18,385. If you had a harbour in the Tees Bay that would take every coasting vessel and every collier, deep or light, caught under the circumstances you have mentioned in Tees Bay, with another harbour further south, for those further to windward or caught between Flamborough Head and Whitby, would it not be of great additional value ?—Most decidedly ; the more harbours of refuge the better.

18,386. Then if both harbours would take all the coasting trade, and you looked only to the coasting trade, which would you therefore have, one or these two ?—Well, I would rather have the large harbour in the Tees Bay, that is the thing most dreaded.

18,387. But I have been asking you, suppose you have a harbour in Tees Bay, that would take every collier, heavy or light, that gets embayed in Tees Bay, would that supply the wants more especially of the coal trade vessels embayed ?—Perhaps it would on some occasions, and perhaps on some occasions it would not.

18,388. But I am speaking of the depth of water at all times night and day ?—If there was room it would do it.

18,389. Are there not very many vessels driven back from Flamborough Head to all the ports ?—Decidedly.

18,390. Then while all the vessels in the bay would get refuge in Tees Bay, would not the vessels that were off Flamborough Head, if there was a harbour at Filey Bay, take that ?—Most decidedly.

18,391. And then would not that divide the vessels partly between the two harbours ?—Decidedly.

18,392. Then would you not consider that an advantage for deep-laden ships bound south to have two such harbours ?—Most decidedly so.

18,393. Suppose there is anchorage ground for a number of laden vessels in ordinary stress of weather to use it, what water between the head of a harbour of refuge would you think it safe to run in with the deepest collier you know ?—The deepest collier they generally say draws about 16 feet, and in entering a harbour that is clear to the sea, even if we could obtain ten fathoms at the entrance we should do well.

18,394. Suppose such a thing to be got in any harbour, would you have any hesitation in running for the Tyne, putting the tide out of the question, for Sunderland, for Hartlepool, the Tees or any other harbour on this coast in a gale of wind, if at clear low water spring tides there were five fathoms ?—I would run for none of them if I could get round Souter Point to get the Tyne.

18,395. So that if you weathered, you would not hesitate for a moment in running for any harbour—at the Tyne for instance, if the Tyne was deepened at all times of the tide to five fathoms at dead low water ; would you have the least fear in running for it at any time of the tide ?—Decidedly not.

18,396. Then if two collier harbours were made, refuge harbours, on this coast, that at lowest spring tides had five fathoms on the entrance and good anchorage ground inside, you would have no hesitation in running for them at any time ?—I would not.

18,397. (*Capt. Vetch.*) You have made numerous voyages from the Baltic to this coast, and I think on one occasion you fetched the land to the north of Peterhead ?—Yes.

18,398. You know the north coast of Scotland very well ?—Not so well as I know the south coast.

18,399. But you know Peterhead ?—I do.

18,400. And do you know Wick ?—I have seen it in passing.

18,401. And as a harbour of refuge you prefer Peterhead ?—I do according to my knowledge of the coast, which is only limited.

18,402. Leaving out of view altogether a harbour of refuge, but merely looking to the saving of life and property, and informing you that at Wick there are 1,400 boats fishing with crews of four men each, and that there are 900 arrivals, and about the same number of departures of vessels from that port, double the number of those belonging to Peterhead, and that they have no shelter in the present natural harbour, and returning to the single question of saving life and property, do you consider that the Government would be more authorized in protecting the harbour of Wick or that of Peterhead ?—My knowledge of the coast is limited, but so far as I see I would prefer Peterhead.

18,403. I ask for the purpose of saving life and property ?—Yes.

18,404. That is the question ?—I prefer Peterhead.

18,405. Then you think a harbour of refuge at Peterhead would save more life and property than one at Wick under those conditions I have stated to you ?—I do.

18,406. Do you consider that Tees Bay, including Hartlepool Bay, or some other part of the north-east coast of England would be preferable for a harbour of refuge ?—The east coast of England, you said ?

18,407. The north-east coast ? — The north-east coast north of the Tyne ?

18,408. No. That between Blyth and Whitby say ?—Redcar.

18,409. That is in Tees Bay, is it not ?—Yes.

18,410. Not in its present condition, I suppose ?—Under its present condition it is a harbour of refuge, so far as life is concerned.

18,411. Have you any plan showing what kind of refuge you require? (*Plan produced.*) Suppose a harbour to be constructed at Redcar such as we see on this plan, and another harbour to be constructed in Hartlepool Bay, do you still prefer the harbour at Redcar ?—I do.

18,412. Will you state your reason why ?—Simply because there is already a harbour at Hartlepool, and we have got none at Redcar. The harbour at Hartlepool may be taken at a proper time of tide and save life, whereas here there is not one, and the place is in the depth of the Tees Bay.

18,413. Do you consider the open bay of Hartlepool to be a harbour of refuge as it now stands ?—(No answer.)

18,414. (*Mr. Coode.*) You said, when engaged in the Baltic, you were generally desirous of making Flamborough Head ?—Yes.

18,415. Has it happened that you have made Flamborough Head oftener than any other point ?—Yes, simply because I steered for it.

18,416. That is just what I wanted to know. On that occasion when caught in the gale of January 1857, where did you sail from ?—From Shields.

18,417. When did you sail ?—On the 1st January.

18,418. Evening tide or morning tide ?—About mid-day on the Friday.

18,419. What time did you reach Flamborough Head ?—On the morning of Saturday.

18,420. About what time ?—About eight o'clock, I think.

18,421. When was it you bore up ?—I never bore up yet.

18,422. When was it you put about ?—The wind was from south-east ; we knocked about, first on and then off, and did not know whether the wind would easter or wester.

18,423. Then you knocked about all Saturday and until Sunday morning ?—No, on Saturday night about four o'clock we