there were a harbour of refuge at Lundy Island, they would go and stop there until there was a fair wind to go upon their voyage.

12,664. State your reasons for preferring Lundy Island to the Mumbles?—The reason is, that all advantages of wind can be taken at Lundy Island. At the Mumbles you cannot do so. I can leave Lundy Island with any wind and in any weather. I can leave with the wind north or south. At the Mumbles, I cannot leave with the wind at south; the wind is dead on shore.

12,665. Have you any other reasons?—Do you mean any other reasons for preferring Lundy Island?

12,666. Yes; for preferring Lundy Island to the Mumbles?—If westward of Lundy Island, when running for the Land's End, I can run boldly on for the island, and if I miss it, I am still in safety; there is nothing under my lee to pitch me up; nothing more than the open Channel to me, and I can boldly run for Lundy Island. Whereas, in running for the Mumbles, if it is thick, I cannot see the light; the Mumbles light is not seen far in thick weather.

12,667. Do you prefer Lundy Island to Clovelly?—Oh yes, by far.

12,668. For what reasons?—If you run for Clovelly with the wind at north-west, and miss the harbour, you are immediately in danger, especially if the tide is low, so that you cannot make for the bar; and if it is blowing north-west round to north-east, you cannot get out of the bay, so for that reason I would not run for that place at all.

12,669. Have you often anchored ships between the Holmes and King's Road?—Yes; I have anchored ships there.

12,670. In heavy weather from the west?—Yes; in heavy weather from the west. The holding ground from the Holmes to King's Road is middling good, but not over good. You drag your anchor unless you have a great scope of cable. Sometimes you drag two or three miles with the tide, until the tide turns again.

12,671. Do you recollect any occasion in which a vessel has dragged in the way you describe?—I was to anchor there last winter on board an American ship, and I dragged close upon a mile.

12,672. What sized ship was it?—800 tons.

12,673. What anchors had she down?—35 cwt.

12,674. One anchor?—Yes; we had one.

12,675. And what scope of cable?—60 fathoms.

12,676. What water did you anchor in?—We had 11 fathoms.

12,677. What yards aloft?—Mainroyal yard.

12,678. Was it blowing very heavy?—Very heavy from the west-north-west.

12,679. And when the neap tide set you dragged?—When the flood tide came up.

12,680. Is the land about Swansea easy to make in thick weather?—It is very hard to make.

12,681. Why?—Because the land is rather low. The land away at the back is high, the fore part of the land is low.

12,682. And the land about Hartland Point, is it easy to make?—Yes; but in hazy weather all lands are difficult to make.

12,683. I suppose we all know that. Is there any difficulty between the land about Swansea and Hartland Point in thick weather? which site should you prefer?—I can run boldly on to make the land about Hartland Point, but I cannot about Swansea. There are the Helwick Sands to the westward, and the Skerweather Sands to the east in running for Swansea.

12,684. Are you acquainted with Milford Haven?—Yes.

12,685. What kind of place is that to run for from the sea if a ship has had no observations for two or three days?—A very difficult one.

12,686. Why?—Because it is surrounded by danger?—There are the Smalls and the Burrow to the north and west. Up to the east there is Freshwater Bay, and the Crow Rock there. If you get in and it blows south-west you cannot get out.

12,687. Which is your heaviest gale in the Bristol Channel?—From west-south-west to west-north-west.

12,688. And as a general rule, how do the south-west gales begin?—Generally from the south-south-east.

12,689. And back round?—Yes; back round to north-west.

12,690. And when they fall down to north-west do they fly out to the east?—Yes, generally; but in winter time they back round again.

12,691. And continue to blow?—No; they go away calm and rise again.

12,692. Have you ever been at anchor at Lundy Island?—Many times.

12,693. Have you run in there for shelter in heavy westerly weather?—Yes; that is our rendezvous.

12,694. You are obliged to anchor pretty close, are you not?—We generally do in our pilot boats.

12,695. But I am talking of ships?—Ships generally anchor three-quarters of a mile or half a mile off the shore.

12,696. If the wind comes to the eastward, is there any difficulty in getting away?—It has often happened that ships have had to slip their anchors, and put the springs on the cable. It is not the easiest thing to tack out at the south side of the island in east winds.

12,697. Does that arise from the rapidity of the tide?—If you do not get your anchor you go right on the island. For that reason you are bound to slip your anchor, but if the wind should fade away light you have a chance of getting out.

12,698. (*Capt. Sulivan.*) Can you give me any reason why ships use Lundy Island so little as they do?—They are afraid of the wind shifting round to the east upon them.

12,699. From what you say, the only thing, as far as I can see, is losing the anchor and cable. They get away by sacrificing anchor and cable; a vessel then is in no danger?—She would still be in danger getting out if she did not slip her anchor and chain in time.

12,700. But by sacrificing the anchor and chain she can get away?—She will get away clear if she lets go her chain in time.

12,701. Do you find the holding ground good?—Very good.

12,702. Do you find any difficulty in hauling round the island when it is dark? Do you think it would assist you to have a small light on Rat Island?—It would a stranger, but it would not assist us much.

12,703. Not you, because you know the coast well?—Yes.

12,704. Do you think that buoys placed there, from which you could slip, would be an advantage?—It would be a little advantage, because you could hold on by the buoy until the wind falls away light, and then you would be ready to start.

12,705. Do you think there would be more advantage in having buoys to slip from than disadvantage in having them in the way of ships anchoring?—No.

12,706. What I wish to ask is, would you rather have buoys than leave it as it is?—I would rather have buoys than leave it as it is.

12,707. Do you find the lower light hid in thick weather?—The lights are hid.

12,708. Both of them, or do you see the lower one much longer?—When one is obscured the other is.

12,709. Did you ever see the lower one and not the upper one?—I never saw it in my life.

12,710. Do you think a low light on Rat Island would be useful to vessels running between Hartland Point and Lundy Island?—It should be put so as not to be taken for the low light of Lundy Island. It might be a little assistance, but it would be no assistance to us.

12,711. Have you ever anchored at Clovelly?—Never.

12,712. Do you think it an objection to a harbour of refuge that it should be placed in a bight where, with the prevailing shift of wind, a ship is brought upon a lee shore?—When you are in a bight, with the wind as it is, you are bound to be on a lee shore.

12,713. I ask you whether it is desirable to have a harbour of refuge where, with the prevailing shifts of wind, ships would find it difficult to get out of the bay, and go on their voyage?—That would be a great objection.

12,714. If you had to choose a site for a harbour of refuge, and the prevailing winds go round to north-west, making it a fair wind to go from a north shore, which should you prefer, the north or the south shore?—I would prefer the north shore to have a fair wind out.

12,715. Do you consider the great advantage of Lundy Island to be that vessels can go either way?—Yes, either way, and in any wind.

12,716. Have you known any instances in which ships have gone to the westward of Lundy Island, and then were lost in running back?—Last summer a Plymouth schooner was lost on the Culver Sands, in Bridgewater Bay.

12,717. After she had passed Lundy Island?—I do not know whether she had passed Lundy Island or not. It was in coming back.

12,718. You do not know whether she had passed Lundy?—No.

12,719. Were any lives lost?—Yes, all hands.

12,720. Do you know anything of the coast between Hartland Point and the Land's End?—Yes.

12,721. Is there a large coasting trade round the land passing that coast?—Yes, there is a deal of trade in the Bristol Channel.

12,722. Putting aside a harbour for the Bristol Channel, do you think that a harbour between Hartland Point and the Land's End for the coasting trade bound round the land, which they could run for in north-west gales, would be valuable to that portion of the trade?—No large vessels in a gale of wind will run upon a lee shore when they can weather away, but for vessels caught upon a lee shore, harbours would be very serviceable.

12,723. I am asking as to the coasting trade, excluding the foreign trade. Is it the coasting vessels which keep close in?—They do.

12,724. If the wind shifts to north-west, and they are caught close in shore, is it not difficult to weather it?—They are caught close in shore.

12,725. Then for that portion of the trade, would it be desirable to have some port of refuge to get into?—It would be desirable, but if there were a harbour at Lundy Island, they would make for it.

12,726. Do you think that vessels caught so close in shore are at all likely to weather Hartland Paint?—No.

12,727. Do you know, or have you heard in your own experience, of many lives being lost in coasting vessels between the Land's End and Hartland Point?—No, I have never heard of any.

12,728. You spoke of a vessel that drove under the Holmes?—Yes.

12,729. You said she was a ship of 800 tons, and you said she had out a 25 cwt. anchor?—A 35 cwt. anchor, I said.

12,730. Then it is my mistake. I thought you said it was a 25 cwt. anchor?—No, a 35 cwt.

12,731. (*Mr. Coode.*) You have spoken of vessels north and south of Lundy Island in certain winds. Will you tell us what is the fact as to the proportionate number of vessels going north and those going south?—They keep to windward. If the wind is north, they go north; if south, they go south.

12,732. Which are the prevailing winds?—South.

12,733. Then it comes to this, that most of the vessels go to the south?—Most of them.

12,734. Do you know the proportion?—There may be an equal number going to the south as going to the north, on account of the great number of vessels trading to Ireland.

12,735. Am I to understand you to say that vessels from Newport, Cardiff, and Bristol go to the south?—Vessels bound out to sea generally go out mid-channel course; they take their departure from Lundy Island.

12,736. Have you been at Lundy Island with a vessel, and taken in fresh water?—I have, with our own boat.

12,737. Is it your practice to take water at Lundy Island?—Yes.

12,738. Is it good?—Yes, very good.

12,739. And the quantity?—There is a well at the top of the rocks, and a stream runs down by the roadstead.

12,740. Is it near the present Trinity landing place?—It is about one third of a mile from the landing place.

12,741. Towards Rat Island?—To the north.

12,742. Is there any quantity of fresh water there?—The quantity sometimes varies.

12,743. Have you ever had occasion to take water towards the end of a dry summer?—No, I never had occasion to do that.

12,744. (*Chairman.*) You say that the holding ground at Lundy Island is good?—It is very good.

12,745. Has it ever occurred that a vessel has been caught in an east wind and rode it out?—Yes.

12,746. Do I understand you to say that you are acquainted with the coast between Hartland Point and the Land's End?—I am very well acquainted with that coast.

12,747. Supposing you had a harbour at Lundy Island, and it was decided, in order to save the lives of seamen employed in the coasting trade, to put

BRISTOL.

Mr. J. Hall.

2 Oct. 1858.

Chairman.

additional shelter between Hartland Point and the Land's End, what site should you select ?—Padstow.

12,748. Will you state your reason for saying Padstow ?—Padstow is a place planned very nearly out for the purpose, and, moreover, it is half-way from Hartland Point. Vessels bound along the coast reach half way, and then get in ; but when there is a harbour at Lundy Island they would rather return. They would be running on a lee shore with the wind at north-west.

12,749. Then you are decidedly of opinion, that if anything is to be done there, Padstow is preferable to St. Ives ?—A great deal more.

12,750. Would you be disposed to say, that when a vessel gets as far down as St. Ives, she generally gets round the land ?—She generally gets round the Land's End or keeps the sea, unless it blows a terrible gale of wind.

12,751. (*Capt. Vetch.*) Have you ever been at Padstow Harbour ?—Yes.

12,752. Often ?—I have been there perhaps a dozen times in my life.

12,753. How many vessels can find shelter there ?—It may be a dozen sail, but they would fetch the ground in the harbour.

12,754. What wind do you get in with ?—The wind at north-east.

12,755. Do you think a place that can only contain a small number of ships a fit place to make a harbour of refuge ?—That harbour is full of sand.

12,756. Do you expect that you could get rid of that sand ?—I should imagine if you were to make a harbour of refuge there you would make it outside the sand.

12,757. (*Capt. Sulivan.*) What is the difficulty of entering now with a gale from the north-west or the north-north-west ?—It is difficult to enter.

12,758. At high water ?—At all times. The Doom Bar is close, and with a wind you get placed so that you have to go very close to the mainland to get clear of the sand, and to get to deep water. If you go a cable and a half from the Point you are on the land. You have not more room than that.

12,759. Then the difficulty is the baffling wind off the Point ?—The baffling wind off the land.

12,760. Are you aware that they have cut down a small portion of the Point ?—No, I am not aware of it.

12,761. Do you know the first capstan-house ?—Yes.

12,762. If they cut away the Point, and the true wind were carried in as far as that, would that do away with the greater part of the danger encountered by vessels entering ?—The greater part, I should think.

12,763. Do you think that vessels would then take it in a gale of wind which are now afraid of the baffling wind ?—Small vessels would.

12,764. (*Chairman.*) Do the Bristol Channel pilots come for inward-bound ships ?—Yes.

12,765. Where is their cruising ground ?—Ten miles radius off Lundy Island.

Mr. JOHN GILMOUR examined.

Mr. J. Gilmour.

12,766. (*Chairman.*) What is your occupation ?—Bristol Channel pilot.

12,767. How long have you been a pilot ?—14 years.

12,768. Previous to being a pilot, did you follow the sea ?—No, I have always been a pilot.

12,769. Always piloting ?—Yes ; my father was a pilot, and I was always along with him.

12,770. You are aware of the objects of this inquiry ?—Yes.

12,771. State any opinion which you may have as to the advantage or necessity of a harbour of refuge in the Bristol Channel for the passing trade ?—I say there is no place like Lundy Island.

12,772. Will you state first, is a harbour of refuge necessary, in your opinion ?—Yes, I should think it was.

12,773. Will you state why ?—Because there is no harbour here going up channel.

12,774. You state that you consider Lundy Island the best site. Will you tell me why you think it better than the Mumbles ?—There is a way to get out and a way to get in there. You would not like to run upon a lee shore like the Mumbles. I would sooner go up channel or go out than run for the Mumbles.

12,775. Have you ever run for the Mumbles in bad weather ?—Yes ; I have run for the Mumbles and anchored my vessel.

12,776. Which do you prefer, Clovelly or Lundy Island ?—There is a way to go out and a way to go up if you run.

12,777. I am talking now of Clovelly ?—As to Clovelly, you would be running on a lee shore, and you could not get out with the wind to north ; if you were in Clovelly you would have to remain there. You would not get out with the wind at north to go up or down. If it were fair weather it would do very well.

12,778. Are you acquainted with the coast between Hartland Point and the Land's End ?—Yes.

12,779. Supposing a harbour of refuge to be made at Lundy Island, and that it were also considered desirable to spend money with the view of giving shelter to the coasting trade on that part of the coast, where is the best site to spend the money ?—Where do you mean ?

12,780. Between Hartland Point and the Land's End ?—I should say Padstow.

12,781. Will you tell me the reason why you would prefer Padstow to St. Ives ?—I was in St. Ives last summer, and likely to lose the boat. It came on to blow a gale. That is my experience of St. Ives, and to St. Ives I will never go. All the ropes we had on board could not hold her.

12,782. I think you hardly comprehend my question, because if there were a good breakwater at St. Ives accidents of the kind to which you refer would not take place ?—It is a very heavy sea in there.

12,783. Supposing a breakwater were made at St. Ives, which would give good shelter, do you think it would be equally valuable as Padstow, or would you still prefer Padstow ?—I should prefer Padstow myself.

12,784. (*Capt. Vetch.*) How often have you been to St. Ives Bay ?—I have never been there but twice.

12,785. Are you aware that there are very large vessels trading from St. Ives Bay above Hayle ?—Not very large vessels, I believe.

12,786. Vessels of 500 tons ?—No ; I was not aware they had any so large.

12,787. Did you ever go up to Hayle ?—No ; I never did.

12,788. Can you get a large vessel of 500 tons into Padstow ?—Oh yes, with a high tide.

12,789. How many vessels can you get into Padstow of that size ?—Not many of that size.

12,790. It would not accommodate a great number of vessels ?—If you make more water it will accommodate a great deal more.

12,791. You say there is a great sea running into St. Ives Bay. Would it be a great protection to that bay if the heavy sea were prevented ?—I should not like to run for it in a gale of wind.

12,792. Not behind a breakwater ?—I would sooner take Lundy Island or keep to sea.

12,793. You would not run for St. Ives with a breakwater ?—I would rather keep to sea where I had good room, and down that far you would have good room.

12,794. (*Mr. Coode.*) Have you ever been to Padstow ?—Many times.

12,795. Have you ever run for Padstow in a gale of wind ?—No ; I would rather keep out of it then.

12,796. Supposing a really good harbour were constructed at St. Ives and also at Padstow, or in its neighbourhood, which should you prefer to run for ?—Do you mean from Hartland Point to the Land's End ?

12,797. Take what position you like ; select the best situation ?—Padstow.

12,798. Supposing an equally good harbour could be constructed at St. Ives as at Padstow, which would you prefer to run for ?—I would run for Padstow before I would run for St. Ives.

12,799. Why would you do so ?—I should not have to go so far to the westward.

12,800. Do you think vessels would run for one or other which are embayed at Cape Cornwall ?—No vessel has reason to run unless she is embayed, not if she can keep the sea.

12,801. She would prefer to keep the sea ?—I would never run for a harbour in a gale of wind ; I would sooner keep my ship out to sea.

12,802. Then am I to gather from your answer that you consider a harbour down there only necessary for vessels which get embayed between Hartland Point and Cape Cornwall ?—Yes.

12,803. (*Chairman.*) What is the nature of the anchorage ground between the Holmes and King's Road ?—Pretty good.

12,804. Have you often anchored there in heavy weather ?—Yes.

12,805. Have you rode out a gale there ?—I have been there when it has been blowing very hard.

12,806. With what sized ships ?—Different sizes ; 400 and 500 tons.

12,807. What scope of cable ?—50 to 60 fathoms.

12,808. How many anchors down ?—Sometimes two, sometimes three.

12,809. Have you known vessels drive ?—I have, myself, often. It never happened to me but once.

12,810. Are you disposed to say that it happens frequently ?—No, not frequently, if your anchor is fair.

12,811. Upon the occasion on which you drove, do you recollect what yards you had crossed ?—Our gallant yards were crossed. We got them down when we could.

12,812. Within your own knowledge, do you know of many accidents which have happened to vessels anchoring between the Holmes and King's Road ?—No, I never heard of any.

12,813. Have you ever heard of vessels which have parted and gone on the sand, or run up into the road to prevent doing so ?—One Dutch ship parted with both her anchors, and had to run up in the wind.

12,814. Was there any damage to life and property ?—No, none but the loss of the anchors.

12,815. Therefore you are disposed to say that a stranger running in from sea would find safe anchorage above the Holmes ?—Yes.

Mr. WILLIAM THOMAS examined.

12,816. (*Chairman.*) What is your occupation ?—A pilot.

12,817. How long have you been a pilot ?—About eight years.

12,818. Were you a seafaring man previously ?—I have been a pilot from 14 years of age up to the present time, with the exception of four years at sea.

12,819. Are you well acquainted with the Bristol Channel ?—Yes.

12,820. You are aware of the object of this inquiry ?—Yes.

12,821. Have you heard the evidence of the previous witnesses ?—Yes.

12,822. Do you agree with that evidence ?—As regards a harbour of refuge, I believe Lundy Island is better than any other place.

12,823. Have you any reason for that opinion to offer in addition to those which have been already offered by other witnesses ?—In regard to going to Clovelly, vessels which come up the Channel do not like to run there. At Lundy, if you miss the island, you are still in safety.

12,824. Did you ever know a ship get into trouble running for Lundy Island in thick weather ?—Do you mean get on the island ?

12,825. Yes ?—No.

12,826. During all your experience you have known no ships running for Lundy Island get into trouble ?—No.

12,827. Running for the Mumbles, what do you say for that under the same circumstances ?—In thick weather ?

12,828. Yes ?—It is not easy to run for the Mumbles.

12,829. Why ?—You have got the Nixons, the Skerweather and other sands. A vessel was lost in the Nixons since my recollection.

12,830. Therefore do all these dangers make pilots and masters hesitate in running for the Mumbles ?—Yes.

12,831. They do not like to make free with it ?—No.

12,832. But you can make free with Lundy Island ?—You can.

12,833. Running for Hartland Point, what do you say ?—It is a bold place and little danger.

12,834. Is Hartland Point as easy to make as Lundy Island ?—It is a bold shore, but you cannot run with north or north-west winds, as you can at Lundy Island.

12,835. Do you mean that because in those winds if you miss Lundy Island you can run past it ?—Yes.

12,836. Tell us what is your opinion as to Clovelly ?—The evil which I see in Clovelly is the danger of getting embayed in north-west or north-north-west gales. Running for the harbour, if you get out a little bit you are on a lee shore directly.

12,837. If you miss the harbour you go on the shore ?—Yes, you go on the shore.

12,838. You have heard the evidence of the previous witnesses as to the anchorage above the Holmes. Do you concur in that evidence ?—Yes ; I have anchored there a good many times.

12,839. Is that a place where a strange vessel can run in, drop her anchor, and lay in safety ?—Yes, provided you get the ship well up, because flood tide brings up a very heavy sea.

12,840. Then a vessel anchoring there might find herself in difficulty ?—Yes, with the tide running strong and blowing a heavy gale of wind.

12,841. Do you know what sort of a place Milford Haven is for a ship to run into from the sea, not knowing her position ?—It is a blind place. They have to encounter the Crow Rock, Freshwater Bay, and of course a person cannot be accountable to hit the entrance of the harbour coming in from sea.

12,842. Are you acquainted with the coast between Hartland Point and the Land's End ?—Yes.

12,843. Supposing all the wants of the Bristol Channel were provided for by a harbour of refuge at Lundy Island, and it were determined to spend some money to give protection to the coasting trade, where would you expend the money ?—At Lundy Island.

12,844. But I am putting to you the question upon the supposition that that harbour is made entirely to your satisfaction, and that it was intended to spend more money upon some other place ?—Well, then, Padstow.

12,845. Is Padstow the place which you would prefer ?—Yes.

12,846. Will you state your reasons ?—It is near

BRISTOL.

Mr. W. Thomas.

2 Oct. 1858.

Chairman.

about mid-way between the Land's End and Hartland Point.

12,847. And therefore you think it more useful being mid-way. Are you disposed to say that when a vessel gets as far down as St. Ives she generally gets round the Land's End?—If the wind is any way north of the westward they go off a little way and get round.

12,848. They can either get round to Land's End or stand to sea with a north wind?—Yes, if they are any distance off.

12,849. And if it is not a north wind they get off the shore?—Yes, they can get off the shore on the other tack.

12,850. (*Capt. Sulivan.*) Supposing a harbour of refuge were made at the Mumbles, and you had your choice of putting back from Lundy Island in thick weather, and a south-west gale, running for the Mumbles, or running back to the Holmes, which should you do?—I should run back to the Holmes.

12,851. Have you ever known any vessel within your own knowledge which, after having passed Lundy Island, has had to put back and been wrecked?—I do know of a schooner, but I do not know whether she had reached Lundy Island.

12,852. You do not know how far down she had got?—No.

12,853. You do not know whether a harbour would have saved her or not?—Vessels often do come back to Cardiff Roads, and receive damage from the roadstead being so crowded.

12,854. Have you been into Padstow?—Yes.

12,855. Often?—Several times.

12,856. We have heard of the baffling winds making the difficulty of entering Padstow, is it so?—Yes.

12,857. Do you agree in that statement?—Yes, I know it to be true.

12,858. Do you think if the Point were cut away that would obviate the difficulty?—You would not have the baffling winds so much off the Point if the Point were cut away.

12,859. When a vessel has got in as far as the first capstan house is she in comparative safety?—Yes, after she had passed the baffling winds at north-north-east she would be free again.

12,860. (*Mr. Coode.*) When you went to Padstow where you taking a vessel in?—No, I have been in our own boat.

12,861. Were you obliged to run for it in a gale of wind?—I was never forced to run for it. I have been in there with an easterly wind, when it was very hard to beat up.

12,862. Have you ever had occasion to take vessels there?—No.

(*Mr. Brice.*) Perhaps, before you call the next witness, you will allow me to state that I have received a letter from Bridgewater, in which they inform me that it is their intention to send a deputation to meet you on Monday next; so that probably if you sit until Monday you will have an opportunity of hearing from them what their opinions on this subject are.

(*Chairman.*) Be good enough to hand that communication in.

Mr. Thomas Lee examined.

Mr. T. Lee.

12,863. (*Chairman.*) Have you followed the sea?—Yes.

12,864. For how many years were you at sea?—I was brought up as long as I can recollect at sea. I was bred in a fishing boat out of Clovelly, and have followed the sea ever since, with the exception of the last two years, when I have been residing at Lundy Island, in consequence of deafness. I then gave up the sea, but my home was always at Lundy Island.

12,865. How many years were you in command of vessels?—About 10 years.

12,866. What description of vessels did you command, steam or sail?—From a smack to a schooner.

12,867. In what trade were the vessels employed which you commanded?—Coasting, the Mediterranean and South of Spain, and to Cadiz; in the fruit trade.

12,868. Will you proceed to make any statement you may wish relative to the subject of this inquiry?—Being acquainted with the Bristol Channel all my life, I recommend Lundy Island as the site for a harbour of refuge. It must appear to all practical men, the Royal Commissioners included, in passing Lundy Island, that the place was fixed there on purpose. You must have been impressed with that, coming up the Channel. The advantages are the access and departure. Now I will suppose you and your ship knocking about the Bristol Channel in a disabled state, in which many vessels are in the winter time. Coasters generally put into harbour when the wind comes on, but the larger outward-bound ships, many of which trade to this Channel now, hang on as long as possible. If you are caught to the westward in strong westerly gales, you must make Lundy Island. You cannot make the coast without sighting Lundy Island. The Bristol Channel is much exposed to ground sea, and no place is more free from ground sea than the east side of Lundy Island. It is the place in the Channel which vessels try to sight.

12,869. How long have you been a resident on the island of Lundy?—For 15 years it has been my home. I have myself surveyed the place, and have found the depth of water to be exaggerated. I would recommend the outer place with the pen mark, which you will find on the plan produced. The depth of water averages from 9 to 10 fathoms at low water, and if you are expected to go farther out, you can make a harbour there in 9 fathoms. I would propose the larger place, taking into consideration how it would ease the upper ports, I mean Penarth Roads. Wrecks and damage frequently occur, and collisions also, because these roads are so crowded, and many ships are detained waiting for a chance to load, which enhances the freight.

12,870. How long do you say you have been a resident on Lundy Island?—For 15 years it has been my home, and I have been residing generally there for the last six years.

12,871. Do you possess any property there?—No.

12,872. Who is the proprietor?—My father rents the property, but his term expires in three years.

12,873. To whom does it belong?—To Mr. Heaven; the name is spelt in the same way as the place to which we all wish to go.

12,874. (*Capt. Vetch.*) You have resided 15 years on the island?—For 15 years it has been my home; but I have been to sea since that.

12,875. What is the largest number of vessels which you ever saw taking refuge there at a time?—I have seen upwards of 100 there. I may tell you that last July 84 vessels left the road with a south-east wind to proceed to the westward. I am a native of Clovelly. A vessel was lost on the pier there. At the same time there was a smack. The wind veered north-west, and she was caught in Bude Bay. The 84 vessels which left Lundy Island had 9 miles offing from the Cornish coast, and were safe. Having an offing, they could have proceeded back up the Channel. Supposing they had all left Clovelly, where one was lost there might have been 20.

12,876. Did 100 vessels take refuge at Lundy Island in a south-west wind?—Vessels take shelter in Lundy Roads until the wind is favourable to go to the west.

12,877. (*Mr. Coode.*) Do you know whether the greatest number of vessels pass to the north or to the south of Lundy Island?—It depends upon the wind. The fact is, Lundy Island is just in the track of your whole shipping, and many prefer the south side, on account of the shoals about the Welsh coast; but as to the question of going north or south, with a north or north-east wind, they would take the south coast.

BRISTOL.

Mr. T. Lee.

2 Oct. 1858.

12,878. Taking the average of the whole, what course do you say most of the vessels would take?—The south side.

12,879. (*Chairman.*) You said you wished to make a statement with reference to the chart. Before you commence that statement, will you let me know whether it is in reference to that plan as a breakwater?—Yes.

12,880. Are you a professional engineer?—No.

12,881. Have you taken the advice of any professional engineer on the subject?—No.

12,882. Then, although I am unwilling in any way to check any statement you may wish to make, before you begin, you must understand that this harbour engineering is a question upon which the first men in the profession differ very much; and therefore I hope you will not take up our time at any length, unless you have had the advice of a proper professional engineer?—All I can say is, that I recommend a pier carried out to the outer part. There is an average depth of 9 to 10 fathoms only at low water, and you might have anchorage for the whole trade of the Channel, if necessary. If you take Lundy Island as the site, as I think you ought, taking into consideration that it is the Gibraltar of the Bristol Channel, you might keep a few large ships of war there, to defend the trade of the Channel.

12,883. Our inquiry has nothing to do with the defence of the Bristol Channel; it is purely as to the shelter of the mercantile marine. Therefore, we cannot allow you to go on about the Gibraltar of the Bristol Channel.—All I can say is, that you might make the place smaller if you are so disposed; you might take a pier three quarters of a mile in length, and another a mile and a half in length.

Mr. Joseph Sawyer examined.

Mr. Joseph Sawyer.

12,884. (*Chairman.*) You were examined before the Committee of the House of Commons, with reference to Clovelly as a site for a harbour of refuge, were you not?—Yes.

12,885. Have you any statement to make in addition to what you then said?—Nothing more, but that I still retain the same opinion.

12,886. Are you acquainted with the coast between Hartland Point and the Land's End?—No, only by passing at a distance.

12,887. Therefore you have no opinion relative to the comparative merits of Padstow and St. Ives?—No.

12,888. (*Capt. Sulivan.*) If you were running for a harbour in the prevailing foul gales of wind, would you not consider it an advantage if it were so situated that when the wind came fair with the ordinary shift of wind, you should be able to go out easily, without working out of a deep bay?—You allude to Clovelly.

12,889. I am putting the question irrespective of Clovelly or Lundy Island. As a general question, would you prefer, for a harbour of refuge, a place that you could run out of on either side, with the wind fair in the prevailing shifts of wind, or would you prefer a place where the wind shifting fair, you would be in a bight and on a lee shore?—I believe you have overlooked the entrance. With a fair wind out of the Channel, you would be able to get out of Clovelly with two or three tacks.

12,890. I was not speaking with reference to Clovelly, I was speaking generally; whether a port where you would have to work out against a strong wind would be preferable to a place that you could run from with a fair wind when you wanted to go to sea?—I do not see the question in the way you put it.

12,891. I will take Clovelly. With a north-north-west gale, if the gale shifted from south-west round to west and north-north-west, a ship anywhere in the Bristol Channel which could weather Hartland Point or Lundy Island would go down channel, would she not?—Yes.

12,892. In Clovelly, with the gale having shifted round, but still blowing strong, would a vessel be able to get away without working out of the bay—would she be able to weather Hartland Point?—No, she would not.

12,893. If she were at Lundy Island, would she be able to round the south end of the island with a fair wind, and go to sea without any difficulty?—She would.

12,894. If a harbour of refuge were made at the Mumbles, and you were at Lundy Island, and had to put back in a heavy south-west gale, which should you prefer running for, the harbour in Swansea Bay or the Holmes?—I should prefer the Holmes by all means.

Mr. John Edwards examined.

Mr. John Edwards.

12,895. (*Chairman.*) Are you connected with the sea in any way?—I am a shipowner. I have been a seafaring man for 30 or 40 years.

12,896. And during that period, how long in command in vessels?—About 26 years.

12,897. What size of vessels have you chiefly commanded?—Small vessels.

12,898. In what trade have you been chiefly employed?—For the last 19 years trading to France for brandies.

12,899. Are you aware of the object of this inquiry?—I am.

12,900. Will you now proceed to make any statement which you may wish relative to the advantage or necessity of a harbour of refuge in the Bristol Channel for the passing trade?—As a member of the Chamber of Commerce my evidence was given in favour of Clovelly. In the early part of my life I was trading over Barnstaple Bar, and I know well how many lives would have been saved if there had been a harbour at Clovelly. Many vessels have been wrecked on the Barrows and many lives lost. For my own part, I have passed many a night in Barnstaple Bay when I would have given all that I possessed if there had been a place where I could have taken shelter, there not being water to go over Barnstaple Bar.

12,901. How was the wind under the circumstances you have named?—West-north-west.

12,902. Was it right into the bay?—North-west was right into the bay.

12,903. I understand you to say, if there had been a harbour of refuge at Clovelly you would have anchored there?—Yes; instead of keeping my vessel in a heavy sea going to and fro.

12,904. I think I understood you to say a considerable loss of life had taken place in Barnstaple Bay in bad weather from the circumstance of the difficulty of entering the harbour—is that so?—Yes, that is the case.

12,905. Would a harbour of refuge at Lundy Island meet the difficulty?—I do not think it would.

12,906. State the reason why?—Lundy Island is often capped. I have known cases where vessels have run in near the island, and not seen the lights, when, if there had been a light placed on the north-east extremity they would have seen it. I wish to make a remark on the suggestion of a light on Rat Island. I think it would have a very good effect, because the fog often caps Lundy Island down to the water's edge, and therefore a light which was not very high would be seen a sufficient distance before a ship got ashore.

12,907. Do you think that the principal disadvantage of making a harbour of refuge at Lundy Island is the difficulty of making out the lights as they are at present?—More than that. When you get in you

BRISTOL.

Mr. John Edwards.
2 Oct. 1858.

Chairman.

have to go very close to get an anchorage, and you are met with baffling winds.

12,908. As respects Lundy lights, do you not think that is a difficulty which could easily be removed by having fog lights ?—Very possibly.

12,909. As respects the baffling winds, are they such as to prevent a ship getting into the anchorage ?—You can have greater facilities for getting to the anchorage in Barnstaple Bay ; no man can gainsay that.

12,910. Though the difficulties are greater, is it not the case that a great many ships take shelter under the island in westerly gales ?—When a pilot is not to be found ships go round the island and bring up.

12,911. Therefore the baffling winds do not prevent their anchoring ?—No ; only sometimes they have to go and leave their anchors, and seek refuge elsewhere. The anchors of a Russian frigate are there now ; they were lost a number of years ago, when the ship had to come up to King's Road.

12,912. Does that often happen ?—I suppose so, for I very often hear of vessels picking up anchors which other ships must have left behind.

12,913. Do you not think they are the anchors of vessels which have had to slip for fear of easterly winds ?—It may be so.

12,914. Do you not think it is not only possible but likely ? Is it not more likely that the anchors picked up are anchors which vessels left behind when they slipped them, than that they are the anchors of vessels which had parted from them in westerly gales ?—Most likely they are the anchors of ships which have slipped and got away.

12,915. (*Capt. Sulivan.*) If there were a good harbour at Lundy Island and another at Clovelly, and you were to the westward of Lundy Island, and wanted to take shelter in a place convenient to go from when the wind was north-north-west, to which place should you go ?—Well, I should go into Barnstaple Bay.

12,916. Do you think you would get out of Clovelly with a north-north-west wind to go down channel as easily as you could out of Lundy Island, if you had a good harbour in that place ?—I am not prepared to answer that question. It depends upon how the breakwater is constructed. I think Clovelly quite as good as Lundy Island, and for naval reasons—for the protection of ships in time of war—I should say Clovelly decidedly.

12,917. I only ask you as a sailor whether, if you had to choose leaving Clovelly after a south-west gale, when the wind went round to the northward, or leaving Lundy Island, which would be the safest to leave ?—I should not leave either with a north-north-west wind, because I think Padstow would pick me up.

12,918. Well, a north wind ?—North is bare enough in any case, and particularly for coasters bound round the land.

12,919. Which would be the easiest for them, to get out of Lundy Island or out of Clovelly ?—Perhaps it is easier at Lundy Island to get to sea, but if the weather is fit to go to sea, I should prefer to be at Clovelly then.

12,920. Which would be the best place for vessels only going to Barnstaple and Bideford if they wanted shelter because they could not take the bar ?—Clovelly would be the best place then.

12,921. In reference to Clovelly, have you considered more particularly vessels entering Barnstaple or Bideford rather than the general trade of the Channel ?—I have no interest in either place.

12,922. I do not ask you if you have any interest in either place, but whether you have considered the danger they are exposed to more than the general trade of the Channel ?—No ; the general trade of the Bristol Channel. There was a vessel bound for the West Indies lost on the Moor Stone and a part of her crew drowned. If there had been a harbour in Barnstaple Bay that vessel would not have been lost.

12,923. If there had been a harbour of refuge at Lundy Island, could she have taken refuge there ?—Very possibly she might.

12,924. Do you think that she was south of her reckoning, and was not aware that she was running on a lee shore ?—Yes ; vessels are south of their reckoning sometimes.

12,925. Please to answer the question. Do you believe that she was running back, and being south of her reckoning, ran on the east coast ?—Yes.

12,926. Then even if there had been a harbour at Clovelly, could she possibly have found out her mistake any sooner, and would she not probably have gone ashore all the same ?—No, she would not, because they saw Baggy Point before.

12,927. Is Baggy Point the second point ?—It is the north head of Barnstaple Bay.

12,928. Can a vessel, being inside of Barnstaple Bay in a westerly wind, haul up and fetch Clovelly ?—With a west-north-west wind she would go down to Clovelly.

12,929. With a westerly wind she could not ?—No ; with a westerly wind she could not get back.

12,930. Putting Clovelly out of the question, if there were a harbour at the Mumbles, and you were at Lundy Island, and had to put back in a strong gale, which should you prefer running for, the Mumbles or the Holmes ; which should you consider the safest in a south-west wind and thick weather ?—If bound for Swansea ?

12,931. No, not bound to Swansea, merely putting back for refuge ; I wanted to know which you thought the safest place ; if you want to run for a safe place, and have no alternative than to run for the Mumbles or the Holmes, which should you run for ?—I should go to King's Road, most undoubtedly.

12,932. I think you said you traded with France ?—Yes.

12,933. In that case you can tell me how you generally round the Cornish coast ?—Between the Land's End and the Scilly Islands ?

12,934. And going round in south-west weather, would the usual course be along the land ?—We always give the land a pretty wide berth, for fear of the wind coming to the north or the west.

12,935. Do you consider a harbour somewhere between Cape Cornwall and Hartland Point would be valuable for vessels caught in north gales on that coast ?—Undoubtedly.

12,936. Do you know St. Ives ?—Yes.

12,937. Do you know Padstow ?—Yes. I went there to seek a harbour, to see if I could find a place where a steamer could lay afloat.

12,938. If such a harbour of refuge for the coasting trade were to be put either at St. Ives or Padstow, which should you prefer ?—I think a harbour is half made by the stones which lie at St. Ives now.

12,939. If a pier were carried out so as to protect St. Ives from north-west or north winds, do you think it would be a valuable place of refuge for the trade round the land ?—There is no doubt as to that for a moment.

12,940. (*Chairman.*) Supposing it were determined to spend money at some place between Hartland Point and the Land's End, to give shelter to the coasting vessels, which place do you think the best ?—I think both places equally eligible. Cutting the Point at Padstow away would make it accessible for small vessels. A breakwater at the stones would make St. Ives Bay a very efficient place. When I was at sea, a vessel came into contact with another off the Land's End ; she made a considerable quantity of water. They were afraid to go back to Milford, they went into St. Ives and got over Hayle Bar, and both were repaired there. As a place of refuge St. Ives is all very well.

12,941. But which would be the more useful, St. Ives or Padstow ?—Why Padstow is about half way, and if Padstow could be made equally eligible, I should say Padstow, myself.

12,942. Therefore, if Padstow can be made accessible and improved, you would say Padstow ?—If Padstow can be made equally eligible with St. Ives.

12,943. (*Capt. Vetch.*) Do you think Padstow can

BRISTOL.

Mr. John Edwards.

2 Oct. 1858.

be made equally eligible with St. Ives ?—I do not, myself. I do not think it can be made equally eligible.

12,944. (*Mr. Coode.*) Supposing an eligible site could be found in the immediate vicinity of Padstow, which then should you say, that site or St. Ives ?—If made equally eligible I should prefer the place near Padstow, because it would be mid-distance between Hartland Point and the Land's End.

12,945. You spoke of making a pier at "The Stones"; should you prefer that position to St. Ives Point ?—I should, because the "Stones" almost form a low breakwater now.

12,946. What winds are most required to be protected from at St. Ives ?—North-west and north-north-west winds, when you can neither get up nor down.

12,947. Do you know enough of the bay to say whether shelter would be given against north-west winds by a breakwater on the Stones ?—If it were carried off the head as well it would make it safe.

12,948. You would propose two piers ?—That's it.

12,949. What opening would you propose between the two ?—About a mile.

12,950. Do you know the length such piers would be ?—No.

12,951. Are you intimately acquainted with St. Ives Bay ?—I traded to Hayle in early life.

(*Mr. Brice.*) I am instructed by the Merchant Adventurers to say that they do not think it necessary to offer any further evidence, as they are satisfied with the evidence which has been already produced on behalf of the Corporation, whom they simply represent in this matter.

Mr. William Brown Clegrer examined.

Mr. W. B. Clegrer.

12,952. (*Chairman.*) In what way are you connected with the port of Gloucester ?—I am a solicitor of Gloucester, solicitor to the Gloucester and Hartland Canal Company, and a member of the Committee of the Chamber of Commerce, and represent both parties here.

12,953. Will you proceed to state anything which you may wish to offer to the Commissioners concerning this inquiry ?—I will not detain the Commissioners long. I am not prepared with any witnesses, and I am not aware that any evidence which I could give would be different from that which you have had on this occasion. I wish shortly to state, that the matter was considered by the Chamber of Commerce and the Gloucester and Hartland Canal Company, and they are decidedly of opinion that Lundy Island is the best site for a harbour of refuge in the Bristol Channel. Without wishing to deny the advantages of a sheltered roadstead at Clovelly and the Mumbles, still if there is to be only one harbour, they think Lundy Island more advantageous than Clovelly or the Mumbles. Further than that, I have no statement to offer. There is no difference of opinion at Gloucester among the mercantile community as to Lundy Island being the best site under all circumstances.

(*Chairman.*) Are there any other parties present who wish to tender evidence to the Commissioners on the subject of this inquiry ?

No answer.

Sitting at Bristol closed.

NORTH SHIELDS.

Wednesday, 13th October 1858.

PRESENT :

Admiral Hope, Chairman.

Sir Frederic Smith.
Mr. Lindsay.
Captain Washington.
Captain Sulivan.
Captain Vetch.
Mr. Coode.
Mr. Evans, Secretary.

NORTH SHIELDS.

13 Oct. 1858.

(*Mr. James Mather.*) I have a memorial to hand in from the seamen of South Shields, agreed to unanimously at a public meeting in September last, praying, not that this Commission will thoroughly inquire, because of that they have no doubt, but that as the Tyne is one of the principal harbours of refuge on the north-east coast in time of danger, it will receive their particular attention. They pray also most earnestly, that they may be heard before the Commissioners. They can prove to the Commissioners that the destruction of life and property on their coast is caused principally in south-east and south-south-east gales, and those gales which prevail from the south, in which a harbour of refuge to the northward is the only security. They can show, by facts innumerable, that such is the case ; but, like generous men of their profession, they do not confine themselves to their own interests and their own locality. They pray that the three great ports, the Tyne, the Wear, and the Tees, may, by the recommendation of the Commissioners, receive assistance from Parliament and the country ; and they say, that without some assistance of that kind, a solitary harbour of refuge on the coast, if made, would not provide for one half, I may say, one quarter of the wrecks which occur on the coast, and that therefore these great harbours which are used so much, and where we have about a fortieth of the sailing of the kingdom, in and out, and which are the great centres of destruction, may be made sufficient for the purpose not only of their destination to facilitate trade, but be made equally available to the saving of life. Perhaps you will permit me to say, at the same time, that at a meeting of the Maritime Societies of Shields, Stockton, Newcastle, and North Shields, exactly the same sentiments were expressed which I have the honour to lay before you to-day.

Mr. Cowan examined.

Mr. Cowan.

12,954. (*Chairman.*) You are the Chairman of the Tyne Improvement Commissioners ?—I am.

12,955. Will you now proceed to make any statement which you have to offer relative to the advantage or necessity of a national harbour of refuge on this particular part of the coast ?—On behalf of the Tyne Improvement Commissioners, I may now state that it was our intention on this day to have submitted to the Royal

NORTH SHIELDS.

Mr. Cowan.

13 Oct. 1858.

Chairman.

Commissioners plans for the extension of the piers, taking them into 6 fathoms of water, and to have supported that plan by the evidence of the engineer who is in charge of the present piers, Mr. Walker. We regret, however, to state that we are deprived of the assistance of Mr. Walker to-day, in consequence of the death of one of his relatives, whose funeral he attended yesterday or the day before. We are given to understand that it is next to impossible that he can appear here, and we felt that it would be almost an act of cruelty, under such a bereavement, to have requested him to be here. I have, therefore, to ask you, to be kind enough to hear the whole of our engineering evidence in London.

12,956. There can be no possible objection to your proposal to take the whole of your engineering evidence in London.—Very well; then we will produce the plan in London, and the report of Mr. Walker, and Mr. Walker himself, together with any other such engineering evidence as may be considered necessary. We thought it would be more convenient to give the engineering evidence at one time rather than to divide it, if you made no objection.

12,957. None whatever.—Then, on behalf of the Tyne Improvement Commissioners, all I have to say is, that having already given my evidence before the Select Committee of the House of Commons of 1857, which is in the Blue Book of 1857, I am not aware that I have anything to add to that myself, but I shall be happy to answer any questions which any of the Commissioners may wish to put to me, if they think that any part of that evidence requires explanation, and also to give any further information which may be considered necessary relative to the construction of the works now going on in the Tyne. But it does not strike me that I can do more than I have done in that evidence. No doubt it will be borne out by witnesses who will be examined here to-day, which will be much more satisfactory to the Commissioners than having a repetition of my evidence from myself. It has been suggested that I should put in certain statistical tables to the end of 1857; I did give in before the Committee of the House of Commons a table to the end of 1856, and there does not appear to be anything in the statistics of the year following to affect my evidence in any way. After these few remarks, if it is the pleasure of any of the Commissioners to ask me any questions, I shall be very glad to answer them. It is understood, I suppose, that the evidence taken in London will be considered as evidence taken here.

12,958. When we return to London we shall call any evidence up there which we may consider necessary, and of course, that evidence will be as much part of the evidence if taken in London as if taken here?—That is not what I mean. I mean with reference to the evidence already published, which was taken before the Select Committee of the House of Commons.

12,959. We have been in the habit generally of requesting gentlemen, who have already been examined, and who have tendered their evidence before us, to avoid a repetition of that which is already before us in the reports of the Committees of the House of Commons of 1856 and 1857?—That is exactly my case; my evidence is already before you, and it would be merely a repetition and a waste of the time of the Commissioners to go through it again.

12,960. (*Sir F. Smith.*) I was fortunately present when you gave your evidence, Mr. Cowan, before the Select Committee of the House of Commons; and I understand you to say, that you have nothing now to add to that evidence?—No; there is nothing that strikes me at present.

12,961. Have you any reason to believe, on further consideration, that these works, which are now in progress under the direction of Mr. Walker, are calculated to produce the effect imagined?—Yes; they are.

12,962. And the estimate is sufficient for the work to be carried out?—Yes; I think so. The estimate then given in for the piers, as laid down by the plan, was 400,000*l.*, and its correctness has been borne out by further experience since that time.

12,963. Looking at the whole question in a liberal spirit, do you think that if the public funds were applied to the saving of life and property upon this coast, it would be desirable that these funds should be applied to one particular locality, or divided among more than one?—I think it would be right to divide them among more than one. That is decidedly the spirit of the evidence which I gave in London. It would be decidedly the best, the most advantageous, and the most proper to divide it among the existing harbours.

12,964. And those harbours would be those which you enumerated?—Yes; the Tyne, the Wear, and the Tees.

12,965. What amount of money do you imagine would be sufficient to effect the necessary improvements at these three points?—Well; I am not prepared to answer that question. You mean the whole of the three?

12,966. Yes; the whole of the three?—I am not prepared to answer that question. I am only prepared to state so far as my own position goes. The position which we have taken is this,—We are already assisting ourselves by spending money, and we stated to the Government long ago, that we thought it fair, that for each pound laid out by us, the Government should lay out another pound; and that, if we bore half the expense, it was not unfair to ask the Government to bear the other half. I still entertain that same view of the matter.

12,967. Then, in point of fact, your opinion is, that it is quite equitable for the country at large to pay a considerable portion, say one half (the locality paying the other half) for these improvements, on the ground that while the locality will derive advantage from the half which they contribute, the country and the world will also obtain an equivalent advantage for the half contributed by the public?—That is just my opinion.

12,968. And you think that principle likely to apply to the other ports which you named?—I think it is only reasonable that it should apply. I think that each port ought to set an example by doing something for themselves.

12,969. I am aware that in your evidence before the Select Committee of the House of Commons almost everything which we desired to know from you to-day is to be found; but it is dispersed over a considerable number of pages, and it is no doubt highly desirable to concentrate as much as possible the evidence taken before us under the Royal Commission. I am desirous therefore of asking some things of you which you have already stated before the Select Committee of the House of Commons; but I wish to get them more clearly and more completely before us. I will ask you whether you think that a harbour of refuge on this coast is very important?—I think a harbour of refuge on this coast would be important, but at the same time I think that any one single harbour of refuge on this coast would be a total failure as regards meeting the requirements of the coast.

12,970. Then will you be good enough to state why upon this particular coast one harbour of refuge is insufficient when it is considered that in other parts of the coast one would be sufficient?—For this reason, that there is a larger amount of shipping passing and repassing this coast than any other part of the kingdom of the same extent. Not only a larger part, but a considerably larger part, I think we have passing out of these three ports. I believe it amounts to one-fifth of the entire shipping of the country, and I believe one-half of that passes out of the River Tyne.

12,971. One half of the fifth?—Yes. With respect to one particular, I don't know to what extent you could go in forming one harbour of refuge to take in all the ships which in stress of weather find it necessary to go into all these ports.

12,972. Then may I conclude from what you have stated, that if the public funds were applied to an unlimited extent in forming a harbour of refuge on the Tyne, that would not be sufficient for the saving of life and property ?—No, I am not prepared to say that, if you apply the public money to an unlimited extent ; but still I am prepared to say that you would have to go on, that it would be unlimited, and that it would embrace far beyond anything we have ever contemplated ; and my decided opinion is that any one harbour of refuge constructed for anything like 1,000,000*l.*, or 800,000*l.* which has been talked of, would be quite insufficient for the requirements of the locality.

12,973. I don't think my question is quite understood. My object is to ascertain from you whether, if the public funds, or all necessary funds, for that reasonable extension of the harbour which might be expected, the harbour being in one locality would not meet the whole requirements of the trade and commerce of the country ?—I am decidedly of opinion that it would not.

12,974. Even if Mr. Walker had the power of applying money to make one harbour in this locality, it would not satisfy you, you would want other places ?—It would not satisfy us.

12,975. That being the case, suppose we do make such a harbour, what do you think will be the effect on the trade of this locality ?—Do you mean one large harbour ?

12,976. If one large harbour were formed at Tynemouth, would that harbour increase the facilities of trade in this particular position at Shields and Newcastle ?—No doubt it would facilitate trade and diminish the loss of life and property.

12,977. Are the losses sustained by vessels endeavouring to get in, meeting with collisions, or being wrecked in crossing the bar ?—By both, frequently by collisions, and frequently by crossing the bar, or attempting to make the harbour.

12,978. Do you imagine that the works in contemplation will remove that bar ?—Yes, we do.

12,979. You have no doubt about it ?—I have no doubt of it. We shall submit to you a plan for taking the piers out to six fathoms of water, and I have no reason to doubt that we shall maintain, if not that depth of water, something approximate to it.

12,980. And the bar will be removed by the operation of the water or by dredging ?—The bar is nothing but sand, and by the contraction of the mouth of the river, or by the scour of the ebb tides, we have no doubt that the bar will be removed ; in fact, done away with altogether.

12,981. Scoured out into deep water ?—It will be scoured out into deep water.

12,982. Do you think you will have an accumulation of water to produce that effect, because I presume that if you contract the piers you will have less water entering the river ?—That question is more of an engineering character than one for me to answer, but my opinion is the contrary, that we shall have not an equal but a greater quantity of water, that the bed of the river will be deepened consequently, that the water will have more easy access, and rather than less, that we shall have more water.

12,983. Are you able, by statistical returns in your possession, to say whether the losses arising to vessels with cargo are more numerous than those arising to vessels without cargo ?—We will put in an analysis of the wreck chart, which will fully supply that information.

12,984. Do you imagine that a harbour of refuge at Filey Bay would not answer the purposes of the Tynemouth trade ?—I think it would be quite insufficient, that it would not answer at all.

12,985. Do you imagine that a harbour of refuge at Tees Bay would not answer the purposes of the Tynemouth trade ?—It would not ; and besides, there is no doubt, from information in our possession, that the Tees Bay will silt up, there is no back at all to keep it open.

12,986. You have no reason to suppose that your harbour will silt up ?—I have nothing to lead to that supposition.

12,987. In point of fact, your answer is "No" to my question ?—It is "No."

12,988. Do you imagine that if the state were willing to contribute a large sum, the locality would contribute an equal sum for still further improvements ?—I have no doubt at all but that they would do it most willingly.

12,989. (*Mr. Lindsay.*) As Mr. Walker will not be here to-day, do you intend to bring forward any engineering evidence ?—None ; for we thought it best not to divide that evidence.

12,990. Will you have any other witnesses who will be able to speak to the present state of the works, or who will be more competent to speak than yourself ?—No, I think not.

12,991. Will Mr. Taylor be here ?—Yes, Mr. Taylor will be here to-day.

12,992. Will he be able to speak to the present state of the works ?—Mr. Taylor will have something to say to you to-day, and he will be able, perhaps, to give better evidence as to the works than I can, but I thought your question referred to money expended.

12,993. It bears to a certain extent on that point ; and I should like to ask you a question or two upon it. I understand that the original estimate for the construction of the piers to the full extent was 400,000*l.* ?—Yes, it was for that amount.

12,994. And that the works under contract amount to 160,000*l.* ?—To 166,000*l.*

12,995. Now what is it then that prevents you from going on to take contracts for the full amount of the works ?—We cannot get the consent of the Admiralty, consequently we cannot contract for anything more.

12,996. Why have the Admiralty put a veto on your contracting further ?—That is a question which I cannot answer. By the Act of Parliament for the construction of the piers we were obliged to submit our plans to the Admiralty, and the Admiralty had the power of sanctioning the plan and fixing the extent to which we should go. We did submit the plans to the Admiralty, and we got their sanction as far as the contracts have been let.

12,997. That is to say, to so far as the extent of 166,000*l.* ?—Just so.

12,998. Have the Admiralty given any reasons why they will not allow any further contracts to be let ?—The reason was evident, that they wished to see the effect which would be produced by the work done.

12,999. Has any effect at all been produced upon the bar, have the piers tended to deepen the water as far as they have gone ?—The pilots who are to be examined will answer that question ; but I have no doubt, from the statement before me, that the water has deepened two feet upon it.

13,000. The water has deepened two feet ?—We have got a better bar by two feet.

13,001. From what time ?—From the commencement of the piers.

13,002. You have two feet more water than when you began to construct these piers ?—Just so.

13,003. I think, Mr. Cowan, you expressed an opinion to Sir F. Smith that, looking to the enormous trade along this coast, the construction of three smaller harbours of refuge, or the making of the present tidal harbours suitable to receive at all times of the tide the ordinary class of vessels which trade along the coast, would do more to save life and property than the construction of any one harbour of refuge at any particular site along the coast ?—I am decidedly of opinion that that would be the case.

13,004. And you said that the principle by which you proposed money shall be found for the improvements of the Tyne was this,—that for every pound of public money expended you, the people of the Tyne, were willing to spend another pound. I understood from you that Mr. Walker was about to submit to us in London a plan for supplying a further extension of

NORTH SHIELDS.

Mr. Cowan.

13 Oct. 1858.

Mr. Lindsay.

these piers, and that he proposed to carry these piers into six fathoms at low water ?—Yes, that is so.

13,005. Have you any idea about what the cost would be ; can you give me an estimate very roughly ? —That plan would take the piers up to the point where the present works would leave them, so that the present work would have been advantageously done, and form part of the whole ; and I should suppose, from a rough guess, that the cost of the additional work might be about 400,000*l.*

13,006. Then the whole cost would be 800,000*l.*, or would it be 400,000*l.* added to 166,000*l.* ; is that what you mean ?—No ; it would cost 800,000*l.* for the whole. To complete the pier according to the present plan would cost 400,000*l.*, and it would take 400,000*l.* more to take the piers out into six fathoms of water.

13,007. Then, in fact, the bargain you are willing to make is this : you would spend your 400,000*l.*, or the remainder of your 400,000*l.*, towards the construction of this large plan ?—Yes.

13,008. Therefore, by the country subscribing 400,000*l.*, which would be added to your own 400,000*l.*, you would have a harbour of refuge which ships of any size could take in a gale at low water of spring tides ?—That would be so.

13,009. The next point to consider is, what accommodation you would have for those ships which came for shelter. Tell me what the means are to clear your river of the number of ships which come here for trade. What dock accommodation have you ?—Northumberland Dock is already completed.

13,010. How many ships will it hold ?—350 sail.

13,011. Will the Jarrow Dock contain an equal number ?—The two docks will take in at least 700 sail. They will take that quantity of vessels out of the river. We have already had, on more than one occasion, 1,250 ships in the river, consequently we should have berths for 2,000 ships.

13,012. But in your two docks you will only have accommodation for 700 ships ?—But, if before we could accommodate 1,250 ships, then with our additional accommodation for 700 more ships we shall have accommodation for 2,000 ships.

13,013. Are there any other works to be executed at Coble Dean ?—That dock will not be so large as the Northumberland, but will contain 300 ships.

13,014. And consequently you will shortly have dock accommodation for 1,000 ships ?—Yes.

13,015. I need hardly ask you the question, but I wish it down in evidence, for it is always a question the answer to which has great weight with me. Can you give any idea of the number of lives which would have been saved during the last ten years, and the amount of property, if there had been a harbour of refuge constructed at the mouth of the Tyne ? Have you any return which will show that ?—I think I can supply you with the return probably to-morrow. I have spoken to that point before, when I gave evidence in London. I spoke to the fact, and I think all that is before you ; but if not, Mr. Mather can speak to it much more than I can.

13,016. You have a table, I think, which you intend to put in to-morrow, which will analyse the wrecks which have taken place along this coast. May I ask whether the proportion of laden ships is greater than that of light ones ?—That is a question which I would rather you get from nautical men, who are better acquainted with the subject than I am. You will have the exact numbers from other witnesses who are going to be examined.

13,017. Now, one question further ; if such a harbour as that which you propose to be constructed at the Tyne were made, which would give a very large area of water inside (especially when your dock accommodation is complete) would that, in itself, suffice for the wants of this north-east coast ?—It would not.

13,018. You think it would not ?—I think it would not.

13,019. Then you think there ought to be another harbour somewhere near the north of Tees Bay or Sunderland ?—I think there should.

13,020. Then do you think, supposing the harbour at Shields were made as you have recommended, and that there was an extension of the present harbour, either at Sunderland or at Hartlepool, so as to make a harbour of refuge to some extent for vessels which frequent this coast there, do you think the two would suffice, or would it be necessary to have a harbour further south ?—I think that if these three places were all improved on somewhat like the scale which has been laid down, that it would be totally unnecessary to do anything further for the requirements of the trade. That is my opinion.

13,021. I will ask your opinion, as a gentleman of great experience, more especially as you have, much to your credit, given particular attention to this subject, do you think or do you not think that a harbour somewhere about the neighbourhood of Flamborough Head, say at Filey Bay, would be of value to the shipping frequenting the north of England, having a view to the saving of life and property ?—I have no doubt it would be of value, but I have great doubt whether it would be of value in any respect commensurate to the amount of cost. No man can shut his eyes to the fact that a harbour would occasionally be beneficial, wherever you put it, but a harbour at Filey Bay would be quite insufficient to meet the requirements of the trade along the coast.

13,022. Then even if it were decided that there should be a refuge harbour at Filey Bay, with a view of saving life, which is the all-important point for us to consider, you still think something ought to be done for the tidal harbours in this bay ?—I do ; most decidedly I do.

13,023. (*Capt. Washington.*) Will you be good enough to state what amount of funds are available for the extension of the pier ?—The sum which we have by the present Act of Parliament power to borrow is 200,000*l.*

13,024. Yes ; but what amount of dues are levied for the piers ?—The amount of dues for the piers was about 12,000*l.*

13,025. Separate from the river dues ?—Distinctly, it is separate altogether ; it was 12,399*l.* 12*s.* 6*d.*, being an increase of nine per cent. on the collection of 1856.

13,026. It has increased, and is still continuing to increase ?—Quite so.

13,027. There is no objection to that due ?—None whatever.

13,028. It is paid willingly?—Paid willingly. It is a small tax.

13,029. Do you levy the full amount you are empowered to levy ?—Not in all cases. I think they are modified in some cases.

13,030. How much a ton is it ?—1*d.* for coasting and 2*d.* for foreign vessels; and I believe after vessels have gone seven voyages then they are exempt for the rest of the year.

13,031. And can you state the amount of river dues separately, somewhere thereabouts, in round numbers ?—In what way do you wish to have them ?

13,032. The dues available for the improvement of the river separate from the piers.—The net sum available for river purposes?

13,033. Yes.—I can put in a statement. This year it will be about 13,000*l.* net, after paying the interest of the debt, salaries, and everything else.

13,034. There are 13,000*l.* available for the improvement of the river, and 12,000*l.* for the extension of the piers ?—Yes, and I think we may state that we spent 14,000*l.* last year in dredging.

13,035. I hope it has been attended with benefit ? —It has been attended with benefit, for the nine-foot bar has disappeared.

13,036. I am very glad to hear you state so ?—The sea reach is four feet deeper, I am told. We have gone on materially increasing in our dredging. I can give the amount we have dredged each year.

13,037. Can you state what depth there is over the nine-foot bar now? Is it the same as outside?—I think the harbour master will tell you that better than I can: he has been paying more attention to it.

13,038. I think you said that the nine-foot bar had disappeared, or nearly so?—We have taken 7,626 tons from it.

13,039. You found no difficulty, no rock?—We found some difficulty. We found no rock, but large boulder stones.

13,040. I believe that prior to its removal it was a very great cause of obstruction to the trade of the Tyne?—It was; its removal will be of great benefit to the Tyne.

13,041. Has any improvement taken place in the in-sand?—I am hardly able to answer that question. I would rather you would ask the harbour-master; it would be merely my own opinion.

13,042. (*Capt. Sulivan.*) You said, Mr. Cowan, that ships of all sizes would enter if these improvements were carried out?—I did.

13,043. That is, you consider that a fleet of large line-of-battle ships would be able to take refuge in this port?—I reasonably calculate from 20 to 25 feet at low water.

13,044. Do you mean between the pier heads?—Yes.

13,045. Where do you propose that they shall find accommodation inside?—We shall find accommodation for them.

13,046. Do you know the narrow channel called the Narrows?—We contemplate that the Narrows will disappear.

13,047. Would the channel above Shields be available for anchorage ground?—It would, keeping a proper passage at all times in the centre of the river.

13,048. With reference to the trade with the colliery ports and London, have you heard generally that the great want of the trade is some port on the coast that they can put into during their voyage. Has that been the general complaint of the masters of colliers?—I hardly understand your question.

13,049. Has the general complaint of the trade been, that the east coast of England affords no refuge between the coal ports and London?—No, I do not think that is the general complaint; I think it is, that the ports of destination that they go from and have to come to have not sufficient accommodation in getting in and out. It is not so much the want of a harbour into which they can go during their passage.

13,050. When a fleet of laden colliers leave the Tyne, do they ever go out in east-north-east or south-east gales, which make it dangerous outside?—That is a question I would much rather you would put to nautical men. Some nautical men will be examined before you, and I am only commercially connected with the port.

13,051. But as a matter of fact, not relating to the voyage, I want to know whether it is the custom of colliers to go out in all weather, or whether they wait for a slant of wind, or whether they choose fine weather?—I would rather you get an answer from some other person.

13,052. Supposing a fleet of colliers to leave the Tyne under ordinary circumstances, do you think or do you not think, that a refuge harbour between their port and the next point at which they could get shelter would be of great value in east or north-east gales?—I think a harbour would be of value to them, but if the idea is carried out as suggested of two harbours to the south, if the harbour at the Wear were improved, which is the port of the principal trade, and also at the Tees, then there would be two harbours of which they could avail themselves.

13,053. I think you stated that you expect to get 15 feet of water, with the present improvement?—Just so.

13,054. Will that 15 feet at low water enable you to take a large portion of your colliery vessels at all times?—Yes, it will.

13,055. Then if you improve your harbour until you get 15 feet of water, so that it takes nearly all your vessels at all times of the tide, and in addition, you have a harbour to the southward, would that be better for this port than if the outlay were made here to make a harbour for large ships without any port to the southward?—I hardly comprehend your question.

13,056. Would a harbour with 15 feet of water here, which you say would take nearly all your colliery clsss of vessels —— ?—Take the light vessels.

13,057. I asked you whether it would take the ordinary class of vessels. I understood you that it would take them at all times of the tide?—Yes, I think it would.

13,058. With such a harbour here and such a harbour further south, which they could take at all times of tide, make vessels safer than they would be if there was only one harbour here, with 20 feet of water?—If both were to be done—ours taken out to 15 feet, and some other to the south also improved, probably the benefit would be considerable; but whether it would be equivalent to taking ours to 20 feet, I hardly think it would, because when you have 15 feet it will take a large portion of the trade; but the tendency of ships is to increase in size so considerably that I apprehend by the time we had got out to 15 feet, then we should find it necessary to go out to 25 feet; therefore I think it is desirable to go out to 25 feet.

13,059. Is it the case that the sand on the south side is filling up and rising rapidly against the pier?—Not inside but outside.

13,060. But the pier is getting partially buried in sand?—It is so.

13,061. How long has that pier been made?—It has been going on about four years. I think it was commenced in 1854.

13,062. (*Capt. Vetch.*) To what extent has the north pier been carried from the Castle Rock?—I cannot answer that question in an off-hand manner, but I shall be able to tell you to-morrow, or Mr. Taylor will be able to point out exactly.

13,063. I understand you to say that in consequence of the works carried out you have already two feet more water over the bar?—Yes.

13,064. With respect to the south pier, has that had the effect of cutting off the swashway called the Wheal?—It has, so far as it has gone, had that effect.

13,065. And with respect to the nine-feet bar, do I understand that you have cut it away to the same depth as on either side of it?—I am not prepared to say that it is entirely done. We have taken the dredger away now because of the advanced state of the season, with the view to send it back again next year to complete the work. I am not prepared to say it has entirely gone, but a portion of it has.

13,066. Do you not think that if it were entirely removed it would have the effect of increasing the current, both ebb and flow?—No doubt of it.

13,067. (*Mr. Coode.*) You said that the bar had been deepened two feet; has any shoaling taken place?—None whatever.

13,068. Are you sufficiently intimate with the subject to speak with confidence on that point?—I think if there had been such a shoaling, I must have heard of it, because we gave these things before the Commissioners at all our meetings. If anything of the kind happens, I cannot walk in Shields or Newcastle without being taken hold of, to be told of it, so that if there had been any shoaling, some one I am sure would have pulled at my coat long before now, and told me.

13,069. You propose to improve the Tyne, the Wear, and the Tees. Can you tell me the distance between the Tyne and Tees?—About 23 miles.

13,070. And can you tell me the distance from the Tees to Flamborough Head?—No.

13,071. Should you be prepared to find that it was somewhere about 50 miles. I think it may be.

13,072. And would you spend the whole of the

NORTH SHIELDS.

Mr. Cowan.

13 Oct. 1858.

Mr. Coode.

money upon the 23 miles, and leave the 50 wholly unprovided for; because that would be the effect of your proposal?—I would; at Filey Bay you have already got some shelter, and for the best of all reasons, that the bulk of the trade is here.

13,073. Then do I understand you to say that vessels require a harbour of refuge at their ports, and not where they are overtaken by storms in their voyage?—They do.

13,074. You lay that down as a principle?—I do. You find that vessels require more protection where they belong. All the practical information which I have been able to collect, and all the information most distinctly shows that old sailors will make at a considerable risk for the port they belong to, and if those ports have all the facilities which they can have, then it is that life and property will be safe.

13,075. You are not a nautical man?—No, I am not.

13,076. Are you aware of the proportion of laden to the proportion of light vessels which are lost?—No.

13,077. Have you seen the returns of the Board of Trade?—I have, and they will be put in to-morrow.

13,078. (*Capt. Sulivan.*) You say that it is important that the harbour should be improved, because vessels running for the ports they are bound to will persist in doing so. Then, with regard to all these three ports which you mention, that reason would apply to light colliers, and not to laden colliers?—There are a great many merchant vessels bound to the ports, as well as the colliers.

13,079. But as to colliers only, your reason would apply to light and not to the laden colliers?—Yes, it would; the laden vessel, in case of contrary wind, will come back. We have it continually happening that vessels from the Wear come back to the Tyne. You will hear of a vessel which a few nights ago went out and came back again.

(*Mr. T. Glover.*) I have the honour to appear here with Mr. Williamson and Mr. Salmon as a deputation from South Shields. I have only to say that we take the same view as our friends in Newcastle with respect to a harbour of refuge for this important port, and we are very glad that Her Majesty's Government has sent a Commission, and I am sure the evidence which you will hear from the shipowners will be such as to convince you of its necessity.

Mr. Joseph Straker examined.

Mr. Joseph Straker.

13,080. (*Chairman.*) Are you resident in South Shields?—No; I reside now a little further up the Tyne. I was for a great many years resident at North Shields, but I have lately removed from that place.

13,081. In what way are you connected with the port?—I am a shipowner to a small extent. I have been a very considerable shipowner, but I have sold out of it, as not being a very profitable speculation in the present times, with the competition which we have under free trade. I have got into something which pays me better; the coal trade. I may state that I was bred to the sea, and have commanded ships. Afterwards I had something to do with the graving and repairing docks in the river, and I have been a shipowner all my life; for the last 50 or 60 years.

13,082. You are aware of the object of this inquiry?—Perfectly.

13,083. Will you state to the Commissioners any opinion which you may entertain as to the advantage or necessity of a harbour of refuge—a great national harbour—on this part of the coast?—I have given that matter a great deal of consideration; for living, as I did for many years, at the mouth of the Tyne, I have witnessed all the wrecks which have taken place, and I have come to the conclusion that refuge is necessary, but that no harbour of refuge in any one locality will be sufficient for the necessities of the trade. I have quite come to the conclusion that the improvement of the different harbours along the coast will be much more effectual for the preservation of life and property than one single harbour in any particular locality, let it be to what extent it may. And, if you will allow me, I will give you my reasons for that opinion. It has been already stated to you that a very great number of vessels, a very large proportion of the shipping of the country, trade here to this very port and its neighbour the Wear. Now, the nature of the trade is such that people are all employed by the voyage, and not by the month, masters as well as seamen. A great many of these people live in this immediate locality. Their wives and families are here, and if you had a harbour of refuge at any one particular part of the coast, my opinion is that it would not be frequented by anything like the extent anticipated by those who advocate a single harbour of refuge, but that ships would pass it and persevere in going to their port of destination, and that the loss of ships and life will be diminished in a very trifling degree to what it would be if you were to improve the existing harbours. This is the conclusion to which I have come after a great deal of consideration of the matter. The difference between the trade upon this north-east coast and that in the Channel, for instance, where a harbour of refuge may be much more effectual, is this, that a great many foreign ships coming to British ports and passing up the Channel have to call for orders at some port or place; therefore it is necessary they should have some place to go to; there should be some place for them to go to, and a single harbour of refuge would be much more useful to them than on this coast, where it is hardly ever known that a ship calls for orders—ships come direct to the port and discharge, and proceed to their own port. If an opportunity occurs they go in; if not, they keep to sea. In the Channel, I say, it is different. Ships call for orders, and it would answer remarkably to go into a harbour of refuge while they were corresponding with their London and Liverpool friends, to get further provisions and to get their men renovated, for after a day or two's rest a crew come out new men. But here it is quite different. Ships, I believe, almost in 99 cases out of every 100, would pass such a harbour of refuge and come on to the port they are bound to. That is my firm conviction.

13,084. When you were at sea, in what trade were the vessels chiefly employed which you commanded?—The vessels I commanded for some years were engaged in the Baltic, the North American, and the Mediterranean trades, and in the winter season we got into the beautiful coasting trade—the coal trade.

13,085. How many voyages have you made to the Baltic?—Do you mean altogether?

13,086. Yes, altogether?—I really can hardly tell, until I have given the subject some consideration. I think I was for five or six years in the Baltic trade, and sometimes made two, and sometimes three voyages a year, but then we sometimes turned into the coal trade.

13,087. Have you returned from the Baltic late in the year?—Yes, I have.

13,088. Will you give me your opinion as to the advantage or necessity of a harbour of refuge on the east coast of Scotland for the Baltic trade? Would it have been any use to you?—Certainly not to me, for I was always bound to this port and came here.

13,089. But in the event of unfavourable weather; in the event of the prevalence of winds from the south-west, so that you were not able to make a straight course?—I may tell you I always bore up for my port, with a foul wind I kept to sea; but if I should have had to do so, if you will tell me which way the wind, I will tell you what port I should have borne up for. In a south-east gale I would have gone to Leith Roads, unless the weather allowed me to get into the Farn Islands.

13,090. Has it ever occurred to you not to make the land until as far north as Buchan Ness ?—No ; I always made for Tynemouth Castle.

13,091. Therefore you never made the coast of Scotland bound home from the Baltic as far north as Buchan Ness ?—Never, when bound home from the Baltic. I may give as another reason why ships will not enter a harbour of refuge in any particular locality, the very low rate of their freights and the absolute necessity of persevering and making their voyages as quickly as possible. With the competition of railways, freights are reduced so low now that it is with the greatest difficulty ships can pay their way.

13,092. I understand you to say that it is of very great importance that captains who command your ships should keep the sea in all weather, and make their voyages if they can ?—Certainly.

13,093. Has it ever occurred to you, in the course of your experience afloat, that if you had put into a harbour of refuge you would have saved wear and tear of your ship and damage to the cargo ?—Such a thing might happen, unquestionably, but the practice is not to give it the chance.

13,094. (*Sir F. Smith.*) I think you mentioned that you commanded a vessel trading to America ?—Yes.

13,095. Were you in the habit of going north about ?—Generally north about from here.

13,096. Did you go through the Pentland Firth ?—Yes, through the Pentland Firth.

13,097. Have you ever been through the Pentland Firth in a gale of wind ?—Yes, I have.

13,098. And meeting an adverse tide ?—Yes ; and a very ugly navigation it is.

13,099. Which is the usual course to America ?—Going outwards we make Duncansby Head, and make for the Firth, and wait for the proper time to go through.

13,100. You dodge about ?—Yes, dodge about.

13,101. And wait till the tide turns to run through? —Yes.

13,102. Have you ever had occasion to run into Cromarty ?—I never did run into Cromarty.

13,103. Do you know Long Hope ?—Yes, but I never was in it.

13,104. Is it good anchorage ?—It is considered good anchorage.

13,105. And usually taken ?—Yes ; but I never took it.

13,106. Do you know anything of Wick ?—No, nothing but what is on the chart.

13,107. You have passed Peterhead ?—Oh yes, often.

13,108. What do you think of Peterhead and Wick for vessels going north about, either homeward or outward bound ?—I do not know them sufficiently to give an answer to that. The only port to the north of the Firth that ever I was myself in was Aberdeen, and certainly it was not a very good harbour at that time, but I understand it has been improved very much since.

13,109. What size of vessel did you command at that time ?—A brig of about 240 tons.

13,110. Can you go in at low water, or are you obliged to wait for the tide ?—I know you are obliged to wait for the tide.

13,111. I suppose vessels of any size can come in here at high water, can they not ?—When you know the draught of water you can judge. We had one in a gale of wind on Saturday drawing 16 feet of water.

13,112. What time of tide was it ?—She would take the best of the tide, no doubt. I was not here to witness it myself, but I have a memorandum from the harbour-master stating that a ship drawing 16 feet of water came in.

13,113. You are aware of the improvements of the Tyne ?—Perfectly. I have been on the River Commission until now, when, having removed beyond the limits, I can no longer act.

13,114. As a gentleman of considerable observation, have you reflected on the effect of the works ?—Yes, I have given the matter great consideration. There was not one meeting which I did not attend when I was on the Commission. Moreover, I quite agree with what the Chairman has stated, that the depth of water is improved.

13,115. Already ?—Already, and is gradually improving.

13,116. You have no doubt that if the piers are carried out at an expense of 800,000*l.* the result will be highly satisfactory ?—That is my opinion.

13,117. And vessels of the largest draught of water will be able to come in at any time ?—That is more an engineering than a nautical question ; but if the effect which the engineers anticipate is realized then they will.

13,118. And you have no reason to doubt that the effect anticipated will be realized ?—I have no reason to doubt it.

13,119. Then the result of your observations rather leads you to believe that Mr. Walker is right ?—That is so.

13,120. Do you imagine that there is any feeling amongst master mariners and shipowners of the district to make for their own port, so that if a harbour of refuge were made at the Tees it would be a reflection on the sailors of the Tyne to go there ?—Decidedly there is such a feeling ; and, again, they are all so well acquainted with this locality that they would not risk their ships in a strange place if it were possible to reach this one. They know every inch of the ground, and the set of the tide ; therefore, if their own interests do not lead them elsewhere, they will not go.

13,121. Do you think any proportion of the casualties has happened from the circumstance of the master mariners attempting to get to a port not the port of their destination ?—Yes, I know an instance of that very lately, and I believe you will have a captain of a ship before you who will state that instance. I forgot to mention of ships which put back with a south-east or east gale to the Tyne. It happened that they saw a vessel deeper in the water running for Hartlepool. Seeing this ship go in, although they admit they were not well acquainted with the place, they ran for old Hartlepool and stuck fast. Another ship did the same, and each took the ground at the entrance.

13,122. Are there any instances of ships running back from Flamborough Head to take refuge in the Tyne ?—I think that is a thing which does not often occur, because ships rounding the Head can generally reach the Humber.

13,123. But ships being to the northward, awaiting adverse winds, when bound for London, would they not run for this port ?—They would, if they were obliged to take a port.

13,124. Are there instances of casualties in running for the Tyne ?—We have had many instances of laden ships running here and striking the bar.

13,125. We have had evidence before the Select Committee of the House of Commons that ships run back as far as the Firth of Forth ?—That is also the case. Different commanders of ships take different views. Where the great bulk run for the Tyne, more than a fourth run for the Firth of Forth.

13,126. I presume that if there were a harbour at Filey they would be saved that long voyage ?—If they were to the south of it.

13,127. Do you know Bridlington ?—Yes; very well.

13,128. Do you think that bay possesses capabilities for forming a harbour of refuge ?—Yes, very great capability. I think myself Bridlington Bay a much better place to form a harbour than in the bight of the bay down here, and for this reason, that any quantity of materials to form a breakwater may be found at a spot under Flamborough Head, close to Flamborough Head, but a sufficient distance from it to form an excellent place of refuge. There is also a shoal called the Smithic. Now, I think something in the shape of a crescent formed on the Smithic Shoal, leaving an opening between the north end

NORTH SHIELDS.

Mr. Joseph Straker.

13 Oct. 1858.

Sir F. Smith.

and Flamborough Head, and leaving an opening also to the south, would make a decidedly better refuge than any place down in the bight; and there would be this advantage, that a ship would be always to windward, and at an advanced point. Supposing ships took refuge in that harbour from the east-south-east to south-east, they can come round the north end, between it and Flamborough Head, and make their voyage down to their ports. If the gale should be north-east they can go round the south end; laden ships will go to Yarmouth, and light ships will come to the place of their destination.

13,129. Then your opinion is, that Bridlington Bay is well worthy the consideration of the Commissioners?—I think it is; and there is another point. By taking it at the proper time of the tide, you get under weigh at high water. The strong outset of the tide between the Smithic Shoals is such that a laden vessel would drive out.

13,130. Do you know Hartlepool Bay?—Yes; I know Hartlepool Bay.

13,131. In the event of any works being instituted there, do you imagine it would be better to have a detached breakwater with access at both ends, or to connect it with the shore?—You wish me to take an engineering view of it.

13,132. To a certain extent a sailor's view also?—But one great matter would be the expense.

13,133. Consider only the saving of life?—But I mean, to make the place equally effectual. You know that where a breakwater is connected with the land it affords an opportunity for conveying materials at all times of the year on to it. If you could make it equally effective I should prefer its joining the land. If it cannot, then of course the saving of life and property is the first consideration, and you must have it detached from the land. But one of the great objections to that bay is this, that it is very shoal towards the land; it is very shoal a considerable way from the land; that is, it shoals gradually out, and from all that I can ever learn I believe it is shoaling and will continue to shoal. At Old Hartlepool the practice of sluicing into the entrance makes an accumulation on the bar, which has grown out continually. Then the Tees, on the other hand, is surrounded by sands, and every freshet brings a quantity out. The result is a gradual shoaling up of the bay. Supposing, for argument's sake, that a breakwater were formed in either way, either connected with the land or detached from it, and let us suppose also a large fleet of ships caught in that immediate locality, we know by experience that the smaller ships always take the first of the tide, and run in first. It has been proposed that vessels drawing little water should go into the shoal water, and that according to depth vessels should take their stations farther out; but I should be glad to know whether any gentleman here, if he were in a small vessel running in, would not choose the best berth the harbour could afford. The consequence would be that before the larger ships could take their places, the ground would be occupied by the smaller ones. Again, to what extent can that harbour be made available?—At Yarmouth Roads we have a place 12 miles long, and we do know the facilities it has afforded as a natural harbour of refuge. Yet I have known ships obliged to run through Yarmouth Roads because they could not find anchoring ground, and go to Harwich. The same number might be caught down here, and how are they to be accommodated?

13,134. You consider that a great argument in favour of dividing the harbour?—Yes, of dividing.

13,135. You say that no one harbour, however considerable, can meet all the wants of the trade?—I think not. If you give the government money to make only one harbour of refuge, I should say it will not be sufficient.

13,136. Do you consider, as a general principle, taking any coast, that it is better to take the indentations of a bay than a promontory which forms one of the horns of the bay, to make a harbour?—I should prefer the promontory, because a ship with any wind could get out and make her voyage. If she were at the bottom of Tees Bay with a south-east wind she could not get out.

13,137. But supposing a vessel had not to go to a port of discharge but to a port of call, which would afford most facility to trade, a port in the bight of a bay or on a promontory?—I would decidedly prefer improving the ports where ships have to go to, and I would have the greatest improvements, and the largest sums of money laid out upon that port which had the largest amount of trade to accommodate. I think our Chairman, Mr. Cowan, neglected one thing when he spoke of the readiness of the people of the Tyne to lay down pound for pound; he might have gone farther and said that we will admit all ships for refuge without the payment of a farthing.

13,138. What do you think of the Humber as a place of refuge?—It is a good place; it is the only place resorted to in that neighbourhood.

13,139. Can vessels of great draught of water get in?—Yes; they can.

13,140. Looking at the wreck chart, I find an immense amount of collisions and damage off the Humber?—Off the Humber.

13,141. Yes, off the Humber. How do you account for that great loss by collisions?—From collisions I think you said?

13,142. Chiefly from collisions; there are few wrecks?—I can only account for it by the great number of ships running for the same place at one time. There is a very dangerous shoal at the mouth of the Humber called the Stoneybinks. I have known a ship catch their banks, and with a flood tide, though a new first-class vessel, roll over and drown every man on board.

13,143. Then you think it is very probable these collisions happen from the circumstance of vessels running together to get shelter at one time?—Yes.

13,144. And that is an argument for lessening the risk by increasing the number of harbours?—Yes.

13,145. (*Mr. Lindsay.*) How long did you reside at Shields?—Some 60 years, I think; perhaps 70.

13,146. During your long residence at Shields, have you seen any great loss of life?—Yes; I have, I am sorry to say.

13,147. And a large loss of property?—Yes; a large loss of property.

13,148. Out of what description of vessels were the lives chiefly lost?—Coasting vessels chiefly.

13,149. Have you known many strange ships lost in this immediate neighbourhood?—I have known strange ships lost, but nothing in comparison with vessels belonging to the neighbourhood.

13,150. Now, is it your opinion, for you have evidently given great attention to this subject, that if a harbour had been constructed, such as Mr. Cowan has shadowed forth, a large proportion of these lives which have been lost would have been saved?—I have no doubt of it whatever.

13,151. During what gales of wind has the greatest loss of lives and property occurred?—In a wind generally south-east to east-south-east.

13,152. Well, then, a wind from east-south-east will blow right into the Tyne?—It does, right in.

13,153. Supposing these piers carried out in the manner proposed to five or six fathoms of water, would a heavy sea tumble into the bay then during east-south-east gales?—I think not; not in comparison to the present sea which we have.

13,154. Not in comparison?—Not as compared with the present heavy sea, which we have.

13,155. Why do you think that the extension of the pier will lessen the sea tumbling into the harbour?—Because as you get into deep water, the sea does not break it rises and rolls, but it is very different from broken water. A wave will strike a ship, and in one instant turn her head to wind, and many instances have we known of vessels, when struck by the sea, becoming quite unmanageable and driving ashore.

13,156. Is it on account of the heavy ground-swell, which raises a dangerous sea, that a ship becomes un-

manageable, and, consequently, is driven on the rocks to the north or the beach to the south ?—Yes.

13,157. Is there a large amount of property lost ?—Yes.

13,158. And life ?—Yes.

13,159. Were the piers carried out, you would remove that heavy sea, because they would be beyond the limits of the ground swell ?—You would ; even by the piers, as at present projected, I think we shall, in a great measure, obviate that danger, because if a ship is once inside the piers, and is driven on the sand, on one side of the rocks or the other, she will be partially sheltered by the piers.

13,160. Then, in fact, if the piers were constructed there would, if not of property, be a saving of life ?—There would a saving of life and of property too.

13,161. And of property too ?—Yes.

13,162. Have you seen, in your time, many laden vessels get away a good distance from the harbour, and then obliged to put back ; I speak more of vessels bound south, the colliers ?—Ships bound south, if once they can reach and round Flamborough Head, generally get to the Humber ; but if short of Flamborough Head, and a heavy gale comes on, and more especially if the ship has become leaky, which many of these heavy ships do when plunging overhead, they are obliged to put back, and run either for the Tyne or Leith Roads.

13,163. Then your opinion is, that if ships weather Flamborough Head, they usually reach the Humber ?—They usually do.

13,164. Then if that is the case, why do you recommend a harbour of refuge at Bridlington Bay ?—I did not recommend one ; I was asked as to the capabilities of Bridlington Bay.

13,165. You only alluded to the capabilities of Bridlington Bay, not to the site ?—No; I am decidedly of opinion that no one harbour will answer the purpose.

13,166. But I understood you to say, that you considered Bridlington Bay a better site than Filey Bay or Hartlepool. Is that your opinion ? Do you consider it a better site ?—Yes ; than any other place near to it, such as Filey Bay.

13,167. But if it is the case, that ships which weather Flamborough Head, usually reach the Humber, and if it is the case, that ships are usually caught to the northward of Flamborough Head, and, consequently, cannot weather Flamborough Head, and are obliged to run back to the bight of this bay, why do you consider Bridlington Bay, which is to the southward, a better site than a place to the northward of Flamborough Head ?—I think it has this advantage—that supposing a ship were in Bridlington Bay, with such a place we have been describing, if the wind came away to the south-east, she could get under weigh and come north to her port. If she were down in any of the bights, she could not get out with the same facility. But I do not advocate or recommend any of them.

13,168. You do not recommend any of them ?—None of them.

13,169. Supposing the Tyne were converted into a refuge harbour, such as you recommend, and a harbour were made south also, in the bight of the bay, either at Sunderland or Hartlepool, would you then, looking to the expenditure of the public money, think it necessary to have another harbour farther south, somewhere about the site of Filey Bay, or somewhere about the site of Flamborough Head ?—I can only answer that question generally, that the more harbours there are the better.

13,170. I wish you to look at it as a question of the expenditure of the public money to the greatest advantage ?—A harbour of refuge about here would certainly be of use to a certain extent, but still I hold to the principle of improving the present harbours. I am of opinion that that would be far more effectual than any one harbour of refuge. If the government were prepared to give a harbour of refuge in addition to improving the existing harbours, it would be better still.

13,171. From your experience, do you think a harbour south much wanted ?—I do not think so.

13,172. You do not think so ?—I think the result would be, that it would not be used.

13,173. You think it would not be used ?—If these ports were improved in the way contemplated, I think ships would rather run there.

13,174. That is to say, you do not think that a harbour at Filey Bay would tend much to save life and property ?—I think not.

13,175. Ships put out from the Tyne, the Wear, and Hartlepool, with the wind fair and weather fine, thinking they will get to London, but when to the southward, near Flamborough, are caught with a heavy south-east gale or east-south-east gale, which I understand are the most dangerous gales on this coast, and are obliged to run for shelter and come down helter-skelter, and congregate in vast numbers at the mouth of the Tyne, the Tees, or the Wear, as the case may be ; would it or would it not, in your opinion, be a great facility to commerce if there were a harbour somewhere about the site of Filey Bay, where these ships could run in and find shelter until there was a change of wind ?—Taking it in comparison with the other places which have been spoken of—Bridlington Bay, for example—I should prefer Bridlington Bay. The reason is——

13,176. I spoke of vessels caught to the northward of Flamborough Head, which could not get into Bridlington Bay ?—Then, if they could not get to Bridlington Bay, I think it would be of advantage to them ; but there would be this disadvantage, that if the wind came north-east or east-north-east, blowing hard, if they were in an offing they could make their passage, but they could not make their passage out of such a harbour, and it is not the practice of ships to hug the shore to the eastward, they generally take an offing and try to make their passage.

13,177. Going out of the Tyne, if there is any east in the wind, do they go right out to sea till they get a good offing ?—Not right out, but they take a good offing, with the view that if the wind continues east they will be able to weather Flamborough Head and get to the Humber, or make their passage.

13,178. But if there were a harbour somewhere about the site of Flamborough Head or Filey Bay, either south or north of the Head, would it not tend to lessen, to a very considerable extent, the number of vessels which crowd outside the three harbours which I have named, and thus lessen to a considerable extent the loss of life and the damage to propertywhich take place, and which arise from vessels all running to these harbours when there is often not sufficient water to enter?—It would have that effect if ships would take the place, but my opinion still is that they would not take the place, that they would persevere for their ports.

13,179. With a south-east wind, caught to the northward of Flamborough Head, it would be a comparatively easy wind back again to the Tyne, would it not ?—It would.

13,180. Would it not be a considerable saving of time and expense if there were a harbour near the Head, into which vessels could run instead of running back to their own ports ?—Much depends upon the description of harbour which it would be. If it were a place which they could get out of easily again, then they might take it, but if there were any risk of that, then they would not go near it.

13,181. Have you many vessels which run to the Tyne for refuge ?—Well, in comparison to the number of ships which go out and come in, I cannot call the number great. There is a number, but when you look to the immense number of vessels coming and going, I cannot call it great.

13,182. What number of ships have you leaving the Tyne annually ?—About 45,000.

13,183. Do you know about what number of ships take refuge in the Tyne annually ?—I am not prepared to say. There are other gentlemen who will perhaps give you an exact account when under examination.

13,184. Are there many ships which take refuge at Hartlepool now ?—I think not many.

NORTH SHIELDS.

Mr. Joseph Straker.

13 Oct. 1858.

Mr. Lindsay.

13,185. Are there as many which take refuge there as take refuge in the Tyne ?—I should say not.

13,186. Are there half as many ?—I should say not half as many, but I do not know the number.

13,187. Supposing a harbour of refuge constructed at Hartlepool, and every facility for vessels using that harbour of refuge, would it be of much advantage to the shipping of this immediate neighbourhood ?—Generally it would not, for reasons which I have already stated. Ships leaving here take an offing. They do not look to Hartlepool, but if caught near it with the wind dead on the land, they would take it.

13,188. It would be of some use ?—Yes, it would be of some use.

13,189. But you think it would not be of considerable advantage, because vessels bound south take an offing ?—Just so. There are many reasons why vessels prefer the Tyne. The high land at Tynemouth Castle, with the lighthouse and castle, forms a prominent object that men on the coast would know again if they saw it under any circumstances, even through a snow storm. In the neighbourhood of Hartlepool the land is low ; there is no conspicuous object to mark the coast. I think that men at sea, obliged to run for a port, especially in snow showers, would like to run for a place above it, there could be no mistake. With Tynemouth Castle to lay hold of, and the piers to guide a ship into the harbour, I think they would decidedly give it the preference to running down to the bottom of a bay. Besides, the moment a ship enters within the piers she has every facility afforded her, for there are some 200 tugs belonging to the Tyne, so that if 200 sail were to enter at one time, there would be a steam tug for each to carry them away to their berths. Again, it is nearly a mile to run from the bar into Hartlepool Harbour—the Narrows, as it is called—and to a ship under storm sails that is a consideration. At the Tyne they have no occasion to let go their anchors ; a steam tug lays hold of them and takes them to their berths. Again, I have it from experienced pilots, that a port more easy to make than the Tyne is not to be found anywhere, not only on this coast, but on any other coast. Again, if a ship gets damaged—I know it from my own knowledge—there are some 50 or 60 docks, and about 24 shipways and gridirons for the repair of vessels. There is everything to be got here which a ship requires. Now, when we are considering a proposal for a harbour of refuge, it must be remembered that you cannot keep up a staff of that kind purposely for the assistance of ships occasionally frequenting such a harbour. I do not know where the funds are to come from to pay for it. It would not be practicable ; but here you have all these facilities. We have steam men-of-war and other steamers coming in here. We have the best steam coal in the country. We have some of our docks which will take very large vessels. The *Carlo Alberto* frigate was in North Shields, and another in South Shields. The *Bulldog* was also in the harbour. All these are advantages which it is impossible to have in a place simply for refuge.

13,190. Are your most dangerous winds accompanied by thick weather ?—Very often by heavy showers of rain, and in the winter by heavy showers of snow.

13,191. As it is only in gales of wind that harbours of refuge are wanted, it is consequently all-important, if that is the case, that whenever a site of a harbour of refuge is fixed upon, there should be a conspicuous headland to guide vessels in ?—I think that one of the most essential requisites.

13,192. Is the land easier made in the neighbourhood of the Tyne than in the neighbourhood of Hartlepool ?—Yes.

13,193. Is it easier made in thick weather ?—Decidedly.

13,194. Is it easier made than the land at Sunderland ?—I think it is, but there is not much difference there.

13,195. Do I understand you to say that there is a decided difference in that respect between this and Hartlepool ?—Decidedly. There is a much more distinct mark here.

13,196. Is Tynemouth Castle better known to ships trading along the coast than any other point ?—I think so.

13,197. Then, in fact, Mr. Straker, I understand the sum and substance of your evidence is this, that, looking to the objects which the Commissioners have in view, which are, first of all, the saving of life ; secondly, the saving of property ; and, thirdly, facilities of commerce,—taking into consideration all these points, you think that the public money, if it is to be expended at all, should be expended in improving the existing harbours, so as to make them accessible at all times of the tide rather than in the construction of any one harbour of refuge, wherever the site might be ?—That is my decided opinion. I may add that I would not confine it to the three places named by Mr. Cowan, but I would also wish the Government to extend aid to some of the fishing stations to the north. There is never a summer but what some of the fishermen are sacrificed. They go out in the herring fishery, and if they have a good haul they have it at the risk of being swamped coming in. I have observed that during the herring season the gale often comes on north-north-east. There is no place to make for, and almost invariably some of these poor fellows are lost. Therefore, I think that a very small sum comparatively, if laid out on some of these places, would be of great service in the saving of life.

13,198. Do you allude to any particular place ?—I take the whole range of the Scotch coast.

13,199. From Wick southward ?—Yes. As you gentlemen have visited those places you will be better acquainted with them than I can possibly be.

13,200. I do not clearly gather what your opinion is as to the necessity of a harbour on the east coast of Scotland. Have you considered the subject sufficiently to say whether a harbour there is necessary ?—I have not thought so seriously of it as of this place, which has been under my daily observation for half a century. Though I have gone along the Scotch coast, as I have said before, I never put into a harbour in my life, and consequently I have never visited the Scotch ports.

13,201. Then the opinion which you have formed as to the best mode for expending the public money on this coast is not a new one, but one to which you have given your attention for nearly half a century ?—I have, and I have thought of it ever since I thought of anything.

13,202. Then your great experience gives you the opinion that sailors will run, if there is any chance of reaching it, to that port to which they belong in preference to all others ?—That is my opinion.

13,203. Consequently, you have arrived at the conclusion, that if money is spent for the saving of life, which is the all-important consideration, it should be spent at such places as those which men run for when caught in violent gales of wind, and obliged to seek shelter ?—That is my opinion.

13,204. (*Capt. Washington.*) With reference to the last opinion which you have expressed, that sailors will not go into a port of refuge, even if constructed, but rather run for their own ports. I think you have said so ?—Yes.

13,205. And you spoke of the Tyne, of the Wear, and the Tees, do you speak of them in their present state, or as proposed to be improved ?—I spoke always of them in their present state, and what I said will apply much more favourably, of course, if they were improved.

13,206. You have spoken of laden vessels which bear up and run ?—Yes.

13,207. Those laden vessels only go out just at the best of the tide, do they ?—Just so.

13,208. If caught in a gale of wind and obliged to run, they might be 11 hours off one of those ports ?—They might be.

13,209. Is that a safe state of things, and would you recommend that state of things to continue ?—I do not consider it safe.

13,210. To keep a vessel for 11 hours off the port in a gale of wind would expose the lives of the crew to almost certain destruction, would it not ?—No ; because many come in safe, and all expect to do so, and with that expectation they take those ports.

13,211. Might not the contingency arise, that they might be driven back and caught in a gale of wind and obliged to wait 11 hours ?—Yes.

13,212. What must they do under those circumstances ?—Keep in the offing until the tide serves.

13,213. Are vessels which sail from the coal ports of the Tyne, the Wear, and the Tees so found, so fitted, and so manned that they can keep the sea in an on-shore gale ?—Laden ships can.

13,214. Laden ships can ?—Light ships can, but necessity obliges them to throw their ballast at sea.

13,215. What necessity is there obliging them to throw their ballast at sea ?—Many of them, if they brought their ballast into the port, would make a loss instead of a profit.

13,216. Then do I understand that vessels risk the destruction of their crews to save the small sum for ballast dues ?—They certainly do it, there is no denying it.

13,217. Are the ballast dues heavy at the Tyne ?—Rather so.

13,218. Then is not what you have stated an argument that the ballast dues should be decreased ?—There is the loss of time as well, while throwing the ballast. When they come in empty they can take their cargo directly.

13,219. How long does it take to get rid of ballast ?—That depends upon their turn ; they must wait their turn.

13,220. How long does it take them to get rid of ballast ?—When they are at the berth three or four hours.

13,221. How long are vessels waiting to get to their berth ?—That is quite an uncertainty ; it must depend on the number of ships.

13,222. Can you not give an answer?—I do not think I can. I have known ships have to wait two or three days, and I have known at other times when there has been no delay at all, and they could get their ballast out immediately.

13,223. Are those cases of throwing ballast at sea within the power of the Tyne Commissioners to remedy?—Well, I do not know that it is ; the principal part of the dues is derived from ballast.

13,224. Would they not rather sacrifice the dues ?—But it is incurring a risk in another way: if the income is so reduced that they cannot dredge, ships will risk loss at the harbour's mouth. It is a choice of evils.

13,225. Speaking of ballast, we have gone away from the first question which I asked: what vessels would have to do, if they arrived off the bar, and had to wait for 11 hours to come in? — Some of them would keep the sea until tide time; others, if the wind served, would go further north, to Leith Roads.

13,226. And you, as a sailor, do not recommend a harbour of refuge to save those vessels which would rather run the risk you would expose them to ?—I look at the question as it is. I have given my reasons why I would not do it. I do not say that I do not wish vessels to avail themselves of a harbour of refuge, but I say that the practice would be, that they would not do so, for the reasons which I have given. They know the locality, and to their own minds they think there is no greater risk in running for their own ports than in running for a harbour of refuge. They know that there are the appliances which I have mentioned, steam tugs and pilots ; and that if their ship got a little damage, it could be repaired there. If a ship was damaged, and got to a harbour of refuge, she would temporarily repair, and come afterwards to the port she was bound to, to complete her repairs.

13,227. Hartlepool Bay has been mentioned as a harbour of refuge, has it not ?—It has been mentioned incidentally.

13,228. Would there not be the same facilities for the repair of ships at Hartlepool as at the Tyne ?—Certainly not.

13,229. But there would be sufficient means to repair them ?—But still they would have to go into a harbour to do it, because the harbour of refuge is to be outside, in the bay, as I understand.

13,230. But at tide time there would be no difficulty, would there, in that ?—They prefer repairing at their own homes, and they prefer coming to their own ports, rather than go into another port.

13,231. But if it is a case of danger, is there time to think of connections ; are not the lives of the crew entrusted to the commander of a vessel, and is it not his duty to run for a place of safety, rather than risk loss for the sake of his relations ?—But, as I understand, this is when they are in safety, if they were in harbour in Hartlepool ; I say they would not avail themselves of the port nearest to them.

13,232. Do you think it desirable that this state of things should exist, and remain so ?—No, decidedly not ; and I think the best way to effect the improvement is to improve the different ports along the coast, in preference to any one harbour of refuge in any one locality.

13,233. I understand you to advocate the improvement of the three harbours at the mouths of the Tyne, the Wear, and the Tees ?—No, I do not confine myself to these harbours ; I think it should be extended to many other places, even to fishing stations.

13,234. I am very glad to hear you say so ; but for the moment, we are speaking of the north of England. You propose that those three ports should be improved ?—No ; I do not state any place particularly. I leave that to engineers.

13,235. Are there any other harbours near ?—Yes ; there is Blyth Harbour, and Warkworth Harbour to the north, again.

13,236. Do you know Warkworth ?—No.

13,237. Do you know that a sum has been laid out upon it ?—Yes,

13,238. And piers carried out ?—Yes.

13,239. Under one of our most eminent engineers ?—I do not know the name.

13,240. Nor do I ; but I believe he is one of our most eminent engineers. Do you know what money has been laid out there ?—I know that a great deal of money has been laid out at Warkworth, and that it has not answered the purpose.

13,241. Do you think that as much as 150,000*l.* have been laid out at Warkworth ?—I should think so.

12,242. Do you think that more has been laid out ?—I do not know.

13,243. Do you know the depth of water now into Warkworth ?—No ; I am not able to speak to that.

13,244. Perhaps some of the pilots will be able to tell us ?—I dare say they will.

13,245. My belief is, that it is a dry bar ?—Very likely.

13,246. And before any money was expended, there were three feet of water into the harbour ?—I think that is very little.

13,247. Remember, that is one instance of improving by piers a river harbour, and the result is a dry bar at low water. Now can you, in the face of that, recommend that the Tyne, the Wear, and the Tees should be similarly treated ?—I find that the portion of the piers already constructed has had a beneficial effect ; and therefore, I think it is not unfair to conclude, that when completed, they will have a much better effect ;

13,248. I will not confine you to Warkworth, but go round the whole coast of England, and tell me if you know any river harbour which has been improved by piers ?—Will you allow me to increase the limit and go to Ireland ? I will then give you Kingstown.

NORTH SHIELDS.

Mr. Joseph Straker.

13 Oct. 1858.

Capt. Washington.

13,249. Perhaps I shall save you trouble if I tell you that that is not a river harbour ?—I beg your pardon, yes, but I think Aberdeen.

13,250. Which cannot be touched or gone near at low water ?—Perhaps not ; but there is more water into it.

13,251. I will give you a better, Yarmouth ; but it cannot be touched at low water. As I understand, you propose to make refuge harbours of the Tyne, the Wear, and the Tees. Now, I ask you, can you adduce a single instance of a river harbour in the United Kingdom which has been improved, so as to be accessible at low water ?—I do not know that I can.

13,252. Still you wish to lay out money upon these rivers ?—I think if you improve them, even though the improvement should fall short of what is anticipated, and you should not be able to take those bars at low water, a great point will be gained, because ships take them not at low water, but at high water. That is the practice, and if you deepen the water so that they can come in at high water, a great object is gained.

13,253. Although an individual Commissioner, not connected with the Tyne, you will give me credit for caring as much for the enormous traffic going in and out as many residents do, and the desire to improve the river, if possible ?—There is no question about that.

13,254. But would the Commissioners be justified in recommending a large expenditure upon a river harbour without any proofs that that river can be improved ? —I hope that when the Commissioners sit in London, we shall be able to give proofs, with which we are not provided, for the reason which our Chairman has stated.

13,255. You mentioned Kingstown ; do you know that that is a good refuge harbour ?—It is.

13,256. And has not shoaled up since it was made ? —I believe not.

13,257. You are aware that a refuge harbour was made in the bay, that it exists, and is very useful ?— I do.

13,258. Is not that an encouragement to go only to the places in a similar position along the coast of England ?—I do not think that it is conclusive on that point exactly.

13,259. I think you said that you never had occasian to run for a place of shelter, which is an unusual circumstance ; how did it happen ?—Because I thought there was greater safety in deep water than running into shoal water.

13,260. Were you in a vessel well manned, and well found ?—So well manned, that we had come from North America with half a crew, and the pumps going all the way.

13,261. Is it a fact that the ships from the coal ports are well found ?—Well found, decidedly, well provisioned, and as to manning, it is difficult to draw the line there. When one man, in some cases, is worth three, you cannot decide that matter by the number of men.

13,262. Are they sufficiently manned ?—Sufficiently manned generally ; and I may say, that although they are not in the same order in their upper works, they are the strongest ships in their bottoms which go to sea.

13,263. And you do not believe that the chief cause of the wrecks on the east coast of England is due to the unseaworthiness of the vessels ?—I think not ; and when we consider it is not in deep water these ships go down. The great bulk of the loss is in taking the harbours. Upon that principle, as long as a ship will swim under me at sea, I will never run for a harbour.

13,264. You will keep the sea if you can ?—I will.

13,265. Do you think that facilities for repair are indispensable for a refuge harbour ?—Not to say indispensable, but incidentally an advantage.

13,266. You have heard Filey Bay mentioned ?—Yes.

13,267. Are there such facilities in that bay ?—I should say not.

13,268. Do you know it ?—I have never been in. I know it, having passed it.

13,269. Is it an open beach ?—It is an open beach, in part, a reef of rocks.

13,270. Do you believe that if a harbour of refuge is made anywhere, that all the appliances of docks and gridirons for the repair of ships will follow ?—I think they will not follow a refuge harbour. You cannot keep up a staff for an occasional demand. It would be impossible to maintain them.

13,271. Will ships sail in a tolerable wind—a north-east wind ?—Yes.

13,272. When they see a possibility to make a passage ?—Yes.

13,273. What is the course from Tynemouth to London ?—South-east-east. With the wind moderate from the east, they will make their passage.

13,274. They will sail with a north-east wind ?— With an east-north-east wind. They have this advantage, because they are more to windward. From Hartlepool the course is south-east and east clear.

13,275. There some winds then when vessels can sail from the Tyne, and not from the other ports ?— Yes.

13,276. If the wind heads them at Flamborough Head, what do they do ?—They generally fall to windward.

13,277. If the wind is southward, do you know no shelter on the south side of Flamborough Head, not in Bridlington Bay ?—Certainly not to the southward.

13,278. Do you think that if there were one, vessels would strive to round Flamborough Head, and go into the harbour ?—I think they would, because they could go out at all winds, north or south, when they could not out of a harbour in a bight.

13,279. (*Capt. Sulivan.*) Have you ever read a return of the number of laden and light ships which have been lost belonging to the colliery ports ?—Yes, I have.

13,280. I have a return in my hand. In 1856 there were 382 laden colliers lost, and 62 light colliers only were lost. Do you think, from what you know, that that is likely to be something like the proportion ?—I would rather refer that to another witness who has made more particularly a study of it— Mr. Mather.

13,281. Will it be the case that where a laden collier is lost, there will be greater loss of life generally than when a light collier is driven on shore ?— Decidedly.

13,282. Then if the Board of Trade Returns show five or six times as many laden lost as light colliers lost, and the loss of life is double in laden vessels to what it is in light, that would give ten times as great a number of lives lost in laden vessels to what are lost in light vessels, would you have every reason to think that estimate wrong, from your own knowledge ?—How wrong ?

13,283. The proportion in the numbers. If the returns show that double the number of men are lost in laden colliers, and that five times as many laden colliers are lost as light colliers, does that not give ten times as many lives lost in laden colliers to what are lost in light colliers ? would that be in accordance with your general idea of the subject of loss of life in colliers ?—I understand you are speaking of the fact.

13,284. Yes ; we have these returns before us. I ask you, whether you would have any reason to doubt that fact ?—Not at all.

13,285. The fact being, that two lives are lost in laden colliers to one in light colliers ?—I should not doubt that a laden vessel grounds in much deeper water, and there is more danger of loss of life. Light ships ground where the men can walk out dry shod as it were.

13,286. Is there much greater chance of light colliers getting off, and not being wrecked ?—Yes.

13,287. Might that account for the large proportion of laden colliers lost ?—Certainly it would.

13,288. Are not the laden colliers lost by leakage, and sinking at sea?—That would be a very small number.

13,289. Would not that increase the proportion of laden over light?—It would.

13,290. Supposing the returns to be correct, and that there are five times the number of vessels lost with cargoes in comparison with those in ballast, and a much larger number of lives, would you not think it right to consider the placing a harbour where the laden colliers would derive far greater benefit than the light?—Certainly; yes.

13,291. You say that the laden colliers often put back to their own ports, and are lost in taking their harbour?—That is so.

13,292. Do you know whether a large proportion of the loss in laden colliers occurs in that way?—That I am not prepared to speak to, and I would rather not speak to it, inasmuch as there is another witness who has all those particulars, and has taken the trouble to take them out of official returns.

13,293. But you gave as a reason, that they like to run for their own port?—Yes.

13,294. But is it not a fact, that except their own ports, there is no place to run for at the north of Flamborough Head?—Oh yes; they have the chance of all the ports which they pass.

13,295. To a Tynemouth vessel, is there any place between Flamborough Head and the Tyne, with a south-east or easterly gale, where there is such depth of water likely to save her as the Tyne?—I think not.

13,296. Might it not be the case, that these vessels run back to the Tyne as the best mode of saving their lives, more than because it is their own port?—They are best acquainted with it. There are many reasons—one is, that it is the best port they can find; another, that they are better acquainted with it; another, that there are greater facilities by steam tugs, which they cannot have in any other place.

13,297. But is it not the case, that at present there is no port to be compared to it south of it to Flamborough Head?—That is so.

13,298. But supposing a harbour of refuge to be constructed, accessible at all times of tide, either at Filey or Hartlepool, and vessels caught south of the harbour in south-east or easterly gales—do you believe that they would pass that harbour and run back to the Tyne?—I think a great many of them would. A proportion might not, but the greater proportion would, especially if they were subject to any tax for taking it.

13,299. Leave out the question of tax, and consider it purely as to the advantage of a harbour?—Then, I take it, I may suppose there is no more charge at one place than another.

13,300. Exactly so. Leave out all question of charges, and confine yourself to the laden colliers, and take all my questions as bearing upon laden colliers exclusively?—Then my opinion is, that still a large proportion of them would run for the Tyne.

13,301. That they would run for the Tyne in south-east and easterly gales generally?—Yes, generally.

13,302. What do vessels do, if, having left with a north-east breeze, it freshens to an east-north-east or northerly gale, and off Whitby they are in an offing?—They proceed to the southward, and make their passage, and there would be an end to the matter.

13,303. If the wind were dead on shore?—Then they make the best they can on either tack to get off.

13,304. In such a case, would a harbour between Flamborough Head and the Tyne be of any service?—If they could not get off, and there were a harbour under their lee, they would take that; if that were the last alternative they would avail themselves of it.

13,305. You spoke of one disadvantage in a harbour of refuge at Hartlepool—that it would not be sufficient for the number of vessels—that more vessels would enter than there was accommodation for inside?—No; I put it this way—that if a large fleet were caught in the immediate neighbourhood and obliged to run in, what would be the effect of it.

13,306. You said that the small vessels would run in, and the large vessels would have to wait for the tide. Do you think that a harbour of refuge at Hartlepool would still be a tidal harbour?—I do not know.

13,307. Would not a harbour, to be available to save life and property on the coast, if made especially with that object, particularly require to be accessible at all times of tide?—I should think it ought.

13,308. Then that objection to the size of vessels would not apply?—If there were depth of water at all times these ships could then go indiscriminately.

13,309. You said, that if there were a number caught off the port they would all want to enter at once the one harbour, and you instanced sometimes the number of ships in Yarmouth Roads. How do you reconcile that with your opinion that a harbour of refuge would not be used by vessels, if constructed—that it would not be used by vessels in large numbers?—I think I have accounted for it by stating the inducement which the captain and crew have to proceed to their own port.

13,310. From whatever motive, if there is a large number of vessels which will not run for a harbour, how can you fear any crowding in that harbour?—I am supposing a case where they have no chance, when they cannot get off the land on either tack, and are obliged to run to a harbour. If they have to run to Yarmouth Roads it happens that they run in until the roads are filled; and I have known vessels obliged to proceed right through, and go away to Harwich.

13,311. Then I understand you to say, that if there were a harbour of refuge, large numbers would go there?—If the place were in the track, and they cannot get off the land on either tack, then there is no alternative, they must go in.

13,312. Supposing that a harbour of refuge were constructed south of this, near Flamborough Head, would it save those which bear up off Flamborough Head leaking, in a south-east gale?—If a harbour were made where do you say?

13,313. To the southward of this, between this and Flamborough Head. Would it reduce the risk of vessels bearing up leaky?—It would, to the extent of whatever ships happen to be in a leaky state.

13,314. You gave an answer with reference to collisions off the Humber. Is it the case that there is a large passing trade north and south?—Yes.

13,315. Is it the case that there are a large number of steamers leaving it for all parts of the world?—There are a great many.

13,316. A great many steamers go out from there to the north of Europe?—Yes.

13,317. Might not that account for the large number of collisions, the fact of steamers passing the track of a great passing trade?—Yes; I think many collisions attributable to steamers.

13,318. And at Flamborough Head, do most vessels round rather close, and steamers also rather close?—That is so.

13,319. All those collisions do not bear upon a harbour of refuge?—No.

13,320. They often occur at night time in moderate weather, do they not?—Yes.

13,321. You spoke of the difficulty of vessels getting out again. Suppose that Filey Bay were made into a harbour, do you see any greater difficulty in getting out of Filey Bay than in getting out of the Tyne?—Yes; it only needs a glance at the chart to see that with the wind east-north-east they will get out of the Tyne and make their passage, but with the same wind blowing into Filey Bay I do not see how they are to get out at all.

13,322. How do vessels get out of the Tyne with the wind north-east?—By towing down to the north pierhead and sailing from there.

13,323. If vessels tow out of the Tyne, if they wish to proceed to sea with the wind on shore, cannot they be taken out of Filey Bay in the same way?—Not with the wind blowing right on shore. If it blow hard I

NORTH SHIELDS.

Mr. Joseph Straker.

13 Oct. 1858.

Capt. Sulivan.

do not think a steamer can take them out, and then we have already a staff of steamers here to the extent of 200.

13,324. If a harbour of refuge were found to take a large number of ships, and so cause the demand for steam towage in that harbour, do you believe that steamers would go to supply that demand?—You cannot expect it, because it will be only a casual circumstance, but here they are employed every tide. Here 200 fleet of tugs are towing ships in each direction, and they are always ready in any emergency.

13,325. You spoke of Bridlington Bay as a place that vessels could get out of either way with the wind?—Yes.

13,326. Are you aware that Bridlington Bay is as deep as the bay to the north?—I do not intend a harbour down in the bay; I mean one out at the Head.

13,327. Are you aware that with an easterly wind she would have to work to windward through the passage, or be towed out?—Yes, and to enable a vessel to do that, she has a very strong tide under her lee, between the shoal and Flamborough Head.

13,328. You said you considered that Hartlepool had been silting up; have you any knowledge of that subject, from having anchored in the bay?—I never anchored in it in my life; I never went near it; and I believe you will find there are many captains of ships here who have been in the trade all their lives, and have never been in that bay. They always give Hartlepool a wide berth, and keep the sea. I never was in there, but I know something of it from shipping a large quantity of my coals there, and being down at the place occasionally.

13,329. Supposing that you were going in a vessel now, and your own life, and the vessel with the crew under your orders, were at stake, if you had your choice of the Tyne deepened to 15 feet (supposing that were effected), and a good harbour at Filey or Hartlepool besides, accessible at all times of tide; would you prefer that, or your own harbour at Tynemouth made deeper?—If you will tell me the point to go to, I will tell you. If you go to six fathoms, I would prefer the Tyne, but 15 feet is rather little.

13,330. But I am supposing 15 feet at the Tyne, and a harbour to the south with deeper water, to take all classes of vessels; would you prefer the Tyne alone, and no harbour to the south?—I should prefer the Tyne alone, in that case.

13,331. For the Tyne trade?—No, the trade generally; because I think the great bulk of the ships belonging to the other ports would take the Tyne as a refuge. In fact, they do so at present.

13,332. Do laden ships put back?—Yes, but on the sand there is only 16 feet.

13,333. Then laden vessels do not press on their voyage to the south in all weathers?—It happens occasionally they do not; but as long as a ship keeps all right and tight, she will keep the sea and persevere.

13,334. Supposing the Tyne were all that you wished, and it was decided to make a deep-water harbour in addition to the Tyne, between the Tyne and Flamborough Head, and you had to decide for the benefit of the lives and property connected with the colliery trade, would you prefer it at Hartlepool or Filey?—If I were obliged to choose—I am hardly prepared to say which I should choose—I think I should say Filey, as further to windward, and having deeper water in towards the shore. Yes, I would prefer Filey.

13,335. Do you think that for all the trade north of Hartlepool, for Sunderland, Shields, and the Tyne ports, Filey would be better than Hartlepool for the saving of life and property in the deep laden colliers?—Supposing them both to have equal advantages.

13,336. I am supposing they can enter either at all times of tide, that a harbour was made for that purpose, and the site depended on the value set by colliery masters of the north colliery ports?—I should prefer Filey, because it is a bolder shore, and you can see it better, and there is a better chance to see it in snow. If by chance you should not hit the place, you would have a better chance of getting off the land than if you got down into a deep bay; because, with the cross tides which ships encounter here in dirty weather, in winter, they cannot always make an exact point. They go groping and blind, and in that case I prefer Filey, because you can haul off on the other tack, whereas, if you go to the depth of the bay, there is no safety for you.

13,337. Supposing vessels to start with a slant or favourable wind from the Tyne, are they sufficiently far to windward, if it comes on to blow from the east or east-north-east, to fetch Hartlepool or Filey?—With the wind north-east, they would make their passage.

13,338. I speak of east-north-east dead on the shore?—They would weather the Head.

13,339. Supposing they could carry canvas, and hold on?—Yes.

13,340. Which is the safest place to make or run for in a heavy east or north-east gale, Hartlepool or Filey?—Do you mean supposing a harbour were made?

13,341. Which is easiest made?—I should say Filey, for the same reasons. It is a bold shore; you can see it before you are up to it, and you have deep water up to it.

13,342. (*Mr. Lindsay.*) One of the Commissioners asked you if you knew of any harbour constructed at the entrance of a river by means of piers which ships could take at low water. I think you said, in reply, that you did not know of any such a harbour?—I have not any in my recollection.

13,343. But do you know of any harbours where the bar has been deepened, or the entrance of the bar deepened, situated at the mouths of rivers, by means of an extension of piers?—Yes.

13,344. Then is it the case, or is it not the case, that if you carried the piers far enough out, you would be able to make a harbour at the entrance of the river, which ships could take at low water?—I should think so.

13,345. In fact, it is a question of expense?—It is a question of expense as to the extension of the piers.

13,346. As a sailor, having given great attention to it, is it the case that a bar usually follows the piers,—that if you carry out the pier, the bar goes further out to sea?—I think it is very probably rather an engineering question; but as far as my observation has gone, it is very likely that shoal water, though perhaps not the bar itself, will continue out; but if you carry the pier out into deeper water, there is not much fear of the bar forming across the mouth as it does at a shallow part of it before the piers are carried out.

13,347. Why have you arrived at that opinion?—Because I think it would be such a deep deposit at the mouth of the piers, when extended, that it must be a work of very long time, supposing accumulation to be going on, and by the very act of carrying the piers clear of the shore, anything washed out of the river would be carried north or south by the water passing to and fro at the end.

13,348. Then your opinion is, that if the piers were carried out sufficiently far, so as to get to the point where the ocean tide is ebbing and flowing, that tide would get hold of the sediment, and it would be washed away?—That is my opinion to a great extent, but a portion of it might settle there.

(*Mr. Clayton.*) I wish to ask a question.

(*Chairman.*) We have not admitted of any examination of witnesses by parties interested, but we generally give intimation that if any of the parties interested notice points which seem to have escaped the attention of the Commissioners, they are at liberty to put in the shape of queries any questions which they would like to have asked. On the other hand, the Commissioners reserve to themselves the right of judging as to the relevancy or expediency of putting the question or not.

NORTH SHIELDS.

Mr. Joseph Straker.

13 Oct. 1858.

Examination of Mr. STRAKER continued.

13,349. (*Chairman.*) You have been a long time under examination, Mr. Straker, but there are one or two questions which I should like to ask you. From what point of the compass does the wind blow which gives the worst weather in the North Sea?—We have the heaviest sea rolling in with gales from the northward; but the most destructive gales which we have on this coast are from the east round to south-east.

13,350. With what weather do these gales from the south-east commence?—They generally commence with fine weather, and increase to a gale.

13,351. And does the south-east wind generally veer round to north-east, or back the other way?—More frequently round to north-east. Sometimes it ceases altogether, and it springs up from the north-west. That is not unfrequent, but generally the wind backs round to north or north-east.

13,352. Are your south-east gales generally accompanied with thick weather?—Yes.

13,353. And, therefore, it is very difficult for vessels to make out exactly where they are on the coast?—Yes, that is the difficulty; hence the necessity of some conspicuous point to make for, such as Tynemouth Castle.

13,354. And are the north-east gales usually accompanied with clear weather?—Rarely of late; we have here more rain from the north-east than any other quarter. We used to think that our rain came from the east.

13,355. Is the wind on shore from east-north-east to east-south-east generally accompanied with thick weather?—More south-east than north-east. The north-east wind is generally clearer weather.

13,356. There are two questions which Mr. Clayton wishes to be proposed to you. Do you know any case in which there is such a scouring power as in the River Tyne?—I think my reply to that should be, that the scouring power is very great in the Tyne; but I am hardly prepared to say that I do know or that I do not know of any other place where it is greater.

13,357. Does the effect already produced by the works of the pier at the mouth of the Tyne assist your judgment in giving an opinion as to the ultimate result?—Yes, it does. The effect so far has been decidedly favourable, in my opinion.

Mr. MATTHEW POPPELWELL examined.

Mr. Matthew Poppelwell.

13,358. (*Chairman.*) You are connected with the port of Tynemouth?—I am.

13,359. In what capacity?—Lloyd's surveyor for the river Tyne. I served my time at sea, and I am connected with the coal trade.

13,360. Are you a shipowner?—I am not.

13,361. Have you been a shipowner?—I have.

13,362. For how many years?—For 40 years.

13,363. How many years were you at sea?—For 20 years.

13,364. And for how long in command of vessels?—From 10 to 22 years.

13,365. In what trade were the vessels which you commanded chiefly employed?—In the coal, the Baltic, American, and Mediterranean trades.

13,366. How many voyages have you made to the Baltic?—I should not think above 14. I was seven years in the Baltic trade; and I reckon two voyages a-year.

13,367. In making your passage home from the Baltic in the fall of the year, with the wind hanging to the south-west, how do you make your passage, by stretching across to the coast of Scotland, or working to windward?—I have gone in by Lowestoft. I have also come into Flamborough Head and made the Tyne. I was never driven down to the north as many ships are sometimes.

13,368. Is it a fact, that ships are frequently driven to the northward?—They are sometimes.

13,369. And taking that into view, will you give me your opinion as to the advantage or necessity of a harbour of refuge for the Baltic trade about Buchan Ness?—That is, to go through the Firth.

13,370. The advantage or necessity of a harbour near Peterhead?—No doubt, a vessel driven down would go into a harbour of refuge; if the wind were southerly it would be a benefit.

13,371. But are you disposed to say, that the mass of the trade, or that a great quantity of shipping, are driven down, sufficiently to warrant the formation of a harbour of refuge with that especial view?—Not entirely for the Baltic trade.

13,372. Have you made the passage north-about through the Pentland Firth?—I have, to America.

13,373. Give me your opinion as to the difficulties of getting through the Pentland Firth?—The tidal way there makes it very difficult, and the best harbour I know, were a ship bound for Liverpool, is Widewall Bay, in the Orkneys, because you can go there in easterly winds.

13,374. Has it ever occurred to you to run with a heavy gale from the south-east or south-south-east through the Pentland Firth?—It never has.

13,375. Are you acquainted with the harbour or bay of Wick?—I know it by the chart.

13,376. What is your opinion as to the advantage or necessity of a harbour of refuge at Wick for the trade north about to Scotland?—My objection to it is, that in an easterly wind you are land-locked; you cannot get out.

13,377. But as respects the locality, putting that disadvantage on one side?—I think it an excellent harbour.

13,378. You think it an excellent site for a harbour of refuge?—I think it an excellent harbour.

13,379. You are aware of the objects of this inquiry with respect to the north-east coast of England?—Yes.

13,380. Give us your opinion as to a site near Flamborough Head, and another down at Hartlepool?—I go upon the principle, that if the present harbours are not to be improved, Filey would make a good harbour of refuge, but that provided Hartlepool could be made good, like the Tyne, it would be an advantage.

13,381. For the present I am putting the question of expense out of view. Would you be disposed to say, that the most perfect system, with a view to the saving of life first,—and secondly, of property,—would be one harbour of refuge at Filey, backed by the improvement of the harbours along the coast?—Decidedly; it would not be used so generally, but the feeling is, that the coast requires it, because there is none from Whitby to the Tyne.

13,382. (*Sir F. Smith.*) You are well acquainted with the east coast, are you not?—I have been in the trade some time.

13,383. As a master mariner?—As a master mariner.

13,384. What part of the coast do you consider the most dangerous between the Tyne and London?—The sands at Yarmouth is the most dangerous part of the coast.

13,385. Where do the greatest number of wrecks occur on that line of coast?—I have seen the wreck chart, but I have not taken the numbers. There is a large number of wrecks round Yarmouth, as well as on the north coast.

13,386. And a great number at the Tyne?—Yes, a great number at the Tyne.

13,387. Do you know the cause of those wrecks?—My opinion of the cause of the loss of ships near the Tyne is the immense trade which comes to the Tyne. Wherever ships locate, no matter whether it is deep or shallow water, losses will take place, particularly when they run in in distress.

13,388. Is not the trade upon the increase here?—It is gradually increasing.

13,389. And you have found the wrecks increase as the trade has increased?—I cannot speak as to

NORTH SHIELDS.

Mr. Matthew Poppelwell.

13 Oct. 1858.

Sir F. Smith.

that. I think the returns a better guide than anything I can say as to that.

13,390. It should, according to your theory, be so; because, if a great amount of trade causes the loss, the greater the trade the greater the loss?—Not so, exactly; vessels may be better equipped and better navigated.

13,391. Then you think probably that they were not well equipped or navigated before?—I think not.

13,392. Do you think they are better found, better equipped, and better manned?—They are much better manned than during the last war.

13,393. And much better commanded?—Yes.

13,394. Do you suppose that the size of the ships increase?—They have of late years, but I do not think they will go further than they have done.

13,395. Do you imagine that steamers will be used more than they now are in the coal trade?—If the country is rich enough, all coals will be carried by steam.

13,396. Then the chance of accident will be less?—Steamers create many accidents.

13,397. Are not steamers more likely to keep off a lee shore?—No; a little steamer is a dangerous vessel.

13,398. (*Mr. Lindsay.*) Are steam colliers on the increase?—Rather decreasing than increasing. I cannot speak as to the fact, but I suppose so generally.

13,399. But the trade between this port and London is materially on the increase?—It is.

13,400. And consequently the steam colliers are not paying; or does it arise from the fact that they do not pay as well as sailing vessels?—I have seen 20 steam colliers building in the Tyne, and now we have but one or two; that is what makes me say they are not increasing.

13,401. Are not the sailing colliers materially on the increase?—The sailing colliers are materially increased.

13,402. Do you know the east coast of Scotland pretty well?—I never passed above six times through the firth in my life.

13,403. Supposing then it rested between Peterhead and Wick for a harbour of refuge on that coast, which do you think would be of most advantage to the ships belonging to this district employed in the Baltic trade, a harbour of refuge at Wick or at Peterhead?—I should say that for all ships going to America—all ships going north about—it would be of more advantage on the weather point.

13,404. Then do I understand you to say that you think it would be of more advantage to have it at Peterhead?—Yes; or entering the firth at Widemouth Bay.

13,405. Then, giving the preference to Peterhead, does it apply to sailing vessels bound from the Tyne to America, as well as those to the Baltic and Archangel?—It would.

13,406. You heard the evidence of Mr. Straker and Mr. Cowan with regard to the necessity for a harbour of refuge on this coast?—I did.

13,407. Do you agree generally with what was stated by those gentlemen?—Substantially I agree with them.

13,408. Are there any points which those gentlemen did not call the attention of the Commissioners to which you would like to add?—I think not. I am not aware of any points. I think that I agree with them substantially.

13,409. From your knowledge of shipping, and your great connection with it as Lloyd's agent here, and from your intercourse with masters of ships, are you clearly of opinion that, with the object of saving life as the primary object, and property next, the improvement of the existing harbours would tend more to save life and property than one great harbour of refuge further south?—Knowing, as I do, that 93,000 passengers go from the present harbours existing, I am of opinion that the improvement of these harbours would save more life and property than any one single harbour of refuge, place it where you will.

13,410. We will turn to another subject. Are you one of the Commissioners of the Tyne?—I am.

13,411. Do you know anything of a sum of money levied by Newcastle amounting to 10,000*l.* a year on the shipping frequenting the Tyne?—You mean the river dues.

13,412. You have spoken upon the subject?—I know that application was made to purchase from Newcastle the river dues which amount annually to 10,000*l.*

13,413. What is done with it?—There is a debt borrowed on it.

13,414. When were those debts contracted?—I cannot answer.

13,415. You do not know?—No.

13,416. I wish to ask you a question, having in view that which was proposed by Mr. Cowan and recommended by Mr. Straker, namely, the extension of the present piers, which will cost 400,000*l.* more than the sum now intended to lay out. I wish to know if the fund which is now collected from shipping cannot be in some way applied towards assisting in the construction of this very large harbour of refuge which they propose?—If we stop at our present contract, and the Admiralty allows us to go no further at present, and we apply a third of the amount of the pier dues to a larger extension, of course our present funds will be spent in the large extension works.

13,417. Then do I understand that it is the intention of the Commissioners of the Tyne, that if they go on to spend more than 166,000*l.*, for which they are now liable, this tax, which they now levy on shipping, is in some way to be appropriated to aid in the construction of the piers?—It would; and there would thus be 200,000*l.* really in hand to expend upon the piers.

13,418. There would be 200,000*l.*?—Yes; out of the first sum which was named.

13,419. Then the shipping frequenting the Tyne would not be taxed to the extent necessary to pay the capital of 400,000*l.* Do I understand you to say that?—They would be taxed for 400,000*l.*

13,420. Do you intend to raise it by a fresh tax on shipping frequenting the Tyne?—The intention is to raise it upon the present Act, with some improvements.

13,421. By means of a fresh tax?—Yes; the present Act is to be so amended that we should lay no more tax on the coal trade than there is levied in it now.

13,422. Then you intend to relieve the coal trade? It would not be relieved—it would pay the same as now; but the Mercantile Shipping Act took away from us the power of levying the dues on the foreign trade and coal trade outwards, and if we amend the Act to include the foreign trade outwards, and the coal trade outwards, we shall gain 5,000*l.* or 6,000*l.* a year, and the coal trade will be the same.

13,423. Supposing that the Commissioners should decide that it was not advisable to have a harbour of refuge at the Tyne, and that only one site was to be chosen for that harbour of refuge, and that it rested between Hartlepool and Filey Bay, whether do you think a harbour of refuge at Filey Bay or Hartlepool would tend most to save life and property in the ships frequenting this coast?—If life and property were the only question at stake—but in trade it is impossible it can be so—but if life and property only were at stake, then I would leave it to an engineer to choose any place between Hartlepool and Filey Bay.

13,424. Would you say Filey Bay or Hartlepool?—No place that I know of is equal to our own port. Vessels will come down for their harbour south of Sunderland, and as far as a small harbour will hold them, it might be an advantage, but it never would hold them.

13,425. I do not think that I clearly understand your answer; would you give a preference to Filey Bay over Hartlepool?—I would not take the high land

on the bay north of the Heugh. Then it would answer the trade also between Seaham and the Heugh.

13,426. Then you would prefer a harbour somewhere between Hartlepool and Seaham to a harbour in the Tees Bay ?—I would.

13,427. But supposing that you cannot obtain a suitable site for the construction of that harbour, and supposing that the engineers on this Commission had arrived at the conclusion, that the only sites for the construction of a harbour of refuge between Flamborough Head and the Farn Islands (for that is the most dangerous part of the coast), that the only two sites were Hartlepool Bay or Filey Bay, to which would you give the preference ?—I cannot get out of the old thing. Where the trade is, there you should come to save life and property, because people will come were the trade is, and Hartlepool is near.

13,428. You think that Hartlepool would be the better place, provided there were no engineering difficulties ?—It would tend most to save life and property. It would likewise tend to increase trade. Upon the same principle I should like all the ports to be improved.

13,429. But nevertheless I understand your opinion is that if the public money is to be expended for the saving of life and property, it ought not to be spent on one particular spot, but to improve the existing harbours for vessels ?—There is no difficulty in my mind about it. The more harbours you make the better. A ship cannot meet one place, but she may meet one of the two or three.

13,430. (*Capt. Washington.*) If a vessel should be caught in distresss, where would you have the harbour, on a salient point or in the bight of the bay ?—The captain would have to consider two points. He must go to a place where he can have his repairs done. I should like to hand in this paper, showing the capabilities of the Tyne for repairing vessels. There are 52 dry docks, with 24 gridirons ; vessels would always come here for repairs.

13,431. How many dry docks do you say there are ?—52 ; and some of them hold two and some three ships. We have had some of the largest ships in here. There was the *Carlo Alberto*, a 15-gun frigate, and the *Bulldog*, with all her men and guns, and 240 tons of coal in her.

13,432. In fact there is every facility for the repairing of ships ?—Yes.

13,433. There are a large number of steamers always sailing about the Tyne ?—There are about 200 afloat at this time.

13,434. You spoke of 93,000 vessels going out of the Tyne ?—No ; 93,000 passengers.

13,435. Are those the arrivals and sailings at the three ports ?—No ; at six ports.

13,436. Are they the Tyne, the Wear, the Tees and Whitby ?—No ; from Hartlepool, the Tyne, Sunderland, Seaham, Blyth, and Warkworth. From the Tyne 45,000 passengers, from Sunderland 18,794, from Hartlepool 19,066, from Seaham 4,118, from Blyth 2,370, and from Warkworth 4,464 ; making a total of 93,712 passengers.

13,437. In a district of about what length ?—In about 40 miles. I find that the Tyne takes Sunderland, Hartlepool, and Blyth to make them equal to the Tyne.

13,438. I do not quite understand that ?—Sunderland, Blyth, Hartlepool, and Warkworth get 600 sailings and arrivals more than the Tyne ; the Tyne has nearly half the whole.

13,439. And the whole is 93,000 ?—The whole is 93,712.

13,440. Do you know of such a traffic on so short a coast anywhere else ?—I am not come to the knowledge of it.

13,441. Therefore you think it essential that there should be be a refuge provided for those vessels somewhere or another ?—Yes.

13,442. And you have stated your opinion that improving the existing harbours, if it can be done, will be the best mode of providing that refuge ?—I state that on the basis of these passengers. There is no single harbour of refuge can answer the purpose, except a place like Yarmouth Roads. There is no single harbour of refuge, without limitation, which can provide sufficient refuge the same as that within the ports.

13,443. It is not probable that all the vessels would be about the same spot at once, is it ?—Captains do not go in, unless in case of real distress.

13,444. Captains do not go in, except in cases of real distress, and in cases of real distress what situation of harbour would catch them ?—If these ports were made good, they would catch them directly. If laden ships putting back could take the Tyne, being the most northerly point, they would take it in an east-north-east wind in preference to Hartlepool, because if they were down at Hartlepool, they could not get out of the bight.

13,445. You stated in your evidence that the piers were being carried out as far as the Admiralty permitted them to go ?—Yes.

13,446. Do I understand you that you anticipate that the Admiralty will prevent the piers being carried further ? The Act of Parliament allows 2,100 yards on the north, and 4,200 yards on the south pier, and the Admiralty made a mark at two-thirds of each of these points, and allowed the Commissioners to make contracts for that distance.

13,447. But I do not understand you to say that there has been any prohibition by the Admiralty against going further ?—Not at all. They will allow us to go out the whole distance.

13,448. It has been always understood that the present contract is an instalment ?—Quite so, to see the effect of it.

13,449. (*Capt. Sulivan.*) With reference to what you said as to constructing a harbour of refuge at Peterhead, were you thinking of vessels stopping for foul winds, or of a shore where vessels cannot get off on either tack ?—I was thinking of vessels which cannot get off on either tack, and wanted refuge, and were bound either south or round the land.

13,450. Will you tell me what wind would make anywhere near Peterhead a lee shore, and prevent a vessel going off on either tack ?—I cannot speak as to that ; I do not know the distance ; it is out of my course rather.

13,451. Just look at that chart and see if any vessel not bound into the port, making her passage up, can in any wind not go off on the port tack to the Firth of Forth, or on the starboard tack to Cromarty Firth?—She can go on either side of it.

13,452. Then you do think a harbour of refuge on a salient point where the coast runs back almost at right angles, and there is a port under her lee on both tacks, would warrant an expenditure of money ?—Excuse me, I am putting the trade there.

13,453. I put the trade there too ?—If you want to save life only, then the bottom of the bay is the best.

13,454. Recollect that a harbour of refuge is only required where ships are in danger of being driven on shore when they cannot keep the sea, and not as a stopping place to save ships from losing ground. Keep that in view, and tell me whether anything would justify a large outlay of money in such a place as Peterhead ?—I think that a harbour of refuge should always be at the bottom of a bay to catch those vessels which are embayed ; but for life or death; then I would say you are not likely to be so humane as to lay out so much money on a point like Peterhead.

13,455. Are there great dangers in running through the Pentland Firth ?—There are.

13,456. With a south-east gale, and an easterly tide do you think any small vessel dare run into it ?—I think if a vessel is caught there with a south-east gale, she can go in a short distance ; but if she found there was danger of swamping in the strong tide she would not be likely to attempt it at all, and Wick would be very convenient to her.

NORTH SHIELDS.

Mr. Matthew Poppelwell.

13 Oct. 1858.

Capt. Sulivan.

13,457. If a vessel were running that way would she have any means of escape if she could not keep the sea?—Do you put an extreme case of a vessel under bare poles?

13,458. Or storm sails?—If under storm sails she can never keep to windward.

13,459. Then what would happen if she could not make the Pentland Firth on account of the strong tide?—She would lay her head to the south, and go ashore.

13,460. And to all such vessels would Wick make a valuable harbour of refuge?—It would save life.

13,461. If you were told that immediately on the west side of Wick 1,060 vessels had taken refuge in a year, do you think that would be a strong reason for a harbour of refuge also on the east side?—It would.

13,462. With reference to those vessels bound from the Baltic, is it usual for them to be driven so far north when bound for this port that they cannot get into the Firth of Forth?—It will happen now and then.

13,463. But usually?—Not generally.

13,464. What wind would drive them above the Firth of Forth?—With a south-west wind they generally fetch on the starboard tack.

13,465. There is no risk of loss in a south-west wind?—There is no risk of loss.

13,466. And if caught by a north wind, if out too far north of the Farn Islands to go in there, would Pentland Firth serve?—If the tide was in favour.

13,467. I mean the Firth of Forth?—I beg your pardon. The Firth of Forth is now a harbour of refuge.

13,468. Then, for the Baltic trade, coming to the east coast of England, you consider no further harbour of refuge necessary than the Firth of Forth north of that?—That is just according to the degree of humanity. If you think you can save every person, you cannot have too many harbours of refuge.

13,469. But for the general interests of trade, upon the whole, would it be necessary?—I should not think it would.

13,470. You said that vessels go back to the Tyne in preference to Hartlepool in south-east gales; would they do so even if there were a harbour of refuge?—I think they would. I speak now of the Tyne improved.

13,471. Supposing the Tyne had 15 feet of water, would they run back to the Tyne rather than to Hartlepool?—I think many vessels are lost between Hartlepool and the Tyne. And upon no other principle than that the Tyne is the place where they can get repaired.

13,472. Are there not many vessels which are damaged and yet cannot keep the sea?—All the better class of ships keep the sea.

13,473. But caught in a gale of wind with a good harbour under their lee, do you think they would come to the Tyne or enter that harbour to save risk in keeping the sea?—All large ships, such as those which go to India, would keep the sea.

13,474. I am speaking entirely of the colliery trade, heavily laden colliers?—The small colliers and the weakest of the vessels would all take a harbour of refuge.

13,475. Supposing you had 15 feet of water at the Tyne, but a harbour of refuge at Filey Bay, and the vessel were south of Filey Bay so that she could fetch it, would she go back to the Tyne?—If she were well equipped she would remain at Filey Bay, but if she wanted repair she would come to the Tyne.

13,476. But merely wanting refuge?—I think such vessels would keep Filey Bay. I assume you speak of ships bound south.

13,477. Upon the same principle, if there was a harbour of refuge at Hartlepool, and a ship were caught south of Hartlepool, would she not run for Hartlepool in preference to the Tyne?—Am I to speak of the Tyne improved?

13,478. Yes?—No, she would not go to Hartlepool, because it is in the bight.

13,479. If a vessel were to windward of the two ports, and could make either Filey or Hartlepool, and she had no alternative but to run for one or the other, which do you think the master would rather run for?—I would like to know where the vessel is placed.

13,480. I say a vessel to windward, with an offing sufficient to fetch either, if she had the choice of running for either, and could find shelter at either, which would she make for?—It would take some time before a man would run for one. If they were in the practice of going into Hartlepool, they would go there.

13,481. I ask you to put the Tyne out of the question, and give me your opinion as to Filey and Hartlepool; which would masters of colliers prefer to run for in a gale of wind?—They would go to Filey.

13,482. In preference to Hartlepool?—Yes, they would be further south on their voyage, and a better outlet.

13,483. Supposing your view upon that point to be correct, and you had the laying out of a large sum of money purely for a refuge harbour, and it must be laid out either at Hartlepool or Filey Bay, upon which would you lay it out to benefit the trade of Tynemouth and Sunderland?—I cannot give an opinion. I should take the Tees and Hartlepool point.

13,484. I am speaking of the whole trade?—It is then dividing the opinion.

13,485. You said just now a person would rather run for Filey Bay?—But if a vessel were in the position to fetch either Filey Bay or Hartlepool, I should prefer giving to Hartlepool the trade in preference.

13,486. In answering the question, please to shut out of view all benefit to an individual port, and take a larger view.—Taking the whole of the colliery trade as a whole, without reference to the fact of any particular port, and looking to the case simply as refuge, which would be the best place for a harbour of refuge: Hartlepool or Filey Bay, if it must be in one of those places?—I should say Filey Bay, decidedly.

13,487. Give me your reasons?—The whole of the six ports are to the north of it, and the Scotch trade often meet off the Head, and it often happens that when a north wind gets away to the south-west, a large fleet of vessels leave the roads and meet under the Head. The wind comes east-south-east dead on the land, and they must all come north.

13,488. A gale will drive laden colliers to run for safety, will it not?—Yes.

13,489. Then, in that case, what space will you require to hold them; that is the first consideration?—I should gather full a 1,000 or 1,500 sail. Yarmouth Roads are 12 miles long and $1\frac{1}{4}$ wide; and I have seen a thousand vessels at anchor there, and many obliged to leave, and go to Lowestoft or Harwich. There was no place to put a vessel there, and unless you make a place like Yarmouth Roads, how can you get one big enough?

13,490. Would not that apply equally to Filey Bay or Hartlepool?—But if the ships were divided among the ports?

13,491. That is quite foreign to my question. My wish is to confine you to all the ports, putting aside the probability of Hartlepool being selected. But supposing the advantages of construction perfectly equal, and everything equal, which is the best place for a laden collier to seek refuge?—I would go along the coast, and take the best point an engineer would point out, as far north as I could from the bight, so as to get out of it again.

13,492. That is, going up to your north ports again; we have your opinion of that; put that aside. Suppose it were impossible to lay out money where only 15 feet of water could be obtained, which you propose to get at the Tyne, then where would you have the refuge; at Filey Bay or at Hartlepool? You said just now Filey Bay, and I asked you your reasons?—We came after that to 1,500 sail, and Filey could not hold a twentieth of them.

13,493. Put that out of the question. Supposing that there were equal facilities to make a harbour of refuge at Hartlepool as at Filey Bay; consider all things equal, and tell me which port would the colliery trade consider most safe and most beneficial, and which would they prefer to run for in heavy weather?—They would come for the bold land as far north as possible.

13,494. I have asked you to give up all that.—I should like to give a correct answer. I should like to comprehend the thing ———

(*Chairman.*) I think the question which Captain Sulivan asks has reference to the whole coast between Hartlepool and Filey Bay.

(*Witness.*) I did not hear that.

13,495. (*Capt. Sulivan.*) I have said all along, supposing that it was decided that the outlay should be made in one or other of these places, which would you prefer for the benefit of the colliery trade, and particularly for the safety of running to and being in a place available to save most lives and property?—The laden ship no doubt would get into Filey very well.

13,496. Laden ships only?—Laden ships. It is a good bold place to go in. Every master would go in there in preference.

13,497. Would they not go to Hartlepool?—No; Hartlepool is in a bight, and captains generally lose their ships through false judgment. When they leave the high land from Newcastle the inland of the coast is all high; we do not see the coast at all. From that point of the coast across to Redcar the land is low, and most of the seafaring captains to this day have an impression (for I have spoken to many on the subject) that it is much deeper than it is. It is fallacious. The moment they come to Redcar they imagine it is a very deep bay, indeed. This idea grows with the growth of the great bulk of them, but when you lay your rule on the chart you will find out it is not the deepest bay. It is a deception, and they go in there and are lost.

13,498. Is the approach to Filey Bay better marked with high land than the approach to Hartlepool?—With the inland land which we generally see at sea with an offing.

13,499. Is Filey Bay better marked with high land than Hartlepool?—Filey is better marked. It is a bold high land altogether.

13,500. (*Capt. Vetch.*) I think you alleged that the Admiralty had placed some limits to your works, as to how far the north and south piers might be carried out?—I understood their idea was to wait and see the effect of the contract entered into.

13,501. I suppose there is some kind of arrangement as to when the works have arrived at these points?—They have not had any communication to that effect.

NORTH SHIELDS

Mr. Matthew Poppelwell.

13 Oct. 1858.

13,502. There is a supposed understanding that when the works are arrived at these points there will be no difficulty to proceeding further?—The Tyne Commissioners always supposed that when the works were carried to the extent of the contract, the Admiralty would allow them to be carried to the extent of the Act of Parliament.

13,503. You are not arrived yet at the terminal point?—Not yet.

13,504. (*Mr. Coode.*) You said that you had repeatedly made Lowestoft, Tynemouth and the Head coming from the Baltic; what head do you allude to?—Flamborough Head.

13,505. You said that you knew formerly 20 steamers in the Tyne building, and that now there are only two or three?—There are only two or three at this time, and we have known 20. I wish to make one remark to show that ships will come to the ports where they belong to get repaired. A screw steamer—a very large one—broke down in the deeps, and was towed into the Humber. After she was there, and the weather moderated, a steamer went down from here and towed her here to repair her. I mention that to show that vessels will come to the port where there are facilities to have repairs.

13,506. (*Sir F. Smith.*) To whom did the steamer belong?—To Messrs. Palmer and Co.

13,507. Are they concerned in the building trade?—Yes.

13,508. (*Capt. Sulivan.*) Where is their building port?—In the Tyne.

13,509. Then they brought their own ship to their own port?—Yes; she is laden. They will come where the facilities are the greatest.

13,510. If the owner had lived at the Humber do you think he would have found facilities to repair his vessel at Hull?—If there are the same works at Hull no doubt he could repair her there.

13,511. Do you mean that the vessel has come to the Tyne because there are not facilities at Hull, or because the owner prefers to have the repairs done under his own eye?—When I named the case I mentioned it to show that things are done cheaper and better in the Tyne than anywhere else. I do not except London, Liverpool, or any other place.

Thursday, 14th October 1858.

PRESENT:

Admiral HOPE, (Chairman).

Sir FREDERIC SMITH.
Mr. LINDSAY.
Captain WASHINGTON.
Captain SULIVAN.
Captain VETCH.
Mr. COODE.
Mr. EVANS, Secretary.

(*Mr. Poppelwell.*) I wish to correct the evidence which I gave yesterday, as to the owners of the steamers to which I made reference; on the register the names are Hugh Taylor, of the Coal Exchange, London, and Charles Palmer, of Newcastle.

14 Oct. 1858.

Mr. CONRAD GREENHOW examined.

13,512. (*Chairman.*) You are resident at North Shields?—I am.

13,513. How long have you been connected with the port, and in what capacity?—I served my apprenticeship to the sea in the Baltic trade. I have resided here ever since. I commanded a ship for 12 years in the coal and Baltic and Archangel trade.

13,514. You are aware of the objects of this inquiry?—Perfectly.

13,515. Were you present yesterday?—I was.

Mr. Conrad Greenhow.

13,516. Will you now offer any statement you may wish to make relative to the advantage or necessity of having one large national harbour of refuge on the coast?—I perfectly agree with the suggestions of former gentlemen, that it would be much better to improve the present harbours and make them all harbours of refuge. For the reason that with only one harbour, and these harbours un-

NORTH SHIELDS.

Mr. Conrad Greenhow.

14 Oct. 1858.

improved, many more vessels will work to that one harbour than will find accommodation. That will lead to great loss and destruction, to collisions and to accidents of a fearful character. I have no objection to making a harbour of refuge, but at the same time I think you ought also to improve these harbours.

Chairman.

13,517. Then you are of opinion that the system best calculated for the saving of life and property on this coast would not be completed by one harbour in any particular spot, but that there must also be subsidiary ones upon the coast?—Decidedly so.

13,518. With reference to the number of vessels which you say would require accommodation, can you give any idea of the largest number of vessels which have run into the Tyne on any particular day in bad weather?—I should say that certainly between 250 and 300 have run in. I have left Yarmouth Roads with upwards of 500 or 600 sail. If we had been cut short in a north-east gale and had all crowded for one place, we can easily anticipate what would have been the result, and we know that it would require a place of greater extent than can be found to make a harbour for all these vessels at a single spot.

13,519. How many voyages have you made to the Baltic?—Five years' apprenticeship, I should say 30 voyages at least.

13,520. Leaving the Baltic with the wind hanging to the southward at the fall of the year, where do you take your departure generally?—If you come down the Scaw with a south wind you get down to the Naze. If the wind is south-south-west you make west, so that you get hold of the south coast if possible. About three years running I have made Buchan Ness light.

13,521. Are you able to say as a general rule whether vessels, with the wind hanging to the southward, make their passage by stretching across for the Scotch coast?—The general rule is to go into Norwegian harbours of refuge, but those vessels which do get round the Naze must persevere and make west if possible.

13,522. But you mean that when a vessel has taken her departure from the Naze in moderate weather, she makes westing and gets hold of the land wherever she can?—Yes.

13,523. In the fall of the year what winds generally prevail—south-west and generally very heavy weather?—Yes, especially in the Sleeve and on the coast of Norway.

13,524. And are you able to give any notion of the part of the coast where the trade leaving the Baltic in the fall of the year generally make the land?—It depends on the wind. If they are bound to London, they make Lowestoft. Most ships, after the winter is set in, make Flamborough Head.

13,525. You say it depends on the wind, but is the wind generally to the south-west?—Generally.

13,526. These being the prevailing winds, what part of the coast do you say the Baltic trade, homeward bound, make? — Between Flamborough Head and Buchan Ness.

13,527. But looking to the distance across from the coast of Norway to the coast of England, that is rather a wide range. It depends entirely on the state of the wind if you can keep to the south; but a wise man will not be very exact as long as he makes westing, and very often they make the land north of the Bell Rock.

13,528. Are you disposed to say that in many cases the land is made between the Bell Rock and Buchan Ness?—Last year many vessels got into Cromarty.

13,529. You are aware that we have to investigate as to the necessity of a harbour of refuge on the north coast, and where the Baltic ships make the land in the fall of the year is a most important element in its consideration, will you give us your opinion as to the best point between the Firth of Forth and Pentland Firth to form a harbour of refuge for the Baltic trade?—I should say south of Peterhead; Peterhead itself is a very good harbour, and I should say that between Peterhead and Buchan Ness would make a capital site; the Baltic trade does not go generally to Cromarty, because with the wind north-east they are in a bight, and there is no loosing with the wind north-east, because the land trends to the south-west into the Forth.

13,530. Then do I understand you to say that you would name Peterhead as the most eligible site for the purpose?—Yes, on account of leaving with an east-north-east wind.

13,531. Have you had occasion to run up the Firth of Forth in heavy weather?—Yes, in the coal trade but not in the Baltic trade.

13,532. And in thick weather?—Yes.

13,533. Where did you run for?—Leith Roads.

13,534. Did you never run higher up?—No, I never did.

13,535. Is the Firth of Forth a place that many vessels run for?—A man can run there with his chart.

13,536. And a man with his chart can run to Long Hope Roads?—Yes, it is quite as good.

13,537. So that the Firth of Forth is a capital harbour of refuge as it is?—It is.

13,538. Have you ever made a passage north-about through the Pentland Firth?—Yes, going and coming.

13,539. What are the difficulties of the navigation of the Pentland Firth?—Much the same as was said yesterday, the strength of the tide is all the difficulty.

13,540. Would you consider that a difficulty in a well found ship, seeing that you need not run into the Firth in very heavy weather?—If the weather is bad from the eastward I would go into the Orkneys, because I could loose without going through the Firth from Long Hope.

13,541. Have the ships which you have commanded been generally well found ships?—Yes, thoroughly well found. The ship belonged to myself, and I took care to have it well found.

13,542. In a heavily-laden ship have you ever been under the necessity of running because you could not heave to?—No, I never have.

13,543. You could always heave your ship to?—Yes, I could always heave to.

13,544. With perfect safety?—Yes.

13,545. And you have commanded deeply-laden vessels?—By the way, I was once obliged to run coming from Archangel. I carried away my bowsprit.

13,546. On that occasion were you obliged to run?—Yes, for fear I should lose my foremast.

13,547. Then you do not say that you could not have lain to if you had not feared to lose your mast?—No.

13,548. You have a pretty good knowledge of the vessels in the coasting trade?—Yes.

13,549. Would you be disposed to say that a majority of them are as well found as the vessels you commanded?—Yes, I think the vessels from the port are well found and well manned, that is with skilful seamen, and the ships are perfectly safe under their handling.

13,550. Let us go back to the difficulty of the navigation of the Pentland Firth, which to my mind is simply this, that if a deeply-laden ship with a heavy gale from the south-south-east find herself near the Pentland Firth, if she can heave to for a lee tide the danger ceases, but if she cannot heave to then she must run in with the weather tide, and the danger becomes very considerable?—She would not steer.

13,551. Good; now tell me, does that apply to the coasting trade, can they as a general rule heave to in heavy weather, or would many of them be obliged to run?—Do you mean off the Pentland Firth?

13,552. Yes?—A prudent man would not go down with the tide running through against him, he would keep to windward, at any rate he would keep Cromarty Roads open.

13,553. But a prudent man might not be able to heave to and might be obliged to run; that is the pith of my question?—A heavy weatherly tide would help him into the Orkneys.

13,554. Therefore you think he could haul his wind

without danger in getting to the Orkneys ?—I think so.

13,555. And avoid the danger of the Pentland Firth ?—He could not with a heavy gale and a strong tide against him run through the Pentland Firth.

13,556. From your knowledge of the coasting trade can you say that vessels are found near to the Pentland Firth which cannot heave to with safety ?—That is an exceptional case, but it may very well happen.

13,557. Would you think it an exceptional case or a common one ?—I think it a very exceptional case.

13,558. That is your opinion ?—Yes, decidedly.

13,559. That is what I wanted to know as to your opinion. Do you know Scrabster Roads ?—Yes.

13,560. Have you seen vessels lying there in any number ?—The only time I was there there were not a dozen.

13,561. We know that vessels do resort to Scrabster Roads in considerable numbers, therefore a port at the entrance of the Pentland Firth is found a convenience. Will you give me your opinion whether a harbour at Wick would be very convenient to the coasting trade ?—I am afraid in Wick, if the wind is north-north-east or north-east and by north a ship cannot get round to get through the Firth ; it is only when the wind is south of east that she can get through.

13,562. Then your objection to Wick is the difficulty of getting out of the harbour there ?—Yes, in certain winds it would be difficult to get round the point. I think you will find the point extends further to the eastward.

13,563. Waiving that difficulty, and supposing that by means of steam tugs, vessels could be taken out into an offing ?—If there is much wind a tug cannot take a vessel into an offing. The sea is very heavy from the north-east there, it would not be safe, considering the bad navigation, and that she has been seeking refuge in bad weather.

13,564. I am considering that the vessel seeks refuge in bad weather, and that when the weather moderates she comes out to make her voyage. Would you then consider that the difficulty of the tug would apply ?—No ; certainly not so much then. We find in Leith Roads that ships merely go on to wait for a tide. They cannot do that at Wick with the wind north of east.

13,565. Therefore you think that Wick would not be used as a convenient harbour by vessels waiting for a tide ?—I think not.

13,566. Supposing it were determined to make a harbour on this coast, and it lay between Hartlepool and Filey Bay, which would you prefer ?—I should prefer Hartlepool, for this reason, vessels leave the Tyne with very bad prospects, and meet with south-east gales before they can avail themselves of Filey. It is in leaving the ports that they want shelter. After they have rounded Flamborough Head the Humber is open, and therefore I think the harbour ought to be more this way than Filey.

13,567. In fact you think it would be more convenient if it were to the north of Filey ?—Decidedly.

13,568. We have had it in evidence that the Tyne is a more advantageous place for ships to loose from than Hartlepool ?—It is a more weatherly port, with a fair wind.

13,569. But after it has been blowing hard from the south-east, does the wind generally go round to the south-west, and break at north west ?—Mostly.

13,570. Then after heavy weather, the advantage of weatherly position is not great in the Tyne ?—But the wind very generally goes rapidly round and settles at north-east, and before the sea goes down again, for it is often four or five days before the sea falls so that vessels can get out, or it is neap tide and large vessels will not get out. After a south-east gale they generally go when the wind settles to north-east.

13,571. How soon after ?—As soon as the weather settles down to north-east.

13,572. As to the facility of making land, is Hartlepool easy to make in thick weather with the wind blowing on shore ?—I should be very chary of running into Hartlepool with thick showers. It must be a very extreme case to compel a man to do that.

13,573. (*Sir F. Smith.*) You stated that Peterhead is very useful to the Baltic trade ?—I have found it so myself. A vessel would be very glad if there were a place there to get there for supplies.

13,574. Would it be a harbour of refuge or a place of call ?—Both. Ships thrown so far to the north have generally been a long time on their passage and are short of everything.

13,575. What circumstances would induce you to seek Peterhead ?—I would not seek it. If I left the Naze of Norway with the wind south and south-west blowing hard, I could not carry much canvas, and the probability is that I should make land between Aberdeen and Buchan Ness. If short of provisions and my ship had been very much thrashed, it would be very convenient to have a harbour to go into without difficulty or danger.

13,576. Do you know Fraserburgh ?—No. I know the coast well. I know Dundee, because I used to deliver there from the Baltic.

13,577. Dundee or Aberdeen do not present facilities for a harbour ?—No.

13,578. Have you ever been at Aberdeen ?—Never.

13,579. You were employed on the coast ?—Yes.

13,580. Are you aware that the casualties in the last five years have been very considerable, and do you imagine that a harbour of refuge would have prevented those casualties ?—If there had been good access to the Tyne and the Wear and the other parts, no doubt that would have prevented nine-tenths of them.

13,581. You think, in fact, that the formation of a harbour of refuge at the three points you have named would prevent nine-tenths of the casualties which ordinarily occur ?—You will find most of the losses off those harbours, and that better than one half of them, occurred in taking the harbours. I was once standing on Tynemouth cliffs and saw 11 vessels come ashore.

13,582. When was that ?—In February 1853 or 1854.

13,583. Then I apprehend that these were casualties to light vessels ?—No ; laden ships, all of them.

13,584. Were they coming back for shelter ?—No ; only one, from Peru, with a cargo of silver, which was lost, was bound here. The others principally were bound to other ports.

13,585. Were they lost for want of knowledge on the part of the masters ?—No ; from the sea striking them. The sea will turn a ship round in broken water.

13,586. Are you aware of the scheme of Mr. Walker for the improvement of the Tyne ?—I have seen it.

13,587. Do you imagine that that scheme will suffice to give deep water at the bar ?—They are going to carry a pier out to six fathoms. They cannot expect to maintain six fathoms, but no doubt they will have from 23 to 25 feet.

13,588. Why cannot they maintain six fathoms ?—Because of the débris washing out from the harbour, which will deposit when it meets the ocean current.

13,589. Are there no means of counteracting that ?—No ; I do not think so, unless you go further out, to throw it further into the sea.

13,590. And you cannot manage that ?—No ; unless you have a great deal of back water to wash it away.

13,591. Do you imagine that when the piers have narrowed the entrance you will get as much sea water as at present ?—Quite as much. Water will find its level.

13,592. If you give it time it will ?—As to time, I do not suppose that the difference between the bar and Newcastle is more than an hour or an hour and a half.

13,593. Supposing there were to be only one harbour, what capacity would you have it, or what length

NORTH SHIELDS.

Mr. Conrad Greenhow.

14 Oct. 1858.

Sir F. Smith.

of anchorage ?—I do not think you could make any one harbour sufficient.

13,594. You think that impossible ?—Yes ; I have seen Yarmouth Roads so full of vessels that you could not bring up another vessel in them.

13,595. Your opinion is that one harbour would not, that two might, and that three would be sufficient ?—Yes ; three would.

13,596. And if the country is to spend money for the purpose of saving life and property, you think it should be done in three places, and not in one, whatever place that might be ?—One would not do at all.

13,597. No, not even the Tyne ?—No, not even the Tyne.

13,598. You seem to think Hartlepool better than Filey ?—As far as the place goes Filey is the best land to make, but Hartlepool is the best situation.

13,599. Are you of opinion that harbours are better in the bights of bays than on promontories ?—No ; but I think vessels are much more likely to be caught short of Hartlepool ; I should rather have a harbour farther away than Hartlepool, between the two a little.

13,600. Is there any spot you can indicate ?—I am not an engineer, but there is the old place they were talking about some years ago, Redcar.

13,601. Do you know Redcar ?—I have been there, but have only been there by railway.

13,602. Are you aware that Hartlepool is silting up ?—I am not aware of that.

13,603. Are there any indications of silting up in the Tyne ?—None.

13,604. Any accumulation of sand near the newly constructed works ?—No.

13,605. You are not aware that that is the case ?—No.

13,606. (*Mr. Lindsay.*) After the very excellent evidence which you have given and the large amount of information you have rendered the Commissioners, I have very few questions to ask you, Mr. Greenhow ; still I would wish to know from you, if a harbour of refuge were constructed on the Tyne, would it be the means of saving a great number of lives and a large amount of property ?—Decidedly it would.

13,607. Taking the last five or ten years, can you tell me, of your own knowledge, any cases where life and property would have been saved if there had been a harbour there ?—Yes, certainly.

13,608. Do you recollect any ?—In many cases I have seen ships wrecked and their crews drowned.

13,609. I do not wish to go into the matter in a formal manner, but ask you the question off-hand ?—I have seen many ships lost and their crews drowned. I was standing on the cliffs in January 1854, and I saw 11 vessels come ashore, and I saw the crew of one drowned, men lashed to the rigging were rolled over under water ; one poor fellow held on for some time, his hands became benumbed, and then he dangled about by his legs, and was drowned ; I could see the expression of his features, and it was a most distressing thing. There were upwards of 30 vessels came ashore that day ; 11 laden vessels came to the rocks ; if there had been a good entrance they would all have got in ; they were all lost in taking the harbour.

13,610. How was the wind ?—East or east-south-east.

13,611. Did these ships come from the south ?—They came from the south, except the little Peruvian.

13,612. If these ships came from the south, would a harbour to the south have saved them ?—No.

13,613. Then they could not have got it ?—They shaped their course for this river. Filey certainly they could not have touched.

13,614. If they were to the south why would not Filey have done ?—They would have gone to the Humber. I saw from where they were then, that they could not get into Filey, and if they could they would have gone to the Humber.

13,615. As this is a subject which you seem to understand so thoroughly, I wish to put a question to you as a sailor, and I will ask you this question founded on the Report of the Select Committee of the House of Commons. Now is it or is not the case that a large number of laden vessels which leave this port fetch nearly as far south as Flamborough Head, or rather that a large number of vessels which leave these ports bound for London and the ports to the westward of these are usually caught in heavy gales of wind somewhere in the neighbourhood of Flamborough Head, and are obliged to run back from that point ?—Yes ; on the Yorkshire coast.

13,616. Are all the colliers which start from Shields supplied with barometers ?—I should say not.

13,617. Then many of them leave the port in very fine weather, when if they had a barometer on board it would warn them that a gale was approaching ?—Probably ships go out here with very shy prospects, because it is a tidal harbour ; if the piers were carried out they would not go out with a bad prospect, but now they are towed out and risk the weather, and gales are very sudden on this coast.

13,618. On account of being kept in the harbour a lengthened period and the difficulty of getting out, vessels often go to sea now expecting a heavy gale will rise, which they would not otherwise do ?—Decidedly.

13,619. And that is another reason why so many losses take place ?—Very probably. If the harbour were improved they would get to sea even with a swell on.

13,620. That would be a convenience to trade, but would it be the means of saving life as well ?—Decidedly, it would be the means of saving life as well. Men are always sanguine, they will go out if there is any chance at all.

13,621. You said just now, in reply to one of the Commissioners, that a great number of the vessels lost were laden vessels ?—On that particular occasion I should say the proportion was more laden than light vessels ; I am speaking from memory.

13,622. Do many vessels founder and get lost at sea when they are obliged to run back to Hartlepool and the Tyne ?—Sometimes, but they are only exceptional cases.

13,623. Then the losses in fact are principally in taking the harbour ?—In taking the harbour.

13,624. Does this arise from a heavy ground-swell making the ships unmanageable ?—From the badness of the entrance, with a swell, they will not steer through the sea.

13,625. Have you in your experience known any ships belonging to this place get as far south as Flamborough Head and be driven as far north as the Firth of Forth ?—Yes, I have.

13,626. Was that because there was no harbour here which they could attempt to take ?—Yes, on account of the high sea.

13,627. Then ships will not attempt to run for Shields ?—They will not run in on account of the sea. They are afraid of the harbour.

13,628. Does that often happen ?—They go to Leith Roads in preference to taking Shields when the sea is high, and especially at neap tides.

13,629. You seem familiar with the east coast of Scotland, and your evidence was very clear on that point ?—The ship I was apprenticed in traded there.

13,630. From your experience, do you think that a harbour of refuge is necessary on that part of the coast ?—It would be decidedly very useful ; I do not know sufficient of the coast to know whether it is absolutely necessary.

13,631. Do you think it would be the means of saving life ?—Yes.

13,632. And property also ?—Yes.

13,633. Do you think it would afford great facilities to trade ?—Yes.

13,634. Supposing it rested between three places : do you know the sites of Wick, of Fraserburgh, and of Peterhead ?—Yes.

13,635. Taking into consideration the saving of

life and property and the facilities for commerce, to which site would you give the preference if it were left in your own hands?—I would make the harbour at Peterhead.

13,636. All things considered?—All things considered. The probability is if you cannot get Peterhead, you get the Firth on one side, or Cromarty on the other.

13,637. Do you know St. George's or the North Channel?—I have been there sometimes. I do not know much about it.

13,638. Do you know enough about it to state whether a harbour of refuge at the Isle of Man would be of considerable value?—That is more a Liverpool question. I have once put in at Douglas.

13,639. You cannot give an opinion?—I went into Douglas because we had picked up a ship's crew, and our rudder was started; we got in there and put the crew ashore, and got our rudder put right.

13,640. Do you know how the wind was?—South-south-west. It is a dry harbour, but we got in very well.

13,641. Looking to the passing trade, do you think a harbour necessary at the Isle of Man?—I scarcely think it would. It might be very useful.

13,642. But I ask you the question, whether it is necessary?—Not absolutely necessary. At the same time it would be very useful.

13,643. Do you know the harbours in the North Channel from Belfast Lough to Lough Foyle?—No. I know very little about it.

13,644. Not sufficient to offer any opinion?—No.

13,645. (*Capt. Sulivan.*) Will you be kind enough to tell me what danger there is for ships off Buchan Ness that require a harbour of refuge?—I thought more of a harbour for supplies than for refuge.

13,646. Supposing the object of a harbour of refuge to be chiefly the saving of life and property, and that nothing will warrant the outlay of Government money unless these great advantages are gained, will you tell me how ships caught off Buchan Ness are ever in that position that they cannot get to Cromarty, or to the Firth, or keep the sea?—When very close in. But it is an act of humanity to give sailors supplies after they have been knocking about at sea for weeks.

13,647. Set aside the supplies, and look merely to the risk of life and property?—A ship cannot well be anchored at Buchan Ness.

13,648. Is there good anchorage in Peterhead, one side or other, where a ship can get supplies?—Between Peterhead and Buchan Ness, but the coast trends south-west.

13,649. Or, north of Peterhead, could she not get into the Moray Firth?—Vessels would not go there much. They would go south of Peterhead.

13,650. Then if the wind drove a vessel to the south, she would get a supply?—But it is a very bad roadstead with the wind south-east.

13,651. I was speaking of the wind south-west. With the wind south-east cannot a vessel run round for Fraserburgh?—Of course, she is under the lee of the land; when round the point, she can go to Cromarty, or where she likes.

13,652. Do you think that the captain of a vessel, under any circumstances, off Buchan Ness, would have any anxiety as to the saving of the life of her crew?—No, I do not think he would.

13,653. Take the case of Wick, and the Pentland Firth. What would place a ship in the greatest danger? What would be the worst gale for vessels proceeding through the Pentland Firth?—A vessel would not go into the danger at Wick. If a captain were wise, he would fall off on the starboard tack.

13,654. You described the case of some ships which cannot keep to windward, that must run. Place a ship in these two positions, one with any wind off Peterhead, and the other with the worst gale for entering the Pentland Firth, which ship is in the most danger?—At Wick, because the land does not fall away so rapidly at Cromarty as from Peterhead to Leith.

13,655. Then, if the saving of life and property from destruction were merely the object, do you think the trade through the Pentland Firth would find more safety from wreck at Wick than at any other place?—I think it a very exceptional case if a ship is caught at Wick.

13,656. But would you think it a more exceptional case if ships were so caught at Peterhead that lives would be in danger?—Both are almost equally exceptional. But at Peterhead, for all that coast of Scotland generally, a harbour would be very useful. I have found it so myself.

13,657. Do you mean a stopping harbour or a harbour to save vessels?—To save wear and tear, and to renovate the crew.

13,658. To save wear and tear, and not for refuge?—For refuge in fact, because if a crew from the Baltic has been out for a long time on the passage in bad weather they are pretty well exhausted, and a day or two's rest is of great advantage to them and the ship.

13,659. When we have to consider the question of a harbour on the east coast of England, is it not the feeling that it is required to prevent the loss of life and property?—Yes.

13,660. And that gave rise to the idea of making a harbour of refuge?—Yes; but the number of ships off here and off Peterhead are very different.

13,661. Do you consider there is any such chance of loss by wreck in the neighbourhood of Peterhead as to warrant the expense of making a harbour there?—No, I do not.

13,662. Knowing, as you do, the comparative advantages of the two places, will you add to your consideration what one gentleman has very properly alluded to, namely, the great loss of life among the fishermen, and then take the position of Peterhead and Wick, and say which is the proper place for a harbour of refuge. You may know that there is a large extent of fishing and great destruction of life at Wick, which would turn the balance there, because a harbour would be more valuable for the saving of the fishermen's lives?—For the fishermen, Wick, but not for the shipping, I should prefer keeping to windward to get to the Orkneys.

13,663. Do you think any ship, except a very large one, would run down from Duncansby Head, meeting the east tide, across that tide to the Orkneys?—She must be well to the windward before she crosses it. It does not extend very far.

13,664. Have you ever got into a ten-knot tide?—I have crossed the place in a very heavy gale to go to the Orkneys, and my ship was laden with salt too.

13,665. Do you think there is any point on the whole coast at all approaching the danger of the Pentland Firth under the circumstances we have been describing?—I do not know; many would go down with a good gale unless they were caught, and that very seldom happens. A gale does not come on without notice.

13,666. You think that a majority of the ships keep the sea, and keep off a lee shore?—Yes.

13,667. Why does not that apply to the other coast?—Because, going north, when a ship leaves Peterhead she has a good offing to run down on Wick. Here she goes to sea from the coast and has to make her passage by the coast, which makes all the difference.

13,668. When north of Wick, and between Wick and the Orkneys, supposing the Pentland Firth closed, is it not a straight coast?—Yes; but a prudent man would not go down with a bad prospect.

13,669. Do you think, generally, that the coasting vessels wait for the tide?—Every vessel will heave to if the tide is against her and the wind strong.

13,670. Do I understand you to say that of the two places there is more chance of wreck east of Wick than near Peterhead?—Not with a ship; with a fisherman there is. I have not seen the wreck chart so as to know whether there have been wrecks there,

NORTH SHIELDS.

Mr. Conrad Greenhow.

14 Oct. 1858.

Capt. Sullivan.

but I do not think there have been any (*the chart was handed to the witness*). I see that more are lost off Peterhead than off Wick.

13,671. You spoke of the great disadvantage of getting out of Wick when once in?—No, not always. If a ship bound to the westward went in, when the wind moderated she could not get round the point.

13,672. Would not that apply to any harbour at Hartlepool or Filey?—Of course. But the weatherly harbour is the best, if a man has the choice of a harbour.

13,673. You said you would prefer Hartlepool to Filey, on the ground that you wished a place somewhere midway between the Humber and Shields, and you thought Hartlepool would come the nearest?—I said that ships which leave here were more likely to get to Hartlepool than to Filey.

13,674. You said that the great want was somewhere midway between the Humber and Shields?—Not the want; I said if there was only one harbour to be made.

13,675. I find that Filey is 40 miles from the Humber and 60 miles from Shields, while Hartlepool is little more than 20 miles from Shields and 70 from the Humber. Taking that into consideration, how would you apply your remark about wishing for a place midway and yet preferring Hartlepool?—I said that ships leaving the Tyne and the Wear would be more likely to be caught on this side of Filey. If they were much on the other side that would be a very little distance, and one tack would take them to the Humber.

13,676. Would gales from east-south-east and south-east drive them back?—Yes.

13,677. Would they run for the Humber in these gales?—If a vessel were well to windward she would fetch it.

13,678. But must not the wind be north of east to insure her fetching it in a gale of wind?—It would require the wind to be east or north to fetch the Humber to be safe.

13,679. Then in an east-south-east gale a ship is more likely to run back?—Decidedly, because on the starboard tack the land falls away there.

13,680. In speaking of the advantage of improving the ports, do you set aside the idea that this port is already improving?—No, I do not.

13,681. Supposing this port to be deepened to 15 feet of water, would it obviate, so far as the light vessels are concerned, a great deal of the danger?—It would obviate the danger entirely so far as the light vessels are concerned, but not the laden ones.

13,682. You spoke of a large fleet of ships?—I said that 500 or 600 left Yarmouth Roads together.

13,683. Were they all light?—The larger portion of them were.

13,684. If five laden ships are lost to one light one, would you consider the light ones in selecting a harbour, or the laden ones?—I would consider the laden ones, because if they can get in, the light ones can also.

13,685. Then when this port is deepened to 15 feet, do you consider that even if there were a harbour of refuge at Hartlepool or anywhere south, light vessels would still run for the Tyne?—Of course; they do not want refuge.

13,686. Would not that relieve the harbour of refuge of a crowd of light vessels?—With that wind, but not with the wind from the east-north-east if it veered round and took them short.

13,687. Do you think the statement correct, looking at the return, that for 62 light vessels lost in one year there were 380 laden ones?—I think most are lost in taking the Bar, light vessels the same as laden ones.

13,688. How do you account for the small proportion of light vessels which are lost when you consider the risk of their being caught in large clusters with east-north-east gales?—If there is a harbour a light vessel will go in, because a ship in ballast is not very pleasant off the coast in a gale of wind on a dark night.

13,689. Is it not the case that a tidal harbour will save most light vessels?—Yes.

13,690. And would not that reduce the number of light vessels that would run for a harbour of refuge if made?—After these harbours are improved.

13,691. Would that be another reason why laden vessels principally are those which would require the harbour of refuge?—Yes.

13,692. From what you know of the usual trade of these ports, do you consider that if a harbour were made where no means of supply at present exist, and a demand arose for anchors, cables, spars, ropes, and all the ordinary supplies for ships, I am not alluding to their requiring docks but to the ordinary supplies for ships, do you think the trade would follow the demand and that people with capital would go and supply that demand?—If the demand were sufficient they would, but the demand would be only occasional, and larger profits would be required to keep such a place, and vessels would prefer coming where they could obtain a cheaper supply.

13,693. (*Capt. Vetch.*) Looking at the state of the coast here from Blyth to Whitby, you prefer that the existing harbours should be converted into good shelter, rather than that one large harbour should be constructed for the benefit of the whole?—Yes, I should prefer that decidedly.

13,694. Which of the existing harbours would you propose should be benefitted by such works?—The large harbours, the Tyne, the Wear, and Hartlepool.

13,695. Supposing the Government entertained a different opinion, and preferred one single harbour, what site would you propose in that case?—That is a very difficult question. I would take the site where I could get the largest harbour.

13,696. You have no predilection for any place in particular, under these circumstances?—I would prefer Redcar or Hartlepool, on account of the high land about it.

13,697. Speaking of the improvements going on in the River Tyne, supposing that the piers are carried to the proposed depth of 15 feet, will not that be the means of saving all the vessels that are now wrecked inside these pier heads?—Decidedly it will.

13,698. It will save all the lives?—Yes, and save the ships too, because the sea will not break in six fathoms, as it now does, when there is nothing to prevent it.

13,699. Do you know the amount of the tidal current which runs across the mouth of the proposed harbour?—In spring tide it is only about a knot and a half.

13,700. Does that run right across?—Directly at right angles.

13,701. Would not that tend to keep away the formation of any bank?—It would prevent any bank of sand forming immediately in front, but I think it would make a bank to the north.

13,702. (*Mr. Coode.*) Can you tell me what land, ships from the Baltic, make when bound to Hull or Shields?—They generally make Flamborough Head. Bound south for London they make Lowestoft.

13,703. Is it not the practice to endeavour to make Flamborough Head so as to get holdof the land?—Not if they go to the southward.

13,704. Have you not said that the wind prevails from the south?—It does.

13,705. But as a matter of fact do not vessels make Flamborough Head generally?—I should say, from my own experience, that five-sevenths of them make it north of Flamborough Head.

13,706. (*Chairman.*) Can you tell me if the Archangel trade and the trade to the Baltic is very considerable or otherwise?—It is a very considerable—a very large trade.

13,707. Are the ships engaged in it generally of a large size?—No; about 300 tons is the outside, except vessels going to St. Petersburg. The other ports will not take them larger than 300 tons. Archangel Bar is only 14 feet.

13,708. In the fall of the year, coming from the Baltic, is the weather very coarse ?—Yes, it is very nasty. There is a strong current down the Sleeve, and it makes a nasty sea.

13,709. What do you call a good passage in the fall of the year ?—After November we consider three weeks a good passage from Elsinore.

13,710. And from Archangel, what is a fair passage ?—Why, I made three passages, each in 17 days from Archangel, very curiously, by keeping well to the north. A ship going in a high northern latitude is sure to make her passage.

13,711. Was that a good passage ?—Above the average, I should say the average from Archangel was 30 days.

13,712. And what do you call a bad passage from the Baltic in the fall of the year ?—Some vessels have been four months from the Sound before they got to London.

13,713. And of that time were they a great deal at sea ?—They got into Cromarty and lied there some time.

13,714. What is a bad passage from Archangel ?—I have known ships six months on the passage. In 1828 several were six months. But about two months.

13,715. Is two months a bad passage ?—Anything above 30 days.

13,716. But passages above 30 days—are they unfrequent or not ?—Frequent, I should say.

13,717. And in making the passage, is the work hard ?—The weather is severe after the month of October.

13,718. And the work is hard to the people ?—Of course, and the people are exhausted and worn out when they make the Scotch land.

13,719. Therefore, although as respects the mere question of saving life or even saving property a harbour at Peterhead might not be required, still it would be a decided advantage for the weather-worn crews ?—It would be a great boon to the Baltic and Archangel trade.

13,720. Although not absolutely required for the saving of life and property ?—Yes.

13,721. Do you think you can procure for me any tracks home from the Baltic or Archangel in the fall of the year ?—I will try, if I can, to get a log.

13,722. If you will not object to the trouble ?—It will take up some time. I shall have to get hold of a log-book, and prick the mark off on the chart.

13,723. But if you will undertake to superintend the preparation of these tracks the Commissioners will meet the expense of employing proper persons ?—I will do it myself. It will be less trouble than superintending others.

13,724. What I wish is that these tracks should be selected not with the view of maintaining any particular opinion of mine, if you suppose I have one. They will be the more valuable the more indiscriminately they are taken.—You mean a fair average of the passage ?

13,725. Yes, from Archangel and the Baltic in the fall of the year.—Will you have the track all the way from Archangel, or after latitude 60 ?

13,726. I should say the latitude of the Orkneys and the Shetland Islands, and also taking the departure from the Sound and the Naze, as the case may be, the object being to show where the ships make land under these circumstances ?—Yes, I will do that.

13,727. (*Sir F. Smith.*) Do you imagine that the coal trade will be carried in steam vessels ?—No ; I do not think it will.

13,728. Do you think that the size of the vessels will increase ?—No, not beyond what they are now.

13,729. So that the depth of water required now will be sufficient ?—For the coal trade. But for long voyages, in my opinion, the size of the vessels will increase, and the trade from the Tyne is very extensive to the East Indies, and the West Indies, and all parts of the world.

13,730. And is that trade increasing ?—It is increasing rapidly.

13,731. You do not happen to know the number of vessels trading for a year from the Tyne ?—I do not.

13,732. But they are very much upon the increase ?—They are very much on the increase, and are increasing in the size of the vessels.

13,733. (*Mr. Lindsay.*) Look at this parliamentary paper. The question I am about to ask bears reference to an answer which you gave, where you stated that if one harbour were to be made on any particular part of the coast, you would choose that where there would be most room ?—Yes.

13,734. Do you know Hartlepool Bay ?—Yes.

13,735. Have you seen any plan for a harbour proposed to be made there ?—I have.

13,736. You see before you a plan of Filey Bay ?—Yes.

13,737. Looking with the eye of a sailor, and at the scale to measure the size and depth, would you have more space for ships in a harbour in that bay or in Hartlepool Bay ?—In Hartlepool Bay, I think, if a breakwater were made as I have seen it laid down, making a curve from the Heugh.

13,738. Was there any estimate attached to that plan ?—No.

13,739. But looking to the plan of Hartlepool Bay and the plan of Filey Bay, you would consider there is more space in Hartlepool Bay ?—If the wind got south-east, very few ships in Filey Bay would be really sheltered.

13,740. Do you know the plan which has been proposed to extend the piers at the Tyne so as to give five or six fathoms at the entrance ? Which would then be the most spacious for refuge, the harbour in the Tyne or Hartlepool Bay ?—There would be much more room in the Tyne. In Hartlepool Bay vessels would have to ride at single anchor, but in the Tyne the tugs would take hold of them ; they would be moored safely, and there would be no risk of further injury from collision or driving.

13,741. When you say more ships, you mean more stowage of ships ?—Yes.

13,742. You are taking into consideration that most of the ships would be moored as they came into the Tyne ?—They would be moored as they came in, without confusion and without difficulty.

13,743. Now, in your opinion, would any harbour, such as that before you in Filey Bay,—would any harbour of that extent be sufficient on all occasions for the number of vessels which may require to run for it in a heavy easterly gale ?—I do not think it would. The number of light ships in Bridlington Bay would sometimes fill that harbour to crowding.

13,744. With the practised eye of a sailor, can you tell us what number of ships that harbour at Filey would hold riding at anchor in a gale of wind ?—I do not think it would stow above 250 ships.

13,745. About 250 ships ?—A ship with 50 fathoms of chain, would take eight acres to swing in.

13,746. By a return it appears, that five laden vessels are lost to every light vessel, consequently a harbour of refuge, in the strict sense of the word, ought to be such a harbour as will admit laden vessels at all times of the tide ?—Decidedly so.

13,747. Will that be the case with the Tyne when the piers now going on are completed ?—Not with the present plan. It will not.

13,748. Then to make the Tyne a harbour in the strict sense of the word, it is necessary to carry the piers further to sea ?—Decidedly.

13,749. So as to give a greater depth than 15 feet at low water at spring tides ?—Decidedly, to prevent it breaking between the piers in ordinary gales.

13,750. And although these piers when carried out, so as to give 15 feet will lessen the danger, they would lessen it a great deal more if carried out to a greater depth ?—If we could have six fathoms a ship might come in at low water, and at low water the sea would not break. It will not break unless there are undulations, and the piers would prevent it from breaking.

13,751. Then it is necessary to carry the piers

NORTH SHIELDS.

Mr. Conrad Greenhow.

14 Oct. 1848.

so far out that the sea will not break upon the bar. That is your opinion ?—Yes, decidedly so.

13,752. (*Capt. Washington.*) Do you say that you had seen from 400 to 500 light vessels in Bridlington Bay ?—In Yarmouth Roads, I said.

13,753. Will you state what number of laden vessels you have ever seen making their way together which a south-east gale would oblige to bear up ?—I have seen 200 go out of the Tyne, and as many out of Sunderland, and off the Yorkshire coast 400 or 500. As the tide serves they always go out together.

13,754. Is that a very unusual circumstance ?—Not at all in the winter time. At the same time a south-east breeze gives very little notice.

13,755. Then you consider that if the work is to be confined to one harbour, provision must be made for 500 vessels at least ?—Yes, it will require provision for 500 vessels.

13,756. If the three harbours were improved, would these 500 vessels be distributed ?—If the Tyne were improved they could stow away 500 sail. They would be taken by tugs to their berths without confusion.

13,757. (*Capt. Sulivan.*) You say six fathoms of water, I presume you mean between the pier heads ?—I am telling you what the engineers report.

13,758. Tell me how you could get a ship ride ?—In my opinion the present bar would disappear. I do not expect to keep six fathoms, but I do not think the growing up would diminish it to less than 25 feet.

13,759. You said before that the silt was carried out to sea ?—It must follow the piers out of course.

13,760. Then I presume that, with the present piers and the depth which they will give, it will only be a question of time when this silt accumulated outside ?—If the piers are carried far enough, there will be no fear.

13,761. But at present, or when you have the 15 feet ?—I think the present piers are beyond the range of the beach, and it will take a long time for sand to accumulate outside.

13,762. You said it must accumulate ?—There is sure to be a deposit.

13,763. Then you consider it is merely a difference of time as to when the silt will form ?—In six fathoms I don't think it will ever form so as to be detrimental.

13,764. Do you think that the whole passage over the Narrows and the nine-feet bar will be swept sufficiently clear for large vessels to enter, even supposing that the six fathoms are kept at the pier head ?—There will be earth works to concentrate the current and make it take the true direction.

13,765. You mean that down from the Narrows there will be other works to confine the current to the channel ?—To give a true direction to the current decidedly, to prevent its spreading.

13,766. Supposing that were done, when large vessels come in for refuge, a line-of-battle ship say, where would she bring up ?—In ordinary circumstances she would bring up generally where the present bar is ; but she would merely temporarily bring up ; she would not ride.

13,767. At present is there one depth in the Narrows ?—No, there is Peggy's Hole.

13,768. Can a ship drawing 26 or 27 feet of water anchor there ?—No.

13,769. You are aware that all men-of-war draw from 26 to 27 feet ?—I am aware of it.

13,770. Do you think that the Narrows, a place with a strong tide, a proper place for a line-of-battle ship to bring up in ?—Not a very large number might bring up. A few might. We expect the harbour to be improved inside. We can easily remove what is in it if we can keep it out.

13,771. Must not the channel be very narrow to keep it deep ?—No. There would be a great body of water in the channel if it were not allowed to disperse, and it would maintain a good stream.

13,772. At present the steam is confined until it passes the Narrows ?—It then disperses.

13,773. Then you require a channel as narrow as the Narrows ?—No, I do not think that. The Narrows are much narrower than they were 30 years ago. They will widen when the works are done.

13,774. If the volume of water only sweeps out a channel of 15 feet in depth, would it not require you to narrow that channel to sweep out 26 feet ?—No, I do not think it would, not if it were directed in its energy. If allowed to disperse about and lose its energy it will deposit.

13,775. What is the strength of the tide in the Narrows ?—In spring tides I should say at once, four knots quite.

13,776. Supposing a harbour were made at Hartlepool, if large ships are running in, where would you rather bring up, in a bay like that with no tides in it, or in a four-knot stream ?—The four-knot stream ; in the Narrows down there is not two knots.

13,777. Where it is two knots there must be a wide expanse to carry the tide ?—Yes.

13,778. And you must confine the channel to get a depth ?—I would not confine it as narrow as the Narrows.

13,779. In any case, would you rather bring up a large ship in a tidal channel or in deep water ?—Under certain circumstances I would rather bring up in smooth water, but with a weatherly tide I would as soon bring up in a tidal channel.

13,780. You say there are 500 or 600 vessels off the coast in gales at one time, can you tell us, upon the average how many persevere, being generally well found, and endeavour to keep to sea, and what number try to get shelter ?—Every ship, if she is well ballasted, will keep to sea.

13,781. I spoke of laden ships ?—If laden, every ship will persevere so long as there is no absolute danger of doing so, and then she will go back to her own port if she does go back.

13,782. Out of the 400 or 500 vessels which you have known to leave the northern ports in one day, and congregate off the coast at Flamborough Head, what number would you think it necessary to provide refuge for, allowing for the proportion of those who endeavour to keep to sea ?—That is a very difficult question to answer, because I cannot tell how many would require shelter. Cases occur where ships cannot keep to sea, and must run. Deeply laden colliers in certain gales must run. In my opinion there is not 10 per cent. that would not keep to sea.

13,783. (*Mr. Coode.*) You have spoken of a plan for a harbour in Hartlepool Bay ?—No, I did not. I merely saw a plan roughly drawn to show a harbour there. I think it was Mr. Calver's.

13,784. Can you tell us the exact number of acres sheltered by that plan? —No, I cannot.

13,785. Speaking of the plan before you, of Filey, and the plan of Hartlepool, can you state generally which has the most space ?—I can see with my eye that there would be more room at Hartlepool, because at Filey laden ships would not take advantage of it as it is exposed to the south-east.

13,786. Please to refer to the plan of Filey, and tell me how many acres there are in that breakwater for laden ships sheltered from the winds ?—I cannot tell, unless I know what depth they would require.

13,787. I believe $2\frac{1}{2}$ fathoms will suffice for a laden collier ?—I have known some of them drawing 16 feet ground.

13,788. What proportion of the colliers out of the Tyne draw 16 feet ?—Fully one half of them. These ships would not be safe in three fathoms anchorage, even if it were smooth.

13,789. Do you know the anchorage in Hartlepool Bay ?—No, I do not. I merely saw a plan, and I think it is more extensive than Filey Bay.

13,790. (*Capt. Vetch.*) Looking to the present plans for the improvement of the Tyne there would be an opening of 1,100 feet left between the piers ?—I believe so.

13,791. When these piers are completed, will not

all the water which flows in at flood tide be confined to a much narrower space ?—Of course, where you want more energy you must narrow the stream.

13,792. Will not that produce a much greater current between the pier heads ?—Decidedly.

13,793. And will not that increased current tend to scour out the channel of the river ?—It will, and by the works on the north side to prevent its flowing over the Flats it will divert the whole force upon the channel.

13,794. Independently of any further extension, will not that be a great benefit ?—It will.

Mr. COWAN re-examined.

Mr. Cowan.

13,795. (*Chairman.*) In the revenue account of the Tyne Improvement Commissioners, I find for the year from the 1st of January to the 31st of December, 1857, the amount arising from the duty of 2*d.* per chaldron of 53 cwt. on coal, coke, culm, and limestone is 19,138*l.* odd shillings and pence ; the Corporation of Newcastle receive the whole in their name and pay over to the River Improvement Commissioners three-eighths of that amount, 7,177*l.* odd, leaving a balance of 11,961*l.*, and that balance of 11,961*l.* is applied to other purposes than the improvement of the river ?—It is applied by the Corporation of Newcastle to such purposes as they think proper. By the Tyne Improvement Act of 1850, there was an arrangement made with the Corporation, that they were to retain five-eighths of the amount, and of course the Corporation can do what they think proper with that five-eighths. Previous to the passing of that act the Corporation of Newcastle were entitled to the whole receipts, and to lay out such portions as they thought proper on the maintenance of the river.

13,796. And in fact the revenue derived by the Corporation of Newcastle from dues is probably chartered right of very ancient date ?—It is.

13,797. And by custom, whatever was the original intention, it has been appropriated as a part of the town income ?—Just so.

13,798. Then when this arrangement of which you have just told me was made, am I to understand that the three-eighths which is now devoted to the improvement of the navigation of the river was considered a fair compensation, under the circumstances, that the Corporation of Newcastle should give three-eighths for that purpose, and keep five-eighths, as being entitled to it under this old vested interest or right ?—There were two parties contending at that time, and the two bills which were then before Parliament, in consequence of an arrangement, were run into one. I was a party myself to the arrangement. Each party thought they had done the best they could, and had made the best bargain they could under the circumstances. It was a compromise between the parties under the circumstances, bearing this in mind that the River Tyne Commissioners were to get a much larger sum for the improvement of the river than the Corporation of Newcastle were in the habit of doing.

13,799. And as far as respects the parties concerned in this compromise, how would any disturbance of the compromise be viewed, as fair and right or the reverse ?—We have in the last session of Parliament attempted to disturb it ; but were prevented from doiug so by the present Government. The Corporation of Newcastle and the Tyne Commissioners agreed, the Commissioners to purchase and the Corporation to sell them the remainder of those dues, and they agreed upon the principle on which the value should be determined by arbitration. In consequence of the present Government inserting a clause with reference to certain dues, which they thought unreasonable, the arrangement went off, but I have no doubt that arrangement would have been of benefit to the Commissioners.

13,800. Then if I understand you rightly that arrangement indicated that it would not have been considered honourable on the part of the parties concerned in that compromise to have disturbed it except by mutual agreement ?—Certainly not. There is no greater proof of this than the circumstance that the Improvement Commissioners were the parties who brought in the bill for the purpose of effecting the arrangement, they did not think it honourable to take anything away from the Corporation without compensation.

13,801. (*Mr. Lindsay.*) You said that this 11,961*l.* which the Corporation receive annually from the coal duties was used for corporation purposes ; do you mean that the whole of it is so expended ?—It goes into the general funds of the Corporation. I am not aware what they do with it, but I presume they pay the interest of some debt incurred, or appropriate it to the general purposes of the Corporation.

13,802. But if you levy dues upon the coal trade, what do you do for the coal trade in return ?—We maintain the river, as far as the improvements are concerned, and we lay out our funds for the benefit of the general trade.

13,803. But is any portion of the 11,961*l.* laid out for the benefit of the river ?—Not at all, we do not draw it.

13,804. Do I understand you to say that no part of this 11,961*l.* which is levied upon the coal trade is expended for the improvement of the river ?—None at all.

13,805. You said yesterday that 400,000*l.* was the sum that you contemplated laying out in the construction of the present pier ?—Yes.

13,806. And that you would require 400,000*l.* more to turn the Tyne into a harbour of refuge so as to give six fathoms at low water ?—Just so.

13,807. How much would 11,961*l.* per annum, if capitalized, give at the present rate of interest ?—I have not gone into the question. It is a matter of calculation as to what it would give, but I have not made it.

13,808. It would give close upon 300,000*l.* at four per cent. ?—Probably it would.

13,809. Would the extension of the piers to the extent you have named be of great value to the trade of this immediate district ?—No doubt of it.

13,810. Would Newcastle derive very great benefit from it ?—No doubt it would.

13,811. Do you not think it would be for the interest of Newcastle to capitalize this 11,961*l.* a year, or at least, if not the whole, a large slice of it, towards the 400,000*l.* required for the construction of the piers ?—It was the intention of the Corporation that some such idea should be acted upon in the bill which we had before Parliament in the last session. It was to be a compromise, even that, because it was arranged that the value should be ascertained by arbitration, and that the parties would take all the circumstances of the case into consideration, as to the value which they would put. My own notion is that the Corporation did not expect to receive such a sum as would be given for the bonâ fide purchase of property of a different description, therefore they are prepared to compromise to a certain extent, and to act upon the principle to which I am alluding. At any rate, that is my impression.

13,812. Then do you think that if the Government were disposed to assist, the Corporation of Newcastle would do that which I suggest ?—In the same bill it was proposed to lessen the ballast dues, and thereby give compensation to the shipping interest at once.

13,813. Supposing the Government were disposed to assist in the construction of this great harbour, do you think the Corporation of Newcastle would be disposed to meet the Government readily in regard to this sum of 11,961*l.* annually, which they now draw ?—I cannot answer for the Corporation. I can only state what has already passed. As I have stated, my own impression is that the bulk of the Corporation, the majority of the Corporation, expected in the sale and purchase of the dues which would be effected by the bill, that they would not get the full value. It was upon this principle that the arrangement was made.

NORTH SHIELDS.

Mr. Cowan.

14 Oct. 1858.

Mr. Lindsay.

13,814. Would the difference in value have gone to the extension of the piers, or to the general improvement of the river? Had the Corporation power to apply the money either to the piers or to the river?—I have no doubt in my own mind that that was their intention. The Corporation did not expect to receive so large a value by far as they would have done from a purchase of real property.

13,815. You are now speaking your own individual opinion?—Certainly, I am not prepared to give any answer on the part of the Corporation.

13,816. Do you think it would be policy on the part of the Corporation of Newcastle to consent to such an arrangement?—Yes, I do.

13,817. If the Government come forward and offered a sum of money to aid in the construction of the piers, do you think it would be a wise policy on the part of the Corporation to place a portion of the 11,961*l.* at their disposal?—I think it would be wise for them to do it. I have always said so.

13,818. (*Capt. Sulivan.*) Be kind enough to explain the exact nature of this due of 2*d.* a ton?—2*d.* a chaldron.

13,819. Is it a coal tax to that amount, or 2*d.* a chaldron for what ships carry?—It is for what ships carry.

13,820. Then it is not a shipping tax, but a coal tax?—Yes.

13,821. More like what the Corporation of London receive?—Yes, it is paid usually by the purchaser of the coals. The vendor is obliged to pay sometimes.

13,822. But it does not fall upon the shipping? It falls more upon the colliery?—There is a difference of opinion on the subject. I have always maintained that it falls on the purchaser of the coal. Some say that it falls actually on the owner of the coal mine. If I am the owner of a coal mine, and open a coal mine, and for every chaldron of coals am subject to a tax of 2*d.*, I presume, as the owner of that royalty or that mine, if I were letting it to any gentleman here I should let it for 2*d.* a chaldron more. Therefore I say that the 2*d.* actually comes out of the pocket of the purchaser of the coals. That is my view of the case, and always has been.

13,823. Then if we could suppose that the Corporation of London were to give three-eighths of their coal tax for the improvement of the Thames, it would be a very similar case?—It would.

Mr. JAMES MATHER examined.

Mr. James Mather.

13,824. (*Chairman.*) You are one of the River Tyne Commissioners?—I am.

13,825. I think you stated yesterday that you wished to supply a list of witnesses, of seafaring men who wished to be examined?—In a few minutes, after I have done myself, I will get these names, and hand them to you.

13,826. You are aware of the objects of this inquiry?—I am.

13,827. Will you make any statement which you wish to offer on the subject. I will ask you, before entering on your statement, to avoid anything we have before us in an official shape in the Report of the Committees of the House of Commons in 1857–8?—I will give, if you have no objection, a portion arranged from official documents, combined with facts which have been ascertained on the spot generally, which strikingly illustrate the question in all its bearings upon the subject of a harbour of refuge. I will not trouble the Commissioners with every detail. In showing the importance of the Tyne and the ports along the coast, I will not go over all the facts given in the parliamentary and official first returns, but I will state, if you will permit me, the great increase which has taken place in the last five years at these several ports, as bearing on your important inquiry. I find that the Tyne has had an increase on shipping of 967,731 tons within the last five years. Sunderland has had an increase of 617,349 tons within the last five years. Hartlepool has had an increase of 17,604 tons during the same time. Last year the Tyne had an increase of 394,000 tons; Sunderland had an increase of 328,000 tons; Hartlepool had a decrease of 69,525 tons. This statement will illustrate, I fancy, the condition of these harbours, the character they bear in the minds of commercial and nautical men. The Tyne, with its enormous increase of nearly 1,000,000 tons in five years, and increasing in a greater ratio now than before, is a proof of the great improvement which has taken place here, to which the previous witnesses have spoken. At Sunderland, owing to the very creditable efforts making there, there is also a very large increase; while, with all the efforts which Hartlepool can make it is perfectly plain that if she is to be saved, she must be saved immediately. With regard to the great staple commodities of the places, coal and coke, in the last five years the Tyne had increased 711,653 tons, the Wear 736,189 tons, while Hartlepool has decreased by 61,050 tons.

13,828. In what time?—In five years, but it has been chiefly in the last year that Hartlepool has decreased. She has had an increase at other times, but this year's decrease balances and turns the scale the other way. It is an important feature to state the quantity of coals carried coastwise. We are now losing that trade to a certain extent; in the five years there being a decrease on the coasting trade of 153,858 tons. Sunderland has increased 234,620 tons, whilst Hartlepool has decreased 124,865 tons. Sunderland has balanced nearly the two decreases in the Tyne and Hartlepool trade. We have lost the trade in consequence of the cheap rate coals are carried by railway to London. In the year 1852, 3,330,428 tons were carried by sea, and by inland carriage only 414,917 tons, making altogether 3,745,345 tons. In the year 1857, six years afterwards, the decrease in ship-carried coal was 196,969 tons, while the increase of the inland coal trade by railway to London was 820,332 tons, London taking during the last year 4,368,708 tons. The increase to London has been 623,363 tons, while the trade of carrying coals by ships has decreased 196,900 tons. Showing that we are losing the coasting trade, owing to the competition of railways. The steamers, no doubt, are doing harm, but I have not a shadow of doubt that they are on their last legs, and will disappear entirely from the waters of the Tyne, and be employed elsewhere. We have, however, compensation for the decrease in the quantity of coal carried coastwise. We have an export of coal and coke to foreign ports, and that trade has increased in five years, from 1853 to 1857, 61 per cent. in the Tyne. The Tyne has an increase of 836,697 tons; Sunderland has an increase of 494,995 tons; and Hartlepool an increase of 77,292 tons; being an increase in the export trade equal to 61 per cent., as I have said, for the Tyne, 91 per cent. for the Wear, and 17 per cent. for Hartlepool. Stockton had an increase of 117,390 tons, making a total of 3,865,703 tons exported last year from the north-east ports, and showing the enormous increase of 1,500,000 tons of export trade. The total coal exported by the United Kingdom is 6,737,718 tons, and we sent from the northern ports considerably upwards of one half. This shows that the loss we have sustained by railways is more than made up by the gain where no railways come; and I think I may congratulate the shipping on having this sheet anchor in their difficulties. Perhaps you will permit me hereafter to give these tables in.

13,829. Perhaps it would be desirable that you should supply a statement in order to check the figures?—Another element in the increase of the foreign vessels which come to the Tyne is, that these vessels cannot discover along the coast any sufficient harbour. They seek the Tyne harbour in all difficulties. When therefore the Tyne has more foreign vessels engaged in trade than London itself, it is a matter of consideration whether suitable provision should not be made for those vessels. We last year had for this river upwards of 7,000 foreign ships,

giving a trade in foreign ships to the Tyne upwards of one half of those to all the north-east ports. There has been some statement made of the number of vessels along the coast, which I think may be taken merely as a little guess-work. The total number of vessels, in and out, laden and light, was 93,802 for all these ports, the Tyne itself having upwards of 41,600 tons.

13,830. Ships you mean?—I meant ships, of course; 41,688 ships for the Tyne. This will partly apply to the wrecks which are perpetually occurring on these shores. It will account partly for the great number of laden ships which are wrecked, although not to so great an amount as you have already heard in the statement made to you. I cannot clearly comprehend that statement, but I will submit other figures from the Admiralty returns, showing that the laden vessels are not five to one to the light vessels wrecked. I believe the proportion is rather against them. The Board of Trade do not favour the public with particulars, and since the Admiralty have given up making the wreck returns, we have to take for granted all that the Board of Trade states, and that is a general summary. I conceive that when the Admiralty favour the public with the details ship by ship, where bound to, what weather and wind, whether light or laden, the public are advantaged by these papers. I wish the Board of Trade would take a leaf out of the Admiralty book. I may add that with regard to the foreign trade, bearing on that subject is the number of different ports with which these ports deal. The Tyne, in the month of July, dealt with 166 foreign ports. We sent and had shipping from those 166 foreign ports. The Wear dealt with 93 foreign ports; Hartlepool with 90 foreign ports; Middlesborough with 30 foreign ports. We had nearly double the whole trade of the kingdoms of Scotland or Ireland; and I trust the Commissioners will remember that in dealing with us they are dealing, not with a port, but with a great maritime people.

13,831. I did not catch that expression.—I take the liberty of saying this, that this important river has more maritime property afloat, and as many vessels as the kingdoms of Scotland or Ireland, and therefore when you are adopting measures for their advantage and protection, you will, I hope, consider that you are dealing with interests equal to those of a kingdom, and not with a river of that kingdom. We now come to a very disputed point in the tables, about the winds.

13,832. Before you proceed further, Mr. Mather, may I ask if you have furnished the statistical part of your statement?—I have, I have got to the wrecks and the winds.

13,833. Then I would suggest that to make your inquiries of value, you should attach to the margin of these returns the authorities from which they are drawn. You will see the object is to give them greater weight and authority than they would otherwise possess.—They are chiefly from official tables; and I will, with your permission, forward tabulated statements, with the authorities whence derived, to the Commission. Some of them have been already published.

13,834. Any authority, not of a public nature, you will please to authenticate as best you can.—In coming to these tables I am happy to say that I have had results, corroborated by a gentleman whose authority will be recognised everywhere, Mr. Tom John Taylor, who, with great industry and application, has devoted himself to the development of this subject. I had not known that Mr. Taylor had applied himself at all to it, but the results which I arrive at, although not his precise results, are sufficient to show their general accuracy, considering also the independent sources from which we both derived our information. I will give you first my own statement as to the direction of the winds on the coast, and then Mr. Taylor's. I think it was observed in the north that you had not evidence as to the winds, such as you would like—that you could not exactly ascertain the prevailing winds—and a desire was expressed by the Court to have a return showing their direction and prevalence. The first return which I shall give is from the *Shipping Gazette*. I went over the whole of it for four months, and these are the results:—On fifty-three days in these four months, the wind in the district prevailed from the south, on thirty-three days from south and east, and on thirty-three days from the north. We will get more precise information than that. I will give now the direction of the wind for every day in the year for 1857, at the mouth of the river Tyne. My authority is the pilot master at South Shields. He keeps a register, which I hope will be laid before you, because there are some very good remarks in it on the state of the weather, the barometer, the way the wind is blowing, the state of the sea, and many things in which nautical men are interested. From that register I find that for 1857 there were 184 days on which the wind blew from the south, 148 when it blew from the north, 18 when it blew from the west, and 15 when it blew from the east. Looking at the matter in a harbour of refuge point of view, there were 75 days when the wind blew from the south and east, and 68 days on which it blew from the north and east. The west being rarely dangerous winds, are of course not noticed. For the six months of the present year, up to July, there were 82 days on which the wind blew from the south, 82 days from the north, 6 from the west, and 11 from the east. There were 41 days when it blew south and east, and 31 when it blew from the north and east. These are then the prevailing winds for the last eighteen months, which I have the pleasure of stating to you. If you will permit me, I will now give you the number of wrecks at the mouth of the Tyne, and the prevailing winds, from the Admiralty Wreck Charts. The wrecks which occurred in five years at the mouths of the three rivers were 126 with the wind from the south and east, east-south-east, and so on; 105 with the wind from the north and east, east-north-east, and so on; 17 with the wind from east by north. There were 107 vessels wrecked when laden, according to the Admiralty reports, and 95 of these lost vessels were in ballast. There were also 44 laden vessels in which there was no direction of the wind ascertained, making 151 laden vessels altogether.

13,835. (*Capt. Washington.*) For how long a period are these returns?—I think I have stated that the return is for five years, from 1850 to 1854 inclusive. There were 22 vessels also in ballast, in which no direction of the wind was ascertained, making 117 light vessels altogether; and 66 vessels, laden and light together, in which no direction of the wind was ascertained. This is from an important state document, on which one can safely rely. If we take the total wrecks on the seaboard of the north-east coast, without deducting the wrecks at Blyth, Warkworth, Filey, and Redcar, with the wind from south by east and south-east, there were 142 wrecks; with the wind from the north-east, north-north-east, and north by east, there were 119 wrecks; 62, however, of the 119 occurred in and round the Tyne; so that a harbour of refuge to the south would not have protected these 62 ships, which were wrecked in the north-east gales. This shows that if a harbour were made, as suggested, to the southward, it would only meet the wants of a portion of the wrecks; and here is a proof that there are 62 vessels seeking for proper shelter in the Tyne in gales from the north-east. If south-east gales are to be provided for—and they must be provided for—and if you provide for the wrecks to the northward, you must add 142 east-south-east wrecked ships to the 62 wrecked in north-east gales, which make upwards of 202 vessels which would be provided for by a harbour of refuge here to the north, leaving just 57 vessels to provide for by a harbour of refuge to the south, or little more than one quarter. If the claims of humanity are to be the great consideration, which I understand from the members

NORTH SHIELDS.

Mr. James Mather.

14 Oct. 1858.

Capt. Washington.

of the Court it is intended to be, here is an opportunity to respect them. It is all very well speculating upon one part of the coast, and placing a ship here and a ship there, with a certain wind. Here are facts, with the hand of Providence pointing where harbours of refuge should be made. I really regret occupying the time of the Commissioners so long, but there are more important facts. I have taken up a considerable time, but I now come to the figures of Mr. Taylor, which are of great value, and which I shall have the pleasure of offering to you. I know that he has given the closest attention to the subject, and that his figures are results chiefly drawn from the Admiralty returns. Mine are for five years, his are for three years. The number of vessels stranded, according to Mr. Taylor, was 140 in ballast, and 133 in cargo, making together 273.

13,836–7. (*Capt. Sulivan.*) Where was that ?—On the north-east coast, including Warkworth, Blyth, the Tyne, Sunderland, Seaham, Hartlepool, and the Tees, but excluding Whitby, as outside the local limits. Mr. Taylor states that along that coast in three years there foundered at sea three ships in ballast and 22 ships with cargo, making a total of 25. There were stranded after collisione one vssel in ballast and two with cargo ; total three. There foundered after collision two in ballast and 10 with cargo ; total 12. Here are the winds and wrecks in the three years. They give a total of 102 wrecks with the wind from north to east ; 135 wrecks with the wind from south to east; giving a preponderance, as I have shown before, to the south-east gales. There were 21 wrecks with the wind from north to west, and 15 wrecks with the wind from south to west, making a total, as above, of 273 wrecks. There foundered six vessels with the wind north to east, two with the wind south to east, six with the wind north to west, 11 with the wind south to west, making a total of 25. He has separated the vessels which foundered after collision from those which have stranded after collision; and he gives, as stranded after collision, one with the wind north to east, one with the wind south-east, one with the wind north-west, none with the wind south to west ; total three. Foundered after collision, one with the wind north to east, two with the wind south-east, none with the wind north-west, nine with the wind south-west ; total 12. The average I need not give, I suppose. Here is a fact showing that strangers are as likely to want shelter as vessels belonging to these ports. The vessels trading to and belonging to the ports, which were wrecked in 1852, were 88 ; in 1853, 55; in 1854, 159 ; total 302, making an average of 100 $\frac{2}{3}$ ships a year. The vessels wrecked not belonging to these ports were three in 1852, five in 1853, three in 1854 ; total 11. The vessels from the Tyne wrecked and stranded were 13 with cargo, with the wind north to east ; 16 with cargo, with the wind south to east ; eight with cargo, with the wind north to west ; four with cargo with the wind south to west. These were vessels from the Tyne. The vessels to the Tyne were 19 with the wind from north to east in ballast, and seven with cargo, total 26 ; with the wind south to east in ballast 18, with cargo nine, total 27 ; with the wind north to west, in ballast two, with cargo three, total five ; with the wind south to west in ballast one, with cargo three, total four. This is the last table, summing up the whole of his results. I need not trouble you with it, and will merely refer to a portion.

13,838. (*Chairman.*) It rests with yourself. We are here to listen to what you have to say. It rests entirely with yourself.—The number of light vessels stranded is nearly equal to the whole of the wrecked and stranded vessels shown in table No. 1. Table No. 2 shows the number of vessels foundered at sea, and the laden exceed the light vessels. The casualties from collisions in the light vessels are about five per cent. of the whole. That is in the third table. The fourth table shows a greater number of wrecked and stranded vessels with the wind south to east than with the wind north to east. The proportion is 135 with the wind south to east, and 102 with the wind north to east. 57 light vessels were wrecked with the wind north to east, and 72 with the wind south to east ; 45 laden vessels with the wind north to east, and 63 with the wind south to east. The fifth result shows the great number of vessels which have foundered in the same direction westward. The sixth result shows that the casualties are almost all confined to vessels trading to ports in the bay, the passing vessels being only three per cent. on the whole, while, as regards the Tyne in particular, only one not belonging to the port was wrecked at the harbour; she was a timber ship bound from Stettin to Dundee. There was also a vessel going from Hartlepool to a foreign port which was wrecked here, and which is not stated in the Admiralty report. The seventh result shows that the number of vessels wrecked at the mouth of the harbour, or to the north, was 34 out of 43, equal to 79 per cent. as compared with the vessels wrecked to the southward of the Tyne. This paper is signed Tom John Taylor.

13,839. Is your statement finished ?—It is quite finished.

13,840. Do I understand you to say that you draw the conclusion that a harbour of refuge to the south would be comparatively of no service, because the greatest number of wrecks occurred in north-east winds ?— I have misstated it then. I intended to state that, comparatively speaking, it would be of little service, because vessels in east-south-east and south-east winds must be provided for by a harbour here, northward ; and out of the north-east wrecks, as the greater number had been wrecked at the harbour, it is clear that even in east-north-east and north-east winds they will find their way here. Had there been a harbour here, there would have been only 67 vessels to be provided for to the southward, and altogether, had we had a harbour here, there might have been saved upwards of 200 vessels out of those which were wrecked here during the five years specified.

13,841. Have you at any period of your life been at sea ? Have you any nautical experience ? — None whatever.

13,842. Have you been in communication with seafaring men upon this subject to any considerable extent ?—To a considerable extent, because the Shipowners' Society have done me the honour to send me as one of their representatives. I have also presented to the Commissioners a petition from the seafaring men.

13,843. Were these seafaring people masters and mates of vessels employed in trade ?—A portion, a small portion, the chief being seamen.

13,844. Was there any wish on the part of the seamen in question to tender evidence personally to the Commissioners ?—There are two or three parties present who are deputed by the mates and captains, and they are prepared to give you evidence of their opinion.

13,845. Then I understand you to say that the body of seafaring men who presented that memorial through you will be entirely satisfied if we hear these two or three witnesses ?—I believe so, entirely.

13,846. Will you supply a list of these witnesses ? —I will do so.

13,847. (*Mr. Lindsay.*) Summing up all that you have said in these returns, which are interesting and valuable—looking at these returns, at what point of the coast between Flamborough Head and the Farn Islands would the construction of a harbour of refuge tend most to save life and property ? Having regard to these wrecks and these returns, at what point of the coast, if any one harbour is to be made, would it be best to construct it ?—Looking at these returns, and answering as well as I can your question, which has rather an engineering question mixed up with it——

13,848. I am not speaking of it as an engineering question. I don't want you to consider whether the site which you give will be suitable in an engineering point of view for a harbour, but I want you to say at what point of the coast between these two headlands would a harbour tend most to save life and property ?

—Looking at the returns I should say either here or at the Wear. Heaven forbid that a solitary one should be constructed ; but a harbour here would have done more to have preserved all those ships and lives which have been lost than in any other place.

13,849. You stated that a considerable decrease of trade has taken place at Hartlepool during the last twelve months ?—There has.

13,850. Is that coasting or foreign trade ?—It is the general trade inwards and outwards to the extent of 69,500 tons.

13,851. Are you or are you not competent to say what is the cause of it ?—Does it arise from the fact that the coals shipped at Hartlepool are not considered equal to those which are shipped in the Tyne ; or does it arise from the fact that ships come more regularly to the Tyne than to Hartlepool ?—I think the chief cause is that vessels find greater conveniences for trade here in the Tyne and the Wear than they do to the southward ; and, if I may go so far as to anticipate the future, I should say that the preparation of the magnificent docks now going on at the Tyne, which will hold 500 or 600 vessels, will empty the harbours to the southward as soon as those docks are laid open to the trade. We shall be able to load an enormous number of vessels—I believe 200 vessels a tide—in those docks ; and they will, on leaving the docks, be always ready for sea. This line of railway, terminating at the docks, gives complete communication with the coal fields of Durham, Lady Londonderry's mines, Earl Durham's, and other large properties, where the finest coal is to be obtained. Therefore I think the statement which I have given is merely a foreshadowing of that which is to come.

13,852. You have told us of a great fact—that the trade of Hartlepool has decreased during the last year. Is it because there is better dock accommodation or more conveniences for shipping, or greater facilities for shipping, by entering the Tyne or the Wear ?—It is so. That is the chief reason.

13,853. You said something about the Board of Trade. Did I understand you to say that you have no faith in the accuracy of the Board of Trade return ?—No ; I said it was not a complete return.

13,854. Do I understand you to say then, that this return, which shows that there are 382 laden vessels lost for every 62 of colliers lost in ballast, is not correct ?—I did not deny the accuracy, but I merely meant to say that the circumstances of those cases are not stated.

13,855. But to state all the circumstances of all those wrecks would make a very voluminous document, would it not ?—The agents of the Admiralty did it for five years very efficiently.

13,856. You do not doubt the accuracy of the statement in these returns that the proportion of laden to light vessels lost is as five to one ?—I neither doubt the accuracy nor the contrary. I should like to see the data on which the Board of Trade has given this return. It is so contrary to what I have seen as the facts for five years previously that I cannot accept any such statement without its being demonstrated.

13,857. Can you tell us, of your own knowledge, whether it is right or wrong ?—I do not know, of my own knowledge, that it is right.

13,858. But do you know that it is wrong ?—It is so contrary to the facts which have gone before that I doubt it.

13,859. Can you tell me whether the proportion of laden vessels lost in the five years previous was far fewer than the proportion of light vessels ?—Much fewer in proportion.

13,860. You say they were much fewer in proportion ?—Yes ; the proportion was 151 laden to 117 light. It was not five to one.

13,861. During what years ? — During the five years preceding the time when the Board of Trade took up the returns.

13,862. Therefore you arrive at the natural conclusion that there is something you cannot understand, when you see the proportion of laden and light vessels which are lost instead of being about the same, is, since the time the Board of Trade took up these returns, five to one ?—The difference is so great that I cannot comprehend their data for arriving at such a conclusion.

13,863. But are you aware of the fact that when the Admiralty kept these returns, and gave the proportion of these losses, they were absolutely correct ? —They did not give the proportion. I gave it. I did not make them responsible for my return ; I make them responsible only for the data of my return. In the Admiralty returns each ship is stated, and I gave you returns drawn from their report.

13,864. What strikes you as very remarkable is that the proportion of laden to light ships lost should be five to one, when they were in about equal proportions before ?—That is so.

13,865. You cannot account for it ?—No.

13,866. You are not a sailor, but for many years you have taken great interest, much to your credit, in the cause of the poor sailors. Speaking as you have done, no doubt, to the sailors belonging both to the Wear, the Tees, and the Tyne, can you tell us whether it is the general opinion or not of these men that if a harbour of refuge could be constructed at the Tyne it would do more to save their lives than at any point of the coast between Flamborough Head and the Farn Islands ?—If you refer to the memorial it will give you the best possible proof of what their opinions are.

13,867. I do not look for a formal answer, but from the conversations which you have had with them have you gathered it to be the general feeling among these men that there ought to be a harbour here for the saving of their lives ?—The question has only been before them a very little. I have had means of communicating with them, and from what I have heard from ships' captains and others, North Sea pilots, and men capable of forming a sound judgment—the men, in fact, for whom a harbour would be made—I think they are all of opinion that the three ports should be improved. Much as I value the interests of the Tyne, and much as I think it ought to be improved, I think the same thing should be done for the more southerly ports like the Tees and the Wear, so as to render all these harbours perfectly accessible, or as accessible as possible, at all times of tide.

13,868. Is that their opinion also ?—To make them, as far as possible, accessible at all times of tide, is their view.

13,869. (*Capt. Washington.*) We may presume that the very valuable statistics which you have laid before the Commissioners are correct ; but you are aware probably that the Board of Trade have much more perfect machinery for ascertaining the causes of wreck that the Admiralty had ?—From the results I am not aware of that.

13,870. Such is the fact. When the returns were collected by the Admiralty eight years ago, they had no power, or they did not choose to exercise the power, over the receivers of droits upon the coast; they had no perfect machinery to ascertain the numbers and causes of wrecks. The best that could be done was done, but when they handed it over to the Board of Trade, the Board of Trade had much better means of obtaining accurate information. Therefore there is great reason to suppose that the latter return will be more accurate than the previous one. Probably that is one of the causes of the discrepancies to which you allude. I think you make a comparison between the trade of the Tyne and the trade of Hartlepool. May I ask you whether you included the Tees in the trade of Hartlepool, or whether you confined the returns simply to the shipping of Hartlepool?—In the one place I included the Tees; in the other place it was excluded.

13,871. When you mentioned the falling off of trade, did you include all the nine shipping places of the Tyne and compare them with the two of Hartlepool? —I did.

13,872. Do you think it was just to exclude the

NORTH SHIELDS.

Mr. James Mather.

14 Oct. 1858.

Capt. Washington.

whole trade of the Tees in the comparison?—In one other place you will find it stated. In giving the comparison in another place as to the coals, culm, and timber, which form the staple trade, I included the Tees there.

13,873. Besides Newcastle and North and South Shields, there are some six or seven other important shipping places in the Tyne?—There is Blyth.

13,874. I mean within the Tyne?—The most important shipping place is South Shields.

13,875. Is the Tyne Main coal shipped at South Shields?—Yes.

13,876. But in the Northumberland dock, that is not shipped at North or South Shields?—But I should think it is nearly on an equality with South Shields.

13,877. I wish to understand the comparison which you have made. Is it between the nine shipping places of the Tyne and the two of Hartlepool, or the whole of the Tees?—I gave the whole of the river Tees, which is recorded passing through the customs there.

13,878. You included Stockton and Middlesborough?—Yes; I included Stockton and Middlesborough for the Tees.

13,879. And as to the falling off of which you spoke at Hartlepool, was the Tees included?—No; that was entirely Hartlepool. As Hartlepool has been made a perminent feature in this question—I hope I do not err in saying that—I dealt with Hartlepool independently, in order to show its condition.

13,880. If by that observation as to Hartlepool being a prominent feature you allude to the Commissioners, I may tell you that I am not aware that Hartlepool has been treated in any way except accidentally as one of the sites for a harbour of refuge on this coast. You spoke of a decrease of shipping amounting to 69,000 tons?—That is confined to Hartlepool, and has nothing to do with the Tees. In 1853 it had 87,000 tons; and in 1857 it had 748,000 tons.

13,881. I only wish to have it quite clear. As you have handed in Mr. Taylor's figures, perhaps you will express to him the feeling of the Commissioners, that they set great value on his labours.—Providing they are correct, they are very important indeed.

13,882. (*Capt. Sulivan.*) I think your complaint is, that the details of each wreck are not published by the Board of Trade?—I incidentally named that the returns of the Board of Trade were not as full as those of the Admiralty.

13,883. Be kind enough, without going into any statement, to tell me whether you did not complain that there were not ample details of each wreck now published?—I implied it, but I did not complain.

13,884. You are aware probably of these three or four pages of abstract of all the wrecks, particularly of every class, whether steam or sail, whether laden or in ballast, and the cargoes of all. Now, for the general public, irrespective of any special inquiry and any special purpose, anxious as we are to get the details of each wreck, do not you consider an abstract sufficient?—I think not.

13,885. You are aware that it would make a very large publication to give the whole details of 1,140 wrecks?—I have no doubt of it.

13,886. And that great expenditure would attend such a publication?—The expense would be justifiably incurred.

13,887. You are aware that the expense comes out of the Mercantile Marine Fund?—I know it does to a large degree.

13,888. Do you know that the particulars can be obtained for any special purpose, and, knowing that, do you think it would warrant the outlay to publish all the details in addition to the abstract, merely upon the chance that one might now and then be wanted, when they could be obtained by those who wanted them?—I do not know what use they can be in their present form, except for a Commission of this kind. They do not meet the case of nautical men, who, if approaching a difficult coast, will examine the wreck register to see the dangers ahead, the effects of prevalent winds, and all that he must seek to shun. I presume it would be of great assistance to nautical men to know wherever the most serious danger arises.

13,889. Then, do you think that, if published, vessels in general, and colliers particularly, would have a wreck register on board?—No one had the Board of Trade report the other day. I had to hunt it out.

13,890. Then, if they will not have a short report, do you believe they would have a long one?—Yes; if it were useful. They will not have a small one if it is useless.

13,891. When the returns were published more in detail, do you think that the vessels were supplied with them for assistance and guidance?—I know I saw them more frequently.

13,892. You are aware that the table refers to the whole wrecks of the kingdom?—So I understand.

13,893. And that the proportion of colliers, laden and light, which are lost refers to the whole wrecks of the kingdom?—Yes.

13,894. Have you seen the return of the last two years prior to this?—Yes.

13,895. Did you notice that two years ago only one fourth of the vessels lost were light, and that during the last year they have increased to five to one and six to one. Now, if two years ago they were only four to one and are now five to one, is it not probable that if you go still further back you will find a still smaller proportion?—We do go further back. The only returns we have analysed are those of the Admiralty.

13,896. If you found that during the last three years the proportion of laden and light colliers which have been lost has increased from four to one to five to one and six to one, would you not infer that previous to that period there was a still smaller proportion, and therefore might not those returns coincide more nearly than you at first imagined?—Allow me to state that four to one is an enormous disproportion in comparison to the previous documents. I must take them upon your authority, but I cannot comprehend them.

13,897. Have you remarked upon the proportion of vessels not colliers? Take the general vessels; there are 623 laden ships of all kinds, and only 138 in ballast, lost, exclusive of colliers, giving a proportion of six to one. Would not that confirm the idea that there was an equal proportion of losses among the colliers?—I am obliged to take this as a government return, but I should prefer infinitely the detail being given of the circumstances of each loss instead of a mere dry statement of the losses. It is still my conviction that in this form they are of no benefit at all.

13,898. Did you feel it was important to have these returns for the purpose of this special inquiry? Would you have found them very valuable?—Perhaps you will allow me to state——

13,899. Be kind enough to answer the question.—No, distinctly then, not for this purpose.

13,900. Then, if the previous returns by the Admiralty enable you to give such valuable information, would not an analysis of the returns of the Board of Trade have been equally valuable?—Infinitely more valuable; but we could not wish them especially for this inquiry.

13,901. But as they would have been more valuable, did you think of asking the Board of Trade to give you the return specially for this purpose?—I certainly found, and I stated so, that after the Admiralty returns terminated, I could not proceed. I wrote to the Admiralty, asking for the details of the later returns, and I was answered that they did not now publish these returns and that I must apply elsewhere.

13,902. Did you apply elsewhere? Did you apply to the Board of Trade?—I would if I had thought they would have given me the returns in detail.

13,903. Then perhaps you will be glad to know that the details have been prepared by the Board of

Trade for the inquiry on this part of this coast?—I am glad to hear it.

13,904. You gave a large number of vessels wrecked at the mouth of the Tyne. Does not the Tyne give the deepest water, and is there not more chance of safety at the Tyne than at the other colliery ports?—It is so.

13,905. If there were a good harbour accessible at all times at Hartlepool, do you believe that they would run for the Tyne, especially in north-east winds, with the risk of entering the bar at the time? Would not those vessels have made for Hartlepool?—I do not think they would. I think nothing would induce them.

13,906. (*Capt. Vetch.*) Captain Washington has anticipated me in one point. You gave a comparative statement of the trade between the Wear and Hartlepool; did you include the trade of the Tees?—In one place I included it.

13,907. Do you not think it would make your statement more complete if you included it in every case?—I should be very glad to include it, but it is but a small item—some 200,000 tons.

13,908. Are these ports, such as Seaham, included?—Seaham is included with Sunderland, and Blyth with the Tyne.

13,909. (*Mr. Coode.*) You have given a return of some wrecks in the southern district; was the river Tees excluded because of its being beyond the local limits?—In another place I gave Redcar, I went further southward as far as Filey.

13,910. Did you not set aside the Tees?—No, Mr. Taylor stated that his return ceased at Whitby.

13,911. And your return ended there?—My return included Filey, and within a certain range of the Tees.

13,912. Did you go as far as Flamborough Head?—No.

13,913. Have you read the report of the Select Committee of the House of Commons?—I attended the Committee.

13,914. Are you aware that the Committee considered that between Flamborough Head and the Tyne, the greater number of wrecks occurred?—This return does not go so far south, nor is it very material it should.

13,915. Have you a copy of the wreck chart for the five years ending in 1857, which was published by the Select Committee?—I have not. (*A copy of the chart was placed in the hands of the witness.*)

13,916. Will you be kind enough to look at the number of wrecks between Flamborough Head and Redcar, and tell me whether they do or do not exceed a dozen?—With the collisions and others they do considerably; I am sure I included Filey at one time.

13,917. Did you say that you stopped at Redcar?—No, I think I did not say that.

13,918. Tell me where your returns do terminate? Is Filey included?—Some portion of the returns were restricted partly to the locality of the rivers.

13,919. Will you be kind enough to state the limits embraced by your returns?—I shall have pleasure in doing so.

13,920. (*Sir F. Smith.*) In the results which you have been so kind as to give us there is a sort of analysis of the return. Under the head of No. 2, I find "Foundered at Sea," and of that number the laden vessels exceed greatly the light vessels. What do you mean by "Foundered at Sea"? Do you mean considerably beyond the limits of the coast?—Considerably beyond the limits of the coast, I cannot specify the distance. It may be from a few miles to 20 miles off.

13,921. Would a harbour of refuge influence that return very much?—I cannot say that those ships which foundered from westerly gales would fetch a harbour. In such a case the wind would be dead off the land, and they could scarcely come in under any circumstances.

13,922. You do state that these ships foundered in westerly winds, and therefore such vessels could not have taken a harbour of refuge here?—That is so.

13,923. (*Capt. Sulivan.*) Will you explain why vessels founder more with the wind off shore than with the wind from the south-east?—They get off into the full effects of the sea. I am not a sailor, but I know that.

13,924. As you have included the neighbouring ports as interested in a harbour of refuge at the Tyne, do you not think it would have been fair to have included all the Tees ports as equally interested in the harbour of refuge at Hartlepool?—I do not understand your question.

13,925. As you have included the neighbouring ports to show the increase of the trade of the Tyne, and as you have given the decrease of the trade of Hartlepool, do you not think it would have been equally fair to have included the Tees in making a comparison with Hartlepool?—I have already accepted a hint to include that.

13,926. You say that you will include it, but do you not think it would have been fair to have done so at first?—It has nothing to do with fairness at all. I take the ports as they stand. I give the ports of the Tyne, the Wear, and Hartlepool, and it was not for me to break down the official arrangements, and prevent my being able to certify them by including the Tees, and putting it with Hartlepool. I can give them separately. It is something less than 4,000 or 5,000 tons. It will not bear upon the question at all.

13,927. You gave a small increase in one of your returns for Hartlepool; did you give there the increase or decrease of the Tees trade?—I shall be glad to do so. There was a great decrease of a million and a half at one time. It has increased lately. I believe it was stated here yesterday that the Admiralty would give their authority to the River Tyne Commissioners to carry the piers out further, and as one of the River Tyne Commissioners I am extremely glad to hear it.

13,928. (*Chairman.*) That is not at all relevant to the present inquiry. You must recollect that this is a Royal Commission, and that we are perfectly independent of every department of Government. We have nothing to do with the Admiralty, the Treasury, or the Home Office; therefore you must apply to the Admiralty in a proper way?—I was anxious to know whether the piers would go on or not.

Mr. Philip John Messent examined.

13,929. (*Chairman.*) In the absence of Mr. Walker, the chief engineer, I must ask you just to make a short statement as to what has been done in the river Tyne in the way of harbour improvements, for the information of myself and others?—What I have to state will have more reference to the piers at the mouth of the Tyne than to what has been done in the Tyne up the river. These are the only works with which I am acquainted.

13,930. Precisely, and not the others?—The works were commenced in 1854, and I think you have seen a plan of them. A contract was made with Mr. Laughton, the amount of which, as you are already aware, was 166,000*l.*, and of that contract about half of the works contained in it—rather under than over half—have been completed. The north pier will be 1,400 feet, the south pier 2,500 feet. On the north side about 700 feet have been completed, and on the south side 1,700 feet, and the total value of the whole amounts to nearly half the contract or more, taking into consideration that the contractor has been obliged to expend a large sum before he could get on with the works. The value of the work done is quite half of the contract. The time for the completion of the contract is May 1861, and with fair weather or average weather, such as we have had up to the present time, there is every reasonable chance of the contract being completed by the period specified.

13,931. Will you tell me the object with which the work has been undertaken, and what has been the

NORTH SHIELDS.

Mr. P. J. Messent.

14 Oct. 1858.

Chairman.

result ?—To extend the entrance of the harbour into deep water, and to deepen the present bar ; but that is all explained in the original report to Mr. Walker, which probably you have before you.

13,932. And so far as the works have been conducted are you able to form any opinion whether the result desired is likely to be attained ?—As far as they have gone the result has been satisfactory, but at present they are not nearly far enough advanced to form a very certain opinion upon the improvement. The improvement on the bar at present is no doubt partially the result of the works.

13,933. (*Mr. Lindsay.*) One question only ; the question which I want to ask is one in which as a sailor I am interested. Have you sounded the bar, and did you sound it to know the depth of water before you commenced to carry out the piers ?—I did.

13,934. And have you sounded it recently ?—Not very recently. I have confined my attention to the works of the piers. The improvement of the river navigation is in charge of other engineers. The harbour master takes periodical soundings, and I do not interfere with his duty.

13,935. From what you have seen has the effect been to deepen the water on the bar or otherwise ?—From what I have seen and heard the bar at present is deeper than is shown by the figures on the plan before you.

13,936. (*Capt. Washington.*) You do not mention when the works were begun ?—They were begun in 1854 ; perhaps a little before.

13,937. Can they, if you are so disposed, be pushed forward much more rapidly ?—A little more rapidly.

13,938. A little more rapidly. But in case it was desired by the River Tyne Commissioners to push them forward much more rapidly, could not that be done ?—By extraordinary exertions it could.

13,939. Is the south pier under your direction ?—It is.

13,940. Is there a staging on the outer pier ?—It is not a staging ; it is a large travelling crane, the object being to set the facing stones. The south pier is a core.

13,941. Rubble work ?—Faced with a heavy kind of pitching.

13,942. My only object is to know if the works could be forwarded in case of need ?—Yes.

13,943. (*Capt. Vetch.*) When did you say the works were commenced ?—In 1854.

13,944. Do you remember when the Act was passed ?—It was the end of the year 1855, when the works were commenced.

13,945. To what amount is the present contract ?—166,000*l.*

13,946. And how much of that has been expended ?—Between 70,000*l.* and 80,000*l.*

13,947. What is about the monthly cost of the work ?—It varies ; in the summer it is of course much higher than at other times.

13,948. Taking the present month, what is it ?—Some months are very small ; the highest monthly expenditure has been 6,000*l.*

13,949. And the works, as far as they have gone, have stood the weather very well ?—Exceedingly well.

13,950. You are quite confident that the sandstone employed in the structure of the north pier will stand ?—Quite confident, it is freestone. The lower portion of the north pier is made of limestone magnesian ; it is only the lower portion which is exposed to friction.

13,951. Where do you get the magnesian limestone?—From Hartlepool.

13,952. From the Heugh rock ?—Yes.

13,953. Is there an abundant supply ?—At present we have an abundant supply.

13,954. When do you think the works will be completed to the extremity now shown in the plan ?—Do you mean the contract ?

13,955. The piers altogether. Within what period, if funds are amply provided, can these piers be finished ?—If it is decided at once to proceed with the full scheme I think the whole might be completed two years after the completion of the present contract.

13,956. And when will that contract be completed ?—In May 1861, by the contractor's agreement.

13,957. Then the whole would not be completed until 1863 ?—That is the whole scheme, but if the present contract were hurried it might be done sooner. I say two years from the completion of the present contract.

13,958. But if it were pushed on to the greatest possible extent, within what period would the whole work be completed ?—A year earlier than that.

13,959. Within what period would it be completed from the present date ?—Do you mean the whole scheme ?

13,960. Yes.—I do not think you could calculate on shortening it more than I have already stated—by a year.

13,961. Does that mean that the works would be finished in 1861 ?—No, in 1862 instead of 1863, and that would require extraordinary exertions to do it.

Mr. George Shotten examined.

Mr. G. Shotten.

13,962. (*Chairman.*) Are you resident in Shields ?—I am.

13,963. How long were you at sea ?—Nearly 40 years.

13,964. And during that period for how many years were you in command of vessels ?—About 30 years.

13,965. And in what trade were the vessels which you commanded chiefly employed ?—They have been very generally employed in short voyages—not exactly in the coal trade, as a collier, except during my apprenticeship. The rest of the time I have been going to the Baltic, the Mediterranean and America, and I was for a considerable time a regular trader to Bordeaux from London, and elsewhere.

13,966. What was the size of the vessels which you generally commanded ?—Mostly small vessels ; in fact, all sizes, from 500 tons.

13,967. Have you often come home from the Baltic in the fall of the year ?—I was not much in the Baltic trade.

13,968. How did your mostly make you passage after leaving the Naze of Norway or the Scaw ?—It would depend partly where I was bound to.

13,969. I am supposing that you were bound to Tynemouth ?—I suppose we should keep reaching on the larboard tack so as to fetch the land as far as we could to the southward—as near the port as possible.

13,970. And how far north have you ever made the land ?—Once, as far as Dundee.

13,971. Generally how far north ?—It is an exception if you go farther north than that, but some do get as far as Moray Firth.

13,972. Have you made the passage north-about through the Pentland Firth ?—Yes.

13,973. You have heard the evidence given this morning ?—I have.

13,974. And as to the advantage and necessity of a harbour of refuge at Wick, give me your opinion ?—I am not well acquainted with the Moray Firth.

13,975. The Pentland Firth I am talking of ?—I know the Pentland Firth very well ; I thought you meant the Moray Firth.

13,976. You heard the evidence given this morning about the advantage and necessity of a harbour of refuge at Wick for ships passing north about. Will you give me your opinion on that subject ?—As I said before, I am not acquainted with the Moray Firth ; Wick I do not know at all.

13,977. But did you ever see or know of any difficulty in going through the Pentland Firth? Has it never occurred to you to run through with heavy weather to the southward?—I have.

13,978. And do you recollect under what circumstances you did it, with the weather or a lee tide?—Excepting once, I have gone with a lee tide, because I should heave to if the tide were going to windward until the tide changed. There is no difficulty in keeping to windward until the tide has slackened. With all her yards to the mast a ship will keep to windward if she does not get into the tide.

13,979. Is your knowlege of vessels employed in the coasting trade so great as to enable you to assert that under a closed-reef main-topsail you could bring a ship to the wind with safety and watch for the tide to run through the Pentland Firth?—It is generally understood, when you can no longer scud, that you should do what you can for the safety of the ship. But a ship is safer lying to than scudding.

13,980. Will that apply to a deeply-laden ship?—Under any circumstances, no matter what. A ship scudding has got to be afraid of being pooped, and rather than run the risk she will take the sea to the bow and heave to.

13,981. Am I to understand that a deeply-laden ship under those circumstances will bow the sea well when hove to?—Generally it is so.

13,982. Is it generally so?—The coasting vessels are shorter built than the foreign-going trade, and the shorter the vessel the better she lies to.

13,983. And therefore any man well acquainted with the difficulty of running through the Pentland Firth—the strong weather tide of eight or nine knots—can, generally speaking, heave to and wait for the tide?—Nine times out of ten you can shorten sail without the necessity of heaving to; but if it comes to the worst you can heave to.

13,984. Now give me you opinion as to the advantage or necessity of Peterhead as a harbour of refuge for the trade from the north, from Archangel and the Baltic?—As Mr. Greenhow has said, I think I agree with him. Peterhead is a nice place to call at or put in at wind-bound, but I do not think there is any necessity for a harbour there for saving life.

13,985. Well, then as there is no necessity as respects the saving of life, I will call your attention to the question or series of questions which I put to him with reference to the length of the passage sometimes made by the ships from the Baltic in the worst season of the year. Are you disposed to concur with him on that point, that it would be a great boon to the Baltic and Archangel trade to have a harbour there?—I quite agree with him in that. Ships are very often much thrashed. Their sails are split, their provisions run short, their people exhausted, and if there is a place they can get conveniently into it is a very great benefit to them.

13,986. Now, view the question as respects damage to the cargo which ships experience in knocking about in bad weather?—Naturally if a ship has been knocking about, if the cargo is grain, it is a great chance that part of it may get wet.

13,987. Would Peterhead be a convenient place of call for the Archangel trade?—The most convenient place that I know of.

13,988. Have you run for the Firth of Forth in bad weather?—I have.

13,989. Have you run to Long Hope?—Not to Long Hope, but to Grangemouth.

13,990. Do you consider the facility of access such as to render it a harbour of refuge in gales from the eastward?—I think it is, and it has been much improved by the lighthouse at St. Abb's Head and at the Bass Rock. It is a most extraordinary thing that there was no light there before. Two fine ships were lost there in Dunbar Bay. They did not see the May light; they saw the light on the shore, and they ran in one alongside the other. That was about 45 years ago.

13,991. I am to understand that you consider the Firth of Forth perfectly easy of access at night in bad weather?—If you make those lights.

13,992. And ships in bad weather can run up as high as Long Hope?—I cannot say so high as Long Hope in the night-time; but I consider Leith Roads a perfectly good roadstead for ships with good anchors and cables.

13,993. (*Sir F. Smith.*) Have you much experience of the east coast?—I have.

13,994. You have navigated it often?—Yes.

13,995. In colliers?—Not directly in colliers, though I served my apprenticeship to one. I was very much in the habit of going to the Baltic and to Bordeaux, and of leading out with the colliers.

13,996. The trade has much extended since your apprenticeship, I suppose?—It has, indeed. I went to sea in 1801; you will be able therefore to judge by that.

13,997. Do you think that any one harbour of refuge placed anywhere would be sufficient for the trade of this coast?—I do not think so.

13,998. You think the trade so extensive and the demand for accommodation so great, that to construct one harbour in any one place would be insufficient?—I think so.

13,999. Do you think two would be sufficient?—I think they might, but three would be better.

14,000. Supposing that the national funds could not afford to construct three harbours, which two spots would you select for the two harbours?—I think I would rather that the three harbours which we have—the three harbours so frequently named, the Tyne, the Wear, and the Tees—were improved. If those three places were assisted it would answer better than making any one harbour of refuge, no matter where it might be.

14,001. Is it a feeling among shipmasters and the seafaring class generally, that it is discreditable to run to a port to which they do not belong if they can get to their own port any how? Do the ships belonging to the Tyne and the Wear go to the Tyne and the Wear and risk a good deal in doing so?—Decidedly. The men are paid for the voyage, and as soon as they get the voyage over they are done. This makes them anxious to get it over as soon as possible, and they often run great risk in order to terminate the voyage, many times when a prudent man would have run in.

14,002. Would not that feeling induce them to keep to sea rather than go into port?—But I was speaking of a ship going into her own port.

14,003. Supposing a ship were beaten back, would she not make great efforts to keep at sea?—But in a heavy gale you are sure to lose more ground when you cannot carry sail.

14,004. Is not that a reason why there should be more than one harbour of refuge?—It is not only that, but if it was at their own port they would make efforts to get to it. They frequently put in here even when laden; they come back laden and run the risk of striking the bar, which they do very often.

14,005. Let us suppose that the Tyne was improved and that there was a harbour of refuge at Hartlepool, and that vessels as far to the southward as Flamborough Head are caught and driven back, do you think they would pass a good harbour at Hartlepool and come on to the Tyne?—I think they would.

14,006. They would give the preference to their own port, and run by a port of safety in order to come to their own port?—It might turn out that 30 miles further might be an advantage, because if a wind goes round to north-east instead of south-east, which it frequently does, they cannot come out of Hartlepool, as they can out of the Tyne, because the Tyne is much more to windward.

14,007. Supposing we divided the bay into two portions, without reference to the Tyne or any particular locality, would you, for the purpose of safety, place a harbour of refuge to the north or the south of that divisional line?—I would certainly place it to the north, in consequence of the greater number of

NORTH SHIELDS.

Mr. G. Shotten.

14 Oct. 1858.

Sir. F. Smith.

ships which sail in and out. Wherever there is the greater number of ships, I would place the harbour as near as possible.

14,008. Taking the prevailing winds, should the harbour be to windward or leeward ?—As far as this bay goes it does not make much difference. There is not much difference with the coast down from Redcar.

14,009. You know Redcar ?—I do.

14,010. Do you think Redcar offers facilities for a harbour of refuge ?—I think it does.

14,011. Do you think ships would go there ?—It would be an advantage, but there is one thing, that if there were a harbour there it would not be frequented so much as here, where the ships load their cargoes.

14,012. Then, all things considered, you prefer to put the harbours where the trade is ?—Yes.

14,013. For many reasons ?—For almost every reason.

14,014. Do you think it desirable to place harbours in the bights of bays, or upon salient or prominent points ?—That depends upon circumstances, upon the centre point and the lands. As an old sailor I will say that no sailor likes to run down upon a lee shore to be embayed, particularly if the land happens to be low, because in a gale of wind it is never easy to make sure of your distance by two miles or so, and if you happen to miss it you are upon the shore before you can do anything with your ship ; whereas if you run for bold land, such as Tynemouth Castle, it is better to make out than anything on the coast.

14,015. Is the high land distant from the shore at Hartlepool ?—Yes.

14,016. And that is a disadvantage ?—Yes.

14,017. Therefore, for mariners making the coast the land is better at Flamborough Head than Hartlepool Bay ?—I think it would be better.

14,018. You know Bridlington and Filey?—Yes.

14,019. Which of those two would you select for a harbour of refuge ?—Filey.

14,020. Why?—Because in Bridlington Bay there is a very large extensive place, and a first-rate roadstead at present, while Filey Bay is good for nothing, because it is not safe. But if Filey were made safe we should have the advantage of Filey, and not lose that of Bridlington.

14,021. So, whichever way the wind blew, you would have the advantage of both places ?—Besides that, when a fleet of colliers or ships from the Baltic are caught about Flamborough Head, it would be very convenient to have such a place as Filey instead of running all the way back to the Tyne or the Tees.

14,022. Would a vessel come out easily from Filey? —If a ship were bound to the south she would sail out perfectly free. It is perfectly free to go out.

14,023. You are not aware of any disadvantage in the Harbour of Filey?—I am not aware of any.

14,024. What is the amount of acreage which each vessel would require ?—It depends on the description of the harbour. If there is no tide in the harbour, very much less scope is required. At such a place as Filey, ships would always lie head to wind, and they would require less space than lying at Yarmouth or Hartlepool, where the tide naturally goes through, and ships swing with the tide ; whereas in a place like Filey there is no tide and not half the scope is required.

14,025. Would four acres to a ship be enough ?—In Filey four acres would be enough ; whereas in the other places eight would scarcely suffice.

14,026. If a breakwater were to be constructed in Hartlepool Bay, would you construct it from the shore or with an opening at each end ?—There would not be space unless it was extended a long way out. A place like that is very shallow from the shore, and a ship drawing 16 feet of water requires about four fathoms to ride in, and that would be a good bit from the shore at Hartlepool.

14,027. Do you know anything of the Sunderland trade ?—At present Sunderland has got a most excellent dock, and that is almost as much as can be said for it.

14,028. Do you know what draught of water is going over the bar at Sunderland at spring tides ?—Do you mean the docks or the harbour ?

14,029. Through the harbour ?—There must be very little at low water indeed.

14,030. Are there 10 feet ?—I should not think there would be half of that, or not more than half.

14,031. Do you know the Bristol Channel ?—A little.

14,032. Can you favour the Commissioners with any opinion as to the advantage of a harbour on the coast of Cornwall ?—I am not so well acquainted with the coast as to be able to give an opinion. I would rather decline.

14,033. (*Mr. Lindsay.*) Supposing that the Government should consider it necessary to have a harbour of refuge on the east coast of Scotland, and taking into consideration the trade from the ports in this neighbourhood and the trade from London to the Baltic ports, and also to Archangel, and also taking into consideration the trade which goes north about, at what point do you think that a harbour would tend most to save life and property, and offer the greatest facilities to commerce ?—Do you mean as a place to take shelter in ?

14,034. I want you to consider it for a moment as a place for the saving of life, the saving of property, and the convenience of commerce. Take your time, and taking all those circumstances into consideration, tell me at what point you think the harbour should be. Do you think the harbour would be better at Wick, at Fraserburgh, or at Peterhead ?—Well, really I do not know. I will give the preference, I think still, as I said before, to Peterhead.

14,035. All points considered ?—Yes, all points considered, taking the bad with the good.

14,036. Just carry your mind back to the time when you were at sea, and suppose you were in command of a ship going north about to Quebec, and supposing that you were caught with a strong south-east gale between Kinnaird's Head and Duncansby Head—do you know these points ?—Yes, well.

14,037. And supposing that a harbour of refuge were made at Wick, and the gale was such that you found it necessary to seek shelter, whether would you take the harbour, at Wick—I am speaking of a harbour so constructed that you could take it with safety—whether would you take that harbour at Wick or run through the Pentland Firth, and seek anchorage in Long Hope ?—Bound to the westward, do you mean ?

14,038. Supposing you were bound to America ?—Why, I would not take either of them.

14,039. But I am supposing it was necessary for you to take shelter ?—Then I would go to Long Hope.

14,040. Even if there were a harbour at Wick which you could take with every facility ?—Yes.

14,041. Supposing you were driven down on the coast from Archangel somewhere about the points I have named, and it was necessary to take a harbour of refuge, whether would you take Wick or Long Hope ? —If I could fetch it I would take Long Hope. It is a place to get out of at all times of the tide, when you cannot get out from the other.

14,042. How long have you retired from the sea ? —I can scarcely say that I am retired from the sea now. I am engaged in under-writing; I am a shipping master, and have been among ships all my life.

14,043. How long have you resided on shore ?—I think 18 or 19 years.

14,044. Supposing that the Government resolved to make the Tyne a harbour of refuge, can you tell me, of your own knowledge, whether it would be the means of saving life and property to any very large extent ?—I believe it would.

14,045. Do you recollect any instance within the last ten years where, if there had been such a harbour as that which has been pointed out by Mr. Cowan, life and property would have been saved to a considerable extent ?—Yes, I think I do.

14,046. Just state the case ?—I was not aware that

I should have such a question put to me until to-day, but I thought I would not trust my memory, so I have just put down on paper a few cases. There was the *Percy*. She went under the lighthouse. We fired rockets and got part of the crew on shore, but the rope failed, and the captain was drowned. Afterwards, when the ship was breaking up, the lifeboat by great exertions got the rest of the men out, but the captain was lost. There was a brig, belonging to South Shields. She was in a sinking state and breaking up at Cully Ports, wind east, and she had a signal of distress flying. We could not launch the boat, but it did so happen that, contrary to every one's expectation, the crew landed all right in their own boat. The vessel went down ten minutes after they left her. She would have been saved and the people would not have been put to that peril if there had been a harbour of refuge here. There was also the schooner, the *William Wallace*, belonging to Scotland. She went on shore on the Herd sands, and all hands were lost. There was a brig belonging to this place, the pilot and 12 hands were lost in her, when going out last year. There was a schooner came ashore close to the haven where the people were all drowned. Mr. Greenhow mentioned that case where the people were all lashed to the rigging, and everybody saw them, but could render them no assistance whatever. There was another schooner anchored off Souter Point. She let go both her anchors ; the crew took to the boat, and they were all drowned, but the vessel rode the gale out. These are cases which I can recollect without referring to papers.

14,047. What is the greatest number of vessels which you have seen ashore at any one time within the immediate neighbourhood of the Tyne ?—I should think 20.

14,048. At one time ?—I think there have been 20 at one time.

14,049. During an easterly gale ?—Yes.

14,050. And if there had been a harbour here would these ships have been able to come in ?—Yes, decidedly. One of the great causes why ships are wrecked while coming in is, that one approaches too near another and takes the wind out of her sails. A wave strikes her, which makes her lose steerage, and go ashore. If there were a harbour of refuge here, they would come in as they come down, but now they are obliged to wait for high water, which then they would not have to do. All are brought in in a body, and at the same time there are others going to sea. All are obliged to stop until there is high water, whereas if there were a harbour of refuge they would go out and come in at any time.

14,051. I want to ask you a question referring to this coast, of the same nature as I asked you with reference to the east coast of Scotland. Supposing that the Government should decide upon constructing only one harbour of refuge between Flamborough Head and the Farn Islands, at what point in your opinion ought that harbour to be constructed, bearing always in view, first, the saving of life, and secondly, the saving of property ?—I have no hesitation in saying that that would be the Tyne.

14,052. You have no hesitation in saying the Tyne? —Not at all. It would only require more accommodation for ships. If there were a dock at the low heights large vessels could lie there afloat.

14,053. That is to say, you think that if the Tyne were made into a harbour of refuge, and the piers extended, there ought to be a dock much closer to the entrance than any which now exists, so that ships might get into dock and get out of the way more readily?—I think, in fact, that is absolutely necessary. In the present day trade is increasing in such a way that we don't know what dock accommodation we shall require.

14,054. Can ships come out of the docks which now exist, and go to sea with the same tide ?—It is rarely done, but sometimes it is done.

14,055. Then, in your opinion, the site of a dock at the entrance would be of advantage, if we look only to the clearing of the river, because it would be in such a situation that ships could leave dock and proceed to sea in the same tide ?—I do think so, especially for large ships. I speak of ships drawing 17 and 18 feet of water. These ships could lie close to the bar if there were a dock, and could get out quite readily.

14,056. Supposing that it rested between Hartlepool and Filey Bay, bearing always in view that only one harbour was to be constructed, and looking only to the saving of life and property, and supposing that it rested with yourself to decide at which of those points you would spend the money, at which would you spend it ?—Bearing in mind also the improved state of the Tyne ?

14,057. No ; putting the Tyne altogether out of the question in the meantime, I want you to tell me which of these two places you would prefer. You have stated, and I hope it will be considered, especially what you have told me, that, in your opinion, a harbour of refuge at the Tyne, if any one harbour is to be constructed, would do more to save life and property than anywhere else. But supposing that the Government should arrive at a different conclusion, and it rested between Hartlepool and Filey Bay, tell me candidly as a sailor at which of those two points you think the construction of a harbour would do most to save life and property ?—If you will allow me to say just what I was about to say at the time, I should prefer Filey Bay. Bearing in mind that the Tyne is always improving and has improved, Filey Bay would be the place.

14,058. That is to say, in addition to the harbour constructed at the Tyne ?—I did not mean constructed by Government. I did not mean the harbour of the Tyne being made by Government.

14,059. No ; but suppose that you are constructing at the Tyne works which will admit ships of a much larger size than vessels which can now enter at low water, and supposing that harbour were constructed, then, taking that into consideration, you would give the preference to Filey Bay over Hartlepool ?—I would.

14,060. Supposing it should turn out that the expenditure of this 400,000*l.* does not increase the depth of water on the bar, and consequently does not afford greater facilities for ships entering the Tyne than now exist, or, in other words, supposing that the Tyne bar remains in its present state, will you tell me whether you consider the construction of a harbour, either at Filey Bay or at Hartlepool, would do most to save life and property ?—I would still say Filey.

14,061. Will you state your reasons for arriving at that conclusion ?—Because, if you make Hartlepool Bay a harbour of refuge it is so likely to fill up. It is a very sandy bay to begin with ; and to make a harbour, you must carry the breakwater outside the Heugh, and the sand which travels to the south would fall into the wide space and would soon fill up.

14,062. You and I are sailors, and it is no use our talking about engineering ?—I consider myself a sort of engineer.

14,063. It is a serious question we are considering. —And I think seriously about it, I assure you.

14,064. Excuse me for a moment. Supposing that as great facilities can be obtained at Hartlepool—for that is a question to be inquired into by engineers—supposing as much water can be obtained and kept at Hartlepool, and as large an acreage of deep water can be kept there, will you tell me then, under these circumstances which I have named, whether you would think a harbour at Hartlepool or at Filey Bay would do most to save life and property ?—It is a very difficult matter to judge, because there are so many contingencies. Things which are anticipated may not be realised ; and it is contrary to common sense to expect it to be so. But I think it is only a trial which can ascertain which will be the best.

14,065. You are not prepared, under such circumstances as these, to offer any decided opinion ?—I think, after all, I may answer the question upon the same

NORTH SHIELDS.

Mr. G. Shotten.

14 Oct. 1858.

Mr. Lindsay.

principle as that on which I gave an answer just now. I spoke just now as to Filey in preference to Bridlington, because Bridlington was already a good roadstead, and Filey is a bad harbour. We have already Hartlepool as a middling harbour, which the smaller class of ships, at any rate, can go into to wait until the weather moderates. Therefore we can have Hartlepool but not Filey; but if Filey were made, then Hartlepool would still be of use in the state in which it is at present.

14,066. Now one question more. Supposing that the Government, taking into consideration the great loss of life and property which takes place on this coast, and being desirous to alleviate the sufferings and the losses which take place, were to place in your hands a million of money to be expended, so as to alleviate these sufferings, and save those losses which now take place, as far as money can do it, where would you expend that million of money?—As I said in the beginning, I would spend it at three places—the Tyne, the Wear, and the Tees, or Hartlepool, as the case may be.

14,067. Would you or would you not use any portion of that million of money upon points farther south?—I do not know that we could go farther south, because Filey is a place which would require so very large a sum that the whole million would be swamped there or pretty nearly so, and there would be nothing left for the other places.

14,068. Well, then, supposing that sum were increased, would you, under such circumstances as those, consider it necessary for the safety of life and property to spend a portion southward of the Tees?—I would.

14,069. You would?—Yes, at Filey.

14,070. Would you spend it at Filey in preference to Redcar?—Redcar is a very nice point; it might be divided between them. Redcar is very close to Hartlepool, it is true, and it might not be necessary to have two so close together; but I think dividing the cost would be better than having only one at Filey. If a harbour were made at Redcar, then there would be no need to make one at Hartlepool.

14,071. Then the substance of your evidence is this—that if the sum were limited to a million, you would spend that million at the three points you have named?—Yes.

14,072. But if it extended beyond a million, and you had sufficient money, you would expend a portion of it to the south of the Tees Bay, and that point would be Filey Bay?—Yes.

14,073. You say that is your opinion?—That is my opinion.

14,074. (*Capt. Washington.*) From the last answer you gave, do you keep in consideration the saving of life?—Yes.

14,075. And you understand that that is the great object of a refuge harbour?—Yes.

14,076. Do you know Robin Hood's Bay?—I do.

14,077. And North Sunderland, close to the Farn Islands?—I do.

14,078. Supposing a line were drawn from one to the other, it would include the whole of the coal ports, would it not?—It would.

14,079. From those ports within such a line there are a great many vessels sailing and returning?—Yes, a great many.

14,080. What is the worst wind which blows on this part of the coast, which makes it most difficult to get off shore?—From east to east-south-east.

14,081. And not to the northward of east?—No; not to the northward of east—it is worse weather; but we have not so much difficulty in getting off shore as when the wind is east or southward of east.

14,081 *a*. Supposing the wind east-south-east, could vessels sailing within that line weather the north of Robin Hood's Bay?—They seldom go to sea with the wind that way unless it is fine weather.

14,082. They would sail with a north-east wind?—Yes, or an east-north-east wind.

14,083. Not an east-north-east wind?—A north-east wind.

14,084. But the wind east by north is the most embaying wind, is it not?—Then they would not go to sea; it blows right into the harbour.

14,085. But with an east-north-east wind they would?—If it were blowing hard they could not get out.

14,086. I thought you said they would sail with an east-north-east wind?—If it did not blow hard.

14,087. Suppose it were moderate weather?—Then they would go to sea any way.

14,088. Supposing a ship should sail, and the wind should come to east-south-east, could she weather the north of Robin Hood's Bay?—No.

14,089. What would she do?—Put back to a harbour of refuge. If there was not water to go into the Tyne, she would go into the Forth.

14,090. Do a large number of vessels go out and get caught in that way?—It is not a great many; it is not every one that will venture out with the wind scant.

14,091. Could any of these vessels reach Filey Bay?—Do you mean with the wind east by north?

14,092. With the wind east-south-east or east by north?—No, they could not.

14,093. Then would a harbour here be of any use to them?—No, it would not; but very often a large fleet is caught about Flamborough Head. They want shelter, and they would be very glad to have such a place as Filey Bay.

14,094. It would be a great convenience to them, they would not have to run back?—Yes.

14,095. What would vessels do caught with the wind east by north?—There would be nothing for them but to run ashore, or to get Scarborough Pier, and there is very little choice between the two. There would be very little chance, because there is very little sand; all the rest is rock.

14,096. Would Filey Bay be a good stopping place?—It would indeed.

14,097. But would they come into a harbour of refuge there?—In such a case, when they cannot fetch round on the larboard tack with a gale of wind, they have nothing but to put their heads to the north and go ashore at Scarborough.

14,098. Why could they not run to the north?—A deeply-laden ship, under close-reef maintopsails, with the sea washing over her, will make very little way, I assure you.

14,099. Do all vessels come close to Flamborough Head?—All steer for Flamborough Head, because it is a very fine bold line.

14,100. What is the distance to Flamborough Head?—70 miles.

14,101. And Filey would be 10 miles to the north?—Somewhere thereabout.

14,102. Then there would be 60 miles of coast unprovided for?—Not by the Government, except by the harbours at present.

14,103. Do you think we must either improve or create?—Yes, or make a harbour in the bight.

14,104. You think we should improve the harbour at the bottom of the bay?—Yes.

14,105. And your reason is because in the bay is where vessels are caught?—It is so, but I have a great objection to running for a low coast; I like high land.

14,106. Is not the entrance to the Tyne some way in a bay?—No, it does not deserve the name.

14,107. As compared with Flamborough Head and North Sunderland?—It is a very wide reach.

14,108. You spoke so strongly of Filey Bay, I wish you to assign a reason?—If there is any other explanation I shall be most happy to give it. As I have already said, we have other harbours, such as they are; and if further money is to be expended on them it will only improve them; whereas Filey Bay, as at present, is useless.

14,109. Do you think that the Tyne is being improved by the piers being carried out?—Yes.

14,110. And that some depth of water is gained?—I have reason to believe that there are two feet more

water over the bar. I have seen a vessel coming in and out with large boulder stones of two or three tons weight, which they have taken up during this summer, and I saw a wreck taken up close upon the bar. It was the bottom of a ship, and with all that taken away the sea sand has been scoured out.

14,111. And that is the great object of the Tyne Improvement Commissioners?—It is.

14,112. And the Admiralty have sanctioned that principle?—As far as I know they have. I have no doubt, that if they only go on next year as they have during the last year, double the amount of gain will be made.

14,113. Do you think the works could go on a little faster?—I would like to see them go much faster.

14,114. You mentioned the case of lives being saved by the life-boats; is there a good supply of life-boats?—Yes, I am glad you have named it, because I think we are better supplied with life-boats and life-boat men that any other port in the kingdom, or in the world. We have four very fine life-boats, and the best men in the world to man them.

14,115. Do you mean the Tyne pilots?—Yes, they are never wanted. It is more difficult keeping them out of the boats than getting them in, whereas very often men have been drowned in ships which have been wrecked very close to us in the south.

14,116. That is not the case in the Tyne?—That is one reason why so few men are lost in the neighbourhood of the Tyne, by having such good boats for getting the crews out.

14,117. I am very glad to hear of such a state of things?—And another reason is, that the ships lost are generally light ships, which do not become total wrecks. They hold out some little time, while a laden ship goes to pieces directly.

14,118. (*Capt. Sulivan.*) You have said you would recommend Peterhead as a harbour of refuge, combined with the advantage of a place for ships calling?—Yes.

14,119. Tell me under what circumstances a vessel could be off Peterhead or Buchan Ness, so as to go on shore, if she had not a harbour to run for?—It is the best place.

14,120. Tell me under what circumstances a ship can be so caught off Buchan Ness, with what wind can she be caught, that she cannot now save herself from going on shore? Just look at the chart?—It is not necessary, because I know the coast so well. As I said before, when I answered, I think it was a question of Mr. Lindsay's, I do not say much for it for saving of life, but as a place of refuge for ships to go in which have been out a long time, and are short of provisions—have sails split and their crews exhausted—it would be a capital thing for that perhaps; but as to saving of life, I do not think there is any necessity for it.

14,121. In laying out a large sum of money, do you think that the whole should be laid out where life and property are in danger, or that a portion should be laid out there and a portion laid out for the convenience of vessels stopping?—I think there is a great deal of reason for laying out money on places for stopping, because for want of such a place, ships are often in danger of being wrecked. For instance, supposing a ship coming from Archangel, she passes 10 or 20 miles off a harbour, but if she had been coming to the land she might have anchored close to the land. She might drive, it is true, but that is not a thing to be anticipated.

14,122. Have you ever known such instances?—I have known them.

14,123. Then you think an outlay would be justifiable by the possibility of such a thing occurring?—No, I will not say that.

14,124. You spoke of wrecks at the mouth of the harbour; had the works been completed to the present plan, and 15 feet obtained, do you think that many wrecks would have been saved?—I should think nine out of ten would have been saved.

14,125. Do you consider it very important that those who recommend the outlay of the public money and have the responsibility for its application to harbours of refuge, should be particular in advising that it should be laid out where there is no human probability of the money being wasted by the harbour silting up?—I think it very necessary to be very careful upon that point.

14,126. Can you yourself feel at all certain that the harbours you have mentioned would, after a large outlay, give that depth of water necessary for ships to enter at all times of tide?—I cannot so well answer for Sunderland. I do not know how far they are prepared to make a harbour of refuge there, but certainly, their harbour might be improved, and I dare say the Tees Bay or Redcar could be improved very much, particularly Hartlepool, without laying out a great deal of money there.

14,127. Do you mean by constructing an outer harbour at Hartlepool, or by making the channel deeper up to the present harbour?—I am not sufficiently acquainted with Hartlepool to give an engineering opinion.

14,128. You said just now, that from the depth of water, you know that a breakwater to enclose ships of some size must be carried a long way out?—Certainly.

14,129. Do you know whether there has been a decrease of water there for the last few years?—I cannot answer that question.

14,130. You said that men were glad to run for their own ports, because, being hired by the voyage, they wanted to complete the voyage as soon as possible, that remark would apply to light vessels?—It would.

14,131. Would not laden vessels make an endeavour to get shelter on the voyage, rather than put back, for the same reason?—I think they would, if it was a safe anchorage, and it would also depend on the distance they might have to come back.

14,132. You said that vessels caught in certain winds between Redcar and Flamborough Head would have to beach at Scarborough?—Yes, and also north of Whitby too.

14,133. Is that an ordinary thing in a bad wind from east-north-east?—There is scarcely a winter that the like does not occur.

14,134. And those are vessels which would not be able to fetch back to Hartlepool, or fetch round Flamborough Head?—When their canvass is blown away, or they are leaky.

14,135. Do you confine that remark to laden vessels?—Yes.

14,136. Do light vessels run on the beach to save life?—They do.

14,137. Would a harbour at Filey save all those ships?—I do not say all.

14,138. But a large proportion of them?—Yes.

14,139. The large mass of vessels which have left the Tyne and are proceeding south, if caught in the same way in east-south-east or east gales, would they not also, if there were a harbour at Hartlepool, prefer bearing up for that, notwithstanding the low land, rather than risk going on the starboard tack, and reaching back to the Tyne?—If they have a fair chance of reaching the Tyne they would do it; because, as I said, the wind from the east generally backs to north-east, and they can fetch round Flamborough Head when they cannot get out of other ports.

14,140. (*Capt. Vetch.*) I think you said you knew the coast from Cromarty up the Pentland Firth?—I have been along it; I have not been in any of the ports.

14,141. Are you aware of any natural port besides Wick?—There are two or three small ports.

14,142. How small are they?—I cannot speak as to that.

14,143. You would not take your vessel in there?—I understand there are places where a great many fishing boats go in during the herring season.

14,144. Do you know Wick?—Only sailing past to Duncansby.

NORTH SHIELDS.

Mr. G. Shotten.

14 Oct. 1858.

Capt. Vetch.

14,145. It is an open creek; there are between 200 and 300 vessels sometimes in it, and there are 1,500 boats fishing off it. Supposing a north-east gale to come on, what must become of them?—I know it is an iron-bound coast, but it is a nice bold coast.

14,146. Knowing the coast to the extent which you do, and knowing that there is no refuge at hand, do you not think that they require a harbour there, where the fishing boats and vessels are congregated? —For that trade I think it would be a great advantage, that the natural harbour should be improved, but as to the question which I was asked before, as to vessels going to the Baltic or the Pentland Firth, it is a place I should not think about.

14,147. I am referring only to the local necessities for saving these boats and the lives of the fishermen? —I think it would be a great benefit for that.

14,148. (*Capt. Sulivan.*) In addition to what Captain Vetch has said, if you knew that the trade of Wick was exposed by having to anchor in that open creek exposed to easterly gales, and that that trade was double the amount of tonnage, besides three times the number of fishing boats than there is at any other Scotch port, would you then say whether you think the outlay of public money to save life and property should be at Wick or Peterhead?—Wick, decidedly. I said, as to saving of life, I did not name Peterhead; Peterhead is a place to put into, but Wick for the saving of life, decidedly.

14,149. (*Mr. Lindsay.*) Taking into consideration the saving of life and the number of lives exposed in those fishing boats, you say Wick?—Yes.

14,150. Leaving them out of consideration, and taking into consideration the passing trade and the saving of life and property, which would you say, Wick, Fraserburgh, or Peterhead?—Peterhead. When you talk of the fishermen it is another question.

Mr. William Wake examined.

Mr. William Wake.

14,151. (*Chairman.*) You are harbour-master at the Tyne?—Yes, harbour master of the Tyne.

14,152. How long have you been connected with the port in that capacity?—I have been harbour-master of the Tyne for 12 years.

14,153. And previous to that, were you at sea?— Yes; I served my apprenticeship to the sea, and commanded a ship for 22 years.

14,154. In what trade were the ships employed which you commanded generally?—The general trade, not much in the coasting trade.

14,155. And to what parts of the world did they trade?—To various parts; a great deal to the Mediterranean, North America, the Baltic and West Indies.

14,156. You have been present during the course of this inquiry?—I have.

14,157. Give me your opinion as to the advantage or necessity of Wick as a harbour of refuge for ships going north about?—I never was in Wick; I have been off Peterhead; as far as regards the saving of life, I think Wick a very desirable place to make a harbour of refuge. I have seen an immense number of fishermen who, in heavy gales, are placed in a very perilous situation.

14,158. Viewing the question merely as respects the passing trade, give me your opinion as to the advantage of Wick, not for the fishermen, but for vessels going through the Pentland Firth?—I think, if they were bound north about, they would endeavour to get to the Orkneys and Longhope, if possible.

14,159. From the evidence you have heard given, and the questions you have heard asked relative to the Pentland Firth, I dare say you will be aware of the difficulties of navigating it which exist, or are supposed to exist, from the strong tide running through it, and vessels being forced in against this tide. Knowing they have to meet this weather tide, will you tell me, from your knowledge of the coasting trade, are they vessels which generally can heave to in time?—They generally heave to, and haul to the eastward, and endeavour to get to Longhope.

14,160. You heard from the last witness that he was employed in the coasting trade, and that the vessels in that trade run as long as they can, and then heave to as a safer thing to do; is that your opinion? —It is.

14,161. Therefore, I am to understand that a man running for the Pentland Firth has no difficulty in rounding to in time, and waiting for the lee tide?— Quite so.

14,162. There is no difficulty?—None at all. I have done it frequently.

14,163. You have heard the evidence as to Peterhead, what is your opinion as to the advantage or necessity of Peterhead as a harbour of refuge for the Baltic or Archangel trade?—I do not see the great necessity for it, because the distance is short and you can either get to one firth or the other, northwards or southwards.

14,164. Therefore, you are disposed to say the coast is provided sufficiently with natural harbours of refuge? —I never was in Peterhead.

14,165. With reference to your answer that the firths are both open, do you think there are sufficient harbours of refuge for the wants of that coast?—I do, as far as the saving of life, they can take the one firth or the other.

14,166. Have you run up the Firth of Forth in heavy weather?—Not since my apprenticeship; never since I was master of a ship.

14,167. Coming further south, respecting a harbour of refuge, what is your opinion?—With respect to what harbour?

14,168. I mean from Berwick to the Humber?—I think to improve the harbours in existence is better than to have only one harbour.

14,169. And do you concur in the opinion that no one harbour can be constructed for any practicable sum which would be sufficiently large for the wants of the trade?—I am afraid not. I think it could not be.

14,170. Do you consider Hartlepool difficult to make in thick weather blowing from the eastward?— I have been very little at Hartlepool.

14,171. What is the heaviest weather on this part of the coast?—Generally east-south-east and south-east.

14,172. How do your gales commence, with what kind of weather?—They begin foggy, with the wind south, and often to the east.

14,173. Does the wind go to the southward, and back round to east-south-east?—Yes.

14,174. With rain and thick weather?—Yes, and back round again.

14,175. Do your south-west winds go to the north-west and north, and break?—Very often.

14,176. Would you say, that that was generally the case?—Yes.

14,177. Does the south-east back round to north-east, and blow very hard, does that ever happen? —Very seldom.

14,178. (*Sir F. Smith.*) You are harbour-master here?—I am.

14,179. Are you aware whether the works conducted by Mr. Walker have had any effect in lowering the bar?—There is a considerable improvement in the depth of water on the bar. Whether it is owing to the extenston of the piers or the removal of the stones on the nine-foot bar, I cannot say. There has been a great deal of improvement in that part through the Narrows down to the bar, particularly in the present year.

14,180. Do you know the amount of alteration?— Do you mean the quantity of material taken up?

14,181. No, the depth to which the bar has been lowered?—2½ feet.

14,182. Can you speak to 2½ feet from your own soundings?—From my own soundings.

14,183. Are they recent?—About a month ago I sounded the bar and found eight feet at low water.

14,184. When had you previously sounded?—I get a return from the pilots every month, and I frequently sound myself.

14,185. Is it a regular progression, or does it go by fits and starts?—No, the bar has improved during the last six months.

14,186. To any extent?—In 1849 the *Lady Faversham*, drawing 4½ feet, touched on the bar.

14,187. All that you require to make the Tyne a desirable harbour is to deepen the bar?—The distance between the nine-foot bar and the bar might be deepened at the same time.

14,188. What is the extent of accommodation in the harbour?—There is a good deal of room for shipping. We have 362 ships moored on the north side of the river here. We have had 512 ships moored in South Shields; at Wall's End 163; from Wall's End to Newcastle 414. That was on the 3rd of January 1857.

14,189. Was the whole amount of that shipping in the Tyne at that time?—Yes, on the 3rd of January 1857.

14,190. What is the total?—Making 1,250 ships in all. We have one dock open now and another will be open early in the ensuing year, which we calculate will hold 800 more.

14,191. Are you able as harbour-master to say whether the trade of the Tyne has increased very much?—So much so, that only in the month of September 819 vessels arrived in the River Tyne from foreign ports.

14,192. Have you at any time observed a number of ships in the offing waiting for a rise of tide to come in here for refuge?—I have frequently.

14,193. What is the greatest number?—From 50 to 100 sail sometimes.

14,194. Waiting off the port to come in?—Yes.

14,195. And do collisions occur on these occasions?—I have never seen many collisions.

14,196. Do you know the coast south from here?—No, I have passed, but I know very little about it. I commanded a ship belonging to the Tyne, and I never had her here for ten years.

14,197. (*Mr. Lindsay.*) As harbour-master, what are your limits? Have you charge of all ships which come into the Tyne?—As far as Bell Point, between five and six miles up the river.

14,198. Are all the ships bound to either side below that point under you charge?—Yes.

14,199. Is it your duty to give directions how these vessels shall moor?—Yes.

14,200. Supposing that a harbour were constructed so as to admit vessels at all times of tide, that is, if the pier were carried out to five or six fathoms at low water—and large ships run for this harbour in distress in strong south-east gales, how would you deal with them?—There is room now to bring vessels up drawing 18 and 19 feet, and with the facility of steam tugs we should soon have them placed at their moorings.

14,201. Do you think there would be much chance of damage to ships running in in heavy gales of wind?—There might be, but very little of that.

14,202. There is not much damage now from ships running in?—Very little indeed.

14,203. What is the greatest number of ships which you have known to leave the Tyne at any one tide?—330. When the *Hecate* was here two officers were stationed in her to count, and they counted that number. That is the greatest number I have ever known.

14,204. What is the greatest number which you have known to come in?—I think I have known 300.

14,205. Do you keep any return of the wrecks which take place upon the bar or in the immediate neighbourhood of the Tyne?—I have not entered in my journal the number of ships which have got ashore.

14,206. Have many been ashore during the 12 years that you have been here?—A great many.

14,207. In your opinion, what proportion of those ships would have been saved if a harbour had been constructed such as I have named?—I think, most might have been saved if the piers had been extended. There are such facilities with steamboats, and they are very active. We always keep one close to the weather pier, so that if a ship gets any way disabled a steamboat is sure to grapple her, bring her into smooth water, and place her at her moorings.

14,208. Have many lives been lost?—Not so many as we might expect, because of the great exertions of the life-boats.

14,209. How was the wind when the greatest number of vessels went ashore—south of east or north of east?—More go on the hard sand with the wind north of east. They go on the rocks with the wind south of east.

14,210. Is south of east a much more dangerous wind for life?—Yes.

14,211. As it has been your duty to get returns, and as I am glad to know you have paid great attention to the subject, I wish to ask you as a practical man who has watched the progress of the bar, do you think that if the piers were extended to five fathoms or 30 feet at low water, that that depth of water would be maintained?—I think it would, because we have a cross tide to keep the piers clear, and there is so much dredging as well, that we should be sure to keep the openings.

14,212. You think then if the piers were carried to the crest of the tide, where the tide runs along the coast, the effect would be to scour away the sediment brought down to that point?—I think so.

14,213. To scour away and scatter it?—I think so.

14,214. Then do you think that the water would be maintained at somewhere about five fathoms?—It might silt up, but I do not think it would silt up very fast.

14,215. And that for the reason named, the effect of the sea tide?—Yes.

14,216. (*Capt. Washington.*) You stated that you had great accommodation at the Northumberland Dock. Do you know recently what draught of water can go into it?—Ships have gone to sea from the docks drawing 18 feet of water.

14,217. At high water and spring tide?—Yes.

14,218. And from the Jarrow Docks?—I expect the same depth at the Jarrow Docks. We have not completed the dredging at the entrance, but we are in a fair way to do so.

14,219. Will that dock accommodation be sufficient?—No, from the increase of the trade we must increase the dock accommodation.

14,220. Where will be the best position for a new dock?—I think at Coble Dean. I have always had that opinion. If the piers were carried out a fine dock could be made at the Low Lights.

14,221. There was a proposal for a dock at the Low Lights?—There was.

14,222. Which should take vessels of a larger draught of water?—It would depend on where the entrance was made.

14,223. The object would be to take into that dock the larger class of vessels—as large as could pass the bar?—As large as could pass the bar. In fact, it would be of very little use to place a dock there for the small ships.

14,224. You stated that the foreign trade and the size of the ships are increasing?—They do, very much.

14,225. It is only limited by the depth of water over the bar?—In a great measure.

14,226. If there were deeper water over the bar, the ships would increase?—I have no doubt that large American ships, which we should have had here, did not come from London in consequence of that.

14,227. And if the depth of water on the bar which is supposed could be obtained, you have no doubt

NORTH SHIELDS.

Mr. William Wake.

14 Oct. 1858.

Capt. Washington.

that the Low Light docks would be carried out ?—I think they would when the piers were extended.

14,228. Would the extension of the piers cause those works to be carried out with greater facility, with less risk, and at less expense ?—A great deal.

14,229. (*Capt. Sulivan.*) You said that there had been an extra depth on the bar, but you did not feel certain whether it arose from the piers or the removal of the stones by dredging, I think ?—By dredging. At the same time we have taken up a very large quantity of boulders—one of five tons weight. We had to slip the drdger from her moorings, and drop it on the land. We could not get it into the barge.

14,230. Have those boulders been removed from the bar ?—They have.

14,231. Where you have now increased water ?—We have taken up in addition the bottom of a ship with 35 feet length of keel, and, strange to say, an anchor on the top. When the wreck was placed on the Spanish battery it stood a foot and a half high.

14,232. Were those wrecks where the shallowest water was found on the bar ?—No, inside it.

14,233. Is the nine-foot bar still further inside ?—Considerably.

14,234. Has the nine-foot bar been deepened by dredging ?—In fact there are three feet difference on the stones as compared with the depth before we commenced the dredging.

14,235. Has the deepening of the nine-foot bar and the removal of the wrecks tended to keep the current in the channel and so throw more strength on the outer bar ?—No doubt.

14,236. Might that account for the extra depth of water on the bar ?—Yes.

14,237. Might that have occurred if no piers had been built, if you had removed the same material from the channel ?—It might, but one thing is the effect of the sand on the south side—the sand forming the morticing line. We have dredged a portion on the Black Scarf, and we have taken that off, which I think is a great improvement to the channel too.

14,238. Would that dredging have assisted to deepen the channel if no piers had been built ?—It would.

14,239. Has sand accumulated ?—The bar inside has. It has increased considerably too at the south side of the pier.

14,240. Has it very much accumulated outside ?—Very much.

14,241. Does the sand travel round the corner ?—I have seen sand coming round the pier end.

14,242. When the pier is extended to the extent now proposed, is it probable that the sand will fill up ?—Perhaps time will do that, but it will be a very long time first.

14,243. You say it is increasing at the pier ?—The inner pier.

14,244. Is it also increasing towards the part which is finished—towards the end ?—It is not very far out from the end.

14,245. If in the course of years the sand accumulates outside until it reaches the south pier, will not the effect be that it will meet the sand coming out of the harbour, and the two will be stopped at the entrance ?—That is more an engineer's question than a sailor's question, but it will be a long time first. The south pier must be carried beyond the bar line.

14,246. Would the sand continue to accumulate at the back of the pier, however far out it was carried ?—It might.

14,247. If it did not accumulate outwards would it not go over the pier into the inner harbour ?—I think not.

14,248. If it did not come over and the sand was accumulating, must it not be spreading outwards towards the pier head ?—It might spread out.

14,249. You said that from 50 to 100 vessels have been waiting outside for the tide at one time ?—More than that.

14,250. Do you think that under ordinary circumstances any harbour of refuge made south would ever require to take more vessels in a single gale than now often come into the Tyne under similar circumstances in a single tide ?—It might happen from different circumstances, from the many ports and the immense number of ships. There is a large fleet from Sunderland and Hartlepool which is gathered together previous to a gale coming on.

14,251. (*Capt. Vetch.*) When did the deepening of the nine-foot bar first take place ?—We have been dredging off it about two years.

14,252. What is the present depth ?—Eight feet on the stones. That is on the nine-foot bar. Over the stones there is from eight to 14 feet.

14,253. Well, how much was there on the stones ?—Only five feet before we commenced dredging, where there is now eight feet.

14,254. Whereabouts are those large boulders found ?—Just inside the bar, with the lights nearly in one.

14,255. A considerable distance from the nine-foot bar ?—Yes.

14,256. And I think you gave it as your opinion that the deepening out of the nine-foot bar in some degree unburied the wreck and the boulders ?—I think it had an effect on the tide in making the tide run truer.

14,257. You rather attribute the deepening of the bar to that effect than to the piers ?—One combining with the other perhaps.

14,258. Both combined have tended, in your opinion, to lower the bar two feet ?—Two feet—in fact more than two feet. During one year we had not five feet on the bar all the year round.

14,259. Taking these piers as they now exist, and so far as they are carried, do they serve to save lives out of vessels coming on the sand ?—There has been no instance of that.

14,260. Should such a case occur, do the piers give a greater shelter and a greater chance of getting the crews out ?—The piers make the bar smoother, I think much smoother.

14,261. (*Mr. Coode.*) When did your dredging operations cease on the nine-foot bar ?—About two years ago we commenced working.

14,262. Are you working on the nine-foot bar up to the present time ?—Yes, until last week ; we were working there from May until last week.

14,263. Have you any reason to think that the bar will grow up again ?—Not from the stones, as big as a person's head, and the shingle which we took out.

14,264. There is no deposit of sand ?—There is no sand, or very little indeed.

14,265. You spoke of having taken soundings,—did you refer them to a fixed point ?—Of course I have a point for soundings.

14,266. You have a standard to which all your soundings are referred ?—Yes, certainly.

14,267. The increase of depth has extended over some years ?—Yes.

14,268. For how many years has the depth been increasing ?—For the last three or four years ; certainly for the last three.

14,269. How long since were the piers commenced ?—About that time.

14,270. Did you notice any increase prior to the commencement of the piers ?—A little.

14,271. Has the increase been gradual and regular ?—For the last year more than the previous.

14,272. What has been the increase during the last twelve months ?—2½ feet ; 1½ feet on the stones.

14,273. Do you not think that to have an efficient harbour of refuge it should be available by night as well as by day ?—Yes.

14,274. You spoke of the necessity of steam tugs to get vessels into the anchorage. How would you deal with a vessel in a gale of wind on a dark night ? Would you still attempt to take her to a safe anchorage by steam tugs ?—Certainly.

14,275. Then you would rely on that just as much as on a good anchorage ?—Yes ; there is little fear

NORTH SHIELDS.

Mr. William Wake.

14 Oct. 1858.

but that ships will get into a good berth if a steamer gets hold of them.

14,276. Will you have no difficulty on a dark night and during thick weather ?—Never any difficulty but that I think we should always overcome it.

14,277. (*Chairman.*) I think you talked of a considerable number of vessels waiting off the port for a tide to run in ?—I have seen them frequently.

14,278. How many have you seen ?—From 50 to 100.

14,279. That happens in heavy, blowing weather ?—Yes.

14,280. Do vessels on such an occasion stand backwards and forwards under close-reefed topsails, or do they heave to ?—They keep an offing until the tide suits them.

14,281. With deeply-laden colliers have you ever known them to suffer damage from the sea breaking on board ?—Yes I have.

14,282. Considerable damage ?—No, knocking away a stern boat of a dark night.

14,283. Have you ever known a vessel lie to under storm sails which could not carry close-reefed topsails ?—No, I never saw that.

14,284. And therefore I am to understand that these deeply-laden colliers can haul to the wind with close-reefed topsails in a heavy sea without suffering damage from the sea breaking on board. They bow the sea well ?—There have been instances of damage.

14,285. They do not get into the trough of the sea and suffer from the sea breaking on board of them ?—Very seldom.

14,286. And when these vessels run into port, though not actually in the breakers, are they often pooped ?—Very often.

14,287. Do you mean in the harbour's mouth ?—Outside the bar I have seen the sea break into a ship.

14,288. Does that happen frequently ?—Frequently.

14,289. (*Mr. Lindsay.*) You speak of a bar. I understand the bar to be a sort of hillock. Is it a hillock or part of a long flat ?—It is a rising of sand with deeper water inside and outside.

14,290. And is there deeper water to the southward and northward also ?—Yes, there is.

14,291. Then, in fact, it is an accumulation at the entrance of the harbour?—It is a good width across it.

14,292. What is the extent ?—About 400 feet, east and west.

14,293. How far does it run north and south ?—About 700 feet.

14,294. (*Capt. Washington.*) Can you, without much trouble, mark upon the plan where the stones were dredged up ? Can you mark where the five-ton stone and the wreck you spoke of were taken up, because we have quite understood hitherto that they were on the bar ?—Yes ; all the large stones were taken from the place that I have marked as near as possible, and the wreck too. I have marked them on chart 1,934.

14,295. Then it was not the shore part of the bar ?—No.

14,296. Nor directly in the track of navigation ?—Yes.

14,297. Was it not rather on the south side of it ?—Rather ; it was just off the Spanish battery.

14,298. Has much benefit arisen from the use of the dredger in the Tyne ?—From dredging, a great deal.

14,299. It has been rather a recent practice to dredge in the Tyne, has it not ?—We have increased the use of the dredger.

14,300. How many have you ?—We have three.

14,301. Are they constantly employed ?—Yes. The Jarrow Dock Company have one now at the entrance of the Jarrow Dock.

14,302. How much can they lift in a day ?—We can take 2,000 tons, but that is a very great day's work.

14,303. How much horse-power—20 ?—More than that, but the dredgers are not in my department ; I have nothing to do with them.

14,304. They have never been applied to the nine-foot bar except at the stones ?—They move them about considerably, both east and west, north and south.

14,305. Do you know the breadth of the nine-foot bar between the deep water ?—It is a great deal.

14,306. Is there a deeper channel over there ?—A great deal deeper.

14,307. How much ?—There are 13 or 15 feet of water.

14,308. From that part ?—From that part.

14,309. Do you think it likely there are any wrecks or stones on the main bar ?—It is possible, but we have not ascertained any except what we have grappled with. The diver has been over and we know of none.

14,310. It appears to be a simple deposit of sand ?—In fact borings were taken, and Mr. Brooks reported that it was sand down to 18 feet.

14,311. (*Mr. Coode.*) Have you a copy of the result of Mr. Brooks' borings which you could put in ?—I have not.

14,312. (*Chairman.*) Supposing Mr. Walker's plan for the extension of the piers and the additional dock accommodation which you expect to have, carried out, can you furnish us with a chart showing the area in the river which would be strictly available for refuge purposes ?—Oh yes.

14,313. You can supply us with a chart at your convenience, with the refuge part marked in it ?—Yes.

14,314. Will you also put down the area in acres ?—Yes.

Mr. Robert Tully examined.

Mr. R. Tully.

14,315. (*Chairman.*) You are a pilot for the Tyne ?—I am.

14,316. How long have you been connected with the port in that capacity ?—Do you mean how long as a pilot ?

14,317. Yes, how long as a pilot ?—For 50 years and upwards.

14,318. Are you aware of Mr. Walker's proposed plan for the improvement of this harbour, so as to make it a harbour of refuge ; have you seen the plan ?—No, I have not.

Mr. Wake recalled.

Mr. William Wake.

14,319. (*Chairman.*) Did you understand the questions which were put to you to apply to the present channel, or to Mr. Walker's proposed plan ?—I understood to the inside of the harbour only.

Mr. Tully's examination continued.

Mr. R. Tully.

14,320. (*Chairman.*) Look at the chart before you, do you see the piers ?—Yes, I see them.

14,321. Do vessels running in with a heavy wind experience great danger from the sea breaking right across, the entrance of the river ?—Yes, it breaks right across.

14,322. Do you suppose that the facility of getting into the harbour would be improved by the piers which you see there ?—Of course it would be very much improved indeed.

14,323. Is the weather so bad that pilots cannot get on board ships coming in ?—That is very often the case.

14,324. And you have a strong sea running, which

NORTH SHIELDS.

Mr. R. Tully.

14 Oct. 1858.

Chairman.

breaks across the harbour ?—Yes, so that in thick weather you cannot see the sands and must not run in.

14,325. Do you speak of vessels being afraid to run in ?—If there is an easy sea they can come in with high water in safety ; but I have known occasions when the sea has been very high indeed, when they could not come in.

14,326. But, as I understand, in such weather the tugs cannot get out ?—It must blow very heavy indeed to prevent tugs getting out.

14,327. If a boat can live at sea, they can get out ?—If you can lower a boat down to put a pilot on board a ship they can get over the bars.

14,328. Is it a practice for tugs to get hold of ships before running in ?—It is so, with scant winds ; in fair winds they want no tugs.

14,329. In fair winds they never take a tug then ?—Sometimes they do, but it is only to put them in tiers.

14,330. To put them in their berths, not to prevent the risk of running in ?—Yes, that is it.

14,331. (*Mr. Lindsay.*) Do you know Hartlepool and Sunderland ?—Yes, I know the coast perfectly.

14,332. Whether do you think it is easier, in thick weather, to make Hartlepool or the Tyne ?—I have told you just now that you cannot see the road in thick weather.

14,333. But whether do you think it is easier to make the Tyne, the Wear, or the Tees, in thick weather ?—The Tyne, of course.

14,334. Why ?—You can tell the road by the soundings.

14,335. Then you think the soundings in running would guide you better in running for the Tyne than for the Wear or the Tees ?—For us it would, but not for the Hartlepool pilots. I don't know the soundings ; you gentlemen know them better, for you have sounded oftener than I have done.

14,336. Will you answer this simple question ?—I will answer anything.

14,337. Whether is the land of the Tyne, the Tees, or the Wear, seen at the greatest distance at sea ?—You can see the Tyne farthest, and it is a rocky shore ; the land can be seen further, and you know where Hartlepool pier is by the land.

14,338. What is the entrance most easily made out ?—The Tyne.

14,339. You say that the formation of the land in the neighbourhood of the Tyne makes the entrance easier to be made out by vessels ?—You have Tynemouth Castle before you and a beautiful light, and it is easier made out.

14,340. (*Capt. Washington.*) I should like to ask you, Mr. Tully, whether you have all the lights and buoys you want at the entrance of the Tyne ?—We have all the lights, I think, that are wanted. You want lights to carry you clear of the stones, but they are partly gone now.

14,341. And the leading lights lead you fairly in ?—Yes, they lead fairly in.

14,342. Is the Herd sand marked by a good buoy ?—It is a capital mark.

14,343. Is that put down by the Trinity Board of Newcastle ?—I believe so.

14,344. Not by the Trinity House of London ?—No, by the Board of Newcastle, I believe.

14,345. How many pilots have you on the Tyne ?—Two hundred.

14,346. Have you a steam tug to go out in ?—We have a steam tug, the *Robert Myhon.*

(*Chairman.*) Just let me make a remark: when an old pilot or an old seamen is under examination we are inclined to grant a little indulgence, but you must recollect the respect you owe to us.

14,347. (*Capt. Washington.*) How far do the Tyne pilots go ?—Sometimes to Flamborough Head, and sometimes to Coquet Island to the north.

14,348. And do you go out in blowing weather ?—We go out in fine weather, and sometimes are overtaken by strong winds.

14,349. Does the tug go out at night ?—At tide times, as long as the lights are lighted.

14,350. Do you agree that there is a greater depth over the bar than there was two years ago ?—Yes, the bar has been two feet better within the last two years or nearly so, I cannot say exactly, as I have not sounded, it may be a little more.

14,351. What is the largest draught which has come into the port ?—Ships have gone out drawing 21 feet.

14,352. Lately ?—Yes, more than once ; two or three times.

14,353. This year ?—Yes.

14,354. What is the rise of the tide at spring tides ?—These last springs it was 16 feet, if I am not mistaken.

14,355. (*Chairman.*) You have been so long a pilot, that you are acquainted with the condition of the vessels which sail out of this port ?—Yes.

14,356. Are they generally well found ?—Pretty fairly.

14,357. Looking at the vessels in the coal trade, would you be disposed to say that, as a general rule, they are as well found as vessels engaged in the foreign trade ?—Ships going a long voyage have an extra fit up. In the coal trade, a surveyor is put on board every six months to see that everything is in proper order.

14,358. I understood, from a previous witness, that although as respects their upper works they may not appear so good as other vessels are, yet, with respect to their bottom and underwater, they are the strongest vessels afloat : does your experience bear out that opinion ?—I do not know. A surveyor is put on board to see that they are good. A vessel on the letter A can command a dry cargo for a long voyage ; and when she is off the letter she can come into the coal trade and command a cargo of coals. Of course, such a ship cannot be so good as a first-class ship.

14,359. Then, referring to the question I have just asked you, do you or do you not consider the vessels in the coal trade to be such as have been described to me ?—What was that ?

14,360. As being sounder in their bottoms than any vessel afloat?—I do not think that. I cannot say that.

14,361. As a general rule, would you say that vessels of an inferior description are put into that trade when perhaps they are not fit for a foreign voyage?—So far as that goes, they are off the letter. They are old ships.

14,362. Now, as respects the gear aloft, masts, sails, and all which is most essential for vessels in rough weather, are they generally well-found vessels ?—I tell you that a surveyor is put on board to survey them and make them all good. He can order new topsails, new masts, and new yards, if they want them.

14,363. Under the system which you describe, are they good or are they not good, so far as you know?—They are good.

14,364. As respects these vessels which are deeply laden off this port in heavy weather, have you frequently seen a large number heave to or standing backwards or forwards?—I have.

14,365. And do you consider that these vessels bow the sea well, and are not exposed to any great danger in rough weather when they do so?—I have seen them make very bad weather, the sea washing right over them.

14,366. And under such circumstances has there been risk to the safety of the vessel?—Yes.

14,367. And do you consider that one of these vessels is safer hove to, or standing on a wind, than she is running?—I would say she is safer running.

14,368. She is safer running?—Yes. In the western ocean, where the sea is high, they can heave to, they tell me; but I think it is safer running.

14,369. Would you say that a vessel was safer running or hove to?—I would say running, in the North Sea here.

14,370. It has been given in evidence before us

NORTH SHIELDS.

Mr. R. Tully.

14 Oct. 1858.

that vessels in the coasting trade always by preference run for their own port?—Yes.

14,371. Is that according to your experience?—Yes.

14,372. How do you account for that? what is the reason?—Because it is the best harbour on the coast.

14,373. You have mistaken my question. We have it in evidence that vessels belonging to particular ports, not the particular port of the Tyne, by preference in heavy weather run for their own port; each ship runs for its own port; is that in accordance with your own experience?—It is generally the case.

14,374. What is the reason?—The Tyne is the best port. There is more water and less expense than in any other port. If you put into Hartlepool there is 2*d.* a ton on the register; whereas you pay nothing here except for lights, a shilling or two shillings on each ship.

14,375. Then, do I understand that Seaham, Sunderland, and Hartlepool vessels run for the Tyne in preference, and not to their own ports?—That is generally the case.

14,376. They do not run for their own ports, but they run for the Tyne?—Generally, not always.

14,377. (*Mr. Lindsay.*) Within your long experience as a pilot, have you seen great loss of life in this neighbourhood?—I have seen a good many ships lost, but not many lives. The life-boat is always ready.

14,378. If it were not for the life-boat there would be a large loss of life?—That would be mostly the case. I have been in the life-boat taking crews out when they have been standing in the rigging for an hour or an hour and a half.

14,379. In what quarter was the wind when the largest number of vessels were lost?—There is more happen when the wind comes from the south. When the wind is north there are fewer come. When the wind is from the south it makes a larger quantity come back.

14,380. If there were a harbour here, would the greatest portion of the ships be saved?—I should say they would if they had fallen in with that harbour of refuge. I know you might make a harbour of refuge at Flamborough Head. If a ship is taken back close under the Head and looks to leeward, the first land she makes is a harbour of refuge.

14,381. If such a harbour were made, and ships were able to use it, you think a great number of them would be saved?—That is my opinion, with the wind on shore.

14,382. You spoke of the number of vessels driven ashore at the mouth of the Tyne. Supposing a harbour were made such as that named, and that these ships were able to use that harbour, would it be the means of saving them and the lives in them?—No; they would still have to come to the Tyne.

14,383. Just think for a moment. I asked if you had in your experience known a great loss of life and property at the mouth of the Tyne?—Yes.

14,384. And you said you had?—Yes.

14,385. Now, I ask this question; if there were a harbour of refuge at the mouth of the Tyne, would it have been the means of saving to a large extent of those ships and those lives that you saw lost?—It would.

14,386. (*Capt. Sulivan.*) You said that a person goes on board to see that the vessel is properly found?—Yes.

14,387. Does that apply to vessels insured in clubs?—Yes.

14,388. Does it apply also to those which are not insured in clubs, but insured in London?—I believe that the underwriters at Lloyds' have a man appointed to inspect them.

14,389. Do you believe that the vessels which run for this port, but belonging to ports south of the Tyne, come here because they think there is a greater chance of safety and deeper water than in their own ports?—Yes.

(*Chairman.*) Mr. Clayton, the Commissioners are disposed to say they have had evidence enough, but they are still open to hear other evidence if there is any one in particular whom you wish to call.

(*Mr. Clayton.*) Perhaps you will hear a ship's captain.

Mr. JOHN T. WAWN examined.

Mr. J. T. Wawn.

14,390. (*Chairman.*) In what way are you connected with the Tyne?—I have been a shipowner upwards of 30 years, and my family for half a century before that.

14,391. You have been present at this inquiry?—I have.

14,392. Will you make any statement you may think fit relative to the advantage or necessity of a harbour of refuge on this coast?—The necessity arises from the increase of the trade of the various ports, more especially of the Tyne. There are more vessels frequenting the harbour, and the number is increasing every year. If the entrance were improved, the harbour might be made a harbour of refuge of itself, and I think the piers constructed, especially that on the south side, will be the means of so improving the harbour as to make it a safe place in heavy gales of wind. The south pier prevents the sand from coming in. The north pier projecting further north than the south pier, the flood sweeps round the Trow Rocks, and sends over the sand to the south pier, and has filled the harbour much more with sand, because forty years ago we had south of the harbour what is called the Banks. When a youth I used to ride on these sands. The tide now rises, and the whole sand has disappeared. No doubt as the south pier progresses, the sand will find a resting place, and if we are once rid of it the south pier will prevent its coming back.

14,393. Then you concur in the opinion expressed by, I think, all the witnesses who have been examined, that an improvement of the several ports on the coast is better than the establishment of one large harbour further to the south?—Most decidedly, from the number of ships coming and going. If there is shelter under their lee, they will take it at the nearest point where they can do it with safety; and if these ports are improved there will be a great saving of life and property.

14,394. With reference to running back by preference to the port to which they belong, do you concur in the previous evidence, or do you concur with the last witness, who stated that ships belonging to other ports run in preference for the Tyne?—A captain will naturally run for that port with which he is best acquainted, if there is water enough. I think the Tyne captains will run for the Tyne, and that the Sunderland and Hartlepool captains will run for their own ports. But I believe that a great many Sunderland vessels take refuge in the Tyne in gales of wind, which they could not get now without having to go to Leith Roads.

14,395. Have you any means of furnishing a return of the vessels belonging to other coal ports which have taken refuge in the Tyne?—I cannot give you any return of the numbers.

(*Chairman.*) Perhaps, Mr. Clayton, you will undertake, if you can, to give us a return for one or two years, showing the number of vessels which have come here from the other coal ports?

(*Mr. Clayton.*) Coming to the Tyne as a place of refuge?

(*Chairman.*) Yes.

(*Mr. Clayton.*) I will do so.

Mr. WAWN's examination continued.

14,396. (*Sir F. Smith.*) Does the sand move to the northward along this coast?—The sand upon the flood tide generally moves principally to the southward. On the flood tide the sand is more lively than

NORTH SHIELDS.

Mr. J. T. Wawn.

14 Oct. 1858.

Sir F. Smith.

on the ebb tides. If you ride on the sand with the tide running it is like a quicksand.

14,397. How do you account for the accumulation of sand behind the south pier?—I think the flood tide has partly prevented the sand from entering the harbour, and that which has entered is depositing itself on the south side of the pier.

14,398. You think that the south pier arrests the entrance of the sand, which would otherwise enter the river mouth?—Yes, and therefore I think it the most valuable.

14,399. And do you think it will form a considerable accumulation and become all dry land?—I have no doubt of it, as it has been heretofore.

14,400. I suppose you have no doubt that two or three ports along the coast would be better than one, however large?—Most decidedly, because any port along the coast would be a harbour sufficient to take those vessels which are sometimes caught between here and Flamborough Head.

14,401. And if a port were sufficiently capacious you would still think it better to divide the money allowed by Parliament into two or three portions?—Most decidedly; and I do not think that Parliament can apply money to better purposes than to improve the ports along the coast.

14,402. It would save life as well as property?—No doubt of it.

14,403. (*Mr. Lindsay.*) Have the shipowners of the Tyne voluntarily taxed themselves to a considerable extent for the improvement of the river?—For works, in the first instance, so as to give accommodation to an increased number of ships instead of letting them lay at their anchors.

14,404. The construction of the present pier will be a considerable tax upon the shipping frequenting the Tyne, and consequently upon the owners of ships resident at Newcastle, North Shields, and South Shields. Can you tell us what was the feeling generally of those gentlemen as to the extra tax necessary for the construction of those piers? what was their feeling, as a body?—They consented to it, expecting to derive great benefit from it. The great source of complaint was that they were so long commencing the work after the tax was levied.

14,405. Was there a general feeling among the shipowners of the Tyne in favour of the piers?—I believe so much so that no petition went up from the shipowners against the piers.

14,406. Do you mean no petition against the tax which was necessarily imposed upon them?—Against the bill which imposed the tax.

14,407. Consequently they have been willing parties to this taxation, so as to improve the entrance of the harbour, and thus tend to save life and property?—Yes.

14,408. (*Capt. Sulivan.*) In dividing the outlay of money upon the different harbours you have mentioned, are you considering that it is not certain that the anticipated advantages will follow the outlay of that money?—I have no doubt of it myself, although I was surprised to hear one of the members of your body doubt it. I should like to know the places where piers have been injurious to harbours. If I knew a place I think I might be able to give some reason for it.

14,409. You are giving your present evidence with the conviction that increased accommodation and depth of water at the Tyne will follow an outlay of public money?—Yes, if you go into deeper water, with the immense scouring power you have.

14,410. Do you think that those who are responsible for the outlay of public money should be very careful, under the circumstances, to lay it out where there is not every certainty, humanly speaking, that the depth of water will be attained, and accommodation given to the trade?—I certainly think that you ought to be firmly persuaded in your own mind that it will be so. I find that the increasing trade is such, that if we get a larger class of vessels to the Tyne, we shall require the harbour to be improved, as far as it can be, for these ships.

14,411. Is it not the case that your present works are very like an experiment, with the hope that it will be followed by success?—As far as the south pier is concerned it is not an experiment but a certainty. It prevents the sand from coming in, and if you do that the harbour of Shields will become a great basin where a navy can ride, as well as ships frequenting the port find shelter.

14,412. In all these plans mentioned are you sure that the improvement will be followed by the greater safety of shipping?—Not so much anywhere as in the Tyne, but still to a certain extent they will be most useful and valuable.

14,413. And if it rested with you, with all the responsibility as to where a sum of public money should be laid out, either in a place where you had not a certainty that it would be necessarily followed by advantage, or at a place where you could make sure that for many generations the harbours would remain valuable as a harbour of refuge, where would you make that outlay?—I should really have doubts about laying it out in any of the spots named, because I think many of these places, from the immense quantity of sand found there, will be filled with sand, that they will be silted up.

14,414. But supposing, with all the engineering talent you could command, you were to think a harbour would be certain not to silt up, and that it would give a harbour of refuge for the passing trade—supposing that were the case, would you, with the responsibility upon you, recommend the public money to be laid out where there is no such certainty or preference in granting a harbour which you could rely upon for a long period of time?—I do not think I should recommend any money to be laid out on any place where the back water was not sufficient. There is the harbour of Ramsgate. It is a trap for shipowners. We do not care how soon it is lost, as we have to pay a passing toll.

14,415. That is quite foreign to this inquiry?—I will answer your question pertinently.

14,416. I am speaking of the ports you are alluding to, and my question bears directly upon the responsibility of laying out money where you are sure it will be usefully, to a certain extent, laid out, or risking it where you are not morally certain it would be useful, but as far as any man can give an opinion, which is doubtful, whether the advantage will or will not follow?—I certainly think you have the responsibility, and I cannot recommend money to be laid out unless the advantage will follow, and I think it would be very foolish to do so.

14,417. (*Mr. Lindsay.*) You were asked a question just now, if the construction of these piers was not an experiment, the result of which would be doubtful. Now, from your knowledge of the people of the Tyne, do you think that shrewd men, such as those who manage the affairs of this river, would be willing to tax themselves to the extent of 400,000*l.* if they were not perfectly certain as to the results which would follow that expenditure?—Certainly not. I have some doubts as to the north pier, but I have none as to the south pier.

14,418. Is it not the case, that when men spend their own money, as in the present instance, they make long and very cautious inquiries as to whether the expenditure of that money will produce the results for which they expend it?—Most assuredly. We find very often that public trusts are very much abused.

14,419. Were not inquiries made whether, for an expenditure of 400,000*l.*, they could have the depth of water at the entrance which they expect to have, in consequence of that expenditure?—Most assuredly. They made sure from the circumstance of the deep water coast near the entrance.

14,420. But did they take the opinion of very competent men, as engineers and nautical men, who were able to give an opinion?—I know they did.

14,421. You know that of your own knowledge ?—Yes; because I was present when that evidence was tendered, and the parties to whom it was tendered were convinced that it was sufficient to justify the expenditure.

(*Capt. Washington.*) As you have referred to something which fell from me, I should like to explain that I am not aware that I expressed any opinion as to whether the Tyne can or cannot be improved. A witness under examination expressed a very confident opinion that the Tyne would be improved by the works being carried out, and I simply asked in return whether he could name any river harbour which had been improved by piers to the extent he expected. So far from wishing to express any opinion, it is my hearty hope that the plan may succeed to the utmost extent of your wishes. If I did express an opinion it was not my intention to do so I merely asked the witness if he could mention any harbour which had been improved to the extent he supposed, because he assumed so very confidently. I am very glad you alluded to it. I was under the impression that you wished to put the question in this light, that the pier at the entrance instead of doing good would do harm. I asked to invite questions upon the subject. I wished to know what harbours had been improved, and hoped to give my own opinion with respect to them. The witness instanced Warkworth. That has not been quite a successful attempt. I did not follow it up, because I did not wish to express any opinion on the subject.

Thank you; I am much obliged to you for the explanation.

14,422. (*Capt. Sulivan.*) You said that every inquiry was made with respect to these piers, and that the parties would not have laid out their money without a firm conviction that the result would be equal to their anticipations. But you stated at the same time, that you doubted whether the north pier would be so beneficial as the south pier. Is not the north pier the very expensive part of the work ?—But I am not speaking of any works beyond those now going on. I confine myself to what they are at present. I approve of Mr. Rendel's plan. I wished the north pier or jetty were open, and I wished that as much tidal water as possible should enter the harbour, so as to increase the flow upwards to Newcastle. Unless the south pier is extended out further than the north pier, you are shutting the harbour mouth, and driving the current across the mouth, thereby reducing the quantity of water which would be useful inside for the improvement of the river.

14,423. I do not wish to ask you as an engineering question, but merely as to the fact, whether, as you have expressed a doubt respecting the north pier, it does not show that with every precaution you could not ascertain that the whole of the money expended would be laid out beneficially ?—I think that, as the works have proceeded, so the improvement has gone on, and I cannot doubt that the money will be beneficially expended.

14,424. You have heard of the failure of another work at Warkworth. Do you not think that the proprietor there used every precaution, and was quite as satisfied that the money laid out at Warkworth would be as much to the advantage of Warkworth as others are that the money laid out here will be to the advantage of the Tyne ?—As a coaling port, it is a mere creek.

14,425. I am aware what Warkworth is. But I ask you whether that person thought that if he laid out his money, he would for that outlay make it the port which he wished it to be ?—I have no doubt he did. But we had no railways then. If he had foreseen that railways would have conveyed the coal to the Tyne he would never have laid out one shilling there.

14,426. But does it not prove that a person may lay out his money and be disappointed in the effect that the money was intended to produce ?—Most assuredly.

14,427. Am I right in understanding that you consider the north and south piers as one project, and that of that project the south pier will render the greatest amount of service ?—I think so.

Mr. Martin Cay examined.

14,428. (*Chairman.*) You are resident in Shields ?—In South Shields.

14,429. You have been at sea ?—I have been 30 years at sea, in command of a ship for 22 years of that period, and am now residing ashore.

14,430. In what trade were the ships which you commanded chiefly employed ?—Chiefly in the coasting trade, but for one fourth of the time in the foreign trade.

14,431. And when you sailed foreign, where did you go ?—To the Baltic, to America, to the Mediterranean, and one voyage to India.

14,432. You have been present during the course of this inquiry ?—I have.

14,433. You have heard the question about vessels going north-about. Will you give me your opinion as to the necessity or advantage of a harbour at Wick for vessels going north-about ?—I would prefer taking a port on the other side, Long Hope. As a humane project, I think it well worthy of the country's money being laid out, considering the fishermen.

14,434. Therefore you consider that a harbour at Wick would be more for the advantage of the fishermen than for the advantage of the passing trade ?—I do.

14,435. Give me your opinion about Peterhead ?—I cannot see that there is any pretence at all for making a harbour of refuge at Peterhead. If the wind is one way the Firth of Forth is accessible, and if the other there is Cromarty.

14,436. You are disposed to say it would hardly be justifiable to spend the public money at Peterhead ?—I think so.

14,437. Have you run up the Firth of Forth with a gale of wind from the east ?—I have.

14,438. And in thick weather ?—In snowy weather, so that you could not see an object.

14,439. How far did you go up; to Long Hope ?—One time to Long Hope.

14,440. Do you consider it is easy of access, that it is now a good harbour of refuge ?—Assuredly.

14,441. By night and day ?—Yes.

14,442. And that Cromarty also is a capital place to run into ?—I have not been up there, but I believe so.

14,443. What is your opinion about a harbour in this district ?—I think one harbour of refuge would come far short of what seafaring men demand of the country, and much less than their necessities require. It would be cruel to place only one, for you could not tell where to put it. I think that Filey has greater facilities for giving refuge than any other place. I have been told of the number of docks, and the draught of water which we expect to attain shortly, and great advantage will be found from the piers, because the entrance will be completely defended, which it is not strictly now. They have two leading lights, but in running over a bar-harbour, people are not quite so cool as they are sitting in this room. Many lose their nerve, and are likely sometimes to take one side and sometimes the other. That would not be the case if the place were defined. They would then naturally run in the middle of it, and the number of wrecks would be diminished. More than that. A ship seeking a cargo can always get one here. Any damage can be replaced on very reasonable terms, and I do not see that such advantages are possessed by any other port in the neighbourhood.

14,444. Do you attach much importance to the weatherly position of the port for ships sailing again ?

NORTH SHIELDS.

Mr. Martin Cay.

14 Oct, 1858.

Chairman.

—The east-north-east becomes a more favourable wind for going away. The east-south-east is an embaying wind, because you cannot clear the Staples unless you carry a very tight sail, and going to the southward you can clear no place; with the wind east-north-east you have a better chance from here than from any more weatherly port.

14,445. Are east-north-east winds more prevalent than winds from the east-south-east?—I think the east-south-east winds are more prevalent in the winter time, during the frosty season.

14,446. Then you think the Tyne loses the advantage of being a weather port?—It does with the wind from east-south-east.

14,447. You have heard the question asked about heaving to and running. Is it safer for a heavily laden collier to heave to or to run?—It is safer to run in the North Sea.

14,448. Yes, if you can see where to run to. I am not now talking of danger from the land but of the fact. Is it safer to run than to heave to?—They do run, because vessels laden with coals are generally deeply laden, and they make rather bad weather when it becomes continuous.

14,449. Bad weather under storm sails?—They would make better reaching than heaving to. It is more open. They can haul more to the wind. If they are under reaching canvass, they can do much better than heaving to.

14,450. (*Sir F. Smith.*) Are you of opinion that one harbour alone would not suffice for the coast?—I think not.

14,451. Is that the result of deep thought?—It is an opinion formed from experience.

14,452. It is not an opinion formed to-day?—No.

14,453. If there is to be more than one harbour, you have no doubt the Tyne should be one?—I think so. It is a more northerly point.

14,454. You say that as the winds prevail from the south more than from the north, it would be more to leeward?—In some seasons one wind prevails, and in some another, but during the winter, when it is snowy, I should say the east-south-east.

14,455. Of course the perfection of security is to have as great a number of harbours of refuge as possible?—I think so.

14,456. And the more to approach perfection, the greater number of harbours you should have?—The more the better.

14,457. And you think the public money would be well expended upon them?—I think it cannot be better expended than in saving the lives of poor sailors.

14,458. You think that if the object is to save life and property, the Commissioners would be justified in recommending more than one harbour?—I think so, and I trust they will.

14,459. (*Mr. Lindsay.*) But supposing the Government arrive at the conclusion that only one harbour is necessary, looking to the saving of life and property, at which part of the coast would it be of most advantage, between Flamborough Head and the Farn Islands?—I think the Tyne has claims beyond any other place that I know of.

14,460. Leave the Tyne out altogether, would a harbour at Filey Bay or at Hartlepool do most to save life and property?—I should like to see a harbour at both places. It is very difficult to say which, but I would rather say, if the Commissioners think so, that it is better to have one at each place.

14,461. We cannot get all we want in this world. But supposing it rested between these two places, to which would you give the preference—Hartlepool or Filey, all things considered?—With the hope of getting Hartlepool at some future day, I should say Filey at present.

14,462. But supposing there were no hope of getting Hartlepool?—We must have hope; we will never give up hope.

14,463. Supposing there were no hope of Hartlepool for the future, and you were told there was to be only one harbour, and that it was to be either of these two points, which would you prefer?—I think I should prefer Filey.

14,464. All things considered?—Yes, all things considered. It is easily approached, in consequence of the boldness of the cliffs. Hartlepool is not. I remember being blown two miles off the Humber, and driven all the way to the Firth of Forth.

14,465. If it rested between the three points, Filey, Hartlepool, and the Tyne, taking into consideration the saving of life and property, which of the three would you prefer?—The Tyne.

14,466. Have you considered that?—I have well considered it.

14,467. And you are clearly of opinion that with all the objects in view you would prefer the Tyne?—Yes. Filey is very contracted in its space. It can never be *the* harbour of refuge. It would save a great deal of bad weather and loss of time, but it cannot help the ships which want it. But ships running for it would run the chance of disaster if the harbour was too small to hold those which went for it.

14,468. Then it is your opinion that if a harbour were made at Filey it might so happen that it would become so full that when ships drew nigh they would find no room to enter, and would consequently run great risk of doing damage to themselves or other ships?—Yes, or go ashore.

14,469. And therefore your fear of Filey is on account of its limited space?—Yes.

14,470. Would that apply to Hartlepool?—Hartlepool is not so limited as Filey.

14,471. Would it apply to a less extent to Hartlepool?—To a less extent.

14,472. Would it apply to the Tyne?—I do not think it would apply to the Tyne. If you take the water at low water it is perfectly safe, and there is safe mooring; it is not in a bight.

14,473. Then you think that the contingency is less likely to arise at the Tyne than at any other place?—Much less likely.

14,474. Supposing the Government decided upon a harbour for the east coast of Scotland, looking at the passing trade and the saving of the lives of those who are employed in it, which do you think would be the best point—Wick, Fraserburgh, or Peterhead?—I think Wick.

14,475. (*Capt. Sulivan.*) You said you would prefer two harbours under any circumstances to one?—I would.

14,476. Would you do so if the two harbours had less depth of water than one large harbour?—I think they would be more useful even then.

14,477. Do you believe that 15 feet of water will be gained by the present projected improvements?—It is so anticipated.

14,478. Then would not the Tyne become to a considerable extent available as a harbour to the north colliery ports?—It would.

14,479. Then if another were added somewhere southward of the Tyne, you would have the benefit of two harbours, and would not that more nearly approach the notion of two harbours of refuge instead of one, supposing even that the greater depth were realized at the Tyne?—If we get the depth we anticipate I think we shall get all that we want, and all that we desire. Still we want refuge for vessels which leave in the winter months and in unsettled weather, and cannot clear round, particularly small vessels, which never stay out two bad nights at sea if they can avoid it.

14,480. Then, in addition to the Tyne, a harbour to the south would be of great advantage to the Tyne trade?—No doubt of it.

14,481. You seem to have some difficulty as to which you would prefer, Filey or Hartlepool: do the advantages and the disadvantages make it difficult to decide between the two?—Truly so, there is a great trade at Hartlepool.

14,482. Supposing you found that engineers were of opinion that a deeper harbour for the same money,

NORTH SHIELDS.

Mr. Martin Cay.

14 Oct. 1858.

and of greater extent, could be obtained off there, would that be sufficient to turn the scale, and would you have the money laid out on the one that would give the largest amount of area, and the largest depth of water, and accommodate the largest number of ships?—It is very difficult to decide in the manner you put the question. I have been twice driven back from the Head, once to within two miles of the Humber.

14,483. Do you mean Flamborough Head?—Yes, Flamborough Head. I was near it both times, and if Filey had been available I could have got in. I could not run down in the bight for Hartlepool. A sailor is chary of running to leeward.

14,484. That is all in favour of Filey?—Yes.

14,485. But supposing the advantages were balanced, and you found that the largest and best harbour could be made at either one of these ports, would you choose it for these reasons?—I should like to know where the money is to come from.

14,486. The public money, the object being to save life and property?—I would say Hartlepool should do something to help themselves, and after that they could go with a good face and ask for public money. If they do not do anything to help themselves, how in the name of reason can they ask the Government to help them?

14,487. Set aside the Hartlepool interest alone, and consider the trade of the Tyne. If the outlay of public money either at Hartlepool or Filey would give you the largest harbour, would that be the best if they were on any equality in most other things?—If it must be, it will be, but at the same time I think they ought to help themselves.

14,488. You said you entertained a fear that vessels entering a harbour of refuge, if it were crowded, would be in great danger?—They would.

14,489. Where a harbour of refuge has smooth water inside, and a clean sandy beach at the bottom, as Filey and Hartlepool both have, would there be much danger to life or property, if a captain were to run his ship on the beach?—It is not a good beach. I have had a ship on that beach.

14,490. Which beach?—Hartlepool. I have had a ship ashore there. The repairs alone cost me 1,900*l.*

14,491. Would not the danger be increased by its being open to the sea?—It is open to the sea, no doubt.

14,492. But if it were smooth water, the danger of beaching would be reduced?—Yes, but it is a strange kind of harbour if you must run ashore. That is anything but a sailor's idea of safety. Please to let us keep afloat, if possible.

14,493. But I am putting it that the harbour is full, and that there is a breakwater outside giving smooth water?—There would not be much swell; but a great many vessels have been lost on Hartlepool beach within the last ten or twelve years.

14,494. But would not that be a harbour of refuge for saving of life?—It seems a brilliant kind of refuge when a ship has to run on shore. I cannot conceive the two things possible. It cannot be a harbour of refuge.

14,495. I take your own words. Supposing the harbour were crowded, it would still be a good harbour for the vessels which filled it?—It would, probably.

14,496. Would not those who run for the beach save their lives and very likely their property?—They would save their lives, certainly.

14,497. Do you know Filey?—Yes, I have been riding in the bay.

14,498. Is the beach clean?—I think it is, but I cannot say. I think I have heard old sailors say they used to scuttle vessels and let them be half the winter at Filey.

14,499. (*Capt. Vetch.*) Do you know the Pentland Firth?—Not very well. I have been through the Pentland Firth several times since I had the command of a ship.

14,500. You made some remark about Wick?—More by a chart and what I read of the evidence before the Select Committee of the House of Commons.

14,501. Putting altogether out of the question the coasting trade, and considering that of Wick, which has 1,500 fishing boats, and is frequented by many ships, making annually about 915 arrivals engaged in the local trade, would you consider that a proper case for a harbour of refuge for the protection of the fishermen and their vessels?—I do most certainly. I think it would be very worthy to have the public money laid out for such a purpose.

14,502. (*Mr. Coode.*) You referred to some old story of vessels being scuttled at Filey as an intimation that the beach was a good one?—I did. It struck me so, and also Mr. Schotton particularly.

14,503. Supposing a large harbour of refuge to be formed to the southward, and the Tyne with 15 feet of water, what acreage of shelter do you think should be provided—for how many ships should shelter be provided in the refuge harbour?—I think at Filey, considering the number of vessels which meet at Flamborough Head, as a sort of turning point, you would want room for 500 or 600 vessels, and at times that would be found little enough.

14,504. Do you think the same acreage required at Hartlepool?—I think so. Occasionally it would be wanted.

14,505. And assuming a harbour to be made at either of those places, you think accommodation should be provided for 500 ships at least?—Yes.

Mr. JAMES WHITEHEAD examined.

Mr. J. Whitehead.

14,506. (*Chairman.*) You are in command of a vessel trading out of this port?—Yes.

14,507. How long have you followed the sea?—40 years.

14,508. And how long have you been in command of a vessel?—More than 30 years.

14,509. Have you heard the evidence of the last witness?—The last witness and the last two witnesses.

14,510. Do you concur in their evidence?—No, not entirely.

14,511. State in what point you differ from them?—I differ materially from his idea of Filey being a proper place of refuge on this coast in preference to Hartlepool.

14,512. Will you state your reasons?—Filey is to windward; it is more out to sea. If I sail away from here, and am caught in a wind going to the south-east, I could not fetch Filey, whereas I might fetch Hartlepool, because it is less to windward. If I can get so far with an east wind, it may be reasonably supposed that I can get round the Head, and then I can fetch the Humber.

14,513. And as respects the advantage of having one great harbour of refuge, or improving the harbours on the coast, what is your opinion?—My opinion is, that if it were decided that there was to be only one, Hartlepool Bay is the place.

14,514. You think Hartlepool the place?—Hartlepool Bay; I would say Redcar.

14,515. Which should you prefer, to improve the ports which at present exist, or to have one harbour at Redcar?—I think it would be much better and less expensive to improve all the harbours.

14,516. Put the question of expense out of view, how would life be saved best?—There would be a better chance if all the harbours were improved.

14,517. Then do you concur in the opinion expressed, that any single harbour must contain 600 sail?—Yes, quite.

14,518. You fully concur in that opinion?—Yes. There is danger of a single harbour of refuge being overcrowded. Each port sometimes sends to sea a fleet of vessels which are caught in the same gale. They would go to their own ports; but if they go to

NORTH SHIELDS.

Mr. J. Whitehead.

14 Oct. 1858.

Chairman.

the same place, there is the danger that they might crush each other to pieces.

14,519. Although there were 500 or 600 vessels, or even a larger number, perhaps a proportion would not take a harbour of refuge: how would you view that?—I should still give the preference to each returning to her own port, rather than making for a single special place.

14,520. They would prefer running to their own port to running to a strange port?—I should think naturally, if each port was equally available. If they knew that they could return to their own port with comparative safety, they would give that the preference, rather than run to another.

14,521. Why?—Because of their acquaintance with a place which they have been habituated to sail from and return to.

14,522. I understand by that, that a captain running for a place which he knows much better, has more confidence?—Unquestionably.

14,523. Do Seaham, Sunderland, and Hartlepool ships run into the Tyne sometimes?—The Tyne has the preference. I have been sailing from Sunderland, and instead of returning to Sunderland, I have returned to the Tyne.

14,524. And could you have gone to Sunderland?—Not with safety; but I knew I could come with greater safety to Shields, and therefore I preferred it.

14,525. (*Mr. Lindsay.*) Are you employed in the coal trade between this port and London?—Yes.

14,526. How long have you been so employed?—I have been more than 30 years master of a ship.

14,527. Supposing only one harbour were to be made between Flamborough Head and the Farn Islands, and looking to the saving of life and property, where would you make that harbour; at what point, if it were left for you to decide?—I would go into the Tees Bay.

14,528. You would prefer the Tees Bay to the Tyne or Filey?—Yes, decidedly, because it is right down dead in the bight. You can go there when you cannot get elsewhere.

14,529. Do you mean Hartlepool?—No, my mind carries me to the natural harbour at Redcar.

14,530. Then your idea is, that if there is only one harbour, it should be made at Redcar?—That is my opinion, decidedly.

14,531. But supposing that a harbour could not be made at Redcar sufficient to contain the ships?—I would go to the Tyne for the other.

14,532. As a single place, to be the only place, you would say Redcar?—Yes; but failing Redcar, I would give the Tyne the preference.

14,533. But I understood you to say that, looking to the saving of life and property, the money would be better expended in improving the present harbours?—Decidedly. The Tyne is much better than it used to be; it is almost a refuge as it is.

14,534. Supposing the Commissioners were to require your evidence in London, could you attend?—Yes.

14,535. Then, as you can give evidence in London, I will not trouble you with any other question.

14,536. (*Mr. Coode.*) Have you ever been detained off Flamborough Head by contrary winds?—Frequently; many times.

14,537. Have you ever run back?—I have run back to the Tyne and to the Forth; to Leith, on more than one occasion.

14,538. Would not on such occasions a harbour at Filey have been better situated than at the Tees Bay?—Decidedly it would; but if it had been in the Tees Bay I should have got equal safety.

14,539. Would not there be less risk in running nine miles to Filey than in running 50 miles to the Tees Bay?—Decidedly there would be less risk.

Mr. Charles Morris examined.

Mr. C. Morris.

14,540. (*Chairman.*) You are resident in Shields?—I am.

14,541. In what way are you connected with the port of Shields?—As captain of a ship for 30 years in the coal trade.

14,542. Are you a shipowner at present?—No; unfortunately, I have lost the ship in which I had a share.

14,543. You have been present in the course of this inquiry?—I have.

14,544. And you generally concur in the opinion as to the improvement of the three ports being more advisable than the establishment of one large harbour?—I do, assuredly.

14,545. Is there any point which has not been brought under our notice which it occurs to you to state to us?—I am sorry to say I think you are omitting Bridlington. There is an excellent harbour there for riding 400 or 500 ships with the wind north-west and north-north-east. I have known 70 laden ships take shelter in the bay, which dare not run across the bay into the Humber.

14,546. Bridlington, you say, is at present a capital anchorage in certain winds for how many vessels?—500 or 600 sail.

14,547. Bridlington being so good, would it not be advisable, as suggested by the previous witness, to expend the money somewhere else, where the anchorage is not so good?—We have the wind veering from east to east-north-east, and if we had protection by a curve from the Smithic Sand into the land, it would be complete.

14,548. With such a breakwater, how far would it protect you from winds to the southward?—From north-east to south-west.

14,549. Then, in point of fact, it would be a closed harbour?—It would be a closed harbour.

14,550. And you decidedly think that such a harbour would be of advantage to the coal trade?—Yes. I have missed Scarborough, and had to drive round the Head again; whereas, if there had been a harbour, I should have gone there.

14,551. Does your preference arise from the greater capability, or being, in your opinion, a more eligible place to put a harbour of refuge?—It is a more eligible place. Filey I do not admire at all, not on any account.

14,552. Supposing there was equal accommodation at Filey Bay, which should you prefer?—You must close in Filey from the south-east, and that is the only passage out. If you go south, as soon as the water flows over the brigs there is a rolling swell in Filey scarcely to be accounted for; vessels break their windlasses and then go to Bridlington. As soon as the wind goes to north-north-west there is no shelter.

14,553. I think we have it in evidence that a large number of laden vessels never get to the windward of Bridlington, so a harbour there would be no use to them?—It is a very easy reach to get round between the Smithic and the Head.

14,554. Blowing hard?—Yes, blowing hard.

14,555. But supposing a vessel under close-reefed topsails, and with canvas as much as she can carry, with a flood tide, can she manage it?—She might in some cases. It may be that small vessels would not attempt it.

14,556. (*Mr. Lindsay.*) Is it not the fact that when you weather Flamborough Head you can reach the Humber?—Yes, when it is possible to do so; but you are blocked under the Head so frequently.

14,557. Is it the case that the greatest number of vessels are caught to the northward of Flamborough Head and obliged to run?—When the wind is south-south-west they lie under the Head until the flood makes.

14,558. From your experience what particular point do vessels make for?—Most to the northward of Flamborough Head.

14,559. Then why do you prefer a harbour to the southward?—Because we are frequently caught on

NORTH SHIELDS.

Mr. C. Morris.

14 Oct. 1858.

the deeps with heavy winds from the south and south-south-east.

14,560. In your experience have you known many laden vessels obliged to put back to the Tyne?—Frequently.

14,561. How many?—In 1854, when so many wrecks occurred, I bore up from Hartlepool and run for the Forth.

14,562. Was that because there was no harbour to take nearer?—It was night time and I dare not do it. It was on January 3, 1854, that we sailed from Seaham.

14,563. Supposing only one harbour was to be made between Flamborough Head, or including Bridlington, and the Farn Islands, at what point would you place it for the saving of life and property? —Decidedly at the Tyne. I recommend the Tyne if it can be improved as expected.

14,564. At the same time you think that even at the Tyne one harbour would not be sufficient?—I fear not.

14,565. Supposing a second harbour were to be made, whether would you have it at Bridlington or Hartlepool?—If Hartlepool were improved it would be a very safe anchorage. I have run for it, but before it was improved as much as it is now.

14,566. I am speaking of whether it would be better at Bridlington or Hartlepool. At what part would it do most good?—More ships would be caught at Bridlington, but of course they would be at liberty to run for Hartlepool.

14,567. Would you prefer it at Bridlington rather than at Hartlepool?—Not exactly, because Hartlepool is a very safe harbour, because it is easy of access to the south.

14,568. Would you prefer it at Hartlepool rather than at Bridlington?—If only one was to be made I should prefer Hartlepool; still I like Bridlington.

14,569. Supposing only one was to be made?—Of course I would give it to the Tees.

14,570. Do you mean Hartlepool?—I mean Hartlepool Bay from the Salt Scars to the Heugh.

14,571. Are you aware that ships have taken refuge at Hartlepool?—I have myself, under serious circumstances.

14,572. Are there as many which take refuge now at Hartlepool as in the Tyne?—Sunderland ships, if they have the preference, generally prefer Hartlepool.

14,573. I am speaking of all ships. Whether do more ships seek shelter in the Tyne or at Hartlepool?—I should think in the Tyne.

14,574. In what proportion?—Two thirds, I should think.

14,575. (*Capt. Sulivan.*) What shelter do they take at Hartlepool? Do they go into the inner harbour, or do they anchor in the bay?—They go into the inner harbour.

14,576. You said that the great objection at Filey was the difficulty of getting out?—I suppose it would depend how the mouth was contracted.

14,577. Supposing a breakwater built off the Brig, if a passage were left either to the southward or northward, would that obviate the objection?—I can scarcely be made of opinion that it can be done so.

14,578. If it could be done would that obviate your objection to Filey as a harbour of refuge?—No, I do not think it would. I never liked Filey.

14,579. Do you know Hartlepool Bay?—I do.

14,580. Do you know whether the depth in Hartlepool Bay is reduced since you knew it?—I believe so, but I cannot be positive.

14,581. You believe so?—I believe so.

14,582. (*Mr. Coode.*) Have you ever taken shelter in Filey Bay?—No, never.

14,583. Have you ever been driven back from Flamborough Head to the Firth of Forth?—Not so far generally. I never got to the northward of the Tyne until the heavy gale in 1854.

15,584. Do vessels find a difficulty in getting round Flamborough Head? Are they not oftener detained there than anywhere else?—Specially with south-south-west winds, but it is smooth water.

14,585. And those are the prevailing winds?—It is generally easy to get shelter under the Head, to south-south-east.

14,586. Are vessels detained a considerable time there?—Three or four days.

14,587. And exposed to risk for want of shelter in case a gale of wind comes on from the east?—Of course they are quite in danger of the wind shifting.

14,588. (*Mr. Lindsay.*) You said you had often run for Hartlepool?—Not often.

14,589. When you did run, did you get safely in?—No, I grounded on one side, and the ship alongside of me grounded on the other. If we had run for the Tyne we could not save the tide. 70 sail of ships came in at the same time.

14,590. You ran for Hartlepool because you could not make the tide at the Tyne?—Yes, and the ship was making water.

Mr. Mather handed in the names of two witnesses, and one was called.

(*Chairman.*) Before proceeding to the examination of the witnesses, I wish to ask you for the meteorological observations of which you spoke. Will you be kind enough to procure them for us?

(*Mr. Mather.*) Certainly.

(*Chairman.*) Who kept those observations?

(*Mr. Mather.*) The pilot-master at the mouth of the river.

Mr. JOHN JOBLIN examined.

Mr. J. Joblin.

14,591. (*Chairman.*) Do you command a vessel, or are you a mate?—Not at present.

14,592. How long have you followed the sea?—About 37 years.

14,593. In what capacity?—Fourteen years master of a vessel in the coal trade.

14,594. And previous to that, mate for any time?—Yes, as mate and a regular apprenticeship.

14,595. I understand that you, Mr. Joblin, and Mr. Croshier, are deputed to represent the body of seafaring men who have sent in a memorial to us?—Yes.

14,596. And you are fully in possession of their sentiments?—Yes, I believe so.

14,597. Would you prefer to make any statement, or that I should put questions?—I should prefer you to question me.

14,598. Have you been present during the course of this inquiry?—Part of to-day—not yesterday.

14,599. From what you have heard, you will have understood that the pith of the matter is, whether there should be one harbour in the neighbourhood of Filey or Hartlepool, or whether, with the view of saving of life, it would be better to spend the money in improving the three ports of the Tyne, the Wear, and the Tees. Representing your constituents, what is your opinion?—My opinion is, that if the harbours were improved it would be to the advantage of trade, and the means of saving life and property. I believe that one harbour of refuge would be of no use at all on this coast, or, comparatively speaking, of no use.

14,600. Can you give me an idea of the number of seafaring men whom you represent, because there are no names to this memorial?—I should think nearly 3,000.

14,601. Do you mean that that number were present at a meeting at which this memorial was agreed to or discussed?—No; the meeting was publicly called, but a number of the men were at sea. It cannot be expected that the number of men whom I represent would be at one time in the port.

14,602. How many were present at that meeting?—I cannot say exactly.

14,603. But about?—Not more than 200 or 300.

14,604. Were they from the different ports?—All from this port.

NORTH SHIELDS.

Mr. J. Joblin.

14 Oct. 1858.

Chairman.

14,605. Then what authority have men from this port to represent the seafaring men of Sunderland and Hartlepool?—I do not assume that authority.

14,606. I understood the memorial was from the body of seafaring men belonging to the three ports?—No; one port only.

14,607. Then these men at this meeting had distinct authority to represent the sentiments of their brother seamen? Were they deputed to do so?—No; they were aware of the fact that a Commission was instituted. A meeting was called for the seamen to express their opinion on the subject of a harbour of refuge. The memorial was got up and signed by the chairman, and the sentiments of the memorial are the sentiments of the seamen, which it purports to be.

14,608. You must understand that this is a very serious matter, and that I cannot take 300 men present at a meeting as representing 3,000 of their fellow seamen, unless they have a distinct authority to do so. I am perfectly willing to take such sentiments or opinions as they are willing to offer, but that is entirely a distinct thing from your being deputed to express the opinion of the whole body of seamen who belong to the port. Do you understand?—Yes.

14,609. And that was the fact which I wished to elicit, whether you had any distinct authority to bind them, from the men personally. Now let me ask you, whether, from your experience of their sentiments, you think the memorial does formally represent the opinion of a majority of the seamen belonging to the port?—I believe that meeting does formally represent the feeling of the majority of the seafaring men.

14,610. (*Mr. Lindsay.*) Are you secretary to some association?—Yes.

14,611. What is the name of the association?—The Royal Standard.

14,612. How many members are there?—Nearly 1,400.

14,613. As secretary, do you know the views of those 1,400 men?—I will not vouch for the views of the whole of those individuals; but their views upon the whole seem to me to hold with the opinion, that one harbour of refuge would not satisfy the wants of the trade upon the coast, that the present harbours ought to be improved, and that if they were, a great portion of the property and lives which are lost would be saved.

14,614. Are all those 1,400 men Tyne men? Are there any Sunderland seamen amongst them?—Yes, and Blyth men.

14,615. Looking to the views of those seamen and to the saving of life, if only one harbour was to be constructed?—It would certainly require more than only one harbour.

14,616. At what particular point do you think such a harbour would be the means of saving life?—Do you mean independent of the present harbours?

14,617. Yes?—I should not agree, as far as my opinion goes, that Filey should be one. It is a very contracted entrance and certainly not a safe place. I do not think there is any necessity existing for a harbour in Bridlington Bay. It is a safe roadstead, and with the wind to the southward laden vessels run in and take shelter there. I consider, myself, from my experience, that the Tees Bay would not be a good place for a harbour of refuge.

14,618. You said the Tees Bay?—I include from the Heugh to Redcar.

14,619. Tell me, in a word, if only one harbour was to be made, where would you place that harbour?—I think between Sunderland and Hartlepool.

14,620. I think! It is to be only one harbour?—If one harbour only is to be made.

14,621. You think between Sunderland and Hartlepool it would do more to save life?—I think the improvement of the present harbours would be considerably better.

14,622. (*Capt. Sulivan.*) Do you know of any place north of Hartlepool where the natural formation of a bay or point renders it easy to make a harbour?—It forms a natural bay from Hartlepool to Sunderland. I know no particular place which can be appropriated without considerable expense. In all places where there are harbours of refuge it implies that there should be room, considerable room. In dangerous times the harbours must be roomy for ships to take advantage of it, for there may be impediments to those coming in. Hence it must be a spacious place for a harbour of refuge.

14,623. For that reason would not the best place be where nature has formed a bay?—It would depend upon circumstances and the position of the place.

14,624. Supposing that at Hartlepool or Filey a good harbour would ensure accommodation, would either of those ports satisfy the wants of the south part of the district you have mentioned?—I do not think Filey can, because if you miss it there is nothing but hard cliffs to go against, and nothing but loss of life must ensue. If 150 vessels only can get in, and there are 100 following them, a portion would be saved, but a portion would be lost.

14,625. What position would you prefer, Filey or Hartlepool?—I would decidedly prefer Hartlepool to Filey; but still I have an objection to Hartlepool which I cannot easily get over, and I think at all times the Tyne is best.

14,626. From what you know of Hartlepool and Filey, which do you think would make the best harbour? which would give the greatest extent of deep water?—Do I understand that you are referring to Hartlepool Harbour or Hartlepool Bay?

14,627. Hartlepool with the corner turned into a breakwater, or Filey?—Of course, I must naturally prefer Hartlepool.

14,628. (*Sir F. Smith.*) I think that, in answer to the last question, you said that if the same accommodation could be obtained at Hartlepool and Filey you would prefer Hartlepool to Filey?—Yes, simply from the fact that there are so many vessels in the locality. It is easy of access, and it frequently happens that vessels are taken before they reach so far south as Filey. It often happens that they leave Seaham, Sunderland, and Shields, and meet with contrary winds, quite a storm, and they would be glad to avail themselves of a harbour of refuge at Hartlepool.

14,629. They would come to the Tyne if the bar were reduced?—Yes, the Tyne has already advantages which a harbour of refuge at Hartlepool could not have.

14,630. What do laden colliers draw?—From fourteen to sixteen feet.

14,631. Then sixteen feet over the bar would not suffice for those?—They could contend a little and wait until to tide rose.

14,632. But as you stated that they draw sixteen feet, they would require a little more water, I suppose, if it were blowing fresh?—Of course they would.

14,633. What would a vessel drawing sixteen feet require over her draught?—At least five feet in extreme weather.

14,634. That would be twenty-one feet. What does the tide rise?—In spring tides sixteen feet.

14,635. That is, how much per hour?—I have seen some tides rise much more rapidly than others; but about two and a half feet per hour.

14,636. They would dodge about for two hours before they could come over the bar, according to your calculation?—Yes.

14,637. Is there any remedy for that?—Nothing, except engineering.

14,638. Do you think you would remedy it by carrying the piers out to deep water?—I think you would.

14,639. How far out would you carry them?—To seven fathoms water.

14,640. Have you taken into consideration that Hartlepool is silting up?—I believe it is slightly. That is the opinion of the fishermen.

14,641. You have not heard that Filey is silting up?—No, there is no silting at Filey.

14,642. So that whatever water you got there by

forming a breakwater, you would retain, would you not?—I should think you would at Filey.

14,643. But you would not retain it at Hartlepool?—I used to hear, when trading there, pilots and fishermen say that there was not so much water in the bay as formerly.

14,644. But you do not know of your own knowledge?—No, not at present.

Mr. JAMES CROZIER examined.

Mr. J. Crozier.

14,645. (*Chairman.*) How long have you followed the sea?—Forty years.

14,646. And of that time how long in command of vessels?—I never commanded any vessels yet; I have just been a seaman.

14,647. Have you been mate in a vessel?—Yes; I have been mate of a collier.

14,648. You were present during Mr. Joblin's examination?—Yes.

14,649. And you heard the explanation which I gave him as to the extent to which we could receive your memorial as representing your brother seamen, and you perfectly understand my explanation?—Yes.

14,650. That being the case, would you prefer to make a statement, or would you prefer that I should put questions to you?—Well, I can generally say that all the seamen in this river think that if there was only one harbour of refuge to be made, it should be in the Tyne.

14,651. Then, I understand you to say that is the general opinion of seafaring men?—That is the general opinion of the people here.

14,652. And they are prepared to prefer distinctly the improvement of the three ports to having one large harbour in the neighbourhood of Flamborough Head?—Yes; and they reckon the Tyne as good a place as any which they can prefer to the improvement of those harbours.

14,653. (*Mr. Lindsay.*) Do you agree generally in the views stated by Mr. Joblin?—Yes.

14,654. You concur in those views generally?—Yes.

14,655. Have you anything to add to them—anything which we have not heard?—Yes. I have travelled the seas for 30 years, and I have often been caught during that time on this coast. I have very seldom been out of the coal trade myself during these last 20 years, and oft times I have been caught very short; and I have been caught off Flamborough Head and off Tuffitt, but ships in general are frightened to run to Hartlepool because of the broken water. They come to Shields and sometimes to Leith, but I have not been to Leith Roads myself.

14,656. They are not so afraid to come to Shields as to come to Hartlepool?—No, considering the broken water in the bay. My opinion is, that I think to have a refuge in the Tyne is preferable to any other place that I know of.

14,657. Then you think a harbour of refuge at the Tyne would do most to save life?—Yes, I do.

14,658. That is your opinion as a sailor?—Yes.

14,659. (*Capt. Sulivan.*) Supposing you were caught in an east or east-north-east gale off Flamborough Head, which would be the safest to run for, Hartlepool or Filey, if there were a harbour of refuge in both?—I would sooner run to Hartlepool than Filey with a gale of wind from the east-north-east.

14,660. Supposing you could fetch either, and you had your choice. You made an objection to Hartlepool as a dangerous place to run for, and having broken water. Supposing there were harbours at Filey and Hartlepool, and you could fetch either, which would you choose as the safest place to run for?—It all depends what kind of a harbour you do make at Hartlepool.

14,661. Supposing there was an equally good harbour at Filey?—I would sooner run for Filey with the wind east-north-east.

14,662. Which would be most available in an east-north-east gale?—I reckon Filey.

14,663. Do you know whether there is less water in Hartlepool Bay?—I cannot say.

14,664. Have you struck more heavily of late than you did some years back?—It is about six years ago since I went in, and then we struck.

(*Chairman.*) Before Mr. Crozier and Mr. Joblin leave, I wish to say, that although we do not receive their memorial as expressing more than the sentiments of 300 seamen, there is nothing to prevent their having a memorial drawn up, and having it signed by any number who may choose to sign, and that can be forwarded, properly authenticated, to our Secretary. I think, Mr. Mather, these are the only two witnesses whom you wished to have called.

(*Mr. Mather.*) Yes.

Mr. KENDLISH examined.

Mr. Kendlish.

14,665. (*Chairman.*) You are a North Sea pilot?—Yes.

14,666. Do you belong to this port?—Yes.

14,667. For what period have you been a pilot?—For 21 years.

14,668. And for what period a master?—Fifteen years besides the 21 years.

14,669. Have you been present during this inquiry?—Occasionally.

14,670. Do you generally concur in the opinion which has been given to us, that the improvement of the three ports, the Tyne, the Wear, and the Tees, is preferable to one large harbour of refuge?—I should say that one harbour of refuge is wanted.

14,671. You say that one harbour would be preferable to the improvement of the three?—No; the Tyne improvement of itself.

14,672. State to me your opinion, whether you consider it more advisable to improve the Tyne, the Wear, and the Tees, with the view of making them harbours of refuge for the saving of life, or whether it is more advisable to have one large harbour at Hartlepool or Flamborough Head?—One harbour of refuge, and let the Tyne and the others go on improving—the Tyne to go on improving, as it has improved of late immensely.

14,673. Where would you consider the best site for that one harbour of refuge?—Where the greatest number of ships are passing or repassing, consequently Filey Bay.

14,674. (*Sir F. Smith.*) You reckon that the Tyne is doing its own work?—Yes.

14,675. Therefore whatever is done should be done somewhere else?—Yes.

14,676. But do you not think that if the shipowners of the Tyne are doing a great deal, not only for themselves, but for the nation, they have as much right to be assisted as those who are doing nothing?—I do not understand you rightly. The Tyne is improving.

14,677. I know that. I will put the question rather more simply. The Tyne shipowners are doing a great deal towards improving the Tyne, at their own cost, without any help from the nation?—Yes.

14,678. But in order to do all which is required, a much larger sum is needed than is already available?—I do not know how to answer that question. We are assisting the Tyne.

14,679. I take it for granted that you would not object to a portion of the national funds coming to assist the Tyne?—None whatever.

14,680. And if there is any to spare you would like that to be applied to other harbours?—Yes.

14,681. Supposing the Tyne completed, partly by national funds, where else would you apply the national money, with a view to save life and property? Supposing that you had to indicate the position,

NORTH SHIELDS.

Mr. Kendlish.

14 Oct. 1858.

what point would you fix upon ?—On the coast from Duncansby Head up to Flamborough Head.

14,682. (*Mr. Lindsay.*) Where do you belong to ?—I belong to Shields.

14,683. You are employed as a North Sea pilot ?—I am retired.

14,684. Were you employed in taking ships to the north and to London ?—I have been pilot of H.M. ships all round the Orkneys, and to Portsmouth and Sheerness.

14,685. Do you think that a harbour of refuge is necessary on the north-east coast of Scotland ?—Yes.

14,686. Where is the best site, Wick, Fraserburgh, or Peterhead ?—I should prefer Wick. I was in it last year ; I have been in it frequently.

14,687. Looking to this coast, and supposing that the Commissioners of the existing harbours were making no improvements, and spending no money, and looking alone to the site, which, in your opinion, would save most life and property ? At what particular point would a harbour of refuge do most good between Flamborough Head and the Farn Islands ?—There is no place which I can point to where you want it more, both for light and laden vessels, than Filey Bay.

14,688. Looking at all considerations, if only one harbour was to be made, is it your opinion that it ought to be made at Filey in preference to Hartlepool or the Tyne ?—Supposing the Tyne is going on as it is ?

14,689. I want to know your opinion, supposing that no improvements were going on at the Tyne ; I want your opinion as to the best position within those limits ?—I know.

14,690. Supposing the Tyne were not completed ?—There is no other point I can point to you but Filey Bay.

14,691. Tell me the place which you are in favour of ?—That is the only place I can point to, Filey. It would frequently be clear of shipping, but that is the place to run to in gales of wind from the south-east and south-south-east.

14,692. Do you think it would do more to save life and property than the harbour of the Tyne ?—No ; the harbour of the Tyne must go on improving. When a vessel goes so far southwards as the Head she does not want to be bearing up to the Tyne or Leith Roads.

14,693. But whether do you think a harbour at the Tyne or at Filey would do more to save life and property ?—At the Tyne, of course. It is the best weather port we have on the east coast of England.

14,694. Then it is your opinion that a harbour at the Tyne would do more to save life and property than at Filey Bay ?—I cannot answer that question. The Tyne is one place to run to for refuge at present, or Leith Roads, but a harbour at Filey is wanted. When ships get southward of the Head, and are obliged to run back and cannot take the Tyne, they are obliged to go to Leith Roads. If there were a harbour of refuge at Filey they would go into Filey.

14,695. You would like to have a harbour of refuge at Filey, but you would like, also, to see the Tyne improved ?—Yes.

14,696. To which would you give the preference ?—I would give the preference to Shields.

14,697. (*Capt. Sulivan.*) Supposing that those improvements are going on at the Tyne, and 15 feet of water, as it is said, are obtained, then do you consider the best outlay of public money is upon a harbour of refuge further south ?—The Tyne improved to 15 feet would make it a harbour of refuge at low water.

14,698. Supposing that to be the case then, do you consider the next best place would be a harbour of refuge in Filey Bay ?—Yes.

14,699. You know that there are works going on at the Tyne to improve it ?—Yes.

14,700. And that if they answer there will be a greater depth of water than at present ?—Yes.

14,701. Then if the works succeed there will be more depth of water ?—If the piers go off to five fathoms no doubt it will be improved.

14,702. But if the present works fail to give increased depth then, would it be certain that any outlay of money would improve it ?—If it were four fathoms it would be improved.

14,703. Do you believe that 15 feet of water or more will be obtained by the present works ?—With the present works more than 15 feet.

14,704. Will it be a valuable harbour then with more than 15 feet of water ?—It would.

14,705. Then would you have no harbour south and try to get more depth than 15 feet at the Tyne ?—There would be 60 miles difference for us to come back.

14,706. Then you would rather have two harbours, than one having 15 feet, and another further south, than have that at the Tyne deeper than 15 feet ?—If the Tyne had more than 15 feet there would be only one harbour from Flamborough Head to Duncansby Head.

14,707. Then you consider two harbours better than one deeper one ?—Yes, one at the Tyne and one at Filey.

14,708. Have you had much experience at Hartlepool ?—Very little. I was never but twice in Hartlepool in my life.

14,709. Then why do you speak so confidently that it is inferior to Filey ?—It is in a bight. You cannot clear the land.

14,710. Then supposing it is in the depth of a bay, would you not fetch in more surely than at a more weatherly point ?—No, I should say not. It is a bad place to get in.

14,711. Would Filey be a good place to get out of if the wind were north of east ?—If the wind were east-north-east you would be able to get on your passage to London.

14,712. Is the beach good at Filey for beaching upon ?—Yes, a good sandy beach. When I was last at sea, in December, 200 vessels were riding in Filey, and I came home from Flamborough Head with the wind east-half-south against me.

14,713. (*Mr. Coode.*) Do many vessels get shelter under Flamborough Head in going to the southward ?—Dead under the Head.

14,714. Because they cannot get to the southward ?—Yes.

14,715. Does that often happen ?—Frequently. When it is blowing strong it is the only shelter you have.

14,716. If a ship cannot get in, what does she do ?—Dodge under the Head to see whether she can get a chance in a few hours. There is quite a roadstead off Filey Bay, and the ships go in to anchor.

14,717. If the wind goes to the south-east might you not be in danger ?—If you are going to the northward.

14,718. But with proper shelter you could hold very comfortably at Filey ?—You could hold very comfortably. By the plan I have seen you could lie there in any wind.

14,719. Have you talked with experienced masters as to the best site for a harbour of refuge on this coast ?—I have had conversation with some.

14,720. What is the opinion which you have gathered from them ?—Their opinion is for Filey. It has a good outlet, and in my opinion, in northerly gales, there would not be so many ships run for Bridlington Bay as there have done.

14,721. (*Mr. Lindsay.*) Have you had conversation with others besides masters and pilots ?—No, none besides nautical men—seamen.

14,722. Has anybody asked you to give evidence here to-day ?—There was a gentleman asked me if I knew anything about Filey. I told that him I had rode out many gales of wind there.

14,723. Who was he ?—I do not know his name.

14,724. Where did you meet him ?—In the street. He said he was looking out for experienced men who knew Filey, and he asked me if I would go and give evidence.

14,725. And you said you would ?—Yes.

Mr. EDWARD MACE examined.

NORTH SHIELDS.

Mr. E. Mace.

14 Oct. 1858.

14,726. (*Chairman.*) How long have you followed the sea?—Thirty-eight years.

14,727. How long in command of a vessel?—Twenty-four years come Christmas.

14,728. You have been present during the course of this inquiry?—Yes, partly.

14,729. Will you now give me your opinion whether it is better to improve the three ports of the Tyne, the Wear, and the Tees, or to have a single harbour in the neighbourhood of Flamborough Head? I should prefer one about the neighbourhood of Flamborough Head.

14,730. Will you state your reason?—I have been trading to the Tyne for the last 24 years, and I have looked in vain oftentimes for a harbour of refuge along the coast, and I have been one among many congregated under the Head hove to. I have dodged about according to the nature of the wind and looked in vain for a harbour, and could not find it.

14,731. Did you hear the evidence about Bridlington Bay?—I have heard some.

14,732. If we are told that Bridlington Bay is preferable as a site?—It is not my opinion.

14,733. Why?—Because oftentimes you cannot get round the Head with the wind to the southward.

14,734. You have heard the opinion expressed by the witnesses that you would want a harbour so large that it would be very difficult to make one large enough at Filey. What is your opinion about that?—I should think it very desirable if it could be done.

14,735. If it could be made a large harbour, what number should it be made to accommodate?—Not less than to hold 700 sail.

14,736. But supposing that a harbour to hold 700 sail would cost two millions of money, do you think that Filey to hold 300 would be of service in the meantime?—Undoubtedly it would.

14,737. And would you consider it still more desirable, if in the formation of a harbour the extension of it hereafter should be kept in view, if it should be found to answer. Do you understand the question?—Not properly.

14,738. You say that this harbour, to be of real service, should hold 700 sail. You have also told me that one to hold 300 sail would be of great service. Would it be of still more service if in the formation of the harbour to hold 300 sail it was kept in view that if the trade were found to resort to it it might be increased. Would that increase its value very much in your opinion?—I think so.

14,739. (*Sir F. Smith.*) You have had great experience on this coast, I think you said?—Yes.

14,740. Did you ever see 700 vessels off Flamborough Head at one time?—Not so many, not at one time.

14,741. Then why do you think you must have a harbour to hold 700 ships. They do not require a harbour of refuge all at the same time?—Those bound to the south do.

14,742. You have never heard of 700 wanting shelter?—Yes, I have.

14,743. In what year was that?—In 1826.

14,744. What month?—I cannot tell.

14,745. Bound north or south?—Bound to the south, because they were laden ships.

14,746. Chiefly colliers?—Chiefly colliers.

14,747. Was it summer or winter time?—In the winter time.

14,748. It is a very large number. Supposing that it were found impossible to form a harbour to hold 700 ships at Filey, and still thinking that 700 require refuge, where would you apply the funds to take in the residue of those which could not be taken in at Filey. Assuming that a breakwater was made to give as much capacity as possible, and only 300 could be taken in at Filey, what would you do with the other 400; where would you accommodate them?—I would make another harbour in the Tyne.

14,749. Could you take 400 ships in the Tyne in addition to the ordinary trade?—I should think so.

14,750. Where would your anchorage be?—In the Tyne.

14,751. Yes, but where?—I have known in the Tyne as many as 1,200 vessels.

14,752. You have room for your ordinary trading vessels, but you are not prepared to take in 400 bound elsewhere besides, are you?—I should think that the Tyne would hold them, with the improvements which are talked of.

14,753. Would it not be dangerous with so many ships about the mouth of the harbour and in the offing?—If there was a harbour of refuge they would come in one after another.

14,754. They would all try to run in, you know; remember, 400 vessels all struggling for the same entrance?—Many of them would not run in at all. Some of the superior ships would keep to sea.

14,755. Would it not lead to collisions?—I think it would.

14,756. Have you seen the wreck chart?—No.

14,757. Do you know the Firth of Forth?—No, I have never been north of the Tyne.

14,758. The Firth of Forth being naturally a good harbour of refuge, and a great many collisions having occurred off it, do you think that those collisions have occurred from a number of vessels trying to get in at one time?—I dare say they have.

14,759. If you place a harbour of refuge at each end of your limit, do you not leave the centre part very much unprovided for?—I do not understand.

14,760. If you form a harbour at one extremity—at Flamborough Head, Bridlington, or Filey,—and another here, do you not leave a large space unprovided for?—Yes.

14,761. Would it not be better to have three harbours?—The more you have the better.

14,762. Would not that tend very much more, in your opinion, to diminish the loss of life?—I think it would.

14,763. (*Mr. Lindsay.*) Supposing there was only to be one harbour between the Farn Islands and Flamborough Head, where would you prefer it?—In the neighbourhood of the Head, because of the number of ships which congregate there.

14,764. Do you belong to the Tyne?—No; I belong to London.

14,765. Did any one ask you to come here?—A gentleman asked me.

14,766. Do you know him?—No.

14,767. Did he put any questions to you?—No; he asked if I would give evidence for Filey.

14,768. There was no other conversation?—I broached the subject to him. I did not know that he felt any interest in harbours of refuge.

14,769. Did he speak first?—Yes, he spoke to me first.

14,770. What did he say?—He asked if I would give evidence for a harbour of refuge. I said there was one very much wanted about here, and I had felt the want of it myself often times.

14,771. Did anything else pass?—I said that I had no objection to give evidence; I would speak the truth if I came here. There is certainly a harbour of refuge wanting for ships trading between here and London. I have been trading between here and London for the last 20 years.

14,772. Do you think the expenditure of money at three places would do more than at one?—I would rather see one large harbour of refuge.

14,773. Do you think that would do more to save life than the improvement of the Tyne and Hartlepool, so as to admit ships at all times of the tide?—If you improve them, I think it will be more an advantage for shipping.

14,774. Supposing you could make a harbour at the Tyne, which vessels could enter at all times of the tide, whether do you think such a harbour would do more to save life and property than such a harbour at Filey?—I should still say Filey.

14,775. (*Capt. Sulivan.*) Do you think the London

NORTH SHIELDS.

Mr. E. Mace.

14 Oct. 1858.

Capt. Sulivan.

masters trading to the colliery ports generally will agree with you?—I think so.

14,776. Do you not think that a London master is quite as likely to give independent evidence as any master in this port or any other colliery port?—Certainly I do.

14,777. Do you think there will be any difficulty at any time in getting the London masters to give evidence in London?—I do not think there will be much difficulty in doing so.

14,778. Supposing an improvement of the harbours to the depth of 15 feet in this harbour, will that, in your opinion, give a harbour of refuge to that extent here?—Yes; and a harbour of refuge to the south will prevent laden ships running back to the Tyne.

14,779. Is it for laden ships that you generally desire a harbour of refuge?—Yes, decidedly for the laden ships.

14,780. Speaking of the number of ships off Flamborough Head which would avail themselves of a harbour of refuge at Filey, do you consider that a harbour there would be useful, not only as a stopping place, but actually for saving life and property, by saving the risk they would run in running back?—Decidedly they would, for there is more risk off Flamborough Head than at any part of the coast I know of.

14,781. Do you know Hartlepool?—I have been there only twice.

14,782. Would vessels caught in easterly gales more easily reach Hartlepool than Filey?—I do not like Hartlepool. I was drove ashore once. We were taken off the Head with the wind dead east. There were 50 ships; 14 went ashore, and three foundered in the bay. I always steer clear of Hartlepool if I can.

14,783. If there had been a harbour of refuge there, would not those ships have been saved?—In a harbour of refuge you are always safe.

14,784. Where were those vessels?—Off Whitby. That was in November, 1841.

14,785. Would they have been saved if there had been a harbour at Filey?—In my opinion not, when caught off the Head 10 miles.

14,786. Was the wind too far northward of east?—The wind was dead east. We could not fetch the Tyne or the Wear. We bore up for Hartlepool and went on to the beach; 14 of us I counted in the morning.

14,787. From what you know of Filey, if the wind had shifted east-north-east would you have been able to get round the Head?—With a great deal of ease. The course is south-east-south. If the wind was east-north-east they would haul out.

14,788. From what you know of the custom of trade, do you think that if there were a demand for ships' anchors and cables at Filey, the trade would supply the demand there?—I believe they would.

14,789. Although there is nothing there of the kind now?—Trade will follow the ships, I have seen that in my experience.

14,790. Do you know the beach at Filey?—I do.

14,791. Is it a good beach for beaching?—Yes.

14,792. Supposing the harbour was crowded, and it would be a great risk for any more to anchor, would vessels running on that beach, even if the harbour were overcrowded, be likely to save the lives and the property in them, although they could not anchor?—It is my opinion that they would save both life and property.

14,793. (*Capt. Vetch.*) In 1826 you counted 700 vessels off Flamborough Head?—I did not count them, I heard that such a thing had taken place.

14,794. Where were they bound for?—Bound to different parts; to the south.

14,795. What direction?—To the south. They were brought up under Speeton Cliff, where they ride when the wind is southerly.

14,796. They were unable to proceed on their voyage?—Yes.

14,797. Where did they take shelter?—They were riding under Speeton Cliff. That is in Filey Bay.

14,798. Where did your ship run to on that occasion?—I was not there; I said I had only heard of such an occasion.

14,799. (*Chairman.*) Of course you know Yarmouth Roads very well?—Yes.

14,800. What is the greatest number of vessels which you have known lying there?—In Lowestoft Roads, 1,700 sail.

14,801. Have you ever found Yarmouth Roads so crowded that there was difficulty to find anchorage for a vessel?—Yes, but only once.

14,802. (*Sir F. Smith.*) You stated that where he ships go the trade will follow. From your own experience you say you know that will be the case. Tell me what case you have known in your own experience?—I say from what I have seen.

14,803. Tell me where your experience has been?—Even at the Tyne the trade follows the ships.

14,804. I do not think that is a case in point, because the ships which come to the Tyne come where the trade is; you said that your own experience proved to you that the trade would follow the ships. I want to know the case which has proved that to you?—If a trade springs up, the trade follows, where the ships go. There is Lowestoft I can mention for one instance.

14,805. That is a case in which the trade has followed the ships. Do you know any other case?—No; but it is naturally so.

14,806. I will ask one other question to strengthen your evidence. You said that you were asked to give evidence before the Commissioners, but that you were not asked to give evidence in reference to harbours of refuge in general, but in favour of one locality?—In favour of the part I wanted myself.

Previous questions put by Mr. Lindsay having been read over from the short-hand writers' notes:—

14,807. In reference to those questions, you were asked to give evidence in favour of Filey; I wanted to know where you came in contact with the gentleman who asked you; was it in the street?—At the New Quay.

14,808. Did you accost him, or did he accost you?—He said, will you give evidence? I said, what for? He said, for Filey. I said, yes; I have seen the necessity for a harbour of refuge in Filey Bay for the last 17 years.

14,809. And that is all that passed?—Yes, I would go to London to speak for a harbour in Filey. More than that, I warrant me, I speak the sentiments of one half the maritime population out of the port of the Tyne.

14,810. Have you ever consulted anybody to ascertain that fact?—Yes.

14,811. Because you are speaking as if you had authority for saying that?—It is merely from conversation which I have had with different people, different ships' people. When we go to London we lie in crowds, quarter to quarter, and we hold conversation upon the different ports of the coast as to harbours of refuge.

14,812. And it is the general feeling that Filey is the place?—I believe it is.

14,813. Have you ever heard Redcar mentioned?—I might.

14,814. Have you ever anchored in Filey Bay?—Yes, several times.

14,815. Where bound for?—For London.

14,816. Laden?—Yes, we were waiting for a change of wind to get round the Head, and after knocking about for three or four days we were glad to lay up, and get a little rest.

14,817. Do you think the great objection to Filey is the fear of the wind from the east?—Yes.

14,818. You have heard the evidence as to the north coast of Scotland?—I have, but I was a long distance off.

14,819. It is stated, that it is very desirable to have

NORTH SHIELDS.

Mr. F. Mace.

14 Oct. 1858.

a port where vessels can come in, to give the worn-out seamen rest and refreshment?—Yes, I think so.

14,820. How many vessels were there in Filey Bay on the occasion to which you refer?—About 130.

14,821. Was there good shelter there?—It was then.

14,822. From what winds?—South and by west.

14,823. How would you place a breakwater to give the protection necessary for your large fleet of vessels?—It is a harbour partly formed by nature. The Brigs run off in an east-south-east direction. Extend those Brigs. You can run it as far as you like.

14,824. How far would you run it?—I am not a judge of building breakwaters.

14,825. You have been there often?—I have seen the necessity of a harbour by the quantity of shipping riding there.

14,826. You have on idea of the extent of the breakwater to get the acreage which you want?—It might be a mile, or a mile and three quarters, but I think a harbour of refuge can be made very well at Filey, and it has been wanted for a long time past.

14,827. (*Capt. Sulivan.*) Were you in great danger at Filey of being caught on a lee shore if the wind had gone to the eastward?—Yes.

14,828. On the coast of Scotland, would you say a harbour should be placed where a ship can go off on either tack?—I know nothing of Scotland. I have never seen Scotland. I have never been driven to the north of the Tyne.

14,829. But if there were a point of coast where a ship could go off with the wind abaft the beam, would she be in any danger?—If a ship can go off with the wind fair, I do not see any danger of her going ashore.

14,830. (*Chairman.*) You wish to make some statement?—I beg to inform you, gentlemen, that I have no interest in coming here this evening, and I merely came to give evidence in favour of a harbour of refuge somewhere.

14,831. Upon our return to London shall we be able to have some masters of colliers before us?—Oh yes, every one of them, and they will speak the same sentiments which I speak here.

(*Chairman.*) Is there any person present whatever who wishes to tender evidence on the subject of this inquiry?

The short-hand writer was directed to minute "No answer."

(*Mr Gray.*) I have not been solicited to give evidence, and I shall give such evidence as I am able, having served an apprenticeship, and being now a shipowner of this port, if you think proper to examine me. I, to a great extent, disagree with most of the evidence which has been given.

Mr. William Gray examined.

Mr. W. Gray.

14,832. (*Chairman.*) For what periods have you been in command of vessels, and at sea?—I was for about 15 years in command of a vessel. I served an apprenticeship, and was mate of a ship besides.

14,833. You have been present during this inquiry?—I have.

14,834. State in what point you disagree from the previous evidence?—In my opinion no tidal harbour can be considered as a port of refuge, and I do not consider that any improvement in either of the three ports—the Tyne, the Wear, or the Tees—can make them anything more than actual tidal harbours. I have no objection to all those three harbours being improved by Government aid; but at the same time I would not be disposed to consider them as harbours of refuge, such as I consider a harbour of refuge should be, a place where a large ship as well as a small one might enter night or day at any time of tide.

14,835. State where, in your opinion, is the most eligible site for a harbour of refuge, such as you propose?—I consider the very depth of the bight mentioned by Mr. Poppelwell and Mr. Joblin, that part of the coast north of Hartlepool, the deepest part of the bight between Hartlepool and Sunderland, that being the deepest part, drawing a line from the Farn Islands to Flamborough Head. A harbour being placed in that position would consequently be to leeward of all vessels which stand in need of it, and would be accessible by a greater number of vessels than if placed at the point of Flamborough Head. The great bulk of the vessels leaving these ports may be caught on the coast before they get to Flamborough Head, and, consequently, could not reach Filey Bay unless they were far enough to windward. I have no objection to a port at Filey Bay, because if a vessel is at sea and can reach Filey she would never come down in a bight, because Filey would be a better loose from.

14,836. Are you acquainted with the land about Hartlepool?—I traded there for nine months.

14,837. Is the land easy to make in thick weather, blowing very heavy from the eastward?—No; the land is low there.

14,838. Would you consider that a disadvantageous circumstance as respects placing a harbour of refuge there?—I consider that a ship going out of one of these ports has some idea of where her position is. The land to the north of Hartlepool is higher, and has some landmark. If there were a harbour there it would be a breakwater, and it would be bold close to the cliff, so that you could see before you got into any danger.

14,839. (*Mr. Lindsay.*) You stated, as your opinion, that no harbour can be called a harbour of refuge unless it is accessible at all times of the tide, and either by night or day?—Not such as I would call a harbour of refuge.

14,840. That is, a harbour of refuge in the strict sense of the word, in your opinion?—Yes.

14,841. Well then, if the places named to-day, Hartlepool, the Wear, or the Tyne, could be made so that they would admit ships at all times of the tide, and vessels of all sizes, would you not consider them harbours of refuge in the strict sense of the word?—I look upon it as an impossibility.

14,842. But supposing that it could be done?—But any place that can be made a place to enter at any time of tide with any size ship must be admitted to be a safe harbour of refuge.

14,843. Why is it a matter of greater impossibility to make either of these places a harbour of refuge than it would be to make one at the site proposed, to the north of Hartlepool?—I do not catch the question.

14,844. You say that if those harbours could be made accessible at all times of tide, then you would consider them harbours of refuge; but you consider it impossible to make them so. Why is it more impossible to make those harbours accessible at all times of tide than to make one to the north of Hartlepool?—Suppose you do deepen the water at the bar to 15 feet by extending the piers, still you have shallow water in the harbour of Shields. Consequently, with 15 feet on the bar, with a heavy sea, it would be no good to large ships.

14,845. Supposing that the piers were extended to 30 feet of water?—Then you must deepen the harbour, you must take away the in-grounds, you must take away the middle grounds; you must deepen the narrows down to the bar. Now, you cannot cross over to the north side to the moving berths, although they are the lowest in the Tyne.

14,846. Do you not think the Narrows would deepen to the same depths as the bar?—I cannot answer that question. I cannot see that it is possible, and I do not think that it is credible.

14,847. You cannot see that it is possible?—I do not say that it is impossible.

14,848. Because I understood you, when you commenced, to say it was impossible?—Looking to the

NORTH SHIELDS.

Mr. W. Gray.

14 Oct. 1858.

Mr. Lindsay.

Tyne as it is, I think it is impossible to make the Tyne a harbour of refuge. In the present condition of the harbour of Shields there is not more accommodation than will accommodate the present trade of the port. I have seen the harbour filled with ships. A notice signed W. Wake, "That ships cannot come down from the Spouts, as there is not room for them in harbour," is of frequent occurrence in the winter season with gales from the south-east.

14,849. And if the dock accommodation were to clear the river would that remove your objection to the Tyne?—As a harbour of refuge, I cannot say that it would ever remove my objection. Docks will improve the harbour gates, but as to making a place to save life, I cannot see any place along the coast adapted, except by a breakwater and some space to lie in.

14,850. If the harbour here were deepened to 15 feet, would it not save as much life as anywhere else?—It would be better for ships to come in.

14,851. And in that case the lives of their crews would be saved?—But you cannot call it a harbour of refuge to have to run ashore to save life.

14,852. Would it be necessary for ships to run ashore?—At low water it would.

14,853. If the channel were deepened to the same depths?—If it were deepened to the same depth to admit all the way in, and there was room for all of them in, but considering that in a south-east gale there is always a collection of ships here, as I have heard the harbour-master state, and many times I have seen the harbour-master at a loss to find places to put the ships after they come down laden.

14,854. Looking to the question of site. We will suppose that the Tyne, the Tees, and Filey Bay all afforded equal facilities as harbours of refuge. Then at which of those points do you think the construction of a harbour would do most to save life and property?—If they all possessed the same amount of facility to save life, I consider the Tyne or Hartlepool, inside the Tees, that is, supposing that inside the Tees there was room for any number of ships.

14,855. If they afforded equal facilities, am I to understand that you would prefer Hartlepool?—Supposing equal facilities, I should say the depth of the bight.

14,856. That is, that either Hartlepool or the Tyne would be better than Filey Bay?—Decidedly so.

14,857. (*Capt. Sulivan.*) Do you consider that the public money, if laid out to obtain a permanent harbour of refuge, should be risked on a site where it included within its boundaries a tidal river?—No.

14,858. Do you think that the first object in expending the public money to get a harbour of refuge should be to find a place where there was no chance of a tidal river, or any other cause, bringing silt and sand into it, if such a place could be found?—Most assuredly.

14,859. Do you further think it a desideratum, where nature has partly made a harbour and a smaller amount of money will enclose a larger area?—I think that idea should be a subject of consideration for the Commissioners.

14,860. Do you know, north of Hartlepool on that coast, any bay, such as Hartlepool Bay or Filey Bay, where the indentation of the coast partly makes the harbours, so that a pier run out from the head would enclose a sufficient area?—From Hartlepool here it runs out to the east, and the bay is indented as far north as Seaham.

14,861. How many miles is that?—Four or five miles.

14,862. How can you enclose that bay with a breakwater which should involve an at all moderate amount of money?—I cannot answer that question.

14,863. Then supposing you had to go to either Hartlepool or Filey, supposing they were equally safe from silting up, and putting aside what you have heard about Hartlepool silting up, which is the best place, do you consider, to lay out money?—My own private opinion is, that sand naturally tends to gather on Hartlepool Bay. Sand on the flood being more alive and tending to drive south, Hartlepool Bay is continually silting up, and consequently a harbour there would have that tendency; but if that were removed I would say in that bay, because it is down in the deep part of the bight, and drawing a line from the two outer nabs or heads, Flamborough Head and the Farn Islands, it affords a harbour of refuge to the largest number of ships.

14,864. You think that more vessels would fetch it in dangerous gales of wind?—Decidedly.

14,865. But supposing, from what you have stated, that there is some risk of Hartlepool continuing to silt up, and engineers and surveyors had discovered that in Filey there was no such risk, would you consider Filey a very useful place for the colliery trade as a harbour of refuge?—Considering that Filey would be available in a heavy gale of wind for a very small portion of the ships on the coast, I consider Hartlepool would be preferable to Filey Bay. Ships at Flamborough Head can always fetch Hartlepool or the Humber.

14,866. But I ask you, supposing that Hartlepool was silting up, allowing that if it is not silting up, it is the best place, would it be desirable to give some shelter to ships at Filey Bay?—The more shelter for ships the better, but for laying out the public money I think a better site can be found than Filey Bay.

14,867. South of Hartlepool?—No, north of Hartlepool. By making a breakwater to the north you would shelter Hartlepool from the north-east, and Sunderland from the south-east winds, and consequently it would be advantageous to both those ports.

14,868. Would not a breakwater necessarily be of enormous extent and in very deep water to afford any shelter to Sunderland and Hartlepool?—It would require a breakwater of three miles long to accommodate a fleet of 500 sail.

14,869. In what depth of water?—I dare say you must run it off in 10 fathoms of water.

(*Chairman.*) Is any one present from Warkworth. We have your memorial, Mr. Harrison, and we are quite prepared to go on with the matter if the deputation is here.

(*Mr. H. John Harrison.*) Unfortunately all our witnesses have gone off to Warkworth again.

(*Chairman.*) What course do you wish to propose? You can lodge your memorial and send further documentary evidence to London.

(*Mr. J. Harrison.*) Then you wish it to be in writing?

(*Chairman.*) Yes.

(*Chairman.*) Is there any person present who wishes to tender further evidence with respect to this inquiry?

No answer.

Sittings at North Shields closed.

BLYTH.

Friday, 15th October 1858.

PRESENT :

Sir FREDERIC SMITH.

Captain VETCH. | Mr. COODE.

After inspecting the harbour works, the Commissioners adjourned to the harbour office, where they proceeded to receive a statement from

Mr. JAMES ABERNETHY, engineer to the Blyth Harbour and Dock Company, who laid before the Commissioners a plan of Blyth harbour, on a large scale, showing the extent of the works executed, and of the tidal estuary at the mouth of the river Blyth. He said, the harbour of Blyth may be termed a tidal estuary ; the river Blyth, which is a small stream terminating about four miles from the harbour mouth, by a dam across the head of the estuary, the navigable entrance channel to the harbour being maintained entirely by the ebbing and flowing of the tidal current. It is not, therefore, in the proper sense of the term a river or bar harbour. Previous to the year 1843, the entrance channel, extending from the eastern shore seaward, a length of 5,000 feet, was completely exposed to the action of the easterly storms. The entrance channel to the harbour has now been protected for a length of upwards of 4,000 feet, by the formation of a breakwater on its eastern side, thus converting what was formerly exposed upon sea shore into a sheltered haven. Dredging operations have also been carried out, and are in progress for the purpose of deepening and straightening the channel throughout its whole length. Powers have been obtained for the formation of docks on the western side of the entrance channel ; but previous to the construction of this work it was necessary to protect the site by the formation of the eastern breakwater. Contracts have been entered into for its final completion in a short period of time. The total length when completed will be 4,500 feet, at a cost of 35,600*l*. I have had some conversation with pilots and shipowners, and they are of opinion with the people of Tynemouth and of other ports, that the improvement of the existing harbours on the north-east coast of England would better serve the purposes of the shipping than the formation of a great harbour of refuge at any one given point. Entertaining this view of the matter, they would submit that the port of Blyth has some claims for consideration, inasmuch as at high water during the prevalent south-easterly storms light colliers driven in those storms northward of the Tyne mouth are very frequently in the habit of taking refuge in the port of Blyth. I have here a statement.

14,870. (*Sir F. Smith.*) Is that statement signed by any person ?

(*Mr. Abernethy.*) It is. It is signed by Robert Oliver. It shows that on the 30th of March 1850, and the 31st of March, no less than fifty-eight vessels took refuge in the port of Blyth during a south-easterly storm.

14,871. (*Sir F. Smith.*) Can you furnish the Commissioners with a copy of that statement ?

(*Mr. Abernethy.*) I can do so. Loaded colliers also in south-easterly gales are very frequently driven northward of the Tyne mouth, and are obliged to run as far north as the Firth of Forth for shelter. By the extension of the eastern breakwater, now constructing at the port of Blyth, as far as the rocks called the Beacon Bushes, aided by the dredging operations, a depth of ten feet could be obtained at low water of spring tides, which would enable the greater number of the laden colliers, at a very early period of the tide, in case of south-easterly storms and missing Tynemouth, to take refuge in the port of Blyth; the extension of the breakwater to this length would cost the sum of 29,000*l*. The trade of the port of Blyth is on the increase.

14,872. (*Sir F. Smith.*) Will you furnish the Commissioners with that return from which you are reading ?

Mr. Abernethy undertook to send to the Commissioners a statistical return of the trade and revenue of the port of Blyth. Mr. Abernethy also undertook to instruct the harbour master to give to the Commissioners a return of all vessels, laden and in ballast, that have taken refuge in the port of Blyth for the last five years.

14,873. (*Capt. Vetch.*) Do I understand that the length of the pier down to the Beacon Bushes has been contracted for ?—No ; only as far as the parliamentary limits, as shown here upon the plan, called the Outer Beacon. It is not proposed at present to carry it further.

14,874. (*Sir F. Smith.*) Do you intend that vessels coming in here shall go alongside of wharfs or swing at anchor ?—You will observe that we have here a very wide tidal estuary which forms the Blyth harbour proper, and by dredging it might be increased to admit a very considerable number of vessels.

14,875. I presume you contemplate that vessels will ground here ?—We propose to have floating dock accommodation for foreign-going vessels which come here for steam coals.

14,876. Do I understand that you are going to make a dock ?—We propose to construct a dock, as shown on the plan, a tidal basin of 4½ acres area, and a dock of 15¾ acres.

14,877. You contemplate that ?—Yes.

14,878. Have you funds for that purpose ?—At present we have not funds ; the expenditure has been devoted entirely to the construction of the first necessary work, the eastern breakwater.

14,879. Until these docks are completed you are really not in a state to take in a number of vessels ? —We can take in a large number of ordinary class colliers, but not coppered vessels, which require floating-dock accommodation ; they object to lie on the shore.

14,880. What will be the depth of that channel throughout to seaward ?—The dredging operations are for the purpose, in the first place, of straightening the exceedingly tortuous and narrow existing channel, as well as of deepening it so as to ensure a depth of 17 feet in the first place at high water of ordinary spring tides, to be afterwards increased to 21 feet on the construction of the docks.

14,881. I believe colliers generally draw from 15 to 16 feet of water ?—That would be the largest class of colliers.

14,882. Have you a smaller class to take less water ? —We have a great number of colliers of a smaller class and a number of foreign vessels from France which do not draw more than 8, 10, or 12 feet water.

14,883. For these you will have ample depth of water at high water ?—Yes.

14,884. In fact it would be only a high-water harbour ?—But by the extension of the breakwater to Beacon Bushes, aided by the dredging operations to which there is no limits——

14,885. Except the limits of funds ?—Except the limits of funds——The port of Blyth might be made accessible to the ordinary class of colliers at low water of spring tides, and we find from experience that the additional depth obtained by the dredging is maintained.

14,886. Is there no silting up or forming of bars? —No, inasmuch as the entrance of the channel is preserved by the out-going current ; we have, as you will observe, 350 acres of tidal estuary above the

BLYTH.

Mr. Abernethy.

15 Oct. 1858.

Sir F. Smith.

entrance, which would keep and maintain the additional depth which we obtain by dredging.

14,887. There is no set of sand from the tide ?—There was a slight tendency for the sand to set in from the direction of the ebbing tide, but by the construction of the half-tide breakwater upon the western side of the entrance channel that tendency will be obviated.

14,888. Are there any rocks seaward of the harbour mouth which would make it difficult for vessels unacquainted with the port to enter at night ?—By the erection of proper leading lights in the direction of the entrance channel, under all circumstance vessels could enter with safety ; but, undoubtedly, the port would be rendered more safe in all cases if the pier was extended to the rocks called the Beacon Bushes, about 1,000 feet from the proposed termination of the present pier.

14,889. What depth of water is there round the Beacon Bushes ? What are the soundings ?—The soundings show a depth from 7 to 12 feet at low water spring tides round the Beacon Bushes ; and a depth of 3 feet at low water upon the rocks.

14,890. Are there any other dangerous rocks above the Beacon Bushes ?—There are not.

14,891. So that by daylight foreign vessels would have no difficulty in seeing their way into your harbour ; and at night you would exhibit a light which they would see ?—They would be greatly aided by the exhibition of a light on the point of the breakwater proposed.

14,892. Do you propose to give to the Commissioners any drawing explanatory of your system of breakwater ?—I propose to furnish the Commissioners with a detailed drawing explanatory of my system of breakwater at Blyth and at other sites, under different circumstances.

14,893. When will the Commissioners have these drawings ? Will they be sent to London ?—In London I propose to advise the Secretary to the Commission when I shall be ready to appear before the Commissioners.

14,894. Can you give any idea when we shall have the required drawings, in order that we may expect you, so as to arrange our other duties ?—I think within a period of a month from this time I shall be prepared.

14,895. (*Mr. Coode.*) What is the material forming the bed in the upper part of the harbour ?—Chiefly sandy and alluvial matter.

14,896. Have you had any perceptible increase over a series of years ?—We have not. There is an extensive creek lying to the westward of the main estuary into which the tide ebbs and flows, and in which there has been no perceptible deposit for a long period of years.

14,897. The water is perfectly still within that creek ?—It is perfectly still, and it is pure sea water.

14,898. Is there any accumulation at the back or the eastern side of the breakwater ?—I find that the beach is slightly raised since the formation of the eastern or half-tidal breakwater ; and one object which I wish to attain is, to confine the outgoing current between the western breakwater and the eastern breakwater, so as to do away with the tendency of the sandy point, opposite the outer beacon, to extend to the eastward. I find that the action of the outgoing current will have a most beneficial effect in the removal of that point.

14,899. What is the nature of the material at the back of the eastern half-tide breakwater ?—Sand.

14,900. Have you found any material accumulation since the construction of that breakwater ?—The beach has been slightly raised since the formation of that portion of the half-tide breakwater, and I am desirous that this effect should be produced, so that the whole amount of the outgoing tidal current may pass down the entrance channel proper, instead of passing out as originally over the sands to the westward of the entrance.

14,901. Do you think you can furnish to the Commissioners a detailed drawing of the construction of Blyth breakwater at any early period ? When will you undertake to do it ?—As far as the construction of the Blyth breakwater is concerned, I can furnish it within a fortnight from this period.

14,902. I had reference also to the proposed improvements of which you spoke ; you spoke of other sites with which you are connected, can you name any earlier period than a month to furnish the drawings ? —The drawings will be very numerous, and I shall have to devote much time to them. I have to furnish details for the Aberdeen harbour, Fraserburgh harbour, Mumble roadstead, in the Bristol Channel, and also for the port of Blyth, so that the drawings will be very numerous.

14,903. (*Sir F. Smith.*) I am obliged to you for the information you have given the Commissioners ; would you like to present any memorial ?—I think the ship-owners would like to send a memorial in.

Very well, and if there is any individual here anxious to say anything to us, we shall be happy to hear him. We can also see any person in London ; we would be happy to do that.

(*Capt. Vetch.*) We cannot reach London for a fortnight yet.

Sir Matthew White Ridley stated, That many vessels which previously took in only a portion of their cargo of coals, now can take their whole cargo in, without keeling off at sea.

Mr. Abernethy re-examined.

Mr. Abernethy.

14,904. We have deepened the channel to the extent of three feet throughout.

14,905. (*Capt. Vetch.*) How far have you extended the breakwater in any one week ?—We have extended the breakwater 130 feet in one week.

14,906. (*Mr. Coode.*) Were those piles fixed at or above the level of low water ?—In that case the breakwater piles were fixed at the level of low water of a low spring tide.

14,907. (*Capt. Vetch.*) Was the hearting complete as well as the piling to the extent of 130 feet in one week ?—It was.

14,908. You have a contract in hand for those works? —We have a contract in hand now for the completion of the breakwater to the outer beacon, and the formation of a lighthouse at its termination.

14,909. What is the length of it ?—365 feet beyond its present termination. The contract for the completion of the pier to the outer beacon, including a lighthouse, is 6,800*l.*

14,910. In what depth will that pier terminate ?—Three feet of water at low spring tides.

14,911. At what period will the present contract be completed ?—The 30th of June next year ; of course the lighthouse is additional work, and it will require more time. The work might have been done in a shorter period.

14,912. How much of that sum is for the pier, and how much for the lighthouse ?—It was a lump sum.

14,913. Could you give us your estimate for the lighthouse independent of the pier ?—Yes, I will do so.

Mr. Abernethy agreed to furnish a copy of the plan of Blyth harbour and works on the Commissioners' scale.

The proceedings then terminated.

SUNDERLAND.

Friday, 15th October 1858.

PRESENT:

Admiral Hope (Chairman).

Mr. Lindsay.
Captain Washington.

Captain Sulivan.
Mr. Evans, Secretary.

SUNDERLAND.

15 Oct. 1858.

Mr. J. S. Robinson.—On behalf of the commissioners of the River Wear, and as their clerk, I beg to submit a memorial from them, and which, with your permission, I will read.

Port of Sunderland.

To the Royal Commissioners appointed to inquire into the subject of Harbours of Refuge.

The Memorial of the Commissioners of the River Wear and Port and Haven of Sunderland in the county palatine of Durham,

Humbly showeth,

That your memorialists view with the highest satisfaction the visit of a Royal Commission to this port, to inquire into the best means of affording increased protection to the valuable property constantly jeopardized on this dangerous coast, and to the still more valuable lives that are so frequently sacrificed for want of shelter for shipping in stress of weather.

That your memorialists, as being the public body intrusted by Parliament with the government of this harbour, under an Act passed in the year 1830, and comprising amongst their body the representatives of every class connected as well with the shipping as with the trade and commerce of the port, and the manufactures and minerals shipped therein, feel deeply interested in this truly national subject, and earnestly hope that through the aid of the knowledge and experience combined in the present Royal Commission the best means that can be discovered will be speedily adopted for the saving of life and property upon this coast.

Your memorialists, with some degree of pride, refer to the works that have been carried on under the superintendence of themselves and their predecessors for the improvement of this harbour, by means of which Sunderland has been raised from a small fishing creek to its present position, although still inappropriately designated a creek of Newcastle. This vast progress has been obtained by a very large outlay of money, as may be learnt from the fact that during the last 30 years your memorialists have expended upwards of 450,000*l.* in improving the harbour.

Your memorialists, however, in referring to the present trade of this port, must not omit to mention how greatly that trade has been increased by the construction of those magnificent docks immediately south of the harbour.

That in order to meet the requirements arising out of the increased size of vessels entering by the river entrance, as well as to improve the bar, and to render more tranquil the lower parts of the harbour, your memorialists determined, if possible, to carry out some external works, with a view of obtaining these objects, and accordingly, about the end of last year, resolved upon consulting the eminent harbour engineers (Messrs. Stevenson of Edinburgh), who on several former occasions have advised your memorialists as to matters connected with the port, and they were requested to prepare a plan to effect the desired objects at as small an estimated outlay as practicable.

The result of the investigations of those engineers is contained in their plan and report dated April 1858, which is handed in. The estimate of 180,000*l.* mentioned in that report is, in the opinion of your memorialists, a larger sum than, keeping in view the trade of the port, it would be wise and prudent for them to expend.

Your memorialists do not forget that they have powerful and enterprising competitors on all sides, and it is only by making Sunderland a place of cheap shipment that they can hope to secure and retain the coal trade properly belonging to it. At present the tax levied on coals produces fully two-thirds of the entire revenue; and if the full toll authorized by Parliament, which is 6*d.* per chaldron, were levied, the proportion would be much greater; but, for the above reasons, your memorialists at present only levy 3*d.* per chaldron. This rate is higher than the coal rate levied in the river Tyne, where the charge is only 2*d.* per chaldron. The only other material source of revenue is a tax of 1*d.* per ton per voyage, paid by shipping for three voyages in the year only. From these two sources a revenue, which now amounts to about 18,000*l.* per annum, is collected.

Such was the state of matters when the attention of your memorialists was first drawn to the subject of a harbour of refuge. Situated on a rocky foreshore, exposed to the heaviest seas of the German Ocean, and visited by the very large fleets of vessels that trade to the harbour and docks, the necessity for refuge accommodation at this place is too apparent to demand further notice, and is, indeed, painfully confirmed by a glance at any of the recent wreck charts, in which the long lines of black marks opposite to this port too clearly point out the correctness of this assertion.

Evidence will be submitted by our engineer, Mr. Meik, who has been for many years a resident in Sunderland, showing the sad proportion of shipwrecks upon that part of the coast within the jurisdiction of your memorialists as compared with any other portion of coast in the United Kingdom.

Our engineer is prepared with details of many of the most important storms that have visited this coast during the last few years, and will also give much information as to the number of shipwrecks and casualties during those storms, from which it appears that by far the greater number of vessels have been lost in their return voyage from London while in ballast, and with a wind to the southward of east. He will also be able to furnish full particulars of the number of vessels leaving and entering this port, with their tonnage.

It was after a careful consideration of all the circumstances of the case, as well as from the personal observation of your memorialists, that they unanimously arrived at the conclusion that one general harbour of refuge at any one part of the coast will not give that real and practical security and protection to life and property which the necessities of the case demand.

Your memorialists concur in the statement so forcibly brought out in the evidence given before the Committee of the House of Commons upon this subject, that a master will always make for his port of destination.

The great bulk of the coal trade must necessarily be carried on at the Tyne and the Wear, both north of Hartlepool, where it has been suggested a harbour of refuge should be formed; and your memorialists are of opinion that were such a harbour established at that place it would not be available for vessels during a south-east gale, bound for either of the above ports.

Your memorialists therefore have no hesitation in stating that in their judgment the best mode of providing safe and available shelter is by the improvement of the most important harbours upon the coast, so as to make them easily accessible for the class of vessels trading to them.

With this view your memorialists again consulted Messrs. Stevenson, who have submitted a design which meets with the approbation of your memorialists and of the public generally in this locality, as calculated to afford an effectual protection both to life and property, as well as to improve the whole of the lower portion of the harbour, which at present, during heavy seas, is unavailable for shipping.

The estimate for these works is 300,000*l.*, but it is impossible to entertain the idea of burthening the trade of the port to such an extent.

Your memorialists will be prepared to contribute to the utmost of their power to carry out so great an improvement to the harbour; but as the lives of hardy sailors ought, in their opinion, to be a nation's care, they humbly submit that the improvement of the harbour of Sunderland is an object towards which Government assistance may with propriety be granted.

Your memorialists therefore humbly pray that they may be heard in evidence in support of the facts stated in this memorial, and that their views may be maturely considered and favourably entertained by your Royal Commission.

And your memorialists will ever pray, &c.

(Signed) Joseph Simpson,
Chairman to the River Wear Commission.

SUNDERLAND.

Mr. T. Meik.

15 Oct. 1858.

Mr. Thomas Meik examined.

14,914. (*Chairman.*) You are the engineer to the commissioners of the River Wear ?—I am.

14,915. For how long have you been connected with the port in that capacity ?—For 13 years.

14,916. Will you now proceed to make any statement you may wish relative to the port, observing that at present we only wish to have from you such a statement as will enable the Commissioners who are present to fully understand the evidence which is to follow. The special engineering evidence we wish reserved until we are joined later in the afternoon by Sir F. Smith, Captain Vetch, and Mr. Coode, the members of the Commission who are engineers by profession ?—Will you, in the first place, allow me to explain this model ?

14,917. Take your own line ?—This model has been prepared for the purpose of showing the coast and harbour of Sunderland. The River Wear passes through the town of Sunderland, and enters the sea through two piers at the mouth of the harbour. The south dock has lately been constructed to the south of the port. There is a south outlet attached to the dock. The commissioners' boundary extends from Souter Point on the north to seven miles along the coast to Ryhope Dean. The model does not go so far as that, but nearly to Ryhope Snook. The front shows the roadstead for the anchorage of ships before entering the harbour, and also the projected works which the commissioners have referred to in the memorial just presented. These plans on the wall show the works, and these are the different designs proposed at the harbour's mouth. Here also is the dock and outlet. That is a chart of the north-east coast, which is generally taken to extend from Flamborough Head to the Farn Islands, a distance of 115 nautical miles. You see the situation of the port of Sunderland in the centre. It shows the coast and the different ports along it, and the principal ports are all mentioned on the chart. I shall then hand in an account of the wrecks which have taken place at Sunderland since 1852, kept by the commissioners of the River Wear. It gives an account of the vessels, light or laden, that have been wrecked at the entrance of the harbour. This account agrees pretty nearly with the Admiralty lists. It is not expected to be so correct, because it is only an account of the ships that have been wrecked near the end of the piers. In six years 78 vessels were wrecked at the entrance of this harbour, making an average of 13 a year. In the Blue Book published by the Select Committee of the House of Commons the average was taken at $19\frac{3}{5}$. You will find that the proportion of light to laden is as 2 or $2\frac{1}{2}$ to 1. We have principally light vessels wrecked at the entrance of this harbour returning from London in ballast. They come in great crowds and large fleets. Sometimes we have as many as 200 entering in one tide; and you may suppose, from the narrowness of this harbour, there is great difficulty in these large ships getting in together. Although the regulations are as good as can be adopted, accidents do happen; and it is to avoid these accidents at the mouth of the harbour that the commissioners of the River Wear now bring before you these proposed works. You will find also that the number of vessels driven ashore with the wind northward of east is 17; the number driven ashore with the wind southward of east is 48; vessels driven ashore with the winds east 13; making altogether 78; the proportion driven ashore with the wind northward of east to those with the wind southward of east being as three of the latter to one of the former. The majority is with the wind southward of east. Out of the 78 wrecked, 68 were bound for Sunderland (showing that vessels try to make their port of destination); to other ports 10. As you proceed further, and after the return for six years, you will find a detailed register of wrecks for 1854, from the Admiralty register. 1854 is the last year, I think, that detailed accounts of the wrecks were published by the Admiralty. The accounts since published by the Board of Trade do not go into the detail of each particular vessel. On looking over the proportion I have stated, they are rather more than I make out. I may mention that the general class of vessels that come to this port are colliers or coasting vessels. Their tonnage is not very great; from 250 to 350 tons is about the average; and they draw generally about 9 or perhaps 10 feet water when light. This is the class of vessels that the accidents generally happen to when they run for the harbour. We have not, in certain winds, at low water, depth to take in these vessels; so they are frequently kept in the roads till high water; and, as I mentioned just now, great loss has happened therefrom. I will draw your attention to the storm which happened on Tuesday the 3d January 1854. Upwards of 1,300 sail of vessels left Yarmouth Roads for the northern coal ports with a fair wind, many of them being bound for Sunderland. Soon afterwards a strong breeze sprung up from the south-east. It increased to a gale, which lasted the whole week, and was considered one of the most violent storms which had been witnessed on this coast for 32 years previous, causing an immense loss of shipping between Flamborough Head and the Farn Islands. At Sunderland, on the morning of Wednesday the 4th, the wind south-south-east, with a heavy sea rolling, upwards of 120 ships entered the harbour. Owing, however, to the swell outside the piers, and to so many vessels pressing in together, there was considerable confusion, and several received extensive injury. On Thursday the 5th there were behind the north pier 12 vessels, behind the south pier 2, in the Potatoe Garth 12, and in the south beaching basin there were 5 vessels, making a total of 31. The storm still increased in violence during the day, and the loss of life and property along the coast was fearful. On the forenoon of Friday the 6th a schooner was observed off Souter Point with a flag of distress flying, and her sails all shivered. The crew, in the last extremity, took to the long boat, which was instantly overwhelmed by the waves, and all on board drowned.—The next gale that I refer you to was in the same year. The evening of the 14th of November was very fine and sea smooth. About 55 sail brought up in the roads, with the harbour's mouth open. The tide before, I think, 55 sail had entered. These 55 sail that brought up were too late for the tide, and had to anchor in the roads. During the night a heavy squall came on from the south-east. Numbers of these vessels in consequence dragged their anchors, and were driven to leeward of the harbour. The gale increasing in the morning of the 15th, between 7 o'clock and noon, 15 out of the 55 sail were driven on Roker Sands, in the forenoon at eleven, and no assistance could be rendered them whatever. Property to the value of 20,000*l.* was lost on that occasion. The wind south-south-east to east. It thus appears that during a space of a few hours 15 vessels, or about one per cent. of the entire number of vessels wrecked annually on the shores of Great Britain and Ireland, were driven ashore in broad daylight, and an immense amount of property destroyed. It is considered that if a harbour of refuge had been in existence to the south of this port it would have afforded no security for these vessels. Indeed it can be stated, without fear of contradiction, that a local harbour of refuge alone could have saved them from destruction. The wind was so strong from the south-east, and these vessels lying so close in, it was impossible that they could have made to the southward. If such a work as proposed had been in existence these vessels could all have entered the tide before, because it was from want of depth of water principally that they were kept outside. There are other accounts of gales which I need not go over, but this account gives a report of these different gales that have happened along the coast. The loss of life, I may mention, is not great at this port. On one occasion, in October 1852, early in the morning, between

SUNDERLAND.

Mr. T. Meik.

15 Oct. 1858.

three and four o'clock, two vessels were wrecked between the piers. It was a dark, stormy morning, and I think one was a French lugger, and the whole of that crew was lost; the other was a brig called the *Napoleon*, and five out of seven of her crew were lost. At the end of 1854 there was a remarkable case of a vessel, called the *Mary Graham*, that left the harbour, and went out to sea. I believe she went out for the purpose of saving water over the bar. She anchored outside, and during the night a heavy gale sprung up. There were different opinions as to the cause of her loss, but she broke away with a length of chain hanging over her bows. The wind was from the north-east; she drifted along, struck on what is called the Stone Head, and of the crew, with the lumpers and others on board, 25 out of 26 were drowned. I may mention again, that if these works had been constructed at the harbour's mouth there would have been no necessity for this vessel to have gone out. These two instances are about the principal instances of loss of life that have happened at Sunderland within late years. Vessels being wrecked near the entrance of the harbour, the Commissioners of the River Wear have had for a number of years rockets in readiness, which apparatus is now passed into the hands of the coastguard. In six or seven years they have saved 135 lives. This accounts in a great measure for the small loss of life at Sunderland. In December 1850 a large fleet of vessels ran for the harbour, and about 50 were stranded on this Potatoe Garth inside the harbour; this was principally owing to the confusion that existed, and the narrow space of the harbour for such an immense crowd of ships. Five or six or more became total wrecks. This has since, perhaps, in a great measure been obviated by the South Dock Harbour entrance, which takes ships in. This relieves the lower part of the harbour from the crowding of vessels. But I may mention that even with the accommodation of the South Dock the space is too small for the number of vessels that sometimes crowd into Sunderland Harbour. We want increased space when these vessels run in in strong easterly winds, to enable them to bring up, and get up the river into security. The commissioners have on different occasions directed their attention to remedy these evils, and especially the heavy range of sea which runs up Sunderland Harbour. I know no harbour where so heavy a sea runs in; I can only compare it with Aberdeen. A very heavy sea runs in there. I have never been there, but I understand it is so. When accommodation is most required the lower reach cannot be used from this heavy range. The commissioners formed a beaching basin on each side of the harbour, and different works, to try to check this range of sea, but it still continues to a certain extent. The two piers in a great measure lead this sea up the harbour. The new works outside, and which will be described by Mr. Stevenson, are intended particularly for the purpose of stopping this range which runs up the harbour. I may also mention that this range, and the strong set of tide, brings large quantities of sand to the harbour's mouth, and causes accumulations on the bar, which varies in depth very much, from four and five feet to two feet. Sometimes we have hardly two feet upon it; and the loss of one or two feet at the bar of a river where such immense fleets enter is of the most serious consequence. I will now put in a statistical table of the trade of this port, with the number of ships inwards and outwards, the duty paid, the duty received on coals and shipping, and the revenue of the commissioners, from 1846 to 1857. Here also is a financial statement of the commissioners' revenue. I have also here an account of the soundings on the bar, which I shall put in. There has been a great deal done in this harbour by dredging. The commissioners expend 5,000*l.* annually upon the dredging of the harbour. In fact the ships' berths are kept open by dredging; by artificial means. They have this season done a great deal of dredging upon the bar, and they have been enabled through this dredging to bring the bar into the state it formerly was in. I do not know how long it will remain so. We hope it will continue now in a good state. I have got an account of the dredging work done in this harbour for a number of years past. The commissioners have received this plan of the proposed piers from Messrs. Stevenson of Edinburgh. I have considered the plan myself, and I have made observations upon it. So far as I have been able to judge, and go over it, I think it will be a most beneficial plan for the entrance of this harbour. I think it will be the means of remedying in a great measure those evils which I have endeavoured to describe to you, and which cause the wrecks that happen at the mouth of the harbour. I have also on different occasions taken the opportunity of going in a steamboat along this coast, and after full consideration of the best means of providing shelter for those immense fleets that frequent the coast,—for, as I have already shown you, 1,300 sail have been known to leave Yarmouth Roads,—and I believe there have been 700 or 800 sail at one time in Bridlington Bay, which is the best shelter south of this port for a fleet to lie in; when these fleets get embayed, if a place could be found at one spot suitable for a harbour of refuge, capable of containing a fleet of that kind, I doubt whether it would answer the purpose, because I think, from what I have seen at the entrance of this harbour, if such a fleet of 700 or 800 sail ran for one harbour it would end in confusion and loss. I think that if the improvement of the various harbours along the coast where these fleets generally run to could be effected, especially as it is well known that sailors will run for the port of destination on this coast, that would be the best means of remedying the existing evils, and affording the best shelter for vessels overtaken by storms. I have considered what the effect would be of a large harbour if it were placed to the south of this port, anywhere along the Yorkshire coast. I have shown to you what happened in 1854. A fleet such as that caught off Sunderland could not have reached any harbour to the south, and it would be, I consider, an injustice to these vessels if they had not accommodation given to them equally with those which are caught further to the southward. I think if three or four of the principal harbours were improved so as to take in the fleets that generally run for them, a great deal of loss would be prevented. In this plan the proposed work is not called a harbour of refuge; it is merely proposed to give shelter to the class of ships that run to the port. There would be 18 feet water at low water at the pier heads, and I think then in any storm a light collier might enter between these two piers. At all events an hour or two would be the utmost they would have to lie in the roads. At present it is only for about four or five hours, during the top of the tide, that vessels can enter the present harbour. At other periods they must lie off the harbour's mouth, and then, when these storms I have described happen upon the coast, these vessels are lost. That is the opinion I have arrived at from careful observation and visits at different times along the coast, and I do not know of a site where one large harbour, and only one, sufficient for the shipping, could be formed on this north-east coast. There is a difficulty in getting a site, and the work would involve a large expenditure of money. Any work such as an insulated breakwater of stone thrown out on this coast could only be formed at a great expense. We know what Plymouth breakwater has cost, where almost at all winds, except one, craft could go out and deposit stones at sea. Here, on this coast, I do not think craft could go out during more than three or four months of the season, and then during the winter season the stones would be driven about, and it would take years to do the work. I have fully considered the expense of works of that kind, and having been off in all weathers laying down buoys and moorings in the sea, I know how seldom the weather admits of even our ordinary work being done.

BIBLIOTECA DEL C.C.A.M.

SUNDERLAND.

Mr. T. Meik.

15 Oct. 1858.

Chairman.

14,918. Excuse my stopping you, but you are now touching on questions which you must go through when the engineers arrive; I mean questions as to the mode of construction and the expense; so, if you can, reserve that till later.—Then I will put in this return of the shipping that enter and leave this port. I have got returns of shipping to show the rise of this port, but they happen to be in manuscript, which show the comparison between the Tyne, Wear, and Hartlepool during the years 1853, 1854, 1855, 1856, and 1857. I will be prepared afterwards to go into these returns, if you wish.

14,919. Those you have in manuscript?—Yes.

14,920. Can you at your convenience furnish our secretary with a copy?—Yes.

14,921. Do you wish to enter into a statement respecting it?—No; merely to hand it in.

14,922. Does that conclude your statement?—That is my statement for the present.

14,923. Then, as you will be before us later in the day, I shall refrain from asking you any questions except one. You stated that when these works are carried out there will be 18 feet of water at low water spring tides at the pier heads. Now, in the plan I have before me I find 12 and 13 feet marked in the fair way?—Allow me to explain this. You will find there are two plans; Messrs. Stevenson's first plan was for 14 feet, and they were again consulted, and gave an enlarged plan, the 17 feet plan, which is the same as the model.

14,924. I see.—I think from 17 feet to 18 feet is the quantity which will be given by this latter plan.

14,925. (*Mr. Lindsay.*) Are the inner piers the piers which are contemplated by the River Wear commissioners to be carried out at their own expense?—There was no arrangement come to with reference to the expense, if they were to be carried out. Messrs. Stevenson were merely asked to give plans at as low an estimate as possible.

14,926. When did he send the second plan for the inner pier?—He was consulted at the end of last year, and I think his report is dated April or March of this year.

14,927. And the plan for the outer piers are plans which Messrs. Stevenson have more recently sent in?—Yes.

14,928. You spoke, I think, of a south-east gale, and said that during that time this fleet of vessels could not have found shelter at any place to the southward?—Yes.

14,929. That would depend altogether upon the position where these ships were caught when they were obliged to bear up?—Exactly so.

14,930. Where did these ships come from?—They were lying off the harbour in about six or seven fathoms water. A large fleet came up in the night; about 110 sail; about half of that entered the harbour; the other half could not, and they brought up in the roadstead, and before the next tide the gale rose.

14,931. Then the gale rose during the time these ships were anchored in the roadstead, and consequently no harbour of refuge to the south could have been of any value to them; but would a harbour to the north have been of any value to them?—Very few of these ships rounded Souter Point; some did, but with the greatest difficulty; 15, as I have mentioned, were driven ashore.

14,932. Whereabouts were they driven ashore?—To the north of the harbour.

14,933. You have said just now that the greatest number of accidents that take place are within the harbour?—No; at the entrance of the harbour.

14,934. Have many lives been lost?—Not many, in proportion to other places.

14,935. Is that on account of having very efficient lifeboats?—Lifeboats and rockets.

14,936. But say that various ships were running for a harbour such as this in a heavy easterly or south-east gale, they would be still obliged to run up the river, because they would find no shelter within these piers for anchorage?—There is a space of 110 acres between these piers, and the pilots inform me that ships would be in comparative safety between these breakwaters.

14,937. Would any ship bring up between these breakwaters?—Pilots tell me that they could. I do not state it upon my own authority that they could.

14,938. Tell me something about the amount of money which has been expended in dock accommodation here. I see there are two docks; one to the north, and a great work to the south. Tell me what has been expended from first to last on docks or piers?—The dock to the north is a very small one, and is very difficult of access. It is too near the end of the piers. There is generally a heavy sea on the gates, and for some months in the winter time very few vessels can enter the dock; a very limited trade goes on there. That dock may be taken, I think, as having cost in round numbers 100,000*l.*

14,939. What has been the cost of the great dock?—The great dock is of great magnitude, and 700,000*l.* has been expended on it already.

14,940. Is that expenditure going on?—I am not connected with the docks; but I do not think much work is going on there now.

14,941. Do you know what water there is at the pier end at the south dock?—I do not know, from my own personal soundings.

14,942. Speaking to you as an engineer, if the scour of the river, and the enormous dredging, which costs 5,000*l.* a year, does not give a greater depth than two, three, or four feet at low water at the piers now, how do you intend to deepen that front when you make the piers so that ships during a heavy gale of wind may be able to enter, and run up the harbour for safety; how do you expect to deepen and maintain the depth of the channel?—If you observe the outline of the coast on which Sunderland is situated, you see it is considerably embayed. The entrance to the harbour at one time stood bold to the foreshore; since the works of the south outlet were run out it is now embayed. Sand and materials driven along the beach lodge at the entrance, where the conflict takes place between the tides and the scour of the river, and that has led to a heaping up of sand-banks.

14,943. Then it is the sand from the sea which makes the bar within the present piers?—That is my opinion.

14,944. More than the sediment from the river?—Yes.

14,945. Consequently the making of the proposed piers will, in your opinion, prevent that flow of sand coming in as it does now, and filling up the channel?—That is my opinion.

14,946. There was a word in the memorial which struck me very much, and I will ask you a question upon it. Looking to the enormous trade of this place, and considering that more than a million of money has been spent here on the accommodation for shipping, the memorial said Sunderland was "a creek of Newcastle." Is it really the case that a port of such importance is a creek of Newcastle?—Unfortunately it is, I must say; it still pays dues, and very heavy dues, to Newcastle.

14,947. You, a great and enterprising port, still pay dues to Newcastle?

14,948. (*Mr. Lindsay.*) What tribute do you pay to Newcastle?—In the shape of primage dues, I think it is 1,300*l.* annually.

14,949. Do you mean that the shipping, trade of the port and the people of Sunderland pay 1,300*l.* annually to Newcastle?—I do. In the Blue Book of the Shipping Commission it is not very clearly stated what is paid by Sunderland to Newcastle; but I have asked different parties connected with shipping, and they tell me that 1,300*l.* is a low estimate; some say it is more.

14,950. When one man pays money to another he expects to get something in return for his money, and I fancy it is the same with towns. Now what do you get in return for this 1,300*l.* you pay to Newcastle?—Nothing that I know of.

14,951. (*Capt. Washington.*) Are buoys or lights or anything given to the pilots out of this sum by the Trinity House of Newcastle?—The Trinity Board have charge of the pilots here; but I do not know of any money being given to them. I know lately they wished to make a charge upon the pilots which they resisted, and the pilot management altogether at this port is considered by many shipowners very defective.

14,952. Whom does the pilotage depend upon?—I believe entirely upon the Trinity House of Newcastle. There was a board here, but a few years ago they resigned. Another has been appointed, but I do not know whether they act or not; but I believe there is still a board here.

14,953. Do the Sunderland pilots pass before the Trinity House of Newcastle?—They do. They are obliged to go to the Trinity Board of Newcastle to get their licences; and their licences are withdrawn by the Trinity Board of Newcastle.

14,954. In giving an account of the harbour, you stated that the range was very great between the piers; to what does it amount?—On the 1st of March 1858, during a severe storm, wind east to east by south, the force of the wind 8, during a snow storm, 10, sea breaking in 10 fathoms water, the height of the wave at the north pier head was 8 feet; that wave at the north dock entrance was 9 feet, having increased in height owing to the contracted nature of the entrance. There is a marked difference between this entrance and the outlet of the south dock: there the wave is reduced as it goes in; at the north dock entrance it is increased. This is a difficulty we labour under here, and which many engineers have been consulted with regard to, viz., this range, and it has not been yet altogether overcome. This same wave afterwards, when it gets to the breakwater on the north shore, is reduced to 4 feet. When it gets to a jetty on the south side, called the tidal-gauge jetty, it is reduced to 3 feet 6 inches. At the pier works on the south side it is reduced to 2 feet.

14,955. Then do I understand you to say that a wave 8 feet high at the outer pier heads gradually diminishes, and is lost at about three quarters of a mile?—Yes; after being increased at the north dock entrance to 9 feet.

14,956. When you speak of that height of wave, do you mean that the vessels rise and fall to that amount?—Yes, I mean what the vessels scend.

14,957. I believe some works were executed on the south side to obviate it; have they had any effect?—Two beaching basins were formed on the south side, a large one and a small one; but they have not had altogether the desired effect.

14,958. Do you happen to know what the scend in Shields Harbour is?—At the Low Lights it would be in such a storm, three or four feet; it gradually diminishes from the middle sand.

14,959. Do you happen to know what it would be in a similar storm at Aberdeen?—I generally consider it much the same as here. Mr. Abernethy has told me that at the dock gates they have had a range in heavy storms of from two to three feet.

14,960. What is the width at the entrance of the proposed harbour?—The width between the pier heads will be 800 feet; that is according to the last plan of Mr. Stevenson.

14,961. Do you consider that 800 feet at the entrance will be ample for any vessel to take in a gale of wind?—Quite sufficient.

14,962. Do you know the width of the entrance of Kingstown Harbour?—No.

14,963. You said a large number of vessels sometimes ran for the harbour at the same time. What is the largest number you have known to enter at one tide?—About 200 sail. I cannot tell the exact date when these vessels entered. In December 1856 as many as 400 sail entered in four tides.

14,964. What might be the average draught of water of these vessels?—Generally light colliers, drawing from 9 to 13 feet water, perhaps.

14,965. Will these vessels be able to enter at half tide, or not till full tide?—Not till about two-thirds. Generally they run for four or five hours.

14,966. Will they enter upon a falling tide?—I have known vessels to enter upon a falling tide, but it is dangerous to do so.

14,967. It is not the usual practice to enter a harbour upon a falling tide?—It is not, with such a narrow entrance as the present entrance to Sunderland Harbour.—I consider that if these piers were extended vessels could enter with a falling tide.

14,968. In the present state of Sunderland Harbour ships may arrive off here, and possibly may have to wait 8 or 10 hours before they can enter this harbour?—Yes.

14,969. You mentioned that 135 lives had been saved at the immediate entrance to Sunderland Harbour; during what period was that?—From 1846 to 1856; that is 11 years.

14,970. That was by means of lifeboats belonging to the port, and by rockets and mortars?—Yes. May I mention that a remark has been made by a gentleman with regard to a part of my evidence, which I should like to correct. Ten hours is not the time; it is generally about six or seven.

14,971. Do vessels seldom enter upon a falling tide?—Seldom.

14,972. Suppose a vessel then arrived one hour after high water, how long will she have to wait?—Till half tide of the next tide; and it depends upon whether they are neaps or springs, and it would also depend upon the draught of water.

14,973. (*Capt. Washington.*) In the very valuable returns you have laid before the Commissioners, the most valuable I believe the Commissioners have received in any part of the United Kingdom, I observe that you give the details of gales of wind, and the number of wrecks that have occurred in particular gales?—I do.

14,974. Are we indebted for them to your own inquiry?—Yes.

14,975. And at present you say only summaries of the wrecks are published?—Only summaries are published by the Board of Trade.

14,976. Would it be of advantage generally, do you think, if the details of wreck were published every year?—I consider it would be of great advantage to all parties connected with shipping.

14,977. You quite understand that no public board of the Government would go to unnecessary expense; but if the information were considered valuable there is very little doubt that probably it might be attended to, if you really thought it of value?—I think the money would be well spent to publish these returns in detail, as they were done before.

14,978. Is that the general feeling; I mean among seamen?—I should say so.

14,979. And it is a fact that you yourself have derived very great benefit from the details of certain wrecks that are published here?—I have on frequent occasions.

14,980. (*Capt. Sulivan.*) I will merely now put some questions to you on points not bearing on any engineering evidence, but reserving that till the afternoon. With reference to what Captain Washington has just said, do you mean that the general public, or special parties, such as engineers, who are interested in a question of this kind, would use those details if published by the Board of Trade?—I have always found these details very much run after, and very much sought for. I have had frequent applications at the office from different parties for information as to ships that have been lost, and in regard to ships receiving casualties. Any detail of this kind, especially in a court of justice, would be of great advantage.

14,981. For any special cause are you aware that these details can be got by any parties applying for them?—By any parties that know such details are there; but it is only few in the immediate neighbourhood that know of them.

SUNDERLAND.

Mr. T. Meik.

15 Oct. 1858.

Capt. Sulivan.

14,982. All who know that the abstract of those returns given by the Board of Trade is made up from the whole of these details must know that the details are in the office, and available, if required?—Yes; but the great advantage is getting these details in a printed form, not to have to apply to one party or another, but to have them as general information furnished by the country.

14,983. You are aware what the amount of printing and the expense would be in publishing the whole of these 1,100, 1,200, or 1,300 in detail?—No doubt the expenditure for printing would be very large, and no doubt the commissioners of the River Wear think they have gone to a good deal of expense in printing these documents; but I think it is well-spent money.

14,984. Do you think they would be so generally useful that it would warrant the outlay necessary for them?—That is my opinion; but I may be wrong.

14,985. You said that in this heavy gale that Mr. Lindsay asked you about, that the vessels were anchored outside; but in a still greater gale, with more wrecks, I think you said it came on shortly after they left Yarmouth Roads?—That was in January 1854.

14,986. Yes; the principal gale, when so many wrecks occurred. In that case would all these vessels have been caught south of Flamborough Head?—I cannot say exactly, not knowing the coast; but a nautical witness will tell you at once.

14,987. I think you said they were wrecked here on the 5th?—Yes.

14,988. And it came on soon after leaving Yarmouth Roads on the third?—I believe so.

14,989. Then would not the whole of these ships that wished to have run for a harbour of refuge, had one existed anywhere in that bay, have been able to take that harbour of refuge, and so have saved wreck?—I think that in looking over the evidence already given before the Royal Commissioners in different places, it was stated———

14,990. I beg you will answer my question without going into the evidence given at other places. If the gale caught these vessels between Yarmouth Roads and this place, would a harbour of refuge somewhere in this bay, that they could have entered at all times of the tide, in all probability have saved them?—I do not consider that a harbour of refuge could be made on this coast to hold them.

14,991. But if a large number of vessels were running for this bay, and a gale caught them, would not such a harbour of refuge be valuable for them, and better than any tidal harbour?—If I knew the extent of the harbour, perhaps I might tell the number of vessels that was to be sheltered in it.

14,992. Supposing a harbour of refuge sufficient to take the number of vessels requiring it, would not these vessels have been able to run for it, if the harbour had been sufficiently large and easy of access so as to avoid confusion from a large fleet of that kind entering?—Undoubtedly, if they got into it, it would afford shelter to them.

14,993. Is not the great confusion and difficulty of entering these harbours by fleets of vessels at once caused by their having to wait for the tide, and coming in when the tide is high, all flocking for it at that time?—No doubt, so far; but still vessels running into harbours generally run one after another in crowds; as soon as one vessel enters, the others immediately run after.

14,994. If a harbour were accessible at all times of the tide, would it not or might it not very much reduce the number of vessels crowding to enter it, when they could enter it as they came upon the coast?—That would depend upon the size of the fleets taking it.

14,995. You have applied your remarks more especially to light vessels as having been lost in the neighbourhood of Sunderland. Are the loaded vessels that sail from Sunderland ever lost on their voyage to London?—Frequently, to the south of the port.

14,996. Then for these vessels the remarks that you have made do not so directly apply?—They do not.

14,997. Then if you found that by the return six loaded colliers are lost yearly for one light, and nearly the same proportion of these not colliers (coasters and others), would you think a harbour of refuge should more especially be directed for the saving of the laden colliers?—I do not know particularly for laden vessels. I would look to the majority of vessels, whether light or laden; the majority are light, and therefore I think a harbour of refuge should have on this coast reference to these vessels, perhaps more than to laden vessels.

14,998. In what way are the majority of the vessels light?—Because the trade of these northern coal ports is principally to London. It is an export trade; they go to London, and take cargoes up to London, and they return light and in ballast.

14,999. Then there is an equal proportion on an average on the coast of laden and light vessels?—The laden vessels do not go in such large fleets as the light colliers.

15,000. I am asking you as to the number. If the vessels go up loaded and come down light there is an equal proportion of laden and light at sea?—I should say there was a majority of light vessels wrecked.

15,001. I am not asking you that. I am asking you as to the proportion of vessels. You said there was a majority of light vessels wrecked?—There is.

15,002. But if the returns published show that six to one light are wrecked, would you then consider that light vessels should be the ones most considered in a harbour of refuge?—I have no doubt that the majority of six laden to one light exists about Flamborough Head, and there a harbour of refuge for laden vessels would be of great assistance, but that proportion does not exist towards these northern ports.

15,003. The proportion of light vessels in the northern ports being wrecked, I presume, is caused by their generally running light for their ports?—Generally it is.

15,004. But if six laden vessels are lost to one light in any part of the coast between this and London, and in addition to that, if every life in a loaded vessel is much more risked than in a light, then would you consider that for a harbour of refuge to save life and property the loaded vessels should be more especially considered?—On a part of the coast where this happens certainly loaded vessels should be more considered.

15,005. I am speaking generally of the trade between the coal ports and London, without regard to the part of coast; the part of the coast where it is selected as the best possible spot for the saving of life and property, wherever it may be. I ask you whether if six laden to one light are lost, and if there is a still larger proportion of loss of life, whether a harbour should not have special reference to laden vessels?—On such part of the coast where they exist, I have no doubt; but my evidence has been with reference to the port of Sunderland, and there, where light vessels are in proportion, that does not apply.

15,006. But if Sunderland loaded vessels are in danger further south, and if the loss of life and property is much greater in loaded vessels, is not the first consideration a harbour of refuge for these loaded vessels?—I generally consider the first consideration is for light vessels on this part of the coast.

I will not ask you any more questions on this subject after that answer.

15,007. (*Mr. Lindsay.*) In spending the public money, is there not something more to be considered than the light vessels frequenting this particular part of the coast?—I think still the impression is on my mind that the principal works should be directed to the shelter of those light vessels that run down here in such large fleets.

15,008. But if the object of this Commission is to inquire into the best mode of saving life and property,

SUNDERLAND.

Mr. T. Meik.

15 Oct. 1858.

and if the public money is to be spent having that object in view, is there not something more to be considered in the spending of that money than that which affects a particular description of vessels in a locality? —I cannot help saying that I think the improvement of the existing harbours will be the best manner in which the public money can be spent upon this coast; that is giving a general answer to it; it would be far more advantageously spent than in one enormous harbour.

15,009. Then I understand it is your opinion that the improvement of the existing harbours along the coast would be more beneficial to the saving of life and property than the same sum of money spent it any one particular site of the coast?—Yes.

15,010. But if it should appear that there are five laden vessels lost frequenting this coast to every light vessel, and that there are ten lives lost in laden vessels to one in light (the saving of life being the all-important consideration), and if it should appear that the bulk of the laden vessels belonging to Sunderland and the northern coal ports are caught in gales of wind somewhere in the neighbourhood of Flamborough Head, and if it should appear that a harbour of refuge could be made in that neighbourhood would you then hold the opinion that it would be advisable to spend the money at one site there, as well as to improve the existing harbours?—I have at different times endeavoured to answer, that a harbour in the neighbourhood of Flamborough Head for laden vessels going south with the wind south of them would be of the greatest advantage, and would be the means of saving a great many lives. If three or four of the northern ports were improved, and one harbour, principally, say, for laden vessels going south, was made to the south of them, I think the shelter on the coast would be complete.

15,011. Now I understand you; and the sum and substance of your opinion is this, that, looking to the saving of life and property, the existing harbours ought to be so improved as to admit, at all times of the tide, if possible, the vessels frequenting this coast; and, secondly, that the public money should also be expended in the construction of a harbour somewhere about Flamborough Head, for the saving of life, and property, more especially of laden vessels?—That is my opinion.

15,012. You said in answer to a question that you thought if an abstract of these wrecks was published it would be of great value?—I do think so.

15,013. It would be of value, you thought, to guide seamen and master mariners, as showing how losses had taken place, and consequently would put them on their guard to see if possible that they could avoid similar losses in future?—That is quite my opinion.

15,014. Then you said expense was no consideration?—Not a great consideration.

15,015. And you said you thought they would be read to a considerable extent?—Yes.

15,016. Whether do you think the expense of publishing these valuable returns would produce more beneficial results than the publication of the large number of like books which we have upon the bog lands of Ireland, and so forth? Would not the money be a great deal better spent upon the publication of these details, and be more read, than the generality of what is published by the House of Commons?—I think they would. I have got a horror of blue books.

15,017. (*Chairman.*) Would not a harbour of refuge at Hendon Bay be the means of saving both life and property, whether in light or laden ships, whenever ships are caught under the circumstances you have mentioned in that bay?—That is a matter I have not particularly directed my attention to.

Mr. DAVID STEVENSON examined.

Mr. David Stevenson.

15,017. (*Chairman.*) You have had under consideration the improvement of the entrance to this harbour, I believe?—I have; for the last seven years I have been employed.

15,018. Will you now proceed to make any statement you wish relative to the proposed improvements, bearing in mind that our colleagues, who are more especially competent to judge upon these questions, will join us later in the afternoon, and that we shall wish anything that especially relates to engineering to be reserved for that time?—I shall endeavour to state as shortly as I can, without entering upon engineering technicalities or details, what I think is necessary should be known before you hear the nautical evidence in this case. The objections to the present harbour of Sunderland are threefold:—first, there is the small depth of water on the bar, which Mr. Meik has stated varies from 18 inches to 5 feet; there is, in the second place, a very large amount of sea which at present exists at the entrance of the present harbour, and which in some cases is as high as 13 feet; and there is, in the third place, what has been called the range in the lower part of the harbour, and which occurs in consequence of the entrance of the sea at the outer harbour's mouth. It was, I believe, considered that when the south entrance was made these defects would be in a great measure overcome, in consequence of vessels using the south entrance; but I believe it will be proved in evidence that in point of fact this is not the case, and that at present all or nearly all the vessels enter the port of Sunderland by the old entrance. The south entrance is used chiefly by vessels leaving when laden, because there is a greater depth of water there. I think a glance at the plan will show that the south entrance, from its very short distance from the pier heads to the dock gates, is much too short for vessels running in during heavy seas, and consequently, as I have stated, the practical result is that vessels do in point of fact enter by the old harbour. The wrecks and casualties in consequence have already been mentioned, and of course I do not enter upon that. Now the object in view in the preparation of the plan which has been referred to by Mr. Meik was to overcome as far as possible these defects; and it is necessary to the understanding of the plan that I should state that the bar at the entrance of the present harbour consists of sand through which there is a channel kept open by the tidal scour. This bar varies in depth and also in position; sometimes it is close to the pier heads, and sometimes it is 500 or 600 feet in front, those variations depending entirely upon the variations of the tide, wind, and freshes. I may state that the whole of this bar consists of sand and some small pebbles, but at all events that there is no part of it that consists of matter brought down by the river. The matter brought down by the river is deposited in deep holes above, which are made by the dredger, to form berths for the vessels in the river. The bar is in short like all tidal estuaries having sand at the mouth caused entirely by the heaping-up action of the sea; the channel forming the entrance to Sunderland, which is a channel kept open through this beach, the depth of which is not the normal depth of the beach, but a considerably greater depth. That depth is maintained solely by the tidal action. The effect of the sea is to fill it up; and suppose a barrier were thrown across the harbour's mouth, we should have a flat and continuous line of beach formed right across the harbour's mouth. The consequence of this is, that the sea during heavy easterly gales heaps up the sand towards the pier heads. In proof of this I may advert to this section, which shows the channel of the river, and you will see that where the tidal currents are allowed to act without being interfered with by the action of the sea, as at the Potatoe Garth for example, where the harbour is wide, you have actually a much greater depth of water than you have at the outer part of the harbour, even where the scouring current is directed and prevented from spreading by the two piers, showing very clearly that if you can secure the unobstructed action of the tidal scour at the mouth of

SUNDERLAND.

Mr. David Stevenson.

15 Oct. 1858.

the harbour you will maintain the same depth that you have now within. If what I have said be correct as to the origin of the bar, it follows that two methods may be pursued in order to improve it; one is the increase of the back water in the inner part of the harbour, giving the tidal scour the preponderating influence over that of the sea; the other is the protection of the harbour's mouth from the action of the waves. In my report of 1852 the subject of back water is treated of, and I shall hand in a copy; but this present plan is based upon the fundamental principle of protecting the present entrance from the action of the sea, so as to allow the tidal scour to have free course, and to produce the full amount of deepening effect unobstructed. In order to do that I propose the plan which is shown on this model, consisting of those two piers; and I wish the Commissioners to understand that this is purely a local measure. The plan proposed is for the improvement of the entrance to the present harbour of Sunderland. It is not a harbour of refuge. My opinion is, that in the first place the effect of these piers will be to reduce the sea at the mouth of the present harbour, and what has been called the reductive power of the harbour, that is, the proportion in which these waves will be reduced, will be in the ratio of about 1 to ·3. What I mean by that is that a wave of 9 feet at the entrance of the proposed new piers will be reduced to a wave of 3 feet when it approaches to the present harbour entrance. That reduction of the sea will permit the tidal scour to act almost unobstructedly; and I think I am stating what I should consider a very moderate allowance when I say that after these piers are constructed the minimum depth at the bar and entrance of the harbour of Sunderland will be, not the less certainly, but probably more than the maximum depth at present. That is the first improvement. The second is the reduction of the scend due to a wave of 3 feet instead of a wave of 9 feet; and the third improvement is almost, I may say, the total abolition of the range in the lower part of the harbour, rendering the whole of the lower part of the harbour available for berthage and the general purpose of shipping. On the subject of the estimates, and also on my reasons for drawing these deductions, which are of course purely engineering, I shall not enter at present; but these are the improvements which I most confidently anticipate from carrying the prepared works into effect.

15,020. (*Chairman.*) We should like to have tracings of these improvements, as they have been referred to?—I shall take care that you have them.

15,021. (*Mr. Lindsay.*) You say that the object of carrying out these piers will be for a purely local purpose. Do I understand you by that to mean that you have not in contemplation the construction of a harbour of refuge, which vessels not belonging to the port of Sunderland would take in distress?—Not a general harbour of refuge, certainly; but in designating it a purely local improvement I should at the same time add that I firmly believe that were this plan carried out it would prevent the casualties which at present occur at the mouth of Sunderland Harbour. Since I knew the harbour, seven or eight years, many wrecks have occurred which, had these piers been put up, would have been prevented.

15,022. You have no doubt the whole would have been prevented?—I should not perhaps say the whole; a vessel still might possibly have gone to the back of the pier; but the great number would have been saved.

15,023. A question was put to Mr. Meik about a harbour of refuge at Hendon Bay. Where is that?—It is about a mile to the south of the south dock.

15,024. Have you ever given that a glance, to know if such a site would be suitable for the construction of a harbour of refuge?—I have seen the place repeatedly, but my only information on the subject is that contained in the Admiralty chart.

15,025. But looking at it with your ready eye as an engineer, so well accustomed to the construction of harbours, do you think it is a site where a harbour of refuge could be made?—My idea is that there are no prominent engineering facilities for the construction of a harbour of refuge there; and if the Admiralty chart is correct, which I assume it to be, there is a very great deal of rocky ground in the inside; but not having specially surveyed it I should not like to speak confidently on it.

15,026. (*Capt. Washington.*) Mr. Stevenson's statement is so clear that I shall not ask any questions; can you tell us the scale of the model?—It is 18 inches to a mile.

Mr. Robert Anderson examined.

Mr. Robert Anderson.

15,027. (*Chairman.*) You are a commissioner of the River Wear?—I am.

15,028. Do you also appear as representing the Marchioness of Londonderry?—Yes; but not particularly in that character.

15,029. But the Marchioness of Londonderry is connected with Seaham, is she not?—She is.

15,030. To whom was sent a notice that a deputation was to be sent here, if they felt any interest in this question?—I was not at Seaham at the time, and therefore have not seen that notice. I wrote to the person at present in charge at Seaham, and asking, if he thought it was necessary to be present, that he would be here; but I have received no answer.

15,031. Seaham Harbour is the property of the Marchioness of Londonderry?—It is private property altogether, and I have no instructions from her ladyship respecting this Commission. If you think proper to make a harbour of refuge in front of Seaham, I have no objection.

15,032. Are you aware whether the gentleman in charge there gave any public notice to the seafaring portion of Seaham of this inquiry, and that they would be heard here by deputation if they wished?—I am not.

15,033. But it is to be recollected that our inquiry is mainly, not for the purpose of improving the harbours for commercial purposes, but for the purpose of saving the lives of the seafaring men who are employed on board the ships; and therefore we wish that not only the gentlemen who own the ships, and who are connected with shipping property, should be here, but we wish also that the seafaring men, who are actually exposed to the risks and dangers, should be represented at our meetings, and therefore you will oblige me if you will publish a notice to the seamen of our wish to that effect, and state that we shall be very happy to receive in London any deputation the seafaring population may wish to send to us to represent their opinions upon the subject?—I will take care to do so.

15,034. How long have you been connected with the port as a commissioner of the River Wear?—Three or four years, I think.

15,035. You are not a nautical man?—Yes, I am.

15,036. For what period were you at sea?—Twenty-two years.

15,037. For what period in command of a ship?—Eighteen.

15,038. In what trade were the vessels chiefly employed that you commanded?—For the first three years I commanded a collier, afterwards a transport ship, and I also served my apprenticeship in the transport service; then I was in the North American trade and the Mediterranean.

15,039. You are well aware of the objects of this inquiry?—Perfectly.

15,040. Will you now proceed to make to the Commissioners any statement which you may have to offer relative to the advantage or necessity of one single national harbour of refuge on this district of the coast?—I think, that it will be very difficult to construct a harbour of refuge on this coast that would embrace all the views the Government have in this inquiry. A single harbour of refuge, wherever and however constructed, would not answer the purpose

of saving life and property. It might answer if it was intended for a naval station, and large ships using the harbour; but it would not certainly have the effect of saving the lives of the seamen, nor the property of the owners. For instance, it has been said that light vessels coming from the ports of the south, where they have delivered their cargoes, always steer for the port they are bound for; and the question was asked of Mr. Meik if those vessels that left Yarmouth Roads on the 3d January 1854 would have taken refuge in any port to the south, if such had been constructed, instead of continuing their course to the ports of their destination. I am quite of opinion that with a wind from the east-south-east, which I believe at that time it was, they would have held on their course, in the hope of arriving at their port of destination, and passed any port of refuge, unless they happened to be disabled, and then, with the wind at east-south-east, having arrived at the northern ports, it would be quite impossible for them to have gone to the south again, and to have taken advantage of any harbour in that situation. This applies to light vessels, and therefore I think the improvement of the present harbours, if it can be accomplished by the united efforts of the parties who have charge of those harbours, with the means at their disposal, and assisted by a grant from Government, would attain the object of saving life and property to a greater degree than one single harbour of refuge in any situation on the coast. At the same time, having said so much about light vessels, I observe, in passing, that the number of vessels which have been stranded here in the years of which you have already received evidence, of the 78 altogether 23 are laden vessels, not light vessels, and the remainder light, 55; so that they are not all light vessels. Then it frequently happens that great loss of life takes place with laden vessels; colliers are very deeply laden; and I think it would be a very essential advantage to laden vessels if a harbour to shelter a fleet of laden vessels were constructed anywhere near the neighbourhood of Flamborough Head. I have seen frequently, myself, 50, 60, 70, or perhaps 100 sail of laden vessels, when they are caught dodging under the head,—I dare say a sailor will know what that means,—with a gale of wind from the south-south-east. And there are two ways of effecting this object; one would be by making a breakwater upon the Smithic Sand and Bridlington Bay, or lengthening the Steel out at Filey Bay. Either of these would effect that object to a considerable extent, and from the capacity of Bridlington Bay it would certainly be a very useful naval station. I believe there is not more than 10 or 11 feet water at low water upon the Smithic Sand, which lies before the bay, and it might very easily, by stones that could be got very conveniently, be converted into a very good shelter for shipping riding in Bridlington Bay; and as the tide runs through that bay with considerable velocity from south-west to north-east it would never silt up, but would keep perfectly clear. That is one advantage of Bridlington Bay, so far as laden ships are concerned. With respect to the entrance of this harbour, there can be no question but that if the piers could be carried out to 18 feet water at low water light colliers would come in at any time of tide. If there was 18 feet at low water spring tides, it would be sufficiently deep to admit light colliers or any vessels that come to load in the dock. For instance, large ships drawing 12 to 13 feet in ballast could come in almost at low water in any weather, which would be a great advantage certainly to the saving of life; for it is not very many months ago since two large Dutch East Indiamen were wrecked. I do not know that any of the crews were lost, but the vessels were totally lost. I dare say you know very well,—Captain Washington does,—that the lifeboats on this part of the coast are effectually manned by the pilots, and are very useful indeed in saving life, so that comparatively few lives are lost, when you look to the great destruction of property, but still it is desirable that every means should be adopted to render lifeboats unnecessary, for it is a very unpleasant service, and I am quite of opinion that if these piers were made to the extent shewn in Plan No. 2. this harbour would certainly be quite sufficiently safe and easy of access at almost any time of the tide for the description of vessels, though they are much larger now than they used to be, that trade to the port. With respect to this entrance being, as people say, almost superseding the necessity of this improvement, by the construction of the south dock, I can refer you to the return of vessels that have entered this port up to the present period, and by which it will be seen that the very great bulk of the shipping still enter by the old entrance, imperfect and bad as it is. Therefore it shows the impracticability, to a great extent, I think, of vessels using that very useful outlet as an entrance, because the locks are so very near the sea that they must be operated upon to a very considerable extent by the undulation of the water. In this year, not to trouble you with going further back, up to the 31st July the vessels that have entered by the harbour are 3,339, that is the first half of this year, of a tonnage of 437,036 tons. The number of vessels entering by the south outlet, which is perfectly practicable, easy, and convenient in fine weather for ships of almost any draught of water,—and so far it is a great convenience for laden ships arriving with cargoes,—they have deep water, and can enter by this entrance when they cannot enter by the other at all,—the figures, I say, are by the harbour entrance 3,339, and 84 by the south entrance. Now, leaving by the river are 2,374 vessels.

15,041. (*Capt. Washington.*) Is it for six months or the quarter?—Oh, it is for the quarter. I beg your pardon. The proportions are the same; 2,374 have left by the harbour, and 1,023 have left by the south outlet. Of these 1,016 were loaded in the dock and seven in the river. It is very common for vessels of great depth of water to load in the river, pass through the dock, and so take advantage of the deep outlet to go to sea.

15,042. (*Mr. Lindsay.*) In what space of time did the 1,023 leave?—In the quarter ending the 30th September.

15,043. 1,023 left, and only 83 entered by the south entrance?—Yes.

15,044. The 2,374 left by the harbour, in what time?—In the same three months. I only mention these figures to show that the harbour is extensively used at present for sailings.

15,045. (*Chairman.*) Is there anything further which you would like to add to your statement?—Nothing; only what applies to this port will apply to the other ports, of course. The Tyne and Tees, if they were improved,—though it is presumptuous, perhaps, to say anything on such a subject,—but if a sum of money was to be appropriated by the Government for the saving of life and property,—it would be dependent certainly on the amount, extent, and nature generally of the work which was intended to be made,—but I should think a very good and judicious appropriation of that money would be to give as much as could be afforded to the improvement of the three harbours I have mentioned on this coast, Sunderland of course being one of them, and the remainder to construct a harbour particularly for the accommodation of light vessels, where the greatest loss of life is to be apprehended, because vessels that are deep laden do not go so near the shore when stranded. Then I think the object would be realized, particularly if in the arrangement accommodation could be afforded for those vessels that are likely to have charge of the defence of the coast. We cannot tell how the war may be conducted, if there is a war; but I apprehend that a different class of vessels would be employed to what were employed during the last war, and in that case these very harbours, the Tyne, the Wear, and the Tees, and particularly Bridlington Bay, would be all very good naval stations for gunboats and steamers of a lightish draught of water, say 16 or 17 or 18 feet.

SUNDERLAND.

Mr. Robert Anderson.

15 Oct. 1858.

Chairman.

I remember that in the last war there was always a guardship or frigate lying in Shields Harbour.

15,046. Then I think you have mentioned as an eligible situation for a harbour of refuge which you propose in the neighbourhood of Flamborough Head, Bridlington Bay ?—Yes; I mentioned that merely on account of what was said, and what I knew to be the case of the loss of life which I know occurs in laden colliers, and it was for saving these valuable lives that I mentioned these two cases, because they are exactly to the point. If a vessel gets round Flamborough Head, there is the Humber under her lee, and the Humber is a very safe port of refuge for ships of any size and description, though it is rather difficult of access.

15,047. Suppose a harbour of refuge is made in the neighbourhood of Flamborough Head, would you prefer the south side of the head to the north side as the site for the harbour ?—I do not think I am capable of giving an opinion about that, for it would depend upon the nature of the breakwater erected upon the Smithic Sand. If there was one high enough, and anything like the Plymouth Breakwater,—and it would only be like the apex of a cone, for it is very shallow water,—I think there would be room for a very large fleet of vessels to ride under the lee of that breakwater. On the other hand, I do not think there is much room in Filey Bay for a fleet of ships.

15,048. The question I put is not engineering, but nautical. On which side of the head, north or south, supposing you could find a site, would you put it for the purpose of saving life in laden ships ?—I think they are equally good. If the breakwater is sufficient upon Smithic Sand ships would ride perfectly smooth. It would be a low breakwater, and made with very little expense.

15,049. Is it the case that it frequently happens that laden ships get as far south as Flamborough Head, and are then taken in heavy weather, and not able to weather the head ?—In that case Filey Bay would be the most eligible place.

15,050. Taking the facts of the case in view with which you may probably be acquainted, which would be the best site, north or south of the head ?—I should prefer myself the south side, if I had the harbour to make; but I am not engineer enough to know the merits of it sufficiently. It would be what sailors call a better loose if you could go out at either end of it. There might be channels out to the west and east ends, both good deep-water channels. The one nearest the shore would be the shortest of the two, but both would be deep enough.

15,051. (*Mr. Lindsay.*) You and I are sailors, and I want to put a question to you as a sailor. Is it the case that easterly winds are the most dangerous on this coast ?—It is.

15,052. If a ship could weather Flamborough Head could she not get to the Humber ?—She could, if not disabled.

15,053. Then what would be the good of a harbour of refuge at Bridlington, as you recommend, considering that fact; would it not be as much wanted to the south of the Humber as it would be to the north ?—Quite true; but I am speaking of winds when a ship could not get to the southward; the very prevailing winds there are south-west and south-south-west, which blow very hard.

15,054. Which are the most dangerous winds ?—Easterly.

15,055. Then when a ship could weather Flamborough Head could she usually reach the Humber?—Yes, if not disabled; and then she would not of course get into a harbour if it was made there.

15,056. If she could not weather Flamborough Head, then might she get into Filey ?—Yes.

15,057. Is it often the case that a laden vessel is caught to the northward of Flamborough Head, and obliged to run for the bight of the bay here ?—No, I do not think it; there are instances of the kind which have frequently occurred, I believe. I have known vessels driven from Flamborough Head, I dare say as far north as Leith Roads; but that was a very extreme case.

15,058. Why did they go there ?—Because there was no port they could take.

15,059. With the chance of saving their ships and lives ?—Not unless it was Holy Island, and people are not much acquainted with that.

15,060. Is it often the case that laden ships are obliged to put back ?—I do not think it is very often the case.

15,061. I asked the question because by the returns of the proportion of losses of laden vessels I see it is as 6 to 1 of light vessels on the whole coast ?—On the whole of England ?

15,062. It includes the whole of England ?—Very probably, but that will not apply to this particular coast.

15,063. But it will apply to this coast in part. Of the laden vessels lost on this coast, are they usually vessels that have put back after they have made considerable progress south, or are they vessels which are usually lost in going out of the harbours, or very shortly after they have gone out of the harbours ?—I think they are usually lost in contending to get their passage, and, perhaps losing a mast or bowsprit, they drive on shore.

15,064. In the bight of the bay ?—Yes; sometimes vessels are lost in putting back to the harbour ?—I have known several lost in putting back to the Tyne, and have got ashore at the Black Middens at the entrance. They very seldom put back here, laden ships, because it is so difficult to enter.

15,065. Looking to this coast as a whole from Flamborough Head to the Farn Islands, where there is no shelter for shipping to take at low water, and say that Government should arrive at the conclusion that only one harbour was to be made, looking to the saving of life first, and the saving of property second, and the facilities to commerce in the third place, at what point would you consider the construction of such a harbour would tend most to save life and property ?—Well, I must say that is a very difficult question to answer.

15,066. I want your opinion upon it; just consider it for a moment ?—It is a dangerous thing to make a harbour of refuge in a deep bight of a bay, because if you happen to miss it you are sure to go on shore; but if you make it in a place where you can haul off either on one tack or the other you have a chance; but there is no chance if you make a harbour in a deep bight.

15,067. There is a very strong opinion in favour of Hendon Bay?—It is equally situated between the Staples and Flamborough Head. Suppose you could construct a harbour of refuge at anything like a cost that would be at all reasonable and proper to spend upon it, it is a place where a fleet might proceed either north or south. Whitburn Steel projects out to the sea a long way, and between that and the north pier there is good anchorage. Then there is Hendon Smooth, where the ground is good near the shore; further out it is very rocky. I should be very desirous of seeing a harbour of refuge constructed where it would be most useful for the saving of life and property, but I think that would be best effected in the way I have described.

15,068. Then if confined to one harbour, the particular site you are not prepared to give your opinion upon ?—No.

15,069. But, to make it a little more general, whether do you think it would tend most to save life and property if made somewhere between Flamborough Head and Scarborough, or if made somewhere between Redcar and the Tyne ?—Well, with a view to saving life in laden colliers, I think somewhere in the neighbourhood of Flamborough Head is the best place. I have seen very large fleets of laden colliers take shelter under Flamborough Head, as it is now, standing in and off under reefed topsails, and under great risk of running foul of each other.

15,070. Then, looking to the saving of life, you

think it will be a better situation somewhere in the neighbourhood of Flamborough Head ?—I do.

15,071. Then, looking to the safety of property, where do you think ?—Well, I think both life and property go together.

15,072. I ask the question because people distinguish between life and property. By the efficient management of lifeboats, much to the credit of those who reside in this northern district, while there is a very large amount of property lost, it appears that the lives are saved of all on board ; therefore I would like you to distinguish property from life,—where would a harbour be best for the saving of property ?—I think the improvement of the present harbours would be the means of saving property.

15,073. But do you think a site between the limits I have named, Redcar and the Tyne, would do more to save property than a harbour between Flamborough Head and Scarborough, or do you think a harbour between Flamborough Head and Scarborough would also do more to save property as well as life ?—The lives, you know, are perilled in laden ships, and the property is perilled also ; lives are not so much perilled, although they are perilled greatly, in light ships ; if you make only one harbour of refuge, of course it would be applicable for the saving of both ; you cannot in that case separate life from property, because they go together either into the harbour or not into the harbour ; there can be no division between the two risks, you know. I think it is a very great point to have a place sheltered for laden colliers; they are laden very deep, and not over well manned ; and in these pinching times people are obliged to go as near the wind as they can, and consequently loss of life is a greater national care than it would be in other circumstances.

15,074. Then, life and property considered, if only one harbour is to be constructed you say it should be somewhere between Flamborough Head and Scarborough ?—I think that is a very good situation, with a view to the saving of laden ships.

15,075. Well now, knowing the enormous trade along this coast as you do, is it your opinion that if only one harbour is to be made we will require a very large one ?—I should think so ; it must be a very large one ; it would be for a national object, and it would be, I imagine, intended both as a naval station and as a refuge for vessels in the district.

15,076. Does that arise from the fact that, speaking as a sailor, when very large fleets of vessels run for it, and so crowd the harbour, and other ships in distress are obliged to seek shelter, they may run down to a place where there might be certain destruction either for themselves or for other ships if there was not room for them?—A case of that kind might occur, but it would be very rare, because light vessels never start for an anchorage but with a good leading wind. They would not go into a harbour of refuge if they had the chance of making the port they were bound for.

15,077. I asked the question because yesterday a master of a ship stated that in Yarmouth Roads he had known 700 or 800 vessels at anchor at one time ? —I never did.

15,078. And that he had known congregated off Flamborough Head at one time 700 or 800 vessels ? —He might. If there were 700 or 800 vessels there would not be room for them in Filey Bay.

15,079. Then, looking to the object which this Commission has in view, I think you expressed an opinion, Mr. Anderson, that if the expenditure of the public money is to do the good which the Government desires it should do, it should be expended first on the improvement of the three existing harbours, Sunderland, Tees, and the Tyne, and that, secondly, it should be expended in the construction of a harbour somewhere in the neighbourhood of Flamborough?—I think so.

15,080. Then, whether do you put the improvement of the existing harbours first or second ?—First. I beg I may not be misunderstood. I do not look to Government taking upon themselves the improvement of the harbours.

15,081. Yes ; but, looking to the saving of life and property, you in the first place consider that the three harbours you have named ought to be improved ? —Yes.

15,082. In the second place, then, there ought to be some harbour especially for laden ships in the neighbourhood of Flamborough Head ?—Yes ; between Flamborough Head and Newbiggin Point. I give my opinion about Flamborough Head with regard to the laden ships because I know that is the place where they most do congregate, but I do not pretend to say which is the best place.

15,083. Take, for instance, the construction of this pier ; do you mean that Government should give the whole of the money that would be required to construct these two piers, or, supposing the piers were to cost 300,000*l.*, do you mean that if the district or the parties interested in the district raise 150,000*l.* by means of a tax or otherwise upon the shipping entering it, that Government in that case should give another 150,000*l.* ?—I mean that we shall be very thankful to receive all the Government will give us, and that we will endeavour to make up the remainder as well as we can.

15,084. But as Mr. Stevenson says the piers will be of great value locally, do you think that if Government agreed to give 150,000*l.* the parties interested in the district ought to give another 150,000*l.* ?—That is a question I do not think I am competent to answer, for, although I appear here as one of the river commissioners, I am not in possession of the opinion of the commissioners ; but whatever Government thought proper to give, the commissioners would endeavour to make up the rest by loan, or somehow or other, so that the port might be improved.

15,085. Then as you are a commissioner of the River Wear, and have a delicacy in speaking in regard to your own place, and as I am not speaking in regard to the Wear, but in regard to principle, we will take either the Tees or the Tyne, and say, that if the Tyne people were willing to raise 200,000*l.* to extend the piers so as to make a harbour that ships could take at all times of the tide, do you think that Government should in that case give 200,000*l.* ?—I was connected with the Tyne a great many years, and if I may give my opinion with respect to the Tyne I think the exertions the people of the Tyne are making now to improve their harbour entitles them to the consideration of Government, and they have clearly proved that they intend to do all they can ; but I cannot say in what proportion each party ought to give.

15,086. But do you think the parties interested in the particular districts ought to be required to make up some proportion of the sum requisite to construct harbours of refuge ?—Oh yes, certainly, according to their means, and I have no doubt they would be very willing to do it.

15,087. What is the depth of water at the entrance of the south dock at low water spring tides ?—I do not know. I was told the other day by a gentleman connected with the dock that they had 10 feet at low water.

15,088. Is it generally considered a much better entrance than the present entrance of the river ?—Oh, decidedly, it is a deeper entrance ; there is four feet more water, I should suppose.

15,089. And a straighter channel ?—A perfectly straight channel.

15,090. How is it that so many ships continue to go in by the north entrance ?—Because they cannot open the gates ; there is very little more span than the width of a good ship, and you cannot run into them in a gale of wind.

15,091. There is a very limited space at the entrance of the dock gates ?—Yes ; I do not know the distance exactly, but you will get that information correctly from the gentlemen who represent the dock

SUNDERLAND.

Mr. Robert Anderson.

15 Oct. 1858.

company. What I have said is only from second hand, and I beg it may be taken with caution.

15,092. (*Capt. Washington.*) You are a river commissioner ?—Yes.

15,093. In giving an account of the vessels entering and leaving the port, you gave them only for one quarter ?—Only for a quarter.

15,094. Will you turn to page 1 of the return, and give them for the whole year, that is, for the year 1857 ?—I shall be very happy to give them. In the year 1857 there entered by the harbour 10,346 vessels, and by the south outlet 398 vessels, making a total of 10,744. Then the sailings by the harbour were 6,904 vessels, by the south outlet 3,991, of which 3,991 3,717 were loaded in the dock, and 274 in the river, and passed through the dock to sea, making a grand total of arrivals and sailings in the year of 21,639.

15,095. Do you know if that includes the vessels which did not pay customs' dues ?—I do not know ; but there is a return for 1857 of these which pay customs' dues.

Mr. MEIK recalled.

Mr. T. Meik.

15,096. (*Capt. Washington.*) The present return does not give the whole of the arrivals and sailings of the port of Sunderland ?—It cannot be obtained for 1857 till the present year. No return has been kept of light ships that enter.

15,097. For some months and quarters ending December you distinguish between those that pay port dues and those that do not ?—Yes ; and a considerable number do not.

15,098. And are they included in this return ?—They are not.

Mr. ANDERSON recalled.

Mr. Robert Anderson.

15,099. (*Capt. Washington.*) The vessels that do not pay customs' dues are passengers' steamers, ballast keels, hoppers, and fishing craft, and they almost entirely use the old harbour ?—Yes ; there are only 17 in the month ending 31st August of 243 tons each that have used the dock, and the hopper vessels are vessels that carry the ballast out to sea.

15,100. You see that 600 vessels arrived and sailed in one quarter. May we further understand that the same number will arrive and sail each quarter ?—Of vessels not paying customs' dues, do you mean ?

15,101. Yes.—There are 307 arriving, and 296 leaving the harbour, which makes 603.

15,102. May we assume that there are four times that number in the year enter and leave the port of Sunderland ?—You may.

15,103. That is in addition to the 21,600 ?—Yes.

15,104. Can you tell me the whole revenue of the port for 1857 ?—20,428*l.* is the River Wear commissioners' revenue.

15,105. Do you know how much of that is available for the improvement of the river ?—The ordinary expenses are about 12,000*l.* a year ; but the commissioners have reduced their revenue by 1*d.* a chaldron, and they are now receiving only 3*d.* a chaldron instead of 4*d.*, which was considered very high ; and I may mention that nothing pays here but coal, culm, and coke, and shipping goods imported into this port do not pay anything for the maintenance of the river ; they pay a primage to the Trinity House of Newcastle, which I believe is the reason why they are exonerated from paying anything elsewhere.

15,106. Of the whole amount of harbour revenue, how much is applicable to improvements in the river ?—Well, there will be in round numbers about 3,000*l.* or 4,000*l.* a year. The revenue for the present year, supposing that the quantity of coal shipped was the same as in 1857, which I suppose it will be, or a little more, will be about 11,142*l.* for coals, and 5,570*l.* for shipping, which will make us a gross revenue of 16,712*l.* Taking the current expenses at 12,000*l.*,—I am not quite clear that these figures are correct, but they are very near,—there will be 4,412*l.* left.

15,107. You were for many years chairman or secretary of the Lifeboat Association at Shields ?—I was.

15,108. Are the lifeboats here in as good order as they were at Shields ?—I believe they are ; but I do not know anything more about them than seeing them.

15,109. You do not take any interest in them ?—No. I believe they are quite as good at Shields as any in the Wear.

15,110. (*Capt. Sulivan.*) You said a harbour near a point was better for refuge than one in the depth of the bay ?—Yes.

15,111. I think you said because a vessel could go off on either tack if she missed it ?—Yes ; whichever way the wind was she would be in a position to take advantage of that wind.

15,112. And go off on one tack or the other ?—No; that she could go off on either tack.

15,113. If a vessel was embayed, and could not get out on either tack, is she not more in want of a harbour of refuge than one in a place where she can go off on one tack ?—Certainly.

15,114. Then, all other things equal, would not that rather tend to place the harbour of refuge in a bay than near a point ?—In a case of that kind it would.

15,115. As saving a greater number of embayed vessels ?—Yes. There is one thing I would say ; laden vessels are not often embayed ; they hold well to windward; light vessels do get embayed because they are leeward, and therefore are more likely to be embayed than laden vessels.

15,116. Then am I understand by that that it is the general custom of laden vessels to keep an offing till they get Flamborough Head ?—Always, if the wind is easterly.

15,117. Do you know whether, when this south entrance to the dock was constructed, it was supposed that that would make a better entrance to the harbour of Sunderland than the old one; and did the parties who laid out the money on that think that they were insuring a comparatively safe entrance to these docks, and one that could be used in preference to the old harbour entrance ?—Well, what they thought it is impossible for me to say; but there is no doubt it is a very good entrance in fine weather, and capable of admitting vessels of great draughts of water, but it is only available in fine weather, as the returns show.

15,118. These works, therefore, so far as improving the entrance in the most dangerous times in gales of wind, may be considered a failure ?—Well, I do not think it is a failure, comparatively, because I cannot imagine they ever could imagine that an entrance through a dock could be available in gales of wind easterly.

15,119. I am alluding more especially to the piers which I see running outside that lock, and which bear on a small scale to it something like the proportion that Mr. Stevenson's piers bear to the present entrance, and I want to know whether the entrance between these piers has proved as safe as was expected for vessels to take in heavy weather ?—Vessels can take them in heavy weather, no doubt ; but there is no place for them to run into like a river after they are in. There is a marked difference between the two. By those piers of Mr. Stevenson's, when a vessel runs in, she gets into comparatively smooth water, for it is expected that the waves will disperse, and lessen in height, of course, and then vessels can run up the river. Vessels may go very safely in between the piers into the south entrance; but what are they to do afterwards.

15,120. By vessels running up the river when inside of Mr. Stevenson's piers I suppose you allude to the

time when there is water enough for them, and not at all times of the tide?—They run up as soon as there is water, and means will be taken to deepen the water in the harbour where the pier works are going on. The commissioners are now at work increasing the tidal water by taking away the sands out of the river, so as to get a greater area of tidal water, and consequently a greater scour. We do not expect that these piers will improve the harbour and river and do everything that is required. There will be an immense expenditure incurred also by the commissioners in cleansing out the river, and this is now going on.

15,121. I think you said there would be gentlemen who knew more of the entrance and circumstances of this south harbour than you do?—Certainly; I know very little of it.

15,122. (*Chairman.*) What description of vessels are generally used by the coal trade? We had it in evidence the other day, that although they did not look very well in their upper works, their bottoms were sounder and better than any other vessels afloat. Is that your opinion?—I have not been conversant with the sort of vessels in the coal trade, but I believe it is so. I know from experience that they are a better class of vessels now than they were 40 years ago. They are subject, I believe, to annual surveys by the underwriters, and they must be kept in a certain state of repair to be insurable, and therefore there is that guarantee for their soundness. The bottoms are, I believe, kept in very good repair.

15,123. Then, comparing them with the vessels in the foreign trade, should you say that, generally speaking, they are as good, as respects their hulls, as the vessels in the foreign trade?—I would not say they are as good as those very valuable ships that are built for the East India and distant trades; but they are quite as good, and some are better, than many of the ships which trade to Archangel, the Baltic, and short distances.

15,124. Therefore you are disposed to say they are as good as the smaller class of vessels that sail foreign?—Quite as good, and perfectly as seaworthy, I should say, as a class of shipping.

15,125. As respects the way they are found aloft, masts, sails, rigging, rope, should you generally consider them very much improved within the last 40 years too?—I think it is quite as good as it was. They are subject also to annual survey by the underwriter, both in hull and masts, therefore there is no reason why the one should not be kept in as good order as the other; and they all now have chain cables, which are supposed to be very good, as they are not liable to decay as rope was; the ground tackle is therefore very good.

15,126. And aloft, are they as well found as a similar class of vessels that sail foreign?—I should say so.

15,127. Of what use would Filey Bay be to laden vessels leaving Sunderland or the Tyne if caught suddenly with a gale from the south-east shortly after leaving port?—None at all.

15,128. (*Mr. Lindsay.*) That would arise because Filey Bay would be considerably to windward?—Yes.

15,129. What use would Filey Bay be to vessels caught with such a gale of wind off Flamborough Head?—They could run in, and it would be a very good shelter.

Mr. T. B. Ord examined.

15,130. (*Chairman.*) You are a resident in the port of Sunderland?—I am.

15,131. For how long have you been connected with it?—I was born in Sunderland, and have been here ever since.

15,132. In what capacity are you connected with the port?—I am a shipowner, and commissioner of the River Wear.

15,133. Have you been at sea in former days?—Yes; I served my time, and continued at sea several years.

15,134. Were you a commander of a vessel?—Yes, for several years.

15,135. In what trades were the vessels chiefly employed that you commanded?—The Baltic and North American trade.

15,136. You are aware of the objects of this inquiry, and you have been present, I imagine, this forenoon?—I have.

15,137. Will you state to the Commissioners your opinion of the advantage or necessity of one large national harbour of refuge on this district of the coast, or whether you are of opinion that the improvement of the several ports, the Tyne, the Tees, and the Wear, would be the most advantageous for the purpose of saving life?—My opinion is very decidedly in favour of the improvement of the several principal ports on the coast, and my reason is principally because the trade of this coast is peculiar to itself, and nothing like that on any other coast. If a general large harbour of refuge was made on any part of the coast, I think it would not answer the purpose of saving life and property to the extent that the improvement of the existing harbours would do, for this reason, the coal trade is carried on quickly, and its very life and spirit is expedition. It is the interest of every one connected with the ship,—owner, master, and crew,—being paid by the voyage, to make the voyage as quickly as possible, and they never consider a refuge, except under the most extreme necessity, but always run at any risk for the port of destination, the port where they are to load and sail from. Despatch in the coal trade is the very life and soul of it, and the coal trade is the principal part of the navigation on this coast, and for these reasons I think that if the harbours, four or five, or any number that might be thought advisable, could be made accessible at low water, or any time after the tide has flowed a little, and after the tide has fallen considerably, it would be decidedly the best means of saving life and property.

15,138. Then, taking into view the fact which you have stated, that despatch is the very life of the coal trade, would it not be an advantage for loaded vessels that have got as far on their voyage as Flamborough Head, in the event of meeting a strong southerly gale, to have some port they could put into there, instead of running back to the Tyne, the Tees, and the Wear?—That to a certain extent might apply; but the mischief, the loss of property, and a good deal the loss of life too, arises principally out of light ships. Laden ships keep on a fair course, but light ships all run for the harbours, and especially with the wind at east-south-east and that way, so that no harbour of refuge they would ever think of; they would run down at all risks; and if they are too late for the tide they have to depend upon their anchors to keep those light ships off the land; indeed it would not be the interest of any party connected with the ship that they should take a harbour of refuge to the south of the place they are bound for.

15,139. That is, light ships?—Yes.

15,140. I can perfectly understand that light ships, running down from the London river, their great object is to make their port where they have to be loaded; and light ships, in the event of meeting strong north-easterly winds, have a very good harbour of refuge already, have they not, under Flamborough Head?—Yes.

15,141. Putting aside light ships altogether, and taking the case of loaded ships that have got as far as Flamborough Head, or nearly so, if these ships met a strong south-easterly gale, would it not be for their advantage, instead of running back to their own ports, to have a harbour in the neighbourhood of the head,—on the north side of the head,—that they could put into and hold—if I may so express it—what they have got of their voyage?—That would only be in case of a south-east wind. With the wind more to the eastward they would when they rounded the head

SUNDERLAND.

Mr. T. B. Ord.

15 Oct. 1858.

Chairman.

fetch the Humber, which is a good and safe harbour of refuge.

15,142. But I allude more especially to vessels that have rounded the head?—The only place I know of is Filey Bay.

15,143. Then would a harbour of refuge in Filey Bay be of use to laden vessels?—My own opinion is,—not a very great deal. A harbour much north of that would be more so, I think.

15,144. Will you state your reasons why a harbour much north of that would be of more use?—With the wind at south-east ships, unless they have sprung a leak or got disabled, could keep to sea and go off, with the wind to the south-east; it is with the easterly gales that the most mischief is done, when they will scarcely go off on either tack. Then if the wind is well easterly, if they round the head, they can the Humber.

15,145. Then, so far as the saving of life goes, you would say that with the wind at the south-east a harbour of refuge is not required, vessels being able to stand off on the starboard tack?—Not so much; our dangerous wind is from the south-south-east; that is, where they cannot keep off the land; but loaded ships generally keep as good an offing as they can possibly do; light ships always run in for the coast; that is where the great loss of life occurs more in light ships than loaded ones; they run for their ports, and if they are half an hour too late for the tide, and the black ball is hoisted, they must bring up in the roads; they are so close in they can do nothing else, and it is about six or eight hours before they can take the harbour. If the harbours were improved that those vessels could take them when they come down, for instance, the Tyne, Wear, and Tees, and other ports, all this would be avoided, and the immense loss of property avoided. Besides these ports would be accessible to loaded vessels of smaller size as harbours of refuge; for instance, if they make six feet water at the entrance of the Tyne and three fathoms here, there is very little doubt that loaded vessels would be able to take those ports as well as light vessels at high water. Light vessels would escape by taking them at low water. Indeed small loaded coasters now take the Tyne; but if there were six fathoms there, and three fathoms here, they would take those places instead of running back to Leith Roads.

15,146. So far as your experience goes, has the loss of ships off this particular port been greater of light than loaded?—Yes.

15,147. Are you aware that it has been stated, I think in evidence before the Select Committee of the House of Commons, that on the whole coast the loss of loaded ships is very considerably greater than the loss of light ones? Can you give me your opinion as to that fact?—Not on this coast, I think.

15,148. Not on this coast?—My impression is that the reverse is entirely the case. We have rarely a laden vessel lost in this immediate neighbourhood. I have seen eight come ashore from their anchors here within half a mile of the pier heads; they had laid at low water till the tide flowed; whereas if this improvement had been carried out every one of them would have come in with the greatest ease.

15,149. Can you tell me if Sunderland vessels frequently run for the Tyne in heavy weather in consequence of not being able to get into their own port?—Laden vessels do sometimes. Generally speaking, we have had a smaller class of vessels at Sunderland, and when they have been taken with south-east gales, and did not like to keep the sea, they frequently have run for the Tyne; and in many instances where laden vessels have run for the Tyne they have fallen to the leeward, got upon the Black Middens, and the ship and life has been lost; and if these improvements were carried out ships, instead of taking these bars in broken water, for in easterly breezes the water breaks heavily in front of these harbours, the sea would be heavy, but it would run much more easily, and there would be much less danger, and ships would get into comparatively smooth water before they got to very short water.

15,150. (*Capt. Sulivan.*) You said laden ships off Flamborough Head did not generally require a harbour of refuge in south-east gales, because they could go off on the starboard tack, yet you have since said that loaded vessels put back to the Tyne, and even to the Firth of Forth, and that even vessels bound for this port run to the southward of it?—Yes.

15,151. Is it the case that in south-east gales many loaded vessels have to bear up, notwithstanding that they can go off on the starboard tack?—Yes; they bring up, because they do not like to contend.

15,152. Do they not lose much ground and time and incur expense by their having thus to bear up?—Not as a general rule; that is if they bear up for the Tyne. There is a difference between bearing up for the Tyne and a port at a distance. The one would not be a mighty matter to the other. We do not consider it a very great distance between here and any port south of us.

15,153. If vessels bear up for the Firth of Forth, or even for Sunderland, when they are down off Flamborough Head, is it not a great loss of time compared to what it would be if they had a port near Flamborough Head to go into?—Of course it would; it is eighty miles distance.

15,154. Are not vessels running back that way often lost, when a harbour there might have saved them?—I do not think so.

15,155. You do not know a case of a loaded vessel running back, and then being lost, that would have been saved had there been a harbour of refuge fit at all times of the tide to receive them?—Not within my own immediate recollection.

15,156. You say the wrecks on this coast are principally light vessels; do you mean that more light colliers belonging to the northern colliery ports are lost than laden ones on their voyage between this and London and back, or do you mean that the wrecks in the immediate neighbourhood of this place are more light than loaded?—There is no question about it, that in this immediate neighbourhood, the very large majority of the vessels lost are light vessels; the loaded vessels are more frequently lost considerably to the south.

15,157. Take the vessels belonging to Sunderland trading to London or anywhere with coals during the year, then what do you believe the proportion to be of loaded and light colliers?—I cannot say; I must distinguish the ports if I am to give any opinion.

15,158. There are a larger portion of loaded colliers lost near Yarmouth Roads than there are light colliers?—Decidedly. In the Swin and about Yarmouth Roads loaded colliers are frequently lost.

15,159. Is your allusion to light vessels principally with reference to the advantage of the improvement of this particular port or these northern ports, and not with reference to the saving of life and property to the whole collier trade, whether loaded or light; am I to understand that?—Well, that of course is the view I take.

15,160. Without reference exactly to the place where these vessels are wrecked, do you know what the usual idea is as to the proportion of Sunderland vessels that are lost? Are they more generally lost during the year with their cargoes on their way south, or in ballast on their way north?—I cannot speak to that.

15,161. (*Chairman.*) You have a good knowledge of the vessels employed in the coal trade?—I have.

15,162. Are they generally well-found vessels aloft, as far as regards their sails, rigging?—I daresay they are fairly found for the trade; they are employed in short voyages.

15,163. And how should you say they are found compared with vessels of similar size that go foreign?—Well, vessels going long foreign voyages as a matter of necessity have to be kept better found than vessels with two or three or four days' passage. They are

always arriving at one port or the other, and any deficiencies are easily made up.

15,164. But as these vessels that are employed in the coal trade see a great deal of bad weather, and are in the vicinity of land and danger, it appears to me it is quite as essential or more so that they should be as well found as those that go foreign, as far as the safety of the crews are concerned. Would you be disposed to say that?—Yes; only they are a short time exposed, and practical men know that a ship exposed a long time to the weather and labour in the Atlantic ocean is very different to a ship in the coasting trade, where she is only exposed to a gale of wind now and then. The prevalent winds are off the land here.

15,165. Yes; and therefore what I allude to is, that when one of these vessels finds herself on a leeshore, and is obliged to work off that leeshore, if she can, to save the lives of the people on board, and also to save the ship, do you think that her ropes and sails are as well calculated for that as those which are generally found in the foreign trade?—I do not know that I can say that that is the case, generally speaking. I think I would not be wanting in saying that I think the vessels which, generally speaking, are employed in the coal trade, are equal to the vessels employed on long foreign voyages.

15,166. Of the same size?—Yes, of the same size. Generally the vessels going long foreign voyages are A 1. vessels. There are a great many second-class and third-class vessels in the coal trade.

15,167. But A 1. craft does not apply to the gear aloft, which is the most essential thing for the saving of life on a lee shore?—They are, as long as vessels keep tight; but frequently vessels in heavy gales of wind, which only occur occasionally, do not depend so much on their gear aloft, but they turn leaky.

15,168. As respects the hull, do you consider they are as sound and good, considering that they are not, as you say, A 1. vessels, as the vessels of the same class employed in the foreign trade?—Decidedly.

15,169. And on the whole, if you were working off a leeshore for your life, would you rather be in one of the colliers or one of the vessels that go foreign?—Permit me to explain my opinion on that. I would rather be in the average of the colliers than in an American fir-built ship, which all trade foreign.

15,170. But in an English-built ship which trades foreign?—Well, if she was of the same class and the same kind of vessel I would as soon take the one as the other; but the thing is there are so few of these second-class vessels in the foreign trade; it is carried on principally by first-class vessels,—the long voyages.

15,171. And with reference to the gear aloft, upon which the safety of the vessel mainly depends in working off a leeshore, would you feel as comfortable in a collier as in one of the vessels going foreign?—Not generally.

15,172. Now as to the statement with reference to the outlet of the south dock, what is your opinion of it? Has it answered the purpose for which it was intended?—It has answered the purpose exactly that it was intended for. It was never intended as a separate entrance. It was never intended except as a south outlet. Our trade principally depends upon loaded vessels going out of the place. The large proportion of vessels that come in are in ballast, and they depart loaded. It is called the south outlet, and the very name of it distinguishes it. It was never intended except for ships passing through in fine weather as an outlet.

15,173. Therefore I understand you to say the object of this southern outlet was, in the first place, more especially for ships that were leaving the port?—Yes.

15,174. And that, in the second place, it has answered its purpose as an outlet for ships that want to come out at the south dock?—Yes.

15,175. For ships of large draught of water?—Yes; and I would like to make a statement as to the position of the River Wear commissioners in asking for some assistance to improve this harbour. The revenue of the commissioners last year was rather upwards of 20,000*l.*, the whole of which is available for harbour purposes, except the interest of 35,000*l.* which is borrowed, and the officials' salaries. Well, my own opinion is, that the commissioners would not be warranted in expending so large a sum of money as 300,000*l.* in improving this harbour, as it would not in my opinion have the effect of increasing their revenue, except to a very small extent; and my reason for thinking so is, that the vessels coming to this port, if they load to a large draft of water, must leave at the south outlet, it having answered the purpose, and enabled them to load from 20 to 23 feet water. The captains never think about getting in; therefore we may suppose that the opening of this south outlet has increased our trade to almost the extent it will be increased; therefore we would saddle ourselves with the interest of a large sum of money for the improvement of this entrance, without in any way, or at least to a very small degree, increasing our revenue; and I think if this improvement was to have the effect, and if each of the harbours gave something to carrying out these improvements, the Government ought in some measure to assist us. Our revenue last year was 20,000*l.* We have reduced the dues on coals 1*d.* per chaldron, which will reduce this revenue 3,000 and odd pounds. Our ordinary expenditure is from 12,000*l.* to 14,000*l.* a year in dredging, keeping the harbour in order, paying salaries, and such like; and then we have the interest of the 35,000*l.* Now if we are to spend so large a sum as 200,000*l.* or 300,000*l.* it would saddle us with interest at the rate of five per cent. per annum, to the extent of 15,000*l.* a year, and I think, as the improvement of the harbour is the best thing that can possibly be done for the saving of life and property, we should be assisted by the Government.

15,176. (*Mr. Lindsay.*) Are you one of the commissioners of the River Wear?—Yes.

15,177. Then I understand that the revenue at present is about 20,000*l.* per annum?—It was last year.

15,178. And you expended about 12,000*l.*?—Our ordinary expense varies from 12,000*l.* to 14,000*l.*

15,179. What do you do with the difference?—Reduce the dues.

15,180. Have you reduced the dues materially of late years?—At the last meeting we reduced them 1*d.* per chaldron.

15,181. Well, but are you of opinion that if piers such as these were constructed it would be of any great advantage locally?—In the saving of life and property.

15,182. No. I want to know if you think they would tend to increase the trade of the place, and benefit the town and port?—It will not increase the trade of the place materially.

15,183. You think not?—I think not. I gave my reasons just now.

15,184. I was not here?—That the south outlet has increased our trade to almost the extent to which it may be supposed, and it does not depend upon the entrance. Ships coming in here do not inquire how they are to get in, but at what draft of water they are to get out. They make sure that if they can get out at 20 or 22 feet laden they will always get in at from 9 to 13 feet. Unquestionably, therefore, we may calculate that the south outlet has increased our trade, I should suppose well on to one-fourth or one-third. What I wish to be understood is, that the improvement of the inlet will not improve our trade materially.

15,185. Say the Government were disposed to aid in the construction of such piers as those pointed out, would the River Wear commissioners be disposed to contribute towards it, and to what extent?—I have no idea to what extent. No doubt they would contribute to what might be considered reasonable, according to their revenue, for the improvement of the harbour and the advantage of the port.

15,186. Well then, looking to the advantage of the

SUNDERLAND.

Mr. T. B. Ord.

15 Oct. 1858.

Mr. Lindsay.

port, what do you consider reasonable?—I do not know.

15,187. Say it is to exceed 300,000*l.*, what do you think would be a reasonable sum for the commissioners to pay for that?—I think, myself, one-third of it.

15,188. Do you think it would be unreasonable if the Government agreed to give 150,000*l.* towards it, that the commissioners should give another 150,000*l.*? My own impression is, that if we contributed one-third of what it cost, we would do well.

15,189. What is the largest vessel that has loaded here since the south entrance was opened?—About 1,700 tons. She took in about 2,200 tons of coal, and drew somewhere about 22 feet water.

15,190. And what were about the largest-sized vessels that used to load here before the south entrance was opened?—Well, it was not safe, with any chance of getting out to sea in a reasonable time, to load her beyond 16 feet.

15,191. So that in point of fact the south outlet has enabled you to admit ships and to load ships drawing six feet more water than before?—Yes, about that; and that has attracted a trade in ships that we could not have had by any other process, therefore, I say, the power of sailing is the thing that is inquired for, because everybody knows how he is to get in, but not as to how he is to get out.

15,192. But the difficulty before was that ships on account of the heavy sea and the little water on the bar were detained here in great numbers unable to get to sea?—Yes.

15,193. Therefore the south outlet was made to facilitate their getting to sea at a greater depth of water?—Yes.

15,194. And it has answered that purpose?—Yes.

15,195. I know you and your family have taken a great interest, always, in Sunderland. Tell me something about the "Creek." This creek puzzles me. Tell me something about this tax which you pay to Newcastle. You are called a creek of Newcastle, to my surprise. And we are informed that you pay tribute to about 1,300*l.* a year. Is it a tax upon shipping, or a tax upon goods and some trifling tax upon shipping also? On all timber, all goods imported, or———?—Primage.

15,196. On all goods imported?—Yes.

15,197. Is there any tax on exports as well as imports?—I think not, but I am not sure.

15,198. Will any other witness be able to tell me about this?—I am sure I do not know, but I can tell you that the whole town is very much dissatisfied.

15,199. Can you send to our secretary an account of what you pay?—We have no means of getting at it but through the Trinity House of Newcastle or their servants.

15,200. You know what you pay?—We know what we pay in particular cases, but not the whole amount.

15,201. Have the people of Sunderland remonstrated in regard to the payment of this?—Oh yes; the Shipowners' Society had a court trial on the subject.

15,202. Then there will be some gentleman from the Shipowners' Society who will be able to tell us more about it?—The secretary is here.

15,203. (*Capt. Sulivan.*) Will you be kind enough to explain to me how it is as to the harbour and docks? Do the vessels entering the docks by either entrance pay equally to the river fund, or are the south docks a separate trust and a separate fund?—They pay equally to the river fund, that is on dues and ships, but those which use the docks pay dock dues, in addition, to the dock company.

15,204. If a vessel were to enter by the south dock entrance, and only go into the dock, and not to go to sea from that entrance, would she pay river dues the same as if she came in, and went out through the main entrance?—Precisely.

15,205. (*Chairman.*) If you wish to add anything to your statement we are prepared to hear it.—I would wish to give another reason or two for giving the preference to an improvement of these harbours over one large harbour of refuge. No harbour of refuge, however convenient, however large, however suitable, south of this place, can be made available by ships coming down. They would at all risks pass it. If a gale caught a fleet in Yarmouth Roads, if there was a refuge harbour in the bay, and they could take it, they would pass it. It is their interest to make the voyage as quickly as possible, and they would pass any harbour with the wind at east-south-east blowing hard, and take the chance of getting into their ports when they arrived off them. I do not think, so far as the trade of this coast particularly is concerned, that any single harbour of refuge in any place or position would answer the purpose that the improvement of the rivers would do; that is applying it to the peculiar state of the trade along the coast.

15,206. And the reason you have just given has a special application I understand to light vessels?—Yes, because our loss on this coast principally arises from light ships coming down here, when there is no water. Then, if these ports were improved to the extent that is contemplated, they would be able to take these ports as they come down. I have a decided objection myself to making a large harbour of refuge at the bottom of a deep bay, for two very principal reasons; in the first place, when ships run for a harbour of refuge it generally happens to be in thick snowy weather; if they miss the port on either side there is nothing for them but to go on shore; there is no chance of hauling off on the other tack; in the next place, still keeping in view the trade of this coast, when the wind in some measure moderates, or gets round to the south-east or north-east, in a deep bay vessels cannot get out to proceed on their course; there will be a stoppage to trade; whereas if there is to be one harbour of refuge it would be much better, in my opinion, if it were made in something like a straight course, or on a projecting cape, if it could be made so.

Mr. Alexander Noble examined.

Mr. A. Noble.

15,207. (*Chairman.*) You are superintendent harbour-master of the port of Sunderland?—I am.

15,208. For how many years have you been connected with the port in that capacity?—Nearly eleven.

15,209. And previous to that did you follow the sea?—Yes.

15,210. Will you state the number of years?—Sixteen.

15,211. And of those years were you in command of vessels at any time?—I was for nearly nine years.

15,212. And the vessels which you commanded were chiefly employed in what trades?—In different trades; I have commanded on this coast; to the East Indies and other parts.

15,213. Did you ever command ships in the Baltic trade?—I was once there.

15,214. And in the American trade have you gone north about?—I have.

15,215. How many voyages?—I have been, I should think, 5 or 6 times across the Atlantic.

15,216. Are you aware of the objects of this inquiry?—I am.

15,217. Will you state any opinion you entertain as to the necessity or advantage of one single harbour of refuge on this coast, or whether the improvement of the three ports, the Tyne, Wear, and Tees, would be more advantageous for the saving of life?—Practically speaking, I would sooner see the present harbours improved than one given harbour to be made in a given place, because light ships that come round Flamborough Head they generally steer a direct course down to the different ports of Shields, the Tees, and Sunderland, and if a harbour of refuge were placed in any given

spot those vessels that had got opposite to and with an east-south-east wind could not fetch back again ; for instance, if a harbour of refuge was in the Tees Bay, and ships north of that bound down to Sunderland or to Shields were caught in a gale from the east-south-east they could not fetch back.

15,218. As respects laden vessels, what is your opinion as to harbours of refuge; laden vessels making their passage to the south ?—Comparatively speaking, with the number of ships that leave and arrive off these ports, very few laden ships are lost ; some are lost between Flamborough Head and this port.

15,219. Do you consider a refuge harbour is not required for laden ships ?—I would sooner see the present harbours improved than a harbour of refuge in any given spot.

15,220. Well, now suppose it was decided, notwithstanding your opinion to that effect, that there should be a large harbour for ships employed in the coasting and coal trades, where would you place it between the Tyne and Flamborough Head ?—I would place it as near Flamborough Head as possible.

15,221. Will you state your reasons ?—Because it is a promontory that runs into the sea, and ships generally make for that point, both coming and going; and if vessels were caught off there with a gale of wind they could run with the greatest safety into Bridlington Bay or Filey Bay, if it was big enough. I think it would not be advisable to place it further north than somewhere about Flamborough Head.

15,222. Well, you have heard the reasons that have been given by one or two of the previous witnesses as to their preference for a harbour of refuge at a place like Flamborough Head to one in the bight of a bay. What is your opinion on the subject ?—My opinion is, as the witnesses have already stated, that when it is necessary to take these harbours of refuge it is generally very bad, thick, hazy weather, and you do not perhaps exactly know where the ship may be; a man might feel timid in running down into a deep bight like Tees Bay. He would generally hang out, to try to make the bold land like Flamborough Head, so that if he could not fetch it he could go off on the other tack.

15,223. Are you acquainted with the land in the neighbourhood of Hartlepool ?—I am.

15,224. Is it land which is easy to make in blowing and thick weather from the eastward ?—No ; it is low land in Tees Bay ; but it is good land at Redcar.

15,225. Is it therefore easy to make or not ?—I should say it is rather dangerous to make. It is dangerous to run down into that bight.

15,226. Are you aware whether Sunderland ships run into the Tyne in bad weather frequently ?—Sometimes they do. Laden vessels of heavy draught of water go past our port, and knowing there are two or three feet more water on the bar at Shields they take that in preference to taking our port ; but laden vessels run to our port also.

15,227. You know Yarmouth Roads ?—Yes.

15,228. How many vessels have you ever seen lying there at one time ?—I should think 600 or 700 sail off Lowestoft Roads.

15,229. And were these vessels light or laden chiefly ?—The greatest number were light ships.

15,230. And has it ever occurred to you, in running through Yarmouth Roads, to find them so crowded that you could not get anchorage for your vessel ?—I have seen it very thronged sometimes, and bowsprits carried away, and that sort of thing, in bringing up.

15,231. Give me your opinion: suppose we are to have a large harbour of refuge, as to the number of vessels it ought to be calculated to contain to be really of service, taking into view that in heavy weather and in the night-time men cannot pick up a berth very nicely ?—I should think it ought to be able to contain 1,000 or 1,500 ships, to be of any use to the number of ships I have seen on the coast.

15,232. But will you reconsider that number ; because, although that number might be on the coast at any time, are you of opinion that they would accumulate to that extent during the week or ten days' blowing weather, taking into account that the light ships would naturally run for their own ports ? Perhaps there would not be that number if the ports were improved along the coast.

15,233. Would you be disposed to make the number something less than 1,000 or 1,500, on consideration ? —I should say you ought to have provision made for a great number, according to the size of the ships.

15,234. You are still disposed to adhere to your former number ?—Yes.

15,235. (*Mr. Lindsay.*) Then holding the opinion you do, if one great harbour of refuge is to be made it ought to be such as will contain on an emergency 1,000 or 1,500 ships ?—Yes ; but I would not like to see that harbour made and the present harbours not to be improved. My opinion is, that in preference to a harbour being made the present harbours of Shields, Sunderland, and the Tees ought to be improved.

15,236. Then knowing the coast as you do, and no doubt thinking in your own mind that you do not see any site where a harbour of that size could be made, I suppose that is one reason why you advocate the improvement of the existing harbours so as to admit vessels at all times of the tide ?—Yes. I am not aware where such a harbour could be made ; but it is absolutely necessary that something should be done on the east coast here to prevent the loss of life. If a harbour of refuge was made even at Flamborough Head to contain these 1,000 ships, this would be of no use if a vessel got opposite it with the east-south east ; they must still reach down to the north, and they would be in the same predicament as at present.

15,237. It would depend upon the position they were caught in, in a south-east gale, would it not?—Yes ; but if you take the returns of losses that have occurred, you will find that two thirds of the ships that are wrecked on this coast in 1854 were lost to the north of Hartlepool. You have 40 at Shields and 43 at Sunderland.

15,238. Whether is the entrance of the harbour at the Tyne, the Tees, or Hartlepool, or the Wear, easiest made out by a ship at sea ?—We generally reckon that Sunderland is best to pick up.

15,239. Why?—Because we have the Tunstall Hills, for one thing ; they are seen at a great distance, and they are seen when you cannot see the land.

15,240. Are these hills far behind ?—About a mile and a half.

15,241. But to a sailor going along the coast, anxious, in rather thick weather, to make out the entrance to the harbour, which entrance is easiest made out ?—I should say the Sunderland and Durham coast is as easy as any.

15,242. You think the entrance to Sunderland is as easy as the entrance either to the Tees or to the Tyne ?—It is decidedly better than the Tees.

15,243. Better than the Tyne ?—I do not say better than the Tyne ; Tynemouth Castle light is a capital mark.

15,244. The lighthouse is easily made out ?—Quite easily.

15,245. You have been 13 years harbour-master here ?—Eleven.

15,246. Has the sand to the north and south of the pier been accumulating during your experience ?—It has accumulated to the back of the north pier.

15,247. Then has it been accumulating at the south pier ?—It has.

15,248. Then it has been accumulating at both piers ?—Of course it has.

15,249. Then I see by this plan that the sand has gathered out till it has got to the extremity of both piers ?—Yes.

15,250. Then it has been growing gradually out ?—It has.

15,251. Has sand accumulated at the groins to the east of the south dock ?—It has.

15,252. And made the bank ?—The bank has been made to make the dock works.

SUNDERLAND.

Mr. A. Noble.

15 Oct. 1858.

Mr. Lindsay.

15,252*a*. But were the groins put down for the purpose of making the land?—Yes; of assisting.

15,253. And a pier then in reality is something similar to a groin; it collects sand on each side of it?—Not if we run it into the sea.

15,254. These two piers are run out into the sea?—No; they are embayed.

15,255. But still they project out to sea?—They are much more embayed now than they were previous to the dock being made.

15,256. You do not alter your opinion that the sand has grown gradually out to sea till it reached the end of the pier?—It has accumulated at the north side and south side as well.

15,257. If it had accumulated and made land at that particular point, and if it had accumulated, making land at these groins, why would not the effect be the same upon the proposed north and south piers as well?—The reason is, that the proposed piers will throw the entrance of the harbour more into the tideway and into the sea tide, and the tide sluicing past the entrance of the harbour will keep it clear.

15,258. When you were the captain of a ship you sailed to America, north about?—Yes.

15,259. Do you know anything of the coast between Aberdeen and the Pentland Firth?—I know nothing further than just passing.

15,260. Are you able to offer an opinion as to whether you think a harbour would be of most value, looking to the saving of life and the saving of property, and the facilities to commerce, at Fraserburgh, Peterhead, or Wick?—Considering the trade you have got from the northern ports of England to the Baltic, and North America, the safest place for a ship to run to is the Firth of Forth.

15,261. But I am speaking of north about between Peterhead and Wick. Do you consider yourself competent to answer?—I do not.

15,262. (*Capt. Sulivan.*) You said you thought the sand would not accumulate behind the piers because the tide would sweep by the entrance; would that have anything to do with preventing the accumulation at the back of the piers in the corners inside that line of the tide?—I am of opinion that if the piers are formed in the way projected the inside of it will be comparatively smooth.

15,263. I am speaking of the back of the piers. The sand moves along the coast, and accumulates at the back of the piers, as Mr. Lindsay was speaking about. You said the sand would not accumulate at the back outside the piers?—No; because the tide running along the coast would prevent it.

15,264. Even supposing that would prevent the sand accumulating at the mouth of the harbour on the change of tide, would that in any way affect the sand accumulating at the back of these piers projected, as it has accumulated at the back of them?—I do not think any sand of consequence will accumulate.

15,265. Where has the sand come from?—It has been a work of time.

15,266. Then a work of time would be likely to accumulate the sand out there?—No; the beach there is a sandy beach of itself. North of that it is a rocky beach.

15,267. Where does the sand come from that has filled up and added to this beach? It must have come from the sea, must it not?—No; there was sand at Roker.

15,268. Is the line of the sand further out towards the pier head than it used to be?—No, I do not know it is.

15,269. Where has the sand come from?—It has been stirred up along the coast.

15,270. Then will not the waves stir it up along the coast and bring it into the proposed piers?—There is very little sand at the back now.

15,271. (*Chairman.*) You heard the questions I put to two of the former witnesses relative to the state of the vessels employed in the coal trade?—I did.

15,272. Do you fully understand the object of them?—Yes.

15,273. Now give me your opinion, first, as to the state of the vessels employed in the coal trade, with respect to their sails, masts, rigging, and gear aloft. Whether are they as well found as vessels of the same size, generally speaking, in the foreign trade?—The greater part of the ships that belong to this coast of England are insured ships. They undergo an inspection by the clubs' agents that belong to the different ports, and it is their duty to inspect them from time to time to see they are in proper order. They do so, I believe. There are some vessels that I see in this port at different times, which I believe, from inquiries I have made, are many of them uninsured altogether. They will not receive them in the clubs; they are not fit to go on salt water, some of them.

15,274. As respects the hulls of these vessels, what would you say about them?—Well, it is out of my jurisdiction, any further than seeing these vessels. I should say, generally speaking, that the north country colliers, and vessels trading along the coast, are good wholesome strong ships; and I believe if they were not they would be condemned by the agents of the clubs; at least it is their duty to do so.

15,275. And therefore, generally speaking, you would say, as respects their hull, so far as your own opinion goes, they are good?—I would say so, generally speaking; there may be exceptions.

15,276. Can you give me any idea of the proportion of these vessels that are so bad that no clubs will insure them?—I cannot do so; I only see them occasionally in my duties.

Mr. JOHN GRAY examined.

Mr. J. Gray.

15,277. (*Chairman.*) You are inspector for the clubs at Sunderland?—Inspector of materials.

15,278. Do I understand by inspector of clubs, insurance clubs?—Yes, the three principal insurances at the port in which second-class ships are insured; second-class ships using the foreign trade and coasting.

15,279. And are these mutual insurance clubs?—Yes.

15,280. Are you a seafaring man?—Yes; my earliest recollections are of the sea. I was brought up to the sea.

15,281. How long were you at sea?—From a boy of four years old.

15,282. Till how long?—Till I was 38. Four years ago I was appointed harbour master for the east district of the port reaching from the bridge to the sea.

15,283. So that altogether you were 34 years at sea?—In early life my father had a small vessel, and I was brought up in the summer time with him.

15,284. For how many years have you been in command of vessels?—Something like 16 or 17 since I first took the command of a ship, and I was constantly in ships trading to London. It was one of the oldest ships belonging to the port, the *Cynthia* and was built by Mr. Alison, one of the commissioners.

15,285. You know the coast?—Well.

15,286. And you are aware of the object of this inquiry?—Yes.

15,287. You have been present during the whole of our inquiry?—Not during the whole of the early part.

15,288. Give me your opinion as to the advantage or necessity of a single harbour of refuge on this coast, or whether the improvement of the three ports, the Tyne, the Tees, and the Wear, would be more advantageous for saving life?—Where is the single harbour of refuge to be placed?

15,289. Perhaps it may be necessary that I should explain to you that I ask the questions, and you answer them?—I will endeavour to do so. The im-

provement of the three ports would accomplish more than one harbour of refuge on a limited scale.

15,290. What number of ships would you be disposed to say a harbour of refuge on a sufficient scale would hold?—I would not like to say the number of ships, but Yarmouth Roads is about, as near as I can recollect, 10 miles in length; there is about a mile and a half of good anchorage; Lowestoft Roads is about two miles and a half, and half a mile of good anchorage, and I have been riding there when these roads have been crammed from one end to the other.

15,291. And under the circumstances you have mentioned, were these vessels chiefly loaded or light, or were they a mixture of both?—They were light colliers. There might be a mixture of foreign ships bound to the north, but they were principally light colliers bound for the district between the Tees and Blyth.

15,292. You have heard the evidence given to us by some of the previous witnesses, that light colliers invariably run for their own ports?—Yes; it is a sailor's duty to make for his own port; the port he is bound for.

15,293. That being the case, and the large number of vessels you saw in Yarmouth Roads being principally light, would you be disposed to say that a harbour which would hold 500 or 600 sail might be of use?—It might be. If you could make a harbour fully the length of the Scroby and other sands lying at Yarmouth you might do some good.

15,294. Would a harbour of refuge for loaded ships going south be useful somewhere in the neighbourhood of Flamborough Head?—If placed in the open part it would not accomplish the end in view. It might save a loaded ship, in an isolated case or two if it was placed in a separate place, and kept to itself, but it would not accomplish anything in that way if it was placed in the open of any of the ports.

15,295. Are you acquainted with Filey Bay?—Yes; I rode out one of the heaviest winds that ever blew upon this coast there.

15,296. And are you acquainted with Bridlington Bay?—Yes; by cruising inside of it and out.

15,297. And how many vessels were at anchor there at that time?—I cannot say, but they were riding that thick that when the wind veered they fell under each other's bows and sunk each other.

15,298. Can you give me an idea of the number of vessels that was there at that time?—I should think something like 500 or 600 sail, and several ships could not find refuge there, and had to go to the Humber.

15,299. And these principally were light?—They were.

15,300. Therefore with a heavy north-easterly wind Bridlington Bay does afford very good anchorage for a considerable number of ships?—Yes.

15,301. Now, at Filey Bay at present, with the wind from the south-west or south, and so forth, how may vessels could find anchorage there?—About 150 or 200 sail; not more.

15,302. Suppose a harbour of refuge was made in Filey Bay that would hold from 500 to 600 sail, are you of opinion that it would be of use to laden colliers bound south?—Decidedly; it would save several of them. I do not say it would be as much use as a harbour of the same description made in the bight here, where there is sufficient room for the sand to work to the eastward of it.

15,303. Now, with reference to the opinion you have given about a harbour down in the bay, would you prefer a harbour of that kind to a harbour in Filey Bay?—Not right in the bay, but in one corner, to allow the silt to work past; the silt all comes from the northward.

15,304. Such being the case, is there any particular site of the coast from the Tyne to Flamborough Head that you would be disposed to point to for such a harbour of refuge?—One is about as good as the other. Souter Point is better than Hartlepool. But if Government were inclined to make a harbour of refuge they would soon find a site.

15,305. (*Mr. Lindsay.*) You stated that a harbour of refuge, if it could be made at Filey to hold about 500 sail of vessels, would do great good?—It would do some good.

15,306. But you thought it would do still greater good if it was down somewhere between Redcar and Tynemouth?—It would do more harm than good if placed in the open of a bay.

15,307. Do you mean in the deep bight of a bay?—Yes; it must be distant from a port, or the ships using that port going in and ships seeking refuge would confuse each other, there would be such a number of ships.

15,308. Is it your opinion that if it rested between Filey and Hartlepool you would give the preference to Filey?—I would not say that. I have never sounded in Runswick Bay, but I like that place; it would decidedly make the best Government harbour on this coast.

15,309. If it rested between Filey and Hartlepool, would you give the preference to Hartlepool?—No; I would not give the preference to Hartlepool; it is the worst place along the coast.

15,310. Then you would give the preference to Filey?—Yes, because it would keep the vessels clear of a port. It would be exclusively for the ships it was built for. In the opening of a port it would become the trade of the port, and in ten years it would be increased double to what it did in the previous ten years.

15,311. You object to Hartlepool being made a harbour of refuge, because the expenditure of Government money there would tend so materially to increase the trade of the place for a time?—For a time it would.

15,312. Do you object to it on that account?—Yes; but not altogether.

15,313. Give us other reasons. I want your reasons as a sailor why you would prefer Filey to Hartlepool?—Because ships only that need refuge would go to Filey; but when ships have to seek refuge at Hartlepool the ships bound there, especially ships that are light, will run in before them, and if there was a fleet of ships they would fill it up, and confuse them, so that it would do more harm than good. And I mean, in point of equity, it would be injustice to others to improve Hartlepool and her docks in preference to the docks making in the Tyne.

15,314. I want you always to keep in mind one thing, that is, that the object of spending the public money is to save life, and then property next. Looking at these two things, the loss of life about here and the loss of property, if it was left to you to spend the money whether would you spend it at Filey or at Hartlepool?—If it was determined that Filey or Hartlepool should be the place, I should say Filey.

15,315. That is your opinion?—Yes, for laden ships.

15,316. Say that it rested between Filey and the Tyne, and presuming that it was possible to make a harbour at the Tyne to receive the largest description of vessels at all times of the tide, whether do you think, having these objects in view, it would be better at Filey or at the Tyne?—For laden ships I should give the preference to Filey.

15,317. But looking to both laden and light ships?—If for laden and light ships, I would place it in the centre of the district between the Tees and Blyth, so as to allow each ship every facility of getting to it.

15,318. Then is it your opinion that the harbour should be somewhere about the place here?—I do not say this place—not in the open of this place,—although it is as good as Hartlepool. It is about, as far as I can recollect, the same distance from Hartlepool Pier to the five fathom line as it is from one port to the ten fathom line, and it is three miles out to good clear ground.

SUNDERLAND.

Mr. J. Gray.

15 Oct. 1858.

Mr. Lindsay.

15,319. When you say between Hartlepool and Blyth, what particular place do you refer to?—I do not say any particular place. I say the centre, to allow ships at each extremity to get out. They have now to go round Souter Point, which is a queer awkward point with the wind at east to get round.

15,320. Are there many ships lost on Souter Point?—No; they have no business to be lost there.

15,321. You say it is a queer place to get round; what do you mean by that?—It lies off a little bit; about seven or eight miles.

15,322. Then the substance of your evidence is this: that the expenditure of the public money would be better used in improving the existing harbours, so as to make them accessible at all times of the tide, than any one great harbour?—Three places in preference to one.

15,323. But if the Government said there was only to be one harbour, you would give the preference to Filey over Hartlepool, and a preference to Filey over the Tyne; but you would not give a preference to Filey over some site between Hartlepool and Blyth?—Yes; between the Tees and Blyth.

15,324. But you are not prepared to give the site?—I am not. If good holding ground can be found in the immediate district, this is the place; but it ought to be distinct, to keep it from becoming over crowded.

15,325. How many clubs do you inspect for?—Three.

15,326. How many ships are there in those clubs?—About 275.

15,327. Are they what are called first-class ship clubs?—Oh no; there are first-class ships in them, but they are principally second-class.

15,328. In what trade are they chiefly employed?—The North American, Baltic, lower ports of the Mediterranean, and coal trade.

15,329. Do you often find it your duty to refuse a ship on account of being bad?—I have a ship in hands now that I will not allow to go to sea without being put in order.

15,330. Are there many ships sailing out of Sunderland to your knowledge that are not in the clubs?—I cannot say the actual amount, because as many more are insured in other clubs, but many of them are ships that we would not allow to remain in ours; there would not be a fair risk on our ships.

15,331. Are there other clubs that assist them?—Yes; in London, Shields, and Whitby.

15,332. Are you more particular here?—Yes; our committee are very particular.

15,333. Are there many ships sailing out of Sunderland in the coasting trade, to your knowledge, that are not in any clubs?—Very few; I do not know any, except it be Mr. Gideon Smailes' ships of Whitby and Mr. Barker's of Shields. They are not insured.

15,334. Why?—I suppose he can make more money of them that way.

15,335. They have a number of ships?—They are a club of themselves.

15,336. It pays then, on account of the number of ships, not to insure?—Yes.

15,337. Are there any or many ships, to your knowledge, sailing along the coast, that are so badly found and so inefficient in the hulls that the clubs will not have them?—I do not know of any; very little; they all get insured somewhere.

15,338. But I am speaking of the clubs. Are there many ships sailing along the coast that the clubs in the north of England will not admit?—There are clubs in the north of England that will insure them.

15,339. So that there are hardly any ships employed in the coasting trade that are not insured in some club or other?—They generally are insured; an ill-found ship is an exception to the general rule; only we cannot expect second-class to be found as well as ships only twelve months old.

15,340. Do you know whether many ships founder on this coast from being badly found?—Not from being badly found. The trade is carried on in very old ships, and some of them have very hard squeaks sometimes.

15,341. When I refer to being badly found, I refer to the hulls being in bad order, as well as the masts and cables, and you do not think many are lost from want of proper attention being paid to these?—No; but a poor man, if he has a little money, can lay hold of an old ship much easier than he can of a new ship, and for that reason they purchase these old ships, go in them themselves, and carry on the trade.

15,342. (*Capt. Sulivan.*) Do I understand you to say that for laden ships alone you would prefer Filey to other ports?—Yes.

15,343. But for laden and light ships you would prefer it somewhere on the coast between Hartlepool and Blyth?—Yes.

15,344. For laden ships alone, would you prefer a harbour somewhere on the coast in this bay near Sunderland to Filey?—Yes; with sufficient depth of bight for the silt to work through it.

15,345. If a harbour were made at a point, with no port inside it, would a smaller harbour supply the wants of the passing trade than if it were made in a port where there was a trade coming to it also?—Decidedly.

15,346. (*Chairman.*) With reference to coasters being well found, do you mean by well found well found in stores, or well found also in their rigging gear and sails?—My department is principally for the rigging gear, and with that I am determined to do my duty, and that they shall be well found as second-class ships. I am appointed for that purpose, and they must keep their ships in order. If times were better we would have them better found still.

15,347. Then, as a general rule, you would say that the running gear sails and masting, which are really the vital things of consequence when a vessel is off a lee shore, are as good as they ought to be, considering the style of the vessel?—Yes.

15,348. Is a second-class as well found with her running gear as a first-class ship?—It may not be, when a ship is only one or two years old; but when a ship becomes five years old many second-class ships are as well found.

15,349. I understand you to say that, as a general rule, the ill-found ships are vessels that are owned and sailed by men in not very good circumstances?—Yes; and that induces the most of them to remain in the coal trade. I knew an instance of the oldest ship in the port; she was a rotten old ship; but still none of the ships, whether old or not, could make passages with her.

15,350. If a general harbour of refuge was preferred would you have it at Hendon or Hartlepool for the saving of life and property? What part of Hendon Bay would it be?—At the north part, where there is hard ground, there would be a better harbour of refuge than Hartlepool, for this reason, the tide goes in round Hartlepool Heugh, and it would silt up; there is less water at Hartlepool Bay than at any other part of the coast.

15,351. Then I understand you to say that you are of opinion that Hartlepool from its natural disadvantage is unfit as a site for a harbour of refuge?—Yes; it would become overcrowded, and what it is now it would then be on an extended scale, and the remedy would be worse than the disease.

Mr. William Simpson examined.

Mr. W. Simpson.

15,352. (*Chairman.*) You have followed the sea?—Yes.

15,353. How many years?—Sixteen.

15,354. And how many years have you been in command of a vessel?—Twelve.

15,355. And the vessels you have commanded have been chiefly employed in what trades?—The coal and Baltic trades.

15,356. How many voyages have you made to the Baltic?—I have been employed in the Baltic trade

for seven years, and made three voyages a year, nearly.

15,357. And you have returned home pretty late in the year?—Yes; I have come home in January.

15,358. And where did you, taking your departure from the Baltic, say, either from the Scawe or the Naze of Norway, with the wind hanging at southward and westward, how would you make your passage?—In winter we generally endeavour to make Flamborough Head.

15,359. But with the wind hanging to the southward and eastward that is not possible?—If it is not possible to get hold of Flamborough Head we come to the northward.

15,360. And do you stretch right across?—Yes; as long as your ship lies any way to the west-north-west, or any way that can keep her head to the northward.

15,361. How far north have you made the land?—Buchan Ness.

15,362. You are aware, of course, of the object of this inquiry?—Yes.

15,363. And that it extends to a harbour of refuge on the north-east coast of Scotland between the Firth of Forth and the Pentland Firth, as well as a harbour of refuge here?—Yes.

15,364. Give me your opinion whether a harbour at Peterhead would be of advantage or not to the Baltic and Archangel trade?—I think a harbour at Peterhead will be of very great service to both the Baltic and Archangel ships, because generally Archangel ships have to call at Peterhead for orders, and late in the season they generally get them far north.

15,365. And what would be the most eligible site for a harbour of refuge for those trades on that district of the coast?—I think Peterhead.

15,366. Are you aware that Wick is a large fishing port, and lies at the entrance of the Pentland Firth, the navigation of which is very difficult?—I believe it is.

15,367. Taking into view the large number of fishermen who go out of Wick, and also the difficulties of the navigation of the Pentland Frith, and that the object of this inquiry is to find a site for a harbour of refuge which will save life, would you still give the preference to Peterhead?—I should think Peterhead more suitable than Wick. There is a very heavy tide runs off Wick; the ebb goes for about three hours to the northward longer than the flood runs, and ships crossing the Moray Frith are not apt to fetch Wick when they can fetch Peterhead.

15,368. What is the longest passage home from Elsinore that you have ever made to this port?—Twenty-two days.

15,369. Was that an average passage in the fall of the year?—Yes.

15,370. And what would you call a bad passage?—I call that a very bad passage. I have come from Elsinore to London in five days, and I have done it in twenty-two, and ten.

15,371. And was the weather very coarse when you did it in twenty-two?—Yes.

15,372. And your people, did they suffer much from the cold and wet and hard work during the passage?—Yes; and we generally suffer more when we get off the coast, because there is to be a better look-out kept on the coast than in the middle of the North Sea, there are so many ships.

15,373. What are the prevalent winds in the North Sea in the fall of the year?—From south-east to south-west.

15,374. And what is the worst weather?—The heaviest gales are from the south-east.

15,375. What kind of weather do they begin with, and with the wind from what direction?—When the wind gets to the southward of east we have generally thick blowy weather.

15,376. How do the south-easterly gales end?—They generally go round to the east-north-east and north-west.

15,377. So that they back round to the northward?—Yes.

15,378. Does it blow hard from the north-west?—Generally very hard.

15,379. And with reference to this district of the coast, what is your opinion in reference to a harbour of refuge; one or three?—I think three would be more beneficial than one.

15,380. Will you state your reasons?—One reason is, that we generally leave Yarmouth Roads with a very heavy fleet of ships in the winter. I have come down to this coast with as far as 700 sail; and with easterly winds you generally like to keep a good offing, and the weather is generally thick. You come down and make the Head; sometimes you do not, and it is very bad keeping a reckoning in a tideway with a fleet of colliers. After getting to the north of the head we generally run into Hartlepool or Sunderland, to make the land, and after you get down upon the land it is very bad getting off with a light ship, and if there was only one harbour of refuge perhaps it would be over late to reach it. If there was three you might manage to hit one of them, and therefore I think the improvement of the three harbours would be better than one.

15,381. Therefore for light ships you would have no hesitation in saying what should be done?—No.

15,382. Now as respects the loaded?—I have gone out here with as many as 150 laden ships, and on one occasion we got to Whitby, and it came on a very heavy gale of wind from the east-south-east, and I got back to Leith Roads. I could not take either Sunderland or the Tyne with a ship 14 feet water, and I had great difficulty in getting round the Farn Islands. If there had been a harbour of refuge at Sunderland or the Tyne I should have been able to save two lives. I lost two men from the deck and a boy on that occasion.

15,383. What do you say to Filey Bay as a good harbour of refuge for laden ships?—It is a very good holding ground when you are well in, but if you are not it is very bad; the ground is hard and chalky, and the anchor will not hold. The ship will run into the bay with the wind south. I think Filey Bay a very suitable harbour of refuge, because many a time a ship may go out here, and she will reach up as far as the head, and will not go round the head. If a vessel can round the head she can go to the Humber with an ebb tide. If she will not go round there is nothing but coming back; and if you have to put a ship under close reefed topsails for two or three days there is nothing but Leith Roads.

15,384. Then you are of opinion that a harbour of refuge at Filey Bay would be of great advantage to loaded vessels going south?—Yes.

15,385. And that if that were done, and the three ports were improved, we should have arrived at a thoroughly good system?—Yes.

15,386. (*Mr. Lindsay.*) Out of that fleet were there many ships obliged to run for Leith Roads?—A great many.

15,387. Were there many casualties to these ships in running?—A great many of them were clean swept before they got to Leith Roads, and many accidents happened there by ships driving from their anchors. About 15 ships put into Leith.

15,388. Did any of them lose their masts?—I do not know; several lost their yards.

15,389. And several had their decks swept?—Yes; several from this port lost everything from their decks.

15,390. And these ships were obliged to run for Leith because there was no place of refuge on this coast where they could enter with safety?—Yes. I could have got into the Tyne or Wear, but the ship drew too much water. It was low water.

15,391. (*Capt. Washington.*) Could you have taken a harbour of refuge at Filey or Hartlepool?—I could not reach Filey.

15,392. How was the wind?—South-east to east. The gale came on from the south-east first. I was

SUNDERLAND.

Mr. W. Simpson.

15 Oct. 1858.

Capt. Washington.

then abreast of Whitby, and it rounded till it got to the east.

15,393. And the fleet generally were abreast of Whitby?—Yes; between Hartlepool and Whitby.

15,394. You could have run for refuge in Tees Bay?—Tees Bay is a very bad place to run for in a gale of wind from the south. The Yorkshire land in a gale of wind from the south is very often capped, and you cannot make out objects; not only that, but the sea breaks very heavy in Tees Bay, and no man likes to go to Hartlepool with a laden ship, because you are almost certain to get your deck swept before you get into port. Only in January last three ships capsized in Tees Bay. They were light ships, making for Hartlepool in a gale of wind, on the 4th January, and a laden ship, a foreigner from Norway foundered, before she got to Hartlepool.

15,395. Then there is no place along the coast where you think you could place a single harbour?—I think Hendon Bay is decidedly better than Hartlepool, provided one harbour is to be made.

15,396. Is not Hendon Bay rocky?—Some parts of it is.

15,397. Do not you see rocks on the beach?—Yes, at low water.

15,398. Would you rather run on rocks than a sandy beach?—A sandy beach.

15,399. On a sandy beach life is pretty sure to be saved, even if the ship is lost?—Generally.

15,400. (*Capt. Sulivan.*) Do you consider it important that wherever a harbour of refuge is made there should be a clean beach inside it for ships to run on if they have lost their anchors or have a difficulty in bringing up?—Decidedly so. Many a time a ship when she goes for a harbour is half full of water, and when you get in you want some place to lay her in to get it out. You are not able to pump it out, and the crew might not be able to keep up the whole night.

15,401. It would be dangerous to have a rocky shore inside?—Decidedly.

15,402. Supposing the first object of a harbour of refuge is to save life and property, do you know of any ship being caught off Buchan Ness in a wind that could not get off on one tack or the other, either by running to the southward towards the Firth of Forth, or northward into the Moray Firth?—If a ship is caught between Buchan Ness and the Bell Rock she will always go to Peterhead, when she cannot go round Peterhead to go to Wick, and if you can get to the southward you either have the Tay under your lee or the Firth of Forth.

15,403. But when you have made Buchan Ness, can you tell me any wind that would compel a ship to go ashore, if she could not hold her own to windward, or go off on one tack or the other?—Wind at east-south-east is the worst wind on that coast, or south-east by east.

15,404. Then a ship off Buchan Ness, with such a wind on the starboard tack, would she clear the land easily to the northward?—No; she would not go round the Pentland Scar.

15,405. You mistake me. Would she clear the land off Buchan Ness and have the Moray Firth under her lee?—Yes, she might.

15,406. Then no ship off that port would be in danger of loss of life from wreck because she could not get off on one tack or the other?—She would not.

15,407. You said the sea breaks heavily in Hartlepool Bay; will you tell me about the distance out, or about the depth of water where you found it?—I have come across the bay with a light ship when the sea has been breaking in 10 fathoms water.

15,408. Suppose a harbour made at Hartlepool in 5 or 6 fathoms at low water; do you mean that the sea would be breaking dangerously for vessels outside that?—Yes; I have seen vessels turn over in Tees Bay.

15,409. Outside where the breakwater would be?—Outside of 10 fathoms.

15,410. (*Chairman.*) If in one of these laden colliers you were caught in a very heavy gale of wind and a very heavy sea, are you safer running or hove to?—These laden colliers in the London trade generally go out very heavy, and they strain in the bottoms, and when at sea in a gale of wind for 24 hours they generally begin to make water, so that when you have nothing but two close-reefed topsails it is time to seek a harbour of refuge, and she is perhaps, not very well manned. A ship carrying 320 tons has 8 men, 4 for a watch, and out of these there are 2 boys, and where the men have to stand at the helm 4 hours, and get a spell at the pumps every hour or hour and a half, for 6, 12, or 14 hours, in bad weather, you want a harbour of refuge, and when caught in that bay it is impossible to carry canvas on the ship to get out of it.

15,411. Now I gather that you consider it a very essential point to be considered that in bad weather the people on board these ships get so worn out and done that refuge is really necessary for the safety of the vessel?—Yes.

15,412. Is a loaded collier in very heavy weather safer scudding or hove to?—In a heavy gale a loaded collier will not run; they are too deep; they will not steer if you run them; they broach to, and the sea sweeps their decks. You must keep them under two very close reefed topsails. Sometimes the gale is so hard that you cannot keep a fore topsail on them, you take it off, and they drive on shore.

15,413. Then you are safer fore-reaching than attempting to scud?—Decidedly.

15,414. And when they are fore-reaching, do they never fall off into the trough of the sea, and get their decks swept?—Very oft.

15,415. Then heaving to is safer than fore-reaching?—Yes.

Mr. Joseph Henry examined.

Mr. Joseph Henry.

15,416. (*Chairman.*) You are a pilot of the port of Sunderland?—I am.

15,417. For how many years have you been pilot?—I have been a full licensed pilot about 21 years.

15,418. And previous to that did you follow the sea?—Yes.

15,419. And how many years were you at sea?—31 altogether.

15,420. Did you ever command a vessel?—No.

15,421. Have you been present during the course of this inquiry to-day?—Yes.

15,422. You are aware of the object of our coming here?—Oh yes.

15,423. Give me your opinion as to whether the improvement of the three ports, or one harbour in the neighbourhood of Flamborough Head, would be best for saving life?—Well, my firm opinion is that if Sunderland Harbour had three fathoms water at low water, according to Mr. Stevenson's plan, there would be a vast amount of life and property saved in a gale anywhere from the north-east to south-east, because when ships are coming in from the eastward they can take this place better than any other place; the sea is not so strong. I have taken all the bars, both Shields and Hartlepool, in gales of wind, and never saw any of them like Sunderland, provided there was plenty of water. A ship drawing 14 feet water could come in with a strong easterly wind, if there was 18 feet on the bar.

15,424. If there was to be such a thing as a harbour of refuge on this coast, where would you place it?—I have been in every port, creek, and bay from Flamborough Head to Holy Island, and I would prefer Hendon Bay, because there would be more water.

15,425. You tell me Sunderland is easier to run into in heavy weather than the Tyne; why?—Because the sea is not so strong, I do not care which way the wind blows from the east.

15,426. Have you been in Filey Bay?—Yes; I have been riding there three days in a gale of wind from north-north-east.

15,427. And of course you had a very heavy sea rolling in?—At low water it was very well, but when the tide got over Filey Brigs there was a nasty rolling sea.

15,428. How many anchors had you down?—Two.

15,429. What was the size of the vessel?—About 250 tons.

15,430. What scope of cable?—Seventy fathoms of one and sixty of the other.

15,431. What yards had you aloft?—We had the two top gallant yards sent down upon deck to make a ride stone of.

15,432. The holding ground I presume would be very good?—Capitally good, but you must be well to windward of where the fishing boats ride.

15,433. What do you think of Filey Bay as a harbour of refuge?—I do not approve of Filey Bay, because I think when there is a gale of wind many of the ships are caught between Hartlepool and Tynemouth.

15,434. But why should most of the ships be caught when there is a breeze of wind between Hartlepool and Tynemouth?—I will tell you. I have seen a very heavy fleet go out of Sunderland and Shields with the wind from the north-west in winter-time, and frosty. I have seen it come on again to the east-north-east, and that is a very bad wind, and it has got as far as east-south-east, and has blown very strong, and ships have had to go to the northward, and get into Leith Roads, and some of them have been lost where if there had been a harbour of refuge in this bay very likely they would have been saved.

15,435. But if the wind at east-north-east and east-south-east came a few hours later, would they not all be down off Flamborough Head?—They might be caught off Flamborough Head as well as in this bay, but still they are often caught between this and Flamborough.

15,436. Taking your experience of what has happened, are you disposed to say that ships are more generally caught in the neighbourhood of these ports than in the neighbourhood of Flamborough Head?—They are.

15,437. (*Mr. Lindsay.*) Have you been long a pilot?—Twenty-one years.

15,438. From your long experience you must have seen many a bitter gale on this coast?—I have.

15,439. Say the Government resolve to spend the public money in the construction of only one harbour, at what place do you think between Flamborough Head and the Farn Islands should it be made?—I would put it in a bay.

15,440. Why?—Because ships might be caught in a bay, and might not weather the point.

15,441. At what point now do you think would it do most to save life and property?—I would prefer it in Hendon Bay.

15,442. Now tell me, if it rested between Hartlepool and Filey Bay, having always the same object in view, which of these two would you prefer?—I would prefer Filey. Hartlepool is a very dangerous place to make; it is very low land, and a very heavy sea breaks there, and there is the Tees and Hartlepool outset, so that it is a very uncomfortable place to take, especially in rough weather.

15,443. Whether is the entrance to Sunderland Harbour, or Hartlepool, or the Tyne easiest made out?—I would prefer the Tyne to be first, and Sunderland next; the Tyne has the castle, and we have the Tunstall Hills; two conspicuous hills just south of the harbour; and we can see them a long way off; but Hartlepool is really a very bad place to make.

15,444. It is in fact, in nautical phraseology, a blind place?—It is; and before there was a lighthouse it was a very bad place to make.

15,445. You said there was a heavier sea at the Tyne than at Sunderland?—Yes.

15,446. Then suppose you were running with a ship in distress in an easterly gale, and you had but one object in view, the saving of the ship and the lives of the people on board, and say there was the same depth of water to get into Sunderland as there would be to get into the Tyne, and say you were in a position that you could run for either with the same facility, which would you take? I would take this, because the bar is not so heavy as at Shields, and ours is a long bar.

15,447. Do you know the reason why it is a heavier sea at the entrance of the Tyne?—No; but the ebb tides are very strong.

15,448. Say there was a number of vessels caught out at sea, and that 50 of them laden deeply were obliged to run into the proposed harbour here,—I am speaking of ships that could get in, and had not too great draft of water,—would you hesitate to be one of the 50 to run for it?—No. Give one another time, and let them go in rotation, and there is no danger in going up this harbour.

15,449. Say you were the last of the 50 that got in, where would you bring up?—At the Potatoe Garth, if deep enough; that is where they are going to dredge. I would bring up anywhere I could. There is no danger in bringing up when you are in.

15,450. Then you would not hesitate to be one of the 50 of these deeply laden ships to run in?—I would not, if there was water over the bar.

15,451. (*Capt. Washington.*) You have been many years a licensed pilot?—Twenty-one years.

15,452. Where did you receive your licence from?—Newcastle-upon-Tyne.

15,453. Do you hold that licence now?—Yes.

15,454. How many licensed pilots are there belonging to Sunderland?—One hundred and sixty-six.

15,455. Does the Newcastle Trinity House interfere with these pilots at all?—Yes; they have full jurisdiction over them.

15,456. And do they ever exercise it at all?—Yes; they have exercised it upon me, as one.

15,457. How?—Well I will tell you. They wanted us to pay a tax of 6*d.* a ship that we came in with. Government did not make that tax, but it was a bye-law they made; so we appealed to the Board of Trade, and we had Mr. Fenwick for us, and they said that they did not want to tax us, and that they never made the byelaw; and they took my licence, because I went to the Board of Trade to speak against that byelaw.

15,458. And the Board of Trade would not support the Trinity House in doing it?—No. They said they could not make any law to tax me or any other pilot without going to the Board of Trade.

15,459. You have got your licence again?—Yes; last month.

15,460. Only suspended for a short time?—I was suspended twice on that account; once four months, and next about six.

15,461. Do you know the Farn Islands well?—Yes; I have been in Holy Island Harbour.

15,462. Is that a safe place for vessels?—Yes, if they are well acquainted with it.

15,463. It would not be wise to give any inducement to vessels to run for it?—No.

15,464. You consider Hendon Bay would be the best?—Yes.

15,465. Do you think they could get space there?—Yes, they could get a good space.

15,466. Would that be of any use to the vessels belonging to the ports to the southward?—I think it would be a very useful place; but there is nothing beats the improvement of their own harbours.

15,467. I think it is a south-easterly gale that you want most shelter from?—That is the worst wind.

15,468. Where does that usually catch the fleet?—Between here and Whitby in the bays.

15,469. Would you have them run all the way back from Whitby to Hendon?—They have to run back to the Tyne, and sometimes to Leith Roads.

15,470. When down at Redcar they can make a harbour?—It is not a bad place.

15,471. Would that assist vessels, if it could be made?—It is a very dangerous coast on each side, if they were missing it; all the way to the northward of

SUNDERLAND.

Mr. Joseph Henry.

15 Oct. 1858.

Capt. Washington.

it are dangerous rocks, and then to the south there is a dangerous sand.

15,472. That is what is called the Tees ?—Yes.

15,473. You said there was a difficulty in making the land about Hartlepool ?—Yes.

15,474. But a vessel running down would get hold of the land at Huntcliffe, would she not ?—Yes ; but I am speaking of coming from the northward.

15,475. Coming from the southward they could make it ?—Yes ; Huntcliffe is very good land.

15,476. What distance is that from Hartlepool ?—About a dozen miles.

15,477. It is only in coming from the northward that Hartlepool is difficult to make out ?—That is the worst of it.

15,478. You think well of the proposed works at the entrance of Sunderland ?—Yes, I think much of them ; I think it would be a very good place when they are carried out.

15,479. You would have no hesitation in running for this place in a gale of wind, suppose the works were carried out ?—I would not.

15,480. Do you think it likely they will maintain the depth of water ?—I think it is, because when they project the piers out they would get a better run for the tide when the piers are so far out ; there will be a heavy out drift for the water, and I believe it will keep clear.

15,481. What do you say at present is the scend between the piers and the harbour ?—They will scend four feet when they come in ; but there is a difference in ships.

15,482. Do ships often miss the entrance, and go north and south ?—Yes ; especially if they are running nigh the ground, they will not steer, and I have known them go to the back of both piers, even with a fair wind. I have seen ships lost on these Roker rocks with three or four men.

15,483. How far do you go to pick up ships ?—To Flamborough Head and the Coquet Island.

15,484. Have you anything but cobles ?—In the winter time we have a steamer, when we cannot proceed with the boats. The dock company would not let us "bide" in the docks, and we cannot get to sea without the tide is well flowed, and there may be ships ashore before we get out.

15,485. Are you speaking of the steamer ?—Yes. We formerly lay in the middle basin, and about 40 of us used to get to sea, and catch the ships at low water before they get in ; but the dockmaster would not let us stop there though we paid 20*l.* a year.

15,486. What could be his objection ?—I do not know. We paid 37*l.* 10*s.* for six months for that boat lying there, and for towage.

15,487. You do not mean that the dockmaster would prevent the pilots lying in the most useful part ?—I do say so ; positively that is a fact.

15,488. (*Chairman.*) What extent of good anchorage ground could be obtained in Hendon Bay if a harbour of refuge were made there?—I think about all the south part of it, perhaps half of the bay.

15,489. Have you lately sounded in Hendon Bay ?—Yes. I was sounding about three weeks ago. I was one of the men who were there. It is very good to the southward ; the northern port is not so good. It is rather hard. I do not think there is better anchorage on the north-east coast.

Mr. William Simpson re-examined.

Mr. W. Simpson.

15,490. (*Chairman.*) What do you think of the proposed improvements of this harbour ?—I think if carried out they would be a great benefit to the ships that trade to the port.

15,491. At what time of tide could vessels enter ?—Light vessels could enter at all times of the tide, and loaded vessels would come in after the first quarter flood at 14 feet water.

15,492. (*Mr. Lindsay.*) You said you thought it would be a great advantage to the trade of the port ; but looking at it as a place of shelter, say you were one of 50 laden colliers caught in a gale of wind, all of which were running for this harbour as it would be when the piers are carried out, and that you did not belong to the place, but were obliged to take a harbour, because the easterly gale was so strong, would you hesitate to run for it as one of the 50 ?—Not at all.

15,493. Where would you bring your ship up ?—Opposite the Potatoe Garth.

15,494. Would it require to be deepened to give you room ?—Yes ; that is, it would require to be dug out, and that is their intention, I believe.

15,495. (*Capt. Sulivan.*) At what time of the tide would you run with a loaded vessel into this Potatoe Garth ?—A vessel of 13 feet water would come in there the first quarter flood, if the improvements were carried out.

15,496. What depth of water would you get where the bar now is ?—18 feet.

15,497. All the way in ?—No.

15,498. Suppose the bar is only removed to the depth of the present inner part, which is only four or five feet, then how would the 50 vessels get refuge ?—Why, it would be very difficult then.

Mr. Thomas Sutton examined.

Mr. T. Sutton.

15,499. (*Chairman.*) You are a pilot of the port of Sunderland ?—Yes.

15,500. For how many years ?—14 years a licensed pilot.

15,501. And previous to that ?—A fisherman.

15,502. For how many years ?—The rest of my time.

15,503. You have been present during this inquiry to-day ?—Yes.

15,504. Do you generally concur in the opinions which the former witnesses have expressed as to the improvement of the three ports being more likely to be advantageous for the saving of life than the establishment of one large harbour of refuge ?—I do.

15,505. And does that apply equally to loaded as to light ships ?—It does.

15,606. You are well acquainted with the coast between Flamborough Head and the Tyne ?—Yes.

15,507. Suppose it is decided to make a large harbour of refuge somewhere on this coast, where would you prefer to place it ?—I can scarcely tell you that, because Hendon Bay is one half of it smooth, and the other half hard ground and good anchorage, therefore I think the improvement of the harbours would be decidedly better.

15,508. Which of the two places would you prefer, Hartlepool or Filey Bay ?—Hartlepool.

15,509. Will you state your reasons ?—Because Filey Bay is decidedly covered with high land, and it is a good inbight ; besides, when ships are running for a harbour of refuge they like of course to make sure. In dark snowy weather you cannot see the lights on a highland; they would be capped.

15,510. Is your chief objection to Filey Bay that the lights would be high, and would be capped ? Suppose the lights were placed on the breakwater ?—They would be equally as bad.

15,511. Why ?—Because when a ship is running for a harbour it is generally the case that the lights are capped, either with fog or haze, on account of the highland.

15,512. Then would you prefer that laden vessels should endeavour to keep the sea, instead of running for a harbour of refuge ?—No ; they must come to their own ports.

15,513. Will not the lights in their own ports be equally capped and difficult to see ?—In their own

ports the land is not so high, and every man likes to steer for his own port, because he is well acquainted with it.

15,514. You have heard the questions put to some of the witnesses as respects running down into the bight of a bay for a harbour of refuge ?—Sunderland lies entirely in a bight.

15,515. And you do not consider that an objection? —No.

15,516. (*Mr. Lindsay.*) You say if it was to rest between Hartlepool Bay and Filey, you would give the preference to Hartlepool ?—Yes.

15,517. And if it was to rest between Hartlepool and the Tyne, and the same depth of water could be found in either place, which would you prefer, Hartlepool or the Tyne ?—A harbour of refuge is neither fit for the Tyne nor Hartlepool.

15,518. But I asked you if it rested between Hartlepool and the Tyne which would you prefer ?— I would prefer the Tyne.

15,519. Why ?—Because it is a much safer place. The land is not so high about it. About Hartlepool, on the port hand, in going in, the land is very high, and of course counter-tides go about there, and the sands are constantly moving.

15,520. Have you taken a ship into Hartlepool ?— Yes.

15,521. Was it blowing a gale of wind ?—It was not blowing an extreme gale. About a double-reefed topsail breeze.

15,522. Have you ever been in as pilot of a ship ? —No ; but many a time with a pilot boat.

15,523. Have you known many accidents to ships running for Hartlepool ?—Many a one.

15,524. And lives lost ?—Plenty.

15,525. In running for the bay ?—Yes.

15,526. How did it happen ? Did the ships get on shore ?—They did.

15,527. At what part of the bay ?—Both north and south of Hartlepool.

15,528. Holding the opinion you do of Hartlepool, why do you prefer it to Filey Bay ?—Because more accidents happen between Filey Bay and Sunderland than on any other part of the coast.

THOMAS BOLTON examined.

15,529. (*Chairman.*) You are lighthouse-keeper to the commissioners of the River Wear ?—Yes.

15,530. How long have you been connected with the port in that capacity ?—Ten years.

15,531. And previous to that were you a seafaring man ?—I was a sea carpenter for about five years before that.

15,532. During the period that you have been lighthouse-keeper has it occurred to you to see many accidents in consequence of vessels getting to the back of the piers in endeavouring to take the port ?— A great many.

15,533. And has much loss of life ensued in consequence ?—Yes.

15,534. Have you kept any account of the accidents which have come within your knowledge ?—I have.

15,535. Have you kept any account of the winds at the lighthouse ?—I have.

15,536. For the whole period you have been there ? —Yes.

15,537. If we wish you to do so, could you furnish to the Commissioners a copy of your register for the last three years ?—Yes.

15,538. What are the heaviest winds on this coast? —East-north-east to east-south-east.

15,539. And are these winds generally accompanied by thick weather ?—Yes.

15,540. At what distance can you see to seaward generally during this heavy thick weather ?—Not more than half a mile.

15,541. In blowing weather have you ever been watching ships running in for the port ?—Always.

15,542. When you saw them running in, has it ever appeared palpable to you that they have run clear of the entrance of the harbour, from not having been aware of their position ?—Some have. Most of the accidents occur by ships striking the bar and piers.

15,543. (*Mr. Lindsay.*) Will you look at this return of wrecks which has been published, and tell me if that return is made up from the account you have kept ?—They are the same as I keep.

15,544. Have you seen many of these ships go on shore yourself ?—I have seen the whole of them.

15,545. What proportion of the wrecks would have been prevented had there been such piers as those which are contemplated ?—The whole of the ships would have been saved.

15,546. Would the ships driven on the south rocks have been saved if these piers had been constructed ? —Yes ; we would have had a considerable deal more water, and ships would never have to wait for flood tide, but would run in if they had 18 feet water.

15,547. Was it that they became unmanageable on account of the rolling sea, and drifted on the south rocks ?—Yes.

15,548. (*Chairman.*) Have you seen many vessels come on shore waiting the tide ?—Yes.

15,549. Are you disposed to say that a larger number of the vessels that have come on shore and have been lost has occurred in that way than in running ?— The whole of it is for want of water on the bar; and in January 1854 a large fleet was off, and if we had had water on the bar, as now proposed, these ships would have come in that night, and all have been saved.

Mr. JOSHUA WILSON examined.

15,550. (*Chairman.*) What is your occupation ?— I am a merchant and shipowner of the port ; I am also a member of the trade and commerce and shipowners' societies ; but I wish to give my individual views, and not as representing any body.

15,551. For how many years have you been connected with the port ?—From my boyhood, and more closely connected since I came to have a ship in 1821.

15,552. Have you been present during the inquiry? —I have.

15,553. Being aware of its object, will you give your opinion to the Commissioners ?—I differ in my views from those that have given evidence. I give the preference to a single harbour of refuge, or two, as the Government may see fit to grant the money, and I am decidedly of opinion that that harbour of refuge should be in Tees Bay. If I may be allowed I will give the particulars of a gale of wind that occurred when I was a young man, 32 years ago, which may be taken as a type of other gales, and which will show my reasons for preferring the Tees Bay. I may say that I think it was at the commencement of this month in 1826 that we had a gale of wind, on Saturday. I took a walk on Sunday morning on the pier between 9 and 10 o'clock, and the wind was blowing from the north-west. The whole of the silt comes in with wind direct east, and the gale commenced from that, and continued during the whole of that day and night, and on Monday it blew an exceedinglysevere gale, the wind east and east-south-east. I went down about tide-time, about four o'clock, to the corner of the barracks at the moor, and it was then stated that there was a ship riding dismasted in the roads. It was so thick I could not see her, but I saw several ships close in about the broken water, and they evidently could not reach the port. They were to leeward ; they therefore put about, and would have to go southward. Next morning, the wind northward, and clear, I saw a vessel dismasted in the roads. My father and I went to Newcastle to attend one of our meetings, and we there met a

SUNDERLAND.

Mr. Joshua Wilson.

15 Oct. 1858.

Chairman.

Shields captain, who, with my father, had a ship on her passage from London, and as we had had the wind so far to the north they both agreed that their ships could not have left the Thames; but next day my father found that the other ship was ashore at Stannington, and that our vessel, which we expected was still in the river, had put into the Tees. On the Tuesday morning about three o'clock she had been off Hendon Rock, and could not weather the harbour, and they put about with her head towards the south-east. They could not get off, but drove along the coast. It was before Hartlepool Harbour was made. The captain would have run in behind Hartlepool Heugh, where he thought she might have been got off at a slight expense, but it so happened that the mate knew the Tees; it was before it was buoyed or lighted; and he got into the foreyard, and told them how to steer, and he steered her safely into the Tees. Our vessel, with five or six more, were all that got into the Tees. In that gale 24 ships were on shore between Seaton Snook at the entrance of the Tees and Hartlepool; and I have spoken to a pilot of the Tees who has a very distinct recollection of it, and he says that in that gale there were 53 ships ashore between Sunderland and the mouth of the Tees, including, perhaps, a few behind the north pier. There might be about half a dozen on shore behind the two piers. Since the port of Hartlepool has been made I have an impression that there has not been so many wrecks strewed along the coast between Seaton and Hartlepool as previously. That was a time when the coal trade was much less than it is now; no coals were then shipped south of the Wear; yet it shows what a destructive gale it was. These ships were caught in the bight, and could not get out on either tack. When our ship turned about the wind was east and by north. I consider that a harbour of refuge at Sunderland or the Tyne would have been of no value to the ships that were to leeward of it, and that with a harbour of refuge at Filey or thereabouts ships could not have got to it. It must be in the bight of the bay to save the ships. That is a type of the gales not unfrequent on this coast, and these are the gales in which most of the ships are lost. Of course some ships miss the harbour in coming in; but it is in these gales that a harbour of refuge is most required. I am in favour of a harbour in Tees Bay, for a harbour of refuge, in preference to improving these ports. I have no great faith in the improvement of the ports so as to make them fit for a harbour of refuge. I would rather prefer to see a harbour of refuge made at Redcar. Redcar has a great many advantages that Hartlepool has not. I have studied the question for many years, and I feel considerable objection to Hartlepool. There was Mr. Rendel's plan for enclosing a quantity of ground at Hartlepool; but I believe it is now very much given up, on account of that they seem aware it would silt up. Indeed, a small pier has been run out from the Heugh lately, and inside the pier where it was rocky it is now sandy. The short pier is silted up in the bay. It has improved it as a sea-bathing place, but I do not hear that it has improved it as a port. In reading the evidence before the Commissioners on Harbours of Refuge, I see there is an idea of forming a stone breakwater parallel with the coast. I think it would be a very expensive undertaking. I do not see where the stone could be got in the immediate locality, and it could only be carried out during a few months in summer. But my principal objection to that is that I think it would be apt to silt up. I have noticed that the broken wave moves the sand along the shore, and forms the bar; and I consider that the wave would wash the sand in behind the shelter, and where the wave lost its transporting power there the deposit would be formed. We see a similar thing inside Holy Island. If Holy Island could be removed, the sea would act on the sand inside, and clear it away to the south; and I feel very much afraid that if an extensive work was made off Hartlepool the sand would collect inside, and it would be merely a question of time as to how long it would take to silt up. There is a great deal said about the scouring power of the tide in moving sand. I have not much faith in that. To the south of Hartlepool there are the Long Scar Rocks. They are about half-tide rocks, and if the tidal scour was the governing power to scour the sand off we would have deeper water inside these rocks than either at the north or south of them, but it is actually shoaler water inside these rocks, where there would be more scour if the tidal current had any effect, than it is north or south, where it should be comparatively inert. I can easily account for this accumulation from the fact of the wave breaking on the rock; but I notice it constantly on the coast, that the accumulative action bears an inverse ratio to the transporting power of the wave, that as the transporting power of the wave decreases the accumulation increases. I was at Marsden a few weeks ago; that is near Souter Point; and I noticed that between a rock and the shore there was always a rise in the sand; and when a ship has come ashore, in a tide or two there is a rise of sand occasioned by the shelter from the waves. This is my great objection to a pier parallel to the shore. I am afraid it would sand up inside. Mr. Calver's plan of a wave screen I consider would have less objections, because a portion of the wave goes through, but if it reduces the wave the theory of the plan will be weakened, and I cannot depend on the tide, which runs about a knot and a half an hour inside Hartlepool Bay, keeping that bay clear, because tide at a knot and a half an hour will only act on silt and small sand, and it will scarcely act on gravel or shingle. There is a certain agency by which the base is maintained in statu quo; but if you put a shelter you interrupt and put an end to that agency. Mr. Smeaton found this out when making Yarmouth Harbour. As long as they carried out the parallel piers it kept deep inside; as soon as they turned the cant the accumulation began, and he found the accumulation was in proportion to the shelter. Therefore I do not put much faith in the proposed plan for Sunderland Harbour in increasing the capability of the port as a harbour of refuge. I am afraid the sand would collect behind the sheltered piers. The sand would wash along the shore; and the principal is from north to south. It would pass the end of the north pier, form a bar across the entrance outside, as it is now, and the tidal current of this river would have a breadth of 800 or 900 feet to keep clear, instead of the present breadth of 390 feet. We know that when a groin or jetty is put out at right angles to the coast the sand accumulates behind until it fills up, and then it passes. I consider that would be the case here as well as at the Tyne piers. Indeed, I was looking over the evidence given before the Royal Commissioners, and Mr. Walker not only admits that the sand will accumulate inside his proposed piers at Shields, but he also says that it will greatly accumulate inside the south pier. He says the channel will keep clear. I consider that in course of time if these views are carried out we shall have sand inside these piers, as it does on the beaching ground on what is called the Polka Hole. The sand comes in there; and I have repeatedly seen the commissioners remove it by dredging. Before the north pier was lengthened there was a sandy beach running inside the south pier, and it got so high that it was scarcely covered at neap tide. When the north pier was lengthened so as to send a drift in to be caught by the south pier, then it gradually wore away by the action of the current. Therefore I am afraid that with this larger entrance the sand would come in, and fill the inside; that we should be at a great expense, without making the harbour much better; and the same applies to the Tyne. The current would lose its force in meandering through the sand. I think that formations at the entrance of a river are objectionable. The flood tide comes in round the north with a south-west set; there is an eddy at Hendon Bay that runs round the south pier; now, there are no parallel

piers to bring them into a focus, and give them one set, but one would have a tendency to go to one side and the other to the other, which would make very inconvenient eddies. I may also state that harbours, where there are strong currents running out, are not suitable for harbours of refuge, because after we have an easterly gale we have a great deal of heavy rain, and a great deal of freshets running out, and a ship cannot take the harbour. I think it is scarcely the province of the Government to assist individual parties in making improvements for carrying on trade. My idea of the improvement to be carried out is, that there should be a breakwater from Roker to some rocks called the Knocks, very similar to what has been done at Newhaven in Sussex; and I would do nothing more. The action of the sea on the rocks would give the drift which comes from the northward a seaward direction, and it would pass the harbour mouth in deep water, and make little or no bar, so that the entrance of our harbour then would be more in the position that the dock entrance now is; for if you have time to go down you will notice at the jetties that are put between the dock and the shore that the drift passes the two first jetties, but from the rocky shore outside it does not pass the third jetty, and therefore there is no drift at the entrance to form the bar, and we have little or no bar; sometimes there is a slight accumulation of silt, but you have no bar. A similar plan to that proposed for the north breakwater has been eminently successful at Newhaven; and in the parliamentary reports Mr. Walker says, he does not know a harbour that has been so much improved as Newhaven by the putting out of that jetty to the northward. A south pier would be apt to catch the drift in its passage southward. Indeed our ancestors, about a hundred years ago, recommended a south pier to be made to let in the flood tide, but it only acted as a groin, collected the sand, and made the harbour worse; and I am afraid the south pier, according to Mr. Stevenson's plan, would have a similar effect in stopping the drift in its passage southward. I may also state that Redcar is the most likely place, though I know there are objections to it, to form a harbour of refuge. The rocky nature of the coast, I believe, will be such that it will not sand up. The only accumulation will be silting up. But where sand washes in it is much more serious than merely a deposit of silt, which is mechanically held in suspension by the water, and there would be much less silt on that part of the coast than there would be to the north of the Tees at Hartlepool, because the flood tide comes in from the sea clean, and the ebb tide moves off to the north, and the silt would leave Redcar. The site which has the least objection is what we must look to; and if Redcar were made a harbour of refuge the entrance should be made like a bottle-neck, or the bows of a vessel that has wave-line bows, because a hollow curve, with a concave side towards the sea, appears to be naturally formed best to resist the action of the waves.

SUNDERLAND.

Mr. Joshua Wilson.

15 Oct. 1858.

15,554. (*Chairman.*) Have you in your possession any plan of a harbour of refuge at Redcar?—No; I merely give an opinion of the locality. There is a plan of Redcar in 1850. The site has often been indicated; and if the soundings are good, I thought you might consider it.

15,555. What you have handed in is, I see, a parliamentary paper. We are in possession of that.—Yes, I thought you would be.

Saturday, 16th October 1858.

PRESENT:

Admiral HOPE (Chairman).

Sir FREDERIC SMITH.
Mr. LINDSAY.
Captain WASHINGTON.
Captain SULIVAN.
Captain VETCH.
Mr. COODE.
Mr. EVANS, Secretary.

Mr. WILSON's examination continued.

15,556. (*Mr. Lindsay.*) I understood you yesterday to say that you preferred one great harbour of refuge?—Yes.

15,557. To the improvement of the existing harbours?—Yes.

15,558. Did I understand you to mean by that, that in your opinion one great harbour of refuge on the coast would do more to save life and property than the improvement of the existing harbours?—Yes.

15,559. You thought it would?—Yes.

15,560. Did I understand you further to say, that, as to a site, you preferred Redcar to any other site for such a great harbour on the coast?—Yes.

15,561. As this is a subject which I know you have studied, not merely with the view to save property, but with a feeling of humanity for the saving of life, and as it would appear that you have also looked at it with the eye of an engineer, will you tell me how you propose to make a great harbour of refuge at Redcar; because, looking at the chart on the large scale of the Tees Bay, I, as a sailor, knowing nothing of engineering, am anxious to know how you can make such a great harbour as that which you have in view at Redcar. Look at the chart, and tell the Commissioners the manner in which you propose to make such a harbour?—There was a plan which I gave in yesterday which shows an enclosure of 470 odd acres, some of which is available, and I consider that an entrance might be made to that, provided the ground inside was found any way suitable, and perhaps that would hold 300 or 400 sail of ships which I consider would be as many as would require a harbour of refuge at one time on this coast.

15,562. Do I understand you to mean that you would propose constructing that harbour between the Salt Scar Rocks on the one side and the East Scar rocks on the other?—Yes.

Mr. Joshua Wilson.

16 Oct. 1858.

15,563. But between those points I find a great many rocks. There are the High Stone Rocks, and the Off Flash and the Middle Flash Rocks; and there are also a great many shoals. How do you propose,—after you have run your piers along the Salt Scar and the East Scar, — how do you propose to make the harbour? Do you propose to excavate?—I would take those high rocks in the centre which are shown above high-water mark down to about low-water mark; and except in the immediate neighbourhood of the piers, there would be a considerable depth of water for the larger vessels. If those inner rocks were taken down to the level light vessels could run past, and, if necessary, beach on the sand inside, and there would be a sufficiency of deep water outside for them to ride at anchor. But one of the great reasons for preferring Redcar is, that from its being a rocky shore, I have great hopes that it will not silt up. There is no drift to fill the harbour up. I know there are objections to it.

15,564. But, as a sailor, I do not see how it is possible to get anchorage ground for 300 vessels within the limits you have named. However, I will not follow up this part of the examination, but leave it to Sir F. Smith, Captain Vetch, and Mr. Coode, who are familiar with engineering points. —Perhaps I may be allowed to remark that I do not consider 300 vessels would come in at a time. They generally calculate for docks ten ships to the acre. I

SUNDERLAND.

Mr. Joshua Wilson.

16 Oct. 1858.

Mr. Lindsay.

consider that vessels would come in and anchor at the entrance, and after a while drop up the harbour and berth themselves. I think it would be very seldom that more than 200 or 300 ships would come in, and then not all at once.

15,565. Do you mean to have the vessels moored tier and tier, or at anchor ?—Moored tier and tier.

15,566. Would you think it correct to have a harbour of refuge where vessels were obliged to moor tier and tier ?—If a harbour is to be made on the coast, would you not think it right to select such a site where a ship would run in and drop her anchor ?—And subsequently raise her anchor, and drop up as they do in entering our harbour now. That is our idea.

15,567. You deal with ships entering a harbour for refuge as with ships running now for Sunderland and Shields ?—Yes.

15,568. You prefer that to Filey or Hartlepool where ships might run in, drop their anchors, and lie at anchor ?—With smooth water I do not think it necessary that they should be at anchor.

15,569. As a shipowner of considerable standing, and one who has given great attention to the subject, supposing it should be found that Redcar is not considered a proper place, or rather that there are engineering difficulties in the way, which would prevent its being selected as the site for a harbour of refuge, and looking along the whole coast, what point would you then prefer, considering that there was to be only one harbour, and having regard to the saving of life and property ?—As far as my knowledge goes, the next place which I should fix upon would be a little south of the proposed harbour in Hendon Bay. There are the White Stone Rocks immediately south of the Hendon Rock, and if a pier were run out from the shore to those rocks, and another pier to Ryhope Snook to meet it, I should not have the same objection to it which I should have to the other plan of a harbour in Hendon Bay.

15,570. Looking at the chart, you will see that it is a perfectly straight line of coast all along. Do you think a straight line of coast a place at which to put a harbour ?—I consider that there are objections to it, as to other places, but I feel there are less objections to that than any other. There may be sites between here and Hartlepool. The nearer Hartlepool the better ; but I think it would be preferable to Hartlepool myself.

15,571. Are there any reasons why you object to Hartlepool, beyond its liability to silt up, which I think is your main objection ?—That is my great and principal objection.

15,572. Is that your only objection ?—If a parallel pier, or wave screen, were put off Hartlepool Heugh, I think it would be an excellent place.

15,573. Would you then prefer Hartlepool to the site of the Ryhope Snook, if you were not afraid of the silting ?—If I were not afraid of the silting I think the locality better, because it is nearer the bight. In the gale which I mentioned yesterday ships which had weathered the Ryhope Snook could not have taken it. Vessels which make the land about Hartlepool east of north, say east-north-east, if they made Hartlepool would have no harbour of refuge, but all vessels to the north of that would. Vessels which made the land to the south could not reach it.

15,574. Supposing that there were no chance of Hartlepool Bay silting up, would you then prefer Hartlepool to Redcar ?—I do not know why I should, unless on account of the anchorage ground.

15,575. Would you, looking to the saving of life and property, prefer Hartlepool as a site to Filey Bay? —Very decidedly.

15,576. Would you prefer Hartlepool to the Tyne, speaking as if you knew nothing of engineering ?—I would decidedly for light vessels. For loaded vessels I would like the Tyne about as well.

15,577. (*Sir F. Smith.*) You prefer the Tyne for light vessels ?—No, for loaded vessels, and Hartlepool Bay for light vessels.

15,578. (*Capt. Washington.*) You have so long studied the question of harbours, Mr. Wilson, that I shall be glad to hear your opinion on the proposed design for the improvement of Sunderland Harbour, if you have anything to say in addition to that which you said yesterday ?—I may state in addition to what I said yesterday, that I consider the improvement of this harbour is much required for the trade of the port. That we now require more water than we did before we had the dock, that large American vessels, drawing 14 feet of water, come in here to load coals, and in an easterly breeze, and south-east gale more particularly, which is a fair wind from London, they cannot run into the new entrance. There is no ground to tack up, and they take the bar, and very awkward it is at neap tides when there is no water to spare. I have given the subject much attention, and as I have stated I prefer a breakwater from Roker to the Knocks to Mr. Stevenson's plan.

15,579. In an east-south-east direction from Roker ? —Yes. I would allow a curve concave to the north, and let it finish at the Knocks, and go no further.

15,580. Its extremity would be in what depth of water ?—Its extremity would be on the Knocks itself.

15,581. What benefit do you expect to arise from that ?—If you will allow me, I will go into a description of the formation of the bar. I never recollect our bar being better than it was about this time of the year in 1851. Considerable pains had been taken in dredging the channel. Our bar in very good times is considerably below the zero of low-water mark. I may here state that the zero which I speak of is a foot below that used by the Admiralty. That six feet on the bar would be seven feet according to the Admiralty chart. It had continued good for some months; then towards the latter end of the year, we had a succession of east and north-easterly gales. I did not see the accumulation, but in the ensuing summer I saw a great accumulation of sand behind the north pier, and I noticed from the seaweed being young that it must have been covered in the winter. There was a large accumulation of sand behind the north pier. Perhaps I may be allowed to explain how easterly gales cause this sand to come from the shore. All my observations lead me to believe that the flexion of the wave is cumulative. That the wave washes the detritus along the shore when not at right angles, but in an on-shore gale the direction is seaward. I do not attribute that to the alteration of the wave, but to the current created by an on-shore gale. Smeaton observed, that, in a pier a mile long, the water was raised at the end four inches above the natural level, which was eight inches higher than that on the windward end, the depression being equal to the elevation. That necessarily causes the current to flow in an opposite direction. The current is driven to windward to make the equilibrium. I have gone to a hole 20 feet in diameter; I have taken a stick and stirred it up at the bottom. I have seen an under-current go to windward, while the sand went in another direction. I have always noticed that, according to the slope of the shore, an on-shore, gale first acts on the sand, then the small gravel, and then the large gravel; though, after a heavy gale, I have noticed the rough shingle higher than previously ; but all that is acted on by the current is carried down, and sometimes when the lower part of the shore about low-water mark was flat and sloped further inland, I have noticed the sand washed down on the slope, and deposited like a bar on the flat.

15,582. Would you apply that theory to Sunderland Harbour ?—Yes. I apply that theory to Sunderland Harbour. If the back draught is not strong enough to scour the sand, but merely to give any matter which is suspended by the wave a seaward direction, the on-shore gales act on the sand, and give it a seaward direction. Then the north-east swell drives it first to the north pier across the bar, and it diverges a channel to the southward ; then in process of time it goes gradually further and further

south, and the current breaks out a channel to the north. Then we see a different stage of the process, and that is the process by which our bar is formed, for after these easterly gales our bar became worse than I had known it for several years, because the accumulation of the sand had been larger. Mr. Walker, in his report, states, that when the Sparrowhawk is high to the north of the Tyne the bar is good.

15,583. I wish to ask you what book that is?—It is published by the Commissioners of the River Wear, and contains the engineers' reports on Sunderland Harbour. This groin which I was speaking of to the Knocks would interrupt the drift in its passage to the north, and would take it to a rocky point, and immediately to the northward there is a sudden deepening of the coast, and the sand, instead of passing into the harbour, would pass into deep water and pass by in 17 feet of water. It is similar to Newhaven, but I consider this a better locality than that, because Palmer notices a rocky shore giving a seaward direction. I consider it is the rocky shore which occasions the new entrance to be so good. Here, within a mile of the old entrance, we have an entrance without any bar. A few weeks ago, not stormy weather, but a swell on breaking over the north-east pier of the new entrance, I saw a vessel drawing 21 feet of water towed into the entrance, although there might be three or four feet lift. And on these principles I consider that if a simple breakwater were carried out to the Knocks, the bar would be continually in the best state as it would have remained if there had not been an accummulation behind the pier to be forced on to the bar. There are some remarkable facts connected with the same subject to be noticed in the plan of the Wear, showing the mouth between 1837 and 1857. You will notice the short pier to the southward, halfway down the sand grew up; but the pier was carried further out and lessened the inshore draught, so that, had they put stone to preserve the sand from the action of the wave there it would have remained. All along the shore to the south the waves gain rapidly, and that sand not having protection of the draught it was the same as on the south-east shore at Dover. I think this breakwater which I propose would act in the same way, and allow the sand to pass by in deep water as it does at the new entrance. The silt passes No. 1. and 2. groin, but does not pass No. 3. groin, showing that it goes off to sea, and consequently there is no bar. There is a slight accumulation sometimes of a few inches, but that is easily got rid of.

15,584. Do we understand you to say that you believe the reason there is no accumulation at the south entrance is the projecting ledge of rocks 600 yards to the northward of that entrance?—Yes; it is rock all along. It is rock from the Commissioners' boundary at the north groin to the entrance. It is rock which gives a seaward direction.

15,585. Do we understand you to say that from the present pier heads to the south entrance the deposit, or rather the beach, is decreasing?—The beach is decreasing.

15,586. That is certain?—As it goes to the south it decreases.

15,587. Were the groins put to collect the sand?—Yes.

15,588. And to retain the present breach?—The two north ones do retain some, but when you get to the south ones I never saw any.

15,589. In fact, the ledge of rocks is a natural groin and prevents the accumulation of the sand?—The pilots inform me that the sand drift which is at the entrance of the harbour passes the south entrance outlet in five fathoms of water. Objections are urged to the plan which I support on account of its embaying the harbour; and also it was the only reason which engineers gave against carrying out the piers, the notion that doing the works would embay the harbour. That is a notion which I have never admitted; I cannot find any ground for it. It is said that the bar is worse than it was 100 years ago; I may remark that the foreshore of the dock was brought forward before the bar was in a good state. The dock was first opened in 1850. Here are two sets of soundings put upon the chart, one in black ink and one in red ink. They refer to two different data, the black figures to the Admiralty datum, and the red figures to the Commissioners' datum, which is a foot below. To compare you have to add a foot, and you will see that there is very little difference, not much.

15,590. Do you know by whom the soundings in red ink were taken?—They were taken by order of the Commissioners' engineer.

15,591. But by whom?—I do not know. I am not a Commissioner, and I do not know.

15,592. To return to the original question, are you, or are you not, of opinion that Mr. Stevenson's design will improve the entrance to Sunderland harbour?—I think it would not improve it. I think, as I stated yesterday, that the sand would wash in behind the piers in every place, wherever there was a ledge as in this beaching ground.

15,593. Do you think it would be the means of saving life? Supposing the pier heads were in 18 feet at low water could not vessels run within the piers at all times, and so save life and property?—I doubt the 18 feet being maintained, because it is a well known and acknowledged fact that if you carry out works in a bar harbour the bar follows it. I think you would have more water at the entrance by running out a single groin, because by running out to 18 feet of water the current would have less power to keep it clear.

15,594. Why will not Mr. Stevenson's north pier act as beneficially as the pier you propose from Roker's Rocks?—I consider that it is continued too far. It would be more likely to have sand lodge behind it, but the other terminates in rocks, and immediately to the north there is a great hole where sand would not lie. I think Mr. Stevenson's pier more likely to accumulate sand.

15,595. Does Mr. Stevenson's north pier run off from Roker's Rocks as you propose?—Yes; but it runs further.

15,596. Then you think that extended so far out it might be the cause of the bar following?—It might be. The other terminates at rocks where sand, I think, possibly might accumulate behind it; I do not say positively that it would.

15,597. Then do we understand you to be of opinion that a bar would form outside the pier heads as designed by Mr. Stevenson?—Yes; the same as outside the heads of the Tyne piers; and I may state that I have an objection to this form of pier. Suppose that a ship takes it in a gale of wind, which is so strong, that she misses it; she comes ashore near the end of the pier, and probably is upset with her head towards the sea, and from the great slope of the breakwater the comparative peril of her fall with her head to sea would be more dangerous.

15,598. Do you know the proposed width of the entrance?—The first 900 and the last 800 feet.

15,599. Did you hear the pilots say yesterday that they did not anticipate the slightest difficulty in taking the entrance to such a harbour?—Of course they would consider it with the wind in; but of course we know that of a large number of ships some would miss. I know pilots object because vessels would come on the rocks.

15,600. Is the freshet out of the Wear very great?—Yes.

15,601. At what rate does it run?—I think I have heard it said that it runs three or four knots an hour; but sometimes it runs down during the whole of the flood tide.

15,602. At those times is it difficult to take the entrance?—It is with a scant wind as well as a close wind to the north. I have noticed when the wind has fallen there is great danger. One vessel I noticed coming in with great difficulty by being warped to the north pier. The next vessel struck midships; they hauled her up, but she sunk when she got a little way up the harbour.

SUNDERLAND.

Mr. Joshua Wilson.

16 Oct. 1858.

Capt. Washington.

15,603. Do you anticipate that it would be easier to take the proposed than the present entrance?—Provided the depth were maintained, but if the depth were not maintained I do not know that it would be better.

15,604. To return to the general question which is more the object of the Commissioners: You stated that a harbour of refuge between Flamborough Head and the Farn Islands should be placed somewhere about Tees Bay?—Yes; that is my view.

15,605. Is your reason this: because it is the deepest part of the bay?—Yes; it is the place ships run for. The embaying wind is east-south to east by north which are the worst winds which blow, and we have often the wind from that direction. An old captain here, rather shrewder than the rest of his class, observed that when the wind was north-east here and a low barometer, it was south-west in the channel. He used to make a wager at a public house, when he saw the wind north-east here and a low barometer that it was south-west in the Channel, and he invariably won. It was in that way we were mistaken about our ships leaving the Thames. The winds were different. Vessels often find the wind north of them after they pass Flamborough Head.

15,606. You have heard Bridlington Bay proposed by some as the best site?—I do not consider that it would be a benefit to make any alteration in Bridlington Bay. It is useful in north winds, and it would spoil it to alter it; it would rather injure it than otherwise. That is my idea, though not being a nautical man I cannot say positively. I consider Redcar a good position for holding vessels. Filey is rather too near the Humber. Vessels that take the Humber to the south can take the Humber, and Filey only covers the coast between the Humber and Filey; but in the Tees bay it would cover the whole coast. To a captain caught off Whitby, Filey would be no use; but he could run in here; and I think vessels generally make a run to clear the head, and generally, if the wind is far enough to windward, they run for the bay.

15,607. Drawing an imaginary line from Flamborough Head to the Farn Islands, have you any doubt that the right point for a harbour of refuge to save life and property should be in the bight of the bay?—I have not the slightest doubt, provided a good enough site could be obtained; a proper site.

15,608. Would you consider it very preferable to any site within seven or eight miles of the extreme of that line?—Very much so. Yes.

15,609. (*Capt. Sulivan.*) Do you consider that in laying out the public money for making a harbour of refuge, those who are answerable to the country and to the public for the laying out that money should, in the first place, secure, if possible, a site where, when a pier was built, the depth inside would be maintained as long as possible?—Yes; that is my view.

15,610. And do you think that if a place is selected in which there is a slight fear of silting up, or which has been silting up of late years, there is great risk of the money being spent uselessly?—Yes; but a very slight tendency to silt up is so great in all enclosures that we must run a little risk.

15,611. I said selecting a spot where there is a slight fear of silting up?—I think it is the duty of the Commissioners, if I may be allowed to say so, to select a spot which has the slightest possible risk of silting up.

15,612. If a position were very desirable for a harbour of refuge, but there was every probability from past experience of its continuing to silt up; and if there were another position less favourable, would you not think it objectionable to lay out a sum of money on the former, and that it was better to take the less favourable site if there were a less chance of its silting up?—Yes, that is my view; but it would depend on the comparison whether it is much less likely to silt up or not.

15,613. Do you consider that any outlay can be made with the probability of obtaining that object which you now think so important, if the piers include within their boundary a tidal river?—I think not. I think a site with a tidal river quite unadapted for a harbour of refuge in the true sense of the term, because there would be danger of a bar.

15,614. Do you think there would be any difficulty in finding a place where there was no river, stream or dock entrance running into the enclosure?—I think it would be very desirable to do so.

15,615. You have had great experience of all the trade and business of a port of this kind?—Yes.

15,616. Supposing a harbour were made in a place where at present there is no trade—no means of supplying ships with provisions, anchors, sails, and other things required for damaged vessels putting into a harbour of refuge—if a site were selected without those advantages, do you consider that the demand which would arise from those vessels would certainly be followed by parties taking capital there to supply that demand?—I apprehend that a small amount of capital would be invested in those things; but you would not have such a supply as may be had at Hartlepool, Sunderland, and Shields, and probably you would pay greater prices; but in this neighbourhood, with the steam boats, it would be very easy to send what was required.

15,617. Do you know in this neighbourhood any site where difficulty would arise from vessels putting in to get supplies and not being able to obtain them?—Scarcely, I think; with supplies plentiful and railway communication so great, it would not be any serious object.

15,618. (*Capt. Vetch.*) What is your plan?—This.

15,619. (*Chairman.*) Have we that in evidence?—I believe a copy.

15,620. That is the plan you referred to?—I have referred to several. It is Mr. Stevenson's plan which I referred to last.

(*Mr. Robinson.*) We shall be happy to supply the Commissioners with a copy.

(*Witness.*) This is a plan showing the pier from Roker.

15,621. (*Capt. Vetch.*) What is your profession?—A merchant and shipowner.

15,622. Are you acquainted with the coast of England in other places?—Not much, except what I can gather from books.

15,623. How long have you been settled at Sunderland?—All my life. My firm have carried on business for 100 years in the same place.

15,624. Are you well acquainted with the river and the outlet of it?—Yes.

15,625. Can you tell me how far the tide flows up the river?—With a high spring tide it flows as high as Chester bridge. I do not know how far that may be, but it runs seven or eight miles by the road.

15,626. What is the general depth of the river upwards which forms the mercantile port?—The port extends a little more than a mile up the river, and is kept clear by dredging; after that it shoals rather rapidly.

15,627. I asked how deep it was generally?—By dredging they keep it down to twelve feet at low water.

15,628. I do not ask what they do by dredging; I ask what is the depth of the river and in the port at low water?—The depth varies very much. In some places it is four, five, or six feet.

15,629. Is it eleven feet in some places?—In the holes I believe it is.

15,630. Is it generally nine feet above the bridge?—I am not aware.

15,631. Vessels go up at low water?—I doubt it. I cannot speak positively without looking at the diagram.

15,632. Looking to the fact that it is a tidal river, only eight or nine miles long, and that you have to dredge it, can you expect any great amount of scouring water?—Not a great amount of scouring water. The Commissioners are endeavouring to in-

crease it by dredging away some of the hard shoals, which will lower the low-water mark several miles up, and increase the tidal scour.

15,633. Supposing the improvements were all completed, would it contain enough tidal scour to clear a channel to sea?—I am afraid not with a broad entrance like the one proposed. The present entrance is only 370 feet, and it would not preserve one of 800 or 900 feet. I consider the present is rather too broad; that if the pier were made a little more to the south, and the entrance rather narrower, the depth would be better preserved than it has been.

15,634. Will you simply answer the questions? What do you consider to be the bar?—Across the ends of the piers from the end of the north pier to the end of the south pier. Sometimes it moves.

15,635. And what is the depth of water there now?—I think about four feet. I think four feet by the Commissioners' datum, and a foot more by the Admiralty datum.

15,636. What is the depth at the inner end of the pier—the least depth?—I believe it is deeper than the bar; four and five feet, or four feet and a half.

15,637. Have you known it as shoal as two feet and a half?—At low water, yes, I think I have; as near as I can tell. I have not sounded.

15,638. Is it not a bar to vessels passing out or in?—Yes.

15,639. Then that bar requires removal?—The bar or shoal.

15,640. Then, supposing the bar to be at the inner end, what do you consider to be the extent of that bar?—The inner end?

15,641. The inner end of the north bar; what is the length and what is the breadth?—I can scarcely speak as to the breadth of the bar.

15,642. What is a bar?—A bar is a bank of sand crossing the entrance of a river or estuary.

15,643. Then if it prevents vessels passing which are drawing ten feet of water it is a bar?—It is a bar.

15,644. Between the outside and inside of the bank, what is the breadth?—I do not know.

15,645. But to give a fair passage that bar must be removed?—Yes. It is not so broad as across to Shields bar by any means, and not so heavy a sea on it, because the water shoals more gradually seaward than at the Tyne.

15,646. Considering the small amount of water which returns on the ebb, do you think that capable of itself, to carry a clear deep water channel to sea? Do you think the return of the tide would suffice to clear out a deep channel?—I consider it would if the jetty from Roker were carried out.

15,647. Supposing there were two enclosing piers and arms?—Like the proposed plan. I do not think it would keep the channel clear. It is scarcely able to keep 370 feet clear, and it is proposed to have 800 or 900 feet.

15,648. When the waterway expands in width, will the current be maintained or lessened?—I think the current will be lessened. I do not know what the velocity will be—what will be the greatest scouring power.

15,649. Take the velocity as you have it when it gets into a large expanse opposite the pier; will the velocity be continued?—I think not.

15,650. Do I understand you to say that along the shore to the south, behind certain groins which you have named, the sand does not accumulate?—No, I never saw it pass that groin. I do not know the name of the third groin from the south. There are five groins. It is the middle groin.

15,651. Do I understand you to say that at the south entrance it has never silted up?—Sometimes it has been silted up. I do not know whether it is the height of the coffer-dam. There is an accumulation on the beaching ground, and it is swept into the channel; and some sand comes from the south, I am satisfied, sometimes.

15,652. To what extent has it been excavated?—The channel has been excavated twelve feet below the Commissioners' datum line, or thirteen feet below the Admiralty low-water mark.

15,653. Have you ever known it have less than six feet?—I believe it has had less.

15,654. Did you ever know it have only four feet and a half?—I cannot speak to my own knowledge. It has been silted up at times.

15,655. I think you said that from the mere position of your pier it would be able to keep the channel clear?—Yes; clear from a bar in the true sense of the term. I make a distinction between the bar and silting up. I am persuaded a large quantity of sand comes in from the south.

15,656. Then you conceive that the accumulation at the south entrance is not driven in by the sea, but comes from elsewhere?—Except near the dock gates; not the outer entrance. I do not think it is driven in by the sea; but near the dock gates a south-east gale drives it in.

15,657. If it comes in from alongshore would it not be easy to prevent it by groins?—Yes. I have mentioned that to the Commissioners.

15,658. Do you know how much money is spent in dredging it?—I do not know exactly.

15,659. Do you think it is 600*l.* a year?—I do not know. Not being a shareholder I am not interested.

15,660. (*Mr. Coode.*) As I am aware that you have been an observer of the movement of material along the coast, I should like to know the extent of coast over which your observations have been made?—My personal observations have been confined almost altogether to this locality.

15,661. Within what limits?—Within a few miles of Sunderland.

15,662. Do you mean 5, 10, or 15 miles?—Four or five miles.

15,663. Four or five miles north and south?—Yes.

15,664. If I rightly understand, you are decidedly of opinion that the movement is from north to south?—Yes.

15,665. You expressed disapproval of Mr. Stevenson's plan, but I think you approve of the plan marked with red lines. Perhaps you will explain in a few words what modification of Mr. Stevenson's plan you would prefer?—The plan opposite page 10 of the Commissioners' Book, Part 2, engineer's report on Sunderland Harbour.

15,666. Is it because you apprehend there would be no accumulation on the north side, or in a less degree as compared with Mr. Stevenson's?—I apprehend that all accumulation behind that pier will be in-shore, as you get off immediately behind the pier, where there is the greatest danger, it is so rocky; and the rocks are in such deep water to the north that no sand would be there.

15,667. Do I understand you to say that the pilots inform you that they have seen sand moving in five fathoms of water?—As I did not see it myself I gave it on the authority of the pilots. At 22 fathoms the bottom has generally silted. The small sand generally lies at that depth.

15,668. Have you a sufficient knowledge of the state of things in Tees Bay to be able to tell us whether the accumulation there, is principally from the Tees or from the sea?—I believe that the accumulation at the Tees Harbour mouth will be principally outside. Where the waves have any action, it is principally mud which is deposited. There are two drifts north and south. I consider it the focus of two drifts.

15,669. Does accumulation take place in Tees Bay both from northwards and southwards?—Yes; that is my impression.

15,670. Is that impression confirmed by observation elsewhere? Is that the principle you have observed to be in action elsewhere?—Yes.

15,671. You put in yesterday a plan of Redcar of which you approved?—Yes, generally.

15,672. Will you look at the small plan (390) pub-

SUNDERLAND.

Mr. Joshua Wilson.

16 Oct. 1858.

Mr. Coode.

lished in compliance with a return of the House of Commons, 12th June 1851;—is that identical with the plan put in yesterday?—Yes, I believe the plans are identical.

15,673. You said that you would provide there an anchorage for about 300 ships?—I did not say anchorage. I said it would provide berthing, on an average of 10 ships to an acre.

15,674. Do you consider that 10 ships to the acre can find accommodation when putting in for refuge purposes in the middle of the night; or in a gale of wind that you could crowd 10 ships in an acre?—As I said before, I apprehend that 400 vessels will not come in in one single night; but one after the other, anchoring near the entrance. They will then weigh anchor and draw up to a berth, the same way that they do in our own harbour.

15,675. Do you not consider that a harbour of refuge, to be worthy of the name, should be available in all states of the weather, both by day and night?—Yes.

15,676. Then what number of vessels do you think could bring up with safety to themselves in a gale of wind, on a dark night?—I am not sufficiently nautical to give any idea.

15,677. You seemed very precise in your estimate of 10 ships to an acre?—I merely took that upon noticing that docks are generally built on the estimate of 10 ships to an acre.

15,678. But do you not think that docks and harbours of refuge are not exactly identical?—No, they are not identical until the ships get berthing.

15,679. You said that accumulation takes place from Tees Bay, both from the north and south winds?—Yes.

15,680. And I understand that you gave evidence that there has been accumulation there during the last 10 years. If you did not, perhaps you will say so?—I do not recollect referring to 10 years back.

15,681. Do you, or do you not, know whether there has been accumulation in Tees Bay during the last 10 years?—I am not aware of that, except that within the present century the channel to the Tees opens out much further to the north than it used to do. It used to come out more directly east than it does, which is a proof of accumulation, or a proof of diminution of scour; because there is inclosing land in the Tees the same as in the Tyne.

15,682. My question has reference to Tees Bay generally, rather than to the mouth of the Tees. Do you know whether an accumulation has taken place there within the last few years?—There was a pier run out within the last 10 years from the Heugh, and where there was rock there is now sand. That was the commencement of Mr. Rendel's plan, and as far as that plan has gone I think the sand has accumulated.

15,683. Do you not believe now that the tendency of any artificial work in Tees Bay would be to accumulate sand there?—Except at Redcar; I think that is very clear of accumulation, from the rocky nature of the ground.

15,684. Do you think there is accumulation everywhere in Tees Bay, except at Redcar. Is that your answer?—Yes.

15,685. Have you seen the wreck chart attached to the Report of the Committee of the House of Commons for 1857?—No, not for 1857. I have seen it for previous years.

15,686. Perhaps you will look at this wreck chart, which is a wreck chart which shows the wrecks for the last five years?—Oh yes; I have seen that before.

15,687. Will you tell me whether the great accumulation of wrecks is not on the range of coast between Blyth and Flamborough Head?—Yes.

15,688. You were asked just now some question as regards the supplies which could be furnished at any point where a harbour of refuge might be made; from the knowledge which you must have of this coast, will you tell me whether you think there would be any difficulty whatever, anywhere within that range, in furnishing a ship with supplies if she put in in distress and required them?—I certainly do not think that there would be any serious difficulty, because there are so many ports comparatively near,—you can hardly find a place where a port is not near.

15,689. Looking at the facilities of the electric telegraph for giving orders on the one hand, and the facilities of steam tugs and railways on the other hand for executing these orders for supplies, do you think there would be any material loss of time in sending these supplies?—A Middlesborough man put into Hartlepool three months ago; his pumps were out of order; there was some difficulty in getting new pumps from the man from whom he had ordered them, so one day he went across to Sunderland and took two pumps back by the train with him.

15,690. Then looking at the facilities of the present time as compared with former times, it would not be necessary, you think, that any large amount of capital should be embarked at any point where a refuge harbour might be constructed?—No; I think not.

15,691. (*Sir F. Smith.*) I had not the advantage, Mr. Wilson, of hearing your evidence yesterday; can you tell us what is the actual annual cost of dredging in this harbour?—I think it was stated yesterday at 5,000*l.* a year.

15,692. Do you think there would be any difficulty in removing the bar by dredging?—I think there would be great difficulty. You must have fine weather for the dredger to work. When there is any lift in the sea you cannot dredge. I, of course, mean the true bar; the shoal made is a different thing.

15,693. Would you require continuous dredging by your plan or by the plan which you support?—Yes; because the drift across the mouth of the river is sure to deposit.

15,694. Do I understand that the proposed breakwater which you support at the Knocks would not project so far seawards as Mr. Stevenson's?—No, it would not project so far seawards.

15,695. I presume that you have seen the harbours in the south of England?—No, I cannot say that I have, but I have seen drawings of them.

15,696. Do you imagine that the projection of a pier into deeper water is an evil?—I do not consider it an evil, nor do I consider it a good unless that deeper water can be maintained.

15,697. If it should be the case that, in the south of England it is the principle to follow the bar, and thereby remove it by carrying out the piers into deeper water, should you say that that principle is a wrong one?—My view of the drift of sand is this, that if you carry a breakwater at right angles to the coast the angle behind the breakwater will close up; and thus it will pass, unless there are rocks or some cause to send it into deeper water.

15,698. Then do you think it reasonable to suppose that if your short pier will not turn the sand coming northwards into the harbour, that Mr. Stevenson's longer pier will do that?—I think it possible that if the west pier were made without the south pier, there would not be quite so much sand come in. From going out further, and covering the harbour a little more, it would be more likely to stop the sand which goes to the north in south-east gales, and with a longer pier there would be more sand behind the north pier than with a shorter one.

15,699. Then the error which Mr. Stevenson has committed, in your opinion, is in going exactly to the point where he stops?—I think he goes too far, and the south pier will intercept the south drift and bring it into the harbour.

15,700. Then you would make the north pier as long as the south pier and the south pier shorter?—I would certainly make it shorter.

15,701. Is it not a fact that the longer the pier the longer the bar of sand drifts into the harbour?—I think not; a breakwater constructed at the Knocks would allow the drift to go by in deep water. It is a

very simple principle. Pilots inform me that sand goes by in five fathoms at the dock entrance.

15,702. Then you consider it of great value to go only to the Knocks, and you think Mr. Stevenson has done wrong in going further?—Yes; he has gone beyond the Knocks.

15,703. Then, as a matter of fact, the terminating at the Knocks is a great recommendation in the plan you support. I may say, as you have alluded to Newhaven Harbour, that having been there for many years, I know that it is the groins which have improved the harbour most?—Which Newhaven?

15,704. Newhaven in Sussex?—Yes, it was proposed by Mr. Stevens, the resident engineer, and approved by Mr. Walker; and Mr. Walker remarks that he had never known a harbour so much improved as Newhaven. Mr. Stevens, in the Encyclopædia, says, that his plan by leading the drift into the bay, has very much improved Newhaven.

15,705. Do I understand you to say that the east pier was projected by Mr. Walker?—The groin to the eastward of the east pier, occupying the same position to the proposed as our north pier; and it has had the effect of improving Newhaven Harbour. It was made in 1845, and Mr. Walker, in 1856, said, that he had never known a harbour so much improved as Newhaven.

15,706. I may tell you I was employed five or six years in connexion with the groin at Newhaven, and my opinion is that the projection of the pier caught the sand—not the groin but the pier; and therefore my impression of what has been done at Newhaven is quite different from what you suppose?—Not having been there I can of course only give you my views upon the subject.

15,707. Do you mean that the accumulation which comes round the north pier would form a bar?—Yes, I do. It does form a bar.

15,708. I think you have shown a short diagram in the Commissioners' book of the precise time when the sand moves, and the form of the island or shoal in the centre of the bar?—It afterwards moves further southwards.

15,709. That is with the piers as they now exist?—Yes.

15,710. But if the piers were not extended they would not have that effect?—I do not see why they should not. It is a mere question of time. When the space behind the pier was filled up, the drift would form a bar.

15,711. What would be the expense of a breakwater as recommended by you?—I do not know. I believe the Commissioners' engineer made an estimate, before it was originally projected,—before Mr. Stevenson was called in. I think I have heard of 20,000*l.* or 30,000*l.*, as being the sum.

15,712. Then you consider it would be a considerable auxiliary to Mr. Stevenson's plan; because if your groin were to catch the sand coming to the south it would prevent it coming to the north pier?—My view is, that if the pier could be carried eastward to the Knocks the sand would then pass uninterruptedly into deep water; that the water would be deep enough; but that if you went further it would interrupt the passage of the sand, and form an accumulation of sand behind.

15,713. You are for a more economical plan, and would shorten Mr. Stevenson's pier to the Knocks?—Yes.

15,714. And reaching the Knocks you would stop there?—I think the Commissioners ought to do it with their own money.

15,715. You think that to make the harbour complete Mr. Stevenson's piers should be shortened, and instead of that there should be a breakwater?—That is my view.

15,716. The Commissioners are told that sometimes there are from 600 to 700 vessels off Flamborough Head waiting to go to the south. If that should be the case—if there are sometimes 600 or 700 vessels waiting off Flamborough Head to go south——?—To the north you mean.

15,717. No; to the south?—No; they cannot shelter under Flamborough Head going to London. They would get no shelter there in a south gale.

15,718. In a south-west gale it is sheltered?—They do not require shelter, it is off the land fair for London, all the way to Yarmouth Roads.

15,719. Then under any circumstances, supposing that there are from 600 to 700 vessels lying off Flamborough Head, do you think any port can be made to take these vessels in if they should be forced to bear up?—Let the wind be as fair as it may, you will not have the whole make for one port. We know well that men will run for their own port. Evidence was given yesterday of the great risks which men will run in going for their own port, and 200 or 300 are as many as would run for one port.

15,720. But if you formed a harbour of refuge they would probably try to make for that refuge, would they not?—A portion of them would, no doubt.

15,721. Supposing that there were a number of harbours, beginning at Filey Bay and going down to the Tyne, do you not imagine that vessels wishing to go south would not rather go into a port close to Flamborough Head than go to the northward?—If there were a harbour at Flamborough Head which vessels could make, they would rather do that than go to the north, but still that is a mere question of expense; because I consider when a vessel is in a position to weather the head she is in a position to run to Redcar, and as to a harbour at Filey Bay the question is whether it is worth the expense to save laden vessels running further to the north.

15,722. It is not the saving of vessels running to the north that we have to consider, but the saving of life; and if it is shown to you that there would be a greater saving of life by having more harbours, surely you would not object to that?—I apprehend that it would not in fact make any great difference; but on that, of course, a nautical man will be able to give a better opinion. Still my view is this, that when a vessel can run to Filey Bay, she can just as well run to Redcar.

15,723. You said you could enclose 470 acres?—That is so.

15,724. Then at the rate of 10 acres to a ship you provide a range for 47 ships?—No; at 10 ships to an acre; and I suppose there would be space enough for 470 ships.

15,725. Then, in fact, you would not take in all the vessels which might run there?—At high water there would be an area of 470 acres.

15,726. What would be the depth of the water?—At the entrance there would be about six fathoms, and further in for half the distance there would be from four fathoms to six fathoms; then it shoals gradually from 4 feet to 6 feet, and so on to the sand.

15,727. And supposing that you had only one ship to the acre?—I am not nautical enough to say for certain, but I suppose that would be enough ground to swing a ship in. You would be able to take in 470 ships.

15,728. Is not Redcar considerably embayed in comparison with Filey Bay?—Yes.

15,729. That would be a disadvantage, would it not?—On the other hand I consider it an advantage rather, because when a vessel can get off the land she does not require a harbour of refuge. It is those which are embayed which require a harbour of refuge; not like such a coast as Flamborough Head or Peterhead.

15,730. Would they not most likely have to remain there until the wind shifts if they were in a deep part of the bay?—There are plenty of steam tugs at Stockton which would be able to take them out.

15,731. Would those steam tugs be available for the purpose?—Oh dear, yes. There is a greater number of steam tugs in the Tees in proportion to the tonnage than in any other port, because they have to tow vessels there a long way out of the harbour.

15,732. (*Mr. Lindsay.*) The whole tone of your evidence has been to the effect that you would prefer

SUNDERLAND.

Mr. Joshua Wilson.

16 Oct. 1858.

Mr. Lindsay.

one great harbour of refuge to the improvement of the already existing harbours, looking to the consideration of saving life and property ?—Yes.

15,733. In answer to Sir F.Smith you have just now stated that, if from 600 to 700 vessels were obliged to put back to seek shelter, they would not all run for one harbour of refuge wherever that might be placed ; but that very many of them would run for their own harbours, is that your opinion ?—That is my opinion, certainly. It was the case with the ships in Bridlington Bay coming to the north, according to the evidence given yesterday ; many of them probably run a certain amount of risk in order to run for their own harbour, being light vessels they come in with a strong wind from half flood to half ebb.

15,734. Then that being the case, is it not the fact that the loss of life and property which we are here, as a Commission, to obviate for the future, takes place at the mouth of these harbours ?—Yes.

15,735. If that is the case would not the improvement of these harbours, so as to enable ships to take them at all times, if possible, tend, according to your own showing, to save life and property more than any one single harbour of refuge that you could put anywhere on this coast ? — Well, in the first place I have given my views. I doubt the improvement, and should prefer leaving it to the local authorities—to the Harbour Commissioners—to improve their own harbours, and then incidentally they would improve them as harbours of refuge.

15,736. I will only trouble you with one question further. Seeing that the Commissioners have taken full and competent evidence upon the subject, and that they find that these harbours can be improved, and that a depth of water can be maintained at them, would that change your views with regard to the views you have originally expressed as to your preference for one harbour of refuge in place of improving these harbours which already exist ? — I cannot say. I am a little of a free trader, and I like us to do our business ourselves without any Government aid.

15,737. But if it were shown to be certain that the money which the Commissioners of these harbours could by any possibility raise would not be sufficient to improve these harbours so as to make them accessible to vessels at all states of the tide, and thus to prevent the lamentable loss of life which now takes place, would you carry your principle so far as to say that these lives should still continue to be sacrificed rather than that the Government should come forward with money to aid in the improvement of the harbours ?—Under these extreme circumstances I might alter my views, but I do not consider that we are under these circumstances at present.

15,738. But of course you are aware that it is only under extreme circumstances, such as the saving of life and property, that the Government does come forward, and that there must be extreme circumstances proved before Government will come forward. If, therefore, you see no other means of preventing this loss of valuable life and property which now takes place on the coast than those which have been shadowed forth, would you retain the same views which you have now expressed ?—My own opinion is, that if there were a single harbour of refuge it would be optional with the captains whether they should take it or not. If the harbours were made the Government would have done its duty ; and if people would not use when they could Government would not be at all to blame. It is said that men like to make their voyage, and to do so they will run great risks ; but when a man prefers to run a risk in that way I do not see that the Government is to be called to account for any loss that may ensue.

15,739. (*Capt. Sulivan.*) Are you aware that, by the aid of the large works which have been constructed at the Tyne, the Commissioners are hoping to get a depth of 15 feet at low water ?—Oh yes.

15,740. If those works should be successful, and that depth of water should be obtained, they ought to be available as a harbour of refuge for all vessels which pass to the north of Hartlepool, for a large portion of laden vessels at low water, and for a much larger portion of laden vessels soon after low water ? —If they can make and maintain 15 feet of water it will be a great improvement, and will make it much better than it now is as a harbour of refuge.

15,741. I was asking you would it become available as a harbour of refuge for light vessels with 15 feet of water preserved at low water ?—Yes ; provided that depth is preserved.

15,742. I mean provided it is preserved. Then if that outlay is successful, it will give at Newcastle a very fine harbour of refuge, compared with what you now have ?—Yes.

15,743. But suppose it is not successful ; supposing that with all their outlay they should fail to get an increased depth, would that show that any further expenditure of money would be money thrown away ?— I think it would be. I may state that the present piers which are now thrown out, all act as a groin, and drive the sand further out to sea ; and it strikes me whether it would not be worth while, when the present contract is finished, to let the work lie for a time and see the effect.

15,744. I will repeat the question : Whether, if the operations now in progress at the mouth of the Tyne are successful, they will make a good harbour of refuge ?—Yes ; but I do not approve of a harbour of refuge at the Tyne so well as at Tees Bay.

15,745. Then if the best situation were found from Redcar along the coast for a harbour of refuge, and it were constructed there, would you not have the double advantage of having a harbour of refuge, and a harbour much better than it now is, at Newcastle ?— Yes ; more particularly for laden than light vessels. Shields would be better for improving to 15 feet.

15,746. From what you know of the nature of the coast, will you tell me what you think of Filey Bay ? From the nature of the rocky coast on both sides of it, is it a place likely or not likely to silt up ?—I have not been there, but I think there is not much danger of it ; because at similar places, at Scarborough and at Bridlington Bay, there is no silting up.

15,747. (*Mr. Coode.*) Have you ever followed the sea at any time ?—Never.

15,748. Do you know anything of the peculiarities or the dangers of the voyage between London and Newcastle, whether there are any peculiar difficulties at any point ?—Nothing particular, except that in the coal trade I consider that on an average ships are deeper laden, and not so well found, perhaps, on an average as foreign-going vessels.

15,749. You do not apprehend that there would be any difficulty in vessels running back from Flamborough and a little further, would not that distance make a great increase in the danger ?—That is my view.

15,750. Are you aware that the distance is 40 miles ?—I should think that it might be.

15,751. Should you not think there was danger in a full laden ship, such as you describe, running back 40 miles on a lee shore ?—I think it is scarcely on a lee shore with a wind so that she cannot make her passage. If a vessel can clear Flamborough Head she can go to the south, but with an embaying wind, which is east, I think she can run to Redcar.

15,752. You say if she can clear Flamborough Head ; are you aware that there are difficulties in clearing Flamborough Head ?—I have heard of vessels not clearing the head. I should think they could run to Redcar ; but not being a nautical man I do not give any opinion.

(*Mr. Robinson.*) I have now to apply to have Mr. Stevenson's examination finished, as he has attended here at considerable inconvenience.

(*Chairman.*) Before I proceed with the evidence of the next witness, there is a little matter which I wish to notice here. My attention has been called to a paragraph in the local paper of this day, in which it is stated, that up to the present moment no communica-

SUNDERLAND.

Mr. Joshua Wilson.

16 Oct. 1858.

tion has been received as to when the Commissioners will open their sittings in Sunderland, and that there must have been some extraordinary remissness on the part of those who should furnish that information. Upon that I have to observe, that for reasons which I shall mention hereafter, on the 2d of October, at Bristol, the Commissioners adjourned to the 13th to meet at Tynemouth. You will observe that between the 2d and 13th of October no business could be done that had not been previously sanctioned. Upon the 4th of October a communication was written from Bristol to the Mayor of Sunderland, informing him that the Commissioners would meet on the 13th of October at Tynemouth, and that two or three days' previous notice would be given of the day when they would meet at Sunderland; and to the best of my recollection it was noticed in the letter that the reason for not fixing the day was this: that it being the determination of the Commissioners to hear every thing which everybody has to say, it would be quite impossible before commencing an inquiry at any one place, to determine when that inquiry would be finished. Therefore, before we commenced our proceedings at Tynemouth, it was impossible to form any conception how many days we should remain there. We were placed in this difficulty, that if we had named a day we might have put you to the inconvenience of having to adjourn over that day. We thought the lesser inconvenience of the two would be to give the short notice which I have described. I find also, that upon the 6th of October, the letter I have mentioned was acknowledged by the mayor; and upon the 12th of October a letter was written by our secretary to the Mayor, stating that we wished to hold a meeting at Sunderland on Friday next, the 15th, thereby fulfilling, to the letter, the intimation that we would give you two or three days' notice. I will give you the reason why I have taken notice of this paragraph in the paper. Because it touches the value of this Commission, that every body who wishes to give us evidence should have a full and fair opportunity of doing so; and if the measures which we have taken for this purpose have not fully succeeded, it is our intention to sit subsequently in London, and parties who may wish to do so, will have the opportunity of forwarding memorials to us there; and, if we think proper, we can call them up to London to give their evidence there. I will further observe, upon the suggestion of one of my colleagues, that we had thought in the first instance, that one day might have been sufficient for Sunderland, and upon that supposition we gave notice to Hartlepool that we should be there to-day; but the moment we found the time for Sunderland was not sufficient, we determined to remain here, and to put the people at Hartlepool to the inconvenience of postponing their meeting until Monday.

(*The Mayor.*) I am very sorry that there should be some complaint that the meeting has not been advertised in the papers.

(*Chairman.*) There is no complaint as to that, because the letter is in the paper in which you state the cause why no advertisements were inserted.

(*The Mayor.*) I could not possibly advertise in the papers after I received intimation that you would be here yesterday.

(*Chairman.*) Was there no local paper?

(*The Mayor.*) There was one local paper, but not of any extensive circulation.

(*Chairman.*) I am aware of the difficulty of publishing advertisements in the newspapers, and you took the next best course, that of circulating handbills.

Mr. STEVENSON re-called.

Mr. David Stevenson.

15,753. (*Chairman.*) Will you proceed with any statement that you may wish to make relative to the proposed harbour improvements?—May I say anything which I stated yesterday, or shall I begin where I left off, then?

15,754. Yes; begin where you left off?—I stated yesterday, when I concluded, that the effect of the works would be——

15,755. You will permit me to say, you are the best judge whether or not you should refer to anything which you said yesterday, for the elucidation of the subject. As Sir Frederic Smith, Captain Vetch, and Mr. Coode were not here, we must have it over again, if you think it necessary; but we have it on our minutes, and we shall have it published in evidence.—I am most unwilling to take up any time unnecessarily in making a statement over again.

15,756. It is suggested by Sir Frederic Smith that you should make some brief statement, to give the gentlemen who were absent yesterday some idea of the statements you then made?—The objections to the present harbour of Sunderland are three. The first is, the very small depth of water at the bar at the entrance of the harbour, varying from eighteen inches to five feet; the second objection is the extremely heavy sea at the present mouth or entrance; and the third objection, is the amount of range which enters the harbour, running up the lower reach of the harbour, and rendering the whole of the berthage very insecure and inconvenient. The cause of the bar at the mouth of the harbour, I think may be explained as follows:—The shore in front of the harbour consists of sand, through which a channel is kept open by the scouring of the tidal currents. From the high-water mark to the low-water mark the action of the sea upon the coast is to heap up the sand, and of course to fill up this channel, while the action of the tidal scour is to keep it open; and I showed a section yesterday which I think illustrates this pretty clearly. Here is the section to which I allude. Section 2 is through the channel and across the bar. Section 1 is immediately to the north of the harbour, and section 3 is immediately to the south of the harbour. Upon examining those sections, it will be found that Nos. 1 and 3 both incline regularly from high-water mark to low-water mark into deep water, but on examining No. 2 it will be seen that deep water is continued through the beach between the piers into the harbour. If the channel were closed,—if we could suppose such a thing,—the middle section would assimilate to that on either side; in other words, this channel would be wholly closed up. This closing-up action is the effect of every heavy sea, and consequently we have this bar shifting, sometimes driven up close to the pier heads, and at other times, as represented in the section, 400 or 500 feet from it. The next heavy sea will wash up the projecting part shown in the section, and will throw it up and remove the bar inwards. Upon looking at the longitudinal section, you have the bar at the outer end, upon which there is a small depth of water,—some 18 inches, I should suppose. You will also observe that opposite to the Potatoe Garth you have a considerable depth of water, which continues to some extent out between the north and south piers; but you will observe that coming to the outer extremity of the north and south piers we have shoaling commencing. Now, if the natural scour were unobstructed and unimpeded, it would maintain a deeper channel between the piers, where the channel is confined and the scour is naturally greater than at the open part opposite the Potatoe Garth. This affords a very strong indication of the prejudicial effect of the heaping up action at the mouth of the harbour to which I have alluded; and my opinion is, that the shoal water at the mouth of Sunderland Harbour is due entirely to the heaping-up action of the waves. If that be the case, two methods at once occur whereby this evil may be removed. The one is the increase of the backwater or scour, giving it a preponderating effect over the heaping-up action of the waves. The other is mo-

SUNDERLAND.

Mr. David Stevenson.

16 Oct. 1858.

Chairman.

difying the action of the sea itself. Upon the increase of tidal water I reported some years ago; but the present plan which is before the Commission is based entirely upon the principle of protecting the harbour mouth from the action of the sea. For that purpose the piers shown in the model have been designed. It is proposed to effect the object in view by running out two piers, one to the north and the other to the south. The effect of those piers will be threefold. In the first place, they will reduce the swell at the mouth of the harbour in the ratio of one to decimal 3, or, in other words, a nine-feet wave will be a three-feet wave at the mouth of the present harbour. This reduced action of the sea will enable the tidal currents to act with greater power, and it is not too much to expect, that after those piers are thrown out, what is the maximum depth of the bar now would be the minimum depth of the bar then. The second improvement is the reduction of the height of the wave at the pier heads, where, by reducing the action of the sea, you reduce the height of the wave in the proportion of nine to three ; and the third will be the improvement of the lower reach of the harbour. The range now complained of will be done away with. The estimate for carrying out these works is 300,000*l*. I do not know if the Commissioners wish me to give details of those estimates, and the prices of those works.

15,757. Can you let us have the details in the shape of some paper ?—I will give the details in a written statement, giving the prices of the different parts of the work, and also sections showing what sort of work is proposed.

15,758. (*Mr. Coode.*) Will you take care that your sections are reduced to the same scale as the Commissioners' established scale, of which you have been apprised ?—Yes ; I go on to state generally that as this is an exposed place, and that to some extent marine insects are found to affect timber-work on the neighbouring shores, it is proposed to construct these works entirely of stone. The pier heads will be brought up with the diving bell, and the rest will be rubble, and the superstructure will be rough blocks of stone, sufficiently strong to resist the action of the sea. With reference to the maintenance of those works, I should wish to say, that I have very carefully considered the subject, with the object of making up my mind as to whether there was in point of fact any danger to the existing works in constructing them ; or any chance of the works, after being constructed, not being maintained. It has been said by some of the witnesses that this north pier would act as a groin ; but it must be recollected that the construction of a groin to retain materials on a coast is an engineering problem, not always very clear or successful. There is one thing clear, however, that no man employed to project a groin for the purpose of collecting sand in that situation would ever give it the form of the outer portion of the proposed pier. It would not be a curved groin in a sloping direction from north to south ;—a groin of that description would have no effect in retaining the sand passing along the coast, provided (which I admit for the sake of argument, but which I do not admit actually) that the sand does travel in such quantities as was stated by the last witness. I have myself no fear whatever upon that subject ; but admitting that this sand is carried along the coast, and is to be carried along the north pier, you observe that the extremity of it, or the mouth of the harbour, is projected beyond the general outline of the coast ; and therefore, I have no hesitation in saying, there will be increased tidal scour across the mouth of the harbour, so that if we suppose sand is carried out, it will be carried outside the harbour, but I do not suppose that sand in any quantity will be carried out there in that depth of water. The effect of a pier is not like a groin ; a groin is generally a shelving structure from the high water downwards, not terminating in an abrupt bluff point as the pier does ; moreover, against the pier which is projected, there would be constant re-action from the waves, which would keep the whole sea to the north of it more or less in a state of disturbance, and would prevent deposit, even supposing that the sand did travel along the beach. This harbour as laid down I regard as a projection from the line of coast, creating at the mouth of it increased scour. The whole of the movement of sand which I have spoken about, and which has come under my observation here and elsewhere, takes place in shallow water. I am not aware that waves breaking in deep water (say 30 fathoms or any such depth), breaking in that depth in the open sea do disturb the bottom so as to produce a constant progressive motion. I am not aware that the waves disturb the bottom in this way even in three or four fathoms. No doubt there is a certain action at the bottom at that depth, perhaps a percussive. That is rather an obscure subject, but I do not see that there is any evidence at all as to any progressive movement whatever of sand in that depth of water. The wave, it appears to me, though it does break, still appears to break and pass over without producing progressive motion of the materials ; certainly it never acts upon the bottom to the same degree as when it comes in shallow water. We know that it acts upon the sand in shallow water, and by every day's experience we know that the tendency is to heap it up. If it were the case that the sand moved in deep water, we should certainly find after a heavy storm in all sandy bays, that water in two or three fathoms depth was sensibly shoaled. We shall certainly find in the course of years, I should say (if that were the universal law), that all sandy bays were filling up. Now any experience which I have does not lead me to such a conclusion. There is, in point of fact, no such general law that I have ever been able to trace ; therefore what I say is, that the pier heads being projected into that depth of water, there would be no tendency whatever for the sea to throw the sand into this harbour mouth. I have no difficulty whatever in my own mind in coming to the conclusion, that the entrance, when so formed, will be maintained. If you cast your eye over this model, you will see that at Souter Point, immediately to the north of Sunderland, we have a projecting shore. We have deep water keeping very close into it ; there is no foreshore ; there is no collection of sand there, and I attribute that solely to the action of the current in passing it. In fact, what occurs to my own mind in casting my eye on this Admiralty chart of the bay of Sunderland is, that the supposition (the mouth of the new harbour being here) that the foreshore would gradually extend, and that eventually, at some distant period, the point which is shown as the entrance of the proposed harbour would be dry at low water, with a beach extending in front of it, involves a change so great, and belonging to a period altogether so remote, according to my notion, that I confess I am not able to carry my engineering views to that extent. The quantity of material required to produce such an effect is something quite enormous, and where it is to come from I am really at a loss to know ; but I do not think that action will exist at all. I do not think, at this moment, there is any further remark which occurs to me, but I shall be happy to answer any questions which the Commissioners may think fit to put.

15,759. (*Chairman.*) In your evidence yesterday, Mr. Stevenson, I think you stated that you did not view this proposed improvement in the light of a harbour of refuge, but chiefly as a local improvement? —I did.

15,760. Now taking into consideration that any grant of public money will probably depend upon its utility for refuge purposes, will you state to me what area we may reasonably suppose will be retained for that purpose if this improvement succeed ?— The high-water area will be 150 acres ; the low-water, 95 acres. One fathom, 57 acres ; 2 fathoms, 31 acres.

15,761. That is the area outside the piers ?—That is the area enclosed within those new piers.

15,762. Outside the existing harbour piers ?—Yes.

15,763. Then will this improvement render available for refuge purposes a portion of the present harbour within the north and south piers ?—It will render available as a site for berthage the whole of the lower beach of the harbour from the Potatoe Garth upwards, which at present in bad weather cannot be used.

15,764. And what additional area would be gained? —I have not calculated that ; but I can have it done, and give it in.

15,765. Will you furnish our secretary at your convenience with an estimate ; not a very close estimate, but some estimate of the area ?—Yes.

15,766. As I understand you, the proposed improvement will give 18 feet at low water at spring tides ? —At the pier heads.

15,767. By dredging improvements, and whatever improvement arises from the scour of the river, what shall we have in this refuge area inside the north and south piers ?—It depends entirely on the operations which the, Commissioners of the River Wear will ultimately carry out ; if nothing is done but those two piers which I have shown, all I expect is, that there will be a low-water channel from the present pier heads, which shall nowhere have less than the present maximum depth of the bar ; but if the suggestions which are contained in the report I have handed in as to improving the upper part of the river are carried out, additional scouring power will be gained, and that depth will be increased. I am not prepared to say the exact extent, but no doubt to the extent of a foot or two.

15,768. And are you of opinion, that by dredging, that gain of a foot or two can be extended further ?— It would be, partly by dredging, and partly by the construction of training walls in the tidal part of the river.

15,769. By dredging, do I understand you to mean in the area I have mentioned ?—The dredging would be principally for removing the shoals in the upper part of the river so as to allow the tidal water to get further up, and to give a larger amount of it.

15,770. Can you state at what period of the tide this refuge area inside the north and south piers would be available for vessels which have taken shelter within the pier heads ?—Excepting a very small part of it at the outer extremity, no part of it would be available as anchorage at low water at all ; but about the period of the quarter or half tide it certainly would render the present entrance open for light vessels, and would also be a refuge or place where they might bring up ; but there is no object in vessels bringing up there, if they can get into the harbour, which is the great object to attain.

15,771. The depth above being always greater than at the bar ?—Yes.

15,772. (*Sir F. Smith.*) You have shown us three sections, one through the entrance, and one north and one south of the entrance ?—Yes.

15,773. Were those sections taken with great accuracy ?—They were ; they were taken from a contour plan furnished by Mr. Meik, the resident engineer, and I have every reason to believe they are quite correct.

15,774. Do you propose to give in those sections ? —Yes.

15,775. It will be convenient to mark the heights and depths so that we may not have to refer by compass, and if you will be kind enough to have that done upon the responsibility of some person who will sign the drawings ?—Very well.

15,776. When were they taken, at a distant period or recently ?—The date is not upon them ; but it was in the course of last year ; the date is not upon those documents, but I shall have the date put upon them ; it was some time last year.

15,777. It might be satisfactory if you could get sections taken at the present time so as to show what is the difference that has arisen in the intervening period ?—I will have that done.

15,778. Will you point out on the model the exact position of the bar where it now stands ?—It varies, not exactly from day to day, but certainly from week to week, but just at this moment it is a little without the pier heads of the present harbour.

15,779. So far as your knowledge goes, what is the extreme shifting of the bar ?—I think from the pier heads to about 400 or 500 feet in front seaward.

15,780. To what do you ascribe the shifting to that great extent ?—I ascribe the shifting to the effect of the outward current, in moving the sand thrown up by the sea, and depositing it at a point further seaward than the present pier heads ; thus when the bar has been driven close in between the south and north pier heads by violent gales we have at that place a large amount of sand. When the gales take off, and the scour begins to act, it is pushed by the action of the scour considerably seaward of the pier heads, and I think that is the cause of the variation of the position of the bar from the pier heads to 400 or 500 feet seaward.

15,781. You think that the bar is more formed of sand brought direct seaward than of sand brought along the coast ?—Yes ; it is sand thrown up and pushed seaward alternately.

15,782. That strengthens your opinion that there would not be any great movement towards the harbour's mouth if the north pier was formed ?—Yes ; there is to a certain extent periodical wasting and filling up on either side of the present harbour. In the course of last year, when I was here, there was a considerable amount of sand cleared away from the north pier heads, in consequence of a wrecked vessel lying there, and such changes are constantly going on. We have, as I said, always a constant action of the sea to fill up, while the action of the current is to scour it down.

15,783. What amount of backwater do you recommend being obtained, and can you obtain ?—As much as we possibly can. I cannot state from recollection ; but I gave the amount in the report which is given in.

15,784. A considerable amount ? — A considerable amount of backwater, and backwater which would act at the most beneficial time of the tide, being at the last of the ebb tide.

15,785. (*Mr. Lindsay.*) I have got one question to ask you, Mr. Stevenson. You stated, I think, and you gave reasons which struck me very forcibly, that you thought if the piers proposed were carried out you would be able to maintain the depth of water to what it is at the present time ?—Yes, the maximum depth.

15,786. And I think you stated, further, that you did not expect to be able to increase the depth of water between the existing piers more than about two feet ?—I think I said four or five feet.

15,787. You would increase it four or five feet ?— Four or five feet would be the increased depth.

15,788. Do you think the whole depth would then be six feet ?—Yes.

15,789. What would be the good of constructing those piers, for ships running to this place in distress in gales of wind would gain no advantage by them, if, while you had 18 feet at the proposed entrance, you would only have six and a half feet in the channel between the existing piers ; for ships in such gales of wind as I have pointed out cannot anchor within the piers ?—What I stated was that I regarded this as a local improvement; not as a harbour of refuge; and from the observations that I have made at the harbour, and particulars of the wrecks which have occurred, often even a foot or two would have saved the vessel. I have no hesitation whatever in saying that if by this improvement you obtain an increased depth of five feet, and a decreased send in proportion, that that would be a very valuable improvement to the harbour; and to that extent, and that extent alone, my remarks apply, unless a further improvement to increase the depth still more is carried out. But the present plan, and the plan which is before the

SUNDERLAND.

Mr. David Stevenson.

16 Oct. 1858.

Mr. Lindsay.

Commissioners, professes to do what I have stated, and nothing more. There is this to be said about it, that suppose a stray vessel at or about low water, which cannot keep the sea, is forced to run for that harbour, she may let go her anchors, and if they hold for a couple of hours, she may run up the harbour; well and good ; but still even if she drives and goes on the beach behind either of the present piers, she would be in a very different predicament if the proposed new piers are carried out from what she would be in the present state of the harbour. In fact, if she ran on the beach within the proposed new outer harbour she would be under the protection of the covering piers, and certainly there would not be loss of life, and, I think, neither would there be loss of property.

15,790. Then I understand you to say that you will get six feet more at low water between the existing piers, which, with the send of three feet in heavy gales, will be nine and a half feet better than now ?—For ships entering, that will be the effect of it as regards extra depth.

15,791. Do I understand you to say that by extending the existing piers to the length proposed you will reduce the send in gales by three feet ?—I expect that the send will be reduced much more than three feet. With a nine-foot wave you will have a certain send. I am not prepared at this moment to say what it is; you cannot in fact say what it is, because it depends upon the build of the vessel almost entirely; but though I am not prepared to say what the send due to a nine-foot wave, as compared to the send due to a three-foot wave, may be ; I certainly think it is more than three feet.

15,792. But looking at the great difference of depth, between the existing piers and what there would be at the entrance between the proposed piers, do you think it necessary, considering the great difference of the depth, and the fact that within the existing piers there is no proper roadstead in gales of wind—considering the great difference of the depth, do you think it necessary to go to the expense of carrying out the piers to the depth you propose ? Would smaller piers not answer equally well, unless you could manage to get a greater depth than you profess to get in the channel between the existing piers ?—It would not answer equally well by any means. It would unquestionably improve the harbour, but it would not answer as well. In the first place, there is a manifest advantage in having the pier heads to project as far as possible to meet the difficulty, which has been so often stated to-day and yesterday, with reference to the sand, and you will not reduce the send to the same extent if the pier heads are put further in, because the reduction of the send depends upon certain data, and one is the distance of the pier heads to the point of observation, so that such a harbour would not by any means so well answer the purpose as the one projected.

15,793. I understand your reason is, the less chance of silting up by carrying your piers out to 18 feet ; and I understand, from the explanation which you have given in so clear a manner, that if they were carried out to only 14 feet there would be much more chance of silting up. But it appears to me that 14 feet would equally cover the entrance of the harbour, and therefore if the entrance in the prevailing heaviest gales were covered, would not the send be much reduced without carrying them out to so great a distance ?—No, it would not. In stating to the Commissioners that I believe the reduction of the wave would be in the ratio of 1 to decimal 3 I made use of a calculation founded on experience, and upon observations amounting to somewhere about 3,000, which have been made at different harbours within the last four or five years. The calculation is by a formula (the merit of which is not due to me, but to my brother, Mr. Thomas Stevenson), and in that formula the elements are the width of the proposed entrance, the width at the point of observation, and the distance from the proposed entrance to the point of observation. As you increase the distance from the proposed entrance to the point of observation you decrease the height of the wave; consequently if you withdraw the pier heads of the harbour further inwards, so as to approach more nearly to the pier heads of the present harbour, you will, in a certain proportion, decrease what is termed the reductive power of the harbour. If the Commissioners desire it, I shall be very happy to hand in a statement of the application of that formula, and also the observations which have been made upon the subject.

15,794. I think it will be very desirable for you to do so, if convenient ?—I will.

15,795. (*Capt. Washington.*) I think you have stated, Mr. Stevenson, that you do not consider there is any action of the sea on the bottom so as to raise sand and drive it into the harbour in a depth of 18 feet ?—That is my opinion.

15,796. Does that opinion hold good in a lesser depth, and if so state the minimum depth that you think is acted upon by the stroke of the wave ?—I do not say that the bottom is not acted upon at that depth by the stroke of the wave. I believe it is acted upon, but not at all in the same way, certainly, as when you come into shallow depths of water; the minimum depths, or the depth where that particular action takes place, must depend partly on the slope of the beach, and partly, of course, on the height of the wave, and I cannot give a general answer fixing at what depth this action commences.

15,797. Let us take this point. You consider the beach a tolerably flat beach off the entrance of Sunderland Harbour ?—Yes.

15,798. That is the usual slope of beach ?—Yes.

15,799. And that slope extends outwards without any sudden dip ?—Yes, it does.

15,800. How soon do you consider any action takes place on the bottom in easterly gales, so as it would raise the sand, and throw it into the harbour; or how near to the pier heads do you think such action does not take place ? Do I make myself understood ?—I think the answer which I gave before I must give again, that at present I cannot define or determine any particular depth; 5, 10, 15, or 18 feet. I cannot do that; but from my own observation, and from what I have invariably heard, I do not believe that there is in such depths as 18 feet off Sunderland the same action which we have in shoaler water as you approach the shore. There is a tendency to suppose that whenever you have sand you must have silting, which I do not hold. I know, for example, an instance which can be named, that of the Scrabster Pier, which extends into 12 feet at low water, and is founded upon sand, and has sand on either side of it, and there, there is a considerable sea ; not certainly such a sea as we have here; but there is no variation of depth on that pier consequent on the sand being moved by gales of wind, and on the shore there are the same indications which you have here and elsewhere where you have a sandy shore.

15,801. It was stated yesterday by a witness that in crossing the Tees Bay he had seen the sea break in 10 fathoms water. Do you consider that break does have any action on the bottom of the sea, and that we may expect the sand to be taken up at that depth, and taken into the harbour ? I do not think so. I have no doubt that in the place you mention waves have been seen to break ; but I am by no means prepared to say that these waves in that depth of water affect the bottom in the way which you infer.

15,802. Then, supposing a refuge harbour to be constructed at Redcar, would you anticipate any fear of that silting up from the stroke of the wave in Tees Bay, which is rather a shallow bay ?—As regards the mere question of silting up in such a depth of water, I certainly should not. I am not aware of the particular plan, or any plan proposed to be carried out there, but on general principles I should say certainly not.

15,803. Very good. To return to the river Wear:

Can you state in round numbers the area of the tidal river?—I am sorry I cannot say, as I have not looked at that report for many years.

15,804. How far up does the tide flow?—About seven miles.

15,805. And the rise of the tide at the pier heads at spring tide is how many feet?—About 15 feet.

15,806. I see it stated in the Admiralty chart that the maximum rise at spring tide is 14 feet 5 inches?—Yes; they rise to the 18-foot mark on the tide gauge.

15,807. Then, assuming it to be the case, the slope of the bed is 2 feet per mile?—Yes.

15,808. Do you propose very much to decrease that slope?—It might be decreased with perfect safety to the amount of 7 or 8 inches per mile.

15,809. Do you think it would be beneficial to the harbour to decrease that slope materially?—I have no doubt of that.

15,810. Is the one cause of bars the rapid stream coming out of rivers meeting the sea?—Not in this case.

15,811. Not in the case of the Wear?—Not in the case of the Wear.

15,812. That is not likely to cause a bar?—Unless the rapid stream brings a great amount of sediment, which in the case of the Wear is not the fact, for the material of which the bar is composed is pure sea sand; there is not a particle of alluvial matter brought down from above lodges on the bar. In point of fact, what is brought down is chiefly deposited in these shipping berths, and that creates a great amount of dredging, which the Commissioners have every year to carry out, to keep the shipping berths clear; but all the upper matters are intercepted before they reach the bar, and the bar, in my opinion, is due entirely to the action of the sea.

15,813. I believe that in the river Wear there is a larger amount of dredging than any other river in Great Britain, except the Clyde?—There has been a great deal of dredging.

15,814. Supposing the proposed piers were made, is there any reason why the same amount of dredging should not maintain and make an amount of channel through the bar?—I do not apprehend that if these piers were erected any dredging would be required at all at the bar.

15,815. But if continued, could you not get five or six feet or a greater depth be obtained?—Certainly. There is no doubt whatever if the refuse materials which, according to my information, are thrown into the river Wear all the way up as far as Durham, were otherwise disposed of, the dredging of the Wear Commissioners would be trifling in the upper part of the harbour, and they could in that case concentrate their works more in the lower part of the harbour, where dredging, no doubt, in conjunction with the works proposed, would maintain a much greater depth.

15,816. The depth between the two piers existing is five and a half feet?—Generally about that; between five and six feet at the inner end.

15,817. Would the foundation of the existing piers bear dredging to double that depth?—I think they would partly; they are founded, with certain protecting works, upon rock, and I believe especial examination was made by Mr. Meik with reference to that point.

15,818. Can you tell us the reason why, in the event of the proposed piers being erected, a channel of 10 feet could not be maintained from the Potatoe Garth out to sea?—I know no engineering difficulty; the reason is only a financial one.

15,819. Would that not enable all light vessels to be brought into the Wear in safety even at low water?—It would. Very few of them draw more than 9 or 10 feet; and with very little flood indeed they could come in.

15,820. Then supposing, again, the sheltering piers constructed, and a channel of 10 feet into a place of safety, dredged and maintained, would the Wear become to that extent a complete harbour of refuge?—It would, most unquestionably.

15,821. And you know no reason why that should not be done, except for want of funds?—No; I know none.

15,822. Can you roughly state the amount of money required to do that?—I cannot roughly, but I can after a little consideration give it in.

15,823. Will you be good enough to furnish such a statement?—I will.

15,824. (*Capt. Sulivan.*) Can you tell me when the north pier as it at present exists was lengthened?—About 15 years ago, I believe.

15,825. Do you know whether the sand, which now comes out to the north pier head, has grown out to the length of the new part, since it was added to?—I have no doubt whatever that it has.

15,826. Where has that sand come from, do you think? Has it travelled along the coast, or come in directly from the sea, or combined?—Well, it would be a combination. I attribute the collection of the sand immediately to the inner part of this north pier, to the sand thrown from the adjoining beach, which is a sandy beach.

15,827. Do you mean that the whole of the sand has come from the north corner of the beach, and diminished there as it has increased here, and that the beach has been accumulating between the rocky point and the north pier?—I do not know, as a matter of fact, that the sand has decreased at Roker Rock; it is very likely it will have diminished; if not I have no doubt that this sand which has accumulated at the north pier is just the result of what I explained before, namely, the superficial action of the waves at and about low water throwing up a quantity of sand, and like all beaches of the sort, it fluctuates in height, sometimes being a little higher, and sometimes a little lower, depending entirely on the waves; but I do not believe that there is any constant growing of that sand.

15,828. If you are right that the sand is not moved outside that depth, are we to consider that when a certain amount of sand has been thrown up inside the accumulation is all over, and there is no more to come in from seaward?—Certainly not from seaward.

15,829. You said that large amounts of sand came in from seaward to form that bar?—No; the bar is a mass of sand which is constantly changing its direction. Sometimes it is further out, and then by the action of the sea it is driven in. It goes, as I said, from the pier head to 500 or 600 feet further out.

15,830. Then do you think a fixed quantity of sand travels to and fro, not increasing by the sand brought in from the sea?—I believe it is very much of that character; in fact if it were not so it must increase. Now the quantity of sand at the mouth of the harbour has not increased much. It is a difficult subject to ascertain with anything like definiteness, because it is a channel; but even if it could be proved that the sand on the foreshore has increased, I am not prepared to say how far that is due to the embayment of the beach at and about the present harbour, in consequence of the extensive dock works immediately to the south, because before those works were formed the entrance to Sunderland Harbour was a far less embayed entrance than at present, and consequently I can conceive perfectly well that sand has accumulated there, and I confess that my own astonishment is that there has not been a more noticeable and a more decided increase of sand in consequence of these works.

15,831. If that has been increased it must be from seaward, I suppose. It cannot be increased from the southward as these groins cut off all communication from the sand travelling from the southward; therefore that sand must have come from seaward. Is that not so?—No, not necessarily. There was, and it cannot be disputed by any one, a very large excavation taken out of the harbour, and deposited in front of it, in order to make the site for the forming of the

SUNDERLAND.

Mr. David Stevenson.

16 Oct. 1858.

Capt. Sulivan.

docks. That has been going on for a considerable number of years; how many I cannot exactly say; but I myself have seen repeatedly in some of my visits here that the sea at high water was working away that matter, and I have no doubt that matter must have lodged in and about the harbour mouth.

15,832. Can you explain how it is that it is covered by clean sand, as on the north beach, which has apparently come in between the groins to the mouth of the harbour, and is now comparatively a clean sandy beach?—The only explanation of that is this, that the sand is sometimes found in considerable quantities between the groins, and sometimes it is drawn out after particular states of sea; and sand between the groins and the north beach is sand which is occasionally washed up, and occasionally drawn back down south of the groins, and constantly shifting in this locality. I do not say that if there was a very heavy north-east gale it might not strike heavily, and wash some sand from one point to another; but the sand found between these points is sand tossed backwards and forwards by the sea. It is all sand moved in shallow water.

15,833. Do you know whether the cliffs are wearing away to the north?—I have never noticed any wearing away in a northerly direction. The rocky cliffs present the appearance of being under the slow action of the sea. To the south there is wearing away, but it is owing to another cause.

15,834. If you are right in your supposition that there is a fixed amount of sand at the bar, and that the sea does not bring in more sand, would not dredging in the channel give an increased depth of water, and so gradually remove and diminish the amount of sand within the piers, if no more were brought in seawards?—The whole of the bay in front of the harbour mouth is sand, and where the channel was dredged away the next heavy sea would fill it up. You may go on dredging and filling, dredging and filling, but how long you will have to work before you will have exhausted the sand I cannot say; but I do not think that could be termed a legitimate engineering.

15,835. If the sand is a fixed quantity, and no more is coming in, and the present piers are extended to the limit you propose, and the channel dredged out, the channel cannot fill up?—If you extend the present old piers a sufficient distance out you will get unquestionably a greater depth of water, but of course such an entrance will be wholly unfit for the purposes of navigation; moreover, the direction of the piers being at right angles to the shore would be very objectionable for the object in view, for the collection of sand, if there is any travelling sand.

15,836. I do not advocate that; I only illustrate your idea. If there is no more sand coming in than this, and this is a fixed amount of sand, it might be an exact calculation to take the piers to that limit, and to dredge out the channel?—Probably I may explain the thing. Supposing, once more, that the Wear was blocked up, and no tidal scour through the beach, you would have a continuous line of sand across the mouth of the Wear, but that saved would not rise higher than the nominal slope of the beach along the coast. That same action holds good at the present time, only with this difference, that through this beach in front of the harbour mouth which the sea is (if I may use the expression) trying to make and maintain, the tidal scour is trying to make and keep open a channel, so that if you dredge in the channel to produce a depth which is not the normal depth, but is something more than that, the consequence will be, that so long as there is sand on the adjoining beach it will come in and fill up the channel.

15,837. Supposing the increased scour which you propose should remove that bar to the depth given, where is the sand to go which it sweeps away?—The sand will be removed from the mouth of the harbour by the tidal current, and some of it will probably be collected inside of the north breakwater, some inside the south breakwater, some will be carried out altogether, but the quantity which has to be removed is so small that it will not be possible to trace its progress to any particular locality.

15,838. If a groin or pier, somewhat in the direction described by Mr. Wilson, were carried to the rock which he spoke of, would not that, if not successful to improve the harbour, be capable of being extended? If it were carried so far, and did not succeed, could not such a pier be carried further, so that any outlay in trying the experiment of the pier as a groin would be so much done towards the harbour if it did not succeed?—As my opinion is that such a plan would be of no earthly use whatever in having any effect upon the bar of that harbour, I conceive that it would be really more than useless to attempt to make it. I cannot, as an engineer, recommend the river Wear trustees to carry out that plan.

15,839. If any additional dredging were carried out to effect an increase of the back water in the upper part of the river, would there not be a stronger tide at the entrance of the harbour at ebb tide?—Not very much.

15,840. Whatever you added one way you would add to the strength of the tide, and make it more difficult for vessels to enter against that tide?—Unquestionably.

15,841. (*Capt. Vetch.*) You have mentioned and put some weight upon securing additional back water by deepening the river; will you state what additional amount of backwater you think you will procure above the present amount?—I cannot state the amount, but suppose in consequence an additional depth of about two or three feet.

15,842. Supposing the tidal water discharged by the river Wear is increased by this improvement which you speak of by dredging and lining by walls, what additional amount of water will you get returned above the amount now returned?—I cannot state that, from recollection. It is, however, stated in the report which I have handed in.

15,843. Do you think it would amount to one per cent.?—I should prefer to refresh my memory. I have not seen the report for seven years. I did not think it would be referred to, otherwise I should have read it previously.

15,844. But supposing it was two per cent., that would only increase the return of the water to the amount of one in 50; do you think that additional scouring power would be of any great benefit?—Well, I can only state my impression at the time when I drew up and made that report, and it was a very strong impression that the effect of the improvements would be so great as to render it a matter of decided importance to carry them out. With respect to the proportion I cannot give it from recollection.

15,845. If you give the proportion we can form an estimate ourselves?—That I shall do in giving in the estimate which has been called for.

15,846. Will you state of which of the two plans you are now speaking, No. 1. or No. 2.?—No. 2.; the large plan.

15,847. When these two arms are extended to the distance we see, there will be, no doubt, a large extent of still water where now there is very considerable commotion; and will not that have this effect, that if it is still water with an on-shore gale, a considerable quantity of sand will be driven in, and being lodged in that large extent of still water will be likely to settle there and silt up?—No; my opinion is that there will not be sand driven by the gales to which you have alluded into the harbour to any such extent as to produce the effect which you apprehend.

15,848. The shore is pretty gradually shelving seawards, and when the sea comes on shore it drives a certain amount of silt before it,—anything which is moveable; and if that silt is driven within a confined place, and where there is repose, that silt will be deposited, and in process of time will gradually accumulate to a considerable extent, will or will it not?—

If the silt is driven in, and comes into still water, as you have put it, unquestionably it will deposit; but then I have stated my opinion that there will be no silt driven in by the sea at the mouth of the proposed harbour, and therefore I do not think that result which you apprehend will follow.

15,849. If there were no out-flowing current from the river entrance now between the two piers, would it silt up like the rest of the shore, and become one continuous shore? I think you stated so?—Yes.

15,850. That being the case, we will presume that the present entrance to the river Wear is due to the amount of the backwater which comes down, and drives a channel through that fore-shore. Is that the case?—It is.

15,851. Then that backwater coming down the present channel is confined until it gets to the pier heads, and is enabled to keep open the access to sea which it does; but suppose that outside of those piers you enclosed a vast extent of still wtaer, would not the silt and sand brought down by the river deposit in still water?—In my opinion nothing is brought down by the river which would be deposited in the channel.

15,852. No silt?—No.

15,853. Then it is not turbid?—There is no river deposit on the bar.

15,854. I did not ask whether there was any river deposit or not; but there is a certain quantity of muddy sediment, which we can all see. If that is discharged into a still basin, will not that basin fill up?—I quite agree with you that would be the case, and that this sediment, to which you allude, discharged into a still basin, would be deposited. Such a deposit, in the case of this proposed new harbour, is very small indeed, and would be deposited towards the north and south piers; but that is not the heavy deposit, but matter which can be carried in suspension by water, and none of it will be deposited in the fair-way.

15,855. The river at present running to the sea drives a certain amount of silt before it, which enables an entrance to be preserved. But if these great piers are constructed outside, and a basin of comparatively still water is produced, will not the current between the piers flow upon one side or the other, and become a comparatively small power to carry silt to sea and out of the basin?—I do not think it will.

15,856. You think that it will leave the stream equally strong and intact across to the entrance of the new harbour?—I do not state that either. There will be a certain diminution in the velocity at the new entrance as compared with that at the present entrance; but at present the ebb tides (though not protected by a pier) go out from the mouth of the present harbour in the direction where the new entrance is to be; and I cannot see, if that is the case at present, that these piers, erected and protecting that stream, that the current would have a greater tendency to flow out on one side or the other. We have in some respects the same thing in the inner part of the harbour at the Potatoe Garth, where there is an open space, but where still the strength of the current maintains the centre of the space. In the centre you have the greatest velocity, and there you have, as a matter of course, the greatest depth. I do not see anything in the outer harbour which would lead to another result.

15,857. I speak of a general principle. If the backwater which escapes through the present pier heads has room to diffuse itself in all directions, that stream, not being confined, loses its velocity, and losing its velocity loses the power of suspension, and those particles suspended will descend to the bottom, and silt up. Is that the case, or is it not?—No. In this particular case the silt must be of that exceedingly fine description as to float in the water. If, on emerging from these north and south pier heads, we are to suppose (as you have supposed) that the direction of the scour will to some extent approach the proposed piers, then any silt held in suspension by that portion of the current will be deposited in and about the back of the south and north piers; but that minute and fine silt will not be deposited in the fair way *opposite* to the north and south piers.

15,858. Supposing the power of the river stream entirely destroyed, would it not deposit?—If there were no stream at all through this basin, and if water containing silt was to be projected into that basin, unquestionably it would deposit.

15,859. A certain amount of silt is maintained by a certain amount of stream. A large amount of stream keeps a variety of matter in suspension; but if the power of the stream is decreased, the power to keep various particles in suspension will cease, and will naturally deposit; so that, in the course of 50 years, say, you may expect to find somewhere a sand bank somewhat in the same state as Howth Harbour near Dublin?—I admit the truth of the general principle as to the capability of a stream carrying silt or other matter, depending upon its velocity; but I cannot agree that in this case the results which you anticipate will follow, because the bar, as I have said before, is dependent wholly on the action of the sea, and not on silt brought down by the river.

15,860. You do not think the sea will drive any sand into the harbour?—I think it will not.

15,861. You do not think the sea has any action, with a strong wave coming on shore, in driving in any sand?—I do not think it will, in that depth of water.

15,862. You do not think there will be any effect whatever?—I do not think sand (so far as my opinion goes) moves in that depth of water in the way we see the sand moving in shallow parts.

15,863. Then you do not believe that, with a fore-shore in 18 feet, a heavy sea will drive any particle of sand on shore?—I do not think that in that depth of water, sand will have constant progressive motion. As I said before, I find, in point of fact, that these sands do not, so far as I am aware, alter in their depth; and until such is proved by actual observation, I am not disposed to admit the progressive action at that depth of the waves.

15,864. You do not believe that under present circumstances sand has moved landwards by the stroke of the sea; but taking into account that you alter the condition of things, and provide still water, and protect it from the lateral motion, will you not then anticipate that a considerable amount of sand will be brought in?—No, decidedly not.

15,865. (*Mr. Coode.*) Have you before you the copy of a plan attached to the report made in April 1858?—Yes.

15,866. The soundings in black figures are by Mr. Calver; those in red by Mr. Meik?—Yes.

15,867. Can you tell us the period of time between the two soundings being taken?—Mr. Calver's soundings were in 1848.

15,868. The chart was in 1848. Are you sure that the soundings at the bar were taken at the same period?—No.

15,869. Can you ascertain, and give us something like the period which elapsed between the two sets of soundings?—Perhaps Mr. Meik will explain.

(*Mr. Meik.*) The black figures were taken by Mr. Calver in 1848; the red figures were taken in the early part of this year by Mr. Stevenson's and my own assistants, under my direction.

(*Mr. Coode.*) Have you taken any soundings since those which are marked in red figures?

(*Mr. Meik.*) A considerable number are taken every month.

Mr. STEVENSON's examination continued.

15,870. (*Mr. Coode.*) Have you ever had borings made on the site of the bar?—I never have. Mr. Meik has had some on the site of the bar; but I have had borings made on the lines shown in plan No. 1.

15,871. Is that the plan shown in red by the document before us?—Yes.

SUNDERLAND.

Mr. David Stevenson.

16 Oct. 1858.

Mr. Coode.

15,872. Will you furnish the Commissioners with the result of those borings?—I can furnish a section and the line of both.

15,873. Do you find hard bottom in any place?—Yes; the bottom is rock, overlaid to the extent of eight and nine feet with sand and gravel at the pier heads, and gradually shoaling up to low-water mark.

15,874. I imagine you mean at the proposed breakwater heads?—Yes; of plan No. 1.

15,875. Do you say that you do not anticipate sand would move in a greater depth of water than 18 feet?—That is my opinion.

15,876. Have you ever seen the transverse section of Plymouth Breakwater?—Yes.

15,877. You are aware of the depth of water at which the long slope terminates?—There is a movement there to the depth of 12 to 13 feet of the rubble work. I am wrong; it is not so much, but 9 or 10 feet.

15,878. Have you seen a transverse section of the breakwater at Cherbourg?—Yes, I have.

15,879. Can you tell the depth in which the long slope terminates in that case?—Something like the same depth below low-water mark.

15,880. Is it 12 or 13 feet below low-water mark?—Yes, I think so.

15,881. If large material be moved to a depth of 12 or 13 feet, how can you reconcile that with your opinion that there is no movement of sand at only 18 feet?—The action of the wave in meeting such a breakwater as that at Plymouth or Cherbourg I conceive to be totally different from the action of the wave breaking in the open sea without meeting any obstacle whatever. And in the case of Plymouth or Cherbourg, where there is a sloping beach of rubble, I can conceive the roll of one wave meeting the other producing a state of matters, as regards the breaking of the wave, totally different from what you have in the open sea. My statement is, that I believe that sand in the open sea, in the depth of 18 feet, has not progressive motion; at all events, it is not ordinarily moved, but in very exceptional cases. My statement in that respect is merely my opinion, but founded upon the fact that I am not aware that at such depths there are such variations after storms as would lead me to conclude that such action is to be met with. That is the way in which I reconcile what I say with the well-known fact of the movement of these rubble stones to a considerable depth of water in these breakwaters.

15,882. Are you aware of observations made upon a natural beach on the coast of Dorset, where shingle has been moved to the extent of eight fathoms depth?—I am aware of that, and I account for it upon a different principle. I cannot conceive that any wave can be created in 8 fathoms in the open sea to move shingle at the bottom. But we know very well (for I have tested it myself) that there are very extraordinary under-currents in the ocean, for which it is impossible to account; yet they still exist, and to a great extent. I may mention one at Cromarty Firth, where an under-current runs at a velocity double that of the surface velocity, and we do not know the transporting power of such deep currents. Now, if we have such under-currents produced by tidal action, it is quite possible in the particular case to which you allude that the shingle may be moved, or it may be moved by some ground-swell or recoil of waves from the shore, but I do not think the movement can be due to the bonâ fide surface wave.

15,883. At any rate, shingle being moved at such a depth shows some movement to have existed?—I believe that in that particular case it has been well ascertained.

15,884. You said that you thought the material brought down by the river Wear was deposited considerably within the pier heads, and that the material immediately within was brought from the sea. Can you tell us the point of division between these two states of things; where the material brought by the river is deposited, and where the material brought in by the sea is deposited?—I took specimens of deposit in all the bays and creeks on the course of the river Wear, and I found that the presence of matter from above was more apparent at the upper portion, and that it gradually decreased in quantity until, I think, about what is called the South Beaching Basin; somewhere about there. I think that was the general result. I cannot state the particulars, as it is a long time since it was done; but at that time it was done for the purpose of ascertaining from where the deposit at different points were derived.

15,885. And the deposit of the river ceased generally about that point?—Yes.

15,886. Of what material is the bank of the Potatoe Garth formed, and also that which is called the Wave Basin?—There is sand thrown up upon it.

15,887. My question was as to the source from which the material was brought?—That is unquestionably sand from the sea; it is not from above.

15,888. Are these banks increasing in quantity?—No, I think not. I do not know any change since I first knew them.

15,889. Are they decreasing?—No. My impression is that they remain very much the same. There is sometimes a little more sand thrown up by the very heavy range to the top of the Potatoe Garth and Wave Basin. But Mr. Meik's evidence will be more valuable than mine upon that point.

15,890. Your answer is given from general observation?—It is given from my own observation, rounded also upon information which I have obtained through inquiries which I have made.

15,891. I hope you will transmit to us your observations on waves, as they will be very valuable to the Commissioners, and to the profession?—I shall do so.

15,892. (*Capt. Washington.*) I will ask you one question, Mr. Stevenson. Is the present entrance to Sunderland Harbour found sufficiently wide?—I think that if the depth of water was greater, and that if the piers, instead of being nearly parallel, diverged from the entrance ——

15,893. Diverged or converged?—Diverged.

15,894. Diverged trumpet fashion?—Yes—there would be no fault to be found with the present width of the present harbour. It is the small depth of water only and the great sea which causes vessels to lose steerage-way at the entrance.

15,895. What is the width of the present entrance?—370 feet, measured at the pier heads.

15,896. What is the width of the proposed entrance?—It is here 800 feet.

15,897. Cannot that be diminished with advantage?—I was going to say that the width of the proposed entrance I should not wish the Commissioners to suppose to be absolutely determined. If we can decrease the width we shall have greater stillness inside, and enable the tidal scour to act with more effect. But this is always to be kept in view, that having two entrances, the inner and outer, and the water in the outside basin not being absolutely still, it was thought an advantage for a vessel leaving the harbour to have a little latitude, therefore it was wished to have it as wide as possible.

15,898. Would you apply that to all refuge harbours?—I should apply it to all refuge harbours; the wider you can have the entrance consistent with the object in view the better; but I have no hesitation in saying that a width of 600 feet ought to be found sufficient.

15,899. Is that opinion formed from your own experience?—Yes; and from the opinion of seafaring men.

15,900. As an engineer, do you consider the width of 600 feet ample?—I should think so.

15,901. You have been shown a design of Hendon Bay; is it yours?—No.

15,902. Do you know whose it is?—It is Mr. Murray's, I believe.

15,903. Have you any idea of the estimate?—I do not know the length of the breakwater; but it must be some very large sum indeed.

15,904. Can you mention any sum?—From the length of the breakwater, and the exposed nature of the site, I think the sum would be very large.

15,905. Do you think it would exceed a million of money?—Speaking roughly, I should not be prepared to say that it could be made for a million of money.

15,906. In the centre of that harbour is there not a dangerous rock called Hendon Rock?—There are several rocks in the bay. The ground is very rocky; but I have never looked at it to detect its merits or defects.

15,907. You are acquainted with Hendon Rock in Sunderland South Bay?—Yes.

15,908. Is it marked by a conspicuous buoy?—No; by a very poor buoy.

15,909. Is it near the south entrance?—It is.

15,910. Are the White Stones marked by a buoy? No, not that I am aware of.

15,911. Do ships going out pass near those rocks?—They must pass very near.

15,912. One is not marked at all, and the other by a not very conspicuous buoy. Do you not think that a small sum of money could be well spent by the Trinity House of Newcastle in placing conspicuous buoys on those rocks?—Yes.

15,913. And you think that for the safety of the coast it ought to be done?—Unquestionably.

15,914. Are you aware whether the dock company are bound to place buoys upon those rocks?—No, I am not aware.

Mr. Thomas Meik recalled.

Mr. T. Meik.

15,915. (*Chairman.*) We took your evidence yesterday, Mr. Meik. Have you any thing you wish to furnish in addition; any statement which you wish to make in addition?—Very little indeed; I do not wish to detain the Commissioners with any further remarks, but merely to corroborate what Mr. Stevenson has said as to the improvement of the entrance and the effect of the proposed works. I quite agree with him as to what he has stated to you just now with regard to the effect of those works.

15,916. Therefore you only wish to corroborate from your experience Mr. Stevenson's statement?—I have been over the whole of the particulars, and minutely considered them, and so far I agree with them.

15,917. (*Mr. Coode.*) Have you a copy of Mr. Stevenson's design, dated April 1858?—Yes.

15,918. The soundings shown in red figures on the chart are taken by yourself, I believe?—They were taken under my direction by Mr. Stevenson's assistant and my own conjointly.

15,919. They were taken early in this year, I believe?—Either in March or April.

15,920. Have you taken any since? I understood you to say that you had?—We generally take soundings over the bar every month.

15,921. Can you state in general terms the changes which have taken place since April 1858?—If you will refer to Mr. Stevenson's reports, and to my observations upon them, you will see what has been the change of the sand banks.

15,922. To what do you refer?—To plan B.

15,923. That was in 1853?—Yes; but it shows generally the progress of the sand banks across the entrance.

15,924. Have you the results, or will your memory serve you sufficiently to state in general terms the changes which have taken place since April 1858. I do not wish you to go into detail?—Since April in this year a different course has been followed with regard to this bar than on any former occasion. The dredger has been down 12 times dredging on the bar sands.

15,925. Since April 1858?—Since the beginning of this year. It is only during the few months of the summer-time that we can go down on the bar. We have often been obliged to leave on account of the sea. We have found great changes on the bar by the dredger being there; but the changes are much the same as in former years. The diagram handed in shows the changes which have taken place.

15,926. Does it show the state of the bar as the wind changes?—It is given in to show the tendency to change.

15,927. As it is dated in 1853, I may ask whether the tendency remains the same?—It still remains the same; I mean that this year it would have been the same if the bar had been left in its natural state.

15,928. I wish to know, irrespective of the dredging operations, whether the tendency to change is the same in 1858 as it was in 1853?—Much the same.

15,929. Can you hand in to the Commissioners the result of any borings made on the site of the bar?—If you will refer to the large book which has been already handed in you will find them.

15,930. If I can find it there, that will suffice.—You will find it there.

15,931. I see a statement of wrecks which have taken place at the port of Sunderland. Within what limits have those wrecks occurred?—Within the limits of the port, which extends along seven miles of shore.

15,932. To what extent do they go northward, and to what extent southward?—They go northward to Souter Point and southward to Ryhope Dean, and perhaps about three miles beyond the extreme southward point of the model. Those are wrecks which came immediately on shore. It is not a correct account of all the wrecks which have happened at sea.

15,933. Nor does it give an account of vessels which have foundered off the point?—No.

15,934. It is simply wrecks which have come on the beach?—Yes; not any that have occurred a great distance off.

15,935. (*Capt. Washington.*) I think you said, Mr. Meik, that you would corroborate all the evidence given by Mr. Stevenson with reference to his proposed work. Do you include that portion of it in which he stated that he saw no difficulty, supposing the proposed sheltering piers were erected, in dredging that channel to 10 feet depth, and maintaining it from the Potatoe Garth to the outer pier head?—I do not think myself there would be any difficulty in keeping that depth open.

15,936. Would it not be the most desirable thing that could be adopted for the traffic of the Wear?—I have given the improvement of the harbour for a long period of years my utmost consideration, and after all the plans which have been suggested I prefer that of Mr. Stevenson to any that I have seen yet.

15,937. Are you aware that the detritus brought by the river is deposited in the berths for shipping?—I know that from my own practical experience. In visiting the dredging machine I have noticed the material which it raises in the harbour, and what is brought inwards. I should not perhaps go so far down as Mr. Stevenson went. I should say a little higher up, at a place called Foley end, where the material from the country ceases, and where it meets the sand from the sea.

15,938. What amount did you say was expended in dredging in the Wear annually?—About 5,000*l.* annually.

15,939. And you think that amount expended would do much towards making and maintaining the ten feet channel we have spoken of?—I think very little expense would maintain that channel between the piers, if it was once opened out.

15,940. May I ask you what those red buoys imply in the model?—They are ballast buoys, which the commissioners are required to put down by Act of Parliament, prohibiting ballast being thrown into the sea.

15,941. Within what depth?—Ten fathoms at low water.

SUNDERLAND.

Mr. T. Meik.

16 Oct. 1858.

Capt. Washington.

15,942. Is that rule enforced ?—It is enforced, but I cannot say that it is altogether prohibited. Every effort is made to prevent the casting of ballast.

15,943. It is not impossible that some ballast cast at sea is washed by the sea into Sunderland bar ?—Not at all. We frequently detect it. I should say that tons of ballast were not only cast at sea but within the harbour, and we cannot prevent it, because there is no power to make a ship report on coming in in ballast. A ship may enter, and get her ballast discharged, without giving any notice, so that it is almost impossible to detect the casting of ballast. I frequently hear of cases, but we can never detect them.

15,944. And the commissioners have to pay heavily for dredging up that ballast ?—Thousands of tons of London ballast have been taken up in Sunderland Harbour every year. I speak from my own experience, from seeing the material which the dredger raises.

15,945. Do you know the rock called Hendon Rock ?—Yes, I do, very well.

15,946. Do you know the rock called the White Stones ?—I know it also.

15,947. Are they marked by proper buoys ?—Hendon Rock is marked by a buoy.

15,948. Is it a conspicuous buoy ?—Not very conspicuous.

15,949. I think the dock company are bound to maintain a buoy or beacon upon that rock ?—They are.

15,950. Do you consider the spar at present placed upon it complies with that obligation ?—From what I hear from the pilots, they do not like that kind of buoy. We had them formerly to indicate the ballast limits ; but have now got iron buoys, which are made so as to float upright.

15,951. And are far more conspicuous ?—They are far more conspicuous.

15,952. And ride equally well ?—Yes, and ride equally well.

15,953. (*Capt. Sulivan.*) Is the Newcastle Trinity House supposed to keep up the buoys on your coast for the money which is paid to them ?—I always understood that the money is paid for the support of old men and women.

15,954. Does their jurisdiction not extend down as far as this port ?—I do not know how far it extends.

15,955. How can their jurisdiction extend for the collection of dues, if there is no obligation to the same extent ?—I know that dues are collected, and nothing is done in the shape of putting down buoys.

15,956. Is there no jurisdiction over colliers in ballast ?—There is no authority, and there is no account kept of them, except one which was kept last year by the Commissioners.

15,957. With respect to the idea of Sunderland being a creek to Newcastle, has Newcastle no jurisdiction over those colliers coming in, and is there no law of any kind to prevent ballast being thrown into the harbour ?—We have got laws to prevent the casting of ballast, but the difficulty is to detect the abuse of the law. The law at present cannot meet it, on account of the Wear commissioners having no record of ships coming in, in ballast. The purpose of these buoys being put down was to prevent the casting of ballast within certain limits, and if persons are detected they may be taken before a magistrate and fined.

15,958. What is the penalty ?—5*l.* to 10*l.*

15,959. Do they strictly enforce it ?—Yes ; but the difficulty is to obtain proof.

15,960. Is there any river police ?—There is a river police, but they are not under the jurisdiction of the Wear commissioners.

15,961. Have those police rewards in every case in which they get a penalty inflicted ?—The Wear commissioners do not pay money as rewards in cases of that sort.

15,962. Do you not think that if the police knew they would get a good reward upon every conviction they would look more sharply after it ?—But then there is the objection of their trumping up cases, and it was the opinion of the commissioners as well as of the magistrates that it was better not to offer rewards.

15,963. In what way would a register enable you to get at the offenders, and control the abuse, if the police do not exercise the power strictly ?—If the commissioners of the Wear had the same power as the commissioners of the Tyne, where every vessel has to report at a ballast office, and receive a warrant stating where the ballast is to be taken out, and men appointed to see these regulations properly carried out, the abuse of casting ballast within the limits of the port would be stopped altogether. There is no power to board a vessel, and see that she has ballast in.

15,964. Has application ever been made to Government or Parliament to meet that difficulty ?—I do not know ; it has been frequently mentioned to the Admiralty that such an abuse is in existence.

15,965. (*Capt. Vetch.*) Captain Sulivan has nearly anticipated the only question I wish to put. I think you said that some 50,000 tons of ballast were deposited in the harbour every year ?—I said thousands of tons. I will not go to the extent of 50,000. I should say thousands.

15,966. Do you think it would be judicious to spend money in these improvements until that notable abuse is set right ?—I believe if the commissioners saw a prospect of the bill being carried out they would go to Parliament, and obtain further powers.

15,967. But the power to prevent ballast being cast could be had at very little expense. It would not be an opposed bill ; it would receive the support of Parliament and the Government. Why has it been delayed so long ?—The commissioners of the Wear are like most public bodies; they are afraid of a parliamentary contest. The expense of getting a bill through Parliament, if it is opposed, amounts to thousands of pounds, and that is what deters them from applying for such powers as Captain Vetch has suggested.

15,968. The opposition would come from the evildoers, would it not ?—Such parties are generally for getting up applications of that kind. They say they are generally done by engineers and lawyers for their own purposes, and are usually blamed.

15,969. (*Mr. Coode.*) Referring again to the wrecks, I see a detailed table of wrecks in 1854. Are the limits which apply to that table the same as apply to your answer to my former question ?—Yes ; as near as possible. I have calculated from the wreck chart within seven miles the number of vessels, and I have compared them with the Admiralty Return of 1854. I cannot insure its correctness to a vessel or two. There are two unknown, and other two doubtful ; but it is pretty correct.

15,970. Are the limits the same ?—Yes ; I did not go out of the limits of the port.

15,971. Have you a copy of a detailed table for 1854, taken from the Admiralty Wreck Register ? I find there the number of wrecks with the wind south of east 36, north of east 7, and it states the proportion of light to laden as being two to one ?—Yes.

15,972. Is it not a fact that the wind south of east causes vessels to come in towards port, and that the wind north of east entirely prevents laden vessels coming in this direction ?—I cannot give an opinion as to vessels sailing to and fro. I do not like going deep into nautical matters.

15,973. I should like to have your answer. Do you believe that laden vessels caught considerably south of this port would in northerly gales attempt to make for this port ?—I do not think it at all likely that they would ever attempt that.

15,974. (*Capt. Sulivan.*) You spoke of the expense of getting an alteration of these laws for the prevention of casting ballast. Do you recollect the Mercantile Marine Act being passed ?—Yes.

15,975. Was any attempt made at the time of the passing of that Act to get a clause inserted, at a comparatively trifling expense, to modify those laws which are thought to bear so heavily upon the commissioners

of the Wear ?—No ; there was no such attempt made.

15,976. (*Capt. Washington.*) Returning to the buoying and beaconing the approaches of the port, which is my special business, is there any other due levied in the shape of anchorage in connexion with the port, and to whom paid ?—There is a fund levied with respect to beacons and buoys, which amounts to 600*l.* a year, and I believe that is levied by the Bishop of Durham.

15,977. Is any part of that sum applied to these purposes ?—None whatever.

15,978. One more question in connexion with refuge harbours. Are all appliances for repairing disabled vessels to be found at Sunderland ?—All, I think, of the most complete kind. We have the best ships' carpenters in the world, and a graving dock, with facilities for docking a large class of vessels.

15,979. To whom are the Commissioners indebted for that beautiful model which I see before me ?—That model was made at the pier by the workmen, assisted by Mr. Lindsay, a carver and gilder in this town.

It does very great credit to all concerned.

SUNDERLAND.

Mr. T. Meik.

16 Oct. 1858.

(*Mr. Meik.*) I am requested by the Wear commissioners to make a statement with regard to their income. The income of the commissioners was last year 20,000*l.*; and I stated that the annual expenses were from 13,000*l.* and 14,000*l.* They generally expend the whole of the balance upon works, and 4,000*l.* or 5,000*l.* were expended last year on extra works, for the improvement of the harbour ; for example, they have removed large rocks, and improved the harbour approach ; they removed a large sandbank situated up the river. These are additional expenses, so that they expend the whole sum, and the whole of the money which they receive goes in one way or another for the improvement of the harbour.

Mr. Young was called.

Mr. Robinson said Mr. Young was merely a contractor to speak to the details of the proposed works.

(*Chairman.*) We will not trouble you, Mr. Young, at present. We shall be always able to call upon you, if necessary, to corroborate Mr. Stevenson's figures.

Mr. Nicholas Wood examined.

Mr. Nicholas Wood.

15,980. (*Chairman.*) You are a resident in this town, and a director of the Sunderland Docks ?—I am.

15,981. You have been present during this inquiry, and are acquainted with its objects ?—Yes.

15,982. Will you now proceed to offer any statement which you wish to make relative to the advantage or necessity of a harbour of refuge for this district of the coast ; or whether, in your opinion, the improvement of the three ports of the Tyne, the Tees, and the Wear would be the best mode of preventing loss of life ?—I have given the subject my very serious consideration, seeing that as a coalowner I ship coals at all the ports in this locality ; on the Tyne, on the Wear, at Seaham, and at Hartlepool. I am also very much interested in the question as a shipowner ; and having given it very serious consideration, I have come to the conclusion that it would be extremely desirable, and I think of more importance than the establishment of any single harbour of refuge, that the existing harbours of these ports should be improved. I think it would be extremely desirable, and would lead to a great saving of life and property, if the harbours of the Tyne and the Wear and Hartlepool were improved. I have listened, of course, with very great attention, to what has been stated with reference to the improvement of the Wear. I am also one of the commissioners of the River Wear, but I am not prepared to offer any evidence upon the subject of the improvement of the harbour. I believe that the commissioners have agreed to leave that in the hands of their engineers, Mr. Stevenson and Mr. Meik ; and from what I have heard of the evidence of Mr. Stevenson, it has been very clear, and, I think, in most respects very decisive, with regard to the improvement of the Wear. Therefore, as far as that goes, I do not propose to offer any evidence, except to say that, looking at the chart of loss of life on this coast, considering the nature of the traffic between the several ports and London and back again, remembering that the vessels are constantly, as it were, spread over the whole of the distance between London and the ports, and that they make a point of always first of all reaching the port from whence they sail,—looking at all these circumstances,—I think that the improvement of the existing harbours would afford a ready entrance, and of course more entrances than one harbour of refuge, and would probably tend more to the saving of life in the aggregate than would the making of only one harbour of refuge on the coast. I do not mean to say that a harbour of refuge would not be extremely useful ; on the contrary, I think that, looking at the matter from a national point of view, it would. At the same time, I should beg to put the improvement of the present harbours almost as a sine quâ non in the settlement of this question. I think that that is the first thing which should be attended to, and the one which will produce most benefit ; but I am by no means of opinion that that would make the coast quite safe. I think there is a great question whether, in addition to the improvement of the existing harbours, it would not be desirable that there should also be a general harbour of refuge ; but I have already stated that I think the improvement of the existing harbours would be attended by a very great saving of life and property. As a dock director, I beg to lay before you a plan which was originally prepared by Mr. Murray, and has since been adopted by his sub-engineer, Mr. Riddell. This plan, in the first place, shows two breakwaters ; one of these is on the north of the entrance of the dock, to protect it from north-east gales. I need hardly state that the north-east gales here are extremely heavy, and that it is very desirable that the entrance to the dock should be protected from them. The directors have, therefore, projected a breakwater about 500 yards long, which is estimated to cost 44,000*l.* They have also projected, or rather proposed for the consideration of the Commissioners, because I should state that the dock company do not by any means intend to (indeed their means are such that they could not) themselves erect these breakwaters,—another breakwater on the south side of the entrance to the dock, to protect it from south-east gales, which, as some of the witnesses have correctly stated, are very prevalent on this coast. These two works the dock company propose to the Commissioners, with a view to the improvement of the entrance to the dock in case of heavy gales. They think that the erection of these works would enable vessels to enter the dock during such gales, and that, in addition, they would afford considerable shelter in the neighbourhood of the entrance, and would be of great advantage to shipping, and would, in the opinion of the directors, lead to the saving of life and property. I scarcely need state that the depth of the entrance to the dock is very considerable. The channel is excavated to a depth of 12 feet below low-water mark. The depth from low-water mark to the outer sill of the dock is 10 feet, and therefore, not being liable to be silted up in any way, that depth of water might very readily be maintained. It is only fair to state that that depth of water does not at present exist. The channel is deepened, as I have mentioned, but in taking away the coffer dams and the clay of which they were constructed the total depth has not been excavated, so that there is at present only about eight feet of water. Of course it only requires a little more dredging to make it 12 feet, which would be done if any works of this kind were undertaken, and that would afford an entrance to vessels in storms with a much greater depth of water than exists in

SUNDERLAND.

Mr. Nicholas Wood.

16 Oct. 1858.

Chairman.

the present entrance to the Wear. If the works which have been proposed by Mr. Stevenson to the Commissioners are carried out, the depth of the entrance to the river would be considerably more; but I beg to observe that in my opinion 80,000*l.* or 90,000*l.* would be well spent in obtaining an additional entrance to the dock, in addition to the works proposed on the Wear. [*The witness handed in the plan for works at the dock outlet.*] I also beg to lay before the Commissioners a plan which was projected by Mr. Murray for a harbour of refuge at Hendon Bay. The dock directors present that to you because it was laid before them by Mr. Murray. Mr. Riddell, the sub-engineer under Mr. Murray, will be able to give you a detailed estimate of the cost of those works, if you wish it. I will only say that they are estimated to cost 800,000*l.*, including the north breakwater, which I have already mentioned. If a harbour of refuge were made in Hendon Bay, the erection of the south breakwater would be unnecessary; but, including the north breakwater, the estimated cost of the works in Hendon Bay is in round numbers 800,000*l.* That includes an area of 800 acres; and if you lay this plan, which I produce, upon the Admiralty chart, you will see the depth of water at different points. With reference to the questions which have been asked by the Commissioners as to the best position on the coast for a harbour of refuge, I should state that, having considered the matter very carefully, I think that Hendon Bay would be a very good place for such a harbour. If you look at the chart of accidents you will find that the great bulk of them have occurred between the Humber and the Tyne. Thus a harbour of refuge in Hendon Bay would be in the middle of the district in which the great majority of accidents have previous to this time occurred. Not being a nautical man, I cannot give you any opinion, and should not wish to put myself forward as giving any evidence of a nautical character. However, from my slight knowledge of nautical affairs, and having considered the question very much with reference to my own ships, I think that this situation would be a very good one for a harbour of refuge, if it is in other respects suitable for the purpose. Flamborough Head and Filey Bay have been mentioned, and it has also been stated by some of the witnesses that a bay is not a proper place for the construction of a harbour of refuge. I think there is a good deal to be said on both sides of that question. There are two things to be accomplished by a harbour of refuge; you are to get in, and you are to get out. What knowledge I have of the subject leads me to think that it would be easier to get into a harbour made in a bay than into one made at a projecting point. For instance, in a north-east gale ships would sometimes have great difficulty in making Flamborough Head, but there would be no difficulty in getting into a harbour of refuge in Hendon Bay. Again, light vessels could make that in a south-east wind, which is one of the most dangerous to light ships. Vessels could make Hendon Bay as easily as any other point on the coast, and certainly very much better than Flamborough Head or Filey Bay. Therefore I think it is a very serious question whether Hendon Bay would not be a very proper place for a harbour of refuge. Shipowners and shipmasters, whom you will afterwards examine, will give you nautical evidence as to how far it is preferable to other places; but I beg to submit that in my opinion it would be a very proper place for such a harbour.

15,983. Will you put in that plan of the works proposed to be erected in Hendon Bay, as evidence? —Yes.

15,984. Then I understand, Mr. Wood, that primarily you would consider the improvement of the three ports we have already named as the most advantageous mode of proceeding?—I do think so.

15,985. Primarily?—Primarily. I think the improvement of those harbours would tend to a very considerable saving of life and property.

15,986. Secondarily, supposing that there were funds, national or otherwise, that could be used for the purpose, you would recommend the construction of a large harbour of refuge on some point of the coast?—I think so.

15,987. Now, under the circumstances of the three ports being improved, would you, in addition, place this harbour of refuge close to one of them?—Well, I place it there because I think that generally a harbour of refuge there would be as efficient as one at any of the other points which I have heard named. I think that, probably, as regards position, there would be no difference between Hendon Bay and Hartlepool, and the decision would probably depend upon the questions at which point the harbour could be more easily formed, and which of the two is more liable to be silted up. At Hendon Bay I think that there would be no liability to silting up. The plan proposes that a current shall pass within the harbour of refuge, and we know that there has been no silting up in Hendon Bay for years and years.

15,988. Then I understand that after the improvement of the three ports you would like a harbour of refuge either in Hendon Bay or at Hartlepool, as might prove most desirable on engineering grounds? —Yes. I do not object to the construction of a harbour of refuge in Filey Bay. On the contrary, that would depend very much upon evidence which I have not before me, and on which I am not prepared to form an opinion. It would depend very much upon the evidence of nautical men as to which position would be best adapted for saving life and property.

15,989. Therefore are you or are you not prepared to state that, always assuming that the improvement of the three ports comes first, the harbour of refuge should be in the immediate vicinity of one of these ports in preference to putting it in the neighbourhood of Flamborough Head?—I am, on the ground that I think it would produce a greater saving of life and property. There is also another reason: It would be of great advantage if in case of war you could have ships close at hand to protect the shipping of these ports.

15,990. (*Sir F. Smith.*) It has been the habit of your life to give every subject deep consideration, and I am quite certain that you have not come to any determination upon this very important question without deep consideration. You are not, I believe, a nautical man?—No, I am not.

15,991. But you are a shipowner?—Yes.

15,992. How long have you been a shipowner?— Well, I commenced being a shipowner a great many years ago, but more recently I have been connected with screw colliers.

15,993. You are also one of the directors of the dock company?—Yes.

15,994. You are well acquainted with Mr. Stevenson's project?—I am.

15,995. Do you, so far as you have considered it, think that that project is calculated to produce the effect he has in view?—I have not gone into it in an engineering point of view. I have not, in fact, gone into it as one of the commissioners. We have arranged that Mr. Stevenson and Mr. Meik should lay this before you, and give their opinion upon their own responsibility. Not having gone into the question, I should not like to take the responsibility of giving an opinion which I have not well considered. I do think, broadly, that, with the depth of water stated by Mr. Stevenson, the works he proposes would lead to a saving of life and property.

15,996. Then what you lay before the Commissioners is not a rival project?—Not at all.

15,997. It is auxiliary?—Auxiliary, so far as regards the south entrance.

15,998. Just so; with reference to the two piers? —With reference to the two piers.

15,998*a*. [*Referring to the plan of proposed works*

at the south outlet of the dock, put in by the witness.] Do you imagine that having these piers detached from the shore will not tend to produce silting within them in any manner?—The object of keeping these breakwaters so that you have a current between them and the shore is to prevent any silting-up within them. A moderately strong current will run between them and the shore, and will prevent any silting-up of sand.

15,999. You think it will have that effect?—I think it will.

16,000. The sand that came round the inner parts would not go into the opening?—We do not find from experience that any sand goes into the inside of the dock entrance. The piers, you will observe, point seaward, and that sends the sand, if there is any, away to sea.

16,001. They point in nearly an opposite direction to the piers of the harbour?—They do.

16,002. You think the old piers of the harbour are wrongly directed?—I think they are, for sending the sand past.

16,003. In fact they invite the sand to enter?—They do, to a certain extent.

16,004. Have you any reason to believe that the amount at which the cost of the harbour of refuge in Hendon Bay is estimated would be sufficient for its construction?—I have looked at it with Mr. Riddell, who is an experienced practical man.

16,005. And he satisfied you?—He satisfied me that the money would be sufficient.

16,006. I presume you have no doubt that along this coast some protection for life and property is needed?—I have no doubt at all that such protection is needed.

16,007. In a national point of view?—In a national point of view.

16,008. In recommending the improvement of the existing harbours, you do not advocate that improvement in a local so much as in a general point of view?—Certainly not; still I think that the local authorities of these harbours would avail themselves of the opportunity of improving them to a certain extent. Even in the case of the Wear there would have to be a deepening of the inner part of the harbour, in order to make it efficient, and the same or similar improvements would probably be required at the other parts. The authorities of each river would no doubt avail themselves of the opportunity to make such alterations; and I think it is of importance, that while you are constructing works which will produce a saving of life and property, you will also add to the commercial prosperity of the places where they are carried out.

16,009. You have no doubt that these ports will do a great deal, independent of Government means?—They have already done a great deal themselves.

16,010. So far they will do a great deal towards saving life in respect of vessels not laden?—They have; but that can only be carried to a certain extent. The great traffic is the coal trade, and we have to contend against rival collieries in the midland districts, the coals from which are conveyed by railway. Unless coals can be shipped cheaply it would be extremely injurious to the prosperity of these ports, and therefore the means of improving the harbours are extremely limited.

16,011. And are becoming more limited every day, in consequence of the increase of traffic by the railway?—In consequence of the competition from different railways.

(*Mr. Lindsay.*) [*Referring to the plan for a harbour of refuge in Hendon Bay, put in by the witness.*] This appears to be the greatest plan which has been brought before us during our inspection of the coast. I want to ask you one or two questions about it.

16,012. Do you know the length of the large outer breakwater?—No, I do not.

16,013. I have been measuring it on the plan, and find that this outer breakwater will be fully two miles in length?—I believe it will be somewhere thereabouts.

16,014. Besides this there is another breakwater just to the north of the pier?—To the north of the pier.

16,015. And that will be close upon 500 yards in length?—About 500 yards.

16,016. There is another stone breakwater to the south, which will be 500 yards in length?—But that south one would not be required if the large one was erected.

16,017. I am now speaking of the one furthest to the south?—That is a very small one.

16,018. Five hundred yards long?—It is principally of timber.

16,019. Well, of stone work your breakwaters would be at least two miles and a half in length?—I believe they are somewhere thereabout.

16,020. Besides wood work, about half a mile in length, so that the proposed breakwaters, with the pier, would be about three miles in length?—About two miles and a half; but if you are to have a general harbour of refuge, to include an area of, say 800 acres, I do not know that there is any situation on the coast where you could get it with a less extent of breakwater; to include so large an area you must have a great extent of breakwater.

16,021. Looking at Hendon Bay, the course of the land appears to be quite straight; there does not appear to be any projecting points in the formation of the land which would offer the usual facilities for the construction of a great harbour of refuge?—I do not know.

16,022. Looking at it on the ordinary charts, and examining it, as I did this morning, with the other Commissioners, I do not find any appearance in the land which would lead me to the conclusion that this Hendon Bay, so called, is a bay, because there are no projecting points of land?—To the southward the land juts out, but not, I think, so much as greatly to aid in shortening the breakwater. That is done on the principle that it should not touch the shore, that there should be a space between the shore and the great breakwater, so that there shall be a free action of the current along the shore in order to prevent any silting up.

16,023. But are you not aware of any other point along the whole of this coast at which the expenditure of an equal amount of money and the construction of the same length of breakwater would give a larger harbour of refuge than it would at this particular site?—My knowledge does not go as far as that. I give evidence as to what I fancy generally would be the result of making a harbour of refuge in Hendon Bay, rather than with reference to a rival one at any other point. Of course, in the course of your labours you will have laid before you other plans of harbours of refuge; but I believe that, so far as Hendon Bay is concerned, the plan which I have produced is something like what would be the result of constructing a harbour of refuge there.

16,024. You said that Mr. Riddell had told you that the cost would be somewhere about 800,000*l*. Now if it was found that the cost would be nearer 2,000,000*l*. would that in any way alter your opinion with reference to the construction of the harbour?—I think it would be fatal to a harbour of refuge in Hendon Bay.

16,025. You think it would be fatal to a harbour of refuge in Hendon Bay?—I think so, indeed. I could not advocate the erection in that bay of a harbour of refuge that would cost two millions of money.

16,026. Looking to the improvement of the existing harbours as the thing which ought first to be done, you would not then consider it desirable to expend, either at Hendon Bay or any other point on the coast, a further sum of two millions in the construction of a harbour of refuge?—I think it would require very serious consideration before two millions of money was spent on such a thing. I think in that case I should go back to the local harbours, and see whether

SUNDERLAND.

Mr. Nicholas Wood.

16 Oct. 1858.

Mr. Lindsay.

they could not by the expenditure of an additional sum of money be made more effective in some way or other.

16,027. Rather than undertake an expenditure of that kind, you would see if the expenditure of a few hundred thousands more on the existing harbours would not tend to make them still more accessible at all times of the tide for ships of all sizes?—I think so. I think it would be very desirable, in the first place, to spend money on the improvement of the present harbours. That would not occupy any very great length of time. Its effect would be seen, and then probably it might be considered whether they could be further improved, or whether it was then desirable to erect a general harbour of refuge. There is no doubt that the improvement of the existing harbours, and making them accessible at all times of tide, would go a very long way in preventing accidents, because if these harbours were made approachable at all times of the tide I do not think you would see so many vessels lost along the coast. They go to seek shelter here and there, wherever they can pick it up, because they know that if they come to the ports they cannot get in; but if the ports were made so that they could have access at all times of the tide I think that, instead of seeking these shelters, and ultimately being driven ashore, they would go at once to the ports to which they belong, and therefore an additional saving of life would accrue, and there would be less loss of ships along the coast, because I take it that a great many of the ships which are lost at Flamborough Head and other points marked on the chart are lost because they cannot get into their own harbours, are necessarily obliged to seek any shelter they can obtain, and so, the gale increasing, are driven on shore, because with a south-east gale, and most of the vessels which are lost are lost in south-east gales, ships could lie along the coast from Flamborough Head to the Tees or to Sunderland or the Tyne, there would be no occasion for these vessels to seek shelter elsewhere.

16,028. I see laid down upon this plan which you have put in [*the plan of the proposed works at the "south outlet" of the dock*] a breakwater close to the north pier of the south entrance?—Yes.

16,029. I see there is also another breakwater of somewhat the same form, but greater in length, laid down not very far from the south pier of the same entrance. Are these works which the dock company had in contemplation to protect the south entrance of their dock?—No; they were not originally intended. The great object of the dock company was to make this an outlet rather than an entrance. It was at one time thought of making two passages, one for entrance and the other for exit; but the means of the dock company are not such as to enable them to undertake any additional works. They have spent a great deal more money than they originally intended. I believe the works are extremely well executed, and they are very efficient. The money has been very well spent, but still, in a commercial point of view, the docks are not paying very well, and therefore the dock company are not in a position to spend any money on these works. This passage is extremely effective as an outlet; large ships of 1,800 tons have loaded in the dock, and gone out; but these works are for the purpose of making it an entrance in case of storms.

16,030. Have the dock directors in contemplation the construction of any breakwater outside this south entrance?—No, they have not.

16,031. They do not, from their experience, think it necessary?—They think it will be very useful, especially for vessels taking the dock in case of storm. We know that there is there a depth of 10 or 12 feet of water; we know that that depth of water will not be diminished, and therefore it is very important that it should be made available in case of storms for the entrance of vessels. It is not a large sum which is required; these two jetties would cost something like 80,000*l.* or 90,000*l.*

16,032. Then from your evidence it appears that the object which the directors had in view in constructing this south passage as an outlet has been completely accomplished?—It has.

16,033. Therefore, if any breakwater was constructed outside, it would be to afford shelter, and to enable ships to take the south entrance when they could not take the north?—It would; and it has been projected for that purpose.

16,034. Then, to a certain extent, it would be a refuge; it would be turning the south entrance into what it is not now, into a harbour,—to a certain extent, of refuge?—It would.

16,035. From your great experience and knowledge of the coast, Mr. Wood, I should like to have your opinion upon one point; that is to say, supposing the Government adopted the views of which you have expressed yourself in favour, that is, the improvement of the existing harbours, do you think it would be advisable to lay it down as a rule that whatever sum the Government devoted to the improvement of any of these harbours the parties interested in that particular place should be called upon to pay an equal sum, or what proportion?—That will be somewhat difficult to arrange. In all these cases the first work projected is the extension of the piers. I do not know whether the Commissioners intend to go beyond erecting or assisting to erect these piers; but a considerable expense must be incurred within the harbours in order to make them efficient. It would be of no use having deep water at the entrance, unless there was deep water to a certain extent within, so that ships could be brought up after they got within the harbour. It would depend very much upon the situation of different ports what amount would have to be expended upon these works in each. I think that, as a general principle, it would be only right that a certain proportion of the expense should be borne by the local authorities, so that the works should be made efficient; but I do not think that it would be possible to fix any definite per-centage, because, as I said before, it would depend very much upon what was to be expended in making the works efficient. That, I presume, would be matter of negotiation, or some other mode of arrangement, between the local authorities and the Commissioners. I think the fixing of any general per-centage would hardly operate fairly towards each particular case.

16,036. The amount which each harbour ought to pay would depend materially upon the peculiar circumstances of the case?—I think it would.

16,037. But in all cases you are of opinion that as the improvement of these harbours would tend materially to improve the trade of the several places, the local authorities ought to subscribe towards the work?—I think, as a general principle, they ought, in proportion to their means; but I think that could hardly be arranged until the whole expense was before the Commissioners, so that they might know what additional expense beyond the erection of the piers was required in order to make the plan complete, because it is quite clear that unless the interior of the harbours is made efficient the erection of piers would be of very little consequence.

16,038. Now then, supposing that the three harbours which you have named were improved so as to admit the class of vessels usually frequenting this coast when laden at all times of the tide, should you then consider it advisable or necessary to have a harbour of refuge further south, say somewhat in the situation of Filey Bay?—I should not like to give any opinion whereabouts the harbours should be, because I have not evidence before me. Government could, however, afford to spend 800,000*l.* to 1,000,000*l.* for so laudable an object as that of saving life and property; and probably it may be advisable that, in addition to the improvement of the harbours, a general harbour should be made; but the safer plan would be to see to what extent the existing harbours would afford protection before spending a very large sum of money.

16,039. Then I understand that the substance of

your evidence is, that for the saving of life and property you would desire to see the three harbours you have named improved, so as to admit vessels at all times of the tide ?—It is.

16,040. And that in your opinion no money ought to be voted for a general harbour of refuge upon this coast until you see what would be the effect of improving the existing harbours ?—If I had to decide the question it would be a very serious consideration with me whether I should spend any money upon a large harbour of refuge until I was satisfied that the object could not be attained by several harbours, because those that have been mentioned are not the only cases along the coast in which improvements may be made in the entrances to different places. It may be that at some other ports the expenditure of a not very large sum may be extremely useful in affording shelter.

16,041. (*Capt. Washington.*) I did not quite understand which three harbours you recommended to be improved ?—The Tyne, the Wear, and I do not very well know how to deal with Hartlepool.

16,042. Was Hartlepool the third you mentioned ?—It was.

16,043. You think that the same facilities afforded at the Tyne and the Wear should be given at Hartlepool ?—I think so. Hartlepool is a place of very considerable trade ; it is a very improving place, and the ironstone which is opening out in Cleveland will tend further to improve it. I think that ships coming to make these harbours should be assured that there is a shelter for them in case of storm.

16,044. Cast your eye upon the diagram of the north-east coast of England hanging on the opposite wall ; do you see a deep embayment ?—Yes.

16,045. And the Tees Bay forms the deepest part of the whole coast ?—It does.

16,046. Do you think that a reason for placing a refuge harbour in such a position ?—I think, keeping in view the saving of life and property, I should put it in the centre, as it were, of the great trade. Tees Bay is at one extremity. That is one reason why I think that Hendon Bay, or somewhere there, being, as it were, in the centre of the great coal traffic, would be more advisable than Tees Bay.

16,047. Just so ; but are not the vessels carrying coal spread along the coast from the Tyne to Flamborough Head ?—They are.

16,048. Is not Tees Bay almost in the centre of that district ?—It is. I do not know whether you mean that with reference to a harbour of refuge, or to the improvement of the Tees port.

16,049. I am speaking of it as a harbour of refuge. You are a dock director ?—I am.

16,050. The south dock contains, I think, 32 acres?—32 acres.

16,051. Do I understand you to say that as an engineering work it has been highly successful ?—Highly successful.

16,052. As successful as any similar work on any other part of the coast of England ?—It has.

16,053. I think the dockgates and drawbridge are both moved by hydraulic pressure ?—By hydraulic pressure.

16,054. And it has the latest engineering facilities ?—The most recent improvements have been adopted, especially in sluicing. The sluices, I think, are extremely efficient. The sluices, being lifted by hydraulic power, are lifted all at once and with very great rapidity, so as to give full effect to the sluicing.

16,055. And it maintains an outlet deep enough for a vessel of 21 feet draught to pass out without difficulty ?—I think that some of the American vessels have drawn more water than that.

16,056. I think that you said you were the owner of some screw colliers ?—Owner and part owner.

16,057. Are screw colliers on the increase or otherwise ?—Well, I think they are not very much on the increase at present.

16,058. So far as your experience goes, are they likely to increase or not ?—I know from experience that they have been extremely useful in carrying coals ; but they require a good deal of management. You must have complete arrangements at both ends to ensure quick passages. Unless they can make their passages very quickly they are not profitable, and consequently they are not generally profitable to persons who are only owners of screw colliers.

16,059. Might extra facilities be given at Sunderland or in the Thames ?—It depends more upon the coal owners, who themselves can give those facilities. That is the case with me, and that probably is the reason why my screw colliers have been more profitable than is generally the case. They cannot be made profitable without the co-operation of the coal owners, and of course they will drive as hard a bargain with the proprietors as they possibly can.

16,060. If screw colliers did increase in number, it would probably tend considerably to lessen the number of wrecks on the coast ?—Well, there certainly would be fewer vessels, and screw colliers might get off the coast when a sailing ship could not ; but all ships trading between London and these ports keep as near the coast as possible, and make their voyages as quick as possible. Screw colliers caught in a gale would require shelter as well as others. Probably there would be a smaller number of ships, because one screw collier does the work of three or four other vessels.

16,061. Are the pilots of the port of Sunderland efficient, and sufficient in number ?—That is not much in my department. I leave such matters to fitting agents, whom we have here ; but I have heard no complaints about the pilots.

16,062. It came before us in evidence yesterday, that the efficiency of the pilots is very much diminished by their not being able to get out in their steam tug at all times of the tide ?—There is no doubt that it is very desirable that they should be able to do so.

16,063. Is there not at all times sufficient depth of water at the south outlet ?—There is a greater depth there than anywhere else.

16,064. Might not a berth be assigned to the steam tug in the tidal basin, so that she might go out at all times of the tide ?—They could be locked out very well.

16,065. No ; without that. Could not the tug float in the south entrance ?—It might. It is a question of arrangement and cost.

16,066. I presume they would have to pay dock dues for that privilege ?—No ; I think the dock directors would deal very liberally in that respect. The lifeboat and some of the cobles have berths in the south entrance without payment.

16,067. It was said by a pilot that they were ready to pay dues, and had paid them, but still the steam tug was obliged to go out, and they could not put pilots on board vessels in bad weather ?—I never heard of an application being made to the directors for that purpose, and I think that if an application were made they would listen to anything which would tend to the saving of life.

16,068. Perhaps you will have it inquired into ?—I will do so.

16,069. (*Capt. Sulivan.*) I suppose, Mr. Wood, that in advocating the improvement of these piers you are taking it for granted that the money laid out will be sure to have the desired effect ?—Certainly.

16,070. Should it not have that effect, a large sum of money, which might make a refuge harbour somewhere else, will have been thrown away ?—I think that the parties concerned, the Government giving money towards the improvement of harbours, and the local authorities risking another sum, would, before they entered upon the works, be very well satisfied that they would answer. There is no mystery in the present day about what will answer and what will not. It is a question of calm and serious consideration.

16,071. Do you know any instance of a tidal river with piers outside remaining a deep-water harbour, or preserving a deep entrance, in consequence of the im-

SUNDERLAND.

Mr. Nicholas Wood.

16 Oct. 1858.

Capt. Sulivan.

provement which has been made in it?—I think that the improvements of which I am cognizant have always held their ground; that is, if a certain amount of improvement has been projected, I think that, speaking generally, it has always been realised. I have known of no failures.

16,072. Should you, with our present knowledge of these matters, consider a harbour constructed to improve the entrance of a tidal river a certain work, or should you regard it in a great measure in the light of an experiment?—I think it is beyond an experiment. I think it is more certain than an experiment, because in the present state of our information we ought to have before us all the elements to enable us to judge whether it would be successful or not. There may be some difference of opinion, but the elements are easily obtained, and I do not think there is much risk in carrying out such a work.

16,073. Do you know any cases in which such works have been constructed at the entrance of tidal rivers which give sufficient data and sufficient experience to make any works of the kind a certainty rather than an experiment?—I think that the works which have been carried out in the Wear are sufficient to enable engineers to judge whether or not further works would have the desired effect. There have been great improvements since I first knew the Wear; and I think that these improvements have been attended with the success which was anticipated when they were projected.

16,074. Do you recollect the piers being lengthened?—Yes.

16,075. Prior to that, what depth of water was there usually on the bar at low water?—I cannot very well say what was the depth, but I know that a great many years ago the largest vessel that could get out of the Wear held only from ten to twelve keels of coals. The river has been successively improved until there is now something like three or four feet of water at low water.

16,076. Then you consider obtaining three or four feet at low water a great result, for what has been done on the Wear?—Oh, certainly, two or three feet of water makes a great deal of difference. There has been a great deal done in the interior of the river in the way of deepening it. I think it is altogether a question of cost.

16,077. But suppose that in the course of 20, 30, or 40 years these works should so far prove a failure that the bars now inside the harbour are again formed at the entrance, will not all the money spent upon them have been entirely thrown away?—No, I think not; I cannot think that money expended in the way in which it is proposed to expend it here would be inefficient. I think that the whole matter rests upon a question of cost, and for several years I have not the least doubt that it would be successful. Whether or not it might ultimately fail is a question. One cannot say, but, so far as my judgment goes, I think it would not be money thrown away, nor do I think it would be an experiment. As I say, the elements are known, and I do not think at this time of day we ought to be unable to judge whether the works would be successful.

16,078. Then are you taking it for granted that works at the mouth of a tidal river can in the present day be determined as to their results by engineers with as much certainty as they can if carried out in bays or other places where harbours of refuge might be made?—No doubt there is more difficulty in deciding what is necessary to be done in a tidal river than in still water; but I think that in the present day engineers could be found who could reduce it almost to a certainty what would be the result of such works.

16,079. You said that the Sunderland docks cost more than was estimated?—They did.

16,080. Can you state roughly the estimate and the cost?—I have not the documents before me.

16,081. But roughly, how much more did they cost than the estimate?—I do not really know; it has been a series of estimates and a series of extensions. The original plan was not to have a south entrance at all; the original plan was only for an entrance from the river; then the south entrance was projected, and then another dock; so that there has been a succession of improvements, and I could hardly state how much of the excess was to be attached to one and how much to another.

16,082. From your experience, do you believe it is generally the case that in large works, such as railroads, docks, or harbours, the result has been that the original estimate has fallen considerably short, generally very far short, of what the actual cost has proved to be?—Taking it generally, I think not. I think that recently the ultimate cost has more nearly approached the estimate than it did formerly. People have more experience and are better able to judge what will be the cost. At the same time I cannot conceal, nor is it necessary that I should do so, that sea works are the most difficult to estimate correctly; but still it is a matter of estimate; it is a matter of a few thousand pounds here or there. I take it that there could be no great difficulty in estimating what these works would cost. For instance, the carrying out of the north pier of the docks is a part of what will be required, and there would be no difficulty in an engineer, having that experience before him, estimating what similar piers would cost carried out at the mouth of the river.

16,083. (*Mr. Coode.*) You seem to think that the engineering operations of the present day are pretty certainly attended with success; will you tell me if the sluicing operations here have been perfectly successful?—So far as they have been required, I think they have.

16,084. Are they still adopted here?—The sluices are still there. We have not had much occasion to use them. There has not been much accumulation of sand; what has accumulated has come from the dock. The total depth excavated was 12 feet, but the clay of the coffer dams has not all been taken up yet. So far as our experience of the sluicing goes, I think it has been extremely successful. A current of water has been produced which would certainly carry away any sand or silt, but of course it cannot remove the clay; and when gentlemen state that the sluicing has not been successful, I take it that they mean with reference to the clay, not with reference to the sand.

16,085. Is dredging now resorted to?—It has been, to clear away the clay; but there is another matter with reference to the sluicing which has not been carried into operation yet. The difficulty of sluicing is that there is not a sufficient margin between the height of the water in the dock and the depth which is required for vessels to give a sufficiently large quantity of sluicing water. When the improvements projected are partly carried out it would be easy to have deeper water in the southern dock, so that we could put the large vessels into that dock when the sluicing power was in operation, and so render it more effectual. At present we have not more than two feet or two feet and a half that we can employ for sluicing. That is one of our great difficulties.

16,086. Do you know whether the most dangerous gales here are those which back round from the south-east to north-east?—I have heard from nautical men that that is often the case; I do not know from my own experience.

16,087. You have heard from nautical men that the gales which do back round are the most dangerous?—I heard so, from one of the pilots. It is not usually the case. When the wind is in that quarter it generally goes westward about.

16,088. But when it goes round by north-east it is generally more dangerous?—It is.

16,089. Would not ships bound south lying along the coast from Flamborough Head be liable to be driven back by that change of wind?—If the change takes place before they get into the ports, I think they would; but I take it they might get the Humber. The wind would be east before it was north-east, and

then I take it they would run to the Humber or other places.

16,090. With the wind east, could vessels weather Flamborough Head ?—With the wind, first south-east, then east, and then north-east, I think they might.

16,091. The effect would be to cause them to be exposed to the gale for a long time ?—It would.

Mr. James Riddell examined.

16,092. (*Chairman.*) You are resident engineer to the Sunderland Dock Company ?—I am.

16,093. You have been present during the statement of Mr. Wood, the chairman ?—I have.

16,094. Will you now make any further statement relative to the dock company which may appear to you desirable, with special reference to the object of their inquiry, that is, the establishment of harbours of refuge ?—I was instructed to sketch a plan. This plan for a harbour of refuge in Hendon Bay, which has been put in by Mr. Wood, is, with some slight alterations, similar to one projected by Mr. Murray two years ago. It consists of a northern breakwater 500 yards long and an outer breakwater 3,900 yards, or thereabouts, in length. Mr. Wood suggested to me that the northern pier and the inside southern breakwater would greatly increase the safety of vessels going into the south entrance of the dock. That is the smaller plan for the works at the south outlet of the dock which has also been put in by Mr. Wood.

16,095. I will first take the larger plan for a great harbour of refuge in Hendon Bay. Have you any detailed estimates and plans to lay before the Commissioners ?—I have no particularly detailed plans, but I can show you a section, and state generally what will be the cost of the work. [*The witness put in a section, and then continued.*] The dock company have a large quarry adjoining the southern end of the dock, whence they took a large quantity of materials for that dock. The cost of stone from that quarry, put upon waggons and ready for deposit, is 1*s.* 4*d.* per ton, or 2*s.* per cubic yard. That is the total cost, including the royalty and every thing which is paid for the stone. The rubble deposit shown in the section would amount to 354 cubic yards per yard forward, which would cost 70*l.* 8*s.* I allow for staging 6*d.* per cubic yard, amounting to 8*l.* 17*s.*, which, together with other items, would bring up the cost to 170*l.* 1*s.* per yard forward, and consequently make the total cost of the 3,900 yards 66,319*l.* 10*s.* The northern breakwater 500 lineal yards, taking that at——

16,096. Will you give the total result, instead of reading the items, and then hand in the statement from which you are reading ?—The total result is 804,672*l.*, without the inner south breakwater, which would not be required if the large one were made.

16,097. What would be the total result, with an upright wall ?—About 1,200,000*l.*, and I should prefer that to the other plan.

16,098. Now, coming back to the two inner breakwaters, and viewing them independently of the large outer breakwater, I see that the area between the points marked A. and B. on the chart is entirely open to winds from east-north-east to east-south-east ; but is not the area enclosed at the entrance of the dock entirely open from north-east to south-east ?—Pretty nearly it is.

16,099. The heaviest and most dangerous gales on this part of the coast are from north-east to south-east, are they not ?—Yes.

16,100. Then this area of about eighty acres, which you propose to enclose, would be of no use at all for refuge purposes in the most dangerous gales which blow on the coast ?—It would be of great assistance in getting ships into dock in ordinary gales. It would protect us from south and north gales.

16,101. These piers would be very advantageous for getting ships into the dock ?—They would enable steamers to take them in more easily.

16,102. But the area enclosed would be of no use whatever for refuge purposes in the most dangerous gales which blow on the coast ?—Not particularly for that. In ordinary kind of gales we could get ships more easily taken in tow by steam-boats.

16,103. (*Mr. Coode.*) The estimate of 804,000*l.* which you have put in refers, I believe, to the outer breakwater only ?—To the outer breakwater and the north breakwater ; not to the south breakwater.

16,104. Of what material is the outer breakwater to be formed ?—Of limestone.

16,105. From whence do you propose to procure it? —From our quarry ; we have a quarry just close.

16,106. How far is that from the south pier ?—It will be about a mile from the present entrance ; but the timber work on the plan runs close into the quarry.

16,107. Will you state how far it is from the south breakwater ?—It is close at the end of it.

16,108. How far from the north breakwater ?—It will be upwards of a mile.

16,109. I think you stated the cost at 1*s.* 4*d.* per ton upon the waggons ?—That is what it costs the company.

16,110. What have you allowed for leading to the north pier, and depositing ?—2*s.* 4*d.* over all.

16,111. Do you propose to construct the outer breakwater by means of staging ?—We propose to do it with craft.

16,112. How much per ton have you allowed for conveying the stone from the quarry to the site of the work ?—I have allowed 2*s.* 4*d.* upon the whole.

16,113. 2*s.* 4*d.* for leading and depositing ?—For leading and depositing.

16,114. Irrespective of the cost of getting the stone ?—Irrespective of getting the stone.

16,115. Would the larger stones I see marked upon the section, six feet by four feet and four feet six inches, be procured from the same quarry ?—They have stones there of ten tons weight.

16,116. Then you apprehend no difficulty in getting a sufficient quantity of that size ?—I think I should not have any difficulty upon such a large quantity of rubble as I should want. I should have to select the blocks.

16,117. I do not quite understand that answer ?—I should have a large quantity of smaller ones to select the large ones from. I should select the pitching stones from the best of the stones.

16,118. I assume they would be selected; but do you apprehend any difficulty in procuring a sufficient quantity of large blocks ?—I should think not.

16,119. Have you had any experience in constructing isolated breakwaters of this kind ?—I have not, so far out to sea as this, but I have had a good deal of experience in taking stones out, in craft.

16,120. Into what depth of water ?—Only 10 or 11 feet.

16,121. At low water ?—At low water.

16,122. In situations at all exposed like this ?—Not so much exposed.

16,123. Then how many months in the year do you think you could work at this outer breakwater ? —It would depend upon the seasons. One would differ from another. Perhaps eight months; but as I got the breakwater formed I should then find shelter.

16,124. Would you find shelter for the craft which were taking the materials from the shore to the site of the breakwater ; would they not be exposed in attempting to reach the site of the works ?—As soon as I got part of the breakwater down it would shelter me.

16,125. It would, perhaps, shelter you from easterly gales; but would not the craft be exposed to gales from the south-east ?—In that case they would go to the dock entrance.

SUNDERLAND.

Mr. J. Riddell.

16 Oct. 1858.

Mr. Coode.

16,126. And the works would necessarily be stopped ?—Yes.

16,127. Have you made any allowance for loss on account of the plant lying idle for part of the year ?—I consider that it would not be so very much idle.

16,128. I think I understood you to say that you could only calculate upon working during eight months ?—Only the craft would be idle. I should still go on quarrying stones and preparing materials.

16,129. But still the conveyance of stone to the work must necessarily be suspended ?—Yes.

16,130. Have you made any allowance for that ?—Of course. I consider that the 2*s.* 4*d.* would cover all those things.

16,131. Would cover all such contingencies ?—Would cover them all, as I have added 10 per cent.

16,132. Where would you propose to ship these stones ?—I should ship them close to the quarry, bringing part by railroad. A railroad starting from the quarry at present goes to the south outlet. On the northern breakwater I might deposit the stones from gearing.

16,133. I see that the slope which you have drawn from the work seaward is, down to a depth of about nine feet below low water, three to one, and below that one to one. Do you believe those slopes would be sufficient for such a purpose ?—I think they would.

16,134. Do you give that answer from previous experience ?—I do.

16,135. Was that experience derived on this coast ?—We form our works, and generally find them stand there.

16,136. What is the greatest depth of water in which you have formed works ?—About seven feet at low water. I consider that the deeper the water the better the stones lie.

16,137. Do you apprehend you would have any very heavy sea here ?—The sea would come upon the slope down to a greater depth than eight or nine feet ; that is the reason I should prefer the upright wall.

16,138. Have you any section of the upright wall ?—I have not.

16,139. Will you furnish one to the Commissioners at your leisure ?—I will.

Mr. Ralph Hudson examined.

Mr. Ralph Hudson.

16,140. (*Chairman.*) Are you resident in Sunderland ?—Yes.

16,141. In what capacity are you connected with the port ?—I am a shipowner and shipbroker.

16,142. For how many years have you been connected with the port in those capacities ?—I was born and have always lived here.

16,143. You are acquainted with the objects of this inquiry ?—I am.

16,144. Have you been present yesterday and to-day ?—Part of both days.

16,145. State any opinion which you have to offer as to the advantage or necessity of a harbour of refuge for this district, and also whether you think that the construction of a single harbour, or the improvement of the three ports of the Tyne, the Tees, and the Wear, would do more to save life and property ?—I wish in my evidence to remark upon two or three points. The first is with reference to the harbours themselves; the second, with reference to the dues to be imposed on ships for them ; and thirdly, I am in a position to give the Commissioners any information they may require with reference to the primage dues, if they wish it, and also with reference to the pilotage service. With reference to harbours of refuge, so far as I am able to form an opinion, I am decidedly in favour of the improvement of several harbours, and I generally concur in the opinions which have been already expressed. Upon that point I do not know that I need say anything more, because I think you have already had sufficient evidence upon it.

(*Chairman.*) Certainly not, if you generally concur with previous witnesses.

(*Witness.*) I think the question of tolls has not been touched upon. The shipowners, as a body, and I, as an individual, are decidedly opposed to any passing toll. I may, first, broadly give the objections that I hold. That is——

The witness was here interrupted by a consultation among the Commissioners, at the conclusion of which the Chairman said,

You will not proceed with the evidence you were going to give us with respect to passing tolls. It will always be competent to the Commissioners at a future period, if they think proper to do so, to call upon you to give that evidence.

(*Witness.*) I do not know that the other matters to which I referred will come any nearer the objects of the Commission than that, and therefore I need not make any observations upon them. I apprehend that the primage and dues paid to the Trinity House of Newcastle are not more connected with it ; but they have incidentally arisen, and I was prepared to give information upon them, if any question was asked.

16,146. Will you now proceed to state to the Commissioners what the primage dues are ?—They are a charge imposed under a very ancient charter in favour of the Trinity Brethren of Newcastle, upon ports, including Whitby and Blyth. The rates are 2*d.* and 2½*d.* per ton for timber, and in proportion for other goods. They are not very regular. The revenue derived from them is never spent on any of the ports from which it is paid. The amount derivable from primage dues, and payable to the Trinity House, from this port alone, I compute to be about 750*l.* a year. I have a return for 1850 which gives about 450*l.*, but since that time it has materially increased, as trade has. They have another due on ships, which averages about 1*s.* 2*d.* per ship, and that produces, I think, 600*l.* a year, making a total of 1,300*l.* a year paid from this place. There is another anchorage toll, I think, which was spoken of to-day, amounting to somewhere about 600*l.* a year, which belongs to the lessee of the Bishop of Durham,—I believe the Earl of Durham is the present lessee,—for which no services whatever are rendered. That is about 600*l.* a year.

16,147. The primage dues are a very ancient duty? I think they are. There were two trials respecting them. I was a witness for both plaintiff and defendant. On these occasions I paid considerable attention to the evidence, and the charters, I think, were granted by the Charleses or Jameses. They have been collected under those charters ever since. They were given in consideration of some "love and affection" which the king bore to the grantees for their endeavours to support some poor brethren.

16,148. Therefore in point of fact it springs from that vested right, which cannot be interfered with without compensation ?—Well, that is in the wisdom of Parliament.

16,149. Which can only be interfered with by the wisdom of Parliament ?—All that I say about them is, that the places by which they are paid have derived no benefit from them.

16,150. With reference to the pilotage service of the port, there was a question raised which you must have noticed. Have you anything to observe to the Commissioners on that point ?—I am a sub-commissioner. Some 10 or 15 years ago, I think, in consequence of a series of representations, a number of sub-commissioners were appointed to manage the pilotage service at this port under the Trinity House of Newcastle. Some three or four years ago, in consequence of some differences of opinion among them, they resigned in a body. Our pilotage service got into very great disorder. There was no person apparently to come forward; and I was solicited, some 12 months afterwards, to be one, to endeavour to carry on the pilotage service as long as it was under their control. I agreed to do so, but in accepting the appointment stated to the deputation which came

over, that in taking the office I merely took it administratively; that is, to carry out the law as it stood; but that I should not be in any way fettered as to my opinion or endeavours to abrogate that present system. And of course I feel myself quite in a position to state what my opinions are; that I think we can decidedly better it. It would be only justice to the port that the shipowners here, or the town generally, should have the control of the pilots.

16,151. (*Mr. Lindsay.*) You say you pay 1,300*l.* every year to Newcastle, and 600*l.* to the Bishop of Durham, for which you have no return?—For which we have no return that I am aware of in any shape or way.

16,152. Are there any other dues to which the inhabitants of Sunderland, including the shipowners, are subjected, and for which they get really no return?—I cannot say there are.

16,153. Nothing in the shape of passing tolls to any harbour in the south?—Passing tolls? Yes; there are a great many of those.

16,154. For which you get no benefit?—For which, in my opinion, we get no benefit.

16,155. What are those tolls, and the nature of them?—From the nature of the imposition I conceive they have been intended to be imposed on merchandise, but it unfortunately happens that the shipowner has to pay.

16,156. They fall on the shipowner?—Virtually.

16,157. What amount is paid out of Sunderland?—I am not prepared to say. I think plenty of duty.

16,158. Cannot you give somewhere about the sum?—I should not like to say, within a few thousands, because I have not the figures.

16,159. Can you speak as to what you pay for harbours on this coast?—I can speak as to the rates of some of them, but not as to the correct amount.

16,160. You do not know the amount which falls on Sunderland?—I should think, altogether, it is between 3,000*l.* and 4,000*l.* a year; but I am merely speaking from impression.

16,161. With regard to the pilotage, are the pilots here under the management of a local board, or are they under the management of the Trinity House of Newcastle?—Under the management of a local board here.

16,162. Have the shipowners, and others interested in the place, any voice in the nomination and selection of pilots?—None whatever.

16,163. Something was said yesterday about Sunderland being a creek of Newcastle. What do you mean by the word creek?—I think it is obtained from those charters of which I have spoken, where Sunderland is denominated a creek of the port of the Tyne. That is in a charter of James I., I think.

16,164. But you have every privilege and every facility with regard to customs which Newcastle possesses?—Precisely so. It is merely with reference to pilotage, and with reference to these dues.

16,165. It merely applies to the tribute of 1,300*l.* a year paid to Newcastle, and to the election of pilots?—And to the election of pilots.

16,166. The election of the sub-commissioners who appoint the pilots?—The nomination of the sub-commissioners who appoint the pilots?

16,167. (*Capt. Sulivan.*) You said this money was paid to Newcastle for the support of old brethren. Do you mean by that, seamen, or masters of the merchant service?—So far as I can understand, old seamen; a certain number of pensioners; but I am not prepared to speak positively. These matters are not much published, and not much known.

16,168. Is a fair proportion of these appointments given to the seamen of this port, in proportion to the sum you pay?—I think the recipients of the pensions must be brethren of the Trinity House. I do not know of any seamen receiving them.

16,169. Not as pensions to old seamen?—No. I think they are elected; but I am rather in the dark about it.

16,170. You cannot say that any seamen or old men among the masters and seamen of this port derive any benefit from these pensions?—I am not aware of any in any place.

16,171. Could you state more explicitly what that 600*l.* a year is paid for to the Bishop of Durham, and how it is paid?—It is levied on vessels through the medium of the Custom House.

16,172. On each vessel?—1*s.* 2*d.*, I think, on each vessel.

16,173. The same as you pay for tolls to Newcastle?—No. The toll to Newcastle commences at 11*d.* and rises to 1*s.* 5*d.*, according to the size; the average is about 1*s.* 2*d.*

16,174. Then the other is about the same amount?—For the average, about the same amount. I am speaking in the rough. I have not the figures before me.

16,175. How are your pilots paid?—Very indifferently.

16,176. But how? By a scale?—By a scale.

16,177. According to the depth of the vessel?—According to depth. 1*s.* 3*d.* a foot in summer, and 1*s* 6*d.* in winter.

16,178. Do they get all, or is any paid to the pilot board of Newcastle?—6*d.* on each ship is presumed to be deducted from the pilot, and paid to the Trinity House of Newcastle.

16,179. Does any portion go to keep up the sub-commissioners of pilots here?—It is intended to go in keeping up the pilot ruler here, but I believe it is never paid, there are so many defaulters among the pilots who have not paid it.

16,180. Is it paid to keep up the sub-commissioners?—No; a pilot ruler; a pilot master. They call him a pilot ruler here.

16,181. The amount, you say, has never been received?—A great many of the pilots are defaulters. They receive the money themselves, and never pay the contribution which their licence specifies they should pay.

16,182. Have you any power over the pilots?—Suspending them.

16,183. To see that they pay this?—There is a power in the Mercantile Marine Act to call upon them to give up their licences, and some men, under some late proceedings, gave them up a few days ago.

16,184. Is it the case that men were suspended here because they took a lead in trying to get a different system of pilotage?—Certainly not.

16,185. The pilot Hendon, who spoke yesterday, states that he was suspended, for going to the Board of Trade?—The Trinity House and the commissioners say he was suspended for not paying the 6*d.* which he agreed to pay. In other words, he was called upon to give up his licence.

16,186. Was he not suspended soon after he had taken some lead in applying to the Board of Trade?—Not that I am aware of. I believe they were called up before the Trinity House on account of it, but what took place I do not know.

16,187. (*Mr. Lindsay.*) I want your opinion on the main question. You said you thought that the improvement of the existing harbours—and when I say the existing harbours you know those to which I refer—that the improvement of the existing harbours would, in your opinion, do more to save life and property than the construction of any one great harbour on any site between Flamborough Head and the Tyne?—I think so.

16,188. You have great experience as a shipowner?—I was going to give a reason; that the majority of ships which these harbours of refuge would be erected for on this coast are of a small description and of a light draft of water, and I think by improving the present harbours, so as to admit them, presuming that it is possible to carry out the views which have been set forth by Mr. Stevenson and others, I think a larger amount of property would be saved than by any harbour of refuge.

16,189. Presuming, then, that the harbours were

SUNDERLAND.

Mr. Ralph Hudson.

16 Oct. 1858.

Mr. Lindsay.

so improved, do you think it would be necessary, looking to the objects in view, to construct a harbour further south, somewhere in the neighbourhood and to the north of Bridlington ?—Referring to the wreck chart, I see the majority of ships are lost immediately off the north parts ; comparatively few are lost to the south. The larger proportion of them, so far as I can make out, are light ships. The laden ships are generally lost in attempting to go up to London, and in running for their different ports of destination, and no harbour of refuge would save them.

16,190. Then, if the existing harbours were improved, is it your opinion that the Government would not be warranted in spending half a million to a million of the public funds, after they had improved the existing harbours, in constructing a harbour of refuge somewhere in the neighbourhood of Filey ? Is that your opinion ?—I have not the money under my control ; but I do not think the advantage to be received would compensate for the amount.

16,191. That is what I mean. You do not think the advantage to be gained would compensate for so large an expenditure of public money ?—I went into it with reference to the wreck chart, and saw that the number of ships which are in a position to be saved are not nearly so many as people are apt to suppose, on this coast.

(*Chairman.*) Before you go, it may be necessary to state, as we stopped you on that point, that if the question of passing dues should again come under our consideration, or should a different decision on the subject be come to in consequence of all the Commissioners being present, then I shall feel it my duty to bring under their consideration, whether, as a matter of courtesy to you, you also may not be permitted to express your opinion.

(*Witness.*) I think it is very important, with reference to the shipowners. Strange views might be brought out.

Mr. Charles Alcock examined.

Mr. Charles Alcock.

16,192. (*Chairman.*) You are chairman of the Shipowners' Society ?—I am.

16,193. How long have you been connected with the society in that capacity ?—About two or three years. I have belonged to the Shipowners' Society for many years, and have been chairman about three years.

16,194. Are you resident in Sunderland ?—I am.

16,195. Give your opinion as to the advantage or necessity of a harbour of refuge for this district of the coast, or whether it will be better to improve the three ports of the Tyne, the Tees, and the Wear, for the purpose of saving life ?—I will. I have paid considerable attention to the subject from having been 15 years at sea, and have taken a good deal of interest in it so far back as 20 years ago. I am entirely of opinion that if the present harbours could be improved they should be so ; but I have some doubt as to how far they can be rendered accessible to ships of all burdens at all times of the tide. We all unanimously agree that they should be improved as much as possible. That is the first question. To the next question, I answer that I am in favour of having one or two or three general harbours of refuge, but I am not in favour of expending any very large sum of money. Certainly, where the saving of life and property is certain, I would not be niggardly with the Government funds, especially when they expend so much in the English Channel and on both sides of the Irish Channel. They have expended a very large sum of money in those places ; and I think our member justly stated, when he put the question, that he would not vote for supplies for different improvements in the channel without some inquiry. I think that was Mr. Hudson's remark before the House of Commons ; and I entirely agree with him, because we have such an immense traffic here that we are entitled to something. If there are large ports to be made in the channel, I think we ought to have some consideration from the Government. Since I gave evidence (I think in August last) before the Select Committee of the House of Commons, I have paid still more attention to the matter, and I think, with all due deference to everything which has been stated, that if one general harbour of refuge is to be placed at any point between Flamborough Head and the Farn Islands, Hendon Bay is the proper site. We have had at least half a dozen meetings here upon the subject, and I have attended them, both as chairman of the shipowners' society and as non-chairman. The first took place before the Committee was appointed, last year, in March 1857, when Mr. Murray laid his plan before a very large meeting of shipowners. It was fully discussed, and they were unanimously of opinion that Hendon Bay was the proper site for a harbour of refuge. We very much approved of Mr. Murray's plan ; but of course, not being engineers, we did not altogether decide upon it. We thought perhaps it might be good, but that some alterations might be made in it. That is the same plan as Mr. Riddell's, except that Mr. Riddell has carried the piers to a larger extent at the north ; he has carried the pier at least a third of a mile round towards the shore. I do not exactly approve of Mr. Riddell's plan. I do not approve of that portion of the breakwater which extends to the north-west from Hendon. I do not approve of the inside southern breakwater. The northern smaller breakwater I very much approve of, because the absence of such a breakwater is the only thing which in my opinion stops the outlet of the southern dock from being made an inlet. It would perfectly shelter the southern outlet for refuge purposes from the north-east. The only question would be, in an engineering point of view, whether the sand would at all go up inside the southern breakwater. I have been at least 36 years about the water here and on the shore, and I am convinced that the sand all sets south, so much so that the groins all fill up on the north side, and they are nearly perfectly free on the south side. I was chairman of the meeting to which I have referred when we were unanimously of opinion that this was the best site. We had Mr. Murray discussing the matter three hours ; his estimate of the cost was 800,000*l*. I afterwards saw him, and begged him to go into further calculations, to see that his estimate was correct. I afterwards saw him, in London, and he told me he was quite sure that the cost would be under a million. Of course that would be subject to revision. I presume that if it did cost a million of money, if Government spends a million or five millions at Dover, it should not be a consideration altogether of money. I think we should be rather above that. I quite agree that every care should be taken of the public funds, but I do not think that one should have all and another none. I mean that the northern ports should be without any Government money, and that southern ports should have it all. I may perhaps be allowed to state, that at the desire of one of the members of the Select Committee of the House of Commons, who stated that he should like to have an opinion as regards Redcar, I went and made a long examination of Redcar, and my opinion, when I wrote to this gentleman, was that it would be an excellent harbour of refuge for local purposes. The rocks which go south are of some importance ; but I do not agree with Mr. Calver, that they are so bad as he made out. I went at great length into the matter, with one or two pilots. We sounded, and there was some capital ground inside the roads ; inside the rocks upon which the breakwater is proposed to be built. A good deal has been said as regards Filey ; but in the Tees bight another thing struck me, because I paid attention to it, and gave considerable time to it. I think there was another plan, which was for running a breakwater from the south side of the Tees ; a rubble wall to shelter an anchorage in the Tees, which could be made a capital local harbour of refuge. The estimate of the Tees conservancy commission for that work was 50,000*l*. That is my

opinion of the Tees bight and of Redcar. I am also of opinion that, if it could be done at a small cost,—I believe Mr. Coode proposed a plan which would cost 300,000*l.*,—the erection of a harbour of refuge at Filey would be of advantage to ships caught there. I should certainly approve of three harbours of refuge; that is, if we could not improve the present harbours sufficiently to give accommodation for refuge purposes. That is my opinion with reference to that part of the matter.

16,196. I think I understand you to say that primarily you would consider it best to improve the three ports?—If we could do so.

16,197. And, secondarily, that a harbour of refuge in the neighbourhood of Flamborough Head,—to the north of Flamborough Head,—would be advantageous for laden ships?—It would be advantageous; I certainly think that. Our ports here being the centre of traffic, and especially Sunderland, a harbour of refuge at Hendon Bay should have the first consideration, unless the Government intend to go on with all at once. There is great necessity, I acknowledge, for a harbour of refuge, not only for the sake of the great number of ships that are lost, but also for those which are knocking about for three or four days with a heavy gale from the south-east, and despairing of being saved. Therefore I see the requirement and necessity of a harbour of refuge down towards Flamborough Head.

16,198. Is it the case that occasionally loaded colliers founder at sea?—Of course when a ship is overpowered she founders at sea. For instance, Mr. Wilson was talking about 34 years ago. I happened to be off here at the time as a boy, and eight or ten vessels went down with all hands. The cries of the drowning men were awful, and have been stamped upon my memory ever since. One was called the *Mackarel*, and eight or ten all went down in the same gale.

16,199. Have you any idea where they went down?—Between here and the Farn Islands.

16,200. Therefore laden colliers which could reach a harbour of refuge at Filey Bay might very probably be saved from foundering?—Of course, if a ship sprung a leak it would be very likely to save her. We have had numerous instances of ships being lost from foundering. From here to Yarmouth Roads the coast is without any refuge at all.

16,201. Have you been at sea for any time yourself?—Fifteen years.

16,202. In what capacity?—Eight years a captain, and seven as a seaman.

16,203. In the coal trade?—Chiefly in the coal trade.

16,204. Did you notice the description which was given of the number of vessels which were sometimes at anchor in Yarmouth Roads?—I did.

16,205. Is that confirmed by your experience?—Upon my word I do not know. I think I have seen 700 or 800 sail; but I did not count them.

16,206. If we had a harbour of refuge at Filey Bay, what do you consider the number of ships which it should be calculated to hold in order to render it useful?—From 200 to 300. I think Mr. Coode's plan is to afford accommodation for 300 or 400 ships. I approve of that plan, having been in Filey Bay several times, and think it is a very likely plan to succeed in saving life and property on that part of the coast.

16,207. Do you know Bridlington Bay?—Well.

16,208. Which side of the head do you prefer for the harbour of refuge?—Certainly the north.

16,209. Is Bridlington Bay good at present as a refuge from north-east winds?—It is an excellent refuge from the north-east.

16,210. In your opinion, then, it would be a pity to spoil it by making it a harbour of refuge, as a former witness said?—I was rather astonished at an observation of that kind, because my impression is, it would be the same as at Hartlepool, which, according to the experience of captains who have much knowledge of it, is growing up. One says that where 40 years ago he found seven fathoms he now finds only seven feet, which is a mighty difference; and another one states that he found five fathoms 40 years ago where he now only finds three. I believe these gentlemen will give evidence here.

16,211. Are you of opinion that Bridlington Bay is subject to the same disadvantage?—I cannot say; but I know the Smithic Sand was liable to shifting a good deal formerly, and it may be so now.

16,212. (*Mr. Lindsay.*) Say it was found out that Hartlepool Bay was not silting up nor likely to silt up, and presuming that Hartlepool Bay afforded in an engineering point of view equal facilities for the construction of a harbour of refuge as Filey Bay, and supposing that the cost was the same, that the area of three fathoms and upwards which could be obtained was the same for that cost, and supposing that it rested between one or other of those points for the construction of a harbour of refuge, and looking to the saving of life, the saving of property, and facilities of commerce for ships trading along this coast, which site would you prefer?—I would prefer Filey, provided Redcar was made into one; if a small auxiliary harbour were made at Redcar.

16,213. Presuming no other harbour made at all, say that nothing else was to be done, but that it was decided that the public money should be expended on one or other of these sites, and presuming that Hartlepool offered the same facilities as Filey; which site would you prefer?—I would take Filey.

16,214. You still take Filey?—Yes.

16,215. The previous witness stated that Sunderland paid 1,300*l.* per annum to Newcastle, and 600*l.* per annum to the Bishop of Durham, for which it receives no return. Is that the case?—I believe that is so, this year; but I have reason to think that in ordinary years it is 1,500*l.* This year we have had only 3 cargoes where we generally have 12. I do not think it is much more than two thirds this year; so that in my opinion it is much more considerable than 1300*l.* Some years ago,—seven or eight,—I got the sum calculated, and it amounted to nearly 1,500*l.*; and before the Royal commissioners who were down on the Shipping Dues Bill they refused, if I recollect right, to give the amount of dues. At any rate what they did give was a perfect farce. They gave 200*l.* or 300*l.* as the annual revenue. As regards the Bishop of Durham, I think the amount of the dues was 800*l.* per annum at that time

16,216. Whatever the sum is, whether it is in the one case 1,300*l.* or 1,500*l.*, and in the other 600*l.* or 800*l.*, do you receive any return? Is Mr. Hudson correct in stating that nothing is received in return for these payments?—I cannot say "nothing," but next to nothing.

16,217. What is the return, then?—I believe our infirmary gets 10*l.* a year. I happen to be on the committee, and I think they get 10*l.* a year.

16,218. Nothing else?—Nothing, to my knowledge. When I was before the committee on the Tees Conservancy Bill, Mr. Stevenson put it to me, whether there was not some old pilot getting 5*l.*, but I could not find him, and so I presume it is not so.

16,219. To your own knowledge, there is nothing but the 10*l.* to the infirmary and the 5*l.* which you heard was paid to an old pilot?—That is it.

16,220. Are there any other ports or persons to which or to whom the people of Sunderland are called upon to pay annually any sort of dues for which they receive no return?—Yes. I presume your question includes the passing tolls.

16,221. Yes?—We pay passing tolls, in the first place, to Tynemouth Low Light; next, to Whitby, Bridlington, Ramsgate, and Dover.

16,222. About how much is paid by Sunderland annually to these different places?—Somewhere about 1,500*l.* a year. I am not exactly conversant with the sum. I have the Tyne account, and there is paid somewhere about 4,000*l.* some odd hundreds.

16,223. What advantage is derived in return for the 4,000*l.* which is now paid?—We derive

SUNDERLAND.

Mr. Charles Alcock.

16 Oct. 1858.

Mr. Lindsay.

no advantage, because, as a practical shipowner, I give my captains special orders not to go into, Ramsgate under any circumstances. Bridlington is very much blocked up. Whitby it is no use talking about. So we pay all these charges, and have nothing in return.

16,224. Why do you give your shipmasters orders not to go into those harbours?—For this reason, that we have had several ships get more harm by going in than they would receive by stopping out in the open sea. We have had several ships run into Ramsgate. I think I had three or four, which have taken the ground, and got considerable damage. I had one about two years ago; she was running into the entrance from the cross tide; the tide running across the mouth of Ramsgate Harbour, she struck the pier, and was very much damaged.

16,225. Is it the case that not one of those parties, or a very small proportion of those, who are made to pay the 4,000*l.* per annum to these ports, ever derive any benefit; not benefit to you as an individual, but are you aware that any of the parties who pay derive any benefit?—I am not speaking as an individual. I am speaking as an individual only as regards my own ships. I have been at a great many meetings here, and have taken a great interest in the subject. I went with Mr. Fenwick and a large deputation of about 30 gentlemen to Mr. Henley on the passing tolls. He promised to take it into consideration, and give us an answer as to what course the Government thought of taking.

16,226. I do not wish to go into the general question; I wish merely to ask, from your position as a shipowner and the chairman of the Shipowners' Society, if those who pay this passing tribute derive any benefit from the 4,000*l.* a year they have to pay?—None whatever.

16,227. We have the particulars. It is not necessary to go into the general question. I wish merely to ask, is it a fact, as regards this port, that for the 1,400*l.* or thereabouts paid to Newcastle, the 600*l.* to the Bishop of Durham, and the 4,000*l.* paid for passing tolls, in all 6,000*l.*, no benefit is derived?—Next to none.

16,228. If that 6,000*l.* a year were capitalized, at the present rate of interest, three per cent., would it not give a sum of 200,000*l.*?—180,000*l.*, I think.

16,229. If they were relieved from the payment of this 6,000*l.* per annum, for which they derive no benefit, would it be the case that they would have a sum of 200,000*l.*, and thus be provided to that extent with the means of constructing the piers which have been proposed for the improvement of their own harbours, and thus do much towards the saving of life and property?—I included the dues paid at Newcastle in the passing tolls, and said the Tyne and us paid 4,000*l.* a year for the passing tolls.

16,230. How much do you pay?—I think it is 1,300*l.* a year.

16,231. To Bridlington, Whitby, and other ports?—Yes. You will see it by the report of the Royal Commissioners.

16,232. You pay, then, 1,300*l.* to those ports, 1,300*l.* to Newcastle, and 600*l.* to the Bishop of Durham; 3,200*l.* or thereabouts in all?—Yes.

16,233. Which, if capitalized, would give 100,000*l.* or thereabouts?—Thereabouts.

16,234. That 100,000*l.* would, if you were not subject to these dues, for which you receive no benefit at all, be at the disposal of the people of Sunderland for the improvement of their harbour so as to save life and property?—Quite right.

16,235. That is your opinion?—That is my opinion.

16,236. (*Capt. Washington.*) Are you well acquainted with the pilotage of the port?—I am.

16,237. Will you be so good as to state anything which you have to submit to the Commissioners on the subject?—The pilotage is in a very unsatisfactory state. Our pilots are so dissatisfied with Newcastle that they are always complaining. My impression is that the men are so much pressed that they act rather hastily; sometimes, by being led to think that they are so obstinately dealt with by the Trinity House, they are put out of the way. For instance, two men, one of whom gave evidence yesterday, came to me as chairman of the shipowners' society, before we went to London. I recommended him to get our members to assist him, and get a representation to the Board of Trade. The great grievance is the taking of the sixpence. Supposing the pilot get 5*s.* for the piloting of a ship, then he pays 6*d.* out of it, just 10 per cent. on the poor man's earnings. Then there are two classes of pilots here; the harbour pilots and the sea-going pilots. The sea-going pilots complain that those who have no licences have the same privilege as those who hold them. Therefore there is a general scene of dissatisfaction among the pilots. Of course our pilots are very respectable men, but they have not that encouragement to go on with their work the same as the pilots on the Tyne have, who are better regulated, by being under the Trinity Board. They are better managed than they are here, where they are left to the sub-commission, which sometimes takes a great deal of notice of them, and sometimes none at all. The sub-commissioners recommend to the commissioners on the Tyne, and there is sometimes a difference of opinion.

16,238. Can you suggest a remedy?—Nothing but having a pilot board here.

16,239. Is the account we have heard of the pilot steam tug being brought out of the tidal basin at the south outlet a matter within your knowledge?—It is only so by a pilot telling me.

16,240. No complaint came to you?—No complaint came to me.

16,241. Do you consider there would be any difficulty in getting it remedied?—None at all. I think the dock directors would remedy it. The difficulty, I presume, is about opening the dock gates. I do not suppose the steamboat would lie in the channel outside the lock.

16,242. The pilot stated that it would?—I think the pilots are wrong. I think it is the outer basin of which the gates are shut. I think so; but the pilot is here. I am fully convinced that it is this basin. There are two gates; the outer gate is often, in a half gale of wind, kept shut. Of course when the outer gate is open, in fine weather, they could go out and in at any time. I do not speak from personal knowledge of the thing; but I think that is the difficulty, about our going out in bad weather, because the gates here are so large. I explained before a Committee of the House of Commons that I thought they were large enough to take a frigate. When I came home I found they were exactly the dimensions I gave, somewhere about 200 feet long and 60 broad.

16,243. (*Capt. Sulivan.*) Explain how the pilot boats and steamers are paid. Who pays them?—They have to take their own cobles or the steamer.

16,244. Paying for them out of their receipts?—Yes.

16,245. If they are cruising off Flamborough Head, who provides the vessel for the cruising?—They cruise in their own cobles. These are fine vessels; very light and easy to manage.

16,246. They get no vessels provided by the Trinity House of Newcastle?—No; the Trinity House completely neglects them.

16,247. If they were placed under a board here, could they be provided with everything necessary, and could the expenses of the establishment, which would be required for their superintendence, be paid out of the pilotage receipts?—I should think that the receipts would be much increased.

16,248. I suppose you mean that the receipts would be increased by their having better means of reaching vessels at sea?—Yes; and by giving the men more encouragement.

16,249. Do you think that would all be provided, or would it still have to come out of their receipts?—That would be a question. With the men more

organized, and more on the look-out, I, as a shipowner, would rather pay them better. I think the men are under paid. I think they are not well paid, especially in any large class vessels.

16,250. Did you understand the pilot to mean that it was the steamers which they were not allowed to keep in the south dock ?—I understood the steamer.

16,251. Because I understood it was a boat ?—The pilot cobles lie in the outer entrance. They will lie safely, because they draw only from a foot to nine inches of water. They are of a very small draught of water. The steamer is quite a different thing, and will draw about four feet.

16,252. Referring to Ramsgate and other tolls, is it the case that vessels which cannot possibly enter these harbours, even when in danger, and at high water, have still to pay the toll ?—They have always to pay the toll.

16,253. Although the harbours will not receive them ?—Though the harbours will not receive them.

16,254. Yet they have to pay ?—Yes.

16,255. Is there not some alteration in these dues; are they not to be done away with, or has not some change taken place rather recently respecting Ramsgate ?—I believe it was understood that the Admiralty agreed to take off the charges on ships passing Dover; but with regard to Ramsgate, Bridlington, and Whitby nothing has been done.

16,256. (*Chairman.*) Nothing has been done ?—Nothing has been done.

16,257. (*Mr. Coode.*) You said you had been knocked about upon the coast for two or three days, in despair of being saved. Where was it ?—Off Flamborough Head.

16,258. Did you sail in a coal laden vessel ?—I was in a coal-laden vessel nine-tenths of the year.

16,259. Bound to the southward or northward ?—To the south.

16,260. Then for two or three days you were prevented from getting to the south, and were in considerable danger ?—For three or four days.

16,261. Could you have reached a harbour if there had been one in Filey Bay ?—We were reaching into Filey Bay nearly the whole time; I think half a dozen or a dozen times.

Mr. GEORGE SPARKE examined.

16,262. (*Chairman.*) You are resident in Sunderland ?—I am.

16,263. A shipowner ?—I am.

16,264. Have you been a seafaring man ?—I have been at sea, and connected with the sea, all my life.

16,265. Did you command a vessel for any time ?—For 22 years.

16,266. In what trade ?—In the Baltic, coasting, and Archangel trades.

16,267. How many voyages have you made to the Baltic ?—Generally two in the year; but I think I have been more than 20 voyages.

16,268. Have you been present in the course of this inquiry ?—I have.

16,269. Then you are aware that there is a question between Wick and Peterhead, as to which would be most advantageous as a harbour of refuge for ships in the Baltic trade coming home late in the year. If you have any opinion to offer, give it to the Commissioners ?—Peterhead is the nearest point; but you have the Moray Firth open. About Wick I cannot say much; I do not know much of it. I have no personal knowledge of Wick.

16,270. You have no personal knowledge, and therefore you decline giving an opinion on the subject ?—I decline to give an opinion on Wick.

16,271. How far north have you ever made the land in coming home from the Baltic ?—Generally by the Farn Islands; sometimes St. Abb's Head; sometimes the May Light, or the Firth of Forth; seldom to the northward of the Bell Rock.

16,272. Do you think a harbour of refuge in this district would be of great advantage ?—I think a general harbour of refuge would be very serviceable, for the saving of life and property, on this coast, between Flamborough Head and the Farn Islands. Ships are frequently caught in very heavy weather, and have great difficulties to contend with upon this coast, which is a very dangerous coast.

16,273. Where would you put such a harbour ?—The Commissioners will decide upon that point; there has been a great deal of evidence given. For my own part, it is natural to place it close to your own door, and I give my opinion for Hendon Bay. I have seen a good deal of what has taken place. I live very near to the southern part of the bay, and I have seen some disastrous shipwrecks take place in it; one particularly, in the early part of January 1837. There was one vessel came in, and coming through the broken water I think she must have canted her ballast. She came in upon her broadside, and ran quite up against the banks. We on shore all thought that every soul on board had perished; but, to our great astonishment, the men came up the banks. The gale was on a Sunday. The next day, on a Monday, there was a steamer off here. She had been off here two or three days. This steamer came within the White Stone and within Hendon Rock, and took the southern entrance, being the only ship taking the southern entrance in a gale of wind. She came in very light without receiving damage. Steamers are very awkward ships to take in a narrow channel.

16,274. Then would you prefer one large harbour at Hendon Bay to the improvement of the three ports of the Tyne, the Tees, and the Wear ?—I quite agree with the evidence given, that the three harbours should be improved, as well as the general harbour constructed; but I think that the general harbour would be a great national benefit.

16,275. Supposing that both cannot be done, which of the two plans would you prefer ?—The improvement of the harbours.

16,276. (*Mr. Lindsay.*) Did you hear the question I put to Mr. Alcock, as to his opinion, supposing the matter rested between Filey Bay and Hartlepool ? What is your opinion upon that point ?—I should prefer Filey Bay. In Filey Bay there is an inlet, but no outlet in an easterly wind, and you would be obliged to turn out. If you had a harbour upon the line of coast you could either go to the northward or to the southward. You could get out of a harbour in Hendon Bay, and if the wind was east and by north you could go to the southward; but if you get deep in Tees Bay, with the wind east-north-east, and want to go to the southward, you cannot get clear of Whitby.

16,277. All points considered, to which should you give the preference ?—If one were made in Filey Bay it would be a great benefit to the loaded ships, which are frequently caught by the wind from south-south-west to south-west.

16,278. All things considered, which site would you prefer, if it rested between these two ?—Hendon Bay.

16,279. Say it rested between Filey Bay and Hartlepool, to which site should you then give the preference ?—Filey Bay.

(*Witness.*) I should like to make some statement about the pilots.

(*Chairman.*) Make it.

(*Witness.*) The pilots are here exposed in these gales of wind, in these small boats, which endanger their lives very much. Men are frequently lost in these boats. Two or three have been lost, I believe, within a very short period. The dues go to the Trinity House of Newcastle; and it would be much better if the 6*d.* a ship, which is collected by that corporation, went to constitute a fund for providing cutters or steamers for these people to go out in. They would then be more secure of their lives. At present, they are far too much exposed in their small boats or cobles. The cobles are very small things to

SUNDERLAND.

Mr. G. Sparke.

16 Oct. 1858.

drift about in the very hard gales in which they are frequently caught.

16,280. (*Chairman.*) Have any cases occurred in which they have been blown off the coast altogether, and never heard of?—Yes. It is a great shame that these men are not better provided for; and if the ruling of the pilot board was conducted at this port I believe the pilots would be better managed, and better contented.

16,281. Would it be in your power to furnish the Commissioners with a return for any number of years showing the number of pilots lost?—I dare say it could be got.

16,282. Will you, at your convenience, send it to the secretary?—Mr. Brown, the secretary of the shipowners' society, will do it.

16,283. (*Capt. Washington.*) Have any pilots been lost recently?—I believe about three weeks ago two were lost, and never heard of.

16,284. Blown off the shore?—Blown off the shore.

16,285. (*Capt. Sulivan.*) Do the pilots get anything, in the shape of pension, from the Trinity House in return for the 6*d.* they pay?—None.

16,286. No provision for them when worn out?—No provision. The 6*d.* was intended to be so, but they do not get anything of it. I happen to be one of the sub-commissioners who resigned their offices as sub-commissioners when the pilot master was appointed here, and when the 6*d.* a ship was levied on the pilots. All the 21 gentlemen who constituted the board resigned.

16,287. Could you tell me, roughly, about how many ships enter and leave the port which take in pilots in the course of a year?—I cannot speak for that.

16,288. Can you get it?—Yes, I can.

16,289. The colliers, I suppose, rarely take pilots?—Most of them do.

16,290. Do men accustomed to the port take pilots?—Yes; they very generally take pilots. I should say there are very few instances in which ships come in without pilots.

Mr. James Anderson examined.

Mr. J. Anderson.

16,291. (*Chairman.*) You are a shipowner?—Yes.

16,292. How long have you been connected with the port in that capacity?—About 18 years.

16,293. Prior to that did you follow the sea?—Yes; I was captain of a ship.

16,294. How many years?—About 23 years.

16,295. In what trade chiefly?—I was in the Baltic, but was principally, however, in the coasting trade. I was a good deal in the Baltic and in the North American.

16,296. How many voyages have you made from the Baltic?—I cannot exactly say; between 20 and 30.

16,297. And how many north-about?—A few times; not many.

16,298. You never went north-about from the Baltic?—Not from the Baltic, but to and from America.

16,299. Have you ever made the voyage to Archangel?—Yes.

16,300. How many times?—Once.

16,301. You are aware of the question as to a harbour of refuge on the coast of Scotland between the Firth of Forth and the Pentland Firth, and that two sites, Wick and Peterhead, have been mentioned for this harbour. Give your opinion which would be the most eligible?—I think I should prefer Wick. I know it, and have been in Sinclair Bay; I think I should prefer it.

16,302. Will you state your reasons?—I think I can. Peterhead is situated on a promontory. If a ship clears it with a wind from north-east she can then make the firth if bound south. If the wind is from the south-east, clearing Peterhead, she can run to the Moray Firth. The Caithness coast, on the other hand, is a dead lee shore, and ships running to the Pentland Firth will find themselves often embayed, and Wick, if a safe place as a harbour of refuge, would be very advantageous to them. There is also a large number of fishermen always about there, and looking upon their lives as valuable as those of others. I think that a harbour in this situation would be valuable to the fishermen, as well as to a great number of small vessels which trade to Wick. I was in the Orkneys not long ago when a large vessel with 13 or 14 hands came on shore, and all the crew were drowned. I apprehend that if there had been a harbour of refuge at Wick she might have made a bolder course with the other side of the firth, and probably have saved herself.

16,303. Would a harbour of refuge at Wick be of much use to the Baltic trade?—Very little, except to ships bound north about, going to the west side of the island, because I never made the land, that I recollect, to the northward of Tynemouth.

16,304. As a general rule, you do not think that a harbour of refuge on the north coast of Scotland is much needed for the Baltic trade to and from the east coast of England?—That far north, it would, according to my opinion, be useless.

16,305. Should you describe the coast of Scotland from the Firth of Forth to the Pentland Firth as being the district in which this harbour of refuge would be placed?—My own idea is that a harbour of refuge would not be called for on account of the Baltic ships; they do occasionally get to the north, but not frequently; and I think my experience is rather that ships are now of a very superior class and character to what they were, and we can make passages much better than I ever recollect making before. I never recollect making the land to the north of Tynemouth. I have had some bad passages from the Baltic, but I have always had a decent sort of a ship to make them in.

16,306. Therefore for the Baltic trade from the east coast of England a harbour of refuge is not wanted in that district?—I think not, for the Baltic trade. For the general trade it may be very useful. I believe in the neighbourhood of Wick it would be.

16,307. For the Baltic trade, going north-about, you are of opinion that a harbour of refuge would be very useful?—The same would apply to the Baltic ships there as to the general trade. They would make the land somewhere about the opening of the firth. There is another idea: Ships coming from America through the Pentland Firth when they come in from the sea with large deck loads, and not quite so manageable as in general, come through the Pentland Firth, make a way half way across the Moray Firth towards Peterhead. If southerly gales come on they are in a very awkward position. A harbour at Wick would be very advantageous for such a ship or ships to bear up to. It is always desirable to have a harbour of refuge to leeward, and southerly winds prevail very much on that coast, and a great deal of damage is done.

16,308. With reference to this district, what is your opinion?—I have been here, and heard the whole evidence. My opinion is that it is most desirable that we should improve the three harbours to which reference has been made. I have been associated with this place for a long time, was born in it, and have known it from childhood, have been about the water, and have been cognizant of a great amount of damage continually done in the harbours. An immense amount of money is paid by insurance societies solely for damage done on and about the piers. It is most desirable that the harbours should be improved to the greatest possible extent. But the question with regard to the harbours is more a question of property than of life. It is only occasionally that we hear of a loss of life in connexion with ships which

are stranded on or about our harbour; only occasionally.

16,309. But are there cases in which loaded ships founder at sea?—Yes, many.

16,310. Do you think that these cases would not be provided for by a harbour to be established at Flamborough Head?—I think not, generally.

16,311. Supposing it was decided to put a harbour at Flamborough Head, on which side would you place it?—It is of no use on the south side, which has a shelter for light vessels from the north wind, and is naturally protected by the Smithic Sand. I show little favour to a harbour in Filey Bay either, for one reason; I take it for granted that the worst weather is when the winds are south-south-east coming round to east, continuing to blow very hard for a few days in that direction, and then frequently going to north-east. In constructing a harbour to shelter loaded vessels from south-east gales I think it would be unwise to erect it at a very windward point where ships could not get. The further it is to leeward the better, bearing in mind that the distance from Flamborough Head to the Tees or Sunderland is not very great; and then it is much easier for a ship to run back 10 miles than for another to beat to windward a quarter of a mile in the gales of wind from which you want to protect ships.

16,312. How does the question apply to fleets of ships which leave these ports with a fair wind, and get a certain part of the voyage, and then are met by the wind coming upon them from the south? How do you view that?—It depends upon the position in which they are taken. One ship would leave Sunderland, and be caught above Hartlepool; another might get further; another further; another might get to the south of the head, and calculate upon soon getting into the Humber. I have seen a considerable number of ships in the neighbourhood of Flamborough Head, and a considerable number lying a long way to the north at the same time.

16,313. As a general rule, do not the ships leave with a slant of wind?—Very generally; but I have seen them go out with southward winds and bad weather. We are not very nice about putting ships to sea here.

16,314. When they come out with a slant of wind, how far does it take them?—They may not get far, reaching out and reaching in, but always making the same place. I think I have reasons which are good in my judgment for saying that if any general harbour of refuge were made I would have it somewhere on the Durham coast. The principal reason I have already given, that it is on the lee side of the bay, taking the whole of that coast, and that it is very easy to run a few miles to leeward. My experience on this coast is that it comes on to blow from the southward; you put the ship under shortened sail; you often have to lay-to during the night, and when day breaks next morning you find you have drifted in sight of the Durham coast.

16,315. Which is the easier coast to make, Durham or Yorkshire?—As to that, we that are acquainted with them find no difficulty. I think there are few better coasts to make than the Yorkshire coast; it is so undulated and lofty, it is not difficult to make. The only difficulty is that it comes over foggy in bad weather, so that it is not so easy then to make as the Durham coast.

16,316. In foggy weather, if you found yourself off the coast, with the wind on the shore, which would you prefer, Durham or Yorkshire, for the saving of life and property?—I know no place along the shore that I would sooner go to save my life than to Hendon Bay. I have known it since I was a child, have known many ships on shore, and never knew any one lose his life. It is naturally sheltered by the rocks laid outside. I heard it yesterday called a rocky shore, but I do not know that it is. I think it is a sandy beech. From being a boy I have ever heard the maxim, that if ever we were caught on this coast we should run for Hendon Mill, and that maxim has been generally acted upon.

16,317. Taking the coast from the Tees to the Tyne, and south to the head, taking the coast generally, on which part of it would there be the best chance of saving life and property, if taken with a gale of wind dead on shore?—The whole of the Yorkshire coast is what we call rock-bound. Going on shore is inevitable death. The ships go to pieces. There are only one or two places, like the neighbourhood of Filey Brigg and a little south of Scarborough, where there is a beach; only one or two isolated places where there is any prospect of saving life at all.

16,318. I presume if a ship finds herself on the Yorkshire coast with apparently a heavy gale blowing on shore she immediately stretches north to the Durham coast?—That would depend entirely upon her position and the state of the wind.

16,319. Giving you the wind dead on shore,—a gale of wind blowing dead on shore upon the Yorkshire coast,—what would be the most prudent course to pursue?—With a loaded ship and the wind at east, I would give her a chance of going south; but with a light ship I should go north. With the wind at east the ship will lie north-north-east. She might not go to Sunderland, but I should expect her to do so. If the weather got any worse the ships would all get to the Durham coast. With light ships it is generally so, because we have very few ships that go ashore on the Yorkshire coast. I have known instances, but those have been ships caught hugging the land too much aboard. Generally speaking, in coming down with south-east winds, if the wind is at all inclined to get westerly a captain hauls the ship out from the head, and invariably finds a good offing, and is in a position to bear for any point which he thinks most advisable. With regard to laden ships, it has struck me, as I heard the evidence concerning this harbour, that though I do not wish to say a word against the improvement of a harbour, I should be strongly of opinion that it does not meet our requirements. We have coal ships drawing 15 or 16 feet of water, and taking the most favourable view which I can of the contemplated improvements, I should not like to see one of those ships, if she were mine, come into the harbour, because I should calculate on having the cargo to discharge to put her into dock, and to expend 500*l.* or 600*l.* The chance probably is that she would strike in coming in. Hence I think for laden ships we require something more than can be fairly calculated upon, from all I have heard as to the plans we have before us, for the improvement of the Wear. I doubt, too, whether the improvement of the Tyne will give a result according to the calculations. I do not think we should be able to take advantage of that, or even look at the Tyne or the Tees. I do not think these are places for a ship drawing 15 or 16 feet of water to take in a gale of wind. I think a harbour of refuge is required for the safety of those vessels, and more especially for the safety of the lives of their crews, for there is no doubt that the seamen who are drowned are generally drowned in laden ships, which I believe mainly founder at sea from this fact. Seamen and masters who wish to take care of the property intrusted to them get away from the land, as there is no use coming to it, because there is no harbour to go to. I agree with what Mr. Alcock said about ordering captains not to go near certain places. If ships go to Hartlepool they only go to be lost. Owing to ships so keeping out they keep to sea, and if their companies are bad, or the ship should spring a leak, which frequently happens, they lose ships and lives. This year I had a vessel in the Firth of Forth driven back a considerable distance from the south. There were 250 sail in the firth all driven from off the Yorkshire coast. Many received a great deal of damage on their passage to the north, and many others were greatly damaged in the firth. Several lost their anchors. One of mine lost her anchor, and had to pay for salvage, and to run the ship further up the firth into a place of safety. Some provision, I think, is wanted for such emergencies as these. I am afraid, myself, that the contemplated improvements in the

SUNDERLAND.

Mr. J. Anderson.

16 Oct. 1858.

Chairman.

harbours will not meet the case of those vessels which draw 15 or 16 feet of water. Indeed I am satisfied that they cannot make a channel wide enough for the ships to steer. The ships will yaw, and they will go on to shallow ground, injure themselves, and have to be repaired at considerable cost. This, in my opinion, with the lives of men at present drowned in laden ships, demands from the Government the provision of an efficient harbour of refuge for the safety of those employed upon this coast.

16,320. Therefore your opinion is that the improvement of the three harbours would not meet the exigency, and that the single harbour should be somewhere down in this vicinity?—Yes. In considering the question slightly, there seems a great many thousand vessels, 40,000, 60,000, or 100,000, sailing out of port from the Wear and northwards, making altogether a very large number of ships, and I have an impression that it is simple reason and good judgment to make the harbour of refuge in the vicinity of these ships, and not to put it at Flamborough Head, their arrival off which is problematical, but rather where we know they are, at Shields or the mouth of the Wear and Tees. If they get a little to the southward, and the wind is from the north and east, so that they may carry double-reefed topsails or close-reefed sails, they may go to the southward. We want ships to make voyages, and captains with nerve and experience, and a good ship will always aim at doing that; but there are many cases in which a harbour of refuge is an absolute necessity. Tremendous storms take place in which the best ships, with the best canvass, must fail; and I think such a harbour should be made in this neighbourhood, in which great trade is carried on.

16,321. (*Capt. Sulivan.*) Perhaps you are aware that besides choosing the best place for a harbour to be made, it is necessary that some natural formation of the coast should assist, in order to overcome the expense and certain engineering difficulties?—I assume it is; but I am not an engineer.

16,322. Supposing it was found that only two places give those engineering facilities, and that they were Hartlepool and Filey, which should you prefer for laden vessels bound south?—Hartlepool, because a ship could run back 12 miles easier than she could 100 yards to windward.

16,323. Do you know Hartlepool?—Yes.

16,324. Are you satisfied there is no reduction in the depth of Hartlepool Bay?—I am satisfied there is a reduction.

16,325. Would you consider that a great drawback against making a harbour of refuge?—Certainly. I should wish to remark, before I go, that I am very strongly of opinion that Hendon Bay is one of the most preferable places for a harbour that I know of, having regard to the question of natural formation and facilities for the making of a harbour. Taking the whole coast, I think it is very favourable. Although it may not be considered so naturally, I think it might be made so artificially. I would not favour making a harbour of refuge in the curve of a narrow contracted bay. About Filey, with the wind in the north-east, if you wanted to proceed south and you could not get out of Filey Bay, you would be pressed by the breakwater, and have no room to turn out; the sea rolls in dreadfully. I have been riding in Filey Bay when the wind has come round to north of west, and the ship has been rolling. You could not get the ship well out when you wanted to proceed south with the wind east-north-east. The same may be said of the Tees. Now look at Hendon. It is right in the cod of the bight. The harbour could not be made on a better coast, nor with a better port for leaving, than is presented there, and that is what we want. We only want to stay until we can safely proceed, and make a voyage. The further you are to windward with the wind east-north-east the better you go out. I have run to London in 40 hours, and sometimes in less time, and so I do not think much of the whole distance, and a few miles difference in the position of the harbour might not be so much a matter of consideration as choosing the points which would be most favourable for the reception of the ships which would require it. The Durham coast is the most favourable for the loaded ships.

16,326. (*Chairman.*) You consider facility of access and departure the most important points?—Yes.

16,327. (*Capt. Sulivan.*) How do the east-south-east and south-east winds generally draw round?—I have found the wind will blow from south-south and by east, and south-south-west, range down there a long time, and when the wind gets to the east of south-east, east-south-east, it generally blows round then to east; with this it will draw to the east of north, which is always the worst of all.

16,328. Does it blow hard when it is east-north-east?—Generally.

16,329. You would not want to sail with a gale from east-north-east?—I think we should.

16,330. You would not want to sail in a gale?—We want to sail as soon as we possibly can.

16,331. Does the wind more generally go to west and north-west than the other way?—It does. If any place on the Durham coast were selected, directly the wind got off we should most assuredly go away, however hard it might blow. It is part of my experience that we have not such very hard gales of wind from east and east-north-east as we had when I was a boy.

Mr. JAMES SHEPHERD examined.

Mr. J. Shepherd.

16,332. (*Chairman.*) How long have you followed the sea?—From 1830.

16,333. How long have you commanded ships?—I never commanded a ship.

16,334. In what capacity have you served, then?—Generally as mate, and before the mast.

16,335. How many years have you been a mate?—About ten years.

16,336. Have you been present during the course of this inquiry?—Yes.

16,337. Give your opinion as to the best point for a harbour of refuge on this coast, if there was to be only a single one, or say whether you think it would be better that the improvement of the three ports should be carried out?—I beg leave, first, to say, that I was chairman of a meeting of seamen of this port, which was held a short time ago, on the subject of harbours of refuge. I am president of a society of seamen, and the opinion among them is, that the improvement of the existing harbours would be highly beneficial to the seafaring population and the shipping interest generally. They consider that the three harbours improved so as to admit ships under all circumstances would be much better than one general harbour placed anywhere. They consider that one general harbour, wherever it is placed, will not meet the requirements of this busy part of the country. I know, from my own experience, that many ships sail out of these coal-lading ports, sometimes under peculiar circumstances; the wind may be from the south. It generally so happens that the spring tides of these northern ports answer from about three in the afternoon to six. Therefore in the afternoon it so occurs in the winter time that it is soon dark after three. If the wind is southerly the ships stretch off away with the tide. Very often I have known a gale come on in the course of the night, and in the morning the ship has very often been lost, and most of the ships are put to the greatest extremity as regards carrying sail. Now, under these circumstances, I think that a harbour of refuge, or the improvement of the existing harbours, would be highly beneficial to shipping and to the saving of life, more especially as regards the laden ships. In my experience, a great deal of life is lost in laden ships; and if I refer to the wreck chart, I find that the greater

SUNDERLAND.

Mr. J. Shepherd.

16 Oct. 1858.

part of the wrecks are caused about the neighbourhood of Sunderland. I find that the greater part of the wrecks and of the damage, and the greatest loss of life, occurs in the neighbourhood of Sunderland, and between Sunderland and Shields. I have a little statement with me respecting the loss of life :—In 1833 about 52 ships came on shore, and foundered between Flamborough Head and Sunderland. There were very many lives lost in that gale. In 1840 there was a very heavy gale of wind ; a great many ships came on shore, and lives were lost. In 1849 another gale occurred off this coast, and a great many lives and ships were lost. I think, when I compare these circumstances with the wreck chart, and the account given in it, together with my own experience at sea, I infer that the improvement of the existing harbours, so as to admit all ships under ordinary circumstances, would be highly necessary, and highly beneficial to seamen generally, and to the saving of their lives. In 1849 a ship called the *Cyrus* came on shore, behind the north pier of this harbour, and the greater part of the crew were lost. I think if there had been a harbour made available under ordinary circumstances the ship would have got in, and the crew and property would have been saved. In 1853 a very heavy gale occurred on this coast from east-south-east and south-east, when several ships foundered in the Tees Bay, and several lives were lost. There was a gale in 1853 or 1854, when a great many ships had to run back to Leith Roads, and several of the crews and parts of crews were washed overboard. I think if there had been a harbour of refuge, or if the existing harbours had been improved, these casualties would have been avoided ; and the like will be prevented for the future if these works are carried out. Therefore I think, that, considering those things, it is highly necessary that the government of this country should improve the existing harbours, or make one general harbour, so that it should be available under all the circumstances. I am instructed by the seamen to say, that those are their opinions ; and I will read a resolution which was adopted at the meeting I referred to, and which was moved by James Smith, seconded by Richard Kelly. It is to the following effect :—" That " the meeting is of opinion that a single harbour of " refuge on any part of the north-east coast would " not give sufficient protection to life and property. " The meeting is of opinion, that if the existing " harbours were improved, and made available at all " times of tide, and under all circumstances, they " would be more advantageous to the shipping fre- " quenting this part of the coast than a single " harbour of refuge at the entrance south of the " coal-loading ports, or in any other part of the " coast." There was another meeting of shipowners, masters, and seamen, interested in the welfare of the port, of which Mr. Thomas Robson was chairman, and they passed a similar resolution. They came to the conclusion that it would be necessary to give evidence before the Commissioners, and appointed me to do so, in order to show the necessity, if possible, of improving the existing harbours, and making them available under ordinary circumstances, or of establishing one general harbour of refuge. I may say from what I have experienced at sea, and what I know, and from the many lives which have been lost, that it is highly necessary that the Government of this country should do something for the welfare of the seamen who are so much exposed on this part of the coast. According to the wreck chart, numbers of ships have been wrecked and numbers have foundered within the last few years. I know by my own experience, and by my own observation, that very many precious lives have been lost on this coast from the want of a harbour of refuge, or the improvement of the present harbours. In the year 1856 or 1857 a gale came on from the eastward ; a great many ships ran for the harbours, and in Hartlepool Bay two or three light ships foundered. Off Tees Bay several went ashore. One in particular capsized her ballast two or three times, and was lost with all her crew, except one or two. Another ship, as I was informed by some of the crew, capsized her ballast three times, and with great difficulty got into Hartlepool. In that same gale several ships foundered. From all these things, it must be quite evident to this Commission that there is a necessity for some harbour of refuge, or for the improvement of the existing harbours, to be carried out as speedily as possible. The sailors of this port, numbering about 3,000, have desired me to urge the necessity of the question, and to move the Government to improve the existing harbours, or to make one general harbour of refuge in the most convenient place along this busy part of the coast.

16,338. When was the first meeting held ?—I do not exactly know the day.

16,339. About what time ?—About a month since.

16,340. How many were present ?—About 200.

16,341. How many at the second meeting ?—About 180.

16,342. On what authority do you state that the 200 and 180 seamen represented the opinions of 3,000 ?—We form a society of seamen called the Seamen's Benevolent Society or Seamen's Union. I am the president of that society. We consider that when 200 men are assembled for any purpose which is calculated to advance the interest of that society it is a fair representation of the men. It is not possible for us to get all the men together, or one half, at any given time; therefore we set it down as a rule that if 200 men are assembled, and agree upon any one subject which affects the interest of the seamen of this port, it is conclusive evidence of the opinions of the whole body.

16,343. Then, although the men who were present were not specially deputed to express the opinions of their brother seamen on these points, you are still prepared to state, that in your belief the resolutions they came to fairly represent the opinions of the majority of seamen here ?—Yes. You will find that several seamen spoke at the meeting.

16,344. Of course you must be aware that a statement such as you have made cannot possess the authority which a memorial signed by all the seamen would carry with it; and if you think proper at any future period to send a memorial containing these sentiments, signed by those seamen of the port who choose to sign it, that will undoubtedly be a much more authentic evidence of their opinions ?—Yes.

16,345. We have received so much evidence about harbours of refuge, and received it so much in detail, that I merely ask you whether you generally concur in the opinion that the improvement of the three ports is the thing which should be done first ?—Decidedly so.

16,346. Supposing anything further is to be done, it is your opinion that a large harbour of refuge would be useful ?—Yes.

16,347. Supposing such a large harbour of refuge has to be constructed, where would you put it ?—I have gone into the question, so far as my abilities will allow me, and have made inquiries. I have read as much as I could get hold of on harbours of refuge, the improvement of harbours, and such like. I have been at the trouble of going twice to explore Hendon Bay, and have taken soundings in the present harbour twice, for the purpose of giving an opinion. I have explored Hendon Bay, and from what I have seen from the soundings, and from the quality of the bottom, and the position of the rocks—Hendon Rock—the Whitestone—from the soundings, and the quality of the ground generally, I find that it is a very suitable place for a harbour of refuge.

16,348. Then you would prefer Hendon Bay ?—I do, for many reasons. I believe it is a very good place as regards the quality of the ground. There are very good anchorage grounds in it. Hendon Rock and Whitestone Rock are, according to my idea, very good places for building the foundations, and the ground is generally very free for anchorage. In the chart which the Commissioners have before them

SUNDERLAND.

16 Oct. 1858.

Chairman.

there is shown the scar or rock leading out a long way, and Mr. Calver's chart shows rock a little further to the northward even. In some places the soundings I took corresponded very much with Mr. Calver's, but they differed a little as regards the quality of the ground. The depths are something similar, but they differ as to quality of ground.

16,349. Supposing we are to have the three harbours improved, would you place the additional harbour close to one of those to be improved, in preference to putting it on a part of the coast where there is no harbour at all ?—A harbour of refuge is, in my estimation, necessary in the most central point of the coal-laden ports, and I do not know any place more central than Hendon Bay.

16,350. (*Mr. Lindsay.*) I think the seamen have been very fortunate in obtaining a member of their body to state their case so feelingly and so well as you have done, and I have only one question to put to you. If the three harbours, the Tyne, the Wear, and the Tees, were made harbours of refuge, that is, harbours which the vessels usually going along the coast could take at all times of the tide in gales of wind, do you think there would be any further necessity for a harbour of refuge between Filey Bay and the Farn Islands ?—If the harbours can be improved so as to admit ships under ordinary circumstances, I would not go quite as far as the resolution, which says the harbours shall be available under all circumstances. It is a question very likely with some whether they can be improved to be available under all circumstances, and to all sorts of ships; but if the harbours are made available under ordinary circumstances, more especially to admit loaded ships at the first of quarter flood, I think that would meet my views, and meet the necessity of the case. It is the loaded ships to which I look most, because the lives are lost principally from them.

16,351. Say it rested between the improvement of the three harbours to the extent you name, or the having one great harbour at Hendon Bay, which would the sailors prefer ?—The sailors prefer the improvement of the three harbours.

16,352. Say that the Government resolved to do neither,—neither to improve the existing harbours, nor to make a harbour of refuge at Hendon Bay,—but should decide that one harbour should be made either at Filey Bay or Hartlepool, which of them would do most to save life ?—The north side of Hartlepool Bay. I have an impression that Redcar, improved and made a harbour of refuge, would be a very convenient place for ships.

16,353. You would prefer Redcar to Filey or Hartlepool Bay ?—To any place, except Hendon.

16,354. Say it rested between Filey and Hartlepool alone ; which would you prefer ?—I should prefer Hartlepool, then.

16,355. (*Capt. Sulivan.*) Do you know whether the water in the north bay of Hartlepool is decreasing ?—I do.

16,356. Is it a subject generally spoken of among your class of seamen ? Do they ever remark on any of these harbours filling up ?—We, as a class of men, are very anxious about harbours of refuge. Two years ago we moved in the question, and there has been much talk about it lately, especially since the issue of the Royal Commission. At our meetings here, and the men generally hold weekly meetings, we generally have some social conversation on whatever is to their interest, and the harbour of refuge has been a topic of great interest among this most suffering class of people. That has been a question raised on several occasions. I have conversed with several men, and they have generally expressed an opinion that Hartlepool Bay has grown up very materially. I happen to know, from my own experience, that it has grown up. I remember that about 20 years ago I was riding off Seaham Harbour with a gale from the north-east, broke my cable, and went into Hartlepool ; we drove for some time, and the ballast shifted ; we got the ballast righted, and tried to get into Seaham ; found it difficult to get in there, but got into Hartlepool, and brought up somewhere near the Stones buoy. We rode very well there, in about six fathoms water. I find there is not now that depth of water where the Stones buoy is.

16,357. How long is that ago ?—About 20 years.

16,358. Six fathoms at low water ?—I cannot say whether at low-water. I think it would be flood-tide when we went in. The general practice is to get a cast of the lead before letting go the anchor. We were in about six fathoms at that time.

16,359. You are satisfied there is less water now than there was then ?—I am quite satisfied that the sand has very materially grown up. I remember riding there on another occasion, close inside the masonry work. The sand has materially grown up there.

16,360. Then how do you think it would be safe, under any circumstances, to build piers and make a harbour of refuge in Hartlepool Bay ? How could you preserve the harbour with a proper depth if it is gradually silting up ?—That perhaps belongs to engineering. I cannot tell how to keep it clear, but it is quite evident that it is silting up.

16,361. I do not ask you how you would keep it clear, but would you think it desirable to build a harbour where there is such a possibility of its getting shallower ?—I do not think it so desirable ; but the question was put to me, which should I choose, that or Filey Bay ?

16,362. Supposing Filey Bay is not likely to silt up, and Hartlepool is, which then would you choose ? —Filey, of course. I would choose the nearest place to the coal-loading ports ; that is my object. I believe the coal-loading ports pour out such a large mass of shipping, more especially in the summer time, that a harbour of refuge close to the most central place is very necessary. It is almost impossible to see the loss of life continue without doing something for its preservation.

16,363. But if it should be proved that Hartlepool is not so silting up, and that a harbour could be made there with safety, being so deep in the bay, you would decidedly prefer it to a place to the southward ?—I would, with the exception of Redcar.

Mr. William Hodge examined.

Mr. W. Hodge.

16,364. (*Chairman.*) How long have you followed the sea ?—28 years.

16,365. In what capacity ?—Partly before the mast, and as mate.

16,366. How long have you been mate ?—I have not exceeded two or three years in the coasting trade.

16,367. Have you been present to-day and yesterday ?—Yes.

16,368. And have heard the evidence of the witness who has preceded you ?—Yes.

16,369. Do you generally concur in his opinions ? —I do.

16,370. Is there any point that you would like especially to mention ?—I think not. I fully concur with all his remarks.

16,371. I distinctly understand that you are of opinion that the improvement of the three ports would be preferable to making any large harbour, wherever it might be ?—Just so, provided they make them available.

16,372. Provided they can be made available. Do you mean for loaded ships at all times of the tide ?—Yes.

16,373. For loaded ships at all times of the tide ? —Yes.

16,374. That would involve from 16 to 18 feet of water ?—I think the majority of vessels draw from 15 to 16 feet of water.

16,375. Supposing we are to have one single harbour of refuge, in addition to the improvement of these three ports, where would you put it ?—Hendon Bay.

16,376. Would you still put it in Hendon Bay if the Wear was improved, in preference to putting it on a part of the coast where there is no port at all ?—Yes.

16,377. (*Capt. Sulivan.*) You heard the last witness speak about Hartlepool silting up. Do you know whether it is shallower than it was ?—Not of my own knowledge. I never entered the port of West Hartlepool. I have heard different men express the opinion, and I have heard the pilots say that it is silting up gradually, both the old harbour and the bay to the southward of the new harbour.

16,378. I mean the bay leading to the two harbours and bounded by the Heugh ?—Just so. No doubt it is silting up. I have every reason to believe it. No later than yesterday and to-day I have heard different parties expressing the opinion that it has silted up most materially, from seven fathoms some few years back to five now.

16,379. In how many years back do you think they say it has decreased those two fathoms ?—They did not mention a term of years.

16,380. (*Chairman.*) What is the general tonnage of colliers ?—From 250 to 300 tons.

16,381. How many hands do they carry ?—They vary ; some carry six or seven, others eight or nine. There is no fixed number ; some carry more than others.

16,382. After knocking about two or three days in bad weather, with a laden ship, are they generally pretty well done, and have they generally had enough of it ?—I should say so.

16,383. Do the ships from being placed on the ground frequently strain and leak in heavy weather ?—There are exceptions ; some of them do.

16,384. So that besides the ordinary work of the ship, they have a little extra work in pumping occasionally ?—Occasionally ; there are exceptions. Some go very well ; according to which way the ship is affected by the nature of the weather and the deepness of the vessel.

16,385. Light ships, after rounding the head, hug the land, do they not ?—It all depends on the position of the wind. If the wind is south or south of west they steer a direct course ; if it is west-south-west they keep near the land, for fear of losing it.

16,386. When it is blowing a gale of wind along shore and the weather is thick, as a general rule, how far can you see the land ?—Do you mean the Yorkshire coast ?

16,387. No ; along here ?—The land in Hartlepool Bay is very well ; as you come to the northward it begins to decrease. The highest part is Black Hall Monuments.

16,388. In thick weather, blowing hard on shore, at what distance can you make out the land ?—It will depend on the nature and amount of the thickness. The weather is sometimes so exceedingly thick you must be very close in before you can see the land.

16,389. What distance with snow and sleet ?—You will not be able to sight the land ; you must depend on the lead for guiding you. The principal part of the masters would resort to that to guide them, and would calculate their position by the soundings.

16,390. If a ship missed her port in weather of that description, blowing hard on shore, what chance is there for a light ship ? If running for the Wear she missed her port, two or three miles to the north or south, and gets close in land, what chance has she when she has to haul the wind, having it dead on shore ?—It will depend ——

16,391. Having the wind from the east-south-east or east-north-east dead on shore ?—She must do the best she can. If she is embayed between the Wear and the Tees she must keep off the land.

16,392. What chance has she of getting off the land ?—A very poor chance of getting off the land if the weather is that severe. She must endeavour to keep off as long as she can until it clears up. If it does not clear up in many cases they go on shore.

16,393. Do many loaded ships founder at sea ?—No doubt numbers have. Many have never been accounted for.

16,394. If you are obliged to take in your close-reefed topsails, and to heave the ship to, and drag, under what sail do you do it ?—Put her under a trysail and fore-topmast staysail.

16,395. In such weather does the sea break on board loaded ships much ?—It chiefly depends on the abilities of the ship, with reference to her sea qualities, and whether she falls off much.

16,396. Generally, what weather do they make ?—It depends on the position of the ship. The sea may be so foul as to break on board the best of ships. A ship falling off, a foul sea may get on board the best, and do damage, if laying close to the wind.

16,397. If any ship falls into the trough of the sea she runs the chance of getting a sea aboard, particularly, I suppose, these heavy laden colliers, which are not, I am told, more than 18 inches above the water. I want to have your opinion as to whether, when these ships are hove to, under such circumstances, they generally get a good deal of sea on board ?—Decidedly so.

16,398. Tell me how these loaded ships scud ?—Dead before the wind.

16,399. Yes, dead before the wind ; but generally are they vessels that scud pretty well ?—Provided they steer well ; but it all depends on the steerage.

16,400. Do they steer well ?—Many very indifferently.

16,401. Then I presume they do not scud well ?—Not as respects steerage. You must recollect there are many fine vessels in this trade.

16,402. I am asking generally. When these vessels scud, how many points do they fall either way ?—As far as two and three, and four sometimes, either way. That depends a great deal on the man at the helm being careful. Even a bad steering ship will not yaw to the same extent if the man is careful ; but some, with all your watchfulness, you cannot steer at all.

16,403. After three or four days hard work in weather like that we have been speaking of, it is perhaps difficult to be careful ?—Yes, it is.

Mr. JAMES SMITH examined.

16,404. (*Chairman.*) How long have you followed the sea ?—33 years.

16,405. In what capacity ?—For the last 15 years as master.

16,406. Always in the coal trade ?—Generally. A few voyages up the Baltic.

16,407. You know the object of our inquiry; do you generally concur with the two previous witnesses ?—I do.

16,408. Is there any point they have omitted to name which you would like to state ?—I do not know that there is anything particular. I would just wish to state that I have had to take all the three harbours in gales of wind. I went from this harbour in a ship drawing 15 feet of water, got winds down from the south, and got up to Rowcliffe. The wind came down at south, varied to south-east and east-south-east, and came on very suddenly. Being caught suddenly, and knowing the ship was not very good, but was a very old ship, and sometimes made water when the weather sea was bad, I ran for Hartlepool, when the sea grew very bad, and got in. The ship came to the ground three times before I got into the place, but did not receive any serious injury. She made a little more water than usual ; but if I had been an hour and a half later in taking that bar she would have fallen on the bar, and likely have gone to pieces, and it would have been a question whether our lives would have been saved or no. On another occasion I went out from here, got

SUNDERLAND.

Mr. James Smith.

16 Oct. 1858.

Chairman.

up the length of Whitby, wind heavy, blowing strong from the west. We got into Whitby Roads, let go the anchor, and rode there part of one day and part of the night. At night the anchor parted, came off, and we drove out into the sea with about 55 fathoms of chain at the bows, and the anchor stock and shank. The following day at six o'clock the wind was westward, and we went to the south. On that occasion I ran for Shields, not with the same ship, but in a ship of the same size and draft of water. I ran for Shields, but after I got inside I said I would never attempt to take Shields again, for in going over Shields bar the bar seemed to be such a length, and there was such a length of broken water, that at times the ship was completely buried. It happened to be a ship that was built by Johnson of this port, the *Morning Star*. She behaved very well amongst the broken water. She touched the ground once, and her head paid off to the northward, but if she had touched again she would have gone on the Black Middens, and we should have been drowned. She did not, however; she recovered herself, and we got in. I have never been shipwrecked, but have had some near escapes. I have only been once on the ground during that time. That was in Yarmouth Roads, on the Newcome Sand. I have frequently come on to this coast. Much has been said about a place for light ships. That is a second consideration with me. A loaded ship is the one which wants a place of safety. When I leave London or Portsmouth, or any other port, with a light ship, my mind is at perfect ease as regards the saving the lives of those I have committed to my care; but when I am on board a loaded ship, and perfectly know, on leaving this port, that should I be caught in a gale there is no place to which I can go with a ship drawing 15 feet, such as I generally have, I have always been unusually uncomfortable in my mind, and could not sleep easily until I got the Humber under my lee. Then I seemed to get my mind at rest, knowing that there was a perfectly safe place, where, if caught in a gale of wind, I could bear up. I have my opinion, and am prepared to give that opinion, not influenced by any other person.

16,409. I understand you are distinctly of opinion that the first thing to be done is to improve these three ports, and enable loaded ships, drawing 16 feet, to run into them, if we can, at any time of tide?—Yes.

16,410. Supposing anything further done, that we were to have a single harbour, where would you place it? Where would be the best place for loaded ships?—I have been brought up in this town at about the east end of the town, and have seen most of the ships that come on shore. When at home I have seen a great number come ashore, and a number of men's lives lost. For years together we used to heave the ballast at sea from the ships previous to coming into the harbour. It would be always my object, when coming here with a light ship, when I had to heave ballast out at sea, if possible, generally to bring up in a place which the pilots call the Smooth, and for this reason; when we came up with a gale of wind, and could not carry canvas with the ballast, this place named the Smooth was a very safe place for the ship to go ashore. In fact I have seen ships go ashore in this Smooth, and of all the ships I have seen go ashore I have never seen a man drowned in Hendon Bay. I always thought that the safest place that I could see along the Durham coast. I am of opinion that if I was at sea with a loaded ship, and compelled by stress of weather to run for the shore, I should take my chance in Hendon Bay. I think that is a very suitable site, and the best site I can see for a harbour of refuge.

16,411. But bear in mind that were we first to improve the Wear, and make it available for ships drawing 16 feet of water; would you put a harbour of refuge close to an improved port, in preference to putting it on another part of the coast?—Yes.

16,412. (*Mr. Lindsay.*) What is the average size of the colliers; the registered tonnage?—I believe that from 150 up to 320 is about the average.

16,413. Taking a collier of 250 tons, what crew does one carry on the average?—Generally eight hands, two of them boys.

16,414. That is to say———?—Master and mate, three able seamen, and two boys.

16,415. That makes only seven?—There would be four able seamen.

16,416. One boy does the cooking and such things?—No; one man generally goes as cook.

16,417. He is shipped as seaman and cook?—Yes.

16,418. When you require to shorten sail every one must be on deck?—Every one.

16,419. What depth would you be from the main deck to the water's edge?—Ships vary. There are some go out with better than two feet side, some two and a half, and some less, according to size.

16,420. What is about the average?—About two feet.

16,421. For a ship of 250 tons?—Yes.

16,422. Do they go to that depth, winter and summer?—They never make any difference; they are always loaded one way.

16,423. (*Chairman.*) You have heard the question which I asked the previous witness about heaving-to and scudding; do you agree with him in his answers?—Ships vary in scudding.

16,424. I am talking generally; we cannot talk of particular ships?—Some ships steer well; others steer very badly.

16,425. Of course when a ship steers badly it is very dangerous to scud in a gale of wind?—When I have seen ships scud I have generally hove to. There is a difference between ships lying to. Some will lie over close to the wind, and others will fall off. I went out with a brig, the *Elizabeth Jane*, and fell in with a heavy gale of wind, about five years ago. We were driven off the land on to Gravel Bank, lost our canvass, two sets of sails, having nothing else but jibs and staysails, and had to set the fore and aft sails. It was about Christmas 1846. After waiting for a tide we got to Shields with a steamer. If the brig had laid to, like some I have been in, she would not have lost her canvass. When the maintopmast gave way we got a foretopmast staysail into the main rigging; then she fell off, and fetched a sea aboard. It swept the deck, taking away two men, the galley coppers, and all the bulwark, first by our falling off into the trough of the sea; she gave one reel to windward, the sea fell right on her deck, and we thought she would have gone down.

16,426. Does that style of thing happen often?—Yes, very often, in a gale of wind, among laden ships.

16,427. I think you have told us, that although there may not be much loss of life, still people in your ships run very great risk?—Yes, they must do it.

16,428. Many a man who has, like yourself, followed the sea in those ships for many years, although he has not been wrecked, has been near it very often?—Yes.

16,429. Therefore you think that that forms a fair ground for doing something for them?—Yes.

Mr. Thomas Robson examined.

Mr. T. Robson.

16,430. (*Chairman.*) How long have you followed the sea?—About twenty-five years.

16,431. In what capacity have you principally been at sea?—Previous to the last three years, about fourteen years master of a ship.

16,432. You have been present yesterday and to-day?—I have.

16,433. Will you give me your opinion on the subject of this inquiry?—I will. The subject is one of great importance; one in which I take a great

SUNDERLAND.

Mr. T. Robson.

16 Oct. 1858.

deal of interest, being a subject which has occupied my attention for some years. I have studied it, and have listened to many statements which have been laid before me on that question, and, at the same time, with the feeling that I should very anxiously embrace a harbour of refuge. I have heard the statements as regards the importance of the present principal harbours on this coast, and my opinion, as concerning that coast, runs thus :—It is my firm conviction that you may improve them for local purposes, but as to improving them to such an extent as to make a harbour of refuge of any one of the three principal ports on this coast it is my firm conviction that you cannot attain that object. One reason I have is this : In winter time, when losses and wrecks take place on this coast, and the weather is very similar to that which we have outside to-night [*it was raining very fast*], there are very heavy freshets in the rivers. Independent of the ebb tide that runs out of the rivers, there is a freshet added to it. I have seen in the port to which I belong a freshet running at the rate, I think I may safely assert, of seven knots between Sunderland piers. I had a mind to prove it about sixteen years ago. I was mate of a light ship. We came down to the bar with a gale of wind from the south-east and the east. As soon as we entered towards the back of the bar, the black ball went up, which showed that we had not enough water to proceed over the bar ; we instantly took the notice given, and heaved the ship's head out to sea. The captain consulted me. I said, " I am pretty well acquainted with Shields " bar, and I have no doubt she will sail over that, " because if we get round the point we can let go " the anchor in smoother water." He said, " Well, " Thomas, if you think so, we will risk Shields bar." As a specimen of what might be done in improving these harbours of refuge, as soon as we reached Shields bar the sight was enough to frighten us from trying that. Many of the gentlemen present may recollect the circumstances, when Farren's *Ocean* and other ships were lost on the Black Middens. They were landed on the Black Middens, solely on account of the strength of the freshets and the ebb tide. Admitting that these improvements perfectly succeed in providing sufficient water to admit the ships at dead low tide, a vessel would have a double defence ; but it is my conviction that you can never obtain sufficient water at any of the three ports to admit a ship of twelve feet draught at low water.

16,434. Therefore you are decidedly of opinion that we must have one harbour of refuge, independent of the improvements which are to take place at the three ports ?—That is my firm opinion.

16,435. Where there will be no river and no freshets ?—No freshets and no tides to contend with.

16,436. Of course this strong freshet makes a very bad sea ?—It does.

16,437. Have you seen the plan of Mr. Stevenson, for throwing out piers in front of these harbours ?—I have.

16,438. Supposing that was done, do you think you could run in there with safety, notwithstanding the freshet out of the river ?—The freshet would still be as strong as between the present piers ; equally as strong.

16,439. Therefore you think the freshet would continue to be as great an objection to any plan of that kind as it is at present ?—I would say that the proposed plan would improve the entrance of the harbour for local purposes. I have seen the plan, and I find the sea coming in to the large space proposed to be inclosed, and it must increase the height of the sea at the present piers. That I will admit, but then I believe I am that far acquainted with the bar and the bottom of the bar as to be able to say that there are not more than three or four feet of loose ground upon the rock. From one side of Sunderland south pier to the north pier there is a rocky bottom. It would improve the harbour, and make it safer to take in a gale of wind.

16,440. You approve of the improvement of the harbour for local purposes ?—I do.

16,441. But you consider it will be quite inadequate as a harbour of refuge ?—My own opinion goes that far.

16,442. If we have a large harbour of refuge, where is the best place to put it ?—I have stated, that having very closely examined the place which I have heard mentioned to-day, Hendon Bay, and living close to it, I have frequently observed there in a heavy sea, and have wondered how it was that the sea broke so lightly in Hendon Bay, compared with what it did on other parts of the coast. Many statements which have been made I can corroborate. I never saw a ship go ashore in Hendon Bay but that the men were taken out of it. For a harbour of refuge I should say that it ought to be a central place. Many places have been mentioned, Filey Bay, Redcar, Hartlepool, and Hendon Bay ; and, according to my experience as a mariner, Hendon Bay is the most proper place for a harbour of refuge. I can give my reasons on different points, if it is required.

16,443. (*Capt. Sulivan.*) If it was decided that a harbour of refuge should be either at Hartlepool or Filey Bay, and you wanted it for laden vessels bound south, which would be the best and safest place ?—I should prefer Hartlepool, in one respect, to Filey.

16,444. Do you know that Hartlepool is silting up ? —I cannot solve that question ; but from general information I am led to suppose that it is.

16,445. (*Chairman.*) You have heard the question I have asked about heaving to and scudding. Do you agree generally in what the previous witnesses have said ?—Yes ; I know that by experience.

16,446. You agree that frequently when ships are obliged to heave to very serious accidents occur on board ?—Frequently ; particularly in scudding, if the sea runs on the quarter, or with a leading gale. I know that by experience, having been clean swept, and that too in a good ship, considering it was a collier.

16,447. It frequently happens that you are obliged to run with the wind on your quarter ?—Yes. There is something to be allowed for in colliers. We sometimes run unreasonable risks, and the reason is that we are paid by the voyage. Every man is paid by the voyage as well as the captain, and therefore we are sometimes more persevering than ships in the foreign trade are. On that account we never want to go to a harbour of refuge or the Humber, so long as we can make progress. But if we cannot make progress, or have to wait for a tide, we should be as glad of a harbour of refuge as the foreign-going vessels.

16,448. (*Chairman.*) I may remark, that it is perhaps the risks you run which make you the sailors you are.

Captain HURD, R.N., examined.

Captain Hurd, R.N.

16,449. (*Chairman.*) You are inspecting commander of the coastguard in this district ?—I am.

16,450. For what period have you held that appointment ?—Five years.

16,451. I believe you have been present both yesterday and to-day ?—I have.

16,452. It is very late in the evening, but we shall be very desirous to have your opinion well considered on the subject. Would you do us the favour to prepare and forward to the secretary in London any remarks you may wish to make on the evidence you have heard ?—I will.

Mr. ROBERT BROWN examined.

Mr. Robert Brown.

16,453. (*Chairman.*) Are you the chairman of the Shipowners' Society ?—I am.

16,454. How long have you been connected with that society ?—About 15 years.

SUNDERLAND.

Mr. Robert Brown.

16 Oct. 1858.

Chairman.

16,455. The Commissioners have heard all that they wish to know on primage and pilotage; but if there are any remarks you may like to make on these two questions, bringing points under their notice which have hitherto escaped them, they will be glad to hear what you have to say?—I have been requested to make some statement with respect to the basis on which the Trinity House rest their claims, and which it is thought it will be desirable to convey to the Commissioners, inasmuch as in our opinion it forms a strong equitable ground for the conclusion that in dealing with the question as between the Trinity House on the one hand and the promoters of harbours of refuge on the other Parliament would be prepared to appropriate the revenue for refuge purposes. The title of the Trinity House rests upon two bases. One part rests on one basis, a parliamentary basis; another part rests on a prescriptive basis. You have heard from the evidence of Mr. Hudson that there are two classes of dues payable, one of which is only the Trinity dues. These rest upon the parliamentary basis, and are collected by virtue of an Act of Parliament, 41 Geo. 3. c. 86. By that Act of Parliament the Trinity House of Newcastle are empowered to levy dues upon Newcastle, and upon all those places which are designated its creeks, Sunderland being one of them; and about 700*l.* is collected from Sunderland under that Act, and is appropriated exclusively to keeping up the Low Lights in Shields harbour. Sunderland does not derive one tittle of advantage from that 700*l.*; it is appropriated exclusively to keeping up the Low Lights upon the Tyne. As that rests altogether upon a parliamentary title, we presume that Parliament will be able to deal with it. As they made the grant they can take it away, and appropriate it in any way they may think proper. Then, as to the primage dues, 700*l.* is collected in Sunderland from them. They rest upon a prescriptive right, which has been two or three times the subject of litigation, once at the instance of the Newcastle shipowners, and another time at the instance of the Sunderland shipowners. We were advised that if we could only fix upon the origin of the title we should have good grounds for disputing the claims. We entered upon a course of litigation in the hope that we might succeed in doing so. Their last charter is a charter of James II., but that was preceded by a few other charters, tracing them back to a primary charter in the time of Henry VIII. Now the way in which they stated the case was, that Sunderland had paid the dues, which they proved by that document, and by living evidence for the last 50 or 100 years, and there rested the case. We produced the charter of Henry VIII. If we could have shown that that was the origin of the grant, our case would then have been that it had an illegal origin, inasmuch as the Crown had no power to make grants without the authority of Parliament. In that view of the case we were supported by decisions come to in the case of Scarborough, to which, perhaps, the Commissioners will let me refer. It was, however, mentioned in the charter of Henry VIII. as being an ancient due. I mention this with the view of fixing upon the minds of the Commissioners the idea, that although the title of the Trinity House is a legal title, which will perhaps give them the right of possession against all litigants, yet it is but technically legal, because we could have defeated it if we could only have traced it historically back to its true origin, which no doubt was that it was granted in remote antiquity to and was collected probably and in the first instance as a voluntary contribution by the ecclesiastical houses which lined this coast from Holy Island on the north to Whitby on the south, a series of monasteries which were erected under the same auspices, and there is no doubt that it originated with these ecclesiastical houses, and was a contribution for the protection and support of mariners, and for saving them from wreck, or at all events supporting their wives and families when they were shipwrecked. This, however, was too great a distance for us to trace it back to by legal evidence. It appearing upon the face of the charter given in the time of Henry VIII. that it was then an ancient due, we failed at law, although we still think that equitably the Trinity House are but trustees for the benefit of the seamen, on whose behalf these dues were no doubt originally granted. Sunderland, you see, like all the ports south of the Tyne, becomes a creek of Newcastle, in consequence of its having from a very early period been dependent upon that town when there was only one custom-house located at Newcastle. Long before that, however, in the time of Elizabeth, papers prove that it was designated a creek, and it has continued to be called by that name ever since. In the case of Scarborough, where the shipowners of the north had paid a passing toll for 200 years, we disputed it on grounds similar to those on which we dispute the claim of the Trinity House of Newcastle, and we succeeded, because, although they proved the fact that we had paid the due continuously for 200 years, yet we were able to put our fingers upon an early grant made in the time of Charles II., confirmed by a subsequent order in council, and the court at once pronounced that to be an illegal origin, the crown having no power to make such a grant, and it being made in the time of the Stuarts, when they were in the habit of seeking to lay hold of everything they could for the purpose of contributing to the revenue of the crown. Having no parliamentary origin, although it had subsisted for 200 years, we succeeded in destroying that passing toll. I may mention also, in reference both to this subject and generally to that of passing tolls, that we are at present unable to make any return or to form any correct idea of the aggregate amount which is contributed to the passing tolls of Whitby, Bridlington, Ramsgate, and Dover, for these reasons; that within the last two or three years, since all the parliamentary returns were made, we have contested the validity of the claims both of Dover and Ramsgate; and although in both instances they have been levied under parliamentary grants for 50 years and upwards, we succeeded at all events in abolishing them, with the exception of one voyage in the year. They had been in the habit, both at Ramsgate and at Dover, of levying the due upon the coasting vessels every time a ship passed; but in point of fact they had no legal right to collect it for more than the first voyage of the year. As no parliamentary returns have been made since the dues were thus reduced, we are unable to make any accurate return of what is collected at present. I mention these things to show the basis on which we rest the firm conviction that, notwithstanding these dues may appear to have assumed a sort of legal origin by their having been passed over and paid when shipowners were perhaps more affluent, and received perhaps better profits than they do at present, yet, whenever these dues have been tested in similar instances, they have been proved rotten; and we have a firm conviction that the Trinity House due, if it could only be probed to the bottom, and if we were not prevented by the facts of history failing us, would prove equally rotten, and that upon equitable grounds we have a strong basis on which to appeal to the justice of Parliament.

16,456. (*Mr. Lindsay.*) If you have any other facts to state, bearing upon the case, will you send them in the shape of a memorial to the secretary?—Yes.

16,457. You appear as the secretary of the Shipowners' Society?—And on the part of the seamen.

16,458. Are you fully satisfied, on the part of the shipowners of this place and the seamen, that, so far as the main question is concerned, respecting harbours of refuge, you have brought out the whole facts of the case, so far as regards Sunderland?—I am quite satisfied it is so. There have been numerous meetings of shipowners and of seamen, and the greatest publicity has been given to these proceedings.

16,459. (*Chairman.*) Are you perfectly satisfied that our coming here has been as publicly known as was desirable?—Perfectly satisfied. The mayor gave ample notice to all persons that were interested; ample notice. Everybody that had any business here knew several days beforehand.

(*Chairman.*) Are there any other parties present who are interested in this inquiry, who wish to tender their evidence to us?

No answer.

SUNDERLAND.

Mr. Robert Brown.

16 Oct. 1858.

Sittings at Sunderland closed.

HARTLEPOOL.

Monday, 18th October 1858.

PRESENT:

Admiral HOPE (Chairman).

Sir FREDERIC SMITH.
Mr. LINDSAY.
Captain WASHINGTON.
Captain SULIVAN.
Captain VETCH.
Mr. COODE.
Mr. EVANS, Secretary.

Mr. RALPH WARD JACKSON examined.

HARTLEPOOL.

Mr. R. W. Jackson.

18 Oct. 1858.

16,460. (*Chairman.*) Are you prepared to make a statement relative to the subject of our inquiry, as respects this port?—I am.

16,461. You reside in Hartlepool?—Near West Hartlepool.

16,462. Are you connected in any capacity with the harbour and port of Hartlepool?—I am one of the Port and Harbour Commissioners, representing a public trust created in the year 1813.

16,463. Are you a shipowner as well?—I am also a shipowner in the port of Hartlepool.

16,464. Will you now proceed to make any statement which you may wish to make to the Commissioners with reference to the advantage or necessity of a harbour of refuge on this part of the coast, observing that it is the wish of the Commissioners that you should abstain as far as possible from any evidence which is already before us in an official shape in the published evidence of the Committee of the House of Commons in the years 1857 and 1858?—Before presenting to the Commissioners the statistics of the port, I should be glad to make a few observations with reference to the evidence I am about to offer. And I am desirous of doing that because I wish it to be particularly observed by the Commissioners that we at Hartlepool abstain altogether from casting any reflections upon the trade of any other place. We think it is quite sufficient to expose the statistics of the trade of Hartlepool, and shall be careful to avoid any disparagement of our neighbours. I have, therefore, the honour to present to this Commission the result of official returns of ships, with their registered tonnage, entered and cleared with cargoes, coals, and merchandise, foreign and coastwise, exclusive of all ships in ballast, from the under-mentioned ports, namely, Newcastle-upon-Tyne, Shields, separate, Sunderland and Seaham, conjointly as well as separate, Hartlepool, separate, the port of Stockton with Middlesborough and Stockton, separate; and this return, which I will hand in, is a faithful extract from the Board of Trade Returns for the years 1855, 1856, and 1857, together with the tonnage of coal actually shipped, and merchandise exported, with its declared value to Her Majesty's Customs. It does not include the imports of merchandise, because there are no means of ascertaining that; but I may state here that it is extremely large, and it is increasing in a considerable proportion, in a proportion I had no conception of 12 months ago. It will appear by this return that the statements made in other places—I cannot help saying unfairly—are untrue. Instead of the port of Hartlepool decreasing, it is very decidedly increasing, not only as regards trade generally, but especially as regards its merchandise. And if I were to consider the question of refuge for ships as regarding locality, it would not be unfair to include the whole port of Stockton in Tees Bay, Hartlepool Bay being a part of that large estuary. And therefore, if for the purpose of refuge we include the whole trade of the Tees, then there is (not a decrease, which was stated on the Tyne, but) an increase as respects the merchandise. I may at once state that it exceeds, for Hartlepool alone, nearly the whole of the north-east ports put together. The trade in merchandise in Hartlepool, exports I speak of only, commenced only about 1853, in which year the merchandise was 15,987*l.*; in 1854, 252,653*l.*; in 1855, 782,739*l.*; in 1856, 1,537,764*l.*; in 1857, which we all know was a most depressed year, its exports in merchandise amounted to 1,767,160*l.*; and in the nine months of the present year ending September it is 1,595,324*l.* Now at Newcastle in 1857 it was 1,388,075*l.*, Hartlepool was 1,767,160*l.*, Shields 24,892*l.*, which, added to Newcastle, does not anything like reach that of Hartlepool, and Sunderland was 83,832*l.*, Seaham 875*l.*, Middlesborough 618,686*l.*, much more than even Sunderland, and Stockton was 33,794*l.* The value of merchandise also in Hartlepool last year exported, exclusive of coal, was nearly the value of the whole of the coal exported from the Tyne.

16,465. (*Mr. Lindsay.*) As you have given the increase of merchandise year by year, will you also give the increase of shipping for the same years, year by year?—Yes; in 1855 the number of ships in the port of Hartlepool was 9,839. Will it be convenient to the Commissioners that I should read this?

16,466. (*Chairman.*) Yes?—In Hartlepool in 1855, 9839; registered tonnage, 1,387,567; the quantity of coals shipped for that year was 1,613,442; the merchandise in that year, 782,739.

16,467. (*Mr. Lindsay.*) You have given us the merchandise already?—In 1856 the number of ships was 10,406; the registered tonnage, 1,497,081; the coals shipped 1,657,976 tons, being an increase over 1855. But as the number of ships in 1857 was 10,275, it will, therefore, be seen that there are 131 fewer ships.

16,468. Then by this return there appears to be a decrease in the registered tonnage between 1856 and 1857, of how much?—There is a decrease in the number of ships of 131, and in the tonnage there is a diminution of 69,525, distributed over 131 ships, while the coal increase is something like 20,000 tons. So much for the return of all the ships and trade of the place. I am not now in a situation to give the exact trade in the old harbour, the books of which belong to a private company. I

HARTLEPOOL.

Mr. R. W. Jackson.

18 Oct. 1858.

could not ask them to give me the exact trade of their port, but this is taken from *Browne's Export List*, which is an authorized publication by Her Majesty's Letters Patent, and emanating from the Customs at Newcastle. I have a return from the list for the month of September last, in which the quantity of coal shipped for that month, as well of the value of the merchandise, are given, and which at West Hartlepool was 259,049*l.*; compared with 1857, this is an increase of 42,434*l.* At Newcastle the total exports in the same months were 92,876*l.* against 102,477*l.* There was a decrease of 9,601*l.*

16,469. (*Chairman.*) Will you give that in evidence ?—I will ; that is, for the month of September, and I have all the rest, if required. Then, in order that I might show that which is particularly within my own knowledge, namely, the ships, and coal shipped at West Hartlepool,—I have no means of acertaining—I have no right, in fact, to ask the trade of another port which belongs to a private company—I have prepared a return for West Hartlepool, which shows that the statement in another place that there was a decrease is certainly wrong. West Hartlepool is the very youngest port in the kingdom, and I think it is right just to state that there is a decided increase of upwards of 100 ships entering West Hartlepool in the present year, up to September, over the preceding nine months of last year, and that in respect of coal there is also an increase of upwards of 40,000 tons at the present time. I am responsible for these returns, because they have been taken from the books themselves, which are open to examination at any time. I may state that the prospects of Hartlepool are very considerable, and much enhanced by the discovery of a very fine bed of ironstone within a stone's throw of the place. The Cleveland Hills, which are rising to the south of the Tees, abound in ironstone, and have only been brought into development during the last eight years. There is embraced in these hills 200 square miles of ironstone—the authority which I quote is Professor Phillips ; and there is a quantity of ironstone in that neighbourhood equal to the consumption of four times the entire coalfield of Durham and Northumberland. The coalfield of Durham and Northumberland, Durham particularly, closely approaches the port of Hartlepool. It commences within six miles. There is no other part, except Newcastle and Sunderland, where the coal approaches anything like that. As we get further south, into the Yorkshire district, we cannot find any port at Filey or Hull, or any other place nearer to the coal fields than 70 miles. Here we have it within six miles, with the finest coal of all descriptions for household, steam, manufacturing, or coking purposes, and of every quality that may be required for domestic or manufacturing purposes. We consider that this district really and truly is in its infancy. I am now approaching the question immediately before you of a harbour of refuge ; and upon this subject I probably had best refer you to a chart which is upon the wall, which we call the Hartlepool Wreck Chart. This (*handing in a chart*) is a coloured lithograph chart which was prepared when Mr. Rendel laid out for this port, at the instance of the Port Commissioners, a harbour of refuge ; and it is presented here, not for the purpose of advocating the line of piers that are there shown, but we did not think it right in presenting it before you to take out anything which existed upon it when placed in evidence before the Select Committee of the House of Commons on Harbours of Refuge. Therefore, passing altogether, as if it did not exist, the line of piers laid down there, I draw the attention of the Commissioners to the faithful position, as near as can be laid down, of all the wrecks that have occurred in Hartlepool Bay, and that could be easily stuck in that map, during the period of 1846, 1847, to 1857 ; in addition, however, to which, there are about eight vessels which have since been introduced. The ships altogether, during 12 years, number 239, and we know their names and all about them. Out of these there were 92 lives lost in this bay.

16,470. (*Mr. Lindsay.*) Including what time ?—Part of 1846 and 1847 and up to the end of 1857 ; many more lives would have been lost if it had not been for the energetic use of the life-boats. There are in this port, between this and Seaton nine life-boats ; at Redcar there are two, making altogether 11 life-boats within the bay.

16,471. (*Chairman.*) The Tees Bay ?—In the Tees Bay I do not know whether there are any to the south of Redcar, but at all events, between Redcar and Hartlepool, there are 11 life-boats ; and alluding to the youngest life-boat that has been placed here at West Hartlepool, we have saved about 200 lives in our own life-boat in this bay during a period of eight or nine years. It will be found, therefore, by the list that I will hand in with this wreck chart, that there were 239 vessels in the above period wrecked, and 92 lives lost. The tonnage of vessels stranded was 22,586 ; totally wrecked, 928 ; total tonnage, 33,514. The number of lives lost annually being on the average 8·3 ; but in 1857, within the bay of Hartlepool, there were 44 lives lost.

16,472. (*Mr. Lindsay.*) Were those lost from ships, or were they casualties in the bay in boats ?—In ships wrecked, marked on the wreck chart.

16,473. Forty-four lives lost from ships wrecked in the bay ?—Yes, and they are marked upon this chart, and every year has its specific colour to denote it. This has no reference whatever to the losses that have occurred on the Yorkshire coast or in the Tees mouth. These which I allude to just go to Seaton and not on the Yorkshire coast.

16,474. Do I understand you to say that between the Long Scar Rocks and Hartlepool, in this bight or bay, there were 44 lives lost in 1857 ?—Yes, and they do not go to the northward of the Heugh. It is merely within the limits of the Port Commissioners.

16,475. But the port of Hartlepool extends to the northward of it ?—It does.

16,476. How far ? — To Blackhalls, about six miles. But this chart does not take in the six miles.

16,477. Then, within the range of the coast, how many miles were these 44 lives lost in ?—Just three miles ; and these ships you see marked upon the site where the west harbour is, were wrecked before the piers within which they lay were built. But you will observe upon this chart there are no vessels marked within the inner harbour at Hartlepool. Were we to record all the damage that occurs to ships taking these tidal harbours in great crowds, the multiplication would be very great indeed. The wrecks shown are simply on the outside the piers. I will now give in these returns.

16,478. (*Capt. Vetch.*) How many lives were saved by means of the life-boats ?—I do not know. Applicable to the question of refuge, I may give now what has occurred since our sitting. I allude to the ships that have been put in windbound yesterday into West Hartlepool, nearly the whole of which are ships bound for places north of Hartlepool. There were 14 ships ; of these, four were bound to Newcastle, four were bound north of Newcastle, five were bound to Seaham, and one was bound to Stockton. These came in yesterday with a strong breeze.

16,479. (*Chairman.*) Can you put in the force and direction of the wind ?—I will put it in to-morrow. The wind was north-east, about north-north-east.

16,480. Will you give me the force of wind, as well as the direction ?—I will send to the lighthouse which the Port Commissioners have, for the record there.

16,481. Have you anything further to add to your statement ?—I have more statements to put in, which I think will bear more particularly upon refuge. One from the Custom House, which is an account of the number of vessels that put in for refuge, not being vessels which had previously loaded at Hartlepool or West Hartlepool, distinguishing those whose destinations were north of the port from those which were bound south of Hartlepool, from the 1st of January 1852 to the 15th of October 1858. During

that period 2,999 ships arrived in Hartlepool bound for other ports, of which there were 1,347 bound for ports north, and 1,171 bound for ports south of Hartlepool, loaded. Vessels arriving windbound, and not intending to load at Hartlepool, but afterwards loading, were 48. And of vessels whose destinations were for ports north of Hartlepool, the greater number were from Seaham, Sunderland, and the Tyne. That is what is entered in the Custom House as windbound ships. They keep a return of everything that comes in and goes out, except in ballast. Applicable also to the refuge question, I put in from the authority of parties who have made out these returns, namely, the public notaries, returns of all vessels that they have noted casualties, after arriving in this port, from the year 1839 to 1858, from Mr. Belk, notary public; it contains all the causes, where the vessels were, and the causes of their entering. There is a similar return from 1848 to 1858 from Mr. Anthony Dobing, public notary at Hartlepool. The same from Mr. William Todd, from February 1856 to September 1858. A similar return of Mr. Peter Barker, also notary public, from 1845 to 1854; he is now dead. Also from Mr. Edward Turnbull, from the year 1845 to September 1858. In each case there is appended an extract from the depositions of captains giving the grounds for their taking refuge in Hartlepool.

16,482. Does that conclude your statement?—I am going to present what may refer you more immediately to the Bay of Hartlepool. I shall be very glad to put it upon higher grounds than that of mere local advantage, though it would perhaps be perfectly justifiable on my part to state that, while other ports are very properly desiring to have their entrances improved, Hartlepool would, even upon the lower ground, seek to have its port also improved, as being one of great importance to the district, and certainly the third on the north-east coast. The only means the Port Commissioners can devise, in a commercial point of view, for the improvement of the port, would be the throwing out a breakwater at the entrance to or off the bay; but I would rather put the question upon the higher grounds of its importance on the north-east coast in saving life and property, and the return I have put in I think sufficiently justifies me in stating that Hartlepool is the place which the Port Commissioners believe to be the best. I have individually believed it for a long series of years, having deeply reflected upon the question, and having some knowledge of the coast. I have therefore devised what appears to me to be the mode by which Hartlepool Bay will be best protected as a sheltered anchorage, answering all the purposes of refuge, and at the same time carrying out the object which the Commissioners have in view. Now in this suggestion I make of a sheltered anchorage without a close harbour, there are two designs upon the chart I hand in—one is to nine fathoms and the other is to seven fathoms; and the areas in the nine fathoms are these:—Nine fathoms at low-water spring tides gives sheltered anchorage for 1,650 acres; five fathoms low-water spring tides 1,072 acres; three fathoms at low water 488 acres; and one fathom at low water 124 acres. In the design shown by the line upon the chart commencing with seven fathoms there will be a sheltered anchorage of 1,452 acres; five fathoms at low water 1,000 acres; three fathoms 488 acres, and one fathom 124 acres. There may be other designs to provide the sheltered anchorage, according to the ingenuity of persons who give attention to the subject, and there are, no doubt, gentlemen upon this coast who have given considerable attention to it. However, without adopting for this purpose, and at this moment, any of the suggestions of other persons, I put in a design of my own for a breakwater, as suggested upon this chart; and I am prepared also with a very carefully considered estimate, sent by a contractor who will be glad to execute the work at the sum. This is the design (*design produced*), which we call No. 1, the estimate for which I shall be prepared to give in. This is design (*design produced*) No. 2. The models of these designs are at the end of the room. The estimate for the nine-fathom design, with a rubble base, masonry top, is838,156*l.* per statute mile. The material to be found is about two miles from West Hartlepool; and as a material, so far as I know, it is fully equal to Holyhead stone. If plan No. 2 were adopted, which is all of rubble, for the breakwater, it would be 962,544*l.* per statute mile. I give the exact number of tons per lineal yard in each, and the cost per ton for rubble and masonry; the cost per lineal yard; the tons per statute mile, and the cost per statute mile, so that it may be worked out in the minutest detail. In the case of No. 1 design, which is for rubble, and part masonry, in the nine-fathom design the total cost would be 2,130,630*l.*, and for No. 2 design, nine fathom, 2,446,830*l.* For design No. 1, in seven fathoms, the total cost would be 1,604,175*l.*, and for design No. 2, in seven fathoms, 1,758,387*l.* There is a very much larger quantity of material in design No. 2. A gentleman will be prepared to enter into a contract for this work; and he states that in the course of three years he will be prepared to deposit rubble which will in reality give a large amount of shelter. It will not be as complete as when finished, but it will be a partially sheltered anchorage for vessels, inasmuch as it will reach within 10 feet of low-water mark spring tides. If this rubble was deposited outside the Heugh there would be no ground-swell after that, and to complete the work five years would be required. I have also to present a list of wrecks that we have ascertained occurred in one gale from the east-south-east and east-north-east on the 3rd and 4th January 1857, between Flamborough Head and Newbiggen, a distance of 90 miles. I have divided that district into three classes, each about 30 miles;—the Filey district, the Hartlepool, which may be called the Tees district, and the northern ports, or the Tyne district. The Filey district lies between Flamborough Head and Whitby, in which there were 13 wrecks in that gale; in the Hartlepool or Tees district, between Whitby and Blackhalls, 39; and in the northern ports or Tyne district, between Blackhalls and Newbiggen, 15 in number.

16,483. In one gale?—Yes, it goes by the name of the 4th of January gale. It was included in that gale, when the large number of lives in 1857 was embraced; of course it will be observed, that in consequence of the very large traffic that is now flowing through and into the port of Hartlepool, the merchandise requires very much more valuable ships than those that are required for coal, and in that view also we consider that it is highly necessary that this site should be accommodated, and a harbour of refuge provided in which vessels could at all times obtain shelter. In illustration of this I may mention, that while the average registered tons of vessels I have given you as entered in 1856 was about 144 tons register—in 1857 I explained there is about 131 less, the average is 162½, and in both the docks of Old and West Hartlepool there are very large ships coming in, ships of 400, 500, and 600 tons—we, at West Hartlepool, have had ships in of 2,200 tons, 1,400, 700 tons, and so on. I myself went out with a ship of 2,200 tons not long ago. She was a New York steamer 300 feet long, and in one quarter of an hour from her leaving the dock quay she was in the German Ocean.

16,484. Can you name the draught of water?—I can get it from the harbour-master. The piers are, as you see, increasing the depth of water. The water into Old Hartlepool is, I believe, the same as it has been for some time. The depth into West Hartlepool has increased very greatly indeed from nothing on what was called the bar to between five and six feet now at low-water spring tides. I may state, that there is no bar, that every ship passing over the locks, till at West Hartlepool, can go safely to sea. Within the month a large ship from Cronstadt, an American, 1,350 tons register, came in with 1,500 tons of timber the day before quarter-day, drawing upwards of 19 feet of water. I do not enumerate others, because

HARTLEPOOL.

Mr. R. W. Jackson.

18 Oct. 1858.

Chairman.

where one ship can go a thousand can. This leads me to remark, that the depth of water is decidedly on the increase. There is now abreast of West Hartlepool Harbour nothing but clay. The low-water line gave considerably higher up in the shore, showing generally the deepening of the bay. The beaching ground is extremely good, and I have several times seen vessels in hard gales when they have not been able to fetch up, so as to gain the harbour, square yards and run for the beach, thus exhibiting that there is a safe beach for vessels to run upon, although it is not a comfortable place to be in at any time; and yet I have seen many ships, for the purpose of saving life, square their yards and run for the beach. On the south of the west to the harbour at the Long Scar Rocks the sea has got higher up at high water than it did before. This does not make it the less necessary for a harbour of refuge, to prevent ships going upon such a place to beach. There is a capability in these two ports of receiving within their own docks and their own tidal harbours from 900 to 1,000 ships. We may boast also in Hartlepool, as our neighbours in the north do, of having steam tugs amply sufficient for the locality. It will be observed, that it is not so necessary to have many steam tugs where the range of towage is not more than a mile or a mile and a half, as contradistinguished from a long river. I may mention the incident of a ship of my own, called the *Ward Jackson*, which was bound from Hamburgh in the year 1855. At the same time in Hamburgh was a large steamer from Hull, called the *Burlington*, and both captains found their way across the sea, wholly and solely by the lead in a fog. In the case of my ship the captain brought her into Hartlepool Bay safely; he took his soundings perfectly regularly all along the Yorkshire coast, which, as you will hear from the nautical witnesses, are perfectly regular and ascertainable. My captain brought the ship perfectly safe in a dense fog to Hartlepool Bay. But in the case of the *Burlington*, the fine steamer, she was wrecked, totally wrecked, at Flamborough Head.

16,485. Does that finish your statement; do I understand you to say, with reference to this chart showing the wrecks, that it has been put in evidence anywhere before a Committee of the House of Commons?—It was in the room before the Select Committee of the House of Commons when taking the evidence as to a harbour of refuge. It was not in the whole time.

16,486. It is not published?—It is not.

16,487. Do you think it will be possible to let us have a tracing of that?—Yes, certainly.

16,488. You will have all the ships you allude to put in colours, an exact copy of that?—Yes. I must just mention to you that this chart assisted the Act of Parliament that was passed in the year 1855 for authorizing the conversion of the bay of Hartlepool into a harbour of refuge; and the Act specifies that any work there contracted shall not be a close work unless the Admiralty sanction it. The Act has 73 clauses, and is called the "Hartlepool Pier and Port Act of the 16th July 1855." After a very full inquiry by Parliament, the expediency of the conversion of the bay, at as early a period as may be practicable, into a harbour of refuge, was recognized, the Act being "for the improvement, maintenance, and regulation of the port of Hartlepool, for the construction of a harbour of refuge there, and for other purposes." The graving docks at West Hartlepool are the largest and most convenient of any in the north of England, so much so that vessels come from London direct to West Hartlepool for repairs, and vessels also come direct from Antwerp to be fitted out. The large vessel I spoke of as 300 feet long came direct from Antwerp, went back to Antwerp, and was sent from Antwerp to New York. She was called the *Constitution*.

16,489. In a former part of your statement, you handed in returns by a contractor of what he would be willing to make these breakwaters for. Is that contractor present?—He is.

16,490. And if we wish to know the price, we shall be able to do so at a later period?—Certainly.

16,491. What do you consider the boundaries of the Tees Bay, and what of Hartlepool Bay?—For the purpose of refuge, I call Hartlepool Bay inclusive of Tees Bay, and it is so distinguished in the Admiralty published chart; the limits are, I think, from Redcar on the one side to Hartlepool Point on the other. The limits of Hartlepool Bay we have considered coming out to about five fathoms. The limits of the port and jurisdiction of the Port Commissioners is two miles seaward parallel with the shore, for about seven or eight miles of coast from Seaton to the south to a place called Blackhalls on the north. This corresponds also with the Customs Port.

16,492. What are the distances from low-water mark at each end of the proposed breakwater?—It will be intermediate between the six and seven, and a little more than a mile and a half.

16,493. And the same at the outer, I imagine?—A little more than one mile and three quarters.

16,494. (*Mr. Lindsay.*) I think you said, in reply to Admiral Hope, that you were a port commissioner?—I am.

16,495. Have you any other interest in this place?—Yes; I am chairman of the West Hartlepool Harbour and Railway Company, which constructed works and commenced the town in which we are now sitting.

16,496. And you have an interest as a stockholder in both these undertakings?—There is no private interest in the port commission.

16,497. You say there are docks?—The West Hartlepool Docks.

16,498. Yes; and you have an interest and capital in the docks?—Yes, considerable.

16,499. I understood you to state that some evidence which was given before us at another place in regard to the decrease from Hartlepool was incorrect; was it so?—The decrease in the bay of Hartlepool?

16,500. No, the decrease in the trade of Hartlepool; was it incorrect?—Perfectly incorrect.

16,501. Looking at these returns which you have read to us to-day, and handed in, I find that while the ships and registered tonnage of the other northern ports has increased in that time, Hartlepool has decreased by 131 ships and 69,525 tons. Is that correct?—That is correct in those two particulars.

16,502. Then, so far as these two particulars are concerned, the witness in his evidence did not make an incorrect statement?—He would not make it in that respect, but he generalised it, as I heard it, very much; and it was impossible to do otherwise than call it generally incorrect.

16,503. So far as the comparative increase and decrease is concerned, of ships and their tonnage, he was quite correct?—No, he was not in this respect, —that in one case he added the Tees, and in another place he did not add the Tees.

16,504. But so far as regards the increase of ships and tonnage at any one of the other coal ports, they show an increase, and Hartlepool shows a decrease, between 1856 and 1857. Is that the fact, or is it not the fact?—It is the fact in that particular year, but not over the period that the gentleman stated.

16,505. Well, so far as regards last year, you admit the fact is correct as he stated it?—I do not remember his figures. If he said it decreased, he is right, but I do not admit the quantity of his comparison.

16,506. What increased accommodation have you made for ships at the port of Hartlepool between 1855 and the end of 1857; and has there been any increase of dock accommodation?—There has been no increase of dock accommodation at Old Hartlepool; there has been at West Hartlepool, but it is scarcely complete.

16,507. During these periods, has dock accommodation for ships increased?—The dock accommodation has been increased, but not made available yet.

16,508. It is not open to shipping?—It was open for shipping, but it was not completed. At this instant, near the large merchandise dock here, there is a large warehouse being erected.

16,509. But just answer my question. Had you the dock accommodation here in 1857, where ships can load, which you had not in 1855?—Not for loading coal, simply merchandise. There has been no additional accommodation provided during that period.

16,510. But there has been additional accommodation for the shipping of merchandise?—There has.

16,511. To what area?—A dock of 10 acres, a timber dock, with timber yards behind, and another graving dock.

16,512. What is the area of water? Is it 12 acres increase?—It will be about 12 acres or more.

16,513. How do you account for it, that while you have an increase of dock accommodation to that extent, the shipping frequenting Hartlepool between 1856 and 1857 has decreased so very materially?—I account for it in this way, that several collieries have been temporarily diminishing their exports at West Hartlepool, in preparation for a very large extent of trade which will be developed in the course of another year; and that there has not been the quantity of coal which could have been shipped. Two or three collieries are sinking to lower seams, and, consequently, have not been able to ship the usual quantity during the progress of their works.

16,514. Are any parties, to any extent, who were working in 1855 and not in 1857, any of those that ship at Old Hartlepool?—I do not know anything about Old Hartlepool.

16,515. West Hartlepool? Has there been an actual diminution in the coals worked during the process of sinking to the lower seams? Many thousand acres will be available in the course of 12 or 18 months which have never been opened yet or brought out of the bowels of the earth, and the coal owners have been spending large sums of money, and they have not shipped so much coal; but a line of railway has been made to new collieries; within six months they will be opened. It is the best coal that goes to London—the Tees Wallsend.

16,516. Do I understand you to say that there is a large field of coal undeveloped?—Yes.

16,517. Is it to the south of Hartlepool?—The west and south-west.

16,518. Will the port of shipment of that undeveloped field be Hartlepool?—It must be West Hartlepool.

16,519. Now tell me something as to the main point, the saving of life; I think you referred to the fearful gale of January 1857?—Yes.

16,520. And you handed in a list of wrecks which had taken place from Flamborough Head to—which point north did you say?—First from Flamborough Head to Whitby.

16,521. I want to ask you some questions upon that, because a return has been sent to me, and I believe to the other Commissioners, for it comes in a printed form; and in this return the coast is also divided in somewhat a similar manner which you have divided it here, and this return which I hold in my hand gives results very different to those in the return you handed in. It states, that in that gale there were 27 total wrecks between Flamborough Head and Whitby. Your return makes it out that there are 13 wrecks?—Yes.

16,522. Now it gives the names of the ships and the spot where they were lost, and how they were lost; and how do you account for it, that while one gives 13, the other return gives more than double. I will allow you to look at it, perhaps you will be able to tell me. Look at it and compare it with your own?—Well, I detect a fallacy in the very first ship. The first ship, called the *Radcliffe*, of Whitby; it states that she was bound from Hartlepool for London, loaded, and was wrecked at Filey, and the crew saved. I think I was wrong in saying that was a fallacy, for she was wrecked at Filey, but it says, "left Hartlepool on the "second. The captains of these vessels reported "themselves to be caught in the gale off Flamborough Head "in company with a large fleet of vessels, many of "which were lost off Hartlepool and other ports;" and it also states that other vessels were caught off Flamborough Head by the gale. Now, I happen to know that among the list of witnesses I have got, I have got the captains of one or two of these vessels, which are stated to have been wrecked there, and who are prepared to come before the Commissioners and deny it.

16,523. Then, do I understand you to say, because our object here is to arrive at correct information and truth, that it is not correct that 27 ships were lost between Flamborough Head and Whitby in the gale of 4th January?—I do not intend to say it is not correct, but I have not been able to ascertain, by examination of the deposition, that they were.

16,524. Do I understand you to say, you will produce captains who will prove to us that the ships named in this return, nine of which appear to have been wrecked, with all hands; do you mean to say that you will produce captains to prove to us that they were not lost between these places?—No; I apprehend no captain can tell that. A man who was in the gale would have quite enough to look after himself. I cannot say that my captain will say what proportion of vessels were lost there, but these are the only proportions we could ascertain. I beg to make this remark, that it had been said that all the ships that had been put into what is called the Filey district had been caught off Flamborough Head, and could not reach a harbour to the north of Whitby, and yet in the other list, vessels that are acknowledged to have been wrecked to the north of Whitby, and others that were also caught north of Hartlepool, were also caught off Flamborough Head in the same gale, showing that which is represented as being inconsistent. That of the vessels which were wrecked between Whitby and Flamborough Head, 27 are represented as having been unable to reach a harbour north of Whitby, and yet there were 28 that in the same gale did happen to pass Whitby Point, and were wrecked north of it.

16,525. Now then, Mr. Jackson, are you prepared to state that that return which you have handed in to us, contains an account of all vessels which during that dreadful gale were lost on the shore between Flamborough Head and Whitby?—I cannot say all, because some might founder and never be heard of.

16,526. I say in the account?—That is all I can find.

16,527. Then if there had been a harbour of refuge at Hartlepool such as you propose here, where such ships as these could have found safe shelter during that gale, would that harbour of refuge have saved any of those ships?—Humanly speaking, you may say all, except those that foundered, and what the conditions were one is not in a position to tell or speculate upon.

16,528. Do you mean me to get it down in evidence that if there had been a harbour of refuge in Hartlepool Bay, these ships which were wrecked between Flamborough Head and Whitby during that gale would have been saved, humanly speaking?—I do.

16,529. Wrecked on the coast?—Wrecked on the coast between Flamborough Head. The gale commenced on the 3d of January from south-south-east, and veered round to east-north-east. Of course, if seaworthy and able to reach Hartlepool Bay, and it is admitted in that list that there were 28 did reach it, of the other 27 that were wrecked, alluded to in that list as being wrecked between Whitby and Filey Bay,—and they were in a condition to run past Whitby in some way, as 28 did clearly,—they must have been saved.

16,530. But might it not arise from those which reached Hartlepool being further to the windward than those which were unfortunately wrecked between Flamborough Head and Whitby, and could not weather Whitby Point?—Not in a south or south-east gale, it is a fair wind.

HARTLEPOOL.

Mr. R. W. Jackson.

18 Oct. 1858.

Mr. Lindsay.

16,531. But the gale ranged, you say, from east-north-east to east-south-east ?—South-south-east ; it lasted two days.

16,532. If ships were caught between Flamborough Head and Whitby when the gale veered round to the east-north-east, could they have weathered away at Whitby ?—I don't think there were any ships between Flamborough Head and Whitby on the second day of the gale. I would rather you asked some seamen. I only took the depositions of all the parties here who say the wind caught them all about Flamborough Head east-south-east.

16,533. Have you measured the breadth of your proposed breakwater ?—I have.

16,534. What is the length per statute mile ?—4,744 yards.

16,535. How many miles is that?—Two and a half.

16,536. Then the whole breakwater will cost a little more than 2,000,000*l.* ?—Yes.

16,537. What area of sheltered water will you have at the four fathoms and upwards within the limits of the proposed breakwater ?—I will have to calculate that upon the chart.

16,538. What area of three fathoms and upwards will you have ?—1,526 acres.

16,539. What area at four fathoms and upwards ?—There will be fully 1,400 acres.

16,540. You say the depth of water in the bay and the approach to it was very decided on the increase ?—I did not mean to say it was deepening outside of five fathoms.

16,541. Do you mean to say that within the line of the four fathoms the depth of water is decidedly on the increase ?—Decidedly.

16,542. Do you mean the whole area of the bay between the Long Scar Rock and the Heugh Head ?—I take the whole area.

16,543. How do you arrive at that ?—The haven master has made very careful surveys, and he annually reported them to the Commissioners.

16,544. The depth has been decidedly on the increase during what length of time ?—During the last 12 years. For the last 12 years there has been a decided deepening in the mean depth of the whole, and not a shallowing. The approaches at low water have gone higher in the bay, exhibiting clay where I never saw clay before, and I have known the bay intimately for many years.

16,545. I have asked you these questions because by a Parliamentary paper before me, Drawing No. 7, Report to the Admiralty under the 11th and 12th Victoria, c. 129, 1850, I find that the three-fathom line of soundings in 1846 is about 800 feet further to the eastward than what it was in 1838, showing that, if that chart is correct, instead of the bay being very decidedly deepening, it is very decidedly shallowing ?—I don't know upon what authority that chart is prepared.

16,546. Do you know whether that is correct or not ?—I really can't pretend to say. In the centre of the three-fathom line I see there is an extension eastward. As a Commissioner I have understood that between 1838 and 1846 there were and are variations of the three-fathom line in one particular part, but from 1846 to the present period whatever may have been the cause of that little increase to the eastward it does not exist in any altered shape except by a decrease over the whole mean area of the bay. Previous to that period there had been works going on in connection with the dock, and which excluded a large portion of water up to that period from the bay.

16,547. Take a date nearer than 1846. This same chart shews that, between 1846 and 1849, the three-fathom line has gone eastwards about 200 feet ?—Well, so far as my own knowledge is concerned, which arises chiefly from the reports of our officers, that is incorrect.

16,548. Will you be able to explain to the Commissioners the cause of this very great discrepancy, for either this chart must be wrong, or the soundings on which you have given your evidence must be wrong, the one or the other ?—Certainly.

16,549. Will you be able to explain to the Commissioners that point ?—Mr. Mossman will be able to explain his surveys precisely. Those who have known this bay five years ago can see what they never saw before, namely, bare clay and large boulder stones that had hitherto been covered.

16,550. What draught of water was the ship of 2,200 tons ?—Seventeen feet.

16,551. Consequently that ship of 2,000 tons did not draw a great deal more than one of our largest colliers ?—She was a very large ship, and was the mail packet between Antwerp and New York. I take the 2,000 tons from Mr. Pile's return, but whether it is register or burthen I can't tell.

16,552. (*Capt. Washington*). Do you know anything of the lithographic plan that has been put into your hand, or who is the authority for it ?—I don't know who the authority, is except that it was appended to the report of Mr. Cockburn Curtis, who held a preliminary inquiry at Hartlepool, I think, in 1849.

16,553. Did Mr. Cockburn Curtis sound the bay ?—I don't know.

16,554. I see the state of the bay is laid down in 1852 by Mr. Francis Giles. Do you know anything about a survey of that date ?—I do not ; it is amongst the records of the Port and Haven Commissioners.

16,555. Do you know if there is anything in that report or plan which shows the same datum line was used in comparison between the two water lines ?—No.

16,556. You talked of water having been kept out of the bay ?—Out of the slake.

16,557. Do you allude to sluicing ?—No ; during the execution of the works a coffer dam was put across the old harbour.

16,558. Was the whole volume of tidal water which filled and emptied the slake twice a day excluded for a certain period from its return on the bay ?—Yes, for three or four years.

16,559. Are you of opinion that that would be quite sufficient cause to account for any shoaling at a particular part of the bay ?—I think it would certainly have some effect. I also think some effect would be felt when certain displacements of the rock at the Heugh occurred, perhaps thoughtlessly, and caused some washing away of the headland.

16,560. What displacement do you allude to ?—The displacing of the foreshore rocks, taken away by permission of the Duke of Cleveland, who claims the foreshore. They took the stones to build the docks at Old Hartlepool, and let in the sea upon the headland, causing some falling down of the cliff, and it is possible that a portion of that might fall into the bay. The displacement of the rocks terminated, the slake opened, and nature allowed to resume her operations ; there has not been for 12 years any sort of difference between the depths. The mean depth of the whole bay is the same as it was previous to 1846.

16,561. Were any sluicing operations carried on in any part of the time ?—None.

16,562. Between 1838 and 1846 did any sluicing operations go on ?—I don't remember.

16,563. Have sluicing operations gone on since 1846 ?—Yes.

16,564. Do they go on at present ?—Yes.

16,565. Are you aware whether any large amount of silt is driven into the bay by its operations ?—I do not know.

16,566. Is the plan you have produced for a harbour of refuge or sheltered anchorage designed by yourself ?—It is.

16,567. Are you professionally an engineer ?—No.

16,568. Then you would not tie yourself to this plan if an engineer proposed another design, by which a sufficiently sheltered area could be obtained at a

much less cost?—Oh no! If they could produce the same results at a less cost I should be too happy.

16,569. Is there in the possession of the Port and Haven Commissioners any other design?—Not that I am aware of. The Port Commissioners did apply to Parliament to enclose the harbour shown upon the wreck chart on the wall, and the design was deposited according to the usual form of Parliament, and that harbour was authorized, subject, of course, to any alteration.

16,570. By whom was that design made?—By the late Mr. Rendel.

16,571. Did he give any estimate?—Yes.

16,572. What is the amount?—800,000*l.*, and 30,000*l.* for the protection of the headland.

16,573. Then it appears that the late Mr. Rendel, who there is no doubt was as good a harbour engineer as this country ever produced, was satisfied that he could construct a breakwater to shelter sufficient area in Hartlepool Bay for 800,000*l.*, while your estimate is 2,000,000*l.*?—Yes, if all rubble work. No doubt, if we connect with the shore the piers, we could do the same way as they do at Holyhead and Portland; clearly then the estimates would be very materially reduced, but these are detached breakwaters.

16,574. Will you state the width of entrance at the north?—About 1,000 feet.

16,575. Do you consider such a width necessary?—I don't. I would diminish it to about the same as Kingstown Harbour, 880 feet.

16,576. It has been repeatedly stated to the Commissioners, by engineers and others, that 600 feet entrance was ample for any harbour of refuge, and that indeed ships in gales of wind took Sunderland piers, which are only 370 feet wide. Have you any reason to doubt that?—I don't like 600 feet out in five, six, or seven fathoms. 1,500 feet at the centre opening is wide. I thought it better to put it at an increased width, because it would be easier to decrease than increase.

16,577. Are you aware that in the pier run out from Portland there is an opening 400 feet wide, that that is bridged over, and that the stone is carried by railway over it and deposited beyond?—I am quite aware of it.

16,578. Is there any reason why the same process should not be followed at Hartlepool?—It is not the same locality. The opening at Portland, I apprehend, is nearer the shore than the approach to either of these breakwaters.

16,579. Have you ever before to-day seen this paper (*the same referred to by Mr. Lindsay*) which professes to be, so far as its titles goes, facts relating to the inquiry as to the best position for a harbour of refuge on the north-east coast of England?—I have.

16,580. Is the document authenticated?—I am not aware that it is.

16,581. Can you guess where it is likely to have sprung from?—It has a very strong feeling towards Filey.

16,582. It states that petitions were presented to Parliament from Hartlepool and the river Tees containing about 700 signatures in favour of a harbour of refuge at Filey. Can you tell us how these 700 signatures were obtained?—I have not the slightest idea. I can easily imagine that petitioners are got pretty freely from ordinary seamen, and also it may be from masters of ships, to whom it may be represented, that they are going to make a harbour of refuge at any place, and who would say "Oh, very well, then I will sign it." Had I thought of presenting a memorial to this Royal Commission in favour of a harbour at Hartlepool it would have been signed by every man who frequents this port; and I believe there is not a master or seaman in any ship in both these sets of docks that would not volunteer to come and sign it, and come and give evidence.

16,583. And do vessels in the docks come from different parts of the world?—All parts.

16,584. You think 6,300 signatures, including fishermen, could be obtained to a petition in favour of a harbour of refuge in Hartlepool Bay?—Yes, far more than that.

16,585. In this rather singular document it refers to a gale of wind and gives us all the particulars, except the all important one, the direction of the wind, do you happen to know how the wind was?—South-south-east; it blew within two points of a hurricane.

16,586. I see that in No. 2 return, opposite the wreck of the *Union*, it is stated that "this ship, I pre-"sume, left Yarmouth Roads on the 3d, in company "with 70 or 80 others, the wind southing and increas-"ing as they ran down. About 9 p.m. hove to for "the night, Flamborough Head west-south-west nine "miles. There is no doubt 12 out of the vessels "lost that day would have been saved by a har-"bour at Filey." Is there any reason why these vessels, with the wind at south-south-east, should not have run to a refuge harbour in Hartlepool Bay?—None. This extraordinary paper states that 27 of the vessels caught off Flamborough Head were wrecked between Flamborough Head and Whitby because they could not fetch a harbour to the north, while the 28 that are reported to have been lost between Whitby and Hartlepool to the north were caught in the same gale and about the same place, and yet they did fetch to the north; therefore this strikes me as a most extraordinary analysis of any gale of wind.

16,587. After that statement, I think we may dismiss this printed paper as utterly valueless. You said 241 vessels were wrecked in 12 years, was it in Tees Bay or Hartlepool Bay?—In Hartlepool Bay, and a few straggling ones just abreast of Seaton and about half a dozen to the north of the head.

16,588. Can you add those which have taken place at Redcar and the Heugh?—I should say about 40.

16,589. What was the average of the crews of the 241 vessels wrecked?—I should think about seven.

16,590. Then you believe the lives of about 1,700 seamen were risked, and that out of these 92 were lost?—92 were lost, but many were saved by the life-boats.

16,591. And of the whole number the life-boats appear to have saved 200 on the coast in eight years?—The West Hartlepool life-boat has saved 200.

16,592. Are there other life-boats in Hartlepool Bay?—Yes, four in Hartlepool, and West Hartlepool has provided a second.

16,593. Can you procure for the Commissioners the number of lives that have been saved by other life-boats in the same period?—I have no doubt I can.

16,594. And in 1857 as many as 44 lives were lost?—Yes.

16,595. Do you know any part of the coast of the United Kingdom where there was a greater loss of life in the same period?—No.

16,596. Is it notorious that along the north-east coast of England, Tees Bay is the chief site of the wrecks?—It is.

16,597. Taking the coast from Flamborough Head to the Farn Islands, is it not the deepest part of the bight of that bay?—It is; no vessels could even get off on either tack when once embayed between Robin Hood's Bay and North Sunderland. I hear that constantly and frequently.

16,598. Are you of opinion that a harbour of refuge should be placed where it is most likely to catch embayed vessels?—I think it is.

16,599. Should it be placed nearly in the centre of the district that these vessels frequent?—That, I have no doubt, would be the most convenient place.

16,600. Does Tees Bay occupy exactly that site?—It does.

16,601. Do you know any part of the coast of the United Kingdom on which 11 life-boats are stationed in as small an extent of coast as here?—I believe not. The fact of the existence of these life-boats in this very deep bight is strong indication where most wrecks occur and where there is the greatest necessity for means for the preservation of life and property.

HARTLEPOOL.

Mr. R. W. Jackson.

18 Oct. 1858.

Capt. Washington.

16,602. A life-boat and all her paraphernalia cost some money ?—Yes.

16,603. Is it likely a life-boat would be established if there was not an absolute necessity for it ?—Certainly not. I should say Old Hartlepool, which is also extremely energetic in its endeavours to save life, has, during the period I stated, also saved 200.

16,604. From what places does the trade of Hartlepool in merchandise chiefly come ?—From the great manufacturing districts of England, and all parts ; the imports are quite as large, they are very large especially in timber, which trade is thus progressing in a most extraordinary extent, and is likely to be still further developed. I have already provided five acres of bond yard, and only the other day I was asked by influential houses in the trade if I would provide three times that quantity within the next 12 months, and larger ponds as well as timber yards.

16,605. Can you account for the great increase in the traffic of Hartlepool ; is it the facilities offered by the port ?—It is, merchants find it to their advantage ; there is a difference of the rates between Hull and Hartlepool for the freight of large ships. Timber ships alone this year have a difference of 22 per cent. saving at Hartlepool as compared with Hull, from the simple circumstance of the conveniences that have been provided for shipping, the facility of getting to sea, the absence of all river navigation, and a return cargo at all times at command. I consider Hartlepool, therefore, budding forth to immense results. Only this year large ships have ascertained what has been provided. I have heard from several captains of large ships that they had no idea there was such a place on the east coast, and we shall feel it in the course of another year. Ships are not like railway trains. A shipping place takes a little time to develope.

16,606. Are the graving docks at Hartlepool so superior to the graving docks of which all the world has heard at Antwerp ?—I suppose so ; the *Constitution* was an instance in point of one coming here.

16,607. What is the length of the graving docks ?—One is 320 feet and the other 350. Ships at this very moment are coming down to them from London.

16,608. You have not stated the floating area at Old Hartlepool docks ?—About 60 acres ; at West Hartlepool there is dock and harbour accommodation of 78 acres, and the length of dock quays at West Hartlepool is upwards of two miles. Behind the timber yards we have five acres only just started with, and we have available immediately joining that, and very likely to make use of it, 17 more, making 22. Our warehouse accommodation at West Hartlepool covers two acres, and contains an area of 317,720 square feet, or upwards of seven acres. At West Hartlepool we can ship a million and a half tons a year ; at Old Hartlepool they can ship a similar quantity.

16,609. Are there all sorts of appliances for repairing vessels at Hartlepool, and all that vessels taking refuge are likely to require ?—Yes ; at Old Hartlepool there are several ship yards, patent shipways, gridirons, and all appliances that are required ; and at West Hartlepool it is the same. Works are almost in hand for a patent slipway and gridirons, and we have contemplated two more patent slipways.

16,610. What space, for how many vessels, do you consider would be required, looking to the traffic of the coast, if a harbour of refuge were made at Hartlepool ?—For 500 to 700 sail at a time. They will be constantly moving in and out with the entrances north-east and south ; and with such a large area as I am contemplating, with light vessels we might go up to 1,000 ; besides there are docks that will hold a thousand.

16,611. Could you not at high water take the greater part of the vessels from the bay into four docks ?—Yes ; but the refuge ships would displace the loading ships, which we should not exactly like.

16,612. Suppose you put 500 into the docks, would not that afford very great relief to the bay ?—It would.

16,613. Could steam tugs take hold of vessels immediately they came within the piers and take them to their moorings ?—Oh dear, yes ! 106 have gone to sea laden from West Hartlepool with just five tug boats, and if there were 10 they would do an immense quantity of business. The steamers would have about a mile and a half to go to the entrance ; but there is a wonderful difference between that and the entrance to the Tyne, and up to Shields Harbour. There you are in a narrow place in a tidal stream, but at Hartlepool it would be perfectly open anchorage, and ships would scarcely want steam in Hartlepool.

16,614. But without disparaging the claims of the Tyne from its enormous traffic, would there be equal facilities at Hartlepool ?—Oh dear, yes ! I think the Tyne is very deserving of the attention of the Government to carry out their works, and Sunderland also, but the capabilities of this bay are so great that the requirements of steam power would be much less than in rivers.

16,615. (*Capt. Sulivan.*) You are aware of the improvements which are going on in the Tyne, by which they profess to get 15 feet water ?—I am.

16,616. And if it succeeds, will that be a valuable harbour of refuge for all the light ships, and most of the loaded ships belonging to the north coast collier district ?—Yes, at suitable times of tide. It would be a harbour of refuge at flood tide.

16,617. Do you consider it important that the northern coal ports should have a harbour somewhere south, where loaded vessels could run to if caught after leaving in a gale of wind ?—Unquestionably ; as an instance, take the number of vessels which came in here yesterday morning.

16,618. For the same reason, do you not think that, for the Hartlepool collier trade, a port somewhere south of Hartlepool would be equally valuable to the Hartlepool trade ?—Not in the same breeze.

16,619. If a port south of the Tyne is more favourable for vessels leaving and being caught after leaving their harbour, for the Tyne trade, then the vessels leaving Hartlepool would find a port to the south equally favourable for the same reason ; would they not ?—No, that is assuming they all got up to that point.

16,620. Well, assume that Tyne vessels got 40 miles to Hartlepool, Hartlepool would not be made available to them ?—Except in a north-east wind.

16,621. If Hartlepool vessels got an equal distance, then a port equally far to the south would be equally valuable to them ?—Not in an easterly gale ; if you allude to the same circumstances and the same gale, that cannot be.

16,622. If the Tyne vessels have got 40 miles to the south of their port, may we infer that Hartlepool vessels will have got 40 miles south of their port in the same wind ?—Yes.

16,623. And if Hartlepool forms a valuable port of refuge to Tyne ships, would not a harbour south of Hartlepool form an equally valuable harbour of refuge for Hartlepool ships ?—Provided they got to it ; but 40 miles would only bring them up to a little beyond Whitby.

16,624. You state that this paper is valueless because it is not on any authority ; can you tell me, so far as value is concerned, why we should lay any more stress on what you have compiled than those that have been laid on the table ?—There is no more value, of course, to the document I put in than to any other document, provided it is equally correct.

16,625. Do you mean to state that you can prove by those witnesses that are going to be examined that any one of those vessels said to have been lost in the Filey district, were not lost there ? I think I understand you to say that ?—No ; I am going to prove by a witness who was in the gale, and who was caught between Flamborough Head and Whitby, that he could not have fetched a harbour at Filey, but could have fetched one at Hartlepool ; that the vessels caught between Flamborough Head and Whitby could not have fetched north of Whitby.

16,626. That is the point I was going to bring you to. You state that these vessels lost south of Whitby could have reached Hartlepool as well as those that did reach, and because the gale was south-east ?—Certainly.

16,627. Now do you believe that any sailor in command of a ship would allow his vessel to be wrecked between Hartlepool and Whitby in an east-south-east gale, when he could either have kept off the land on the starboard tack, or could have run back to Hartlepool, or into the Firth of Forth ?—It is quite impossible for me to say what a captain would do.

16,628. I ask whether it is probable that any man would have allowed his vessel to be driven into that small bight, if we may so distinguish it, between Whitby and Flamborough Head, when he could have weathered or drawn off the land or run down to the Firth of Forth. Would he not have been a madman to have done so ?—He would, if there had been a harbour at the bottom of the bight.

16,629. I say, as it was ?—We have no harbour of refuge now ; they know it is hit or miss when they come.

16,630. Could not a man have kept off shore on the starboard tack, or run back to the Forth, as long as the gale was south-east ?—I don't say they run in between Filey and Whitby when the gale was south-east ; I said many of them had stood out to sea, and the gale caught them from east-north-east.

16,631. Is it not more likely that all these vessels lost between Filey and Whitby were lost when the wind had shifted to the eastward, so that being leeward they could not weather Whitby, or get off the land on the south tack ?—I think they would be able to weather Whitby.

16,632. Do you think any man who could have weathered Whitby with a sandy bay at Hartlepool on their lee bow would have allowed his ship to be driven on to that rocky coast ?—No ; but in a gale of wind, when there is no harbour of refuge, and when you are knocked about on all sides, I won't profess to say, neither would any man profess to say, what he could do, or what the circumstances of the gale would compel him to do, or where he would choose to come ashore ; but it is the want of a positive position to which he knows he can run at all times without contending with the gale that causes the accidents.

16,633. We have it in evidence in other ports that when ships are caught on this coast, and cannot get off the land, they try to get to the best beach to run their vessels on, and so save their lives. Do you believe that out of these 27 vessels that were wrecked on that rocky shore one man would not have tried to weather the Head and get back to the best beach at Tees Bay or elsewhere, if he could possibly have done so?—It would be a choice of evils necessarily in a gale of wind, such as we had on that occasion. No man whether light or laden could determine which was the best to go to.

16,634. You said that as one half of the vessels fetched back to Hartlepool those others might have done so had they chosen, or words to that effect ?—The paper states so.

16,635. Is it not very possible that in the number of colliers off Flamborough Head, when the wind draws round to the point you have named, while all the weather-most vessels would weather Whitby, and get back to Hartlepool, all the leeward-most must fail to weather Whitby, and so be wrecked there ; and would not this account for different ships going ashore there, and others at Hartlepool ?—No, you see the gale was so long at south-south-east. The report of that gale says they were all caught off Flamborough Head, both the 27 and the 28, on the same day ; therefore if the 28 got down why could not the 27 ?

16,636. Then do you mean that with an east-south-east gale these 27 vessels ran down on that rocky coast, and were wrecked when they could have got off ?—I believe they did not run down in the east-south-east gale, but stood off, and were caught, and then it was a question which was the best.

16,637. If they had stood off, and were far enough to windward to have fetched Hartlepool, would they not have done it rather than have been wrecked ?—Hartlepool would not have saved them.

16,638. Would not Hartlepool, as a rule, with its life boat and beach, save a vast number more men from vessels wrecked there than would have been saved from an equal number of vessels that were wrecked on the shore about Flamborough Head ?—I think so.

16,639. Then would not a collier master, desirous of saving the lives of his crew, do everything he could to fetch Hartlepool or the Tees Bay and beach, rather than be lost ?—I do not believe any master of a ship off Filey Bay, or off Whitby, makes up his mind to run for a beach. If he comes to Hartlepool he makes the best of his way into the harbour if the water will receive him, and if it won't he knows there is the beach ; but no man at 50 or 60 miles from Hartlepool makes up his mind to run his ship ashore unless he has lost his anchors.

16,640. Do you suppose that any sane man off Whitby, or that coast, knowing there is a beach and all those life-boats, would allow himself to be wrecked on that rocky coast if he could by any possible means have weathered Whitby and come back to Hartlepool ?—He would not certainly. He would have contended for Hartlepool if there had been a harbour for him, because he would then have had some point to look to for the saving of his ship, but not having a harbour of refuge, he is tossed about by every wind, and getting worse and worse every time he makes a tack.

16,641. You say there is a channel now five feet deeper than it was outside the West Hartlepool Dock ?—Into the West Harbour.

16,642. Has that channel ever been dredged ?—There is nothing but clay, and we have been dredging it by the ordinary dredging process, and it is maintaining itself.

16,643. Then the channel that you speak of, where the water is deepened at the two-feet mark in the entrance to the west dock, has been in a great measure formed by dredging, and not by any natural movement of the tide ? Not only that, all the sand is dispersed from abreast of the west harbour, and all the clay bare there ?—The lock sills in the west docks are about 5½ to 6 feet below low-water ordinary spring tides.

16,644. Can you be kind enough to say whether you attribute the silting up of the bay to the back water being stopped by the coffer dam about three years ago ?—I don't attribute it altogeher; I say it is a circumstance occurring during a period of years when that operation was performing.

16,645. What years ?—It was in 1832, 1833, 1834, and 1835, I believe.

16,646. Can you account for that ?—It is in a report of Mr. Calver that the depth of from 26 to 28 feet water in the anchorage ground had decreased from two to three feet.

16,647. That was before any of the stoppage of the back water occurred ?—I know nothing about that.

16,648. That from 1838 to 1846 over two-thirds of the bay nearly half a million cubic yards of deposit has been formed ?—I don't think Mr. Calver says that. It is quoted by Mr. Calver from a Report of Mr. Cockburn Curtis.

16,649. Report of Mr. Calver to the same effect, I think ?—No ; I have paid a great deal of attention to it.

16,650. As everybody is bound to do to anything Mr. Calver writes, but the argument in the whole of that document is against a close harbour; I don't wish to go into that question, but just to give the dates to see whether the silt was going on when the back water was stopped ?—Nobody has attempted to say at what particular time the alteration of the three fathoms line had occurred.

16,651. But I was struck by one remark you made. You said the low-water line was going inward, to show that the bay generally was deepening. I see it is stated in the report that that shallowness in the

HARTLEPOOL.

Mr. R. W. Jackson.

18 Oct. 1858.

bay was on both occasions accompanied by a slight deepening of the inner shore of the bay, so that this low-water deepening went on at the same time that the centre of the bay was shoaling up, the greatest amount of the shoaling being unfortunately in the central part of the bay in the anchorage ground on which so much as two or three feet depth had been lost ?

16,652. Have you any means of showing that this silting up during these periods did not take place, or do you dispute the facts stated in this Report ?—I am bound to dispute the facts from all the information that the port can have ; from all the information of the captains who were in the habit of bringing up in the bay.

16,653. That is from 1826 to 1846, I only gave you those two periods ?—Well, I've no means of saying whether it is right.

16,654. From 1846 to 1849 the inspector remarks ; can you tell me who the inspector was?—Mr. Cockburn Curtis.

16,655. He says that the "shoaling has taken place "across the whole width of the bay at its entrance "or mouth, and the whole of the anchorage the "ground has deteriorated, the greatest loss of depth "more than three feet has, unfortunately, taken place "in the northern portion of the Bay, inside the shelter "of the Heugh ;" will you give any documents or evidence to disprove that assertion which agrees with the chart on the three-fathom land ?—I should be very happy if I could give you any information from 1826 to 1838.

16,656. But this loss I mentioned is from 1846 to 1849 ?—Then our haven-master who has made periodical surveys reports to us, and will be able to state that it is not correct.

16,657. Mr. Curtis again states, "This proves not "only there is the presence of foreign matter, but "that it has a disposition to fill the deeper portion "of the bay "?—I am satisfied from my own knowledge, that the whole of the southern portion of the bay is very decidedly deepened.

16,658. Mr. Cockburn Curtis further says, "The "sea sand with other matter is being continually "dredged out at the tidal basin at West Hartlepool ;" is that correct ?—It is not ; it is a new work, and we have been dredging and taking it out into 20 feet.

16,659. Mr. Curtis continues: he says, "Sand drifts are apparently at the tidal basin of Hartlepool;" is it correct that it has been continually dredged out ?—It is not correct.

16,660. Again, it is said, that sand in large quantities is lodged in space between the two harbours, the accumulation keeping pace with the extension of the West Harbour works ; is that the case ?—At high-water mark in the very recess there is an accumulation of sand which is between high and low water mark, but it is not an available part of the bay in any way whatever, it is a fine beaching ground, and nothing else.

16,661. And that deposit of three feet of matter, the greater part sea-silt, is being removed by dredging out of the Victoria Dock, a work only formed 14 years ago, is that correct ?—It cannot be from the Victoria Dock. I have seen that stuff ; it is as black as coal.

16,662. "Three feet of silt has come in at the Victoria Basin, and has to be dredged out ;" is that correct ?—It is not the correct way to put it ; in all these coal ships there is a very considerable amount not shipped, and it is the case in West Hartlepool.

16,663. I am quite right in what I first stated, that this is Mr. Calver's report, and these are quotations from Mr. Curtis ?—I know what Mr. Calver has alluded to with regard to taking it out of the Victoria Dock.

16,664. He only says, "Hartlepool Bay will silt up "were it inclosed, as is proposed, by the pier ? "—I "think that is very likely.

16,665. He also says, "The risk which must attend "its inclosure goes against the attempt to make a harbour of refuge there." I ask you now, whether any works outside the bay, such as you propose, would not in great measure tend to cause additional silting ; may that not to some extent increase the tendency to silt up by confining the water more into the bay, and so tend rather to increase the shoaling up of the bay ?—Mr. Calver does not say there is any shoaling of the bay now.

16,666. He goes up to 1849, and stated shoaling, and states that since 1849 the haven-master told him that it is not increasing, but what I am anxious to get out is, if you can show us that natural causes of the silting up for the previous 20 years have not been in operation since 1849, and are not likely to be in action again, because this is a very material point connected with a harbour of refuge at Hartlepool ?—I think Mr. Calver himself states, that matters in the bay are somewhat stationary. He brings it up 1849. Our haven-master will show there was no increase between 1846 and 1849.

16,667. And, therefore, Mr. Calver and the haven-master are directly at issue, are they ?—Well, they are at issue ; but Mr. Calver does not say to what extent.

16,668. He goes on to say, as an instance of the way in which the silt is held in the water or likely to be deposited, that the Victoria Dock has silted up to the extent mentioned, though the sea water has been admitted to it for only a portion of time, and also that the deepest portion of the bay has shoaled considerably. I can only repeat, that, with regard to the Victoria Dock stuff, I have no doubt in the world it is the same as is found in all docks, more or less. This being a coal port, a considerable quantity of coal is lost in the process of shipment ; and we have at West Hartlepool, though only 10 years old, had to take out the stuff that is so deposited. That which is taken out at West Hartlepool is as black as coal. There is some portion of sand in gales of wind; the sea has in suspension a quantity of sand, and if it were carried into a corner, it would not get out, but would be deposited, and that is the case in every harbour ; but when you come to a sheltered anchorage, I don't propose to bring anything to rest, while there must be something at rest in a dock.

16,669. Taking the inner portion of the bay, which is said to have been silting up in these 20 years, I cannot learn that any works have been going on materially to affect the silting up, or in any way account for that otherwise than by natural causes. Can you say that the construction of these breakwaters will not in this inner bay increase the tendency to deposit, by making the water stiller than it is at present ?—No ; the currents that will be made by these three openings will be of a very different character to waves lashing into the bay unobstructed. Sand does not come into this bay any more than it does into any other part of the coast. There will not be that lashing of the waves into the bay of Hartlepool as in the Tees Bay, Filey Bay, and every other place between high and low water mark. There is no appreciable deposit of sand in Hartlepool Bay. Speaking of a particular spot there may be in all bays a little higher sand than at another, or a shoaling ; but that is not the character of the bay, because as a bay it is not shoaling. At a particular part of the bay, between 1826 and 1828, and between 1838 and 1846, I don't profess to deny that there has been a slight alteration of the three-fathom line. Take it outside, and there is no alteration really and truly of the available anchorage of the bay or outlet. But nobody pretends to speak to a few inches.

16,670. Mr. Calver says the deposit has extended over two-thirds of the bay to the extent of nearly half a million of cubic yards. That is very different from a slight silting up in some places ?—I take Mr. Cockburn Curtis's chart, and I find what I said is corroborated, that it is just about the three-fathom line at the centre, but at the two horns the line remains the same.

16,671. You stated, as one reason why Hartlepool was so easy to make, that one ship found her way by the soundings, and the other was wrecked off Flamborough Head. Suppose an equally careful captain had been in the ship lost off Flamborough Head, the soundings would have brought him in here just as easily as the ship that was saved. Don't you think she was lost by neglect of her soundings?—I should think not.

16,672. You gave us 1,650 acres as the whole area of the three and four fathom line, and you gave us 488 acres as the five fathom line?—I thank you for giving me the opportunity of correcting that four fathoms; taking it as near as you can at a mean between five and three will be about 870 acres.

16,673. I suppose you removed these piers to the increased distance from the shore to endeavour by a stronger current, a larger space, and less interruption from an in-shore current to reduce the probability of any silting up?—Yes.

16,674. If any reduction of the space were made by removing the piers closer in might it not increase the tendency to silt up?—I don't admit the tendency to silt up. If there had been a tendency to silt up in Hartlepool Bay we would have been silted up long ago. Things are remaining much in the same state as they were this time twelve years at all events; but from my own knowledge, and soundings, there is a deepening of a considerable portion of the bay.

16,675. Will not a certain portion of the sediment from these docks find its way into the harbour in the same way that a tidal river brings a certain amount of sediment?—Most unquestionably no; for the simple reason that when the dock gates are closed nothing comes out.

16,676. Where does the sluicing bring the water from?—From the large area of the slake, 168 acres.

16,677. What is the object of the sluicing?—Keeping open the channel, and having an effect on the bar.

16,678. Of deepening the entrance at their docks, and removing some of the bar that prevents vessels approaching so readily to their dock?—Yes.

16,679. Then this sluicing, if it has the desired effect, deposits the sand it removes into the bay?—It deposits no more than it brought in. It is the same thing backwards and forwards. There is no additional quantity, and can be no more, and the same deposit in these very docks takes place in all the rivers to some extent, but there is no detritus.

16,680. Do you believe that in the bay near to the outgate of the Tees any sand is brought up by the water on the beach?—There is the same tendency to sand falling on the beach in Hartlepool Bay that there is in Filey Bay, or any other bay, because the sand on this coast from Yarmouth Roads right away down the bay as far as St. Abb's Head is moving, but there is no sand coming from Tees mouth into Hartlepool Bay.

16,681. (*Capt. Vetch.*) Will you explain to the Commissioners the reason why you prefer this breakwater to a close harbour?—Because I wish to keep nature as near as possible in her present state, and because the line of the breakwater I have suggested is properly in the line of the currents both of the flood and the ebb tide, and will take the currents therefore end on both ways.

16,682. Will you state your objection to a close harbour?—Because upon this coast from Yarmouth Roads to the Farn Islands, sand comes down in gales of wind, particularly in southerly gales, and it is brought down and held in suspension by the water, wherever, therefore, that water is,—and there is no more in the water abreast at Whitby than there is brought off the Tees—wherever that muddy water settles, it must deposit.

16,683. What is the depth of the proposed harbour at the entrance?—One is nine fathoms and the other seven.

16,684. Then you have a clear opinion that at nine fathoms of water the sediment of the sand at the bottom of the sea is moved by the waves and current?—Certainly not, it is the sand that is in commotion, and brought up in a heavy sea, and the water being charged with sand, it is conveyed by the tide, not by the waves alone, into all the recesses wherever the tide comes. Of course if it comes into a dock, as it does in the Tyne and elsewhere, it will deposit.

16,685. Then you consider that with eight or nine fathoms water an aperture open to the sea, the sand and silt would come into that harbour?—No, there would be no sand or silt falling into Hartlepool Bay at that depth.

16,686. Then you could not object to a close harbour on that account?—I have no objection to a close harbour on that account. If you take the close harbour to the same depth, because the same law would apply; but I may mention that when you have got charged water into a small space where there is a run of tide, the chances are there will be a deposit at high water, and generally where it is in a state of rest. In West Hartlepool there was a deposit which might have been seen about a year ago, accumulating in the corners and in the bights, but there is not an inch of silt, and it cannot be while the harbour is one perpetual series of currents.

16,687. That is, in a gale of wind at nine fathoms of water there is sand and silt kept in suspension?—Yes, anybody may see that on the coast. It is so in Yarmouth Roads, and all over; but if this small harbour of West Hartlepool, containing 44 acres, does not silt up one inch, from operations that I have been lately performing, between high and low-water mark, how, in the name of fortune, is a harbour of 1,000 acres, when there is a perpetual revolution of the currents through that harbour into the deep sea, to silt up?

16,688. Would you tell me what the material is with which you propose to construct your breakwater?—The large rubble stone, the different stones of different specimens which are lying behind you.

16,689. Where do they come from?—Some from about two miles of West Hartlepool, some from the coast of Northumberland, Bambrough Castle.

16,690. What are the particular nature and quality of these stones?—Whinstone, and fine hard heavy limestone.

16,691. How do you propose to convey them from the stone quarries to your depth in the sea?—There are different processes. Some come by the sea, and some must be transported in barges, and by gangway.

16,692. But if it cannot by gangway?—Then by barges. But the contractor has made his own calculations, and thinks three years would be sufficient for him to deposit it if he had sufficient money. He is an efficient and experienced contractor, and I have no doubt he would find the means of depositing that stuff if he got the money.

16,693. What stone do you propose to apply to the superstructure?—Fine hard freestone.

16,694. From where?—From the immediate neighbourhood.

16,695. What neighbourhood?—Some 20 or 25 miles off. I am getting a good deal of stone from Bramley Fall now.

16,696. Will not the carriage be very expensive?—We know what it is, we are in the habit of paying for it every month.

16,697. And your contractor has taken it into consideration?—He has; and he tells me, and will tell you, he considers those prices liberal.

16,698. You stated 44 lives were lost in one year?—Yes.

16,699. And 200 were saved by the West Hartlepool boat. In what period was that?—10 years.

16,700. That would be at the rate of 20 lives per annum?—Yes.

16,701. Will you state whether or not these 200 lives saved by the boats, and the numbers that were actually lost, should not be added together to show

HARTLEPOOL.

Mr. R. W. Jackson.

18 Oct. 1858.

the danger of the bay ?—No doubt ; and I have promised to obtain by to-morrow as near an account as I can of the saving of lives by the other boats in addition to those I have given you, and taken out of ships that have come into the bay.

16,702. Is it not the fact that Tees Bay extends from the harbour of Hartlepool to Redcar ?—Yes.

16,703. And that it includes in fact Hartlepool ?—It does.

16,704. Hartlepool Bay then is a portion of Tees Bay ?—Yes.

16,705. Would a harbour of refuge at Hartlepool not be a great advantage to Tees Bay ?—Unquestionably.

16,706. (*Chairman.*) Do you think the set of the Tees in the direction of Hartlepool causes any deposit of sand near the Long Scar ?—I think not.

16,707. Has there been any dredging of sand near the entrance of West Hartlepool during the present year ; and has such dredging been intended to produce increased depth of water ?—The dredging from West Hartlepool this year has been principally of clay. We have now made a complete uniform depth from the dock sill to where the land works out with the bottom of the bay, so that any vessel passing out of West Hartlepool Docks goes to sea safely.

16,708. Can you speak as to the effect of south-east gales on both harbours as respects silting up ?—There is no silting up in the harbours. We have had many gales from the south-east on this coast, and they produce muddy or sandy water the whole way down to the Farn Islands a certain distance outside ; but I have watched many and many a time the ebb tide out of the Tees, taking a course something like east-north-east.

16,709. (*Sir F. Smith.*) You said inside there is positively no silting ?—There is none at all.

16,710. No deposit has taken place in connection with the harbour to show that there is a loss of water? —Certainly not. But a very decided deepening, and it is going on every day. I do not know when it is to stop.

16,711. Is it by a natural process or not ?—By a natural process.

16,712. Are you prepared to affirm that along the coast there is no increase of deposit ?—There is no increase of deposit that I can detect at any part of this coast. The most prominent sand that I know of is the Herd Sand at the mouth of the Tyne. That has been uniform for a number of years. Probably the pilots at the mouth of the Tyne might say that in a heavy south-east gale there would be an accumulation of six inches, but it would go again north-easterly.

16,713.. If there was a deposit, would a portion be in the bight of the bay ?—No doubt.

16,714. Therefore, there might be some accumulation at projecting points ?—Not immediately at projecting point, there might be just inside, on either side of it.

16,715. In ordinary groins put up along the coast, you find deposits of sand on one side or the other ?—Yes, there would be that.

16,716. That does not apply to your case ?—Not to the deep sea.

16,717. At what depth of water, according to your experiments, is sand raised by the action of the wave? —I cannot possibly tell you that, but we have seen in south-east gales on this coast sand in the water at a long distance out, but where this has been disturbed I cannot say. We do find that south-east gales bring a charged water, and we find that north-east gales take it away again. North-east gales clear generally any little accumulation that may be collected down upon those different points, but it would be unfair to assume at Hartlepool Bay any more than at any other place. As near as can be, during a period of 12 years, there has been an increase of depth throughout the bay generally. In one particular part of it, on the north side I think, it is a little higher from the sand, but most unquestionably on the south side of it is not so. I had an opinion that the pier, which the Port Commissioner built about three years ago, had a tendency to cause a little accumulation behind it.

16,718. On the west side of the pier ?—Yes, but if we are to compare great things with small, and to be so minute as to take over inch by inch all a great bay like this, both high and low water mark, and take the little accumulation that may be made by artificial work, and then say the bay is shoaled, is perfectly a wrong principle, for I can find in every place in the United Kingdom variations arising from particular circumstances, but on the whole nature brings herself to her own arrangement, though you may destroy that by artificial works. I should not like to enclose the bay and to prevent those ordinary currents and movements, which, I think, help in the main to keep the bay open, and must keep it open.

16,719. You say you see no reason why Hartlepool should be the place where we assume there is a deposit ?—Certainly.

16,720. Is there any reason for assuming that Hartlepool Bay is placed where there should be no deposit ?—Yes ; I could mention that a vessel came only a month ago direct from Cronstadt was never in the place before, and drawing 19 feet 3. She came into the bay the day before quarter-day. I sent out a couple of steam-boats, and she came in to the West Harbour drawing 19 feet 3 perfectly clear. Speaking therefore practically, I don't think you can find any fault with the bay of Hartlepool, if a ship like that will come in, on quarter-day, one of the tide harbours.

16,721. Do you admit that there will be any difficulty in getting to Hartlepool if a harbour of refuge should be constructed ?—None whatever ; the entrance may be considerably too wide, but I don't object to the entrance ; and I am quite sure that the admission of 1,500 feet of sea into a space of 1,600 acres will not be felt ; it will be quite inappreciable. 1,500 feet of sea would be of no great importance whatever. It would separate immediately on both sides, and fall over the Long Scar ; therefore I am quite sure that any small boat in any gale of wind could go off. If money be an object, it could be reduced.

16,722. Are these red lines projected by you or by an engineer ?—They are my own design, but I have left the details to an engineer of considerable experience, and a contractor.

16,723. And have you well studied the direction for these breakwaters for a length of time ?—Yes, for years. I never thoroughly made up my wind, whether it was desirable to put a breakwater on the Long Scar or not. I considered that when the bay was covered by means of these breakwaters, and would then be a question whether you would run an inner pier upon the Long Scar or not. I think in some circumstances it would be desirable, but in the present state of the bay it is not.

16,724. Then your vessel would be shut out from every wind, and the Heugh would be made perfect smooth water ?—Yes, and it would be a great improvement to the Tees, it would direct the flood tide and ebb.

16,725. Do you not think that the real object required might be attained at considerably less expense by making your breakwater proceed from the north side of the Heugh ?—I never would close a breakwater to the north.

16,726. But if there be no tendency to silt, why not ?—Because the bay for 10 hours is in a complete rotatory state, and I don't want to destroy that. There can be no natural deposit if you keep up the rotatory motion.

16,727. What produces that rotatory motion ?—The flood tide comes into the bay, and of course finds its way immediately round the head, as water will always do,—for the first two hours, therefore, works into the bay ; it then being filled, infringes upon the Long Scar Rock ; then there is the slake behind, and the tendency of the slake water is to draw everything round, and that rotatory motion continues from the

first two hours of flood to low water; the currents are very mild, but still they are there.

16,728. So that if sand were in suspension instead of being deposited it must come into the bay, go round and out again ?—It does.

16,729. If it comes into the bay and goes out of the bay by the Heugh, would it not become still at the mouth of the Heugh, and deposit there ?—You are supposing that sand is rolled along the bottom of the shore.

16,730. I am speaking of the sand in the water ?—The water is charged for a hundred miles north and south, but that deposit never falls. In the whole arrangement of this coast nobody finds any material alteration. We sometimes have in the Tees a deposit of sand ; it gets reduced ; nature finds it convenient, I suppose, to have to deepen the bar on the Tees, according to the prevailing winds ; the same takes place in the Tyne, they lose two and three feet of water and begin again.

16,731. Has any section been taken of Seaton sand, to shew whether there has been any accumulation of sand there ?—I am not aware the decrease of sand is very perceptible off the Long Scar at a place called the House.

16,732. Has it ever occurred to you to have instead of two detached breakwaters one continuous breakwater parallel to the shore ?—That is one way, but I don't recommend it, because in that case you really only get one entrance, and that is from the northward.

16,733. Your present plan will not give an entrance to the south ?—It does not, and it is not wanted. It gives an exit.

16,734. I asked if you had three entrances, and you said yes ; you mean three openings ?—Yes.

16,735. Do you think a harbour of refuge is really called for to save life and property on this coast ?—Oh ! it is a harrowing scene here sometimes, when you see a large fleet of ships knocking about, and the steamboats unable to get out to help them.

16,736. Do you know the number of lives lost in the bay ?—90 and upwards in the bay of Hartlepool.

16,737. Do you know whether these lives were lost by collisions or wrecks ?—None by collisions.

16,738. You have no doubt these vessels would have been saved if there had been a harbour of refuge ?—I have seen vessels founder actually within the line of the breakwater I have suggested.

16,739. I dare say you must feel that the greatest defect about your project is its costly nature ?—I feel no difficulty about that, because I have prepared it with a very comprehensive view, but upon a principle which can be adapted to a reduced character, it could be begun with, and we need not wait before it is all done to get shelter, as in Redcar or any other place. But in this place every yard of underground work would be a protection pro tanto to this bay. If you can form a low breakwater here there would be no heavy sea falling into it. From the very first stone that is put in there would be the gradual improvement of a bay which has already been designated a harbour of safe capability.

16,740. Does that apply to this particular plan of yours ?—Yes ; if you try to make a breakwater on a rock you have not this advantage.

16,741. Will you explain why ?—Nature has provided the very finest breakwater at the Long Scar.

16,742. Is Filey Bay adapted for a harbour of refuge ?—It is a very fine bay, and I don't say some improvement might not be made which would be advantageous to the mariner as a good resting place. At present it is a half-tide rock, and you could only improve it by building on the top of it ; but at Hartlepool you want the ground swell kept out, and there is already a good shelter under the head, and there is a fine harbour and dock for ships to enter if the steamer can get hold of them. If there were thrown out a rubble stone breakwater in nine, eight, seven, six, or five fathoms steamboats would be able to go out and save ships when they cannot now go out.

16,743. Why should you not build the breakwater on a half-tide rock ?—You may ; only you have not got the shelter you have got here of 800 or 900 acres.

16,744. I presume you are of opinion that if you could have more than one harbour of refuge along this coast, it would be very desirable ?—I have no objection to two.

16,745. In fact if the Tyne could be improved, your project carried out, and Filey Bay improved, would not that be desirable for the mariner ?—It would ; but I cannot hear the word harbour of refuge applied to the Tyne or any navigable river, because it cannot be approached on an ebb.

16,746. But if improved it would be a great advantage to the mariner ?—No doubt ; and it is deserving of improvement.

16,747. Do you think the site of Filey Bay is good from its geographical condition ?—It is suitable for a purpose, but not for the dangers this deep bight of the coast has. I have thought much about the description of work available in Filey Bay, and should not be at all sorry to see it accomplished, but if the harbour of refuge were formed on the rocks, I am bound to state that is the wrong place. We don't want protection in Filey Bay in a north-east gale, or any wind at all which will enable a seaman to get round the head. A breakwater to the south-east of the village of Filey might enable vessels to bring up and wait the tide, instead of harassing the crew by dodging about.

16,748. I presume that you have heard that at Flamborough Head there are often very large fleets collected ?—Yes.

16,749. Do you imagine that if such a fleet of vessels is obliged to bear up and come to the northward, any single harbour such as that you propose would be sufficient to hold them ?—Oh, quite ; if there is to be only one harbour, I should recommend as large a space at Hartlepool of sheltered anchorage as the money will produce.

16,750. Are you in a position to afford any local fund towards any Government grant ?—Yes ; but not sufficient. I negotiated some time ago with the Government and the Exchequer Works Loan Commissioners, with a view to a grant of money for something to be done here. The negotiation was in fact taking place at the very time when the Select Committee on Harbours of Refuge was appointed, and in consequence of that it was suggested to me that I had better suspend the application and wait the result of that Committee.

16,751. (*Mr. Lindsay.*) Do you think an opinion is of any value when opposed to fact ?—No ; I think an ounce of fact worth a pound of argument.

16,752. You stated that, in your opinion, a return which had been handed to me, and which stated that 27 ships during the gale of 4th January were lost between Flamborough Head and Whitby, and that nine of those vessels were lost with all the crews on board, was utterly worthless ?—I did not say that.

16,753. You stated "yes," did you not, to one of the Commissioners who expressed that opinion ?

(*Capt. Washington.*) My question was as to a comparison only between two places.

16,754. (*Mr. Lindsay.*) Then you did not state that the return was utterly worthless ?—I did not ; I think it is valuable for the reason I have given, viz., that it shows a great inconsistency as between the 27 vessels wrecked between Flamborough and Whitby, and the 28 between Whitby and Hartlepool, for that very return, in terms, states that all the vessels were caught in the same gale on the same day, and in the same place ; I say that if 28 vessels could get to the north the 27 could also.

16,755. Will you be able to prove by any witness that 27 ships were not lost on the coast during the gale of the 4th January between Flamborough Head and Whitby ?—I cannot.

16,756. Will you be able to bring forward any witness who can state that any of these ships were

HARTLEPOOL.

Mr. R. W. Jackson.

18 Oct. 1858.

Mr. Lindsay.

not lost between the places named on that morning?—I cannot answer that question without asking the witnesses.

16,757. Will you endeavour to show that this return is not correct even to the extent that any one of these 27 ships was not lost between the places named?—I will; there are two persons who were in the gale, who were wrecked, they will be able to tell you.

16,758. In your return, you state that there were only 13 ships lost in that one gale between Flamborough Head and Whitby; this return states there were 27; it gives the names of the ships, and therefore I for one am bound to believe this return is correct, unless it can be shown to me that these ships or some of them were not lost within the limits named?—The return which I have put in, and which gives 13, is not intended to imply that there were not more, but simply that I have not been able to obtain more. As regards Hartlepool or the Tees district, where there are 28 returned, I've ascertained from indisputable authority that there were 28.

16,759. You are not prepared to show there were not more than 13 lost between Flamborough Head and Whitby?—Yes.

16,760. Are you prepared in the same way to show there were not more lost or not fewer lost between Whitby and places further north?—No; but I will give credit to that statement. I would much rather not deny it. I don't know it, but I would much rather assume the correctness of the 27 ships, as is stated in that return to have been lost between Flamborough Head and Whitby.

16,761. That is, you will admit its accuracy?—I will, because I don't know to the contrary.

16,762. Then so far as regards the return which you have handed in, unless it shows the whole of the ships lost south of Whitby, your return becomes utterly valueless as a comparative return; is not that the case?—I have not put it in as a comparative return.

16,763. For what object did you put it in?—For the purpose of ascertaining the distances between which the wrecks occurred in that gale and the whole wrecks.

16,764. But if that return does not show the whole wrecks, what is the value of it?—I say it does as far as I can ascertain it; there are no means of ascertaining the whole.

16,765. Do you intend to lodge your return as containing the truth, and the whole truth?—It contains the truth as far as I know, but it might contain more. I mean to say there will be more that I have not been able to include; but I have not done it, I pledge my honour, to diminish any other person's return, but to give a faithful return of that gale.

16,766. We are dealing with facts?—These are facts.

16,767. But does it contain the whole facts, as far as any one has the means of knowing?—It contains the whole truth that I have been able to ascertain, but it is not for me to say if a person is able to produce 27 instead of 13 that I should deny it.

16,768. Then you searched for the whole truth?—Yes.

16,769. From Whitby to the north?—Yes.

16,770. And you searched for the whole truth from Whitby to Flamborough Head?—These are given, and I have the documents which are my authority.

16,771. Am I to understand that your return contains all the wrecks which were known to take place on the 4th of January between Whitby and Flamborough?—Yes, so far as I have been able to ascertain, but other persons may be able to gain information which I have not, and if so, I give them credit; I don't say there were not 27, but we see there are 39 in the one and 28 in the other. I gave in the return, showing 39 and 15 at the northern ports, and the other paper only gives 28.

16,772. Would you desire to withdraw this return to reconsider it, or do you wish to lodge it as it is?—I lodged the return in the best manner that I have been able to obtain it. I don't say, and no man living can say, whether it contains the whole wrecks that occurred in that unfortunate gale; but it does contain those which have been ascertained within Hartlepool or Tees district, and the Northern ports or Tyne district, where it has been stated in this very return that north of Whitby and then down to the Tyne, and including the Tyne, there are only 28, I produce 54, that is the truth.

16,773. I offer no opinion on the returns, I only wish to be satisfied which is correct?—I can only tell you I have not brought this return for the purpose of contrasting the one with the other.

16,774. But you lodge a return which you desire the Commissioners to understand is a correct return, and you lodge it for their guidance?—But I had not said, and will not say, it contains the whole of what may have occurred; because I have had better means of ascertaining from Whitby to the north, which contains 54, those people who have compiled this other return have given 24. I give them credit for having better information with regard to the Filey district between Flamborough Head and Whitby than they have had between Whitby and the north. I give them 20 for that, and let them give me credit for stating that instead of 28 there were 54. I don't wish to disparage the return. I don't know who prepared it, or anything about it.

16,775. (*Capt. Washington.*) Did you, or did you not, understand the question put to you by myself with respect to these returns that, as a comparison to determine the position of the site for a harbour of refuge on the north-east coast of England, that document was valueless?—Yes, I think I gave my reasons for the statement that it was upon this simple circumstance of 27 vessels having been said to be wrecked in the same gale, when these vessels could not have made Hartlepool.

16,776. (*Capt. Sulivan.*) Taking this as valueless as a comparative return, I presume you mean to say, because the comparative number of ships was stated incorrectly?—It is in one respect, it does not give the quantity as a whole.

16,777. Particularly, I may tell you that we shall have numbers of all the wrecks on this coast by the time we return to London; if, when we get back, it is proved by the comparison of these accounts of the wrecks that his is more correct than yours, will it not be proved that yours is the more worthless and valueless of the two?—Most unquestionably.

16,778. Then at present it is a doubtful point whether this is worthless and valueless, or whether yours may not be the more worthless and valueless for comparison?—Yes, as a return of vessels; but really and truly my observations were directed to the argument that was derived from this return. I don't care at all in making this remark whether my return as regards the quantities, or the return which you hold in your hand is correct. I simply say, that in rejecting this of mine as valueless, and containing too many in the one respect and too few in the other, I then returned to the allegation that I made that it is worthless, as stating that Filey Bay would be a better place than Hartlepool for a harbour of refuge; that is all I meant.

16,779. If the return should prove true and the comparison true, or if yours should prove true and the comparison true, would that not on one side or the other be proving, so far as these returns can go, the importance of one district over the other?—No; per se I don't think that would be a fair way of contrasting it; it must be the men who were on board those vessels who should determine what places they would make best.

16,780. Really, I suppose that all those men,—which you will not allow,—did their best to keep off the coast, and were only wrecked from absolute necessity. May not both parties have included the wrecks on the Whitby beach, and each party have taken those wrecks at Whitby as in his own district?—

I said so before, distinctly. I did not make use of the word Whitby, but I said it might be that we have included in the Hartlepool district some that the gentleman who compiled this return had included in the Whitby district.

16,781. Then, therefore, you might have done yourself injustice by saying in the district?—Precisely; it was meant for that. Instead of 39 in the Hartlepool district, it should be reduced only; you will observe that in the northern part it does not include the Tyne; now I did include the Tyne, and I have stated in the Tyne, though it does not include the 15 which I have ascertained between Black Hall and the Tyne. Assuming 28 to be correct, and that I am incorrect by taking the 11 from the Filey district and giving it to this, I have not included the Seaham, Sunderland, or Tyne wrecks.

16,782. I think you have said the ships wrecked in Hartlepool Bay were most of them laden ships from that batch of ships off Flamborough Head?—I got it out of the returns.

16,783. Exactly. Then, could all those ships, as well as those in the Filey district, have gone into a harbour of refuge at the Filey district?—I think not, with the south-south-east gale in which they were all caught.

16,784. You said that the breakwater would direct the tide more fairly towards the entrance of the harbour?—I think it will.

16,785. If so, must it not be diverting a portion of the tide that would otherwise go into the bay?—Certainly not, because it is after the sea has passed beyond Hartlepool Bay where the south breakwater commences.

16,786. I am speaking of the eastward breakwater, which will deflect the tide towards the Tees mouth?—No, the southward.

16,787. It runs, however, at right angles in the direction of the Tees?—Oh dear, no; it runs nearly end on with it.

16,788. This long breakwater to the north; may that not divert a large portion of the flood tide that now enters round the Heugh in the Hartlepool Bay?—No; if you have an opening of 1,000 feet, you know, in Hartlepool, it will not be felt. Hartlepool Bay is not a river, it is an open bay.

16,789. You made some remark about the work that had been made about the sand collecting at the north corner of the bay?—Yes.

16,790. And at the same time you made the allusion to the trifling alteration of the depth when other parts of the bay had deepened; do you consider a statement that two or three feet over the greater portion of the bay, the greater accumulation having taken place in the southern portion of the bay, which you thought was keeping clear, is a trifling matter?—I don't believe it.

16,791. But suppose it to be true?—I would call it trifling if it remained stationary. I could understand that 12 years ago there was three feet less in the whole of this bay, but from 1846 to the present time there was no alteration, as I have explained to you, in that bay. Then I say the trifling alteration of three feet before is inappreciable to the existing state of things and to the depth of water that now exists, and to its capacity for a sheltered anchorage.

16,792. I understood you to apply the remark the "trifling alterations" to those which had been referred to as having occurred before the year 1846?—No, there were no trifling alterations then.

16,793. Then the alterations you allude to, of two or three feet over the greatest part of the anchorage ground from the centre of the bay, you don't mean to call trifling if they really took place?—I don't call them trifling if they existed at the time, but if nature there consolidated the bay and made her own what she has, then I say that the alteration before 1846, coupled with the unaltering from 1846 to 1858, is not a matter of importance, because it shews that the bay is not filling, and that the regular tendency is not to fill, but the tendency is to maintain its present position.

16,794. One more question. Do you know any cause in action in these two periods, of 10 years each nearly, when the bay was stated to have been silting up different from what has occurred in the last 10 years to account for it?—Yes. I mentioned that there were circumstances which don't exist now.

16,795. I thought you only mentioned one period of three years, because I heard no other?—Yes; it might have occurred during that period.

16,796. I beg your pardon; I gave you two periods?—Then I mean to say there is no alteration.

16,797. That would make six feet?—Yes, then there is no such thing. I cannot go back to 1826, but if the bay shoaled between 1826 and 1838 in any particular part three feet, and if between 1838 and 1846 it shoaled two feet more in another part, and if it is stationary from 1846 to the present time, then I mean to say that nature has done that which we ought not to complain of. But I do state this most distinctly, that from 1846 to the present there are not the same circumstances in operation, and there has been a very natural increase; therefore I am bound to say, though in the whole parts of the bay certain little localities may have accumulated, a point of sand is not to be taken in a great space of 1,000 acres as any disparagement to its position; and I say it is a misnomer to call it a shoaling of the bay.

16,798. Do you consider those who have the responsibility of recommending a place for a harbour of refuge at a great outlay to the public, should consider it of the first importance to ascertain that, so far as ordinary circumstances will go, there will be the least possibility of silting up?—Oh, most certainly; there can be no question of the importance of that.

Mr. W. Ogilvie Mossman examined.

16,799. (*Chairman.*) You are haven-master to the Port and Harbour Commissioners of Hartlepool?—I am.

16,800. How long have you held your present appointment?—Upwards of 12 years.

16,801. And previously how were you occupied?—In Her Majesty's surveying department under the Admiralty, under the command of Captains Slater and Otter for 16 years.

16,802. You are aware of the objects of the present inquiry?—I am.

16,803. Will you now give to the Commissioners your opinion as to the necessity of a harbour of refuge on this coast?—The necessity arises in consequence of the very great traffic that is daily traversing backwards and forwards about the coast, and to the very great number of wrecks, and loss of life, that takes place annually between Flamborough Head and the Farn Island, and to obviate the very great and distressing casualties, of which I have witnessed a good many. I think a harbour of refuge at the most convenient place upon the coast would be a means of diminishing a great deal of the casualties that do take place. If I am to give any opinion as to where the harbour of refuge should be, if there is only one, I think in the centre, at the most convenient place, in the bottom of the bay, that is within the line of embayment; that is the place where a harbour would be most beneficial.

16,804. You are aware, from the evidence which we have already taken, that there is a question as to the silting up of this bay; what is your opinion on that subject?—Well, since 1846, I find, from my own observations, that there is decidedly an increase of from 3 to 5 inches, taking the average depth of the

HARTLEPOOL.

Mr. W. O. Mossman.

18 Oct. 1858.

whole bay. I do not mean to say that it is that, if you go into all the little intricacies of each contour line; but, after going carefully through my plans—of which I have one for every year except one—I find nothing in the bay from which any gentleman should say the bay is inclined to silt up. I have taken levels over the shore, commencing at the Long Scar Rock and coming round the shore, northward to the Old Harbour; I find that, on taking the first survey as a base, including the water and also the shore, there is upwards of half a million cubic yards of moveable matter that I have lost since 1846.

16,805. (*Sir F. Smith.*) If I understand your last observation, it is to the effect that you have found half a million cubic yards of water in that time?—No, not half a million cubic yards of water in that time.

16,806. Then, what is the value of your observation, if you have not got water where you have lost sand?—We shall have it at high water, but I am referring to low water.

16,807. Are you prepared to stake your professional reputation that there is no silting up in this bay?—Yes, I am. None since 1846.

16,808. Your knowledge goes back to 1846?—It might be said to go back for 40 years.

16,809. Then why don't you go back to an early period?—Because I have nothing to prove what I may say.

16,810. You have no reason to doubt that the state of things in 1846 existed in 1836?—I have no idea. It might be, but I did not make a survey in 1836.

16,811. Why there should have been any change for the 12 years previous to your survey the general circumstances of the case are the same, are they not?—Yes, excepting the opening of another harbour in the bay.

16,812. The circumstances are such that they would not deter you, as a man responsible for the advice you give, in recommending that the bay be made a harbour of refuge?—Decidedly not; in fact, I would not be afraid to stake my life in favour of its being made so.

16,813. As an old sailor, may I ask you upon a general principle whether you would prefer to have, all other things being equal as regards holding ground and general site, would you prefer to have harbours of refuge in the bights of bays or on promontories?—In bights of bays decidedly; ships can get to leeward when they cannot get to windward; and if you place a vessel in a gale of wind off a promontory, and she has what a sailor calls "a loose leg," she can go either way, but if you place her in a bay she must go zigzag, back and forward, and she is always going to leeward.

16,814. Suppose you draw a line from Flamborough Head to the Tyne, and that at the Tyne a good harbour of refuge can be made, and also at Flamborough Head, and another at Hartlepool Bay, if the vessels were behind that line, would you recommend a vessel preferring going into a harbour at the bight of the bay or on the promontory?—I would take the harbour that I could most conveniently reach.

16,815. Suppose both were equally convenient?—I would take the nearest.

16,816. Even if it happened to be on the promontory?—No doubt.

16,817. Suppose they were both equally near, would you take the promontory or the bight of the bay?—It would depend upon circumstances as to the part of the coast I would have to make afterwards.

16,818. But supposing all those circumstances equal, I want your decided opinion whether you would prefer the harbour in the bight of a bay or on a promontory?—Decidedly in the bight of the bay, because if a man is stationed anywhere where he can fetch for a headland, and the land flies, as you go, north or south, if he can fetch one way he can fetch the other; but if he is situated between two promontories, between the Farn Islands and Flamborough Head, he cannot get off. If I was making for a promontory an accident might take place as I was steering for it, and I might not be able to reach it.

16,819. Presuming that you did miss the harbour on the promontory, you would still have the bight of the bay to run to if you had a harbour there?—Certainly. If I started for the bight of the bay in the first instance I should always be able to go to leeward when I could not go to windward.

16,820. If the Commissioners have heard anywhere that a harbour of refuge is not wanted on this coast for the safety of life and property, you would be disposed to attach no importance to such opinion?—None whatever; a harbour of refuge is decidedly required for the saving of life and property.

16,821. If the Commissioners have been told that vessels are not well manned and well found, and that a good vessel and skilful master will keep the sea rather than go into a harbour at all, would you think that a sound opinion?—I think if a man told me he would keep the sea rather than go into the harbour, I should be inclined not to believe him.

16,822. Is it not the fact that vessels are better manned and are better officered generally in the mercantile marine than formerly?—I believe so.

16,823. And the vessels are better found generally?—I do not know for that; I see some in a very wretched state.

16,824. Are you disposed to ascribe any of the dreadful casualties which occur to vessels being indifferently found?—I have no doubt they are.

16,825. Do casualties occur more to vessels laden or not laden?—I believe, of the wrecks we have had in the vicinity of Hartlepool, the light vessels are the greatest number wrecked.

16,826. And under what circumstances generally have these light ships been wrecked?—I don't remember that there were more total wrecks of light ships than of laden ships; but a light ship is much more ready to be got off the shore than a laden one.

16,827. Are there facilities for vessels beaching themselves north or south of your harbour?—There are—to some considerable extent. I have known vessels when they could not fetch either of the harbours, square their yards, and run upon the beach.

16,828. Have many of the accidents that have occurred on your coast arisen from collisions?—Not many in the vicinity of Hartlepool.

16,829. Do you think that collisions are more likely to occur if you had only one harbour of refuge than if you had two or three?—There might be collisions, but I think when vessels are running for the same harbour of refuge they would all be running one way. I always apprehend that collisions take place when they are going in opposite ways.

16,830. Suppose a case of 700 vessels being at Flamborough Head coming northward, they would be all going in the same direction?—Yes, but they would not be close enough to come into collision; they are vessels running in one way.

16,831. Do you observe on the chart that there is a small number of wrecks and a greater number of collisions?—I don't know that that has attracted my attention.

16,832. It is a very important fact that. Do you know the north coast of Scotland?—Very well.

16,833. Do you know Peterhead?—I do.

16,834. May I ask your opinion of Peterhead as a harbour of refuge?—It would make a very good small harbour, but I don't think a harbour of refuge is required at that place. It is a place where you can get either one way or the other if you fall in with a gale of wind off Buchan Ness, or even right off Peterhead itself. If you cannot get the Firth of Forth you can at least get into the Moray Firth.

16,835. In fact, there would be no occasion whatever for a vessel being obliged to go into Peterhead?—She might be obliged.

16,836. If disabled, and the wind from the eastward she would go into Cromarty?—She would if she was any distance from land.

16,837. For vessels going north about, would Wick harbour be useful?—Decidedly. Some years ago I

recommended that that bay should be inclosed as a harbour of refuge for the convenience of vessels trading from the Baltic, and the ports on the east coast of England, round to the west coast, and to America, because many times a vessel coming across cannot study the tide. He is anxious to make the land, and is obliged to wait, sometimes in very heavy gales of wind, before he dare take the Firth ; it is one of the most dangerous places we have.

16,838. If that will take him to Wick it will take him through the Forth ?—It will ; but there is a danger in taking the Firth when there is a sea on.

16,839. With an adverse tide, of course ?—Yes, I have seen everything washed from off the decks.

16,840. Do you know Redcar ?—I do.

16,841. Do you think Redcar possesses any facilities for forming a harbour of refuge ?—Well, there is a small space in what is called " the harbour." It is a very small sandy space between the ridges ; the chief part is rock.

16,842. You think the space is not sufficient ?—Oh dear, no !

16,843. What holding ground is there at Redcar ? —In the space alluded to there is good holding ground, but I never knew a vessel of any size to be riding there. The holding ground is amongst the best on the coast.

16,844. Suppose economy of construction would result from making a harbour of certain dimensions here, and a small harbour at Redcar, would that, in your opinion, be a good arrangement ?—I think not ; they are too near each other.

16,845. That is, you are rather disposed to think it is dangerous to have more than one harbour of refuge close together ?—Oh dear, no ! but a seaman might confound himself between the two, and so work his ship ashore. If you give him a long distance to run he will think about it much more sharply.

16,846. We have been told elsewhere that there is a feeling sometimes amongst seamen to run even for a worse port, if it be their own port. Do you think that likely to prevail to any extent ?—No doubt a man is always anxious to reach his own home ; but if ships are bound either north or south of their own port, and the sea is in that state that there is danger in entering any harbour except the one purposely provided for them, they would go into it on the way home, and stop till a more convenient time to approach their own harbour.

16,847. As there is a harbour here, and a thriving town, do you think that if there was not any harbour or any establishment, or any town that Hartlepool would be the best position to form a harbour for the saving of life and property ?—I believe, if the harbours of Hartlepool had not been in existence there would not have been any opposition to the making a harbour of refuge here.

16,848. Do you think it is a feeling of rivalry that leads to the opposition, and that the question of expense has nothing to do with it ?—I do think so. To make a general harbour of refuge it should not be a money question ; there is a great deal of prejudice against Hartlepool, in consequence of rivalry in commercial matters.

16,849. I think no humane man can doubt the desirability of having the place which would save life and property, and therefore I assume that to be the general feeling of mankind ; and I am sure you can only ascribe it to a question of finance the not having a harbour of refuge here or elsewhere ?—I do not think the authorities at any port on this coast are capable of making a sufficient harbour of refuge with borrowed money only.

16,850. Do you attach any value to Bridlington Bay as a place of refuge ?—In northerly and north-east winds I do, but it is so shoal there is only $4\frac{1}{2}$ fathoms within the Smithic. I don't think a harbour of refuge could be made there.

16,851. What do you think of Filey ?—A very nice little harbour might be made there ; but if one harbour only is to be made Filey is not in the position where it can be made useful.

16,852. I am not talking of one harbour only, but of the means of saving life ; and if one harbour cannot do it perhaps the country will feel it right to make more than one ?—If we are to talk about the coast being properly supplied with harbours of refuge I should make three between Flamborough Head and the Farn Islands, one in the centre and one near each of the extreme ends, say at Filey Bay to the south, and Druridge Bay to the north. In Alnmouth Bay two rivers come out ; and that is the reason why I would not recommend it, although I once did so before.

16,853. Does the existence of a river coming out render it unfit for a harbour of refuge ?—It does.

16,854. Do you know Blyth ?—Perfectly.

16,855. Do you think it can be improved in such a manner as even in the smallest degree tend to save life ?—I don't know the state Blyth Harbour is in at present. It is some years since I have been there.

16,856. Are you aware a scheme has been proposed for the formation of a large harbour of refuge at Sunderland ?—I have heard of it.

16,857. Will you favour the Commissioners with your opinion as to the suitability of Hartlepool Bay over Sunderland Bay ?—I have heard they propose to make a harbour of refuge at a place they have recently called Hendon Bay—in the Smooth, inside the White Stone Rocks ; but there is such a large quantity of rocky bottom that I cannot see where they will give accommodation.

16,858. Do you think, if the money were to be expended in such a large harbour as you propose to make, would the circumstance of the better holding ground in Hartlepool Bay induce you to give it the preference ?—It would. Although I am resident in Hartlepool I hope the Commissioners will not think I speak partially on that account.

16,859. Suppose two and a half millions of money were to be spent, would you recommend both Sunderland and Hartlepool ?—No. They are too near each other.

16,860. You don't apprehend that there would be any silting up in this bay ?—Not in the least.

16,861. Are you aware that the breakwaters are not proposed to be attached to the shore ?—I have heard it said so, but I have not seen the plan Mr. Jackson has explained to you.

16,862. (*Mr. Lindsay.*) Speaking to you as a sailor, when a ship is sailing along the coast, does she shape her course so as to keep outside of the headlands ?—It depends upon circumstances.

16,863. If she is off the Farn Islands, coming from Leith to London ?—I think she would try to make Flamborough Head before she went to the southward.

16,864. He would shape his course outside of Flamborough Head ?—Decidedly, if the wind was favourable ; if the wind was from the starboard-hand, he would rather draw a little inshore. In his course, from Leith to London, he would very likely steer for the salient points, if the wind was inclined off the land.

16,865. If you were in a Leith smack off the Farn Islands, bound for London, would you shape your course to go outside Flamborough Head ?—If I was aware the wind would allow me to reach that distance, I would.

16,866. Under any circumstances, would you ?—I should very likely sight Souter Point first, and then Flamborough Head.

16,867. Under ordinary circumstances, sailing along the coast, would you not shape your course so as to keep off the headlands ?—I would certainly shape my course to keep clear of them.

16,868. Say the wind was chopping round upon the land, with the headlands under your lee ?—It would depend entirely upon my position.

16,869. If you shape a course so as to keep outside the headlands, and the wind was to chop round upon the land, would the headland be under your lee ?—

HARTLEPOOL.

Mr. W. O. Mossman.

18 Oct. 1858.

Mr. Lindsay.

It would if the vessel could fetch it on either tack. If not, I would say it was to windward.

16,870. If a headland was under your lee, would you reach it more easily than you would the bight of a bay ?—I might not in some cases.

16,871. If both the bay and the headland were under your lee, would you fetch the headland quite as easy and in less time than you would fetch the bay ?—I don't know that. If I were to do that, the headland would prove to be nearest to me, because I have always understood that all vessels except one that I was in would go faster when the wind was free.

16,872. But shaping your course outside the headland, would not the headland be nearer to you than the bay ?—If I had progressed to bring the headland to a certain bearing, it would.

16,873. As a general rule, sailing along the coast, the headlands would be nearer to you than the bays when you are passing them. Then, if a ship is disabled or in distress, would she or would she not have less distance to run for the headlands than for the bays ?—If you are talking about a disabled ship bearing for a point, I care not whether it be a headland or a bay, but the small variation of one or two points of the compass in the direction of the wind would cause him to make a choice of the one or the other.

16,874. But a ship in distress or disabled, obliged to seek refuge, would have less distance to run for a headland than a bay ?—He might run into one when he could not into the other.

16,875. But I am presuming them both under your lee ?—Then I would take the nearest place.

16,876. Because you would have the least distance to run, and the least danger and risk ?—Certainly.

16,877. Whether do you think that the expenditure of two millions of money at Hartlepool, to construct such a harbour as Mr. Jackson has shadowed forth, would do more to save life and property at this particular place than it would do if those two millions were devoted to construct a harbour at Filey ; a harbour somewhere in Tees Bay ; a harbour somewhere about Sunderland, and a harbour somewhere about the Tyne ;—harbours such as vessels frequenting the coast could enter at all times of the tide ?—I don't think two millions of money would go farther than improve one a little more than to make it sufficient for what is required to give refuge to the trade.

16,878. But should it be found that the expenditure of two millions would do what I have named, whether would you spend it in that way, or at this particular place, with the view of saving life and property ?—What is the depth of water we must come to ?

16,879. Take 20 feet at low water if you like ?—Then I say it could not be done with the money.

16,880. But presuming it could be ?—Well, then I think there would be too many harbours of refuge.

16,881. But say the Government should arrive at a different conclusion ?—Well, it is a very particular question.

16,882. It is a particular question, I know that ?—I think it would require a great deal of consideration before I could properly answer it. What would be the use of having harbours of this sort so close together on this coast, or any other coast, I don't know. From the gradual increase of the shipping on the north-east coast, I am aware that if a first-class harbour of refuge is not now made through the representation of the present Commissioners, one will ultimately have to be made, and should a small one (in the meantime) be constructed upon the site most suitable for the large one, the result would be ruinous.

16,883. If there were so many harbours, would you consider it necessary that each should have space for refuge for ships besides those engaged in the trade ?—I do not ; because if you improve these harbours beyond what is called a simple tide harbour, you must go to this extent : you would encourage destruction of life and ships rather than the safety of life and property. Just say that there is a foot more water at a port, and you will find a dozen ships more there to-day than yesterday.

16,884. Assuming that these harbours were made so that vessels could take them in an easterly gale and at all times of the tide, would that tend more to save life and property than the construction of one great harbour ?—It might do to have more than one harbour, but there might be risk to a certain extent ; a man passing between two harbours might lose his life by not determining in time which to take.

16,885. Then you consider it would tend more to save life and property ?—I would construct one good harbour before I would improve the others : and I am very anxious to see one good harbour made on this coast, if any assistance is to be rendered by Government to any extent, but at the same time keeping the present harbours within certain limits.

16,886. Is it your opinion that one good harbour would do more to save life and property than making all these harbours accessible at all times of the tide ?—I decidedly say that two millions spent upon one harbour would do more to save life and property than if those other harbours were improved ; and one reason is, I don't think any of those harbours can be improved beyond a certain extent ; or then you would do an injury ; as those connected with rivers could only be used in bad weather with safety during the flood tide, or there would be a danger of losing life and property. Because, if you contract the tide it makes the sea on the ebb break heavier by increasing the current.

16,887. (*Capt. Washington.*) You stated that for 12 years you have been haven-master at Hartlepool ?—I have.

16,888. Prior to that how had you been employed ?—In the Surveying Department of the Government for 16 years, under Captains Slater and Otter.

16,889. Were both those officers employed surveying the north-east coast of England ?—They were.

16,890. Did they survey Hartlepool Bay ?—Captain Slater did ; I assisted him. That was in 1838.

16,891. Do you know whether his soundings were reduced to a certain datum ?—They were.

16,892. Were the soundings you have referred to reduced to the same datum at low water ?—To the same datum.

16,893. Was the principal part of your survey service in soundings ?—Not the principal part.

16,894. Were the principal part of the soundings done by you ?—Yes.

16,895. Was the Admiralty chart of Hartlepool Bay done by you ?—It was.

16,896. You have had 26 years' experience with the lead and line ?—Not exactly with the lead altogether.

16,897. Were the soundings you referred to soundings made by yourself or superintended by yourself ?—They were superintended and registered by myself.

16,898. Then you can speak bonâ fide and correctly to the soundings you have named ?—Decidedly.

16,899. Do you remember any soundings being taken at Hartlepool in 1836 by the late Francis Giles ?—I do not know anything about them.

16,900. Is there any records in the Hartlepool Commissioners' Office with reference to that document ?—Not that I am aware of. I have heard of Mr. Giles, and that he made the survey of the bay, but I have not seen it nor his datum. I should be very glad if I did, because I should be able to compare the total result of my observations for the last 12 years, about which there is so much difference. I wish I could find his datum.

16,901. Do you attach value to a sounding unless you know what datum it was reduced to ?—I would not give that for it.

16,902. Then any comparison as to the decrease of water, on a comparison made with Giles' survey and another, you would not place any dependence on ?—I would not, his datum being wanting.

16,903. Do you remember a gentleman named Mr. Cockburn Curtis coming to Hartlepool and

making an examination of the bay 10 years ago ?—I do.

16,904. Did he take any soundings ?—He did, but not to any extent. He took a section of soundings, I think from the Commissioners' harbour to a place just to the southward of the entrance of the west harbour. He would have taken more soundings if the weather had permitted.

16,905. Was there some one watching the tide gauge while he was taking them ?—Yes.

16,906. Were the soundings reduced to the same datum as the others ?—Yes.

16,907. Since the survey was made by Captain Slater in 1838, what other surveys have been made ?—I think Mr. Calver made a survey in 1846.

16,908. Did you compare that survey of 1846 with Captain Slater's of 1838 ?—I did not.

16,909. Did any one ?—I compared my own that I made with Captain Slater's.

16,910. You made a survey in 1846 ?—Yes, previous to Mr. Calver making his, and I compared it afterwards with the survey I made in 1838.

16,911. Our real object is to get at the truth of the soundings ?—I will be most happy to give any information of what belongs to the bay.

16,912. So I should say from my long experience of your character. Did you find any great difference between the soundings in 1846 and those of Captain Slater ?—I did. About the three-fathoms line I found a difference in one spot of three feet.

16,913. Was it a decrease of depth ?—It was in a particular spot of the bay, as if at the bottom of a pit.

16,914. Will you state where it was ?—(*Witness indicated on the plan.*)

16,915. Then on this Admiralty plan of Hartlepool Bay, numbered 1628, you have drawn a line showing where you believe the three-fathoms line to have been in 1846 ?—That portion of the three-fathoms line that projects to the westward with a curvilinear form does not appear the same from my soundings taken in the bay in 1846. The three-fathoms line became more of a natural curve across the bay, but had progressed somewhat seaward in the adjustment of the contour lines.

16,916. This line you have drawn only makes a difference of 12 inches of water ?—I think exactly in that place it appears to be two and half or three feet shoaler since 1846. I have an annual survey from 1846 inclusive, except 1857, when my duties called me away from the bay.

16,917. Will you state any change that resulted from your survey ?—I know of no material change. The physical workings of this bay show an inclination to deepening instead of shallowing. That is the result of my observation of the physical operations of the bay.

16,918. You have heard the statements read to-day from Mr. Cockburn Curtis's report ?—I have.

16,919. Do you know what foundation there is for the statement that there is a decrease of water in the bay ?—I believe this statement was founded in some measure from the contour lines on my own plan. I should have no hesitation in drawing a tracing of it, and you would then be able to see in the zigzag course of these contour lines what a large matter some parties are inclined to make out of a small one.

16,920. I think the occasion of Mr. Curtis's coming down was to report on the design proposed by Mr. Rendel, was it not ?—No, I think it was an extension of the west harbour.

16,921. Who did report on Mr. Rendel's design ?—Mr. Rendel himself.

16,922. Did not Mr. Calver report upon it ?—Yes, he did.

16,923. Was he not in consultation with you, and had access to your charts ?—I believe he had them all at Sunderland.

16,924. Had he all the plans he required ?—He had.

16,925. Do you know what the main object of Mr. Calver's report was ?—I do not ; but there were many observations in it which I did not agree with.

16,926. Mr. Rendel's design was for a close harbour ?—It was.

16,927. If I remember right, Mr. Calver's object was to show that a close harbour would not be a safe design for Hartlepool Bay ?—I believe it was.

16,928. It is true, I suppose, that he would make the utmost of every slight deposit of sand by which to support his own argument ?—There is no doubt about it.

16,929. Have you anything further to state about the soundings in the bay ?—Nothing, except that I trust what I have said will be taken as a fact so far as I have been capable of making observations ; and that it shows that since 1846 the tendency of the bay generally has been to deepen and not to shoal. I have taken soundings over a certain portion of the bay, and I have connected the surveys with levels taken over all the shores where the substance is moveable, and I find that between high and low-water mark there is about half a million cubic yards of substance that I do not know where it has gone to from under my feet since 1846. That is within the limits of the bay, and as Sir Frederick Smith says, if we lose land we must gain water, we must have that quantity of water greater than there was in 1846.

16,930. Does any sluicing go on at present at Hartlepool Old Harbour ?—Yes, they have been sluicing pretty often lately.

16,931. What is the object of the sluicing ?—To deepen the bar ; or, I might add, to keep it in adjustment.

16,932. There is a bar across Hartlepool Old Harbour ?—Yes, there is what we call a bar.

16,933. We have heard something about the quantity of deposit in the Victoria Dock. Do you know anything about the nature of it ?—I do.

16,934. Do you believe it to be sea sand ?—I do not. I distinctly state it is coal dust chiefly, and the substance that is blown from the quays with the wind. It is like a piece of glue in the first instance, and if you allow it to harden and cut it, it will be as black as your hat. No sand goes in there. There may be a little.

16,935. I think you stated distinctly your opinion that Hartlepool Bay is the best site for a harbour of refuge on the north-east coast of England ?—Decidedly. Its position with respect to the configuration of the coast will tell any man the same, if he has a mind to speak impartially with respect to what we want to save, life and property.

16,936. We have heard it stated several times along the coast, that even if a harbour of refuge were made, ships bound to the Wear and the Tyne would not take it, but would go on and try to get into their own ports at all risks ?—They may have said so, but if you will make this bay a harbour of refuge and clap a gale of wind against their vessels, you will soon see where they will be.

16,936*a*. We have heard it stated to-day that in eight years 2,999 vessels took refuge in Hartlepool Bay in its present *ex post* state ?—There has an immense number of vessels come here for refuge and got cargoes on their way. When I have discussed the matter with any sailor, he has told me he would sooner go to Hartlepool than any other place on the coast, because he would always save his life, if not his ship, and if he had to put his ship ashore he could get her off without material loss.

16,937. Suppose a breakwater to be constructed by the most able engineer in this kingdom so as to form a sheltered roadstead for Hartlepool Bay, do you think there would be any risk of this filling up ?—None whatever ; but I would rather a close harbour were made ; because, in the first instance, there is a danger of ships entering the north entrance, and also the south entrance. If ships went round the pier heads in a gale of wind, most certainly you would see many of them go ashore.

16,938. Is there anything to prevent a vessel with

HARTLEPOOL.

Mr. W. O. Mossman.

18 Oct. 1858.

Capt. Washington.

a fair wind taking an entrance with 800 feet ?—No ; but I should be inclined to give a refuge harbour on this coast about 1,000 feet.

16,939. Have you any design for a sheltered roadstead in Hartlepool Bay ?—I have for a close harbour.

16,940. What is the width of the entrance ?—1,000 feet.

16,941. What would be the difficulty in taking such an entrance ?—It is not that I am alluding to, but its being too close in towards the shore.

16,942. Why do you object to an entrance close to the shore ?—Because if there is a ship on the lee shore she would very likely get a sea on the weather bow and be knocked all to pieces, whereas if she were to go in an entrance in the centre there would be no danger, as she would go before the sea.

16,943. Could a vessel take the centre entrance with the worst wind on this coast ?—Yes ; in any weather.

16,944. Do you think Hartlepool Bay should be made a harbour of refuge ?—I do.

16,945. You object to the design that has been laid before the Commissioners ?—I object to an open harbour, and prefer a close one.

16,946. Would you prefer Mr. Rendel's design ?—I would ; but it does not go far enough to seaward ; and I may explain a matter in reference to that design which no other person knows except myself. Mr. Rendel and I discussed the cost of those works in London, and he said, if he was going to draw up a design of a harbour to be made by public money, he would go to seven or eight fathoms with his piers ; but for want of funds he could not go beyond five fathoms with the entrance.

16,947. You do not approve of that design you state ?—I do not, under those circumstances. That it does not occupy area enough within the enclosure, and it does not go into deep enough water.

16,948. You do not think there would be any danger of its throwing the sand into the harbour there ?—No ; at a certain distance seaward of the entrance the bottom is of smooth rock. I have a scheme which I have given myself a great deal of trouble about, although I did not think it would come before the Commissioners. It will show you where the rocky bottom commences outside the bay. I do not put it in as evidence.

16,949. This is very similar to Mr. Rendel's ?—It is. It may almost be said to be a modification of it ; but it occupies a greater area, and goes into a greater depth of water.

16,950. And you think there should be no north entrance ?—I would neither make a north nor a south entrance into this harbour, but construct it with a centre entrance only, and I would connect the piers with the shores on both sides, and keep all tides or currents out except simply what were required to supply the interior with the tidal waters during the flood. Then everything would come to an adjustment, as there would be no opposition to the physical workings within the enclosures.

16,951. Then you do not attach much importance to the rotatory motion of the tide ?—So far as rotatory tides go I do not. But I believe the currents at this moment in the bay do carry substances to sea, otherwise I could not lose such a quantity of sand from under my feet as I have stated ; but if what may be termed detached breakwaters are raised to protect the bay, I do not know what the result would be consequent from altering the direction of the tides, and giving some fresh course to the scouring powers.

16,952. The close harbour you propose must fill and empty every tide ?—Yes.

16,953. Are you acquainted with voyages made from the Tyne, Tees, and Wear ?—Yes ; in former years I was in the coal trade.

16,954. Do you happen to have any diagram showing the position of vessels that have been out six hours and caught in a gale ?—(*Plan produced.*) This is the line of coast extending from Flamborough Head to the Farn Islands.

16,955. I see some vessels marked as sailing out of particular ports ?—There are eight,—one from the Tees, one from Hartlepool, one from Seaham, one from Sunderland, one from Shields, one from Seaton, one from Warkworth, all the coal ports on this coast.

16,956. How came they in this exact position ?—I put them in from my knowledge of the trade, and the winds on the coast.

16,957. How long do you suppose them to have been out of their ports ?—Six hours. I have put them at that position which I have frequently seen vessels in, with north-west and westerly winds, after running to the southward for six hours, which is about 36 miles from the port they have left ; and this brings them to abreast of that part of the coast known to seamen as the Yorkshire high land, or what I call the south horns of the great recess within which so many valuable lives are annually lost and numerous wrecks take place. It frequently happens that these vessels having arrived at the above position with the wind from the land, it dies away, but shortly afterwards a breeze springs up from the south-east ; they tack and stand off, the wind increasing with showers gradually veers more to the eastward, and ultimately blows a perfect storm, from about east or east by north to east-north-east. The vessels so situated are now under low canvas. Some are disabled, and the whole fleet by stress of weather have drifted several miles to leeward ; they cannot clear the land on either tack, and ultimately, first on one tack, then on the other, they drift into the heart of the great recess, where they find Hartlepool Bay directly under their lee. Talking about so many ships reaching one point at the same time, I never knew it in my life. For instance, if a fleet of ships leaves the Tyne, vessels of small draught would leave, very likely, about half flood, and the latter part of the fleet would leave about half ebb. They are then leaving the harbour during the tide about six hours, which distributes them for many miles along the coast, and how can they reach one point at one and the same time ? I have heard a great deal about ships dodging in Filey Bay, and about seeing a great many vessels collected there, but it has always been in south-west winds ; and very likely, when standing off on the first of the flood, if you do not keep a sharp look out, you will have a light collier coming down and knocking your bows in. That is the way I believe collisions take place so frequently off Flamborough Head. I never saw more than 50 or 60 in the bay at once.

16,958. No doubt a good many vessels collect about Flamborough Head. Do you believe the statement we have heard to be greatly exaggerated ?—I do. I never saw a fleet of 700 ships off Flamborough Head or even in Filey Bay.

16,959. If Filey Bay could be made a good shipping place, it would be a great advantage ?—It would ; but it is not the place for a harbour of refuge. I have seen Mr. Coode's plan. It is all right enough, but I do not like it, in consequence of its being what I call a one-sided harbour. I would rather he had made his entrance in the middle, and divided his south pier, and brought a portion of it off from the shore.

16,960. Have you ever been in the Baltic trade ?—I have.

16,961. For some years ?—Oh yes.

16,962. What is the land that ships bound from Hamburgh usually make ?—In the back end of the season, they will steer for what they call the Yorkshire highland, that is the Cleveland Hills.

16,963. Is it very well known among all sailors as the Yorkshire highland ?—Oh yes.

16,964. But in a south-west wind, are they not often driven down to the coast of Scotland ?—Frequently ; I have known ships driven down there repeatedly, and get into both the Orkneys and the Shetland Islands. If the wind is from the southward and westwards, they would endeavour to sight Buchan Ness, because Buchan Ness is well known, and a prominent place to make.

16,965. Then, if there was a stopping place for those vessels at Peterhead, it would be a great convenience ?

—It would, at Wick or Peterhead. But I would make it at Wick, and I would make a secondary one at Peterhead, but I think the one would be wanted ten times for the others once.

16,966. For what vessels, particularly, would a refuge at Wick be wanted ?—For those vessels going through the firth, and it would be an act of charity to make it, in consequence of the loss of life and property in the fishing trade.

16,967. Were you not surveying for Wick Bay ?—Yes.

16,968. Would there be any fear of that bay silting up ?—Not the slightest. There is not a particle of sand about it, except what you may carry away in a wheelbarrow in a day.

16,969. If you made a harbour of refuge, would you enclose the whole bay ?—I would.

16,970. But seeing the Pentland Firth is open in the worst winds that blow, and that there are certain harbours in the Orkneys, would you still think it necessary to put a harbour of refuge at Wick ?—Yes ; because in the heaviest winds on that coast, taking the Firth is so dangerous. There is such a sea breaking in it, and I know from actual measurement that the tide there runs at 11 knots an hour ; when surveying with Capt. Slater, I found it run from 9 to 11 knots.

16,971. And do sailors generally think the navigation of the Pentland Firth extremely dangerous ?—They do.

16,972. Do you happen to have seen in the *Times*, within the last 10 days, that a vessel in the Pentland Firth had had her decks washed, and 10 of her men washed overboard ?—I have not seen it, but I should never dispute it. I came through once with all hands driven to the mastheads to save life ; our vessel went through like a water duck.

16,973. Would sailors, if they could avoid such a piece of navigation, trust themselves in it ?—I think not, if there was a better place to go to.

16,974. Are timber ships coming home from North America in the fall of the year ever caught in the Moray Firth, and driven back ?—Frequently, when they might go into Wick. A ship will be coming down sometimes from the westward with a fine breeze, just as little wind as you could wish to go with pleasantly, and directly she comes to the eastward of the land she meets a gale of wind. If she goes back into the Pentland Firth it is ten to one but that she gets her decks swept, and she has to go at all risks to the north ; until the tide will suit her she dare not go into the Orkneys. Under these circumstances, if a harbour of refuge was made at Wick, a ship could go into or come out of the firth without danger.

16,975. I am bound to say that from the reports of Captain Otter, and the other officers with whom you have served, they have all said that a more faithful servant to the public they had never had under their orders than yourself ?—I can only wish to return my thanks to Captain Otter and his officers for their compliment. It is about all the remuneration, except the regular pay, I have received from the Government for the long time I served them in that service. I hope it will pass through your hands into Captain Otter's, under these circumstances.

16,976. (*Capt. Sulivan.*) I hope it has led to your getting a good berth here ?—I don't complain of it.

16,977. Do you know that last year 1,060 vessels took refuge in Scrabster Roads, immediately to the west of the Pentland Firth. Would you think that a pretty convincing proof that a large number of vessels would equally use a harbour of refuge if made to the eastward ?—Decidedly, because two harbours so situated directly balance each other.

16,978. With reference to Peterhead, do you believe any ship could be caught in a gale of wind, under the ordinary circumstances, and could not get from the land on one tack or the other ?—If she could not get into the Moray Firth she could go up the Firth of Forth.

16,979. Then do you think ships are in such danger off that north-east point of Scotland as to justify the outlay of public money for a harbour of refuge in a place in that neighbourhood ?—Decidedly not.

16,980. Do you consider a harbour of refuge at Hartlepool, 40 or 50 miles south of the coal ports, has a great advantage, that vessels having shortly left their ports, and being caught by foul and dangerous gales, have it under their lee ?—Yes.

16,981. Would it not be the case that if Hartlepool ships advanced an equal distance to the south they would find an equal benefit if they had a harbour as far to the south of Hartlepool as Hartlepool is south of the Tyne ?—Of course, if they get so far south.

16,982. You have placed these ships very closely to the land ?—I have placed them according to the distance I know they pass the land.

16,983. Do you mean that vessels have a choice of shaping their course leaving the Tyne would be as close in as these are placed ?—The Tyne vessels are upon a course that they would pass within a mile of Flamborough Head.

16,984. We have been told that ships to avoid this bay always get more offing than a straight line, so as to go down for Flamborough Head rather more to seaward ?—They do.

16,985. Then they would not be so close to the land as you have drawn them ?—Not with the wind from the east.

16,986. Do ships going along with the wind from the land find it draw to the southward when they are off Flamborough Head more than any other place ?—In leaving the Staples and shaping a course for the Dudgeon light vessel or Flamborough Head the difference is very little. Immediately you get in the vicinity of the Yorkshire land you find the wind incline more ahead of you. That is where the adverse winds take place, both when the vessel is bound north and also when she is bound south ; you will find that vessels will come down here from the southward light, and as soon as they commence to round Whitby Point the wind comes out of the bay from the north-west ; this is when it has been rain with the wind from the southward.

16,987. You have heard the remark made that in the gale in January 1857, which caused such destruction of property, a larger number of vessels were wrecked in this division of the coast than in the Filey division. With your knowledge of the route vessels take, and as a seaman, do you believe that if these vessels were all, as we have been told, caught off the Flamborough Head, and that a certain portion of them weathered Whitby and fetched into Hartlepool, that any one of the captains who lost his vessel between Flamborough Head and Whitby would not have weathered Whitby, and sailed off the land and endeavoured to get to Hartlepool, if he possibly could ?—Yes ; when he came to find himself in danger. But, I believe, if these vessels were lost there, it was because there was no harbour of refuge in the Bay of Hartlepool.

16,988. But is it so at present ? For the saving of life and property is not the Tees Bay altogether more a harbour of refuge than a ledge of rocks, and are there not more facilities for saving the crew of a stranded vessel than in any part of that iron-bound Yorkshire coast ?—Yes.

16,989. Then if you were situated as any of these men were, in command of a ship, and you knew the weather and all the circumstances off Whitby land, would you endeavour to run your vessel on shore in the Tees Bay, if you could fetch it, or would you have allowed your vessel to go on shore between Whitby and Flamborough Head ?—In the Tees Bay, decidedly.

16,990. Then do you believe that all these men lost off Flamborough Head were so far to the southward that they could not weather the Whitby land ?—Yes ; or they would not have been lost. And I believe the cause of these vessels being lost, after I understood there were some other vessels in company with them that had run to the northward and been saved, was that they had tried to hang out too long and could not get to Hartlepool.

16,991. Fourteen vessels in one case, and 27 in

HARTLEPOOL.

Mr. W. O. Mossman.

18 Oct. 1858.

Capt. Sulivan.

another, were colliers loaded, and supposing they were off Flamborough Head when caught, had there been a harbour of refuge in Filey Bay, could the greater number of those vessels have got into Filey Bay ?—I do not know that they could.

16,992. Would those vessels that had gone off the land with a south-east wind when the wind drew to eastward have been able to fetch Hartlepool ?—Yes.

16,993. Might not the ship that fetched Hartlepool have been more to windward than those vessels which could not weather Whitby?—I do not know.

16,994. Those that were wrecked at Hartlepool Bay were those that went further off the land and were more to windward ?—No, I think not.

16,995. I want you to give me the general question as to the loss of vessels which did not get into Hartlepool ; might not they have been in that portion of that batch of vessels that were further to windward when the wind came round to the eastward, and so were not able to fetch Hartlepool ?—I do not know that.

16,996. If the wind veered to the eastward would not the most easterly ship and the furthest from the land have been most to windward, and therefore most likely to fetch Hartlepool ?—Yes ; if they were determined to do so.

16,997. Then all the vessels between Whitby and Flamborough Head could have got into a harbour at Filey ?—If they had immediately taken it when they first met with the wind from the southward and eastward they might, but I do not think they would have gained it afterwards.

16,998. Is it the very great object in laden vessels to prevent running back if possible, and holding their own if they can ?—Yes, decidedly.

16,999. Then if the gale did begin to the south-south-east and freshened very rapidly into a gale, and drew round to the eastward,—if the vessels rounded Flamborough Head when they found the gale coming on, and knowing that there was a harbour in Filey,—if they had borne up could they have got into Filey ?—I believe they would not immediately have gone into it. They would have endeavoured to keep the sea until they saw what the weather was going to be.

17,000. If you were off Flamborough Head under the circumstances, in command of a vessel, a collier, and there was a harbour in Hartlepool or Filey, which would you go to ?—I would go to the first that I could go to with safety.

17,001. At Filey Bay or Hartlepool ?—I would take the harbour most advantageous to my prosecuting my voyage.

17,002. So far as I see by the chart, the course from Filey Bay to Flamborough Head and the course from Hartlepool, is very similar ?—The land is very similar, but you have the advantage of a weatherly position at Hartlepool.

17,003. If you had your choice, and was bound south, would you rather go into Hartlepool Bay than Filey Bay to be in a position to sail for London again ?—Yes.

17,004. By the Government returns we find that the number of laden colliers lost to one of light are as 5 to 1. The loss of life is double in laden colliers compared to the loss in light. Have you any reason to doubt that ?—I believe that on this coast we have more light ships ashore than laden ones.

17,005. Do you think a great many more lives are lost in laden colliers that are wrecked than in light ? —There is a greater chance of a laden ship's crew, if she gets the ground, being lost, than a light one's, because a light ship will in all cases go nearer to the shore than a laden one.

17,006. Many laden also founder before they can reach a port, do they not ?—They do sometimes, but more readily when they get disabled.

17,007. Suppose this return to be correct, and that four or five to one were laden, would you then consider that a harbour of refuge should be especially made with regard to laden colliers or light ?—Decidedly I should prefer making it for the benefit of the laden ships.

17,008. With reference to what you said of the important coal ports, do you believe from what you know of the tidal harbours and bars of these rivers, that any outlay of money should be made for a harbour of refuge, closing the mouth of one of these rivers within it, with a certainty that in years to come it would remain available as a harbour of refuge, and that there would be no fear of its ever silting up ? — I should not recommend the entrance of a tidal river to be enclosed as a harbour of refuge.

17,009. Suppose that 15 feet will be obtained at the entrance of the Tyne at all times of tide, would that become then a very available harbour of refuge, more especially for light vessels running to the northward ?—Oh dear, no ! it would not be what I call an available harbour for light vessels, because I do not see where they are to lay them ; below the Low Lights there is no accommodation.

17,010. I am speaking of entering and running up this 15 feet channel ?—I am not at all certain at this moment but that if they make 15 feet into the Tyne they will cause a lot of wrecks at the mouth of it, unless they can go to this extent—that a ship can go in and float all over the outer portion of the harbour, because ships would run to it, expecting there was more water at it than they would find.

17,011. But would it not be an available harbour of refuge if there were 15 feet at low water ?—It would be a convenience.

17,012. It would save many from wreck in that neighbourhood, would it not ?—I do not say but what it would.

17,013. And therefore would become an auxiliary harbour of refuge on the north end of this district ?—The worst thing in the Tyne being a harbour of refuge is that you cannot turn a ship round in it.

17,014. But compare 15 feet at low water with its present depth, and say whether, the improvement being permanent, it would not make a comparatively useful harbour of refuge for light colliers ? —Certainly, if it could be made permanent it would be valuable, and therefore would be an available auxiliary harbour of refuge.

17,015. If, on the other hand, they fail in getting that depth of water, would you consider that a proof that any Government grant spent for the purpose would be thrown away ?—Decidedly.

17,016. Would the same remark apply to Sunderland as another tidal harbour ?—I think the same remark would apply to any place that had a tidal river to contend with.

17,017. You said something about prejudice at other ports, I suppose you allude to ports that trade— the coal trade competing with those ports ?—I did.

17,018. You cannot apply any remark of that kind to a place in an open bay with no trade, like Filey ?— No, any remark I make about Filey, or any other place, I make as I think.

17,019. I am certain of that ?—I have no interest in any matter whatever but the benefit of the public.

17,020. That I firmly believe, I assure you. With reference to the collisions, do you believe that a large proportion of collisions are caused by the number of steamers that pass this place meeting numbers of sailing vessels, by vessels meeting each other off these places even in moderate weather, and therefore that collisions do not so much apply to a harbour of refuge ? —I am not aware how the collisions altogether take place. I believe many collisions might be avoided if a better look out were kept on board the steamers. I have had to do with steamers, and other vessels, and I was never afraid of running any ship down, but I have been afraid of being run down. There is an excuse for sailing vessels getting into collision, but none for a steamer.

17,021. Do you think collisions apply much to the question of a harbour of refuge ?—I think not so much as general trade. Collisions are not caused by vessels trying to reach one harbour or another.

17,022. (*Mr. Coode.*) You said you did not approve of an open breakwater at Hartlepool, because you did

not know what the result would be; will you tell us what you allude to as that result ?—I did not mention the result.

17,023. In speaking of the comparative advantages of the two plans, I understood you to say that you did not approve of an open breakwater, because you did not know what the result would be ?—I should not say I did not, but I do not remember saying it. I said I did not know how it would affect the tides. There are many different tides in this bay. If the detached piers were constructed, I do not know how it would affect the tide. It would take about three times as much area to hold a ship in an open harbour as it would to hold one in a close harbour, in consequence of the tides and the different motions a ship would be affected by. In a close harbour everything is adjusted, and all vessels in it ride one way, therefore you could always calculate upon half a cable holding a vessel, where you must give her very likely the whole of it in an open harbour where the tides are running and heavy gales blowing.

(*Chairman.*) Your examination will be resumed the first thing next morning. The Commission is adjourned till 10 o'clock to-morrow morning.

Tuesday, 19th October 1858.

PRESENT :

Admiral Hope (Chairman).

Sir F. Smith.
Mr. Lindsay.
Captain Washington.
Captain Sulivan.
Captain Vetch.
Mr. Coode.
Mr. Evans (Secretary).

Mr. Ralph Ward Jackson re-examined.

(*Mr. Jackson.*) I was going to intrude myself upon you for one moment, I have one or two more charts I ought to have given in yesterday. I have them in the room, and will either give them in now or at another period.

(*Chairman.*) Certainly.

(*Mr. Jackson continued.*) That is the map which has been very carefully prepared, and was the subject of very considerable discussion in both Houses of Parliament during the present year, and it shows the entire coalfield connected with the limestone of the counties of Durham, part of Northumberland, and the ironstone of Cleveland, giving, in fact, a coast line from North Shields to Runswick Bay, with the great mineral wealth that is on that coast line. The coalfield has been laid down by an eminent authority in the north of England, Mr. Nicholas Wood, and is accredited by Professor Phillips, as being correct. The ironstone field mentioned yesterday as containing 200 square miles is laid down by Mr. John Bell, of Newcastle, a man thoroughly acquainted with the geology of this country, and is also accredited by Professor Phillips. I put these in as showing the great mineral wealth of two most useful productions of the earth, coal and iron, immediately on the coast line for which we are now considering a harbour of refuge. I was also asked to report the number of lives that have been saved by Hartlepool boats, as well as those I mentioned by West Hartlepool boats. I find from the pilot-master, who generally is in command of the Hartlepool life boats, that from the year 1846 up to the present time, including the lives saved from the wrecks shown on the Hartlepool chart, the lives saved at Hartlepool were 337 ; West Hartlepool 220, making a total of lives saved by the two Hartlepool boats, of 557 since 1846, besides 90 odd that had unfortunately perished, as I stated yesterday. (*The witness put in the Maps and this Return.*) I may also mention, that after the meeting yesterday I communicated with the contractor, whom I had mentioned as having given an estimate for the proposed sheltered anchorage or breakwater, that I submitted to the Commissioners yesterday, and he has revised his estimate, and I have revised my plan by reductions from it. I take the liberty therefore of placing before the Commissioners a work precisely similar in point of character, but reduced in area and very materially in cost, in consequence of its near approach to the shore, and the ability of the contractor in that case to execute the work by staging instead of, as he had previously contemplated, by the sea, making so much difference as to come within one million sterling for a work of 1,286 acres, making it 989,520*l.* instead of 1,604,175*l.*, which was the estimate for the seven-fathom anchorage that I proposed. Of course if you go to nine it is increased, but I have brought it down to seven, with the breakwater approaching the shore, and with greater facilities to get off the land. I have coloured this design blue, and have a tabular statement of the area, which I will now read shortly. The area of seven fathoms to low-water mark, spring tides, 1,286 acres ; the area in five fathoms and upwards, 210 ; the area in four fathoms and upwards, 493 ; in three fathoms and upwards, 815 ; in one fathom and upwards, 1,170. The estimate is signed by Mr. William Hutchinson, who has executed works under my own direction, contracts of upwards of a million of money, and I have always found he has been pretty correct in his estimates, in fact, I never have had five minutes trouble with any work for which he has estimated ; and he states the statute mile to be 621,984*l.* ; the length of both breakwaters is 2,800 yards, and the total amount (the prices exceeding in fact those which I know are paid at Holyhead) is 989,520*l.*

17,024. (*Mr. Lindsay.*) What is the total length of the breakwaters ?—2,800 yards.

17,025. Do you include the piers running out from the Heugh ?—Yes, I should tell you there is a pier there which would be suitable. It is not exactly in the construction, but it is in the piers. It is a small spur pier run out entirely from the land.

17,026. The breakwaters will be about 2,800 yards, without the piers ?—Yes.

17,027. Will you state the length of the piers ?—It is about 500 yards, but it is immediately between high and low water mark.

17,028. Then there is a breakwater of 2,800, and a small pier of 500 yards ?—Yes, there is a substitute for that, but there is another pier which has been made, and the material from that would go into the other.

17,029. This pier (*that in the design*) you would take down and remove ?—Exactly. There would be a little addition, but the contractor has put liberal prices in order to include the whole.

17,030. (*Capt. Washington.*) Then you withdraw your plans of yesterday ?

17,030 *a.* (*Chairman.*) Have you any statement to make with reference to this new plan before the Commissioners proceed to examine you on it ?—No.

17,031. (*Sir F. Smith.*) What is the total area you propose to include in the new plan ?—1,286 acres is the low-water area.

17,032. What do you propose to include by the other plan ?—Nine fathoms.

17,033. Am I to understand that the blue plan breakwater and the red breakwater are in the same

HARTLEPOOL.

Mr. R. W. Jackson.

18 Oct. 1858.

Sir F. Smith.

sounding ?—A portion of the seven-line breakwater is brought nearer land and a little shortened.

17,034. What is the dimension in the actual length of the whole project—the lineal dimension I want to know ?—The seven-fathom design.

17,035. The outer or inner ?—The outer one is 4,474 yards.

17,036. Including the pier fetched out to land ?—No, because in the other case that is a separate work, and a portion of the other work would be obstructed. I have not included it in the length, but it is included in the price.

17,037. It would be convenient for the Commissioners, if you would give the total lineal length of the works you project ?—The spur pier for the nine-fathom design is 400 yards. May I ask, do you wish to have the breakwater separate or the aggregate ?

17,038. Aggregate?—It is as I stated yesterday, and is part in the 4,474, it is 4,500.

17,039. That is the large scheme, now the next scheme ?—3,650.

17,040. And the blue scheme ?—2,800.

17,041. Your larger schemes were the result of very long consideration, were they not ?—They were, and this other scheme itself has been laid down to the other extent. Really since you commenced your labours I may observe, that there was a general desire to make an efficient, a large, and comprehensive harbour. I had no means whatever of judging what would be sufficient for such a purpose, and I therefore, out of my own head, suggest this as a comprehensive measure.

17,042. Naturally looking to the expense, you at that time considered it would not be more than sufficient for the purpose ?—Oh, I don't know what money the Government were prepared to advance ; I never looked to the money.

17,043. Without referring to the Government grant, my question is not directed in that sense at all. I say, I presume you considered the question of what in your opinion would be requisite, having of course a view to the expense ; but if you had not a view to the expense, you would have had a still more gigantic scheme ?—I looked at the measure knowing that it would be an expensive one ; but really with a view to give a very large protection for anchorage on this coast, suitable, I don't hesitate to say, for Her Majesty's navy as well as mercantile marine.

17,044. Had you no project matured when you appeared before the Select Committee of the House of Commons ?—No ; except I spoke of one which is upon the wall, that was the only thing then considered by the Port Commissioners, and they have themselves, as a body, not considered anything else.

17,045. I suppose the Commissioners are to understand that you consider the plan you proposed yesterday is more than sufficient for the purposes of trade and the navy ?—Well, I won't say for the navy, because they might go to a very large extent, but for mercantile protection I think it is too large. I don't think it is necessary. It would be very good to have such a thing as this, but I don't think it absolutely necessary, and I would be satisfied with less.

17,046. When has that conviction come over your mind ?—As to what ?

17,047. As to the money that is sufficient for your large total ; you say you think it is more than sufficient ?—I only formed my conviction the very moment you asked me the question. If you ask me my suggestion for a mercantile marine, then I answer, that the nine-fathom line is not, I think, necessary. But if you ask me, at the same time, to include the navy then I think it is necessary.

17,048. Of course you will understand the duty of this Commission in recommending any site for a harbour of refuge is to see that it is sufficient for the purpose. The difference of the two plans—that of yesterday and that of to-day—is so considerable, it is necessary that we should have your reasoning and arguments to show that the present plan would be sufficient ?—Then I unhesitatingly state that it arose entirely from the examination yesterday of myself and Mr. Mossman. I observed that the great question was, how little can be done in point of construction, and how much can be effected consistent with that grant for protection, and several questions were asked me, I think, as to 600 feet for an entrance. I felt quite sure that 600 feet would do entering, but it won't do very much further out. And it was asked by several honourable Commissioners, how many ships did I think it would be requisite to shelter, and how much each of the harbours would hold, and then leave as many for a sheltered anchorage. And I remember making the remark, from a question by an honourable Commissioner, whether if there were 1,000 they could not all be held in the present docks, that I should be sorry to see them there. It would destroy trade, because there must be trade going on as well as shelter to wind-bound ships ; and it was simply and solely with that view that I had called the contractors together to ascertain what, if the plans were reduced and brought under, the work could be constructed for.

17,049. I hope you are not bringing before us a project solely to meet a question of expense ?—Oh, no !

17,050. But a project which, if carried out, would be sufficient for the purpose. In the largest plan of the three what amount of accommodation do you propose to give ?—In the nine-fathom, 1,650 acres ; in the present plan, 1,286 ; and consequently, though I press the same design, I feel persuaded that it is a correct principle to act upon. I don't say that professed engineers might not suggest some little alteration. But I think the principle is right for an open roadstead or sheltered anchorage.

17,051. Then I presume the Commissioners must understand your first projects are the maximum harbour you require ?—I think so.

17,052. And that the blue is the minimum ?—It is difficult to answer a minimum. You see, suppose we were to construct the blue, and then by the progress of the commerce of this country, which no human mind can grasp, we find it insufficient, my saying it is sufficient to-day would certainly prove to be an incorrect opinion.

17,053. But what position would you put the country, the Commissioners, and the House of Commons in, if you commenced the construction of this harbour of refuge, and then turned round and said "It is true you have voted a million of money for the blue harbour, but I have changed my mind, and it is not sufficient ?"—If it was not the mercantile marine, I am satisfied with the blue plan.

17,054. Then the Commissioners are not to expect, in going minutely into the estimate for this project, if they find it comes to considerably more than you have calculated upon, that you would then reduce the plan a second time ?—If you tell me that you are only going to spend a certain sum of money, then of course you must be content, and you bring the harbour to the money. But if you ask me what is beneficial to trade, the money question does not enter into the consideration of the amount for a great efficient harbour. If it was a man who has had any means to apply it he would take the money, and if you confine the grant by Parliament to a sum of money then you limit of course the work to the money.

17,055. I don't expect that will be the course of action of this Commission, or of the House of Commons ; but if the House of Commons sanction the public funds being applied to the purposes of a harbour of refuge, they would be very unwise if they sanctioned any grant whatever that did not effect the object required. Therefore, I apprehend that the first step is to ascertain what is the minimum project that you can lay before us ; and then it is for us to ascertain what that will cost, and for the House of Commons to determine whether they will grant the bill. We cannot recommend a project if it should be insufficient for the purpose ?—Then I may consider myself responsible for what I am going to state. As one of the Commissioners I supported the application to Parlia-

ment, and Parliament granted that application for the conversion of the bay of Hartlepool into a harbour of refuge, of the dimensions shown upon the chart upon the wall. The prices paid for constructing those piers I do not discuss at this moment, it is irrelevant ; but the Admiralty, when we were at Parliament, required to have control in the construction of these piers, and any person there at the present moment can form an opinion what course ought to be adopted. Parliament had sanctioned that work, subject, of course, to the construction of the works as the Admiralty may be advised. That is the minimum that Mr. Rendel and the Commissioners who employed him thought was required for that bay. But Mr. Mossman stated to you yesterday very truly, and I confirm it, that Mr. Rendel was hemmed in by money ; and had the Commissioners given him any encouragement, and given him 200,000*l.* or 300,000*l.* more, he would have gone to seven fathoms instead of stopping at five. That is the precise position in which we, as public trustees, are. We are fortunately conservators of a bay which is capable of very considerable protection. Give us the money, and we will take it out to five, six, seven, or any other depth. But Mr. Rendel said that it was within the scope of the Pier and Port Commissioners, in conjunction with some Government aid, to construct works which would give an area as shown on these piers ; and I follow Mr. Rendel in his wish, and go for the seven fathom if we possibly can.

17,056. I want a distinct answer whether is this your minimum project ?—Do you mean the minimum according to my ideas of the requirement ?

17,057. Yes ?—No ; I think enclosing a less portion, namely, the five-fathom, would be of immense advantage to this coast.

17,058. I wish to know whether, according to your present view, that would be your minimum plan ?—My minimum plan would be the five-fathom ; but my preferable plan would be the blue plan, if I could not get the nine.

17,059. Then if you find, on going more minutely into the estimate than you have been enabled to do during the night, the amount was not what you thought could reasonably be expected from this bay, you would still be disposed to give in a small plan coming to five fathoms ?—I would. It is in fact making a harbour to the money.

17,060. But still making a harbour which is still sufficient for the purpose of saving life on this coast ?—Then I don't hesitate to say that for saving life and property in connection with ships, the minimum would be the plan of Mr. Rendel. If the enclosure was to be reduced to five fathom, of course the expenditure would be proportionably reduced from that which I have given in this morning, namely, 900,000*l.*

17,061. Are the piers on which the estimate has been reduced the same as those that you calculated in the larger amount ?—They are materially reduced from the simple circumstance that you are closer to the shore, and would be able to execute the whole work by staging.

17,062. But so far as regards that portion of the work which is nearest the shore ; would that work be done at the same price as the other project would be ?—It would be materially lessened.

17,063. I do not precisely see why the shore end should not be made at the same cost as in the other instance ?—A contractor, I apprehend, in laying for a whole work would have to regulate his gearing and plan on one distinct principle.

17,064. Do you think, as a general principle, that larger work is done at less proportionate cost ?—Not if you are farther out at sea ; but I am talking of the same depth of water and the same distance from the shore.

17,065. I should think the cost would be, if not the same, at least less in a larger length ; because the same plant and the same establishment would carry out the progress of the larger work ?—I am not a contractor, though I have had a great many works under my superintendence and suggestion, and I can give you no evidence of that nature.

17,066. In the course of the night you have had before you a new project and a new estimate, and you come to us this morning established with a statement made to you by your contractor, who has never failed you in any previous instance ; and therefore I presume that, as a man of business, when your contractor shows you the diminished cost, you ask him what has enabled him to do so ?—I do ; but I feel perfectly satisfied that the contractor has given more liberal prices for that description of work than those which are paid at Holyhead.

17,067. I beg you to understand that I am not cross-questioning you with a view of leading you to contradictions, but really for the sake of obtaining information ; and I think you are quite capable of giving it, because you have had before you the contractor, whose statement you have sifted ?—He has made a statement that rubble work will be put up at a higher price. The masonry, which is the most expensive work, he keeps exactly the same as in the larger plan.

17,068. At what distance does he propose to get the rubble ?—Within two miles of the place.

17,069. Where is that ?—A little north-west, as inland.

17,070. You don't contemplate getting any portion of the materials from the rocks along the shore ?—No ; not an inch, I hope, will ever be taken away.

17,071. You had better leave them alone ?—Oh dear, yes.

17,072. I think it would be a convenience to the Commissioners if you will put upon the plan what is the red project, and what the blue ?—It can be done in a quarter of an hour.

17,073. I see that the length of the horns of your breakwater are very much smaller in the blue than in the red, and are differently directed ?—Slightly.

17,074. I see also that there is a breakwater which comes from the south side of the headland ?—From the east side.

17,075. Whereas in the red it projects to the sea north of the Heugh, while the other comes from the under side of it. May I ask why you have changed the position of that, perhaps, very important element in your project ?—For the express reason of my having shortened the north-east breakwater. On this coast a north-east breakwater, you will see, overlaps and entirely excludes any sea from the north. It did open to the north-east, when there could be no sea coming materially out of this bay. It lies to the north of Hartlepool Heugh ; it is perfectly straighter. I have not yet made up my mind as to the necessity of it. When you enclose the entrance to the north-east breakwater, it might be a little deflected on shore, and in that case would not be necessary at all.

17,076. Then I am to understand you desire us to consider this as a substitute plan ?—Alternative, if you please.

17,077. (*Mr. Lindsay.*) I think I understood you to say that the plan you now submit will contain an area of 815 acres at three fathoms and upwards at low-water spring tides ?—That is my calculation.

17,078. The shelter for ships will be from easterly gales within the proposed breakwaters. Will the usual class of vessels, the laden colliers trading along this coast, find safe anchorage at three fathoms in your opinion ?—Not laden.

17,079. The average size ?—The average size draws 14 feet ; drawing 14 feet and 18 feet, you know, would not do at low water.

17,080. Then you think they would require three and a half or four fathoms ?—Four fathoms.

17,081. Then the area is reduced to 493 acres of four fathoms ?—I would rather not speak as to ships ; I have not had experience of riding in heavy weather in deep-laden colliers.

17,082. I asked the question because I know you have turned your attention very much to it, but if

HARTLEPOOL.

Mr. R. W. Jackson.

19 Oct. 1858.

Mr. Lindsay.

you would rather I put the question to nautical witnesses I will?—I have not ridden out in a collier in a gale of wind.

17,083. What area at four fathoms and upwards did Mr. Rendel's plan give?—He does not put it in that form. He says a harbour, to be adequate for the wants of the vast trade, should be in size equal to the accommodation at one time of not less than 300 or 400 vessels of all sizes, varying in draught from 18 to 20 feet.

17,084. He goes to the point that you go between the Heugh and the rock called the Long Scar. I wish Mr. Mossman would measure on Rendel's plan, and be particular to answer the question of area. Mr. Rendel's plan gives the area at three fathoms. What was Mr. Rendel's estimate?—800,000*l.*, and 35,000*l.* for the protection of the Headlands.

17,085. In all 835,000*l.*?—Yes.

17,086. Then his piers appear to have been carried out in much shoaler water than you propose. The entrance was just at five fathoms, and of course you will see there that they receded very quickly. They do not cover much at five?—Scarcely any.

17,087. What was the difference in the length of the proposed piers between Mr. Rendel's and yours?—Mine are breakwaters, and his are piers.

17,088. When you include your piers the length is 12,300 feet. What was the length of Mr. Rendel's?—The plan he proposed was to alter the work that the Commissioners had already executed, commencing from the head, and going down upon the rocks. That was executed by the Port Commissioners,—the curves appear in a different direction, and extend 2,600 feet.

17,089. What is the length of the pier from the Long Scar?—The South Pier from its head runs south by west for 2,200 feet in from 25 to 22 feet water, leaving an opening of 1,100 feet between the two heads.

17,090. In all about 16,500 feet?—I dare say you are right.

17,091. I want to know the length of the pier which Mr. Rendel was to construct from the end of the Longscar Rocks?—5,930 yards. There is some little discrepancy between Mr. Rendel's and mine; I think he has measured it at low-water mark.

17,092. Well, as I am anxious to have it correctly down, I would like you or Mr. Mossman to answer me the question as to the area of water, after you have measured it. You got an Act of Parliament I believe two years ago, to carry out Mr. Rendel's plan?—Yes.

17,093. Why was that not carried out; was it want of funds prevented you?—We have carried out a part.

17,094. Why did you stop short?—That very great evil, the want of money.

17,095. What means did you adopt to raise the money?—We applied to the Public Works Loan Commissioners, and having laid our application before them, they submitted to me their usual questions, which are very numerous, and require a great many particulars. They require them also to be sworn to before a magistrate. These I returned, and from time to time communicated both personally and by letter—chiefly personally—with the Commissioners, with the view to raising the portion of the money, corresponding to the belief of the Port Commissioners that they would have funds to pay a reasonable rate of interest upon, and on the ground that as the work proceeded refuge would be gained, and consequently a revenue. But in the middle of that communication, the Select Committee on Harbours of Refuge was appointed by the Government, and then I received the intimation that all communications must be suspended with the Commissioners until the result of this Commission was known.

17,096. Then it was not on account of not being able to offer security in the shape of revenue present or even prospective?—I have had no answer that the security we offered was insufficient, although I cannot say our funds are sufficient for 800,000*l.* or a million of money from the Loan Commissioners.

17,097. But when you went to Parliament to ask leave to construct a harbour, you knew you would require about 850,000*l.*, and must have had an idea as to the mode and means of security you would have to give in the shape of revenue or otherwise for raising the necessary amount of capital?—This is a public trust. It is in pretty much the same position as a company going to apply to Parliament for funds to construct, as it were, a private undertaking. The Port Commission was specially incorporated for the purpose of improving the harbour, and I will read the preamble of the original Bill, which is very significant of our trust. This Act was passed on the 15th of April 1815: "Whereas the pier situated in and near the town and "at the entrance of the port of Hartlepool, in the "county of Durham, is in a state of considerable "decay, and in imminent danger of total destruction, "whereby the houses and other buildings in the "town will be much endangered; and whereas the "repairing, enlarging, and maintaining the said pier "and entrance of the said port will afford security "to the town of Hartlepool, and will be of great "security to the coasting trade of this kingdom"——

17,098. That is not so much my point. Before you applied to Parliament for a bill to construct a harbour of refuge, empowering you to borrow money for the construction of that harbour, you must have had in view some means or other of raising that money. How did you propose to raise it?—As it has been since 1813, by a small toll upon all ships that entered within what was then called the Port of Hartlepool, and by the Act which authorized the harbour of refuge these limits for the purpose of toll were brought within the area of the proposed harbour.

17,099. Then was it because the revenue, present and prospective, was not considered sufficient by capitalists, or by the Exchequer Loan Commissioners, that you ceased going on with your works, or was it because the Committee was appointed in regard to harbours of refuge, and therefore you considered it prudent and desirable to delay these works until you had had the proceedings of that Committee; which was it?—It was both.

17,100. First of all, you could not raise the money, your revenue was not considered sufficient?—Quite so.

17,101. Did you make extra exertions to raise it?—I have made no exertions since the Exchequer Commissioners intimated they could give no answer.

17,102. You and the other gentlemen connected with you, being shrewd men of business, would you have seriously contemplated the construction of a harbour of refuge in this bay, if you had had the most distant idea of its being silted up?—Most undoubtedly not.

17,103. The question of silting up was a question you, as prudent men, inquired into, I presume, before you applied to Parliament for a bill?—Most unquestionably, and it is right I should say I supported the application to Parliament founded upon Mr. Rendel's plan, and he came, upon more matured reflection and actual experience, which is perhaps the best test of the necessity of harbour works of this character, to the conviction that it is not desirable to enclose the bay, but to leave openings.

17,104. You say the whole of the Pier and Port Commissioners were unanimous in regard to the necessity of constructing a harbour of refuge?—Oh dear, yes!

17,105. But were they unanimous whether it should be an enclosed harbour or an open harbour?—I do not think that was ever decided. Mr. Rendel prepared a plan, which was under the consideration of and was sanctioned by Sir James Graham, then First Lord of the Admiralty, and they reported that we had only to apply to Parliament for the necessary powers, hoping at the same time to get the necessary funds for the purpose.

17,106. You were of a different opinion from the rest of the Commissioners as to the mode of con-

structing the harbour, as to whether it should be open or closed ?—Yes, it has never been openly discussed, except by a little conversation together.

17,107. You were of course aware that it would materially tend to increase the trade of West Hartlepool and Old Hartlepool if the bay was formed into a harbour of refuge ?—No doubt it would improve it. I maintain that it would improve any neighbouring port as well.

17,108. Then it was a question of business. Was that the object with which you went to Parliament ?—Certainly not ; because the great majority of the Commissioners were not West Hartlepool people.

17,109. But I included the trade of Old Hartlepool as well. Was it with the object of improving the trade of both places that you went to Parliament for the Bill ?—No.

17,110. Was it on the ground of humanity, then, that you as private individuals applied to Parliament to save life and property along the coast ?—We are not private individuals in this port.

17,111. Was your object then in applying for this Bill, to benefit the trade of the district within these limits, or was it to save life and property along the coast, or was it both ?—You may say both. If there had been no private harbour here there would have been no Commission applying to Parliament, and begging to extend it out of their own private pockets. We are located here with large possessions, but we hold responsible positions as Port Commissioners.

17,112. In fact you consider, as Port and Pier Commissioners, that it was your duty to protect the entrance of these harbours, so that ships could enter them without endangering lives and property ?—Most unquestionably ; the Commission existed for many years before any harbours were in this bay. They had funds which might be put down at nil.

17,113. And, with that object in view, you got a Bill through Parliament, and attempted to raise the necessary funds for the construction of piers ?—Yes ; in accordance with our original trust, that of the improvement of the port and securing the coasting trade, which is our preamble in the original charter.

17,114. (*Capt. Sulivan.*) If Mr. Rendel's plan were carried out, supposing engineers considered that was the best plan, do you think that plan would give not only a valuable protection for those ports and trade, but also a valuable harbour of refuge for all the collier class of vessels that might be embayed within that embayment ?—Do I understand you to ask me the same thing as Sir F. Smith did ? I think it sufficient.

17,115. I did not say sufficient ; I said did you consider it would become a valuable harbour of refuge for all the coasting trade of these ports that would be likely at at any time to be embayed within that line ?—I think it would be a very valuable harbour of refuge.

17,116. As Mr. Rendel appears to have had some question as to the silting up, do you not think he designed these piers at the shore with the idea of guarding against silting up, because I see by his report that he goes into that question of silting a good deal ?—I cannot of course consider what induced Mr. Rendel to lay out this enclosed harbour ; no doubt he, as as everybody else must know, that enclosing a place almost entirely, with the exception of one entrance, must make it of course nearly a dock.

17,117. Supposing the sand to be approaching the bay, either by the tide or by a tide at the Tees assisting a south-east gale, would not the continuance of a pier to the south, guard against any continuance of that contingency ?—The south pier would guard against any contingency from the Tees, or what is passing through the bay.

17,118. Conjoined with the effect of a south-east gale in throwing the sand along the shore ?—Yes.

17,119. Then, if they were constructed, would it not reduce the amount of sand going into the bay, and what was held in suspension by the water coming in by the tide ?—It would if it came that way.

17,120. I am supposing these piers cut off all chances of sand travelling along the shore, and so getting into the bay. The sand that came in then I presume would be what came in by suspension in the water ?—Yes ; and I should tell you that the only part which will prevent sand coming in is the shore end of the Long Scar Rock.

17,121. That is what I am alluding to ; I exclude that portion of the port that is outside the Long Scar. No sand goes through that ; according to your supposition that the sand is driven from the south into Hartlepool Bay, it does not go over the rock. And supposing any sand in Hartlepool Bay to be brought in by the action of the sea, whether from the north or from the south, would the piers stop it, or reduce the chances of silting up to the minimum of the quantity brought in by the tide from the flood and held in suspension ?—Certainly.

17,122. Will you be kind enough to say what duties you are allowed to levy under the Act in vessels coming in, supposing the harbour of refuge to be completed ?—By the Act of the 16th July 1855, after a sum of money amounting to 250,000*l.* has been expended, then the maximum duty comes into operation. There is a similar scale up to 100,000*l.*, or when the maximum is expended. Then, any vessels entering within the limits of the harbour, and also entering any private dock, loading or unloading a cargo, 1½*d.* per ton. For every vessel entering the harbour of refuge, or either entering to use or not entering to use, any shipping place, and not loading or unloading with cargo, if such vessel be in ballast or have any cargo, 3*d.* per ton. If such vessel be laden, 6*d.* per ton burthen ; it is called burthen, but it means register.

17,123. Then do I understand that a vessel using both harbour and dock will only pay 1½*d.*, but loaded vessels coming in for refuge will pay 6*d.* a ton ?—Vessels coming in for refuge have to pay dues as well.

17,124. At 6*d.* per ton, vessels would have the free use of the docks if they required ?—Yes ; and any vessels coming in and discharging here, or loading, have the advantage of the docks, and must pay the Company also.

17,125. Vessels entering only for refuge, and even not using the docks, pay four times as much for harbour dues as vessels coming for the trade of the dort ?—Yes ; it will be found that they pay nearly the same as vessels that enter laden from other ports ; and, according to this, vessels that have the double advantage of a harbour of refuge, making for the port in a gale of wind, have all the convenience of the docks, and pay more than a collier passing the coast coming in for a refuge harbour alone. After so large an expenditure of money, I think it was made out, referring to the evidence already given, that the average between 3*d.* and 6*d.* was 4½*d.*, and that was considered upon a ship of 400 tons would not be a heavy toll.

17,126. Have you any calculation of the dues from the permanent trade of the port, besides the refuge, which would be obtained if a harbour of refuge was made. You are levying a toll upon your present 10,000 vessels, the amount of tonnage last year. What revenue would be received from a harbour of refuge, suppose the arrivals were to the same extent ?—In the blue book there is my calculations on that subject, in great detail. I think I could not improve upon these figures I gave in to the Select Committee of the House of Commons.

17,127. Can you give me any idea even what proportion you considered in your estimate of the trade of the port would bear to the refuge. Taking a much larger number of vessels trading to the port than would come for refuge probably, can you tell me about what proportion there would be paid by the two classes by the 3*d.* and 6*d.* for refuge, and 1½*d.* for the port ?—I might be able, by referring to the papers which give me that calculation, but if I mistake not I put it altogether so many ships, knowing how many ships sailed from the Tyne, the

HARTLEPOOL.

Mr. R. W. Jackson.

19 Oct. 1858.

Capt. Sulivan.

Wear, Seaham, Blyth, Warkworth, and the Tees and Hartlepool.

17,128. Had you only then taken a proportion of these as likely to require refuge?—Yes, I put it at twice in the year, one year with the other, to use a harbour of refuge, and my reflection teaches me that I was within the mark when I said they would require a harbour of refuge, I forget whether it was twice or three times a year.

17,129. Will you refer to the document and let the reporter get it down?—Yes; it is in the appendix to the Report of the Select Committee on Harbours of Refuge, 1857.

17,130. Have you separated then the dues due to the trade of the port from the dues due to refuge?—I do not remember that it did.

17,131. Will you give them in in separate items to our secretary?—I will endeavour to do so.

17,132. Did you calculate for twice in the year?—Three times I think.

17,133. Was that founded on the idea that this would be the only harbour of refuge on this coast, or supposing that there would be a harbour of refuge here and one at Flamborough Head for any collier that might require it. Would that materially reduce your estimate of vessels taking refuge here?—No; I will assume some protection at Filey Bay and it would not very materially reduce it. I am quite persuaded that many ships would be advantaged from having a resting place at Filey Bay, and I do not think it would materially diminish my estimate of the dues at Hartlepool.

17,134. What it did reduce would be principally laden vessels more than the light; would it not, therefore, reduce your higher payment for a harbour of refuge of 6*d.* more than the payment of 3*d.*?—I would not say so, and for this reason, that here only on Sunday we had an instance of fourteen windbound ships coming into Hartlepool; the whole of them light.

17,135. That exactly confirms what I was saying. I say that having a second harbour near Flamborough Head would reduce the loaded ships coming in here more than the light, so that the light vessels would be more likely, having come past Flamborough Head in a south-east gale, to want a refuge nearer their own port, and the laden vessels would be more likely to have got down to Flamborough Head and so to avail themselves of that harbour of refuge?—If I remember right I estimated two-thirds light and one-third loaded.

17,136. (*Capt. Vetch.*) The plan you submitted yesterday was a project for the improving and forming a harbour of refuge at Hartlepool?—It was.

17,137. And you have now submitted to-day another project?—I reduce the one on the same principle.

17,138. I suppose you have not wished the Commissioners to pledge themselves to the adoption of either of these?—Oh dear, no!

17,139. But should be able to consider this with any other project that may be presented?—Most certainly, I only hope they will carry out one or the other.

17,140. (*Mr. Coode.*) A question was asked you just now as to the length of these piers as proposed by Mr. Rendel, and some discrepancy appeared to exist. Will you refer to page 3 of the Parliamentary Paper 110 for the year 1855, and you will see the north pier is to be composed of two cants; the first 637 yards, the second 730 yards. The south pier is also of two cants; the first 2,120, and the second 723. Will you be good enough to add these together?—4,210.

17,141. Now, will you refer to page 7 of the same document, and you will see that Mr. Rendel describes the piers as 1,700 yards and 1,300 yards respectively outside the low-water line?—Yes, he does.

17,142. Making in all 3,200 yards outside the low-water line?—Yes.

17,143. If you will refer to that red chart on the wall you will see that the proportion of 3,200 and 4,210 will bear the same relation to each other as the portion outside the low water bears to the portion inside the low-water. That is, that the two portions outside low-water line would be just about double the portion inside the low-water line, showing that the portion inside the low-water line is one third of the whole?—I do not quite understand you. It appears to me that if you take the line direct from the Long Scar to Hartlepool Point, you will spoil it.

17,144. I am speaking of Mr. Rendel's design as laid down in this chart. Assuming that to be 4,210 yards in all, the two portions outside the low water will be about two-thirds of the whole will they not?—Then you call that low water along the Scar Rock, which would give ——

17,145.. Yes; which would give the discrepancy. Mr. Rendel must have been speaking of the portion only outside the low water, and the Admiralty are speaking of the whole length at high water?—It is very probable that is the case.

17,146. If so, that clears up what appears to be a discrepancy?—It is very possible.

17,147. Have you any authentic copy of that design as laid down by Mr. Rendel?—Oh yes, several.

17,148. Will you undertake to supply the Commissioners with a reduced copy on a scale with which the secretary will furnish you?—Certainly. I may mention that with reference to the cost of Mr. Rendel's design, his design was upright wall throughout. Masonry had nothing to do with rubble or that sort of work.

17,149. (*Capt. Sulivan.*) Was not Mr. Rendel's plan constructed in this way in consequence of the want of large quantities of material close at hand, combined with the idea of making blocks of concrete on the spot to build it?—I do not know. I remember his asking me where he could get large ashlar stones, and I directed him to the Yorkshire Hills, and the hills lying to the extreme west, the same sort of stone as I have adopted in the West Hartlepool works.

17,150. Is it your opinion, and that of the contractors you have consulted, that notwithstanding the distance from the stone you can construct a heavy pier and breakwater at a cheaper rate per yard than the breakwater of Mr. Rendel?—At the time Mr. Rendel made his estimate, we did not know that the stone laid to the west so close to us.

17,151. Then you feel confident you can construct a breakwater, such as has been described, at a lower rate than Mr. Rendel's design?—Most unquestionably. I am exceedingly glad to find that we have so valuable a stone in this neighbourhood. I had no idea of it myself until very recently.

17,152. (*Mr. Coode.*) What is the nature of the stone you have recently discovered?—Hard limestone.

17,153. How is it described among the specimens, that we may identifyit?—Limestone hard; about 13 cubic feet to the ton.

Mr. James Johnson examined.

Mr. J. Johnson.

17,154. (*Chairman.*) You wish to put in extracts from a journal kept by you relative to vessels taking refuge in the year 1847?—Yes.

17,155. Hand it in to our secretary.—(*Document put in.*)

Mr. E. K. Calver, R.N., examined.

Mr. E. K. Calver, R.N.

17,156. (*Chairman.*) You have been engaged for a long period in the survey of this coast?—I have.

17,157. And therefore, as a matter of course, you are perfectly well acquainted with it?—I am.

17,158. (*Mr. Lindsay.*) Have you seen this plan of 1849 of Hartlepool Bay?—I have.

17,159. Do you, from your own knowledge of the coast, think that this plan represents correctly the

soundings at the period of making it ?—It appears to do so.

17,160. Do you notice that the three-fathoms line has been extended very considerably outwards ?—It has.

17,161. Between the different dates marked upon the plans ?—It has somewhere about 900 feet to seaward in one part, I think, in the course of 12 years.

17,162. And at the point of the greatest extension the breadth is about 800 feet ?—Its depth has gone to seaward to that extent (*indicates on plan*).

17,163. Does that show, in your opinion, that between these particular dates there has been a silting up in the bay ?—It shows a silting up.

17,164. Can you account for that silting ?—The facts bearing upon the silting or otherwise of Hartlepool Bay I had to determine for myself in the year 1846, and from the facts then gathered by myself, I have no doubt this plan is correct ; I find there was a silting up. The facts I refer to are given by myself in 1844 in a letter, a copy of which I have in this MS. book. Perhaps I had better depend upon my own facts.

17,165. Has it been published ?—It has not, that I am aware of.

17,166. Then the Commissioners will be very desirous to hear it. To whom was the letter addressed ? —To Captain Washington, Captain of Her Majesty's ship *Blazer*, in which ship I was as Captain Washington's assistant. It was as follows :—

" In August 1846 Her Majesty's ship *Blazer*, commanded by Captain Washington, arrived at Hartlepool with a view to determine any change which might have taken place in the bay since the Admiralty survey in 1838. I was Captain Washington's assistant and received due direction from him for that purpose. I accordingly entered upon the labour of re-examining the bay. I identified Captain Slater's datum, to which his survey was referred, and referred my own observation to the same. After taking the results, I entered them upon some illustrative plans, which, with the letter, I forwarded to Captain Washington, who was then absent on duty :

" ' Sir,—A re-examination of the bay of Hartlepool being now completed, I beg to transmit for your information the accompanying documents in illustration of the changes which have taken place in its depth since the Admiralty survey of 1838 ; and it will be necessary that I mention the circumstances under which this survey has been performed. The re-examination extends over a period of nine days, beginning from the 23d July. At first the wind was from the south-west, causing a slight surface liffer ; latterly it was light and variable with the bay perfectly smooth, so that an opportunity of a suitable character, for comparison with the former survey, has been most favourable. All the sections across the bay run in 1838 have again been sounded at a time of low water, and no precaution has been neglected for insuring a faithful result. The old sounding at zero was identified without difficulty from a former transfer of level at the quay wall at the dock office by Mr. Mossman, and another by myself from the old pier lighthouse, and they agreed within two inches. Such being the circumstances under which the work was undertaken, the result may be stated briefly as follows :—The bay has silted up over two thirds of its extent a deposit varying from $\frac{1}{4}$ to $2\frac{1}{2}$ feet, the great alterations being in the centre and outer portions of the roadstead. On the other hand, the inner portion of the bay skirting the bar near the port, and from the centre to the low bar, as well as a patch outside the bar, has deepened to a like degree and has laid bare large tracts of clay ; and there is little doubt that the sand removed from this quarter has left to swell the amount deposited in other places. The bay was also divided into 14 portions, and specimens of the clay taken in each case ; it appears to be without any variation in quality, what is known among surveyors as muddy sand, in other words the finest of sand mixed with a sufficient quantity of earthy matter to give it tenacity. The exact amount of decrease in depth, as well as its limit, are clearly shown on the plan No. 2, accompanying this report ; but it will be seen, on reference to the document, that no comparison is instituted within four feet of the contour line opposite the old harbour from the sea, though undoubtedly the bar and the channel are improved within the influence of the sluicing, and variations in form and depth may be expected at times if the operation of sluicing is repeated ; the bay before the contour line and above occupying nearly the same position in both places, while the channel within them has improved in breadth and depth.' "

17,167. What is the date of that letter ?—August 1846.

17,168. Then by that letter there appears to be no doubt in your mind that before 1846 silting was taking place in the bay ?—It was.

17,169. Are you able to speak as to the fact whether it has continued from that day up to the present time, or up to 1856 ?—I do not know of my own knowledge, only through the medium of the haven-master.

17,170. Then I must state to you that the haven-master, in his evidence yesterday, said that after the period you referred to, when the bay had been silting up, no silting has taken place ; but that, on the contrary, if anything the depth has increased a few inches. From your great experience I want to ascertain from you, if, in your opinion, that silting having once commenced, and having gone on for 12 or 20 years, it was likely to stop at the year 1846, and not got on from 1846 to 1856 ? Can you give any reason for that, if it is the fact that the bay has not silted up, or should you be disposed to doubt the fact ?—I should be quite ready to receive the fact if stated by Mr. Mossman, from my faith in his accuracy.

17,171. Then can you account for it ?—To my mind it would not be any extraordinary circumstance ; the bay is silting up at one period and not at another.

17,172. Do you know any instance where bays go on for certain times silting up and then suddenly stop ?—An increase of soil and then a subsequent decrease is nothing unknown in nature ; but as a matter of memory I cannot give you an instance at the present moment, but I am quite sure that it is a common occurrence.

17,173. It is a common occurrence for sand to go on gathering in a particular part for 12 years, and then suddenly to stop ?—There is a distinct reason why it should cease. I can quite fancy a basin like Hartlepool Bay filling up from whatever cause, and then ceasing, because in time the material from the increase of depth would be brought within the suspending power of the wave, and there will be a depth when the tendency to deposit will be enlarged by the power of the wave to suspend. What that depth will be, of course I cannot say.

17,174. Then do you think that the silting which took place up to 1846 was caused by the sand coming from the ocean, or by any sediment coming out of the slake, or by the destruction to some extent of the headland called the Heugh ?—In connection with that I will state to you the opinion I appended to the report at the time. After detailing these facts I proceed :—

" So far as to the result. The cause of an alteration so seriously affecting the well-being of a rising port, is a matter much more difficult of solution. The fishermen appear to attribute it to the practice of sluicing from the slake by the present Commissioners ; but a comparison of the statements made by them before the Commissioners would seem to take materially from the value of their opinion. For many reasons I do not think an unprejudiced person will look to the sluice for the cause ; but even supposing it to be the cause, the accumulation in the bay must either have come from the channel, the tide harbour, the surface of the slake, or of the streams passing through it, as neither the channel nor the tide harbour have altered in any

HARTLEPOOL.

Mr. E. K. Calver, R.N.

19 Oct. 1858.

Mr. Lindsay.

material degree since 1838 ; the slake has also worked up frequently for an inch during the past three years, as is clearly proved by numerous levels taken by Mr. Robinson, the resident engineer. And the field drains, which alone empty themselves into the slake, cannot be supposed to be charged with matter similar to that deposited in the bay. Upon mature deliberation, I consider the increase of depth to be owing to three causes :—1st. As before observed, to the scourage of the inner part of the bay. 2dly, to the practice observed by light vessels bound to Seaham, Sunderland, and Shields heaving their ballast while crossing the Tees Bay, the lighter particles of which find their way to the shore abreast. And lastly, to the close neighbourhood of the Tees mouth. That river has been considerably deepened of late years ; and it is but natural to suppose that part of the soil removed has been laid on shore at either side of the entrance."

So far as to opinion.

17,175. But these causes still exist. Colliers, I presume, still heave their ballast at sea when bound north, and the Tees still exists, and the sluicing still takes place ; the harbour also is still in the position in which it was?—Yes.

17,176. Then if these causes still exist, why should the silting go on up to 1846, and suddenly cease at that particular date, and no silting take place between 1846 and the present time, but on the contrary an increase of depth ?—From the reasons I have already stated, that the effects and causes I have specified might he neutralized by another cause, the decrease of depth itself might he a counteravailing cause of no further decrease.

17,177. That is your only reason ?—That is my distinct reason that if such a thing be caused that the silt, as stated, has ceased to accumulate in Hartlepool Bay, then I should be prepared to account for it in that way.

17,178. That is the only way in which you can account for it, knowing as you do that the causes which existed up to 1846 still exist ?—I should account for it in that way.

17,179. That way and no other ?—Yes.

17,180. If, after turning it more over in your own mind, you should discover any other reason for it, perhaps you will address a letter to the secretary of the Commission on the subject ?—I shall be happy to do so.

17,181. I have been reading over, as in duty bound, the evidence which was taken before the Seclet Committee of the House of Commons, and I have been reading perhaps with more than usual care, the evidence which you gave there. At page 118 of the Report of Evidence taken in 1857, and at Question 1,947, you were asked by the Chairman as follows :—" You have no " hesitation in stating as your opinion that a harbour " of refuge is urgently required on that part of " the coast " (referring to Hartlepool). Your reply is " Urgently required," and then you add, " I may " mention that in January last (that was in January " 1857), we had a gale of wind from the east, and I " think as respects that gale, I think I stated in the " Report how many lives were lost, partly from my " own observation, and if on that occasion a harbour " of refuge of sufficient space and judiciously pro- " jected had been in existence at Hartlepool, I have " no hesitation in saying that the whole of these lives " would have been saved," and you answer, " Yes, " certainly." Now I want to ask you, Mr. Calver, what property and what lives do you refer to ? Did you refer to the ships which were lost between Whitby Point and the Black hall Rock four miles north of Hartlepool, or did you refer to the ships which were lost between Flamborough Head and Whitby during that gale ?—My reply would have reference to any vessel embayed and in distress on that occasion, and within the north-east of the bight.

17,182. What do you mean by the north-east of the bight ?—I should define the north-east of the bight as bounded by North Sunderland Point on the northward, and the north cheek of Robin Hood's Bay to the southward.

17,183. Then your answer is that, in your opinion, if there had been a harbour of refuge at Hartlepool such as you have in view, all the property and all the lives which were lost between Robin Hood's Bay and North Sunderland Point would have been saved ?—That is my opinion.

17,184. By the return that has been handed in to you, there appears to have been a considerable loss of life at Whitby ; do I understand you to say, that if a harbour of refuge had been constructed in the Tees Bay at Hartlepool, these ships would have been saved, and the lives on board ?—That is my opinion.

17,185. With the gale at south-south-east these ships had no need to be driven on shore at Whitby ?—No.

17,186. Nor with a gale at south-east ?—No.

17,187. Therefore it would have been when the gale came round to about east or east-north-east, that the ships went on shore ?—Probably.

17,188. Then they were lost, no doubt, because they could not weather away the land at Whitby ?—Probably.

17,189. If they could not, how could a harbour of refuge at Hartlepool have saved them ?—The circumstances would be altogether different if a harbour of refuge had existed. Without a harbour of refuge a person would linger opposite the coast, and hope against hope that the gale would take off, whereas, if a harbour of refuge existed, there would be a motive for altering his plans. If he saw a gale commence, knowing that there was a harbour at Hartlepool, and that the gale might increase, he would immediately run to the north so as to put the harbour under his lee.

17,190. If that is your answer, would it not apply to those ships lost during the gale between Robin Hood's Bay and Flamborough Head ?—It would apply to any vessel placed within the limits of the north-east bight.

17,191. A harbour of refuge then would have saved these ships between Robin Hood's Bay and Flamborough Head ?—It would.

17,192. Then, the same reason which led to the destruction of the ships at Whitby, would equally apply to the destruction of those ships between Robin Hood's Bay and Flamborough Head ?—It would ; because they could not weather away the coast ; but I am not aware of the circumstances.

17,193. If they could not weather away the coast at Whitby, tell me why it should not be the case along the range between Robin Hood's Bay and Flamborough Head ?—The cause of the loss would be the same in the two cases, because they could not weather the head.

17,194. Then, if the reason you have given does not apply to ships which were lost between Flamborough Head and Robin Hood's Bay, I am at a loss to know how it can apply to those ships which could not weather away the land at Whitby ?—They wanted the inducement to make them stretch to the windward, which there would have been had there been a harbour of refuge here.

17,195. Can you account for it, why those ships lingered on that iron-bound coast, instead of making for the Durham coast, where there was a better chance of saving their lives ?—It might have been the want of any precaution.

17,196. If a harbour of refuge was made, do you think it would knock precaution into the heads of masters of ships, if it is not there by nature ; because, if it was the want of precaution which led to the destruction of these ships, and the fearful loss of life, then I am afraid it would be a waste of money to construct a harbour of refuge in the hope of saving them ?—I put it in a different light.

17,197. Tell me how you look upon it ?—If you had a particular harbour of refuge at Hartlepool, a person who is navigating a ship upon the coast would not be in the uncertainty there is now, and would take ad-

vantage of it if necessary. There would be no reason for his lingering and pressing upon the coast until it ended in his ultimate loss.

17,198. Then you think, if there had been a harbour at Hartlepool, these ships would have passed to the north, instead of keeping to the south, in case the wind chopped round to the east-north-east ?—That is my opinion.

17,199. (*Capt. Washington.*) Do you remember the circumstances under which the survey of Hartlepool was made in the year 1846, for I don't ? I do not know the circumstances which led to it ?—I remember you were absent on duty at the time.

17,200. I think at that time I was on the Tidal Harbours Commission ?—I think it was so.

17,201. Your report will be in existence at the Admiralty, of course ?—It will.

17,202–3. (*Capt. Sulivan.*) I suppose they will have a copy of this plan you refer to in 1846 ?—It was forwarded to Captain Washington.

(*Capt. Washington.*) It must be at the Admiralty.

17,204. (*Capt. Sulivan.*) In the report to the Admiralty, you said that a continuation of silting up has gone on from 1846 to 1849, and that the shoaling has taken place across nearly the width of the bay at its entrance or mouth ; while the anchorage ground has thus deteriorated the greatest loss of depth has unfortunately taken place in the northern portion of the bay ?—That is in the same report from which I have been quoting.

17,205. Taking Mr. Mossman's details, you were satisfied there has been no silting up since 1846 ?—I have stated that I am satisfied, that is the fact.

17,206. But in your report you give three more years silting up ?—I observe the paragraph.

17,207. It does not quite agree with your evidence of not silting up since 1846 ?—From my own knowledge.

17,208. Will you state who the inspector is that you refer to as remarking that the shoaling has taken place ?—That was Mr. Cockburn Curtis.

17,209. Now, with reference to what you said about silting up, and why it might have ceased, do you think that another reason might be, that through some unusual clearing out of the Tees during the period of silting up or some series of winter gales acting with an ebb tide, some shoaling might have occurred prior to 1846, but might not have gone on since that time ?—I think it a very likely reason.

17,210. And would it also be the case that some unusual amount of sea in the bay might have added to the silting up, where you describe it, by removing the sand from the inner portion of the bay, where you say it was rather deepened, and swept the clay clear; would that add to the silting up ?—Not if you refer to the dry banks of the river. I should refer it to the waves.

17,211. Referring to this plan of Mr. Rendel, and supposing that any portion of that silting up came from the south-east waves combined with any fall from the Tees, bringing the silt into the bay, would not a breakwater, constructed at the shore, tend to guard against a silting up along the shore from the south ?—It would prevent any material being rolled along the beach by the action of the sea, but it would not prevent the accumulation arising from charged water.

17,212. But it would prevent any tendency to drift along the shore by the action of the south-east wave, acting in combination with an ebb tide, charged with sediment from the Tees ?—It would.

17,213. Then, suppose that any tendency of sand to accumulate around the north head to be stopped by the north breakwater, would it reduce the tendency to silt up to what the tidal water at the entrance of the harbour brought in in suspension ?—It would, up to certain period, when the accumulation at the back of the artificial works had increased to such an extent as to admit of the drift partly getting into the harbour.

17,214. Do you think, from what you know of the tendency of the waves, and the action of the tide along the shore to carry silt along the Long Scar Rocks and round the Long Scar Head, that there would be any fear of these long piers silting up, so as to make it at all dangerous near the mouth of the harbour ?—No ; not by the finer matter held in suspension, but of the coarser sand I should expect a considerable accumulation.

17,215. Suppose there has been no tendency to silt up for the last ten years, do you suppose any amount of sand is travelling towards that bay from the north to the south that, in any moderate period of time, would accumulate and fill up the back of the piers ?—You can only determine the quantity by the artificial works themselves. I have seen cases where you could not, from common observation, detect any moving material, but when the works were put out then I have seen a very large accumulation in a very short time, whereas if you had not had the artificial works you would not have believed such an amount could have been supplied.

17,216. I see there is no silt on the outside of the breakwater that has been built ?—I should expect it.

17,217. What little is in the inside is apparently brought in by the south waves ?—I should not expect it.

17,218. Then from your experience of this would you suppose that along the northern breakwater on the north side, it would have much tendency to silt up at the back ?—I think it would outside low-water edge, not on the rocks, because no materials will lie on rocks.

17,219. Do you suppose that the amount of sand or silt brought in in suspension by the tidal water materially reduces the depth in a material period of time ?—I should fear accumulations resulting from the direct effects of these works going on. Knowing as I do, the highly charged state of the water on this coast, I should apprehend it would accumulate within such a harbour very rapidly.

17,220. I understand you to say that the slake has only silted up a fractional part of an inch in a long period ?—It has.

17,221. Then the water in that will generally be as much charged with silt as the water in the still harbour ?—It will.

17,222. Would that lead you to suppose that the amount of silt from the still water only would not be greater over the bay than it would in the slake, except looking to the difference in the depth ?—What is the fact in one case is most necessarily the fact in the other. I find that, in the one case an agent is provided to prevent an accumulation, in the other no such agency exists.

17,223. Will you mention the agent, if you please ?—The agent which preserves the slake is a small diminutive lipper, which is generated in gales of wind over the surface of the slake, and in all expanses like the slake. Every little lipper suspends its portion of material ; the consequence is, that over centuries you will find nilets of that sort preserved very nearly in a mean state, without sensible increase or decrease, and no such agent would exist in the case of an enclosed outer harbour.

17,224. Will the water in the western docks, generally speaking, be charged with sediment much in the same way as water in the bay ?—In the western docks I should expect an accumulation in the channel harbour, and no accumulation upon the slopes.

17,225. I allude to the actual basin inside where we are told there has been no tendency to deposit any silt ?—I should consider it a singular exception.

17,226. Can you give us your reason for thinking that the silt deposited in the Victoria Basin was sea silt ? Can you give us the precise facts by which you arrive at the conclusion that it was sea silt and not coal dust ?—I cannot as a matter of memory, but I perfectly remember making certain inquiries to satisfy myself as to the source from whence it was derived. It was suggested to me that it might be partly due to the blown material from the coast, and the refuse of the ships. I remember duly considering it, and I

HARTLEPOOL.

Mr. E. K. Calver, R.N.

19 Oct. 1858.

Capt. Sulivan.

arrived at the inevitable conclusion, that the greater part of it was matter resulting from the open water, sea-water pen.

17,227. You say in your report, sand and silt. Did you have specimens of it examined, to see whether it is sand or not?—I think, now you mention it, I did. I got some materials, and compared it with that in the bay.

17,228. Then you are still of opinion, that the water of this bay, whether in the dock or in the bay, deposits a certain amount of sediment answering to what you describe?—That is my opinion.

17,229. I ask you whether, by leaving an opening in the breakwater to the beach above the Long Scar Rocks, that would not leave the bay open to the risk of silting from the Tees, and the action of the set of the sea bringing the sand or silt into the bay in the way supposed it might have been done during the silting up of ten years previously?—Not to that extent.

17,230. But to a similar extent?—Possibly to a small extent.

17,231. If the water coming in from the south, and with the sea and ebb tide, did bring matter in, would not its unobstructed escape to the northwards round the Heugh be very much retarded, and would it not have more tendency to deposit that matter in the bay than it had in an open bay?—It would.

17,232. Would you consider that, on the whole, the argument is in favour of a south breakwater?—No.

17,233. With reference to the question of wrecks on that south part of the coast, you said if there was a harbour at Hartlepool any prudent man would take care in a gale of wind, and sea drawing to the southward, to find himself in such a position to have the harbour that he might come into it for protection. I think that was your remark?—It was.

17,234. Provided on the other tack he could not weather the head and get into a harbour?—I think so.

17,235. Now would you believe, under the present circumstances, knowing what you do of the additional chances of saving live in Hartlepool, compared to any part of that rock-bound coast, that any prudent man would not endeavour either to keep the Humber under his lee bow on the one tack, or, if the weather allowed him, Hartlepool Bay under his lee bow on the short tack before he will allow himself to be driven in on that rock-bound coast?—I think there are certain circumstances which would induce him to adopt a different course; there is the uncertainty of the time of his arrival at Hartlepool to the time of tide, and various other things, and his entrance into a port would not be so certain.

17,236. I am not speaking of his entrance into a port, but merely of the additional chances of his saving the lives of himself and his crew that he would have on Hartlepool beach or the Tees beach, to what he would have on any other portion of that rock coast. Would you, yourself in charge of men's lives in that position, for one moment risk being caught on that shore, and having to take any of those little beaches about there, if you could get Hartlepool under your lee, and use it as the means of saving life if not of saving the vessel?—I cannot, without knowing the case, understand how vessels with the wind first south-south-east and south-east, and then east, linger upon this coast, and are finally lost. I cannot understand it. I can only say they could not effect it with common precaution.

17,237. May it have been that vessels hung off the Head with the south and south-south-east gale too long, hoping still that it might draw to the eastward, could not weather the Head on the one side, and could not fetch Hartlepool, and so were driven on the rocky shore?—That is possible.

17,238. Suppose the greater portion of laden vessels along the coast were caught off Flamborough Head, would those vessels, had there been a harbour of refuge existing both at Filey and Hartlepool, have borne up for Filey if they could fetch it, or would they prefer passing Filey and coming back to Hartlepool?—They would have taken Filey if they could have reached it distinctly.

17,239. While for any vessel to the leeward of the bay that could not have fetched Filey, Hartlepool would form a second harbour of refuge?—It would. You made use of the term caught; I cannot understand on the occasion referred to, with the wind south-south-east and south-east, a vessel caught there.

17,240. Taking it for granted masters of these colliers are some of the best seamen in the world, the whole of their lives have been spent in this work, and that they have seen the same thing over and over again, and would be fully aware of the precaution necessary to the saving of their lives, do you believe that if they had not been caught in the common acceptation of the term, they would have been wrecked along that iron-bound shore?—Then I must make my former reply, that without a harbour of refuge there are circumstances which would make men hang on to the last moment about Flamborough Head, but had a harbour of refuge existed, the circumstances would have been altogether different. Those men who lingered about the Head, and were lost between the Heugh and Whitby would not have acted with the commonest prudence had they not drawn to the northward, knowing that they had this harbour under their lee, which they could enter at any moment.

17,241. Supposing there had been a harbour at Filey at that time, would the vessels caught off Flamborough Head been likely to have taken it at once, being so near and without losing the ground, or would they have run back to Hartlepool had one existed there?—They would have taken Filey.

17,242. But suppose there was only one, not one at each place, would it have been an additional advantage for them to take a harbour of refuge quickly, it being at Filey, and so far advanced on the voyage, than if it had been at Hartlepool?—That, again, involves the question of preference whether they would be soon at Hartlepool or Filey.

17,243. No, I am speaking of those vessels at Flamborough Head having a harbour so close without running back; would they be more likely to take it early without risking their vessel than they would if taking it earlier involved running back 40 miles?—I think that a harbour of refuge would produce this effect, but men would timely take shelter in them and not hang out.

17,244. Would the fact of a harbour being nearer them, and so much more on the advance towards their voyage, make them take it sooner?—Yes.

17,245. For light vessels in such a gale as that, and rounding Flamborough Head, bound for their coast and hoping to reach their coast, would a harbour in Hartlepool have been more valuable than one at Filey?—It would be more valuable as being much further on their course towards home.

17,246. (*Capt. Vetch.*) Does it not happen that during several years the wind and gales prevail more in one direction than another, and produce the effect of deepening the bed of the sea in some places and shoaling in another, and that in another period of years the wind and gales prevail more in the opposite direction, the effect of which is to restore the bed of the sea to its normal condition?—Yes.

17,247. If so, might not such cause satisfactorily account for the different state of the bed of Hartlepool Bay as observed in 1846, and at a later period?—It would.

17,248. Supposing a regular trade proceeded from the Tyne, the Wear, Hartlepool, or the Tees, to southward in somewhat a pretty regular manner as they would in the aggregate, and a gale came on from the south-east that prevented him from proceeding beyond Flamborough Head, whether, in your opinion, would Hartlepool, if a harbour of refuge was made there, or Filey, if a harbour of refuge was made there, be the means of saving a greater number of vessels seeking shelter, supposing the storm to be uniform from the Tyne to Flamborough Head?—Hartlepool;

because I should assume the greatest portion of the vessels would be to the leeward of Filey.

17,249. (*Chairman.*) During your surveys where have you been engaged, I mean generally as to the districts on the coast ?—From the Shetland Island to the Thames principally.

17,250. I do not intend to examine you at any length now, in fact hardly at all, as we shall have the advantage of your evidence at a later period in London, but I will ask you if you are well acquainted with the Tyne, the Wear, and the Tees ?—I am.

17,251. Will you describe the effect of the freshes which come down, in the first place, in the river Tyne ; I mean with a spring ebb, which makes very often a bad sea in the harbour's mouth with a gale blowing along shore ?—It makes a very hollow and dangerous sea.

17,252. And the freshes add to the danger of the sea, but in what degree ?—It adds materially in degree, for it makes the sea hollow—a bursting heavy bad sea.

17,253. And therefore increases the danger of entering a harbour under those circumstances very considerably ?—It does.

17,254. Now as respects the Wear, which I understand to be a river far shorter, and therefore I presume the fresh is not so heavy, how is it affected by freshes ?—It is affected in a similar way, only the river is much smaller, and it has not so great a force as that of the Tyne.

17,255. The Tees—are the freshes in the Tees as serious in their effect as those on the Tyne ?—The sea produced by the freshes in either case would be much the same.

17,256. Is the Tees fresh as bad a subject to deal with as the Tyne fresh ?—As bad ; there is more danger, if I remember rightly, in the Tees than in the Tyne.

17,257. (*Sir F. Smith.*) I had the advantage of hearing your evidence in 1857. In the House of Commons you were asked what was there in this part of the coast which you considered most essential for refuge and the best place for it ; your answer was Hartlepool Bay. Have you any reason to doubt that was a sound conclusion ?—I have no reason to doubt it.

17,258. Your were also asked, with reference to the construction of a breakwater, and in question 1,894 that the Chairman put to you, he said, "Having no communication with the shore on either side?" to which your answer is, "Having no communication with the "shore." Do you still hold to that opinion ?—I do.

17,259. You are aware that Mr. Rendel's plan was to be connected with the shore ?—It was.

17,260. Had you any conversation with Mr. Rendel on that subject ?—I had not.

17,261. I should have imagined, from your great experience here, that Mr. Rendel would have consulted you. A question was put to you, "Still would "you have a strong current running through the harbour ?" and your answer is, "Yes, and it would not "interfere with the current in the smallest way." Do you still hold to that opinion ?—I do.

17,262. The next question that was put to you was, "Do you think that an advantage?" to which the answer is, "It is imperatively necessary." With that opinion you would be strongly opposed to any connection with the shore in any breakwater for the protection of that roadstead ?—I am.

17,263. Question 1,900 is, "In order to insure the "suspension of material in the water a current of that "kind is rather an advantage or otherwise?" and your answer is "Yes ; observing in gales of wind that we "have the sea charged even to the depth of 12 fathoms "on the eastern coast of England, it is quite clear "that to form there a harbour of refuge would be a "very dangerous experiment." Do you still hold to that opinion ?—I still hold to that opinion.

17,264. I ask that question because it is important to know if you have arrived at any change of opinion from the evidence you have heard or read ?—You are asking this question with reference to this bay in particular ?

17,265. Question 2,116, "The great mass of sand "has not shifted so as to effect a general unity of a "place for shelter ?—It has not."

17,266. Question 2,117, "With reference to Har- "tlepool bay, do you know the nature of the bottom "there?" The answer to it is, "It is very thick stiff "clay, with a deposition of sand upon the surface." "Is that deposition of sand of any depth upon the "clay ?" Your answer is, "Several feet at least, "because within the last few years the basin, and "also a part of Hartlepool Bay, has been filled up "several feet by sand." Now answer to a question put by one of my colleagues. You only got up to 1846. Now that was in 1857, eleven years afterwards, yet you say, "within the last few years," do you mean since 1846, or antecedent to 1846 ?—That remark will be limited to 1849, when I had communication on the subject.

17,267. You call that the last few years then ?—Well, it is rather a loose term.

17,268. I wish you to have an opportunity of explaining that, because it seems a little contradictory. You have explained it to me quite satisfactorily. You say there are great facilities for procuring, near Hartlepool, the necessary facilities for a breakwater. Do you give that upon your own knowledge of the facts, or from hearsay ?—Not from my own knowledge, but upon statements I have heard.

17,269. You also stated to the Select Committee of the House of Commons that, excepting for local purposes, a harbour is not expedient at Sunderland ; I suppose from that, you consider Sunderland an unfavourable position for a harbour of refuge ?—As to the position, I should consider it inferior to Hartlepool.

17,270. You say that it is not expedient except for local purposes ?—Yes.

17,271. You are still of that opinion ?—I still am of that opinion.

17,272. Then you gave an opinion that Redcar is a bad site for a harbour of refuge. Do you still hold to that opinion ?—I still hold to that opinion.

17,273. I think at some other part of your evidence you state the probability was that the deposit upon the southern point of this bay came from the neighbourhood of the Tees ?—Yes.

17,274. (*Capt. Sulivan.*) From your knowledge of the tidal rivers on this coast, do you believe any outlay could be made by Government that would be likely to insure the depth necessary within the piers built by that outlay ?—No.

17,275. (*Mr. Coode.*) You stated in reply to the Chairman, that in time of freshes there would be heavy bursting seas at the mouth of the Tyne, the same at the Tees, the same at the Wear, but in a less degree. Do you give that answer from your general knowledge of such matters, or from actual observation and experience on this coast ?—From my own actual experience.

17,276. In which of these three cases ?—In each of these three cases.

Mr. William O. Mossman re-examined.

17,277. (*Chairman.*) Do you know of any vessels loaded out in the bay that have taken part of their cargoes in in the docks ?—I think I remember something about one vessel, and if the captain had stopped in the harbour there would have been plenty of water ; but he would not be persuaded, and would rather go to sea and take in some keels of coals. If these cases were occurring, I should have to look strictly after them, to see that they did not throw the coals overboard instead of putting them into the vessels.

17,278. In what part of the district were you employed under Captains Slater and Otter ?—From the Tees to Stornoway, in the Island of Lewes, Hebrides.

HARTLEPOOL.

Mr. W. O. Mossman.

19 Oct. 1858.

Chairman.

17,279. Then you are well acquainted with the Pentland Firth ?—I think so.

17,280. When you had to take refuge in the rigging were you making the passage from the westward or from the eastward ?—From the westward to the eastward.

17,281. When you ran into the firth, was the weather bad, or did the weather surprise you in the Forth ?—Immediately we got to abreast of St. John Point, or rather what they call the Old Men of May, it fell calm, and we fell into the weight of the tide. The vessel became unnavigable, and the sea broke into her. There was a heavy swell setting in, and it caused us to be in much danger. We hardly had time to take to the rigging, and were obliged to go up aloft and sit looking at everything going away, till we finally drifted out into the open sea outside the Skerry Islands and Duncansby Head clear of the tide.

17,282. When the sea was breaking over your vessel, was she battened down ?—Yes, all but the companion hatch, and it was locked, but a great deal of water went down there.

17,283. As I understand, the tide in the Pentland Firth runs sometimes in the springs at nine or even ten knots an hour. Is that within your experience ?—Yes.

17,284. It has also been given in evidence that the tides run six hours either way ?—Yes.

17,285. The tide runs fair through the centre draught, and the eddy does not extend to any great distance from the shore ; does that accord with your experience ?—There is a certain channel, which may be called the fairway through the firth, but it is difficult to keep a vessel in it except with a fair and commanding wind. If you approach the firth with a foul wind, you can scarcely prevent getting into the eddies in working through.

17,286. What is the breadth of the firth there ?—If we take the main coast, I think about seven miles, but there are several islands.

17,287. What is the breadth of the fairway where the tide runs clear of the eddies ?—Perhaps a couple of miles.

17,288. You limit the extent of the fairway to about two miles in the centre of the firth ?—Yes, as far as I can remember.

17,289. At what distance from the entrance to the firth does the effect of the weather tide extend in a heavy gale of wind in making the sea unfair ?—I should think seven or eight miles.

17,290. To what extent would the sea be more dangerous there than in the open North Sea ?—I should think about three to one.

17,291. In making the sea a more hollow, tumbling sea, and dangerous for a vessel to scud or heave to in ?—Quite so.

17,292. Then at what distance from the entrance to the firth would you be disposed to say that the effect of the tides as respects the sea commences ?—Where we attribute any danger would be about 12 or 15 miles clear of the firth.

17,293. Therefore, at a distance of 15 miles from the entrance of the firth, a vessel would heave to with as much safety as respects the nature of the sea as she would out in the open sea ?—Yes, but I should doubt she would drift into it.

17,294. Are you well acquainted with the coasting trade on this coast ?—I am.

17,295. In those which carry the most dangerous cargo, being loaded with the deadest weight, is it safer with the wind blowing hard to heave to or to scud ?—In some cases it would be more dangerous to scud than to heave to. Some vessels would heave to, but others better adapted to it would scud.

17,296. But take the generality of those vessels, what would be the safest thing for them to do, to scud or to heave to ?—To heave to, decidedly, in many instances.

17,297. (*Mr. Lindsay.*) Have you measured the area which would be obtained under Mr. Rendel's plan of four fathoms ?—Three fathoms and upwards, 307 acres ; four fathoms and upwards, 79 acres.

17,298. Speaking to you as an old sailor, what area in acres would be required for 100 ships of the usual description trading on this coast to ride at anchor ?—If it was a close harbour with one entrance, I should give them about an acre each, or a little more.

17,299. Then with an open harbour, what acreage would you give them ?—I would multiply it by three. I should think it would take about three acres to each.

17,300. Then I understand your answer to be that with a close harbour 100 ships might be moored safely at anchor in an area of 100 acres or little more ; while with an open harbour, such as that proposed by Mr. Jackson, it would require an area of 300 acres to moor in safety the same number of ships ?—I should certainly think so.

17,301. Would you consider three fathoms sufficiently deep water for a vessel drawing 14 feet to moor in, provided it was sheltered as Mr. Rendel shows ?—No ; I should give it a foot more if it was in a close harbour.

17,302. Then this plan of Mr. Rendel's being a close harbour, would not contain a great number of the usual class of vessels frequenting this coast, because there is only of four fathoms and upwards, 79 ; and 330 between three and four ?—It would not contain the quantity of vessels that would resort to a harbour of refuge on this coast. It is too small.

17,303. You think then if Mr. Rendel's plan was carried out it could not be looked upon as a national harbour for this coast, but that it would be a good auxiliary harbour ?—It would be a good auxiliary harbour.

17,304. In your opinion, considering the draught of water that would be inclosed, you think it would not be looked upon in the light of a great harbour suitable for the large amount of trade which is passing along the coast ?—I think it does not go seaward enough ; it should go out into deeper water. If any thing was to be done with this harbour, I should certainly advise that it go to at least seven fathoms at low water.

17,305. Then Mr. Rendel's plan would not answer, in your opinion, the wants of this coast ?—It is too small, if it is to be the harbour of refuge.

17,306. Then, looking at the plan which Mr. Jackson has got, and considering that you would have an open harbour, and would require three times the area in an open harbour to afford safe shelterage to ships that ride at anchor to that which you would require in a close harbour, would you think the plan of Mr. Jackson sufficient as a harbour of refuge for the whole trade of this coast ?—I am not aware there will be the quantity of protection in that harbour that there will be in the other, taking the whole area. It is very open.

17,307. You think that even Mr. Rendel's plan would give more protection, for the reasons you have given, than the extended plan which has been lodged by Mr. Jackson ?—I am not saying that more vessels of heavy draught of water would ride in that area. I am speaking of shelter. I think there will be almost as much of what I now call shelter as in Mr. Jackson's, Mr. Jackson's piers are so very open. The piers extending so far round the bay, and the sea flowing round these piers, particularly at the south end, would cause an immense disturbance where shelter ought to be found under their lee.

17,308. You said that in your opinion you did not think there had been any silting up since 1846, but that, on the contrary, the depth had increased a few inches ?—Going into the total sum I find that the depth as an average over the bay has increased.

17,309. Do you think some part of it has shallowed and some part deepened ?—There are items in such a case as this that never should be taken into account. You cannot split hairs when you come to deal with some millions of cubic feet of water in a bay like this.

17,310. As hairs have been split on this point I am anxious to have the question settled one way or the

other beyond doubt. Can you lay down upon the plan of 1846 not merely the soundings taken in 1846, but also the soundings taken this year, 1858, and lodge it?—Oh, decidedly.

17,311. So that we may see where it has deepened and where it has silted up?—Yes. There are two returns of the prevailing winds on this coast, which were ascertained at the lighthouse, and I omitted to hand them in last night, and there is also a table and return of the different wrecks that have taken place about the coast within the limits of the port of Hartlepool, signifying those stranded and wrecked, laden and light. This (*produced*) is a table showing the number of storms, the force of the gales, the division of the compass in which each has occurred, during the years 1854, 1855, 1856, and 1857.

17,312. (*Capt. Sulivan.*) You have heard, I think, what Mr. Calver said with reference to this southern breakwater. As you have given an opinion in favour of a close harbour, I wish to ask you whether you think one advantage of this southern breakwater would be the cutting off a tendency to drift sand in south-east gales from the mouth of the Tees towards the harbour, and so close the entrance inside and outside the Long Scar Rock?—It will prevent anything from entering there.

17,313. From what you say of the sand in the bay, generally, are you of opinion that the sand generally comes from that direction rather than the north?—I never since I knew anything about Hartlepool had any doubt about the bay silting up from the north, for it was always from the south that I had any doubt. I have never yet, although I have heard repeated assertions made that the bay of Hartlepool was silting up by matter from the Tees, and such as that. I never could find with my own observation that was the case, although I say at this moment, that if you raise detached piers off this bay you will cause an inclination of the water to get into a sort of converging current, where none at present exists, between the pier and the land, and you might cause a scour. Therefore that substance would get into the bay, and it could not get out again.

17,314. Do you doubt that, supposing the harbour to have retained its depth for the last 10 years, at the bays between the two docks the sand is increasing in some places by gales from the sea?—Oh yes; there is the beach in the north-west part of the bay; between the two harbours, for instance: that is the only place where the substances have risen higher than it was when I came to Hartlepool. But still the low-water line, I may explain, is nearly the same, with the exception of a small portion on the north-east side of the west harbour.

17,315. Is it not likely that what has increased there has been brought in from the south?—It is taken from one beach and laid upon the other. Every season I took a level over the beach; I have divided that into 10 or 11 sections to the north, as far as the West Harbour. Between the West Harbour and the other harbour there are four or five sections that come at right angles over the shore, and terminate at low-water mark; and also in the other harbour there are 20 or 30 sections. I took these levels in conjunction with the surveys that I made below low water, and I connected them together, and when I came to compare both the results I found that if the sand goes from here it very likely lodges there, or I lose it altogether, and on the two quantities being put together I find there are lost since 1846 upwards of half a million of cubic yards of substance, which I know has gone to sea somewhere or other, or to where I cannot get hold of it.

17,316. As you do not suppose the bay, since 1846, has had a tendency to silt up, if foreign matter has been brought into the bay previously, may the tide or current from the Tees have caused it?—I believe it must have come from the high-water banks, caused by the storms that prevailed between 1838 and 1846, and by the currents in the bay not being strong enough to carry it out to sea. It had been too voluminous for their weak powers to deal with. There is another reason that I might here explain, and which is, that during a certain period between the years just mentioned the tidal waters were entirely excluded from the slake, and when this is done the currents in the bay are very much weakened. I may also mention that at no period from the opening of the old harbour until I became resident at the port were the tidal waters admitted higher than what is called the neap tide high-water line; thus excluding at an average spring tide a quantity of water equal to about 860,000 cubic yards, which otherwise would have very materially augmented the currents by passing through the bay. I mentioned the circumstance to Mr. Harrison, who is the engineer of the Dock Company, and he ordered the gates in the sluice dam to be opened; after this the full flow of the tide was daily admitted, and since that period the depth in the bay, instead of showing any diminution, has gradually increased; I may say, although the difference is not very great, yet it shows an increase in the average over the whole.

17,317. With reference to what you said about the entrance to your breakwater, there is an angle at each buoy, is there not?—There is.

17,318. Supposing, instead of that one entrance you had an entrance at each of those angles, a vessel from the north-east might run into the north one, while vessels from the south might run into the south one, and vessels leaving the harbour might with a fair wind take the one or the other. That would be more convenient, would it not, for the entering and leaving of these vessels?—It would be a convenience during fine weather.

17,319. But with reference to any deposit in the harbour, should you fear that two openings would run more risk than one; having a large opening, facing as it does the north parapet, and the one overlapping the other, and acting as a funnel to catch any sediment that might come along through the breakwater from the south?—I should have a great idea that a harbour there, under any construction, if there are two entrances given to it, except it may be through a pier parallel to the land, and the two entrances to go direct out to sea, it would be injurious. It would be injurious to the navigation, by the entrances you propose being too near the shore. If you could confine the vessels to pass in fine weather only, it might be a convenience, but in gales from the sea it would cause wrecks upon the shore, and also prove injurious to the bay, because you make the harbour so very open and exposed you give less shelter, and do many other things which I cannot describe at this moment.

17,320. I am not speaking of closing in or of opening, but of the breakwater outside and angle where the buoys are; would not that be quite far enough from the shore to ensure any vessel going in in safety?—Not in bad weather. It is too near the shore.

17,321. If the gale was north-east, would a wave not go into the large opening at the angle, as well as if the gale was from the south-east?—No; the inclination of a wave in its progress towards the shore, immediately it comes in contact with less water than it has been previously running in, is to form itself into that line which is parallel or nearly so to the shore on which it falls. Therefore, with the wind at north-east, the wave would probably be going through direct to the north-west, notwithstanding its previous course being from the north-east.

17,322. Supposing that at that entrance a vessel was coming in from the north-east, would she have to haul right round the pier head on the starboard tack across the sea in the very worst place to get into the harbour?—So far as the wind is concerned she would have, but the sea would be going right after her.

17,323. But in hauling up, she would bring the sea upon her beam?—Yes; if you make a harbour with two entrances it is called an open harbour, where a close harbour would have but one entrance.

17,324. I understand you to apply the term open

HARTLEPOOL.

Mr. W. O. Mossman.

19 Oct. 1858.

Capt. Sulivan.

harbour to those plans which leave a large gap between the pier and the shore, and so leave room for the sea to come in to the south of the breakwater ?—That would be an open harbour, but one would undoubtedly be of a larger extent than the other.

17,325. (*Mr. Coode.*) You said that material coming into the bay came from the south ?—Oh dear, no !

17,326. Did you form your opinion from the relative quantity of sand on the beaches north and south on the bay ?—I hope Captain Sulivan did not construe my answer into that shape. If I did say so I did not intend to say that any substance came from the south. What I meant was, that I could never bring my mind to the fact that the bay was affected with substances from the Tees. We have heard a good deal about the substance in this bay. I think if we had foreign matter coming to it we should have had an increase of sand instead of a decrease. The currents in the bay itself are very gentle, and therefore, if they were getting a greater supply than their physical powers could deal with, there would be some left. It is not my idea that any foreign matter comes to it, but if a breakwater was constructed round the outer part of the bay, it would guide the sea into the entering angle, and the tide coming down from the south may cause a scour that does not take place now. A quantity of substance would probably pass behind the inner end of the breakwater, and ultimately would force its way into the heart of the great harbour, and create an injury. The only current that would go out on the north side would be simply through the Narrows. There would be no current in the harbour to keep it clear, as immediately it passed the Narrows on the south side it would cease, and deposit any substance that there might be in suspension.

17,327. You spoke yesterday of a conference with Mr. Rendel. Now no man could have a higher respect for Mr. Rendel than I have ; but I wish simply to know whether he was acquainted with your views as you expressed them ? Did you express to Mr. Rendel your view of the relative area required for a vessel in a close, as compared with an open harbour ?—I cannot say. I do not remember acquainting him with my views. On the contrary, in the conversation I held with him, I do not know that we discussed the matter. I think he was quite capable of judging of these matters for himself.

17,328. You referred to the wave turning round when it met with a projection. Are you aware that Mr. Rendel proposed to build his wall from the bottom ?—I do not know how he proposed to build his wall or construct his harbour.

17,329. Such was his proposal. Now, that being so, do you think a wave would wheel round to the same extent when it came in contact with a deep wall as it would when it came in contact with an open beach ? —I do not understand your question.

17,330. You said, in reply to Captain Sulivan, that when the wave met an obstruction it would turn round and break at right angles to that obstruction. That is a wave falling on the shore ?—Yes.

17,331. Well, would the wave turn round to the same extent when it met with a vertical wall, as when it met with an open beach ?—When the wave meets with a wall to any extent we always find there is a deflected wave.

17,332. Have you studied the effect of waves in deep water ?—Yes.

17,333. Have you ever marked their action when meeting with a wall in a depth of 15 feet ?—I have not.

17,334. You handed in some returns of wrecks within the limits of the port ; what are the limits ?—The limits is from the south end from Seaton, and a place to the northward of Hartlepool called Black halls.

17,335. How far north of Hartlepool ?—About four miles northward of the Heugh light.

17,336. You made reference to sections you had been in the habit of taking. Will you supply a set of sections on the beach corresponding with the periods at which you have undertaken to supply the soundings ?—I will. In 1846 I did not take so many sections over that beach as in 1847, but the beach was so very regular that I did not think it would make any difference if I had.

17,337. How many did you take in 1846 ?—Three or four and 10 or 12 were taken afterwards.

17,338. Will you supply the three or four you took in 1846, and the sections in corresponding positions taken in 1858 ?—I will. I took sections in different places, but perhaps the most important part is to the southward of the West Harbour piers.

17,339. Yes, between the two harbours also ?—Very well.

17,340. (*Chairman.*) The gale on the 4th and 5th January 1857, which I understand was one of the most destructive gales on the coast, was made a subject of report by you to the Commissioners of Hartlepool, was it not ?—Yes.

17,341. Will you furnish a copy of that report to our secretary ?—I shall be most happy.

17,342. Are you well acquainted with the harbours of the Tyne, the Wear, and the Tees ?—I know them very well.

17,343. You heard the questions I put to a previous witness with respect to the freshes in those rivers with a strong gale blowing on the shore. Do you agree in the account he gave as to that ?—I agree perfectly.

17,344. (*Mr. Lindsay.*) At what rate do these freshes run out of such a river as the Tyne ?—I think I can recollect of a common spring tide, that when trying the lead between the bar and the low lights, I found five knots current without the influence of a fresh.

17,345. This was the ebb tide ?—I remember making these observations from the commencement of the ebb tide down to nearly low water. It attained different rates at different times of the tide. I think the greatest strength of the tide, if I recollect aright, was five knots. I remember going in with a little cutter with a very heavy breeze, the wind from the north-east. She used to sail pretty fast, but I could not get through the Narrows with her. I had to get a steam-boat and tow her through the Narrows, and it was as much as she could do.

17,346. Is it not the case that vessels often take the Tyne on the ebb tide ?—They do ; and many are driven ashore in consequence.

17,347. As a general rule, on the average, what extent would you say the freshes add to the strength of the stream. Is it beyond five knots ?—In the Tweed I have seen from two knots an hour to 10.

17,348. In the case of the Tyne, what do you think the tide is increased by these freshes ?—In some cases five knots will be added to it.

17,349. You surprise me with that. Do you mean it to be put down in evidence that you have known the ebb tide from a river harbour run out to sea at the rate of 10 knots ?—Oh dear, no ! You are asking me what I would suppose the freshes to add to the natural stream, and I say, I have no doubt it would add in some cases five knots.

17,350. But you stated, in reply to a previous question, that in ordinary spring tides you had known the ebb tide to run out five knots an hour ?—That is a fact.

17,351. You said you think the freshes will add to that other five knots ?—I do in some cases.

17,352. Then do you know of water having gone out of the Tyne to sea at the rate of 10 knots an hour ?—I do not mean to say it would run through the sea.

17,353. I say running from the river to the sea ? —I have no doubt that if we paid particular attention to it, it would be found at the Narrows at the Low Lights more sometimes.

17,354. Is this a matter of common occurrence ?—An extreme occurrence.

17,355. Does it often run out at the rate of eight knots an hour ?—At the Low Lights I believe it does.

17,356. Do you think it frequently does?—I should not use the expression frequently, but I should think very frequently.

17,357. You say very frequently it runs out at the rate of eight knots?—Yes, I said so; I certainly give it as an opinion; I do not give it as a fact.

17,358. You have not measured it?—I have not measured it to give that as a fact.

17,359. To what extent have you measured? Have you measured anything beyond five knots?—That is the greatest I have found, taking the average from the Low Lights down to the bar intermediate of that. If I had tried it, very likely I should have found a greater current. I can remember the case perfectly of taking the average; not on the bar, but in the Narrows.

17,360. (*Capt. Washington.*) You only spoke at the time of the fresh?—The five-knot time. I am not aware there was any fresh in the river; it was a spring tide.

17,361. Did you measure it?—Oh yes.

17,362. Are you aware that in the tide in very heavy freshes the fresh naturally overruns the flood tide, and it is not felt at all?—Quite so; you would have no inward tide at all. The fresh from the country supplies the water to the levels, and checks the waters of the flood tide.

17,363. Do you think it would be any advantage to vessels taking a harbour of refuge, that there should be three entrances; one from the south-east, one from the north-east, and a direct passage, rather than one central entrance?—I should not prefer the entrance upon an angle. The only thing I should give my sanction to at all, if the close harbour was to be abandoned, would be, that the two entrances should be in the outer wall.

17,364. In the line of tide?—Just so.

17,365. Do you know that the north and east piers do fall in with the stream tide: at sea, I mean?—The north pier certainly does.

17,366. And the east pier?—Oh yes.

17,367. Don't you think that it is desirable, in constructing piers to cover Hartlepool Bay, to interfere as little as possible with the set of the stream?—I do; the north pier on the flood, and the south pier on the ebb.

17,368. You said you objected to opening out the ends. Is it not an advantage that a vessel making for the piers should have the possibility of escape either way in a slight degree, and therefore is not an angle the most advantageous point at which to put an opening for a ship to take?—I should not prefer to make an entrance in an angle of two piers; it is not the best point, considering the navigation. A sailor would be more afraid to steer upon an angle than upon a whole pier, with the entrance in the centre of it; he has not so much to guide himself in the first instance.

17,369. Is not the entrance to West Hartlepool nearly upon an angle?—It is, to a certain extent.

17,370. And is not that considered an advantage?—But these local harbours are so much embayed that the sea is comparatively smooth when we reach them.

17,371. Have you seen Mr. Walker's design for the improvement on the entrance of the Tyne?—I have not.

17,372. You are not aware there are conveying piers like the entrance to West Hartlepool, and that Mr. David Stevenson has projected piers of the same sort at the entrance of the Wear?—Yes; but I think not such a sharp angle as this. The piers are what we should call curvelinear piers, which does away with such an acute angle; although this is not an acute angle, it is a right angle.

17,373. Is it your opinion that it is better not to have an entrance at the end?—I give my opinion candidly, that if the idea of a perfect closed harbour were abandoned, if there are to be two entrances, I should prefer them in a pier, one the outer or seaward pier, about 200 or 300 yards from the south angle, and the other about the same distance from the north angle, so that vessels would steer directly into the harbour from the sea. The ebb tide would pass them both, so would the flood tide, excepting water sufficient to supply the harbour on the flood.

17,374. (*Capt. Sulivan.*) You have said you have known cases of ships partly loading inside, and then finish loading outside. If your closed harbour was built, would it cause the larger ships to come, which would take a portion of their cargo in at 17 feet, so that they would load to 17 feet before they got over the sill, and perhaps load to two and three and twenty feet in the bay, and thus very much increase the trade of the port?—I think if a harbour such as I have drawn were constructed, it would be a very easy matter to load ships up at the outer piers.

17,375. But would it be the means of bringing trade to the port, and bringing a much larger class of ships to come in in ballast loaded to 17 feet in the docks, and to 22 feet in the bay?—I have not the slightest doubt that they may do so.

17,376. (*Mr. Coode.*) You have described the two openings you have recommended in the eastern pier in the plan just handed to you. What width would you take for the ships to enter?—I should not have them less than 800 feet. I should make them less than one main entrance.

17,377. Do you give that opinion after mature consideration, or is it simply an answer at the moment in reply to my question?—Oh dear, no! I have considered it.

17,378. (*Chairman.*) You were going to make some observation, and I stopped you, and told you, you would have an opportunity of making them when your examination was done. Will you now say anything which you may wish to state?—It was to Captain Washington I was going to make the observation. It was in consequence of what he conveyed to me last night about the statement of Captain Otter's compliments. I wish to convey to Captain Washington, and to all the parties mentioned, that that was the only thanks I have received for my long services, and not the only remuneration. Captain Washington very likely will be kind enough to convey the matter to Captain Otter, but not in the same words, but that he will convey to Captain Otter, that I am exceedingly thankful to him for the flattering compliment he paid me; but at the same time it is the only thanks I have received for my long services yet; but that I was remunerated. I think there was a difference between thanks and remuneration.

17,379. (*Capt. Washington.*) I will convey them to him, but it is not much the habit of Government to return thanks for services?—No, I do not say that it is; there are many ways of returning thanks.

(*Chairman.*) I think it right, bearing the rank I do in Her Majesty's service, to acquaint you that the Admiralty are very chary in returning their thanks for services, it being our rule that it is a man's duty in every station in which he may be placed, to serve the country to the best of his ability, and to consider that when he has done so that he has done no more than his duty. After a service of 30 years, in which perhaps, upon the whole, I may have been as fortunate as many of my brother officers, it has only been my good fortune, to the best of my recollection—at this moment, I cannot speak with certainty—to receive the thanks of the Admiralty two or three times; and if I may venture, which is hardly right for me to do, to offer an opinion on the conduct of my superiors, I would say that they are perfectly right in the course they pursue.

BIBLIOTECA DEL C. O. A. M.

Mr. ROBERT RUSSELL examined.

17,380. (*Chairman.*) You are connected with the port as Chart Inspector of Wrecks for Lloyd's, are you not?—I am out-door manager under the Wreck and Damage Committee at Lloyd's, and of course my

HARTLEPOOL.

Mr. Robert Russell.

19 Oct. 1858.

Chairman.

duties lie all over the coast, wherever wrecks may occur.

17,381. You are a seafaring man ?—I was master of a ship some years.

17,382. How long have you been at sea ?—30 years.

17,383. And how many years in command of vessels ?—I should say 17 or 18.

17,384. And the vessels which you commanded, in what trade where they chiefly employed ?—Principally in the foreign trade.

17,385. How long have you been ashore ?—Six years.

17,386. You have been present during the course of this inquiry ?—Yes.

17,387. Will you now give your opinion as to the advantage or necessity of a harbour of refuge on this district of the coast, or where you would put it, and for what reasons ?—The necessity for a harbour of refuge upon the eastern coast, of course, is not supposed to be denied for one moment ; the number of wrecks we have each year clearly prevents that without any further say upon it ; and my opinion is that a harbour of refuge ought to be formed in this bay, and it is founded upon the great indentation of coast ; and that all the vessels trading to the northern ports more or less get embayed in it in coming to the different ports and loading ; consequently, if a gale of wind sets in, many in the number of vessels in the bay, have necessarily to run to the place where they know it is the best port.

17,388. Then you consider Hartlepool, which is about the central point between the Tyne and the Head, as the best place for a harbour of refuge ?—Certainly. I consider it is from its natural position a much larger place in fact than anywhere else.

17,389. Do you think there is any difference as respects light and loaded ships, as respects the position of a harbour of refuge ? Do you think that touches the question, or that the same place would do equally well for both ?—I do not know that I have ever taken any particular notice of the exact position that light or loaded ships come ashore in. I have seen from the returns, that the greater loss is upon the whole of the coast as six of laden vessels to every one of light.

17,390. In making their passage up from the coal ports loaded vessels generally make an offing, do they ? or do they keep on shore ?—With the wind off shore, I think it is general for all vessels going up the coast to shape a course not for the headlands, but in fact to hug the shore as close as they conveniently can ; with the wind there probably would be a difference, they would keep as far off as they could get.

17,391. And, therefore, meeting with an inshore wind they should at once make the offing with a view to safety ?—No doubt they would get as far as they could, or at any rate till they considered themselves at a safe distance from shore.

17,392. Then making the passage with an off-shore wind, do they hug the coast for the sake of making their passage, and of getting the advantage of the wind or the tide, or what is it ?—No doubt it is partly custom, and partly from the winds occasionally drawing round north ; and getting the land ahead of them, they get a better lee than in dropping close in.

17,393. So they keep in shore because the wind compels them ?—Yes, that is the practice ; they keep in shore with an off-shore wind ; I know that from my own observation.

17,394. Does it frequently happen that when ships get up to the Head that the wind southerns upon them? —That very frequently happens.

17,395. Does it occasion any crowding of vessels in the neighbourhood of the Head, that ships creep up as far as the Head with a scant wind off shore, and then the wind meets them from the south, and so checks them ?—Yes. I have seen a good many vessels hove to under Flamborough Head, with the wind away from the south and south-west.

17,396. As respects light ships when they get away from Hartlepool, bound for other ports, they make as straight a course as they can ?—With the wind off shore they hug the land as close as they can to make sure of their ports, because a light collier is not much of a thing when she comes in contact with a strong wind. She sometimes goes one foot ahead and ten to leeward.

17,397. Are the shifts of the wind sudden on this coast ?—I am not able to say that the shifts of wind are more sudden than in other ports. It occasionally happens, as everywhere else, that the wind draws round suddenly, but I do not know that this coast is particularly liable to sudden shifts.

17,398. In the fall of the year, when ships leave these coal ports and hug the land, are they exposed to risk from finding themselves in shore on the sudden change of wind ?—No doubt of it.

17,399. Can you say, from your own knowledge, that that is a frequent occurrence ?—I would not say from my own experience it is a frequent occurrence, but I have known it in my own experience.

17,400. Then, under these circumstances, would you be disposed to recommend one large harbour at this point in preference to the improvement of the principal harbours along the coast ?—Well, I think, as a matter of refuge only, I should be inclined to recommend a good harbour, than one or two small ones that would not be applicable with all winds and with the wind veering from north and south.

17,401. But these vessels coming too close probably are exposed to the danger of being caught on a lee shore by sudden shifts of wind. Would it be better that they should have several ports to go into than only one ?—No doubt, if there were harbours fit for vessels to run into with an onshore wind ; still, I think, that one good harbour on this bay would be better than two or three small ones in other places.

17,402. But if the ports of the Tyne, the Wear, and the Tees should be so improved as to take in vessels drawing 16 feet water at low water, would you consider that a preferable improvement to making one large harbour for them ?—There is no doubt, as regards the trade of that particular place, it would be all important to make harbours fit for the ships to run into in all weathers ; but I do not know they would be applicable to anything except the northern trade ; I do not know they would be applicable to ships going up and down the coast. No doubt ships would sometimes go and make use of such harbours wherever they might be going to.

17,403. Then you are decidedly for one harbour of refuge ?—I am, decidedly, for many reasons. I would rather have one good one than a lot of bad ones.

17,404. Then you would be disposed to call a harbour of refuge—a harbour on this coast—which would take in laden vessels drawing 16 feet at low water spring tides, a bad one?—No ; I should call that a harbour applicable to the general run of the trade up and down this coast ; it would not be for all the trade, but it would be for perhaps nine-tenths of it.

17,405. And applicable to that portion of the trade probably which was most in want of this harbour of refuge ?—Yes, I should think so.

17,406. What portion of the trade that comes into these ports are in most want of this harbour of refuge ?—I should think that the ordinary run of colliers was more in want of harbours of refuge than any other class of vessels, because they are most of them less weatherly than the bigger description of vessels that come down upon the coast.

17,407. As respects the colliers, are they generally well found ; first, as respects their gear aloft, masts, sails, rigging, running rigging, and standing rigging ? —Well, I think some of them are very well found ; some of them are like all other coasters, very badly found.

17,408. So considerable numbers of them are badly found ?—No, not on the whole ; they may be taken as tolerably well found.

17,409. Would you say the proportion of badly found vessels is not greater than is to be found among vessels going foreign for the same distance and of the

same size?—I think the proportion of badly found vessels and laden vessels in the coal trade is larger than the proportion of badly found vessels going foreign.

17,410. As respects the hulls, are they sound and strong generally, or are there a considerable number, at least, of ill-conditioned vessels in the trade?—They are generally sound and strong, until such time as they have got age on their side, which makes them tender.

17,411. Is it not the necessary practice of putting them on the ground with heavy cargoes in, that gives them a tendency to strain and leak in bad weather?—No doubt it will do them no good. No doubt vessels lying on the ground with heavy cargoes strain more or less.

17,412. And you assent to that as being a fair description of the colliers?—Yes.

17,413. When these vessels are taken in a heavy gale of wind off this coast, they necessarily strain a good deal; does a good deal of work come upon the people in the shape of pumping?—No doubt.

17,414. Are they sufficiently manned in point of numbers?—No doubt they are generally. Every man, no doubt, has to do his work; but considering the voyages and the length of them, I think they are tolerably well manned.

17,415. Would you be disposed to say that in those vessels in the winter time, when they have been at sea during the course of bad weather for two or three days, that it may not unfrequently happen that a considerable number of their crews are pretty well done up with the work of the ship and the pumping?—No doubt but that in strong winds, when they have been knocked about for many days up and down the coast, their crews get thoroughly exhausted, and I do not say incapable, but at any rate they will be all the better for a good rest. We had an instance the other day of an American vessel, that got in off the bay and could not come in, and the description to us was that they tried to wear her off the shore, and that the people were so done up that they could not work the ship.

17,416. Does that kind of thing happen occasionally amongst colliers?—I do not know of my own observation, but I think it is just probable it may occasionally happen.

17,417. That being the case, do you consider that a harbour, which might hardly be said to be absolutely necessary for the saving of their lives, would yet be a great boon to them where they could put in during foul winds, and get a day or two's rest after a week's hard work at sea?—No doubt if there were harbours up and down the coast applicable to these colliers to shore into when they have been knocked about, that would be used as a rule.

17,418. Would it be advantageous, when these vessels have got down to the southward, that they should not have to run back for the harbour, but hold what they have got of their voyage?—No doubt it would be advantageous, so that they could afterwards go upon their voyage.

17,419. (*Mr. Lindsay.*) Referring to the questions which have been put to you by the Chairman, and to the object that the Commission has in view, the saving of life and property, do you think that the construction of one great harbour in any part of the coast between Flamborough head and the Farn Islands would do more to save life and property than the improvement of the Tees, the Wear, and the Tyne, if that were possible, so as to admit vessels at all times of the tide, I mean the description of vessels trading along the coast?—I think, if such improvements could be made at all the harbours along the coast, it would do more good than one harbour, if it could be done so that they could run for them in safety.

17,420. Say the Government resolved to spend two millions of money for humanity's sake upon this coast, is it your opinion that the expenditure of that money, distributed among those harbours named, would do more good to save life and property than the expenditure of that money at any one spot?—So far as I am able to judge you would hardly spend two millions of money at one harbour without making it anything extraordinary.

17,421. That is not what I want your opinion upon. If the existing harbour could be made accessible at all times of the tide, would that do more to save life and property than the spending it on one great harbour?—No doubt it would. That would do all the good you describe. It would do more good than it would at any one lump.

17,422. I am speaking to you as a master of a ship, do you know sufficient of this coast to be able to tell me anything about the distances between Flamborough Head and St. Abb's Head and the intervening places?—No, I do not remember the distances.

17,423. You are not sufficiently familiar with the coast to speak in regard to distances up and down the coast?—I do not remember the distances up and down the coast.

17,424. (*Capt. Sulivan.*) You say the improvement of the three harbours would be better than the making of one large harbour; would you qualify that by saying that if with the certainty of the money being laid out it could produce the desired effect in these harbours, and keep them open at the necessary draught of water at all times by night or day?—Exactly, I say that unless these three or four harbours are improved and made fit to run into in all weathers it is better to make one than to have a lot of bad or indifferent ones.

17,425. Would you think it a good thing to risk a large sum of money for the prospective improvement of the harbour when there would be no certainty that the desired object would be obtained?—I should not like to do it.

17,426. If you had your choice, and were still going to trade from the coal ports to London, would you prefer, for the safety of your crew, and the vessel keeping always to the collier trade, and more especially to laden colliers; a moderate harbour of refuge in two places of the coast as near Flamborough Head and Hartlepool, which would take laden colliers at all times of the tide, by night and day, with enough water to spare the entrance; or would you rather have one large harbour in any one place that would take large ships, and give more space inside?—No, I should prefer two.

17,427. Two moderate harbours to one large one?—Yes.

17,428. Supposing that the money could be laid out at Hartlepool and Filey, would those be the places that would answer better than any others the necessity of the trade on this coast north of Flamborough Head?—Yes, I should think the two places, Hartlepool and Filey, would be two as good places as could be selected this side of Flamborough Head.

17,429. Would Filey be good for those vessels that have got off the Head, and with bad weather, or would it be safer than running back to their ports?—No doubt vessels caught off Flamborough Head find a harbour of refuge under their lee without running back, and the one that would catch them first on the way.

17,430. Would Hartlepool be especially valuable for those that do not weather the high land, laden vessels going to the south, and light vessels returning back to their ports and caught off the bay?—No doubt.

17,431. We have been told that some masters dislike having to go into a harbour even where that harbour was under their lee, except their own ports. Would you like to say that? Do you believe that many ships, in bad weather off Flamborough Head, with the prospect of being driven back to the Tyne and to the Firth of Forth even, would hesitate for a moment which they would choose, either going into Filey, if they were far enough to windward or to Hartlepool, if they were to leeward of Filey, rather than risk being driven to northward?—I do not know what others would do, but I should take the nearest place.

HARTLEPOOL.

Mr. Robert Russell.

19 Oct. 1858.

Capt. Sulivan.

17,432. Generally speaking, do you believe the owners of ships would save more wear and tear and risk of their vessels by taking a prudent course and going into a harbour if it was near them, than they would by knocking about and trying to go on their voyage?—I think considerably they would save more by ships going into a harbour than they would by ships knocking about.

17,433. (*Capt. Vetch.*) You have heard of freshes coming down the Tyne and the Tees, that they are very great obstructions to vessels entering those ports, would not that be rather detrimental as harbours of refuge to vessels wanting shelter?—There is no doubt but a strong current coming out would be a great hindrance to vessels coming in; and I know from my own observation that the currents in the Tyne and the Wear are greatly increased by the freshes. When the snow breaks up in the winter, the currents are very strong, and a great deal of damage is done even in those rivers.

17,434. Then if vessels were trying to come right into this harbour at times of flood tide, when the currents were coming down with freshes, they might not be able to go in?—Very likely they would not.

17,435. Therefore these ports would not serve at all times of the season?—They would not be so certain as a place where there would be no tide.

17,436. I want to ask you, if only one site was selected on this coast for a harbour of refuge, would Filey or Hartlepool, in your opinion, be the best place?—If there was to be one, I would say Hartlepool by all means.

17,437. If a number of vessels were to leave a number of ports at the same time from the Tyne down to the Tees mouth, with the same state of wind, and were to proceed southwards on their voyage, if that stream of vessels were caught off Flamborough Head with adverse winds, would Hartlepool or Filey be most able to receive that stream of vessels running northward for refuge?—I have no doubt that they would get into the bay and go to Hartlepool.

17,438. (*Chairman.*) Have you ever had to run to Hartlepool in heavy weather by your lead?—I never had myself, but I know the practice of the trade is to make the land from the Baltic. Vessels bound from the Baltic to London, usually, indeed, always I may say, endeavour to make the land from Lowestoff; and vessels down from the Humber generally endeavour to make the land off Flamborough Head. That is so far as my observation upon it has gone.

Mr. Simon Fisher examined.

Mr. Simon Fisher.

17,439. (*Chairman.*) How long were you at sea?—40 years.

17,440. How long have you been ashore?—I have been ashore one year. I have gone four years, more or less, one voyage. For 30 years and upwards I commanded a vessel.

17,441. Are you still employed in the command of a vessel?—No, I have been staying at home for the last few months, but I was at sea last winter.

17,442. And what description of vessels have you chiefly commanded?—Vessels trading backward and forward on this coast from London to the Orkneys and Shetland Islands; the north west of Scotland, the Dogger Bank in the fishing business more especially.

17,443. You have been present during the course of this inquiry?—Part of it.

17,444. You are aware of the object of it?—Yes.

17,445. Now, taking this district of the coast from Flamborough Head to Berwick, where would you put one large harbour of refuge, if one was decided upon for the safety of the coasting trade?—I am here before you as a disinterested person altogether; I have not the least interest at all. Supposing a harbour was constructed at Hartlepool or Tees Bay, I do not see a prospect where I can reap one single farthing, therefore I do not give my evidence in favour of Hartlepool on the grounds of self interest. If there was a harbour of refuge at Filey Bay that probably might be an advantage to me, but seeing a greater benefit must arise from a harbour in Hartlepool Bay, and not only that, but it would be the means, I feel confident, of saving 20 ships while the other would not save 10 or, probably 5, I am in favour of one at Hartlepool; it is in the centre nearly between the two extreme points, Souter Point and Flamborough Head. Frequently for several days there is a heavy sea rolling over the bar and the ships cannot get to sea; presently there comes a fine day, and out of the various ports between the Farn Islands and Huntley Fort come 500 sail of ships. The greater part of these ships are bound for the southward; some are fast and some slow; they are distributed along the coast, probably for 50 miles. If the wind is westward when they tow out of the ports, and very frequently it is the case when the wind is easterly, there is a surge or ground swell upon the bar, and it is dangerous to tow out unless there is a good depth of water, therefore they are more likely to tow out with a westerly wind than drag along the shore; many of them probably reach as far as Whitby, some reach Filey, and some few reach the Tees, and some short of that, probably from having come out last. What is the consequence? These ships dragging up in shore for the benefit of the westerly wind and the wind suddenly changes, as we often have known it upon this coast, and a gale comes on from the east-north-east, they are caught in the bight of the Tees Bay. There being no harbour of refuge they cannot get any confidence of escape, and with the greatest peril and danger they drag away to the south without any prospect of life or property being saved; they put their ships' heads to the northward and drag away; probably they cannot lie north-north-east; the ship is making a north-west course; they are dragging into Hartlepool Bay; the master must find himself in difficulties, he gets land ahead, he weighs his ship and goes ashore. In 1844 I crossed the Tees Bay in a gale of wind from east by north to east-north-east; I observed as many as 30 or 40 sail, and probably if I had gone to the mast-head I might have seen 50 vessels dragging to the southward, about a south-south-west course, lying south-south-east under low canvas. I said to the crew on board, "What would be the consequence if "the gale continues throughout the night?" The gale did increase with rather more fury, with thick rain; they dragged till they saw the Yorkshire coast, and about eight of them went on to Redcar reef and every soul perished; 27 sail wrecked in that gale besides what had been lost in other gales. I recollect two other gales besides; one, I think, was in 1833, and one was later than that, considerably. Three different times have I crossed the Tees and seen a number of ships in a most wretched and distressed state, with nothing but death and destruction before the bulk of them; and I found after I had arrived at home that my judgment was not at all out, for I found many wrecked along this coast for want of a harbour of refuge in the Tees Bay. I prefer a harbour in Hartlepool Bay because the advantage is greater of bearing off the land between Hartlepool Bay and Flamborough Head. You see between Hartlepool Bay and Souter Point the variation is upwards of five points and a quarter; it gives a ship an advantage when caught to the northward of Hartlepool by a gale of wind from east-north-east to drag into Tees Bay. Ships that are caught at Flamborough Head have got every advantage to drag to this bay. Five points and a quarter give a ship a great advantage in running to a harbour of refuge in the bay; because, if a ship is caught any distance from the land off Souter Point, she dare not make the Tyne, probably because of the tide; she can drag to Hartlepool Bay, and she can lay south-south-east; if she is anything of a ship at all she will make a south-south-east coast with four points; if she is a good distance off she will clear the

Heugh of Hartlepool sufficiently to gain the harbour of refuge. If a ship is caught towards Scarborough—if she is a fair distance off—a north-east course will bring that ship to the harbour of refuge; she will lay under in a gale of wind to the east and by north, and surely if she will lie east-north-east, and she will make a north-north-west course, and by doing that she will reach her refuge in Hartlepool Bay. Ships caught in a gale of wind at south-south-east or south-east off Flamborough Head, and cannot weather, I consider every captain that is in my presence will naturally say he should get a good offing should the wind last her, and by his dragging to the eastward during the gale he will get a good offing in Tees Bay; if he finds he could not clear himself, and the gale increased, he would have Hartlepool here a harbour of refuge dead to leeward to run to. He could approach the harbour of refuge in this bay by the soundings; the ground rising very gradually for about 40 fathoms till you come to eight, nine, or seven, which would be a great advantage; and I speak from my own experience, and the pains I have taken to gain soundings in every part of the sea I have coasted by. I have no doubt the general bulk of captains are well acquainted with the soundings, and would be able to tell by the depth, and the soil they would be bringing up by the grease upon the lead when they were approaching Hartlepool Bay.

17,446. When you talk of the variation being five points do you mean the variation and leeway upon the voyage?—The variation of the land on the north and south side.

17,447. You are resident at Greenwich?—Yes.

17,448. Did the vessels you sailed in belong to the port of London?—Yes; the vessels I sailed in belonged to myself.

17,449. Then I understand you to say you would recommend a harbour of refuge at Hartlepool simply for this, that when vessels in an eastern gale cannot weather the Head, they are pretty sure if they make leeway, that they would not weather the land to the northward?—It is a great chance if they do.

17,450. And, therefore, if the gale lasts they drag down to leeward, till at last they find themselves at the bottom of the bay?—That is the case, and the cause of the destruction that has taken place in various gales.

17,451. (*Mr. Lindsay.*) I understand you to say, when you referred to those 30 vessels which you saw in the bight of the bay, that the gale was blowing strong from the east-north-east?—Yes.

17,452. Were they in a position to be saved by a harbour of refuge at Hartlepool?—They could not have reached the Tyne nor Filey, from the distance these ships were off the land, and the course they were making upon that tack, they making a south-south-west course, and on the other a north-north-east course, and what possibility was there then of their reaching the Tyne, or a harbour of refuge at Filey Bay? They could have reached no other place in the bight of the bay but Hartlepool. They might have reached Whitby, but that would have been like running to certain destruction.

17,453. Have you known many vessels crowded round Flamborough Head?—I have known as many as 50 or 60 sail, sometimes probably more.

17,454. You said you saw 30 vessels in the bight of the bay that morning, and if you had gone to the masthead you might have seen 50?—No doubt.

17,455. And how many have you ever seen off Flamborough Head from the deck of your ship. Have you not seen more than 50?—I have seen 50 or 60, probably 100.

17,456. Might you not have seen 200 by going to the mast head?—I might, but there was no necessity.

17,457. Might you have seen 300?—I do not think that I should. I might probably during 30 years experience, when a large fleet had been windward, have known as many as 500 or 600 between Harwick and Yarmouth.

17,458. Well, now you have stated the case of the 30 or 40 vessels caught in the gale from east-north-east in Hartlepool Bay, but what would become of the 300 or 400 vessels caught off the Flamborough Head, which could not weather the Head?—If caught off Flamborough Head, they would have dragged round to the Humber.

17,459. Say they could not have reached the Humber?—They would have had to go ashore, and there would have been no other prospect.

17,460. If a harbour of refuge is necessary to save the lives of the crew of those 30 sail which were caught in the bight of this bay, do not you think that a harbour of refuge would be still more necessary to save the lives of those on board all those 300 or 400 ships that might be caught in the same gale off Flamborough Head?—It is a very different thing to be caught off an extreme point.

17,461. Answer my question?—Yes; but that I consider is a very different thing altogether, vessels being caught in a bight, and cannot clear the land, and others being caught off an extreme point and having every advantage.

17,462. If a vessel is in a position that she must go ashore, do you consider she is in any better position off Flamborough Head than she would be in the bight of a bay, so far as regards the saving of the ship and the lives on board?—I say if they could not clear themselves they must go ashore.

17,463. Then in cases where they cannot weather Flamborough Head to the southward and clear themselves, do not you think it necessary, as you stated to the Commissioners, you thought it necessary for a harbour down here for those you named, do not you think it equally necessary to have a harbour further south to save the lives of those men on board the 300 or 400 ships?—I should have no objection at all to a harbour at Filey, if we have resources to construct a harbour there as well as at Hartlepool, but we are not prepared with money to construct a harbour of refuge at Filey and here too, therefore, I prefer this port to Filey, because it would save 10 where Filey would not save one.

17,464. Are there more ships to be found off Flamborough Head than Tees Bay?—There is as often as great a fleet off Tees Bay as off Flamborough Head.

17,465. Do ships from the Baltic bound south come to Tees Bay?—Ships bound for the Baltic to London do not fetch Flamborough Head except a great chance. They always shape their course to Lowestoft, because they have got the Dogger Bank and the Silver Pits to guide them.

17,466. But ships bound to Hull?—They generally shape their course for the Humber and Leamington.

17,467. Do ships from Archangel sight Flamborough Head as a rule?—Some do, but that depends on where the wind is.

17,468. Do the colliers from the ports in the north sight Flamborough Head as a rule?—I should think not.

17,469. Do they pass it?—That depends upon circumstances.

17,470. I ask do colliers from the north bound to London pass Flamborough Head?—Certainly they do.

17,471. Do vessels from Scotland pass Flamborough Head?—Certainly they do for London.

17,472. That being the case, are there not more vessels as a rule off Flamborough Head than off any particular point in the bight of this bay?—I cannot say that vessels distribute themselves generally. Suppose 500 sail tow out at the various ports between the Tees and the Coquet Island in one day, which is the case often; some of these vessels are fast, some slow, and they distribute along the coast. If a gale of wind comes on they are not all kept in one position. It is not the fact that they should, or I do not know what would be the consequence.

17,473. Whether do you think one great harbour at Hartlepool, or two harbours, one at Filey and one at Hartlepool, would do more to save life and property?—I think probably there would be more ships

HARTLEPOOL.

Mr. Simon Fisher.

19 Oct. 1858.

Mr. Lindsay.

saved by two than by one, but it would depend upon what sort of harbour was constructed at Filey.

17,474. Speaking to you as a sailor, and not as an engineer, say you have two millions to spend on this coast between Flamborough Head and the Farn Island to the best advantage for the saving of life and property, whether would you spend the whole of the two millions at one spot at any part along the coast, or distribute it over Filey, Hartlepool Bay, the Wear, and the Tees?—I should prefer spending the two millions over one large harbour of refuge here in preference to one at Filey and the other here; and the two millions of money will be necessary to construct a harbour of refuge sufficient to hold the number of ships that are exposed to danger off this port. I am no judge of how much money it would take to construct a harbour at Filey; and then whether that would leave a sufficiency to construct a harbour here sufficient to receive the ships that would sometimes be constrained to run for it, because we would make the remedy rather worse than the disease if we lose more ships here by not having a sufficiency of room to contain those that run for it owing to having constructed a harbour at Filey.

17,475. Is it your opinion if two millions could be spent on the improvement of the harbours so as to make them accessible at all times, the spending of that two millions on Hartlepool Bay would do more to save life?—That is my deliberate opinion.

17,476. You know the coast of Scotland pretty well?—Yes.

17,477. Do you think a harbour of refuge is necessary between Aberdeen and the Pentland Firth for the saving of life and property?—Yes. Suppose there had been a harbour of refuge at Wick, would it not have been the means of saving both life and property in several instances, for the number of boats that go out there fishing at times is not less than 1,400 and as far as 2,000 sail.

17,478. Then you think it would be necessary to have a harbour of refuge at Wick, on account of the fishing boats and the lives exposed to danger in them?—Not exactly for that, because I have known ships ashore and to be stranded for want of a harbour of refuge about the Caithness shore.

17,479. Suppose no fishing boats at Wick at all, and looking to the vessels that trade to the Baltic, and to Archangel and America, whether do you think a harbour of refuge at Wick, Fraserburgh, or Peterhead, would do the most good?—Decidedly at Wick; because if a ship is caught off Buchan Ness, she is off an extreme point, and has every advantage to drag if the wind is from the eastward and north-east through the Firth; but if the wind is to the south, or anyways that way, she would get the Moray Firth.

17,480. Do you know Long Hope and the different anchorages about the Orkneys?—Yes; Long Hope is a very excellent harbour now, and since they have constructed a light on the head it is easier of access by night and by day; though I fear at times destruction will take place there to both life and property from that light (yet it will save many ships); owing to the two spits of rock, one light obstructs the other, and vessels will catch one or other of those rocks.

17,481. Can you tell me any wind that will carry a ship into Wick and will not carry her through the Firth?—That will depend upon the tide she gets.

17,482. Would the same wind that carried a ship into Wick harbour carry her through the Pentland Firth?—Of course it would.

17,483. It would be during such winds as those that you would require a secure shelter in a harbour of refuge at Wick?—Generally speaking.

17,484. Wind blowing upon shore?—Yes.

17,485. Would you have any hesitation in a ship of 200 tons going through the Pentland Firth with a south-east gale and the tide running to the westward?—None at all, the tide would carry us down.

17,486. Would you have any hesitation in going there with a fair gale in an adverse tide?—I dare not approach it if the tide were anyways rapid at all. I have seen difficulty and danger to life and property more than once or twice in attempting that.

17,487. If it was adverse would not you consider it prudent or safe to go through Pentland Firth?—I think if a ship would run 10 knots, it would be nine chances to one she would run over the tide if it was a spring tide. I have even run 14 knots over that firth—14 miles an hour between Steomar and Swamar.

17,488. Say you were off that coast, and caught in a south-east gale, and the gale was so strong that you considered it advisable to secure shelter, your only shelter would be at present Long Hope?—That would be the only shelter at present.

17,489. What would you do?—I should endeavour to drag through the firth, and keep the ship afloat; I dare not take the firth in a gale of wind from the south.

17,490. You would heave to, to wait the tides?—Yes.

17,491. Would you consider there was more danger to your ship from being hove to than scudding?—It depends upon whether I ran out into the entrance of the firth to get into the tide way or not. If I got into the tide way I should be liable to have everything washed over, and the ship too; but I should not do that; as an experienced man I should know what time the tide flowed, and should not run into the tide sea to heave to.

17,492. You would heave to and dodge the tide in?—Certainly.

17,493. Or get under the southern headland and dodge in?—I could not, because there would be no headland.

17,494. If you were approaching the Firth you could find shelter to some extent?—No; there is no projection or shelter with the wind from south-south-east or south-east.

17,495. Then if you were so close that you saw you could not heave to, and that it would not be prudent to heave to, and the flood tide coming on, would you consider yourself in very great danger?—Of course; the only step I could take would be to run my ship ashore, as I saw one 12 years ago, laden with tobacco from Virginia, run ashore, and a very fine ship she was.

17,496. Have you, in your long experience, known many ships founder in going through Pentland Firth?—There have been a great many lost since I frequented these ports.

17,497. How long have you been trading?—Over 35 years, with the exception of this last year.

17,498. Do you know any part of the west coast of England or Scotland?—I have never been further round than Portsmouth.

17,499. You have not been anywhere about St. George's Channel or the North Channel?—No.

17,500. (*Capt. Sulivan.*) Do you know that vessels bound round to the north by the Pentland Firth, that in their insurance policies there is a provision for reduction of the premium if they go through the Caledonian Canal, instead of going round the north coast?—I am not able to answer that.

17,501. Your vessel would not be insured?—No; I had nothing to do with commercial ships.

17,502. Would you consider the fact of about 1,000 vessels in Scrabster Roads, on the other side of the firth, in one year, is a proof that if there was a harbour on the east side of the Pentland Firth, it would be nearly as available, if not quite, as Scrabster Roads has proved to be on the west?—Undoubtedly.

17,503. Would a harbour at Wick also be valuable for the trade bound eastward, such as timber from America, that had passed the Pentland Firth, and being caught and unable to get to windward, it being able to save them running back into the Pentland Firth?—Certainly; that would be a very great advantage.

17,504. We have had it in evidence that the westerly winds before changing to easterly gales more generally draw to south-west than come on to blow from east-south-east, and then to eastward, whereas you speak of sudden shifts from westerly

winds to easterly gales ?—I do not say it is always the case ; for years that I have frequented this coast, I find that a gale commences very frequently from south-south-west, but rain generally spoils the wind. It makes to the south and gradually to the south-south-west. It increases and blows harder and harder, and as it works to east-north-east there is a most terrific gale.

17,505. Suppose this fleet of colliers going down with the westerly winds, and when towards Flamborough Head, meeting exactly this weather, would not a shift of wind take them more off the coast, instead of setting them into the bay as it drew ahead, and so when it got round and became a lee shore to them, would they not be more off the coast than in the bay ?—Certainly.

17,506. If a fleet of ships in that position were caught by the easterly gale that you describe and which appears to have been exactly the description of gale of January 1857 would not a harbour somewhere between Flamborough Head and Whitby be an excellent position for most of those ships to take refuge in ?—I don't see that that is the case at all ; these ships taken with the gale of wind at south-south-east below Whitby and Flamborough Head would drag away to the eastward, and if they had a harbour of refuge here it would be directly under their lee.

17,507. Decidedly off Whitby ; but I am speaking of vessels that had got down with a wind towards Flamborough Head, then, as the wind drew round and caught the vessels and crowded them together under Flamborough Head, and then drew round to the eastward, would they not be in a position to take Filey Bay ?—Allow me to make a remark there. If the vessels are caught between Whitby and Flamborough Head, and put their heads to the northward, they drag down to Whitby, and how are they again to get back to Filey ?

17,508. You have heard of the gale of 1857 in which some 27 vessels, including the *Whitby* ones, were wrecked between Flamborough Head and Whitby; do you think that those vessels could have been far enough to windward to weather Whitby and get back to Hartlepool, or were they by the stress of the gale driven so far to leeward that they could not weather the high land ?—I think that the captains of the ships caught there near the Head considered there was great risk if they bore away for the ports ; there would be peril and danger in approaching the ports for want of water, and rather than run the risk they hung to windward with the hope that the gale might moderate or the wind veer round to the northward. Well, they dragged away till the gale increased to that rapid fury that they found they could not clear themselves upon either tack ; they had no harbour of refuge when night coming on to flee to ; they could not clear the land to the southward or northward ; when they got close inshore many of the ships became disabled so that they made no headway but they were driven at the mercy of the winds and waves.

17,509. If vessels were in the position you describe would not Filey Bay be a good position to save these vessels ?—That would have been an advantage under these circumstances.

17,510. You having said that Filey would have saved those vessels lost in its neighbourhood, I ask you whether those wrecked in the neighbourhood of Hartlepool, having weathered the high land of Yorkshire, would have been saved by a harbour of refuge in Hartlepool Bay ?—I believe they would.

17,511. I should like to give you an opportunity of explaining what I am sure is in direct contradiction of what is in the reporter's notes, because in answer to one question you said two moderate harbours would be better than one large one ?—Certainly.

17,512. Immediately afterwards you said the one large harbour at Hartlepool would be better than two small ones ?—Yes, but I said if you could construct two with one sum of money—if you could make one large enough to receive the number of ships that would come here, and have a sufficiency left to construct one at Filey as well, I should consider that would be an advantage ; if not, I will rather expend the whole in this one place.

17,513. When you stated two moderate harbours instead of one large one, did you mean by moderate harbours, harbours that would in either of them take such a large number of vessels but between the two would give as much accommodation as one large harbour ?—That was my meaning.

17,514. Then suppose harbours such as these were constructed would you prefer two moderate harbours sufficient to take all the laden colliers at all times of the tide or one large harbour that would take larger vessels than colliers ?—I would give the preference to the two.

17,515. (*Capt. Vetch.*) Are you well acquainted with the north-east coast of Scotland ?—Yes.

17,516. Do you know Wick Haven ?—Yes.

17,517. Do you know Peterhead ?—Quite well.

17,518. You are aware probably that at Wick in the fishing season there are 1,400 boats often crowded there ?—Yes.

17,519. You are aware probably that the quantity at Wick is double that at Peterhead ?—Yes.

17,520. If for the saving of life and property a harbour of refuge is to be provided at one of these two places, which would you consider of the two most deserving of attention ?—Wick, certainly.

17,521. You are probably aware that Wick, at present, is but a natural cove and has no artificial protection ?—Just so.

17,522. You are well acquainted with the Pentland Firth ?—Yes.

17,523. Do you know any navigation of the same length on other coasts that is so difficult and dangerous a passage ?—I consider it the most dangerous passage there is anywhere between the Island of Skye and the Irish Channel. There is another passage which is not commonly taken and which is more dangerous than that, that is the passage between the Islands of Duray and Comache.

17,524. That passage is not so much frequented as the Pentland Firth ?—Yes.

17,525. Suppose the Government decided to provide funds for a harbour of refuge on this part of the coast, would you prefer for the saving of life and property that that harbour should be constructed at Hartlepool or Filey Bay ?—Hartlepool by all means ; I am confident it would save 20 ships where the other would not save 10, besides the lives.

17,526. (*Chairman.*) What kind of land is it about Hartlepool ?—It is very good land to make. The red cliff at the south of Huntcliff a few miles behind Redcar, is very excellent land to make. In coming in from the sea from the north east there is a mountain called Barnaby Moor, and it is such a remarkable square topped mountain that any person acquainted with the coast could not be mistaken. I consider it one of the best parts of the coast to make coming from foreign ; the soundings are also good to guide you in there, so that there is no port to equal it along here.

17,527. And in hazy weather how then ?—The soundings there will be a great guide.

17,528. But when the land is three miles off and you cannot see it distinctly ?—The lead would be a wonderful guide.

17,529. Leave the lead alone ; in hazy weather when the land cannot be seen distinctly only for two or three miles, what kind of land is the land about Hartlepool to make ?—Very excellent ; you will see the Heugh projecting out frequently when you cannot see any other land in the neighbourhood.

17,530. Do the soundings diminish gradually ?—Generally speaking they do.

17,531. You said something about the soil, you can easily tell by the soil what part you are in ?—All practical men frequently use the lead, but you must have a piece of grease on the lead, otherwise it will not bring up the soil ; those that used the lead with

HARTLEPOOL.

Mr. Simon Fisher.

19 Oct. 1858.

Chairman.

the grease at the bottom readily ascertain when he is approaching, if he has practised it.

17,532. In running into Hartlepool from 40 fathoms water, what will be the variations of the bottom which will enable you to know whether you are north or south of your port, or whether you are running in directly for it?—It is in 40 fathoms water you find the ground soft and oozy; as you approach the shore it becomes sandy; but I cannot exactly describe the soil of 40 fathoms, all the way close into the Heugh of Hartlepool. I will not attempt to say the colour of the soil because I have never practised the lead upon these parts having no necessity so to do.

17,533. So that when you speak of running in by the lead, you speak not so much of your own knowledge as what you had heard to be the case?—By the depth of water and not the colour of the soil.

17,534. What is the greatest number of vessels you have seen in Yarmouth Roads and its vicinity?—Sometimes 800 or 900 sail.

17,535. Considering the large number of vessels at anchor there, for what number of vessels do you consider a harbour of refuge should be made on this coast?—It ought to hold at least 500 or 600 sail.

17,536. (*Sir F. Smith.*) Have you seen the plan proposed by Mr. Jackson?—Yes.

17,537. Do you imagine that the plan coloured blue will contain 500 or 600 vessels?—I fear not without the assistance of the docks.

17,538. We have heard some reasons against vessels for refuge going into the docks as it would interfere with the trade. Suppose, in point of fact, that you cannot get the accommodation with this plan, without the docks or with the docks, would you apply the public money to making accommodation which would not do all that is contemplated by Mr. Jackson's plan?—I should certainly think Filey would be the place; I would give the preference to it.

17,539. I think Mr. Ward Jackson's first plan would involve a cost of two millions, and that the smaller plan would not require one million. Suppose that if the two millions be granted for the whole coast would you then extend the plan to the two millions rather than to the one million?—I think that in case one million expended here, would not a harbour capable of containing 500 sail, it would be best to spend the two millions here in preference to spending part of it at Filey.

17,540. Suppose two millions were granted for this part of the coast, and that the larger plan of Mr. Jackson would involve two and a half millions, and, therefore, you are driven to the smaller plan, how would you apply the residue, would you apply the whole at Filey or elsewhere as well as at Filey?—I have no idea of what they would expend at Filey or what kind of harbour they would construct there.

17,541. Well, assume that Filey costs 500,000*l.* and that the harbour here costs a million, that is one and a half millions, you have got half a million to spare, where would you apply the half million beneficially besides at Hartlepool and Filey, or would you not apply it all looking to the saving of life chiefly rather than property?—I think at Whitby, or otherwise the Tyne; but I am afraid it will be spent in vain at the mouth of the Tyne from its rapidity and being a bar harbour—in probably five or 12 months after you carried it into five fathoms. At all the bar harbours I have been acquainted with, although piers have been extended hundreds and hundreds of times, they are still bar harbours—the same as they were before they carried the piers out.

17,542. You think a bar will always go to seaward with the extension of the piers?—Yes, where there is any rapid tide to carry it out to sea. As soon as the current loses its power, down sinks the sand and forms the bar.

17,543. Do you know Aberdeen?—Yes.

17,544. Do you think public money could be advantageously expended there for the saving of life and property?—You see they carried that pier out I do not know how many hundreds of feet, but it soon filled up and became a bar harbour. I fear spending much money would do very little to improve the entrance of the harbour at Aberdeen.

17,545. Then you are not disposed to spend a million there in the chance of saving life and property?—If I thought it would be the means of saving life and property, I would be willing it should be spent there.

17,546. (*Capt. Sulivan.*) As there is a difficulty where this extra half million is to go, and as 500,000*l.* would make a very small harbour at Filey, what would you say to giving the extra 500,000*l.* to Filey, and so make a good harbour there as well as at Hartlepool?—I should have no objection.

17,547. Do you think that would be the means of saving life and property on this coast?—I think it would.

17,548. (*Capt. Vetch.*) Suppose that a harbour capable of containing 700 vessels at a time, which, as I understand you to say, would suffice for the whole of the ships requiring shelter on this coast, at one time would you consider such a harbour as that more essential than dividing she sum of money between this place and Filey?—According to the plan there is but one entrance, which would have I fear a very sad effect upon the ships dragging from the north. Ships dare not put back to the Tyne, knowing that there is not a good harbour of refuge; but if they knew that there was one here they would press on to obtain it; but some would fall short of reaching this breakwater or pier and go ashore in the bight near the Heugh.

17,549. Will you look at this plan and tell me what you think?—(*Witness examines plan.*) I still hold my opinion that the entrance on the north side next to the Heugh would be a very great advantage, only it should be confined to not more than 500 feet of width so as not to admit the ground swell.

17,550. Then with that you think it would answer the object in view, if it would contain 600 or 700 sail of ships with a sufficient depth of water?—I certainly think that that would be at any rate a means of saving an immense amount of life and property.

Mr. WILLIAM HUTCHINSON examined.

Mr. W. Hutchinson.

17,551. (*Chairman.*) Have you been or are you connected with the port of Hartlepool?—I have executed works for the West Harbour and Dock Company.

17,552. (*Sir F. Smith.*) I believe you prepared an estimate for the red scheme for E. Jackson?—Yes.

17,553. And you prepared in the course of last night the estimate for the blue scheme?—Yes.

17,554. Have you in any material degree altered your prices?—So far as I was justified in the difference I made for the conveyance of the material to and from the shore.

17,555. When you formed your estimate for the large plan, I presume you had thoroughly considered the subject and the contractor also, as to the cheapest way to execute your work?—Yes.

17,556. I suppose you did the same thing last night?—Yes.

17,557. Is there any difference in the mode of action which will cause difference of prices?—Yes.

17,558. Will you explain?—Yes.

17,559. Because No. 1, the old one, was at a greater distance from the land, consequently less accessible by waggons?—Yes.

17,560. What is the difference of distance between the two ends and the main land?—Rather more than double the one than the other.

17,561. Is that not shown to be so on this plan; it does not so appear?—It is about that.

17,562. At any rate that would only apply to the northernmost portion and not to the southernmost pier?—No. That cannot apply to the southernmost one.

17,563. The southernmost one is closer than the

north ?—If boats are to be used, a small distance is not of much importance.

17,564. How do you propose to get the material from the southern portion to the northern portion of the blue scheme, by staging from the shore ?—Yes.

17,565. What do you intend to do with regard to the northern and red scheme ?—It will have to be boated.

17,566. Is that alone the cause of the difference of price ?—It is.

17,567. Does that apply to the whole scheme or only the northern portion ?—It applies to the whole in the aggregate, but the whole weight applies to the northern.

17,568. Do you intend to change the system for the construction of the southern one ?—Decidedly not the system, only it is lighter and shorter.

17,569. When you say lighter, what do you mean ?—It does not go into such deep water.

17,570. The other scheme will be the same, will it not ?—Yes, only the deepest part taken off, it will not be required.

17,571. The upper part of the cross section will be the same, and the difference will be in the extension down to the formation ?—Yes.

17,572. Will you explain in a concise manner what is the form of construction you are about to adopt, and how you will proceed to carry out your work ?—In the first place I will deposit rubble as shown there until it attain the width and height.

17,573. What is the entire breadth to the top of the rubble ?—I do not recollect exactly the breadth, but the quantity I can give from estimation.

17,574. Up to what level does that rubble come ?—About 12 feet below low water.

17,575. Then above that three courses, what is the material ?—Concrete blocks form the interior.

17,576. To what level do these concrete blocks come ?—I don't recollect, but it is estimated separately.

17,577. If I understand you it is set at 12 feet below high water ?—Low water.

17,578. Then do these three courses represent 12 feet ?—It takes four courses to represent 12 feet.

17,579. And therefore these three courses only represent nine feet ?—Yes.

17,580. And these nine feet are nine feet of concrete block ; that is, facing of concrete block ?—It is sandstone.

17,581. Then how much is hearting and how much is external courses ? What is the thickness of the sandstone structure ?—There is just one course of sandstone in the outside, and the interior is concrete blocks.

17,582. Then above the concrete blocks you have a different coloured material which I presume is stone ?—Yes.

17,583. The front is ashlar blocks ?—Yes.

17,584. What is the next ?—It is sandstone ; ashlar of a rougher character.

17,585. Not squared stones ?—They are not all squared, merely roughly.

17,586. What is the scale of it ?—Eight feet to the inch.

17,587. Have you ascertained to a certainty that you have the material necessary for all this work within a moderate distance of the place ?—I have ascertained it.

17,588. How far have you to go for your rubble ?—Between two and three miles.

17,589. I suppose it is a known point ?—It is.

17,590. Then you must know exactly how far ?—I do.

17,591. I presume distance has something to do with the cost of that part ?—It is within $2\frac{1}{2}$ miles.

17,592. Where do you propose to get the other material ?—Partly from Bramly Fall, near Leeds, and part from Westerton, near Bishop Auckland.

17,593. What is the actual distance of these places ?—Westerton is 25 to 28 miles by rail ; the other will be about 60.

17,594. What will they draw your stone for at these respective distances ?—What I have been paying for haulage from Leeds is 4*s.* 2*d.*

17,595. You have had stone from that distance to these places ?—Yes, for several years I have had my own engine and waggons merely paying the dues.

17,596. The quantity you are going to use is rather considerable, is it not ?—Yes.

17,597. Do you imagine that the great demand you make will not enhance the price ?—I do not expect it will, because it will have counterbalancing advantages.

17,598. What do you pay for the stone on the spot at both places ?—According to quality, from 9*d.* to 10*d.* per foot, and some 8*d.*, and some 6*d.*—10*d.* being the best.

17,599. I presume you will use the best quality ?—According to the work.

17,600. That is to say for the external work the best, and for the internal work the lighter ?—Yes.

17,601. Are you determined upon this form of breakwater from considerations of other works of the same kind, or, is it a section drawn somewhat at random ?—It is not my business to make the plan ; I refer you to the engineer, Mr. Caseburne, who is the engineer for the Harbour and Railway Company.

17,602. I was not aware of that ; I thought you were both engineer and contractor ?—No.

17,603. And that all you have got to do is the execution of the work ?—That is all.

17,604. And do you now know the extent proposed by Mr. Jackson for the blue scheme ?—Yes.

17,605. And you have gone very closely into the calculations ?—Yes.

17,606. Are you prepared to say any round sum which you would be willing at once to contract for this work ?—What I have given there is an approximate thing. I should like to go a little more closely into it before I took the contract for it, but I am prepared to say it will be very near it.

17,607. But when an experienced contractor gives an approximate estimate, he always takes a safe margin ?—Yes.

17,608. And you have ?—Yes.

17,609. Then you would undertake to do this for Mr. Jackson ?—You may say so generally.

17,610. I may assume that to be the fact ?—Yes, provided nothing comes in the way to make it more disadvantageous to carry out the details of the plan.

17,611. The soundings are well established ?—Yes.

17,612. The circumstances are well known to you ?—Yes.

17,613. Therefore what could arise to cause that change that would get rid of your safe margin ?—Very little; in taking the prices, the greater distance, and making the staging more difficult and inaccessible.

17,614. But I assume that the work is to be carried out precisely according to the dimensions given in to you as shown on this plan ?—Then I say, I am quite ready to do it accordingly.

17,615. So that the Commissioners going away from here and considering this project, may assume, as a moral certainty, that you are prepared to execute the work for the sum stated ?—Yes.

17,616. (*Capt. Vetch.*) Is the section shown, a section of the work generally ?—Yes.

17,617. To what height above low-water mark is the rubble stone carried ?—None approaches nearer than nine feet to low-water mark, and at the outside 12 feet.

17,618. Then the stones are procured from a quarry about $2\frac{1}{2}$ miles distant, from which you have already got a tramway ?—Not all the way.

17,619. Then with respect to the superstructure I think you propose to go a distance of 76 miles, as far as Bramley Fall ?—Yes.

17,620. Will it come up the tramway also ?—Entirely.

17,621. What will the Bramly Fall stone cost ?—Some 10*d.* per cubic foot.

HARTLEPOOL.

Mr. W. Hutchinson.

19 Oct. 1858.

Capt. Vetch.

17,622. To what height does your parapet rise above high water ?—At 18 feet.

17,623. And how much above the platform ?—The platform is 16 feet only above low water.

17,624. What will be the height of the superstructure including the parapet ?—The height of the masonry will be 44 feet altogether.

17,625. (*Mr. Coode.*) You are a man of considerable experience as a contractor, and as this estimate has been put in with your name attached, I would like to ask you a few questions. Have you had experience in the construction of works of a similar kind to this shown in the model ?—Of a similar kind, but not so extensive.

17,626. May I ask you where ?—Some here and some at Plymouth.

17,627. What part of Plymouth Harbour ?—At Mill Bay.

17,628. That was a dock, was it not ?—Yes.

17,629. Have you ever constructed a breakwater in any way ?—Not unless you call a dam I put up across there, a breakwater, about a quarter of a mile in extent. I merely used it as a coffer dam.

17,630. That was in the bay inside of Plymouth Breakwater ?—Yes.

17,631. The cost as given in your estimate yesterday was 439*l.* the lineal yard at seven fathoms depth? —Yes.

17,632. And the average work as last proposed by Mr. Jackson was also in seven fathoms depth, was it not ?—It is bound to seven fathoms, but it comes nearer the last at one end.

17,633. Does not a great part of that work range from six to eight fathoms in depth ?—It reaches not eight, I think.

17,634. Is not the average of that work in seven fathoms water ?—I should rather say six.

17,635. You give that answer deliberately?—Six, or six and a quarter, will be the outside, I think.

17,636. Do you know that there is a work of a similar kind, in course of construction at Alderney ? —I do not know.

17,637. If you were told that the work at Alderney is constructed under nearly as possible similar circumstances to yours, built in the same form or section, and concrete blocks used to the extent to which you use them, but with the masonry work not so good as shown on this drawing ; that the material is got from a quarry about two miles distant, and is all run on to the works by the stage, I ask you whether you think you can construct this work at Hartlepool more rapidly than they have done at Alderney ?—I would, for a sufficient and ostensible reason, because that at Alderney is done with granite.

17,638. How much is done with granite ?—I understand nearly all.

17,639. I may tell you, you are under a mistake. That used for the facing of certain portions of the work is precisely similar to that you propose to use from Bramley Fall, and the cost so far will be just the same. Having made these explanations, I should like to ask you if you can give other reasons why you can construct it cheaper ?—I think I can get other materials cheaper, and on account of cheaper work.

17,640. Is that easily got here ?—It is cheaper got than usual.

17,641. Here is the fact before us ; and as you have had no experience in works similar to these at Alderney, being constructed in a precisely similar way, I give you that information to see if you have any reason to offer, to show us you can do this work cheaper than they are doing at Alderney ?—It would be presumptuous to compare this with Alderney. I do not know anything about it, but that I understand they have granite to work with, which is double the cost.

17,642. It is used to the same extent and precisely in the same way as you are proposing, and the concrete blocks are used in a similar way ; but there is not so much squared stone in the work at Alderney as there is here ; then how can you construct the work here more cheaply than they are going to do at Alderney ? You are a very experienced man in the construction of docks, but not in the construction of breakwaters ; and, I ask you why you can construct this work cheaper than they can at Alderney ?—I can only say it is probable that the quarry can be more easily wrought.

17,643. What difference will that make so far as regards the rubble, for it would only apply to the rubble ?—Of course it would, and then by applying the same thing to the ashlar, and bringing it about one half, it would make a considerable difference, which I have no hesitation in saying may be done.

17,644. How much a yard do you think you can do it for cheaper than they are doing it at Alderney ? —I cannot name it, it would be presumptuous in me to say what they can do it for at Alderney, because I have not seen it.

17,645. But, inasmuch as the work is the same, and the circumstances precisely the same, I want to know why you can do the work more cheaply ?—As they have the work to get out of granite rock it will take twice the money.

17,646. But it is not granite ?—But it may be as bad, and I only give it as a probable reason and because you press me for a reason.

17,647. You say you can do this work in the course of five years ; will you look to the plan again, and tell me whether after mature consideration you are still prepared to give the same answer ?—Yes.

17,648. To what extent will you use staging in this work ?—I would use staging at the north pier, and run it out with waggons.

17,649. And the other breakwater, how would you construct it ?—I do not see any way so ready as boats.

17,650. And in the time which you have named, have you taken into account the loss which must necessarily occur during the winter season, or have you assumed you can work all the year round ?—I have assumed the ordinary stoppage and loss.

17,651. As regards the works connected with the shore, or as regards the sea ?—Both.

17,652. What allowance of time have you made for loss ?—About one half of loss.

17,653. Notwithstanding this allowance you would construct the works within five years ?—Yes.

17,654. Are you aware when the pier works at Alderney were begun ?—I do not recollect the time.

17,655. Do you think it was 10 or 11 years ?—It may be for anything I know.

17,656. Will you look at this Parliamentary Paper on Harbours of Refuge, No. 262, dated May 1858, and tell us is not the work executed up to that date, from the report of the engineer, an average of 960 yards ?—Yes, 960 yards.

17,657. Now if you look down the total column of work certified up to the date of the report, perhaps you will see the total sum ?—545,554*l.*

17,658. Will you be good enough to divide that by the number of yards executed and tell us what is the cost per lineal yard ?—It is under 570*l.* per yard.

17,659. And your estimate 439*l.* per lineal yard ? —Yes.

17,660. In fact a difference of 129*l.* per lineal yard in your favour ?—Rather less.

17,661. And you hope to make this work at 129*l.* per yard cheaper than Alderney ?—No doubt of it.

17,662. Will you look to the date of the commencement ?—1847.

17,663. And this is dated March 1858, a period of 11 years ?—Yes.

17,664. And the quantity laid down in 11 years, is what ?—Not 100 yards a year.

17,665. So that you propose to do here three times the amount of work in half the time that they have done at Alderney ?—I have no hesitation in saying so.

17,666. You still think you can do the work in five years ?—Yes.

17,667. The works proposed are 2,800 yards long, and the cost per yard 439*l.* ?—Yes.

17,668. Will you be good enough to work it out

and tell us what the result is?—It is reduced, you know, first by the barging and then by the staging, and then by the lessening of the depth.

17,669. Then you hope in two years to do the work the greater part of which is detached from the shore, at a cost of 439*l.*, whereas at Alderney in as nearly as possible similar circumstances, they have only accomplished their work at 568*l.* per yard, and that too connected with the shore, and you still think you can accomplish your work at the sum you state?—It does not alter my opinion.

17,670. And your opinion is not founded on experience of works of a similar kind?—I have done something very similar.

17,671. But that is in the case of a dock and not a breakwater?—It is in the case of piers.

17,672. What extent of that work was done below low-water spring tides?—200 or 300 feet.

17,673. And in what depth of low-water spring tides?—Seven or eight feet.

17,674. Was that accomplished by divers?—No, by half-tide coffer dams.

17,675. Do you propose to do this by half-tide coffer dams?—No.

17,676. Then the work is in fact of a different character?—Yes.

17,677. And you have not in the course of your experience executed any similar work?—Not exactly similar.

17,678. Now with regard to this quarry that has been mentioned, about two miles from here; has the ground been opened to any extent?—To the extent of 40 or 50 feet in depth.

17,679. And what length of face?—Perhaps not more than 100 yards, but there are two or three openings in a hole which shows it is not less than a mile in extent, and that it might be obtained at 50 to 100 in depth.

17,680. And is the material similar to that on the platform?—It is.

17,681. Is this a fair representation of the quality?—It is.

17,682. What size of blocks will you be able to obtain for ashlar purposes?—I would not think of getting any for ashlar except for this rough part.

17,683. It would be chiefly rubble and some of a similar character to ashlar?—Yes.

17,684. And the distance from the site of the work is what?—Between two and three miles.

17,685. As to the price per foot or yard, have you allowed for the setting of masonry under low water?—Yes, 3*d.* per foot extra.

17,686. How much for the portions above low water?—1*s.* 6*d.* per cubic foot.

17,687. That is for setting?—No, for setting and riding.

17,688. 1*s.* 6*d.* a foot for the ashlar above low water, and 3*d.* per foot extra below low water?—Yes.

17,689. Can you tell any work that has been set at anything like these prices under similar circumstances or anything like similar circumstances?—I have known this much or somewhat similar to the piers.

17,690. But you have already answered that they were not similar circumstances, because they were half-tide coffer dams. Have you done work like this at anything like these prices?—I have not done work of exactly a similar description, but this is not worse than I have done.

17,691. What allowance have you made for extras at the head of these breakwaters?—Nothing.

17,692. There are five ends, and you have allowed no extra prices for these circular ends?—No.

17,693. What amount have you put down for staging between the two?—It is put in the piers.

17,694. Can you tell how much the distance will be?—About 400 or 500 feet.

17,695. And then it will come to how much to make it complete?—12,000*l.*

17,696. Is there a special sum put down for this staging?—There is that much calculated for it.

(*Chairman.*) It is the opinion of the Commissioners, that the examination of a few more nautical men, upon the list of witnesses handed in, will probably afford them all the evidence they require upon nautical subjects. We wish to ask you whether the examination will satisfy you and the other persons interested?

(*Mr. Jackson.*) I shall be quite satisfied with it.

(*Chairman.*) Are there any persons interested in this inquiry who will not be satisfied with the course we propose to take?

No answer.

(*Mr. Jackson.*) Within the last hour, I have understood that two or three who stand on the list have not arrived. I know the circumstances of the case, and that they are detained from unavoidable circumstances. One would have been here had he arrived in London in time to come; that was Captain Pulwart. John Findley has been here, but was obliged to go and take command of a ship in Sunderland. No. 7 is a captain who has received damage to his ship in Dundee.

(*Chairman.*) As Mr. Pulwart trades to London, if you are desirous of receiving his evidence, it can be taken in London.

(*Mr. Jackson.*) I should be very glad if Henry Renfrew could be heard in London.

(*Chairman.*) If you will give his name to the secretary we will summon him to London.

Mr. JOHN MENZIES examined.

17,697. (*Chairman.*) You are resident at Leith?—Yes.

17,698. You are a pilot by profession?—Yes.

17,699. A North Sea pilot?—Yes.

17,700. And how long have you been at sea?—39 years past.

17,701. Have you been in command of vessels during any part of that time?—Yes.

17,702. For how long?—17 years.

17,703. And in what trade were the vessels employed which you commanded generally?—Most of them to London from Leith—Leith smacks.

17,704. Have you been present during the course of this inquiry?—To-day I have.

17,705. You are aware of the object of it?—Yes.

17,706. Now, from your experience of the sea, would you prefer that the Tyne, the Tees, and the Wear should be so improved, if possible, as to make them low-water harbours for vessels drawing six feet, or that we should have a single large harbour, and if you preferred a single large harbour, tell me where you think it ought to be placed?—I should say the more harbours of refuge the better; but I should say none of them could be improved so that they could do what you say, neither the Tyne, the Tees, nor the Wear.

17,707. But the improvement of the ports is after all more a question for engineers than pilots or seamen, and therefore, I now want your opinion as a seaman who knows the coast, where it would be best, that is if it could be done?—To improve the whole of them you mean.

17,708. Granted that it is possible that these three ports could be improved, which would you as a seafaring man employed on the coast prefer—that they should be improved, or that you should have one large harbour in any particular spot?—If they could be improved, so as to be refuge harbours, it is all very well, but I think you could not improve them so much as you could this place.

17,709. Am I to understand, that if the three ports could be improved to the extent to which I have described, you would then prefer that plan to one large harbour?—Oh yes, I would.

17,710. Now suppose that these ports could not be improved as I have described, which would you then

HARTLEPOOL.

Mr. J. Menzies.

19 Oct. 1858.

Chairman.

prefer as a site for one large harbour, the neighbourhood of Hartlepool, or the neighbourhood of Flamborough Head ?—I would say Hartlepool.

17,711. Will you give your reasons ?—The same number of vessels I should say pass here as Flamborough Head, but the light vessels generally strive to get down to their loading ports, which makes them congregate here more than about Flamborough Head, and they would always be coming to their port of destination by coming north.

17,712. Have you ever run for Hartlepool by your lead in thick weather ?—I have.

17,713. And from what distance out to sea have you run ?—Just 12 months now, I came in with one of Her Majesty's vessels by the lead, it was as thick as could be, and I could not see the land at all.

17,714. And what was your course in ?—We steered south and south by west occasionally.

17,715. Then you were steering along the coast pretty much ?—Yes, we had come along the shore, the vessel had been along the coast for three months last year, she was the *Otter*, Lieutenant Simpson, in command.

17,716. Well, when a vessel is running from sea along shore in thick weather, will you tell me if Hartlepool is easy to be found by the lead ?—It is quite easy. The soundings become gradually less as you come in.

17,717. But when you are coming in the course you describe, south and by west, which is pretty much along shore, do the soundings increase from the northward as you get into the neighbourhood of Hartlepool ?—They do.

17,718. Can you tell by the bottom whether you are in the neighbourhood of Hartlepool ; I do not mean by the depth, but by the nature of the bottom ?—You know perfectly well you must be in this neighbourhood, or you would not have shallow soundings for such a distance.

17,719. Then it is by the soundings you know you are getting down to Hartlepool, and not by the bottom ?—Yes, you know it by the bottom too.

17,720. What description of bottom do you get ? —Generally sand and shell, till you come into the bay where you fall in with mud and clay ; you come into shoal water before you get into mud or clay.

17,721. Have you ever run into Hartlepool, right in from the sea, dead on the land ?—Never ; but that is all the same as coming from the sea ; we knew our position pretty well, we had seen Souter Point.

17,722. Is it quite the same running into Hartlepool from 40 fathoms water as running along the shore from 20 ?—No, that is not the same ; but I say, we barely knew our position, because we had barely seen Souter Point, but till that I had seen nothing.

17,723. You have never run right in from the sea from 40 fathoms water into Hartlepool ?—Never.

17,724. Could you, as a pilot, give the nature of the bottom from 40 fathoms in, if you were sounding in thick weather, do you know the nature of the bottom ?—Yes.

17,725. What is it ?—Sand, and black specks, and small shells.

17,726. Is the bottom sufficiently distinct to enable you to tell whether you are to the north or south of Hartlepool, as you are running in dead from the sea ?—Yes.

17,727. You are sure ?—I am sure of that.

17,728. Then if you are 10 miles to the north of Hartlepool, running in dead on shore would you not have the same soundings as to the character of the bottom as you would have running in a straight course into Hartlepool ?—You might not perceive it in 10 miles further to northward, it is darker and coarser.

17,729. Twenty miles to northward would you perceive it ?—You might.

17,730. Ten miles to the south would you perceive it ?—It becomes finer there.

17,731. Therefore you would tell by the character of the bottom whether you were 10 miles to the southward of Hartlepool if running in from the sea ?—I should not say 10 miles.

17,732. Twenty miles ?—You might see it in 20 miles.

17,733. (*Sir F. Smith.*) Do you think that masters of foreign vessels would know of it ?—They have generally got soundings marked on the chart.

17,734. I know but the character of the bottom ?—Yes.

17,735. And you think they attend to that carefully ?—They can't help doing it when they look upon it.

17,736. (*Mr. Lindsay.*) You say you can tell by the soundings when you are drawing to the land off Hartlepool, with much more facility than drawing to the land off Flamborough Head ?—Oh yes.

17,737. How will it be with other ports in the bight of the bay? Would the soundings lead you in with greater facility than they would at the Wear or the Tyne ?—You know the Wear is not so far off.

17,738. Well, then, we will take the Tyne. Are the soundings as regular in coming in from the sea to the Tyne ?—No, it is deep water close to the Tyne.

17,739. I am speaking of the cause of danger as compared with the Tyne and Hartlepool ?—You will come into shoaler water all at once off the Tyne.

17,740. Then if guided by your soundings, and you had nothing else to guide you, you would run with greater safety for Hartlepool than for the Tyne ?—Yes.

17,741. That is, you would get your soundings more gradually, and therefore that is one reason why you would give the preference to Hartlepool as a site for a harbour of refuge ?—Yes, it is certainly the easiest to be got at.

17,742. Now with regard to making the land, does the land afford greater facilities for making the harbour at Hartlepool than the land does at the Wear or at the Tyne ? I am speaking of thick, hazy sort of weather, when you cannot see the land at a great distance ; whether is the harbour easier made out in such weather at Hartlepool, the Wear, or the Tyne ?—You can easily know Hartlepool, if you see it at all, by the Heugh and the lighthouse.

17,743. Are the marks as conspicuous at Hartlepool for making the harbour as at the Wear or the Tyne ?—There are marks at the Wear and the Tyne, more at the Tyne certainly than here, for you have Tynemouth Castle and lighthouse, and the Collingwood monument, and all that.

17,744. Therefore you think the marks of the harbour are more conspicuous at the Tyne than at Hartlepool ?—At the Tyne they are.

17,745. The Chairman asked you with regard to the improvement of the existing harbours, and I understand you to say if the harbours could be all improved the improvement of those harbours would do more to save life and property than one harbour of refuge ?—Yes, I say the more harbours of refuge the better.

17,746. But say it rested between this place and Filey; and say that a large harbour could be made at Filey of considerable depth of water, and at the same cost as it could be made here, and looking at the whole of the trade along this coast that passes Flamborough Head and the bight of the bay, and looking to the prevailing winds which are the most dangerous ones, at what site if left to yourself would you construct one great harbour ?—Well, I would say here.

17,747. Then do you think that if that sum of money was divided between Hartlepool and Filey it would do more towards saving life and property than if the whole sum was expended at Hartlepool, and that if it would make them both efficient it would be better to have Filey and Hartlepool ?—It would be better to have Hartlepool and Filey than Hartlepool or Filey alone.

17,748. Do ships find good anchorage in Bridlington Bay in easterly gales ?—Not in easterly gales ; they must go out to the Humber.

17,749. Then in easterly gales there is no port along the coast between the Humber and the Firth of Forth where ships can find shelter ?—No.

17,750. In these easterly gales, when a ship can weather Flamborough Head to the southward, is it the case that they are generally able to reach the Humber ?—If the wind is to the east they will, that is if they are able to carry canvas.

17,751. That being the case would there be any necessity for a harbour of refuge at Bridlington ?—It would be essential there as being a protection from easterly winds as well as from north-east.

17,752. Say it could be made a protection from easterly, the most dangerous and prevailing winds, do you think it could be of as much service as it would be at Filey ?—No, I should say not, for all the vessels try to get as far north as they can to reach their harbours.

17,753. Then if it rested between Bridlington and Filey, you would give the preference to Filey ?—No ; I would rather give it to Bridlington Bay, because it would be more extensive.

17,754. I understood you to give an answer to me that you thought a harbour of refuge at Filey in easterly gales would be more advantageous to the ships frequenting this coast than it would be at Bridlington Bay ?—No; I said if Bridlington could be sheltered from easterly winds, south-east, and north-east it would be a fine anchorage and good harbour.

17,755. Would it do more good, do you think, there than at Filey ?—A great deal.

17,756. Then will you consider your previous answer to me when you said that when ships in easterly gales can weather Flamborough Head they easily reach the Humber ?—Yes.

17,757. What, then, would be the good of a harbour of refuge at Bridlington ? Has a ship more need of a harbour of refuge in easterly gales, which can weather Flamborough Head, than she has if she cannot weather it away ?—If there was a harbour there it would be much better than at Filey.

17,758. You are still of the opinion it would be better than Filey ?—Yes.

17,759. I am speaking of colliers bound for London, are you of opinion a harbour of refuge for them would be of more advantage at Bridlington Bay than Filey ?—Yes, if it was properly constructed, it would.

17,760. Are you still of that opinion after what you have stated to me ?—Filey would not hold more than 300 or 400 ships.

17,761. But you spoke, not taking into consideration the size of the harbour, assuming that in either place the same sum of money would make a harbour of the same size, what site would you say would be the best ?—It would take a deal of money to make a harbour at Flamborough Head.

17,762. But we are not engineers ; which site do you think would be of most service, Bridlington Bay or Filey Bay ?—I would say Bridlington Bay.

17,763. Therefore you would not be inclined to give a very favourable opinion of Filey as a site ?—No, I do not like it.

17,764. I draw from your answer that you do not consider a harbour at Filey would be of any material advantage to the ships that frequent that coast. Am I to understand that ?—No. I say it would be very good were it properly filled up.

17,765. (*Capt. Sulivan.*) If vessels are bound south-east off Flamborough Head, with south-east or southerly gales, would many vessels be able to fetch into Filey that could not round Flamborough Head and get into Bridlington ?—All that were to the windward could.

17,766. But would not many ships that could not weather the Head yet weather Filey ?—Yes.

17,767. Would not Filey take all the ships immediately off the Head as well as those that could not weather the Head and get into Bridlington ?—Yes.

17,768. Suppose the great object was the colliers bound to the south ; say the colliers that weathered the Head with these dangerous easterly gales could get into the Humber under ordinary circumstances, but for those that could not weather the Head there is no refuge ? Do you not think that it would be better to provide some refuge for these colliers north of the Head than immediately south of it ?—I would say so.

17,769. Now are you aware what is the depth of water in Bridlington Bay ?—Yes ; there is very little water inside the Smithic, unless you are close in shore.

17,770. When you speak of a breakwater at Bridlington, I suppose you mean it would be erected on the Smithic as the only point ?—Yes.

17,771. That would leave a great distance between the pier and the shore, would it not ?—It is only half a mile distant.

17,772. Then being a breakwater made out into the sea it would be much more expensive than one run from a point ?—Yes.

17,773. If you knew that from six to four fathoms could be enclosed at Filey Bay for a good space, and that you cannot get that depth in Bridlington Bay, would that be another reason why a harbour should be on the north of the Head rather than on the south ?—What do you say ?

17,774. You can get more depth of water covered to the same extent, with the same expensive breakwater, I am supposing that, as you say, one might be made to the sea ?—One would have to be made to the sea, but I would not propose to make a harbour there at all. I am only answering your question.

17,775. I understood you to answer Mr. Lindsay ?—He asked me if it would do, and I said it would.

17,776. But he understood you to lay out the money in Bridlington rather than Filey Bay ?—Yes ; there is more space there.

17,777. With more space you would require a much larger breakwater to cover that space ?—Yes.

17,778. Therefore it would be very much more expensive ?—Yes.

17,779. I see you say it is shallow water ; but in Filey Bay you can have from five to six fathoms at less expense ; would you say then that you would make a harbour in Bridlington Bay ?—No, not if it could be for less expense ; but looking to the vessels that Bridlington Bay contains, Filey Bay would not contain half.

17,780. Does it generally contain light colliers bound to the northward ?—It is only light vessels it does contain.

17,781. And it affords very good protection to those with north-east wind ?—Yes.

17,782. You said that two harbours, if sufficient for the purpose, would be better than one large one ; would you think a harbour of refuge sufficient for the purpose of saving life and property that would take all the largest class of colliers in perfect safety in the heaviest sea at all times of the day and night ?—Yes ; I should say that was a very good harbour.

17,783. If two such harbours could be made with that depth on this coast, say one at Hartlepool and one at Filey, would you think that better than one large harbour at this place with deeper water ?—Well, as I have told you, Filey cannot contain so many vessels.

17,784. I am not asking you that ; that is a question for the engineers. Suppose it could do what I tell you ?—Then I say it would be better than one.

17,785. In what port do you get your North Sea certificate ?—From the Trinity House of Leith.

17,786. Have they power to grant licences outside of the Firth of Forth for the North Sea ?—Yes.

17,787. How far ?—All round Scotland and to the south.

Mr. Abel Haisman examined.

HARTLEPOOL.

Mr. Abel Haisman.

19 Oct. 1858.

17,788. (*Chairman.*) You reside at Rochester ?—I do.

17,789. How many years were you at sea ?—Twenty-six.

17,790. Do you follow the sea now ?—I have been on shore since 12th of last September.

17,791. Are you a shipowner ?—Yes ; and go to sea at times ; I have been constantly employed within the last 12 months at sea.

17,792. In what trade have the vessels been employed chiefly that you have commanded ?—Chiefly in the coal trade ; sometimes in the Baltic, in the Hamburg and Mediterranean occasionally, but principally on the north-east coast.

17,793. Are you aware of the objects of this enquiry ?—I am.

17,794. Give me your opinion as to which would be the most advantageous, the improvement of the three ports of the Tyne, the Tees, and Wear, or the establishment of one large harbour of refuge, supposing that these ports could be improved to take in ships drawing six feet at low water ?—I am decidedly for one large harbour.

17,795. Will you give me your reasons ?—Because it is not affected by the tide, and can be entered at any time without any interference from the freshes during the winter season, which are most prevalent between the months of September and March or April, both freshes and gales of wind. Harbours are comparatively useless from April to September during the summer months, because the weather is more moderate and fine upon the coast than from September to April or May, consequently during the winter you have the worst of weather, and rivers are more affected with freshes after heavy falls of snow ; and what frequently befalls a master in taking these bar harbours is that the current is setting in at flood tide, and just when you come within the influence of the current it whips you to the back of the north pier, or if taking Shields you get on the Herd Sand. Sometimes when you imagine when you have the flood tide you find you have the ebb. These things frequently cause you to loose your ship and your life too.

17,796. Then if you had to decide in favour of one harbour, where would you put it ?—In Hartlepool Bay.

17,797. Will you give me your reasons for preferring Hartlepool Bay to any other place along the coast ?—Because there are more indraughts in the bay than anywhere else along the coast. The flood tide sets you in more to the southward and westward in Tees Bay than anywhere else upon the coast, consequently with a gale of wind between these points you make great leeway, you are more under the influence of an inshore set in crossing Tees Bay than anywhere else, you come bumping into the bay before you are aware of it, consequently it makes Tees Bay more dangerous than anywhere else upon the coast, because the tide there sets more parallel north and south ; between Robin Hood's Bay and Tynemouth is, I consider, the most dangerous part of the coast, in consequence of the indrafts prevailing more thoroughly right into the bay than anywhere else. (*Plan out of Select Committee's Report of* 1857 *produced to witness.*)

17,798. You see the line of embayment drawn on that plan. Suppose a loaded collier was on that line or more out, with the wind dead on shore, would there be any chance of her weathering either extreme of the bay ?—None.

17,799. Then the only option she would have would be to run for one of the ports ?—Yes ; I have seen many gales in which it would not have been possible for a ship within that line to keep clear of the coast.

17,800. As a general rule, would you say that laden ships within or on that line would infallibly go into the bay ?—Yes.

17,801. What style of vessel is it that you have generally commanded ? Have they been a better description of vessel should you say than the general run ?—I have commanded good ones, and very indifferent ones. I had an old North American ship as the first of my experience, which is not the best description afloat. She was about 25 years old, but it has been my good fortune since then to have rather a better class of ships.

17,802. Ships, brigs, or barques have they been ?—Brigs and barques.

17,803. In a gale of wind, as a general rule, would it have been safer for you to have scudded or laid to ?—It would depend which way the wind was.

17,804. I do not mean to say as respects escaping the land. I suppose you to be in the North Sea, or anywhere you please, in a heavy gale of wind with a heavy sea on. Would it be safer for you, as a general rule, to scud or to heave to ?—It would depend entirely on the build of the ship how I should form my conviction of her for scudding or lying to.

17,805. Yes, ships being different ; but taking the ships you have commanded generally, which would have been safer, heaving to or scudding ?—There are times when you must heave a ship to. There are times when there is great danger of her broaching to, and that is worse than bowing the sea. There are emergencies when it is not possible to scud, but it is a last resource to lay a ship to. I believe all the time you can carry your canvass, to run a ship you are safer, but there are gales of wind and seas so heavy that it is not safe to scud.

17,806. And then you would heave to ?—Yes ; provided the position of the land would allow me to do so in safety.

17,807. I have given you lots of sea room ?—Yes.

17,808. I want you to give me the result of your experience as to the ships generally employed in the coal trade on this point. With lots of sea room, would they be safer scudding or hove to in a heavy gale of wind and heavy sea ?—On the coast I should never attempt to heave a ship to.

17,809. Without reference to the coast. I give you plenty of sea room ?—It would apply to that class of ships as well as to any other. I speak of ships as a general rule.

17,810. Has it ever occurred to you to run into Hartlepool Bay in thick weather by your lead only ?—Frequently.

17,811. What are the character of the soundings as respects depths ?—Gradual shoaling as you draw into the bay.

17,812. As respects the character of the bottom, what are the soundings, say from 12 to 15 miles out from land ?—About 30 fathoms, and you gradually shoal your water till you draw into nine and eight fathoms water, and then in thick weather you are close enough in.

17,813. I mean as respects the nature of the bottom ?—I never examined the nature of the bottom particularly in running in ; I depended entirely upon my shoaling.

17,814. And you found your shoaling a sufficient guide ?—Yes, regularly from the shoaling of my water.

17,815. Is that regularity of which you tell me sufficiently marked when you are running dead in for Hartlepool to make you quite sure you are not either north or south ?—Yes ; you cannot get such gradual soundings anywhere else upon the coast between Flamborough Head and the north.

17,816. (*Mr. Lindsay.*) Do you remember the 4th of January gale, 1857 ?—I was in the Mediterranean on 4th January 1857. I was coming down from Marseilles to Malaga.

17,817. I will not trouble you with any questions as you were not upon the coast at that time ?—I was on the coast in a very heavy gale in January 1854, when about 30 or 40 ships came ashore in the bay.

17,818. How was the gale ?—It commenced south-east. I came down just ahead of the fleet. I got in

a single ship the tide before it backed into east-north-east.

17,819. And there were a great many ships lost?—A great many.

17,820. Where were they?—The bay was full of ships on shore and knocking to pieces. I never saw such a sight in my life.

17,821. Would all these ships have been saved if there had been a harbour of refuge at Hartlepool?—Every one.

17,822. Any lives lost?—Yes; I well remember seeing them, and could render no assistance.

17,823. And would every ship that was within the line of embayment to which you have just now referred have found shelter in Hartlepool during that period?—There was nothing to have stopped them, they must have come in in safety, if the broken water had been kept out by any piers.

17,824. Were any ships lost during that gale between Whitby and Flamborough Head, do you think?—I cannot say positively, but I should imagine not. In my experience, which lasts over 20 years, constantly on this coast winter and summer, never stopping, in Mr. William Lee's employment, I think where there was one ship lost to the southward of Whitby, there were ten lost to the northward. We all consider ourselves comparatively safe when we get to the southward of Whitby to what we were to the northward of Whitby.

17,825. That is, you always consider yourselves safe when bound south?—Yes.

17,826. Do you consider yourselves more safe with this sandy beach of Hartlepool under your lee, than the rocky shore of Whitby, or Flamborough Head?—We consider ourselves more comparatively safe when not embayed. You never consider yourself so safe, at least, I never do, as when I am on a parallel coast. I feel myself more secure when clear of the bay.

17,827. Saying that you were going along your usual track from Rochester to Hartlepool or from Hartlepool to Rochester, and say you were caught on the rocky shore between Whitby and Flamborough Head, with that heavy gale from east-north-east, would you consider yourself in a safe position?—Yes; I could get the Humber.

17,828. When clear of Whitby you could get the Humber?—Yes.

17,829. I suppose you mean as long as you were able to carry canvass?—I always considered myself comparatively safe when I was clear of the Tees Bay, because when to the southward and eastward of Whitby, and with the wind at east-north-east, it will be very raw weather that will very seldom occur on this coast, if the ship has anything of canvass, but that she will get the Humber.

17,830. Say you were in the usual track of vessels between Whitby and Flamborough Head, and you were caught with an east-north-east gale, so that you were obliged to shorten sail, to close-reef topsails, and reef courses, do you think that in such a case as that you could weather away the land?—I should not get so close under the land in winter time. We never make so free with the Yorkshire land during September, March, and April as at other intervals. Consequently we have more sea room. I never make so free supposing the wind is likely to incline inwards. We always give the Yorkshire land a greater berth during those months, except it is a dead set westerly gale, and we can depend on it.

17,831. Suppose Scarborough was bearing due west of you, at the time you were so caught, at what distance would you consider you required to have the land to be safe, and to weather away Flamborough Head, or to run back and find shelter in Hartlepool Bay to the north?—Well, Scarborough lies in a sort of bight and I never got near Scarborough.

17,832. How far to the eastward would you be?—I shall want to be from 15 to 20 miles.

17,833. If you had been at that distance from Scarborough under such circumstances, you would not have felt that your ship was in peril?—I should not, because I should have had Flamborough Head bearing to the westward and south of me.

17,834. When ships are bound to London in the winter season, they generally keep that distance from the land?—Quite so.

17,835. (*Capt. Sulivan.*) During the winter months if ships generally got such a good offing, would not that make them much less likely to be embayed within the line of Tees Bay?—Undoubtedly.

17,836. Suppose two harbours could be made sufficient for the largest sized colliers in all weathers and at all times of the night and day, would you prefer these two, one near Flamborough Head, and one in the bight of the bay, to one larger or deeper harbour at either of these points?—I should prefer one large deep harbour in the bay of the Tees, Hartlepool in preference to two smaller ones.

17,837. Do you think one large harbour in Hartlepool Bay would save more lives in the vessels driven to the very last extremity, and better enable them to keep the sea, than one harbour at Filey and another at Hartlepool?—No doubt of it; Hartlepool would save ten to one, because where there is one ship and one life lost to the southward and in the neighbourhood of Flamborough Head, there is ten lost to the northward.

17,838. Will you give me an idea about how many vessels you ever knew lost for want of a harbour of of refuge somewhere about Tees Bay, and the district right and left of it?—In the gale I spoke about they were innumerable.

17,839. Roughly?—Do you mean all that foundered in the gale as well as stranded?

17,840. Yes; those that were lost right and left of Hartlepool, and in Hartlepool Bay, within a short distance that a harbour in Hartlepool Bay would have saved?—I should say that in that gale of wind, above 100 sail, I have no hesitation in saying, were on shore on the sand, in January 1854.

17,841. If a harbour in Hartlepool would take in safety 300 or 400 vessels of the same size as those you say were wrecked, do you believe that any one gale would occur that more vessels would try for it than it would hold?—Yes.

17,842. More than the 300 or 400 which you tell me was the greatest number you ever knew?—Yes, because some went into ports; there were 1,500 sail of ships on the coast in that gale in the vicinity of Tees Bay.

17,843. All the vessels so embayed off Hartlepool, if they could not get off, would have chosen the beach at Hartlepool in preference to any place right or left of it, would they not?—They tried the chance of getting into their own harbours, you know.

17,844. Then you still think that a couple of harbours, one near Flamborough Head and one in the bight of the bay, moderate harbours, able to take 300 or 400 colliers each, at all times of the tide, night and day, would not be so good for the saving of life and property as one large harbour in Hartlepool?—I do, and for this reason; I never saw so many ships in the neighbourhood of Flamborough Head as I have seen in Tees Bay, not by one fourth.

17,845. All the flocks of ships that are off Tees Bay and going south will be equally in one part of their voyage off Flamborough Head; will they not, and any fleet of light colliers going north must have been equally off Flamborough Head a little before?—Oh, no; because ships coming north when the tide don't suit they heave to. There is a large fleet waiting for the harbours at tide time.

17,846. This waiting for the tide would not apply to entering a harbour of refuge that could be entered at all times of the tide?—Certainly not, I am speaking of the present state of things.

17,847. I am speaking of two harbours constructed that would take 200 or 300 ships in. Will you tell me one thing,—what becomes of all the old colliers?—The same as what becomes of all the old men and women.

17,848. Do you ever see in the coal ports any pro-

HARTLEPOOL.

Mr. Abel Haisman.

19 Oct. 1858.

Capt. Sulivan.

portion of colliers that are broken up to those that are built ?—I don't understand.

17,849. Do you ever see a fair proportion according to numbers of colliers that are building and added to the stock broken up in port as unfit to go to sea ?—I see as many new ships get wrecked as new ones on the coast.

17,850. I don't ask that ?—I don't know whether the proportion is not greater.

17,851. I ask you what becomes of the old colliers, whether they are broken up in port, or whether it is a rare thing to see a collier broken up in a collier port ?—Well I can answer the question as near as I can.

17,852. I ask you whether you have ever seen any old collier broken up in the collier ports having been condemned as unseaworthy ? Can you call to recollection having seen the ribs and planks of a collier, and the men working at her and breaking her up ?—I really don't know what becomes of them if they don't go the same way as old men and women.

17,853. (*Chairman.*) From your knowledge of the coasting trade, and the coal trade especially, have you any reason to suppose that a larger number of colliers founder at sea than of other vessels employed in other trades ?—I don't think they do ; they are generally provided with very excellent pumps, and the crews don't mind working at them as much as southern ships do. I believe there are as many ships founder in the southern trade, if not more, than colliers ; colliers generally are better provided with pumping gear, holding ground, tackle anchors and chains ; many are better supplied with holding tackle than many foreign going ships.

17,854. Do you attribute the circumstance that the greater number of colliers in proportion do not founder at sea to the circumstance of their being better provided with pumping gear, and having more occasion to use it in consequence of their bottoms not being so good ?—Not altogether ; but in the case of a few hours, when they leak heavily, they can fetch a port or get assistance from the shore ; whereas a ship crossing the Atlantic has no alternative ; she cannot make a port and have her leak stopped. Many a ship is carried, as it is termed, into port in the sailor's arms because she has a port close at hand ; but this cannot be done in crossing the Atlantic, and this is one of the many reasons why so many founder there.

17,855. When they are carried into port in the sailor's arms, as you describe it, are they carried into port in consequence of their bottoms not being good and sound, or is it from the circumstance that they frequently lie on the ground and therefore leak and strain more than others do ?—Some of them do strain by lying on the ground ; you cannot lay an old ship on the ground without straining her if she has a full cargo in, unless it is a very soft bed.

17,856. And therefore you consider that the leaky condition of the colliers which you have described is, to a certain extent, the consequence of the character of the trade in which they are employed ?—I do not say that, but you cannot lay a ship on the ground without straining her ; some ships are built for lying on the ground when used in that trade, but if the owner knows his ships will not stand the ground, he will not lay her on the ground. All ships at sea are liable to spring a leak through straining in heavy weather, and being deeply laden, and struck by heavy seas.

17,857. And therefore, according to your experience, colliers are as seaworthy in respect of their hulls as other vessels, and do not founder at sea in consequence of being unseaworthy more than other vessels ?—I do not believe they do so.

17,858. (*Mr. Lindsay.*) You are not here with your ship at present ?—I am not.

17,859. Did you come down from Rochester to give evidence here ?—Just so.

17,860. (*Capt. Sulivan.*) During the last few years you were in the coal trade, what coal ports did you usually trade to ?—Old Hartlepool, Sunderland, West Hartlepool, and Shields.

17,861. Equally to all ?—More into Hartlepool Bay than any other parts.

17,862. (*Mr. Lindsay.*) Did you come down of your own free will to tender evidence, or were you invited to come here ?—From the earliest information I had of this Commission, I felt a deep sense of the importance of it, and from feelings of humanity and the necessity of a harbour of refuge, I felt it my duty to give my opinion that it should be according to my idea in the right place, which was Tees Bay and Hartlepool ; and I received a letter last week from Mr. Jackson, telling me that if I could come they would be happy to see me, and that you were expected here at the earlier part of this week.

17,863. And with the feeling you held as to the necessity of a harbour of refuge you gladly accepted the invitation ?—I did ; I felt it my duty from feelings of humanity to come down here, after witnessing so much loss of life and property as I had done, and I feel I have only done my duty as an humble individual in society in expressing my knowledge of it.

(*Chairman.*) Thank you.

Mr. JOHN CLARK examined.

Mr. J. Clark.

17,864. (*Chairman.*) You belong to Whitby ?—Yes, I am an inhabitant of Whitby.

17,865. How many years have you been at sea ?—Thirty-seven.

17,866. And in what capacity generally ?—Since 1828, as master generally.

17,867. And in what trade have you been employed chiefly ?—The Baltic for the first 15 years, and since that in various trades, Archangel, American, Hamburg, and Mediterranean.

17,868. Have you been present during the course of this inquiry ?—Yes ; I live in Hartlepool now, and have been living here 12 years.

17,869. And you have heard the evidence of the witnesses who have preceded you, I mean the seafaring men ?—I have.

17,870. Do you generally agree with them as to its being more advantageous to have one large harbour than to have an improvement to the three ports, the Tyne, Tees, and Wear ?—I do.

17,871. Will you give your reasons ?—The first reason I have is, that in the Tyne and Wear in the winter season there is a strong fresh and a strong tide, and though there may be sufficient water a ship steers badly, and if there was a large fleet of ships coming in they cannot get away and they come together, whereas coming into a place like Hartlepool, where it is still water, as soon as you are in, you down with your anchor and the ship is safe.

17,872. Have you ever made Hartlepool in thick weather ?—I have more than once.

17,873. Is the land easy to make out in thick hazy weather when you can only see it at a distance of two or three miles ?—I do not know but that it is quite as easy to make out as any other port on the coast, more particularly with a lead.

17,874. But is the land easy to make out ?—I have the Heugh and Lighthouse, and the bold land to the north and south of it.

17,875. And it is quite as easy to make out as Tynemouth, for instance ?—Quite.

17,876. And quite as easy to make out as about the Wear ?—Quite as easy.

17,877. And is it as easy to make out as the Head ?—I would not say that, as I can see Flamborough Head probably further, but if it was anything like, I could see the land two or three miles off, and I could come in with more safety.

17,878. Have you ever run in by the land in thick weather ?—Frequently.

17,879. And is it a thing you have no hesitation in doing in a heavy gale of wind blowing on shore ?—I cannot say I ever ran with a heavy gale of wind

HARTLEPOOL.

Mr. J. Clark.

19 Oct. 1858.

on shore; we had to guard against that; we had no place to run to.

17,880. You could run for Hartlepool at high water, even in a gale of wind, in a small vessel?—Undoubtedly.

17,881. Have you ever run into Hartlepool in a gale of wind on shore?—Never but once.

17,882. On that occasion did you run in by the lead, or did you see the land?—By the lead.

17,883. And you had no hesitation in doing it?—None whatever.

17,884. And how did you know when you were running in by your lead, that you were not either to the north or south of Hartlepool?—I knew well when I was to the north of it by the soundings.

17,885. That you were running in direct for the bay?—Yes.

17,886. Explain to me how you knew?—East of Hartlepool you have a sandy bottom, not particularly fine but with small shells; at a little south, say Redcar, you have the ground coarser there. If you get north there is plenty of ballast chalk and gravel, and all sorts of mixtures put together, you can't tell what sort of bottom it is, but if you get south of that you know that you are in the neighbourhood of Hartlepool.

17,887. And that distinction between the bottom of the north and south is marked at what distance out from shore?—About 15 or 20 miles, but I would not say I could go north so far as that.

17,888. Then in thick weather when you could not see the lights or the land, would your soundings assist you into Hartlepool, keeping your way along shore?—Yes, right into Hartlepool pier almost. I have done so outside of the Long Scars.

17,889. And come in quite by your soundings?—Yes.

17,890. And feeling your way in from the south, could you do it by your soundings?—Yes.

17,891. Both north and south?—Yes.

17,892. (*Mr. Lindsay.*) Do I understand you to say you are master of a Whitby ship?—Not at present.

17,893. You were?—Yes, many times.

17,894. And you belong to Whitby?—Runswick in the neighbourhood of Whitby.

17,895. Were you at sea during the gale of the 4th January 1857?—I was not.

17,896. Were you at Whitby shortly after that gale?—I was not.

17,897. Then you are unable to speak as to the fact whether there were many ships driven ashore about Whitby?—Only from what I heard.

17,898. (*Capt. Washington.*) Do you know Runswick Bay?—I do.

17,899. Do you think it would be a good place for a harbour of refuge?—Upon a small scale it is the best upon the coast.

17,900. Would it be a convenient part of the coast for vessels to run to?—Not at all; it is merely in case of necessity.

17,901. More as a stopping place than as a harbour of refuge?—Just so.

17,902. It would be useful as that?—Very useful.

17,903. Have you any doubt upon your mind, after your experience at sea, as to the best site for a harbour of refuge on this coast?—Hartlepool.

17,904. You are quite sure of that?—Quite sure.

17,905. (*Capt. Sulivan.*) Do you reside at Hartlepool?—Yes.

17,906. I asked you that, as in the list of witnesses you are put down as residing at Whitby, as if you did not belong to Hartlepool?—I have resided 12 years at Hartlepool. Hartlepool is my place of residence.

17,907. From what you know of the coast would you say that two harbours at Hartlepool or Filey, provided that each was accessible at all times of the tide for the largest colliers in safety, would be more useful than one large harbour at either place?—I don't say it should; that there is so little need of a harbour of refuge at Filey.

Mr. Robert Jordison examined.

Mr. R. Jordison.

17,908. (*Chairman.*) I see you have followed the sea for a number of years; how many?—About 40.

17,909. And of that period how long have you been in command of vessels?—About 30 years.

17,910. And in what trades have the vessels you have commanded been chiefly employed?—Chiefly in in the North American trades and Baltic, occasionally coastwise in the spring of the year.

17,911. Where are you resident now?—In Runswick just now.

17,912. And were you a native of that place?—No.

17,913. Of where?—Of Sunderland, in the county of Durham.

17,914. Have you been present to-day during this inquiry?—Most of the time, I think.

17,915. Have you heard the evidence of the three or four last witnesses?—I think I have.

17,916. Do you generally agree in their evidence?—Generally speaking.

17,917. That it is more desirable to have one large harbour, say at Hartlepool, than to improve the three harbours, the Tyne, Tees, and Wear?—I should say it is better to have one large harbour than to improve the harbours you have mentioned, for I think the harbours could not be improved to that extent that would do the good that a large harbour of refuge would.

17,918. Will you state to me any further reasons you have for preferring one large harbour to the improvement of the three?—As Mr. Clark stated, freshes and those things come down rivers such as the Wear, Tees, and Tyne, and of course makes it more dangerous to take those harbours, as he had stated before, and that is one reason I should think for keeping this bight open, that is, from Robin Hood's Bay down as far as the Farn Islands, as preferable to going south of Whitby point and a lee shore.

17,919. In the evidence given us in other places we have been told it is the general practice for vessels always to run back for their own ports when taken in a breeze of wind; would that in your opinion be an objection to this one large harbour, because if we make one large harbour and they did not use it, you know it would be of very little service?—I don't know that I ever ran back in my life for the port from which I had sailed, that is, upon this coast.

17,920. Then you are not disposed, from your knowledge of the general practice on the coast among colliers, chiefly to agree in that statement which has been made to us that they generally run back to their own ports?—Some small vessels might, but the vessels I generally have had charge of could not do so with safety. I have gone all the way from north of the Humber down to Leith Roads twice in one voyage, but not wholly from there, because I have been taken off Sunderland down to Leith Roads, and then come from there as far as Leamington Church and back to Leith Roads in eight or nine days after.

17,921. You have heard the character that has been given us of Hartlepool Bay, as to vessels making it by the lead, do you agree in that?—I believe there is a more regular sounding coming into Tees Bay, that is Hartlepool Bay included, than there is perhaps north or south, but I would not pretend to run down upon this bay in a gale of wind and thick weather, or weather that I could not see the land or the lights. I should not attempt it with my lead. I should not have that confidence in myself, but there is a difference of men having more practice. Those having more practice on the coast than I have would be more likely to do so than I would be.

17,922. But you have been employed a great deal in the foreign trade, or North Sea trade, and in the coasting trade; now from your knowledge of the coasting trade, and of coasters and colliers who do make a very great use of their lead, and who are very

HARTLEPOOL.

Mr. R. Jordison.

19 Oct. 1858.

Chairman.

good hands at it, do you suppose they do it, though you would not ?—They might do so, but I would not.

17,923. How many voyages have you made home from the Baltic in the fall of the year ?—Nine or ten, perhaps.

17,924. What is the northernmost land you have made on this side ?—I tried to steer for Flamborough Head, but sometimes I have made Buchan Ness and the Firth of Forth, in some voyages when bound for London.

17,925. You have only made 10 or 12 voyages ; now would you say you have made the land as far north as Buchan Ness two or three times out of that ?—I should say seven or eight times, but it was not on account of any preference I gave to the land there.

17,926. From your knowlege of the winds that prevail in the North Sea at the fall of the year, do you think the bulk of the ships will make the land as far to the north as Buchan Ness ?—Not without they are driven there if bound to the south.

17,927. I do not ask you whether they go there voluntarily, but whether they are driven there by the wind, many of them ? I ask you whether many of the ships that come home from the Baltic in the fall of the year make the land as far north as Buchan Ness ?—It has happened so with me, not to be always to the northward of Buchan Ness, but down about the Bell Rock, and St. Abb's Head, and sometimes about the Coquet Island, and as far as Tynemouth.

17,928. In fact you are not able to speak as to what others have done ?—I cannot.

17,929. Have you made the passage north-about ; to and from America ?—Yes ; frequently.

17,930. How many times would you say ?—I should say about 16 to 20 voyages perhaps.

17,931. From your knowledge of that passage north-about, if Peterhead Bay or Wick Bay were to be improved and made a harbour of refuge, which would you prefer ?—I should say Wick Bay for a harbour of refuge in preference to Peterhead on that coast, for if I was off Peterhead I could make my way round with the wind from the southward, in behind Conrad's Head, and, if I chose, I could run down for Wick, or dodge under the weather land, and if the weather and wind would permit, if the wind was from the north I could get to the southward, and into Leith Roads, if I could not get down on to this coast.

17,932. So that you would give a decided preference to Wick ?—I would give a decided preference to Wick.

17,933. (*Mr. Lindsay.*) From your knowledge of that coast, should you think that a harbour of refuge is necessary ?—Near Wick ?

17,934. Along that coast, the east coast of Scotland ?—I should say so ; I should think that ships would be very glad of a refuge harbour instead of going to Long Hope.

17,935. Quite so ; then you think a harbour of refuge along that coast would be the means of saving life and property ?—I should think it would.

17,936. (*Capt. Washington.*) I think you are a native of Runswick ?—No, near to Sunderland.

17,937. You have lived some time at Runswick ?—I have lived about seven or eight years at Runswick.

17,938. Then you are acquainted with Runswick Bay ?—Well I have never been further than just going off in a boat to catch the steamboat ; I don't pretend to know much about Runswick Bay as far as regards the bay or anything. It might make a small harbour of refuge, but not a large one, it is infested with rocks all round at low-water mark, except a bit of sand at the head of it.

17,939. Is that the case, that the shores are very rocky ?—It is all rock thereabout, except at the head of Runswick Bay there is a small bit sand.

17,940. Do you consider it a suitable place for a harbour of refuge ?—I should say not, without it should be a very small one.

17,941. Would it be a very useful place for vessels ?—If it was improved it might, but it will require something to be done to make it safe to stop in ; of course in summer time frequently ships go in and stop one or two tides, but as soon as the wind draws in from the east they are obliged to leave it.

17,942. Do vessels often go there ?—Very rarely ; unless they are vessels belonging to the place.

17,943. Would Robin Hood's Bay be a better place ?—I should say not ; I don't pretend to know a great deal about Robin Hood's Bay ; I have passed it often.

17,944. Do ships often stop there ?—I have seen ships stop there, both light and laden, in summer, but not frequently in winter.

17,945. Vessels do keep off that iron-bound coast, do they ?—I have always endeavoured to keep off it, if I could get off it ; if I was off it and saw the wind was going to come on the land, I generally gave it a wide berth.

17,946. Once again, are you quite clear in your opinion as to which is the best site for a refuge harbour on the coast between Flamborough Head and the Farn Islands ?—I have formed the opinion many years ago, that a harbour of refuge was wanted on this coast, and as a harbour, only one, I should say Hartlepool Bay is the best in my opinion.

17,947. Are you in any way connected with Hartlepool ?—Not in the least. I have not a stone, nor a foot of ground in fact anywhere in England, not of my own to call my own property.

17,948. (*Capt. Sulivan.*) If you had a place to select for a second harbour for the collier trade bound south after Hartlepool where would you put it ?—If I was obliged to give a positive answer I should say Filey, perhaps.

17,949. Suppose it a fair harbour at Hartlepool and another at Filey, that is five or six fathoms, that would take colliers at all times of the tide, night and day, and of the largest size, would two harbours of that size be better for the collier trade than one large harbour at one place ?—If they were equally efficient and suitable I would say two harbours are better than one.

17,950. Each would not be so effective as a large one, because if it went to seven or eight or nine fathoms with a larger area it would take more vessels, but suppose it went to the moderate depth of five or six fathoms, and that you divided the money between two ports, each taking 300 or 400 vessels for refuge, and the deepest colliers and even the largest vessels by night or by day, would that be better than one harbour carried out to two or three fathoms deeper water ?—I would say one good harbour would be better than two bad ones.

17,951. I am not asking you about that. I said two good harbours from their depth and size ?—I understood you to say that if a harbour was made at Filey you would not make this so large and spacious if made here, that is making one harbour of refuge on the coast.

17,952. I ask you whether one harbour if carried to deeper water, that is up to seven, eight, or nine fathoms, or two at five or six fathoms at Filey and Hartlepool, would be the best, keeping in view not the accommodation of the trade of any port but the saving of life and property, and principally for the collier trade ?—Well, two harbours might pick up more ships, but I don't know that there would be that safety in these small harbours of about five or six fathoms that there would be in one seven or eight or nine fathoms.

17,953. You think they would pick up more ships ?—Yes ; I think they would pick up more ships, light ships.

17,954. Now with respect to the answer you gave respecting vessels returning for their own ports ; do you apply that principally to light vessels running to the north ; is it those you think don't run for their own ports, or were you speaking of loaded vessels ?—I spoke of loaded vessels.

17,955. But do you consider that light vessels run-

ning northwards generally try to make their port?—No, they make to the port where they intend loading.

17,956. Well, I mean, when I say their port, the port they are bound for?—Yes.

17,957. But a loaded collier will persevere on her voyage, I suppose, if she can?—Yes.

17,958. And would it be a convenience for these loaded vessels that cannot round Flamborough Head and can fetch Filey to have a harbour there rather than run back into the bight of Hartlepool?—It would certainly; if there was a harbour of refuge at Filey not many ships would run back to Hartlepool, unless they were obliged and could not get further.

17,959. While the vessels that were embayed and could not weather the high land near Whitby would find perfect shelter in a harbour at Hartlepool?—Of course they would.

Mr. Thomas Bayley examined.

Mr. T. Bayley.

17,960. (*Chairman.*) You reside at the Tyne?—Yes.

17,961. Are you a native of the Tyne, or of what place?—Of the Tyne.

17,962. How long have you followed the sea?—Twenty-seven years.

17,963. And for what time have you been captain?—Five.

17,964. In what trade have the vessels been employed that you have commanded chiefly?—The coasting trade from Seaham.

17,965. The coal trade?—Yes.

17,966. You have been present during the inquiry to-day?—Yes.

17,967. Have you heard the evidence of the three or four witnesses that have preceded you?—Yes.

17,968. Do you generally agree in their evidence?—Yes.

17,969. Is there any point on which you are disposed to differ from them, or should you like to bring under our notice anything that they have omitted to state?—Not one.

17,970. It appears that you were caught in a gale on 4th January 1857, off Whitby, and that you were wrecked in Hartlepool Bay?—No; I was caught between Filey and Scarborough.

17,971. And that you were wrecked in Hartlepool Bay?—Yes.

17,972. Will you describe to me the nature of the gale, and how you were wrecked?—Yes. I started from between Filey and Scarborough on Saturday morning at 10 o'clock, the wind south-south-east, keeping my head off till the wind got southward. It turned fine weather. Afterwards it broke out to north-north-west, and then easted; and as we went northward, I got it as far east; I had it that till 10 o'clock on Sunday morning. At 3 on Sunday afternoon I made Seaham, and I put the ship's head to southward again. I could not weather Souter Point, and I got to southward, and again weathered the Heugh. There was nothing else for me but either get the Humber, or go round and beach. Had there been a harbour of refuge, I should have got into it, and many besides me.

17,973. Where were you when the gale took place?—Between Scarborough and Filey.

17,974. You sailed out of Seaham?—Yes; on the Sunday.

17,975. How many days had you been out when the gale caught you?—I came out on the 2nd. It was on the morning of the 3rd.

17,976. How far to the north were you? You were off Souter Point not Seaham Point. You never got to the northward of Seaham?—Never.

17,977. When you were wrecked in Hartlepool Bay, where did the vessel go on shore?—Middleton Sand.

17,978. Where is Middleton Sand?—Between the two harbours.

17,979. And were your people all saved?—I lost one overboard, but the rest were saved.

17,980. At what time of the tide did you go on shore?—About the last quarter flood.

17,981. And were you running for the harbour when you went on shore?—Trying for the harbour.

17,982. And what drove you on shore?—I only could weather the Heugh on the larboard tack, and could not have ventured much further southward, without losing my life and my ship.

17,983. And when you went on shore, how was the wind?—About east and by north; but we had not seen the compass for more than half an hour, we had no light in the binnacle.

17,984. What tack were you on when you went on shore?—The starboard tack hauling up to the harbour.

17,985. Then you drove on the sands, in fact?—I struck, and unshipped my rudder, close into the harbour's mouth.

17,986. If it had not been for that, you would have got in?—I cannot say.

17,987. You might?—Perhaps I might.

17,988. Do you agree with the previous witnesses as to the facility of making Hartlepool better with the lead than any other part of the coast?—I never did it.

17,989. (*Sir F. Smith.*) What was the size of your ship?—She carries 230 tons.

17,990. Very heavy laden?—Yes.

17,991. Well manned?—Yes.

17,992. And a harbour of refuge would have saved you?—Yes.

17,993. (*Mr. Lindsay.*) What was the name of your ship?—The *Duke*.

17,994. You said the gale was south-east, I understood?—South-south-east when it began.

17,995. And you were off Scarborough?—Yes.

17,996. And you were bound for Lynn?—Yes.

17,997. With a cargo of coals?—Yes.

17,998. What distance were you from Scarborough at the time when the gale caught you?—About five miles.

17,999. If there had been a harbour at Filey, could you have reached it?—It would have been a chance. I would not say I could, or could not. The gale came on so heavy that I had to put up under close-reefed topsails.

18,000. Say you were caught in that position, and if there had been a harbour of refuge at Filey, would you have attempted to make it?—I would have tried hard for it.

18,001. Now say that during part of the gale, when the wind was east and by north during the latter part of it, when you were in that position, would you in that case have reached Hartlepool?—I should have run for the Humber; I should have gone round the head.

18,002. What, in your position! Five miles off Scarborough?—Yes.

18,003. Five miles from the land, wind east and by north, blowing a gale, and you distinctly think you would have weathered away Flamborough Head?—I should have carried canvas and tried it.

18,004. Do you think there would be much hope?—I should have had hope of doing it. I should have had no heavier canvas to carry than I would have had to get here.

18,005. Say there was only one harbour to be made on this coast, and it rested between Filey Bay and Hartlepool as a site, which would you prefer?—Hartlepool.

18,006. Knowing the coast as you do, and the number of ships passing along the coast, do you think one large harbour at Hartlepool Bay would tend more to save life and property than two moderate harbours, one at Hartlepool Bay, and another at Filey Bay?—I should say one good harbour at Hartlepool.

18,007. Now, considering this in a perfectly unbiassed manner,—because your word is of more weight than you can suppose,—if it was divided between

HARTLEPOOL.

Mr. T. Bayley.

19 Oct. 1858.

these two moderate harbours, or one large harbour, and that one large harbour at Hartlepool, do you think that this one large harbour would do more to save life and property than the two moderate harbours?—I do.

18,008. (*Capt. Sulivan.*) What is the deepest draught of any collier you have known in the coasting trade to London from the North?—I have never been in the London coal trade.

18,009. Well, trading from the northern ports anywhere south?—Generally, in the Seaham trade, they are not heavy draught; 14 feet is the heaviest draught.

18,010. Taking the large colliers you see alongside you in other ports?—I have never seen one more than 16 feet to my knowledge.

18,011. If you were going to trade now in a collier drawing 18 feet, and were going to pass up and down the coast every winter for the next 10 years, which would you rather have, a harbour at Hartlepool and a harbour at Filey, each being able to take 24 feet at all times of tide night or day, or one large harbour at Hartlepool taking 30 feet?—I would say one large harbour at Hartlepool that would take 30 feet.

18,012. Rather than have two that would take your vessel at all times of tide?—Yes.

18,013. (*Capt. Vetch.*) Suppose, as was suggested just now, that there were two moderate sized harbours provided, one at Filey, and another of moderate size at Hartlepool, what proportion of the vessels out of 100 would go to one place, and how many to the other?—That would all depend upon where they were catched, and how they were placed.

18,014. I speak on the average; take for instance a season, during an entire season, or 12 months if you please, and what would be the proportion that could take one harbour, and the proportion that could take the other?—I would say Hartlepool.

18,015. That more vessels would go to Hartlepool than Filey?—Yes.

18,016. Do you think there would be many more?—Yes, light ships particularly.

18,017. Do you think there would be double the number?—I should say there would.

18,018. (*Capt. Sulivan.*) You say with light vessels in particular. Is it the case that light ships press to the northwards towards their own ports?—Yes.

18,019. And therefore would commonly find themselves caught in this bay, and so find Hartlepool frequently valuable?—The more so if there was a harbour of refuge.

18,020. Yes, I am supposing a harbour of refuge, and taking the fleets of colliers that leave Seaham, Sunderland, and the Tyne, all laden, and passing to the southward, do you believe that a larger proportion of laden colliers would find greater benefit from Filey than light colliers would?—Yes, all the laden colliers would find benefit.

18,021. I say, would a larger proportion of laden colliers find greater benefit from Filey than light colliers would bound for the north?—Yes.

18,022. You said just now you might have fetched Filey?—Yes; it would have been a trial.

18,023. Had the wind been blowing hard from the east you would have endeavoured to go under Flamborough Head?—Yes.

18,024. If there had been a harbour at Filey under your lee, would you have gone on much more confidently and tried to weather the Head, knowing that you had safety under your lee, in a harbour at Filey Bay?—Decidedly.

18,025. (*Chairman.*) Can you tell me what proportion of the fleet caught in the gale of January 1857 had got so far south as Flamborough Head?—Not half a dozen.

Mr. Robert Chadds examined.

Mr. R. Chadds.

18,026. (*Chairman.*) Do you reside at Lynn?—Yes.

18,027. Are you a native of that place?—Yes.

18,028. How long have you followed the sea?—Twenty-five years.

18,029. How long have you been in command of vessels?—Twenty years.

18,030. In what trade have the vessels you command been chiefly employed?—In the coal trade.

18,031. Were you wrecked at Hartlepool in the gale of the 4th January 1857?—Yes.

18,032. Will you describe to me the circumstances, beginning with where you sailed from?—I sailed from London on the Friday morning with a loaded ship, and we get down as far as Flamborough Head, and the gale caught us off Scarborough—Scarborough lying west-south-west from us at a distance of eight or nine miles. When the gale first caught us it blew our foretopsail away, and we had to bend another. We had to carry canvas and get round Whitby; the wind easted and the snow came on. After that we split the foresail; then we were obliged to carry canvas and get to northward, and one sail went away with half of the other. At daylight in the morning Hartlepool was bearing west of me; we got the maintopsails secured, when I come ashore.

18,033. Was Hartlepool the port you were bound to?—Yes.

18,034. And when you were wrecked were you endeavouring to enter the harbour?—Yes; I could not get the ship clear of the rocks, and I drove into the bay in the last extremity. I felt very comfortable when I got the ship before the wind, when I knew where I was going. The ship came, and the men let go the wheel, and she broke the wheel chain, and the ship flew towards the stem buoys, and we had no command over her after that.

18,035. And the ship was lost in consequence of the wheel ropes breaking?—Yes.

18,036. And if it had not been that you would have run in?—Yes.

18,037. You have heard the evidence of the previous witnesses?—Yes.

18,038. Do you agree generally in the opinion they have given that one harbour at Hartlepool is the best to be done?—Yes.

18,039. (*Mr. Lindsay.*) What was the name of your ship?—The *Agnes*.

18,040. Was she a laden ship when lost?—Yes.

18,041. What part of Hartlepool were you lost in?—Close by Seaton Sand; close by the piers.

18,042. If there had been a harbour of refuge at Hartlepool would your ship have been saved?—Yes; she would have been clear of the land when she broached to.

18,043. I think you said, in reply to Admiral Hope, that your ship was lost because you carried away your wheel rope, and she was not under command?—Yes.

18,044. Then under command you would have fetched into the present harbour?—Yes.

18,045. Then if your ship was not under command, do you think you would have fetched into a harbour of refuge?—She was not under command after she broached to and broke the wheel chain.

18,046. Where did she broach to?—Abreast the Stone Buoy.

18,047. When she came into the ground-swell?—Yes.

18,048. Consequently, at the entrance of a harbour of refuge properly situated, there would not have been that ground-swell, and the accident would never have happened in all probability?—No.

18,049. (*Capt. Sulivan.*) How had you the wind before you weathered Flamborough Head?—South-south-east.

18,050. Blowing hard?—Not to make a gale of it.

18,051. Before a large fleet of ships with you?—I am of opinion that I was ahead of most of the fleet.

18,052. Would they have been caught with that gale further south than you?—Yes; as they went back to the Humber, and could not round the Head.

18,053. Many vessels in that gale around the Head

were lost between the Head and Whitby? — No doubt.

18,054. For all those vessels would a harbour at Filey have been very valuable?—Yes, if they could have fetched it.

18,055. Those lost between the Head and Whitby only I am speaking of? I am speaking of when the gale went to eastward, those that were too far to leeward to weather Whitby Head on the one hand and the Head on the other. Would Filey have been a valuable harbour for many of them?—It would.

18,056. For the coasting trade, more especially for laden ships, suppose that a larger proportion of laden are lost than light, and that the loss of life is greater in the laden, and assuming, therefore, that a harbour for the protection of lives is more required for the laden than for the light, would a harbour that would take the largest loaded collier at all times, by night or day, at Hartlepool and Filey, be better than one large harbour at Hartlepool?—I would like to have a large harbour at Hartlepool, and more of them.

18,057. But if you have harbours which would take the largest colliers, and give them perfect shelter by night or by day, would not for the collier trade these two ports within 40 miles be better than one?—Decidedly.

Mr. MALTMAN SHAW examined.

Mr. Maltman Shaw.

18,058. (*Chairman.*) You are a resident in Lynn?—Yes.

18,059. You are connected with the port as a shipowner?—Yes.

18,060. Have you been to sea?—No.

18,061. Have you been present during this inquiry?—The latter part of the day.

18,062. Will you favour me with your opinion as to the advantage of a single harbour of refuge on this coast, or rather will it be better to improve the three ports, the Tyne, the Wear, and the Tees?—I have no nautical experience to bring to bear upon it, but I speak merely the sentiments of those with whom I am accustomed to meet, namely, shipowners like myself. I have heard the opinion expressed very strongly in favour of a harbour of refuge at Hartlepool in the Tees Bay, and more especially I may say that I myself, as also many other shipowners, think had there been a harbour of refuge here it would have saved in many instances our ships. My ships have run in here when I believe they could not be anywhere else. It is not that I frequently trade from here, because I trade from Seaham; but I instruct my captains that in all cases when it comes on bad weather, if there is no chance of their reaching the ports of Seaham, Sunderland, or the Tyne, wherever they are bound for, that they are to go to West Hartlepool, and not run any risk. Such are my instructions and those of many others. I do not bring any nautical knowledge to it, but looking to the geographical position I am convinced it is the best place.

18,063. (*Mr. Lindsay.*) Is there any shelter in Hartlepool during easterly gales?—I cannot profess to bring any nautical experience upon it. I tell you the captains have orders to go to Hartlepool if they can get it.

18,064. Why do you tell them to go to it in preference to other places if they found difficulty?—If bound for Seaham I say go there if you can, but if it is difficult, get to Hartlepool, because I believe it is the place of greater safety when they get to the north.

18,065. They can go into West Hartlepool in gales of wind when they cannot get into Seaham?—So they tell me.

18,066. Have you had conversations with your brother shipowners of Lynn as to the desirability of a harbour on this coast, and are they all of opinion that there ought to be a harbour of refuge on this coast?—Entirely.

18,067. You have had no conversation with any who say a harbour of refuge was not necessary on this coast?—Certainly. I cannot imagine such an opinion to be existing.

18,068. And in your conversation with them, do they seem to think one great harbour would suit the trade better than the improving of the existing harbours if they were to make them accessible at all times?—The question never presented itself in that form.

18,069. And the general opinion is with the Lynn shipowners, that along the whole range of this coast Hartlepool is the best place for the construction of this harbour?—It is.

18,070. And that is the opinion of the owners of ships trading to the Tyne also, and to the northward of it?—Yes.

18,071. (*Capt. Sulivan.*) For the coal trade that you are concerned in at these ports, and for the general coasting trade of England, which do you believe will be the best for saving life and property, two harbours, one near Flamborough Head and the other at Hartlepool, that will take the largest colliers and coasters in England at all times of the tide, or one larger one at Hartlepool that would, in addition, take the larger ships that come to our coasts?—To the shipowner or trader unquestionably two harbours must be better than one if they be of equal capacity.

18,072. I say provided they were large enough and deep enough to take the colliers and coasters at all times of the tide. Would two, large enough and deep enough for them, be better than one large one at Hartlepool which would take the larger over-sea ships as well?—Speaking of the colliers you have described, two ports would be better than one.

18,073. Have you had experience as a shipowner about the class of colliers and the state in which they go to sea?—I think I have had a fair amount of experience.

18,074. I do not think it is a thing to make light of when we think it is a thing on which seamen's lives would depend. Is it the case that coasting colliers are run till they are foundered and lost, or is it the case they survey them and pronounce them unseaworthy when they are broken up?—To the best of my memory I have only known three or four vessels broken up.

18,075. Do you find these old colliers broken up in the ports?—I do not. I know an instance of a collier being 50 or 60 years old, one of my own vessels ran down about a year and a half ago, a vessel 50 or 60 years old, which was classed A 1 for five years.

18,076. These old vessels must wear out, and do you know whether they are worn out, surveyed, condemned and sold, or, whether they are run till worn out, and lost, by foundering?—I think they are repaired two or three times in their existence. That is the practice in the coal trade.

18,077. But at last what becomes of them?—I mentioned an instance of one that a vessel of mine ran down off Whitby last year that was 50 years old, and she was classed A 1 for five years.

18,078. What became of her?—My ship ran over her.

18,079. Was she not broken up?—No, she went down.

11,080. Can you tell me of any colliers broken up and sold for old timber?—I have seen a great many ships in the breaking-up yards, but I cannot say whether they were colliers or other ships. I believe, as a rule, colliers are as well found as any other class of coasting vessels.

18,081. Is it the case that vessels when they are sold, that they will not carry a better class of cargo, they are put in the collier trade, because it is of less consequence their leaking?—I think so, because coal is not a perishable article.

18,082. (*Mr. Coode.*) You are a shipowner of Lynn? Are the shipowners of Lynn of one mind as to the desirability of a harbour of refuge on this coast?—I do not know that they are of one mind,

HARTLEPOOL.

Mr M Shaw.

19 Oct. 1858.

Mr. Coode.

but I speak the general opinion, and I have consulted many.

18,083. How many will that be ?—Some half dozen or three persons.

18,084. (*Chairman.*) You mentioned a vessel within your experience, 50 or 60 years old, as having been repaired several times; is it the general practice among colliers to repair them and give them thorough repairs, so as to make them in fact new vessels ?—It is the case.

Mr. Robert Huntley examined.

Mr. Robert Huntley.

18,085. (*Chairman.*) You are a resident in Greenwich and a shipowner ?—Yes.

18,086. Have you ever been at sea ?—Yes.

18,087. What number of years ?—I have merely gone a few voyages.

18,088. You have never followed the sea as a profession ?—No; but I have been from the Orkneys to London.

18,089. You have been present during the inquiry ?—Yes.

18,090. Will you give the Commissioners your opinion whether it would be better to have a single harbour of refuge on this coast, or would it be better to improve the ports of the Tyne, the Wear, and the Tees; or if you consider one harbour preferable, where you would place that harbour ?—I have no objection to seeing all the harbours improved, but as to a harbour of refuge, I decidedly give my preference to one.

18,091. Where would you put it ?—In Tees Bay.

18,092. And will you state your reasons ?—Because it is the deepest on the coast, and I think you will find you can make the Tees Bay when you cannot make the other ports so easily. I have twice come down from the Dogger in a fog loaded, and brought in deep water; the fog has cleared away and I have found myself all right.

18,093. (*Sir F. Smith.*) Do you insure your vessels habitually ?—Some of them.

18,094. Do they trade chiefly round this coast ?—All of them.

18,095. Do you imagine that if a harbour of refuge were made in the Tees Bay, Hartlepool, it would tend to diminish the amount of premium paid to the underwriters ?—I think it would very much.

18,096. (*Mr. Lindsay.*) How many vessels have you trading on this coast ?—Five.

18,097. How long have you been owner of vessels trading on this coast ?—About 14 or 15 years.

18,098. And is it your opinion, and the opinion of all your captains, that if only one harbour was to be made that Hartlepool is the best site ?—The whole of them. I have taken the evidence of all my masters, and also questioned about 50 of the men and a number of individuals in our locality, and the whole of them seem to give their opinion in favour of Hartlepool Bay.

18,099. Before you came down here to give your evidence to-day you felt it to be your duty to ascertain not only the masters' opinions, but the opinion of the seamen in your employment as to which was the best site for a harbour of refuge ?—I did.

18,100. And they were all of opinion that only one harbour ought to be made, and that that should be at Hartlepool ?—Yes, and two gentlemen volunteered their services and came down with me. One you have heard and one you have not.

18,101. They were so strongly impressed with the necessity of a harbour of refuge on this coast ?—Yes; I have also, during the last two months, been much in the north of England, and knowing the number of clever persevering men along the coast, I have asked where would be the best place for a harbour of refuge, and to get it out, I have generally taken Filey Bay. But the arguments the whole of the men brought forward have all been in favour of Tees Bay; and I have no doubt I could bring 50 men forward that I have taken evidence from during that time who would say the same thing.

18,102. Will you state one or two of the leading reasons that they have given against Filey Bay, or did they state any?—They stated the principal reason was this being the deepest bay.

18,103. Did you discuss with them the importance of the existing harbours, so as to make them accessible at all times of tide ?—I did not, because I was not aware of any other particular form of harbours until I came down here.

18,104. So that you are not able to offer an opinion upon the point, whether the construction of one large harbour at Hartlepool, or the improvement of the existing harbours would do more to save life and property ?—I think one would.

18,105. (*Capt. Sulivan.*) Did you discuss the question with these men, whether to have one at Hartlepool and one at Filey, that would take the colliery trade at all times of the tide, would be better for their trade than one at Hartlepool ?—I did not discuss it about two, but only one.

18,106. Which would you prefer for your trade, the colliery trade of England; and which would bear most on the premium for insurances, two harbours that would take the deepest colliers at all times of tide, one at Hartlepool and one at Filey, or one larger, that would take large ships at Hartlepool alone ?—I think one would answer all purposes, if you make it large enough.

18,107. Do you think it would be better for the colliers passing the east coast of England that two harbours deep enough to take them at all times of tide should be made, one at Hartlepool and one at Filey ?—No doubt it would; it would be serviceable; but Hartlepool would save ten to one more than Filey. The evidence I have principally got from men in the trade has been that they frequently fall in with the waves rather to the north of Filey.

18,108. That would be an argument for Hartlepool as against Filey, if there were only one; but would that be an argument against one at each place that would take in all the largest and deepest vessels that pass the coast at all times of tide, and at all times of night and day ?—There is no question but it would be of great service.

18,109. I ask if it would not be of great service to the collier trade; London trade more especially; though that one might take in still larger ships more easily?—For my own part, I should be quite satisfied with one good one.

18,110. Would two be better than one ?—It would be decidedly best; there is no question.

18,111. Would you say, that taking all the ships embayed in this bay, whether loaded or light, and that most of the light were running to northwards, that one at Filey Bay would be more especially useful to vessels caught off Flamborough Head in a south and south-east gale, and so prevent their running back, or risk running back to being driven on the coast ?—According to the plan I have seen, Filey.

18,112. I do not ask about any plan. I am supposing the engineers could make a plan in either case all right. I say a harbour that would be useful for all the largest colliers at all times of tide and in every gale of wind ?—According to the evidence I have heard, the nautical men and men of a good deal of experience up and down the coast, entirely object to a harbour at Filey, on the ground that there would be so much broken water; they have not got water enough in an east-south-east gale; in six or seven fathoms it is nothing but broken water.

18,113. Are you aware this is the first evidence we have had to that effect out of 100, and we have heard many give objections to Hartlepool that it is shallow so far out, and that the sea breaks, while we have not heard the same objection, until you have put it, to Filey. Would that do away with your objection as to the sea, and if you also consider that at Filey a

harbour can be made at least as deep and probably deeper than one at Hartlepool Bay. I say, supposing that all that was required could be done by engineers, then I ask for vessels off Flamborough Head, and caught there, the vessels we hear of being driven back off the coast, would a safe harbour at Filey Bay be very valuable ?—It would.

(*Chairman.*) I see in the list with which you have supplied me there are to be a considerable number of gentlemen who come from a distance, and I am unwilling, under the circumstances, that their names should not be recorded on our minutes. I shall therefore call the names over, and they will be kind enough to stand up and answer. Mr. Porter, you belong to Gravesend ; you are described as having been 55 years at sea, nine years as master, and as having been engaged all your life in the coasting and fishing trades, and as having saved 79 lives in smacks and schooners.—Mr. Weatherly, you reside at West Hartlepool ; you are described as a captain ; you have had great experience in the Baltic and coasting trades, both in command of sailing and steam ships ; you served under Sir Charles Napier in the Portuguese navy.—Mr. Sidey, you reside at Berwick ; you are described as 50 years of age, and 45 years at sea, 25 years master ; and principally engaged in the London and Berwick trade.—Mr. Grange, you are described as residing at Scarborough, 55 years at sea, 45 years master ; had great experience in the coasting trade.—Mr. Rich, described as residing at Rochester ; a captain, 45 years at sea, 22 years master ; of great experience in the Hamburgh, Baltic, and coasting trades.—Mr. Layton, you are described as a North Sea pilot, residing at Hartlepool, 48 years at sea ; of great experience in the North Sea, Baltic, and coasting trade.

(*Mr. Jackson.*) He has gone to pilot a ship ; he could not stay longer.

(*Chairman.*) Mr. Peaty, you are described as residing at Shields ; as having been a captain, 48 years at sea, 38 years master, and North Sea pilot.—Mr. Spence, captain, Greenwich, 28 years at sea, eight years master; making 16 or 18 voyages every year between London and West Hartlepool.—Mr. Spenster, West Hartlepool, captain, 20 years at sea, 12 years master; was master of the *Dapper*, bound from Hartlepool loaded, was driven back and wrecked in Hartlepool Bay, and all hands drowned except two.—Mr. Pearson, West Hartlepool, captain, 50 years at sea, 30 years master; of great experience on the coast.—Mr. Wilson, residing at Hartlepool, captain, 30 years at sea, 21 years master ; had much experience in the Hamburgh, Baltic, and coasting trade. — Mr. Brown, you are described as residing at Leith, and as being captain, 55 years at sea, 30 years master, Marine Manager of the London and Leith Shipping Company.—Mr. Manners, described as belonging to Leith, captain, 54 years at sea, 30 years master ; principally in the Leith and London trade. — Mr. Jackson, you are described as residing at Leith, captain, 58 years at sea, 38 years master; principally in the Leith and London trade.—Mr. Prestgirdle, of Greenwich, master and owner of smacks, 63 years at sea ; engaged all your life on the east coast of England and Scotland.—Mr. Minn, described as residing at Lynn, captain; was in the gale of the 4th January 1854.—Mr. Porrell, resident at Lynn, captain, 24 years master ; trades principally between Seaham and Lynn.—Mr. Winterton, Rochester, 20 years captain, 34 years at sea. I want to ask you, gentlemen, whose names have been called, whether any of you in substance, or in any material point, disagree from the seafaring evidence which you have heard given by the others. If any of you do, speak out ; if you are all agreed, then I expect nobody will answer.

No answer.

Captain CHARLES BOHR examined.

18,114. (*Chairman.*) Do you understand English ?—Yes, I understand it well enough ; except, perhaps, some words which I cannot understand well enough.

18,115. You commanded the ship *Love*, of Hamburgh ?—Yes.

18,116. How many years have you been at sea ?—Twenty-three.

18,117. For how many years have you commanded vessels ?—Eleven.

18,118. In what trade have the vessels you commanded been chiefly employed ?—In the coal trade between here and Hamburgh, sometimes bound south for stone.

18,119. Have you been present here to-day ?—Yes.

18,120. And have you attended to what has been going on ?—Yes, I understood it perfectly.

18,121. Give us your opinion as to where this harbour of refuge should be, as you have been accustomed to trade to this port ?—I should say the harbour should be somewhere in the Tees Bay.

18,122. Will you tell me why ?—Every ship that takes the sea loaded, with the wind blowing from east-south-east, and south-east, the worst gale, it will keep the ship right into the Tees Bay, the flood tide is setting into the bay, so that it would be a smart sailing ship to keep out of that bay and east the shore.

18,123. Has this question of a harbour of refuge on this coast been the subject of conversation among your captains at Hamburgh ?—It has, a good many times.

18,124. And have they heard anything of this Commission being appointed, or of the possibility of a harbour of refuge being made ?—Yes, sometimes ; for some years the papers have said something about it.

18,125. You think they understand there is something going to be done ?—Yes.

18,126. Are you able to speak at all as to the others; their opinion upon the subject as well as your own ?—Yes, all I have spoken to would like to get it somewhere here ; that is, it must be somewhere in the Tees Bay.

18,127. (*Mr. Lindsay.*) Have you been long trading to this coast ?—Many years ; the first time I was into Hartlepool was 15 years ago, and I have been constantly trading to Newcastle, Sunderland, and very often to the river Tees, up to Middlesborough.

18,128. Then you have, in fact, for the last 15 years been trading from Hamburgh to the coal ports here ?—Sometimes. I have been two or three times up the Baltic, and sometimes to Archangel, and sometimes in the Humber. I have been from Newcastle to Spain.

18,129. Do you foreign captains consider this is a very dangerous coast ?—Yes, one of the most dangerous places there is on the east coast of England.

18,130. And are you very much afraid when caught upon it with an easterly gale ?—Yes, as every one knowing its position must be afraid.

(*Chairman.*) You were going to make some statement, Mr. Jackson ?

(*Mr. Jackson.*) It was with reference to what Mr. Lindsay had mentioned respecting the return that was put into my hand ; he said he would be glad to know whether there was any person who could state any inaccuracy in it. It is very far from me to find any fault at all about it ; I said I was not able to do that. I merely stated that I had got no return from official documents, and these are all that I have found. It was not improbable that some that have been given in that printed paper may have been those that foundered at sea, and of which there is no record ; or they may have been known to have foundered. But a gentleman has called upon me and stated, with reference to a ship he was put down in the list as having sailed from Hartlepool, I allude to the *Dapper*, laden, and numbered among the 27 in the wrecks north of Whitby, as having left Hartlepool

HARTLEPOOL.

Captain Charles Bohr.

19 Oct. 1858.

on the 1st, and been wrecked. He has called, and says his ship was not wrecked at all, while he was bound to Dieppe, and reached Dieppe without loss or damage. He is put down in the list as being wrecked north of Whitby. I am also informed that the preceding witness, who was the master of the *Agnes*, of Lynn, was bound from Lynn for Hartlepool, light, it is put down here that he was wrecked bound from Hartlepool to London, laden.

18,131. (*Mr. Lindsay.*) The second return does not bear so much upon the point I had in view in the first return. The return of wrecks you have deposited gives 13 ships as being lost in that gale, and this return gives 27 wrecks. Have you been able to ascertain upon which return the Commissioners may place the greatest confidence as to the number; and are you prepared to show that any one of these 27 ships was not lost during the gale of the 4th of January between Flamborough Head and Whitby?—I have not been able to make any very accurate inquiry on the subject, but upon looking it over, as I mentioned yesterday, it is possible the one has taken a ship as having been wrecked between Whitby and Filey; that one return has called a ship that was wrecked near Whitby, north of Whitby, and mine vice versâ; and this return might have considered it south of Whitby. Now, I find in the printed return several ships enumerated in the 27, one called as being wrecked near Whitby, on the south of Whitby, while in the return that has been handed in by me they may have been included as having been wrecked really north of Whitby.

18,132. As the names of the ships are stated which were lost near Whitby, and are included in that return as lost between Flamborough Head and Whitby, does your list include some of these ships as lost near Whitby, to the north of Whitby, because that may account for it?—I understand it does, and that may account for the difference.

18,133. Will you give the names of ships lost northward of Whitby that are put in as lost between Whitby and Flamborough Head?—I understand the *William Pitt* is one, and perhaps the *Matador*.

18,134. You have these as being lost north of Whitby in your list?—The point I mentioned was, that a person whose vessel is put down here in the printed list as having been wrecked north of Whitby, was not wrecked at all. The shipowner is here, and he says that his vessel, the *Severn*, which was put down as having been lost, was not lost at all.

18,135. That does not bear on the point, as his ship is put down as having been lost to the north, in the Tees Bay?—All I mean to say is, that as I have not gone very carefully into it, I cannot speak to it.

18,136. It has with me an important bearing, because if these ships which are marked down in that return as lost near Whitby were lost to the north of Whitby, and not between Whitby and Flamborough Head, in the gale of January 1857, they might have been saved if there had been a harbour of refuge at Hartlepool; but if they were lost to the south of Whitby and in a position not able to weather the point, then a harbour of refuge at Hartlepool would not have saved these ships?—If I had my list I could compare it; but I have not had any time for that purpose.

18,137. I will leave that list, and perhaps, if you desire to do it, you will send a communication to the secretary?—I will do that.

18,138. (*Capt. Washington.*) You said something about the *Agnes*?—Yes.

18,139. (*Mr. Lindsay.*) But that ship is not in the list I have spoken of at all?—The whole is incorporated, if the printed paper gives 28 as having been wrecked north of Whitby, and I have given 54.

18,140. It must be incorporated in the No. 2 paper as well. There are two ships; one is stated to be from Hartlepool, laden, and the other from Lynn to Hartlepool, light?—The next ship in the list is one belonging to Mr. Ranson, a shipowner, in the room: he says, "My ship was not wrecked, and it was bound from Hartlepool for Dieppe."

18,141. We have never been questioning or inquiring into No. 2?—I took the liberty to object to No. 2, because it gives only 28 and I made 54.

18,142. (*Capt. Washington.*) And what about the *Agnes*?—It is put down as "Unknown; Hartlepool, "from London, laden; wrecked near Hartlepool; crew "saved; left Hartlepool on the 2nd." Now that vessel was bound from London to Hartlepool, light, and was wrecked in this bay.

18,143. (*Capt. Sulivan.*) Had you made this mistake in your list by taking credit for one vessel more lost than was lost in Hartlepool Bay, it might have been taken, might it not, as having been rather unfair for comparison in your favour?—I did not complain of it.

18,144. But I ask you this question: It might have been said that you had put in one ship more than was lost in your district, and it might have been tried to be shown that possibly it would rather make the comparison tell too favourably for your district, might it not?—Yes; but there could be no return in favour of it, if it is an incorrect return. I do not want any return that is in that way.

18,145. I ask you whether you had put one more ship than was lost in your district; there might have been a report that you had taken credit for a ship to make your comparison better?—No doubt.

18,146. Then if they have given you credit for one more ship than was lost in your district, does it not, if anything, rather tell against their own argument, and in favour of Hartlepool district; and if so, what have you to pick out as an instance of unfairness or inaccuracy in that list?—I do not wish any return should be put in of wrecks in Hartlepool district that did not exist. I would be very sorry to have it said that because their numbers are increasing in Hartlepool district, that therefore I take credit for it.

18,147. I am sure you would, but this has been rather against those who drew up the table. Surely that is a thing that Hartlepool ought not to complain of as showing an inaccuracy?—I did not complain, but this is really and truly a statement made to myself since I came into the room by the shipowner, therefore I merely communicate it to you as I have heard it.

18,148. If your list has no more inaccuracies than one loaded for one light ship, that is a very wonderful inaccuracy to bring forward?—It is just within a single second that this extraordinary instance has been mentioned to me. Mr. Lindsay asked if there was any person present that was in No. 1 that ought not to be, and here is the captain behind me of the *William Pitt*.

18,149. I should like you, Mr. Jackson, to answer my question, and the question I ask you is whether you thought that a mistake of one vessel, even if it had happened, was a mistake that you ought to bring forward? Was it not too trifling to alter the evidence that might be given in any place by yourself or anybody else?—I think so.

18,150. Was it not too trifling a thing to bring forward to prove the inaccuracy of the list?—I qualify it by saying it was mentioned to my amazement. I would not myself have questioned the accuracy as to whether it was light or loaded. I might have made that mistake, but I understand the actual point Mr. Lindsay wants is, was there any ship put into the list No. 1, as having been wrecked between Flamborough Head and Whitby, that was in point of fact wrecked north of Whitby. I am told—I do not know the man—that the *William Pitt* was wrecked north of Whitby, and he is put in as wrecked between Whitby and Filey. I do not know him; he is here, and therefore you can ask him.

Mr. Isaac Stockton examined.

HARTLEPOOL.

Mr. Isaac Stockton.

19 Oct. 1858.

18,151. (*Mr. Lindsay.*) Were you the captain of the *William Pitt* on the 4th January 1857 ?—No.

18,152. Did the ship *William Pitt* belong to you ?—Half of her belonged to me.

18,153. Was that ship lost during that gale ?—She was on shore during the gale near Whitby. I was in Hartlepool.

18,154. What part of Whitby ?—About 300 yards to the north of Whitby Harbour.

18,155. Would that ship have been saved if there had been a harbour of refuge at Hartlepool ?—I believe not.

(*Mr. Lindsay.*) Mr. Jackson, I thought it my duty to call your attention to it, and seeing your return contains 13 losses between certain points, and another return 27, it will be satisfactory to us, as it is a question of facts which we have to deal with, and facts alone, if you could inquire into this matter and satisfy your own mind and mine which return comes nearer the truth.

(*Mr. Jackson.*) I shall be very glad to do that. May I ask if we can elucidate this matter by comparing notes ? I shall be sincerely glad if I can communicate with the author of this paper. He may have had access to returns or official documents which I have not had an opportunity of doing, and I pledge myself to communicate every source of information that we have received. If the gentlemen who is the author of this document will give his name, I am sure I shall be most happy to meet him at at any time, and to go any distance.

Mr. Isaac Stockton recalled.

18,156. (*Capt. Sulivan.*) I wish to ask whether another part of the return is correct, that she was caught in the gale of February ?—I believe not and the reason is, I have seen the log. I believe she was near Robin Hood Bay at the time, and I believe she was down near the length of Huntcliff, and had to put her head round south in consequence of her ballast falling over on the lee side. She wore round for Robin Hood Bay, and went aground within half a mile of Whitby Harbour. They squared the main yards and ran her ashore. Had there been a harbour at Hartlepool under the circumstances, and the situation she was placed in, she could not have got down to Hartlepool.

Mr. Thomas Smith examined.

Mr. T. Smith.

18,157. (*Chairman.*) You are a seafaring man ?—Yes.

18,158. How long have you followed the sea ?—Twenty-nine years.

18,159. Have you been master of a vessel ?—Yes ; I am master at present.

18,160. For how many years ?—About three.

18,161. And you wish to offer some observations on the subject of our inquiry ?—Yes.

18,162. Will you be good enough to proceed ?—The object which I have in speaking is, that I should like to see two great breakwaters made, and I should like to see them put in the right place. And my object is that there should be a great breakwater made in Hartlepool Bay as a rendezvous for vessels of all classes, as a rendezvous for coasting vessels and merchantmen, and men-of-war in case of any emergency, that we shall have batteries all afloat ready to take up any position we may think proper.

18,163. Will you stop. I see you are probably not acquainted with the precise object of our inquiry ; we are not here to inquire which are the most eligible situations for ships of war or batteries, but what are the best places for harbours for the shelter of merchant ships, and, therefore, instead of asking you to proceed with your statement, I will put a question to you. You prefer Hartlepool Bay for this harbour of refuge? —Yes.

18,164. In preference to the improvement of the three ports, the Tyne, Tees, and Wear ?—Yes.

18,165. And you also prefer Hartlepool to Filey Bay ?—I don't prefer Filey at all.

18,166. Do you prefer Hartlepool Bay ?—Yes ; Bridlington Bay and Hartlepool.

18,167. Would you put a breakwater in Bridlington Bay and thus spend the money ?—Yes. I will give you three reasons why I object to Filey Bay. In the first place, Filey Bay is a rocky iron-bound land, and if I was going into Filey Bay in a gale of wind and missed it, undoubtedly I should lose my ship and undoubtedly myself. Provided, again, the wind was at the eastward, I would have no passage out of Filey Bay but must lie there, whereas had I been in Bridlington Bay I would have gone away at my pleasure. And in the next place, should I be going along the coast with a heavy gale of wind from the north-east and in snowy, stormy weather, when it is not prudent to put a ship into the deeps, I should prefer going into Bridlington Bay till the weather moderated. Was there a breakwater in Bridlington Bay on the Smithic, it is not for me to be an engineer, but say something of a south-south-west direction, there would be shelter both for laden ships and for light.

18,168. Then suppose we are only to have one of these harbours, would you prefer Bridlington or Hartlepool Bay ?—Decidedly Hartlepool first, and I gave my reasons.

18,169. I understand your reasons, you gave very good reasons. If it is decided to place a harbour at the other side of Flamborough Head, I understand you decidedly to prefer Bridlington ?—Decidedly. Allow me another remark on my reasens for Hartlepool. Should there be a gale of wind from the east, ships from the Farn Islands could fetch Hartlepool Bay, ships from Robin Hood Bay could fetch Hartlepool Bay or go to the southward of Bridlington, which they thought proper.

Your reasons are very good, and we are much obliged to you for giving us the advantage of them.

(*Chairman.*) Are there any other parties present who are interested in this inquiry, and who wish to tender their evidence ?

No answer.

Sittings at Hartlepool closed.

REDCAR.

Wednesday, 20th October 1858.

PRESENT :

Admiral HOPE (Chairman).

Sir FREDERICK SMITH.
Mr. LINDSAY.
Captain WASHINGTON.
Captain SULIVAN.
Captain VETCH.
Mr. COODE.
Mr. EVANS, Secretary.

REDCAR.
20 Oct. 1858.

(*Chairman.*) I understand, Mr. Dodds, that you take charge of the proceedings as representing Stockton ?

(*Mr. Dodds.*) I have the honour to appear, with my friends, Messrs. Aldermen Trotter and Craggs, who have been deputed by the Corporation of Stockton to represent them on this occasion. But we don't intend, on the part of the Corporation of Stockton, to tender any evidence to you, because the evidence which will be produced on the part of the Tees Conservancy Commissioners is identical with that which the Corporation would have produced had they produced any at all. It appears, therefore, unnecessary. I have also the honour to appear as chief clerk to the Tees Conservancy Commissioners, and am accompanied by Mr. Trotter, who is the chairman of that body, and by Messrs. Craggs, Bolckow, Fallowes, and other members of it ; and on their part we propose to tender to you the evidence of witnesses, most of whose names are enumerated in the list which I have had the honour to hand in to you. Mr. Trotter will give some brief particulars as to the Tees Conservancy Commissioners in the first instance, after which the witnesses will be produced in whatever order may be wished. I may add, that public notice was given on Saturday at Stockton of your intention to hold the inquiry here on Tuesday and Wednesday, and that immediately on the decision being come to as to the day, further notices were prepared, of which copies have been read by Mr. Oxley, and were very extensively distributed in Stockton. There were also communications to the Mayor of Middlesborough, who is present, and will inform you that they have been made public there also.

(*Chairman.*) Mr. Oxley, I think I understood you to say the gentlemen who managed the case for Redcar were to come at half-past 12 to-day ?

(*Mr. Oxley.*) Yes ; Mr. Coulson, Lloyd's agent. And there is a Captain Mackenzie who will be brought in the list of witnesses, and he will give some important evidence ; and he is obliged to leave this evening. He is present in the room, but must go back to Shields.

Mr. THOMAS MACKENZIE examined.

Mr. T. Mackenzie.

18,170. (*Chairman.*) You are a resident at North Shields ?—Yes.

18,171. How long have you followed the sea ?—Thirty-nine years.

18,172. Of that period how long have you been in command of vessels ?—Twenty.

18,173. In what trades have the vessels been employed chiefly that you have commanded ? — The coasting, home, and foreign.

18,174. By coasting do you mean the coal trade ?—Yes, and the oversea trade to the Baltic I have been in.

18,175. And for what period did you command a vessel in the coal trade ?—The period was one connected with the other. I was not 10 years in one trade. It was equally divided, perhaps a voyage or two in each trade, perhaps five or six, as circumstances required.

18,176. Have you made the passage north-about to America ?—Oh yes, several times, both north and south.

18,177. Then how many times have you made the passage to and from the Baltic ?—I can hardly answer you how many voyages during the 20 years.

18,178. And you have come home pretty late in the fall of the year ?—Yes, as late as December.

18,179. Tell me how far to the northward you ever made the land in coming across after taking your departure from the Baltic ?—I have made it as far north as 60 degrees, the Shetland Islands.

18,180. And has that frequently happened ?—Not frequently, on two different occasions.

18,181. How often do you think you have made the land to the north of Buchan Ness ?—Never, except once I think, in coming home in the fall of the year.

18,182. When I say to the north of Buchan Ness I, of course, include the Shetland Islands ?—Yes, I have only on one occasion.

18,183. And generally speaking, where did you make your land coming across in the fall of the year ?—Flamborough Head ; we are desirous of getting sight of it.

18,184. You make Flamborough Head if you can with a fair wind ?—Yes.

18,185. But do not the winds prevail from the southward and westward in the fall of the year ?—Yes.

18,186. Then don't they drive you very much out of your right course ?—Yes.

18,187. Then where would you say you have generally made the land ?—Generally Tynemouth Castle, Huntcliffe, or anywhere we could fetch. We do the best we can.

18,188. Yes, but what have you actually done ?—Tynemouth Castle generally, sometimes Huntcliffe. We have generally managed to get in there.

18,189. And when you are coming across from the Baltic, when you take your departure from the Scaw or the Naze, and probably with the wind hanging to the southward and westward, how do you make your passage ; do you stretch across to the opposite coast and make westing ?—Generally in the fall of the year, with the wind hanging at south-south-west, and it blows hard, we get a good sailing reef out of that, but in all probability the wind will fall into the north-east for a few hours. At the end of that time we wear the ship and come the other way.

18,190. If you find the wind hanging to the south-west and westward you keep the coast till the wind comes round to the north-west ?—Yes.

18,191. Have you been present at any of the sittings of this Commission anywhere else ?—I have not.

18,192. One object of our inquiry is to decide where a harbour of refuge can be best placed for the passing trade between the Firth of Forth and the Pentland Firth, and the two places which have been more particularly brought under our notice are Wick, the position of which you are probably acquainted with, and Peterhead ; now give me your opinion which would be the best place ?—The Tees Bay, in my opinion.

18,193. I am talking now of between the Firth of Forth and the Pentland Firth ?—I should say Peterhead.

18,194. Well, now bearing in mind that the object of these harbours of refuge is not so much as a con-

venience for trade as for saving of life, give me your reasons for preferring Peterhead to Wick ?—Because I think there is more room at Peterhead.

18,195. You think it to be a more eligible site for a harbour of refuge ?—Yes.

18,196. And that Wick will not be sufficiently large ?—I think not.

18,197. Now what is the longest passage you have made across from the Baltic in the fall of the year ?—20 days. I think I never was longer to Hull or London.

18,198. And coming across in the fall of the year is the weather very coarse ?—Oh yes ; we must expect it, and we find it to be so.

18,199. With a great deal of sleet, snow, and wind ?—Not with a south-west wind, we don't have much snow or sleet, but generally rain and blowing hard.

18,200. It is pretty hard work for the people ?—Yes, it is all that.

18,201. And when they get across, after a three weeks' voyage, they are pretty ready I suppose for a little rest if they can get it anywhere ?—Oh yes.

18,202. Now do you know the coal trade, and the kind of thing which sailors have to go through in bad weather ?—Yes.

18,203. And which would you say as a rule would be the hardest work, two or three days' passage up in the winter in a collier, or coming across the Baltic late in the year ?—I would take the three or four days' passage to London, because it is short and sweet, whereas the Baltic is neither one thing nor another.

18,204. Therefore coming across from the Baltic is the harder of the two ?—Yes.

18,205. And perhaps a harbour would be more acceptable as respects the refreshment of the crews than to colliers ?—Decidedly.

18,206. Have you ever been to Archangel ?—Once only.

18,207. Do you know the strength of the tide in the Pentland Firth ?—Yes, I am quite aware of it.

18,208. And being made aware of it, would you, with a fair wind right through the firth, run into the firth against the tide running out ?—I would not if I could keep the sea.

18,209. Then what would you do ?—Keep the sea, if possible, till the tide ceased.

18,210. Well now, putting the question of the tide on one side altogether, is there any peculiar difficulty in running through the Pentland Firth ? Is the land free from danger ?—Very free from danger if it is clear weather.

18,211. And if it is not clear weather is there any peculiar danger attaching to that firth more than to any other passage of the same width ?—Yes, there is, simply for this reason. The lead is of no use in thick weather in the Pentland Firth. Of course on other coasts we can generally take hold of the lead and ascertain our whereabouts.

18,212. Therefore you have considerable hesitation in running down on the Pentland Firth in very thick weather, unless you were sure of your position ?—Decidedly so.

18,213. You think there would be no donger about the Pentland Firth as respects the tide if you could wait for the lee tide ?—Yes, in clear weather.

18,214. Then as to heaving to, suppose it was blowing very hard from the south-south-east, and you were running down on the Pentland Firth, would you have any difficulty about heaving your vessel to if she were heavily laden ?—I would have to ascertain my position, and if I thought I could see anything I would run through ; if not I would haul the ship out to sea rather than run into a place where I could see nothing.

18,215. Suppose you hauled out to sea and it was blowing hard, and that she was under her storm sails ; and suppose it was a brig, and that you had to heave her to under the maintrysail, would you then have any difficulty about bringing your vessel to the wind, and heaving her to till the tide slackened ?—Not any, if the position of the vessel would allow it.

18,216. Well, now tell me about this tide that runs out of the Pentland Firth; it makes a very unfair and tumbling sea, does it not ?—A desperate sea.

18,217. And how far from the entrance of the firth does that desperate sea extend, how far out ? I suppose if we go to four miles each way we go to a great extent?—I should rather say three.

18,218. Would you say you could heave your ship to with as much ease 12 miles from the entrance of the Forth as you could do anywhere else in the North Sea?—I would not hesitate about it provided the ship was clear of the land when hove to.

18,219. But I am talking of the danger to the vessel arising from the tide sea ; if a vessel was hove-to 12 miles from the entrance of the Forth, would you be afraid of a tide sea ?—I would not.

18,220. If you were running down from the Pentland Firth, and knowing the tides, would you shorten sail a little, so that you would arrive at the proper time of the tide?—Most decidedly I would.

18,221. Well, now we come to the north-east coast of England. You are aware that the object of our inquiry is to provide some shelter or refuge for the passing trade on this coast; which would you prefer, to have one harbour of refuge on a particular part of the coast or the improvement of the three ports, the Tyne, Tees, and Wear, if it was possible to improve them so that vessels could go in drawing 16 feet at low water ?—I should say, in the first instance, as regards the improvement, that we ought to have a harbour at Redcar.

18,222. Therefore, you prefer one single harbour at Redcar to the improvement of the three ports?—No, I do not, if the improvement of the three ports is to be taken into consideration.

18,223. Then you do not want a harbour at Redcar; is that it?—Oh yes; we must have one at Redcar.

18,224. We should have one at Redcar. Suppose we had a million of money to spend, should we spend it in making a harbour at Redcar, or should we spend it in the improvement of the Tyne, Tees, and Wear, so that vessels could run into them at low water, which would be the best ?—Most certainly that would be very good, yet I think we ought to have a harbour at Redcar.

18,225. But just think the matter over, and tell me which of the two you would prefer if you could not have both ?—The Tyne is already improved, and the improvements which are going, on when they are finished, is as much as will ever be done for the Tyne. I don't think much more can be done for it ; when they are finished we will have all we desire in that point of view; and as for the Wear it is of no consequence whatever ; it will never be a harbour of refuge in my opinion.

18,226. And the Tees ?—Stockton Tees! Oh dear, that will never be a place of refuge in the world as long as I live—it may be hereafter.

18,227. Well, now you have given very good and solid reasons why you would prefer Redcar to the improvement of these three places, for the best of all reasons, you say they cannot be improved; that it is impossible ; that is your answer, is it not ?—Yes ; I said so on two occasions.

18,228. Well, now let me make a supposition for you, for engineers do wonderful things now-a-days : say that these three harbours could be improved, and that they could be so improved that we should get vessels drawing 16 feet water into them at any time of the tide, would you then prefer a single harbour here to these three rivers so improved ? — Most decidedly not ; could there be 16 feet water got into them at low water.

18,229. Then you would prefer them to one in that case?—Decidedly so, with 16 feet water at low water.

18,230. Suppose we could not manage quite 16 feet water at all, but could get 16 feet water at the Tyne, and 16 feet water at Hartlepool, and that we could

REDCAR.

Mr. T. Mackenzie.

20 Oct. 1858.

Chairman.

get say 10 feet at the Wear, how would you say then?—One part of it is very good, but still we are wanting when we come into the bight; we come in a gale of wind easterly and north and south, and we meet each other, as it were, and drive right into a bight, into a net, as it were, and the harder it blows the faster we go ashore.

18,231. And, therefore, for that reason the lower down in the bight you can place your harbour the better; is that your opinion?—Yes, it is.

18,232. The more down in the bight, the more useful it will be, you think, in saving life?—Decidedly so.

18,233. (*Sir F. Smith.*) You have been several times to the Baltic?—Yes, I have.

18,234. Can you give the tracks of any of your passages from the Baltic?—Yes, I can give you them if you hand me a chart.

18,235. Perhaps, you will be able to do it hereafter. With regard to Peterhead and Wick, you stated that you preferred Peterhead to Wick, because there is not space enough at Wick?—Yes, I said so; but I am not so well acquainted there as I am with our own coast here. I have only been a few times there, and cannot give a very positive opinion; but I have given my opinion as far as I have seen it.

18,236. But you would not give a very decided opinion on that point?—Decidedly not.

18,237. If Wick could be made large enough for the purpose, would you then prefer Wick to Peterhead or not?—No, I would prefer Peterhead as far as I have seen.

18,238. You mean as a harbour of refuge?—Yes.

18,239. Is there any wind in which a vessel cannot get out of Peterhead?—Decidedly, a wind directly off land.

18,240. Would she be able to get off if directly off either on one tack or the other?—If she could carry canvass she would.

18,241. You are well acquainted with this district, are you not?—I ought to be, I have been 39 years knocking about it.

18,242. And you seem to have a decided preference for Redcar as a harbour of refuge?—I have.

18,243. Do you prefer it to Hartlepool?—I do.

18,244. Will you tell me why?—At Hartlepool they have already a harbour which may be taken at the proper time of tide to save life, whereas at Redcar we have no harbour.

18,245. But we apprehend, and I believe others concur with us, that if a harbour of refuge is made, it should be such as could be taken at all times of the tide?—Yes.

18,246. And are you quite aware that you cannot take the harbour of Hartlepool at all times of the tide?—No, it cannot; it is only at the proper time of the tide that it can be taken.

18,247. Are you aware that on this coast a very great number of lives are lost?—I am well aware of it.

18,248. The object of Government and Parliament is to provide some security for seafaring men; in fact, the best security that can be found for a reasonable sum of money?—Yes.

18,249. Now, you seem to think that the improvement of the three harbours that have been named by the Chairman, if they could be improved sufficiently to give 16 feet water, would be preferable to a harbour at Redcar?—Well, no; I would really not. I would like to see a harbour of refuge at Redcar.

18,250. Suppose a harbour did not exist at Hartlepool,—we will put that out of the question for a moment,—do you think that if no harbour did exist either in the docks or otherwise, then that Redcar could be compared to Hartlepool as a site for a great harbour of refuge?—Yes, I do indeed.

18,251. Will you say why?—In the first place, the Tees Bay is a shoal bay; there is little water in it, and I witnessed plenty of it two years ago when I lost a ship on the rocks. As I went north, ranging along to clear the land, it was a continued broken sea in the Tees Bay, whereas when I wore ship, and came southward to take the rocks on Redcar or Hartlepool bight, there was as much difference in the sea as possible, so that my vessel made three points less leeway as she came to the southward than she did in the open of the bay.

18,252. But if we could get a harbour of refuge with seven fathoms water in front of Hartlepool, would not that answer all your purpose, and take you into water free from shoals?—It will be a ridiculous thing, a harbour in Hartlepool, because the Salt Scars will always be where they are, and vessels will be wrecked as they are now.

18,253. But they would be in a fair way for a harbour of refuge, would they not?—Vessels which are wrecked here cannot obtain Hartlepool.

18,254. Oh! it is supposing you cannot get there?—Yes.

18,255. If you could get to Hartlepool you would not have the same objection?—I have no objection whatever if I could get to Hartlepool.

18,256. Do you think you could form a harbour here to the same extent as you could at Hartlepool?—I think it could.

18,257. Suppose you were told you could not get to the same extent a harbour at the same cost as you can at the front of Hartlepool, would you still prefer Redcar to Hartlepool?—I know nothing of engineering; my object is to get a harbour to run to in an easterly gale.

18,258. Regardless of cost,—Is the situation of Redcar here better than Hartlepool?—I do really think so.

18,259. Do you think there is any place along the coast between Flamborough Head and the Tyne equal to Redcar?—I do not.

18,260. Do you think there is any place like Redcar for a harbour of refuge?—Not in Tees Bay.

18,261. Well, what do you think of Filey?—Filey would make a very good harbour—a beautiful harbour, perhaps the best of the lot, but it is too far to the south.

18,262. Then, if you object to Filey as a harbour of refuge you would object also to Bridlington?—Bridlington is a harbour when the wind is in the right way, but it is too near the Humber.

18,263. What do you think of Sunderland, as a place in front of which a capacious harbour might be formed?—I should say it would make a very good place if there was a harbour of refuge there.

18,264. Suppose the expenditure should be the same, would you prefer Hartlepool or Sunderland; which of these places would you select to lay out the same amount of money, and to get the same amount of accommodation?—As regards Sunderland and Hartlepool, Hartlepool I prefer before Sunderland, because I have the Tyne under my lee when I am down there.

18,265. And you think the Tyne will be a very good harbour of refuge as far as it goes?—It is already one.

18,266. But is it not a bar harbour?—It is.

18,267. Suppose that the bar could be removed into deeper water, and that you could get an entrance of 16 feet at low-water spring tides, do you think that would be sufficient for the ordinary purposes of the coal trade?—I think so.

18,268. Do you think that in thick weather you would venture to run into a harbour at Hartlepool by the lead by the soundings?—If I could keep the sea I would not attempt it; it would have to be a case of emergency.

18,269. Would you be afraid in thick weather to run into Hartlepool by the lead?—I would not be afraid if I could see anything; but the lead I would not run into with unless the shore was before me.

18,270. You would not trust the lead alone?—I would not.

18,271. You think that the soundings and bottom immediately abreast of Hartlepool and 10 miles north

or south of it, are so nearly alike that you could not feel certain of your course?—They won't indicate the road right to Hartlepool in a fog.

18,272. (*Mr. Lindsay.*) I think you said you preferred Redcar to Hartlepool?—I do prefer it.

18,273. As a sailor, can you tell me in what gales a ship can get into Redcar that cannot get into Hartlepool?—Yes, I will state one. I believe on January 4th, 1857, there was about as heavy a gale of wind as ever blew on this coast; the fishermen acknowledge that they never saw the sea higher. I lost a ship on the Salt Scar, that is, the Redcar Rocks.

18,274. How was the wind when you drove on shore?—When the storm first came on we left Flamborough Head, and it was from the south-east. The ship's head was laid to sea to gain an offing; as she came north the storm increased and the wind veered more into the eastward; when she got into the bight of Hartlepool the wind got into the east-north-east. I made Hartlepool light, and had then to contend with the broken sea. It was no use heaving the lead to ascertain where the ship was; consequently she must go ashore. The question was then for me whether I would risk the South Gare to go ashore, or take the Redcar Rocks. I preferred the latter and wore the ship round, set all the canvas and stood to southward. The ship's head lay south-east half south. As soon as I got into deep water, the ship made better way through, and I considered she might so round the Salt Scars, and on to the sand by Marske; But I was deceived, the ship grounded at dead low water in that gale on the Salt Scars.

18,275. Did the wind range from south-east to east-north-east?—From east-south-east on shore, and east by north, and north-east; it never varied more.

18,276. What was to prevent the ship when off Redcar from going into Hartlepool Bay with that gale if you had been a prudent distance from the shore?—A prudent distance I could not hold. I had carried all the sail I could. I had washed the ship quite clear by carrying canvas to keep an offing, and could do no more.

18,277. Was Redcar a lee shore during any portion of the gale?—The shore was not often to be seen.

18,278. Did the wind blow upon the land?—Decidedly.

18,279. Upon the land down here?—Decidedly.

18,280. What is the course into Hartlepool Bay?—From here?

18,281. Yes.—North-west by west.

18,282. Very well; then do you mean to say you would not, if you had been at a prudent distance from the land, have gone right down into Hartlepool Bay?—The ship would not fetch off; if she had been far enough off she would.

18,283. No harbour of refuge can prevent a captain getting too near the shore. If you had been at a prudent distance from the land, do you mean to tell me that gale would not have carried you into Hartlepool Bay?—I could not hold a prudent distance. I had done all I could, and could do no more. I could only hold the position I had.

18,284. The wind during this gale was blowing right into Hartlepool Bay, was it not?—It was east-south-east at first, but the wind veered into east-north-east.

18,285. It is very natural for you to hold your opinion about Redcar, but I am fond of facts; you tell me the gale was blowing from south-east, veering to east and by north?—No, it began with south-east.

18,286. And it finished with east and by north?—Yes.

18,287. Would not that blow right into Hartlepool Bay, or nearly so, from the sea?—But the ship had not got far enough north.

18,288. That is another question; but if you had been at a prudent and proper distance from the land, the power of that gale need not have driven you upon the land at Redcar?—Everything was carried off from the head that even the ship would carry, and I could not hold a prudent distance from the land. Everything was gone, the decks were swept by carrying so much canvas. I could do no more than carry all she would hold.

18,289. Where were you bound to when you were caught with the gale; we'll begin it again?—To Spain.

18,290. Where from?—Newcastle.

18,291. Where were you when the gale caught you?—Off Flamborough Head, bound south and south-west.

18,292. Then the gale caught you at south-east?—South-south-east.

18,293. Then that was a fair wind for you to run along the coast, and seek refuge in some harbour in the bight of this bay?—I did not want refuge at the time; I wanted the sea. With the wind to the south-east, I did not want refuge, I could have cleared the land, and that was all I wanted.

18,294. Were you driven down from off Flamborough Head to Redcar?—If I had held the wind to south-east, and got a proper position off the land, I would have squared away and gone north-about to my port.

18,295. But with the wind at south-south-east, as you say it was, could you not have gone north-about, and was there any necessity for your coming so close to the shore?—As the ship went north, she only carried two close-reefed topsails. The wind easted, and she broke off. Therefore she would just merely drag along the land.

18,296. With the gale south-east and her head to the northward, you would not need to be close in with the land down about Redcar?—That was only the beginning.

18,297. I am aware of that?—It was only the beginning of the gale, it was very soon to the east. It began at south-east.

18,298. Then do you mean to say that you were regularly driven into Redcar, or were you running for any place at the time your ship was lost at Redcar?—I most decidedly say I never ran before the wind, except for wearing the ship. The wind was straining her all to pieces by carrying canvas to keep clear off the land.

18,299. Then you say that you were in fact close hauled to the wind during the whole of the time?—Yes.

18,300. And you were driven, you say, ashore while close hauled, and wrecked upon the rocks at Redcar, and could not help yourself from being on that land?—Most decidedly.

18,301. You give that as your answer during this gale ranging from south-south-east to east and by north?—Yes, south-east and south-south-east.

18,302. Very well, that is your answer. Did I understand you to say, that if the existing harbours could be improved so as to let ships in at all times of the tide with 16 feet of water, you would prefer that to any one harbour?—Yes.

18,303. But supposing there were only to be one harbour, and looking to the whole trade upon the coast and all things considered, the saving of life and property, the convenience to ships, and say it rested between Hartlepool Bay and Filey, which would you prefer now?—If there was only to be one harbour, I would prefer Redcar.

18,304. We may talk about Redcar afterwards; tell me if it rested between Hartlepool and Filey, which would you have?—Filey is too far south, and I would not prefer it at all.

18,305. You would rather have Hartlepool than Filey, if it rested between the two places?—Yes.

18,306. If it rested between the two places, with all the disadvantages you conceive of Hartlepool, for you say it is a shoal; but you say, you would prefer Hartlepool to Filey?—Decidedly.

18,307. Now, then, I think I understood you to say, you would prefer Redcar as a site to Hartlepool?—Decidedly I did.

REDCAR.

Mr. T. Mackenzie.

20 Oct. 1858.

Mr. Lindsay.

18,308. Well, say there could only be a harbour made at Redcar that would hold 100 ships riding at anchor, and say that a harbour could be made at Hartlepool that would hold 300 ships, would you then prefer Redcar to Hartlepool?—With a harbour here to contain 100 ships, I still prefer Redcar.

18,309. You still think that a harbour that would hold 100 sail of vessels at their anchors would be of more service for the coasting trade, and for the vessels going along the coast, than a harbour at Hartlepool that would hold 300 sail?—I do think so.

18,310. (*Capt. Washington.*) In the gale you have been telling us of, Flamborough Head bore south-west?—Yes.

18,311. About what distance?—Eight miles.

18,312. How did Filey bear at that time?—It could not be seen.

18,313. Could you have fetched Filey?—At that time I could have fetched Filey, but I would not go at that time to a harbour of refuge. I wanted the sea.

18,314. How long did you try to hold your own?—We held our own from Saturday night at eight o'clock until Sunday morning at four.

18,315. About what time did the gale strike you?—We had it not very heavy till Sunday morning at four o'clock. That would be the 4th. It then increased, and blew so hard that the ship could scarcely carry any canvass at all. The ship's decks were swept with every sea, and as we went north the wind kept drawing round to the east. It was no use put-the ship's head to the southward.

18,316. Whereabouts were you on Sunday morning when the gale came on heavy?—I estimated myself to be somewhere abreast of Scarborough. See anything you could not for snow, and sleet, and sea foam.

18,317. At that time would the wind have allowed you to fetch a refuge in Filey Bay, had there been one?—Not at the time the gale came on. I was beyond it. Filey was gone.

18,318. What happened afterwards?—Well, I carried all the canvass I could to clear the land, and as I went north the wind headed me.

18,319. You were on the starboard tack at that time?—Yes, with her head to the northward. I thought, when we got round Whitby, we would get a point or two off the land, but the wind backed into the east; therefore we only laid north.

18,320. About what rate were you going?—We were not making more than 2½ or 3 knots.

18,321. You were making as much leeway as headway?—Decidedly. We dragged along until 11 o'clock at night, and the ship broke off from the north-north-west, and when the shower cleared off, I saw Hartlepool light west and by north. The sea then was continually breaking. I weared the ship and came to the southward, fearing I would get upon the South Gare, and determined I would sooner risk the rocks at Redcar than go ashore at the mouth of the Tees.

18,322. But you did not run for the rocks?—No; but I knew the beach was my portion. I could not keep off till daylight.

18,323. You run for the beach?—No; I wore the ship to put her head the other way to take advantage of the wind. If I had stood on as I was going when the ship bore the wind at north-north-west, I should have stood decidedly on to the South Gare, and there been drowned in a very few minutes. That was not my object.

18,324. You said Hartlepool light bore west and by north?—I estimated myself about eight miles from it; but I may have been deceived. My duty was to get the ship's head round to the southward as fast as I could.

18,325. The wind was then east-north-east?—Yes, or north-east by east.

18,326. And Hartlepool light bore west and by north?—Yes.

18,327. Consider a little. What was to prevent your putting your helm hard a starboard and running into Hartlepool Bay, if there had been a refuge there?—She would not have looked at it. The sea was heaving right on the ship.

18,328. If you had put your helm up and run before the east-north-east wind, you would have made a great deal of way?—She would not have fetched the Heugh if she had had all the sail and all the men in England.

18,329. You wore round, and ——?—Got her on the other tack to clear the South Gare.

18,330. What happened?—We went on till we grounded upon the rocks at Redcar.

18,331. Where? Inside the buoy?—Yes, on what is called the Salt Scars.

18,332. Did you know you were so close to the shore as you proved to be?—No; I expected to clear.

18,333. You did not think it was sufficiently desperate to put your helm up and run for the beach?—Decidedly not; so long as she held off I would not. She was a valuable ship.

18,334. Did you loose the lives?—Not any.

18,335. How were you saved?—By the lifeboats, and in the end the cobles.

18,336. Could the cobles come off?—The cobles had to go off to take the remaining part of the crew off when the lifeboats could not get near enough to the ship.

18,337. She lay dry at low water?—Nearly dry; about a foot off the water upon the top of the rocks.

18,338. At that time, had there been a harbour of refuge at Redcar, you could have run into it?—Most decidedly so; in fact, had it been daylight I would have got in. It is already a harbour of refuge at daylight, so far as lives are concerned, but we want daylight to see the path.

18,339. Do you consider it a refuge in an east-north-east gale?—Yes, with daylight.

18,340. Does not that blow right on the bluff of the rocks?—No, at angles a little, and as we advance in the water is comparatively smooth. If it is life you wish to save it is all right; but property will go to the wall at the present time.

18,341. Were there any other vessels caught in the same gale up about Flamborough Head?—Many. I can hardly say how many wrecks there were, but I believe there were four or five light vessels in ballast upset in Tees Bay. Many were wrecked about West Hartlepool.

18,342. Were many running off Flamborough Head at the time you were caught?—Many were knocking about, but what became of them I cannot say; many of them perished.

18,343. In going south with a laden ship have you often been stopped off Flamborough Head for want of some harbour to go to there?—I have often been detained off Flamborough Head, but with a good ship we never think about a harbour till a gale of wind comes on.

18,344. It is a common case, is it not, that the wind southers as you open the Head?—It generally does.

18,345. What do you do then, get under the cliffs and lie there?—We generally come down and get into Filey Bay, but some prefer keeping under canvas.

18,346. Is that a common occurrence?—It is.

18,347. Have you seen any number of large vessels doing that?—I have not; it is generally among the smaller craft. No large ship will go there.

18,348. Do ships anchor all along the coast from Flamborough Head to Filey?—Not all along; never on the north part of Speeton Cliffs, but on the Head.

18,349. If there was a refuge at Filey would it not be very convenient for those vessels?—Very convenient; but if it is to be only one it is too far south; it is too near the Humber if we are to have no more than one.

18,350. Then you say, if there was to be only one harbour, it should be somewhere in Tees Bay?—Yes.

18,351. I think you said your reason for that was, that ships could not get off shore if once caught with a gale that embayed them between Souter Point

and the cheek of Robin Hood's Bay ?—They cannot get off; it is impossible. They may in an ordinary gale, but not in such a gale as that was of the 4th January 1857.

18,352. Did many wrecks take place at Redcar at that time ?—Many; I think the beach was strewed with numerous wrecks.

18,353. Do you know how many ?—I cannot say exactly how many, but there were a great many.

18,354. Where do you belong to yourself ?—North Shields.

18,355. (*Capt. Sulivan.*) You say the light bore west and by north from you when you first made Hartlepool light ?—Yes.

18,356. You were heading north-north-west ?—Yes.

18,357. Do you think any good vessel, if her helm had been put up and kept away at five points, would not have made nearly a straight course ?—She would not in such a sea; it was a continual broken sea.

18,358. Would you hesitate, on a lee shore, if you saw the mouth of a harbour of refuge under your lee, in the heaviest gale that blew, and it was five points under your lee bow, to put your helm up and run for it ?—Most decidedly not.

18,359. Would you have any doubt about fetching the entrance of any harbour, if you made your harbour you were bound to in a heavy gale under two close-reefed topsails five points on your lee bow,—would you have any hesitation in putting your helm up immediately and steering for that entrance ?—Decidedly not, if I thought I could make up the course.

18,360. Had you in this case done so, or even been a point more to leeward of it, would you not have gone right into any harbour of refuge, had one existed in Hartlepool Bay ?—I don't know; a harbour of refuge was certainly not there then; where it is to be I know not.

18,361. Suppose the space between Hartlepool Point and the Long Scars to be enclosed and made into a harbour of refuge, and that the entrance was marked by a light, and there had been five points on your lee bow in that gale, do you think that in a ship not damaged, and having two close-reefed topsails set —— I beg your pardon for interrupting you, but she was damaged.

18,362. But she was under command of the helm ?—Yes.

18,363. Do you mean to say you could not have borne up five points and ran into that harbour of refuge ?—If it had existed I should have seen the lights, and known whether the ship was making the course good or not, but as it was there was nothing for me but to come the other way.

18,364. But if there had been a harbour of refuge could you have any doubt about making your course ?—If I saw the place I should be better able to ascertain than I can here.

18,365. I am speaking to you as a sailor. You have borne up for the entrance of harbours when you have made them in very heavy weather and very heavy seas ?—Not very many; I generally prefer the sea.

18,366. I am speaking of ports you are bound to Do you feel any hesitation in a gale of wind when you find a port five points from your lee bow, and you can carry sail to keep the ship up ?—It depended upon how the sea run.

18,367. In the gale then that blew you on shore, you could not weather the land on the port tack, and you expected to go ashore on the Redcar rocks,—now place yourself in the same position, with a harbour of refuge at Hartlepool, and with the certainty that on the port tack it was only a question of where you went on shore, would you not immediately have put your helm up instead of wearing, and run for that entrance on your lee bow five points, and tried to get into Hartlepool ?—If I had seen the harbour, and knew the position to go to, I would immediately have borne up, but it did not exist.

18,368. But suppose it to be made there, would you have any fear of bearing up for it with five points on your lee bow ?—No; a final effort might have been made.

18,369. The vessels then that were closer in with the land than you might have not fetched Hartlepool as you did, might they not ?—Under these circumstances decidedly.

18,370. To them it would have been more difficult to reach Hartlepool ?—Yes.

18,371. Now suppose vessels coming from the northward in the same gale, close-hauled on the port tack, drifting with the way, and the course south or south-south-west, some of these ships might have weathered the Heugh and got into Hartlepool when they could not have fetched Redcar, might they not ?—Under these circumstances.

18,372. Therefore, when in some cases ships might fetch a harbour at Redcar coming from the south, and could not fetch Hartlepool, in other cases vessels coming from the north might fetch one at Hartlepool when they could not fetch Redcar ?—Yes.

18,373. You were eight miles off Flamborough Head when the gale took place, and it drew round to the eastward, and so you put your head to the northward ?—Yes.

18,374. If there had been a good harbour in Filey Bay then, and you knew it, would you then have tried the port tack to fetch Filey ?—Most decidedly not: I wanted the sea.

18,375. But when you found the gale throwing you off to the northward, and were still to the eastward of Scarborough, and were 10 or 12 miles from the coast, would you not then have tried to fetch Filey instead of risking being driven on shore to the northward ?—In all probability I would.

18,376. Were there many ships off Flamborough Head with you ?—Yes.

18,377. Many of these ships were to the leeward of you ?—Many.

18,378. Were there many to the windward ?—I saw a few, not many; five or six, probably.

18,379. Of these vessels to the northwards, would many of them have been saved by a harbour at Hartlepool, and would many of the vessels to the southward, if they had been able to fetch into a harbour of refuge at Filey, have been saved ?—Decidedly they would.

18,380. A large amount of laden vessels going south are, I believe, caught off Flamborough Head in the way that you speak of, though not always so severely ?—Yes.

18,381. To deep-laden vessels more especially would Filey Bay often become a valuable harbour for that class of vessels so situate, to prevent their being driven back to their coal ports again, and even sometimes to the Frith of Forth ?—Most decidedly.

18,382. For light vessels coming up from the southwards to Flamborough Head, would a harbour in the depth of the bay nearer than northern ports be more valuable for them ?—I think it would.

18,383. Looking to the collier and existing trades of the east coast, and more especially keeping laden vessels in view, in which there is the greatest loss of life,—if you had to choose between a harbour that would take in large American ships in Tees Bay, or two smaller harbours, one in Tees Bay and one in Filey that would take the whole of the coasting trade at all times of the tide, by night or by day, which would you have, the large one in Tees Bay, or the two smaller ones, one in Tees Bay and the other in Filey Bay ?—I would take the large one in Tees Bay.

18,384. What, for the collier and coasting trade, and including all the foreign trade, would you rather have one deep harbour in the bight of the bay than a harbour there sufficient for all the collier trade, and another near Flamborough Head sufficient for the same trade ?—Generally when a gale of wind comes on ships bound north come into a net, and once in you never come out; if it blows hard you cannot get out of that bay, it is impossible; and every seaman I

REDCAR.

Mr. T. Mackenzie.

20 Oct. 1858.

Capt. Sulivan.

have known, and I know a good many who have dragged the mouth of the Tees, say the same.
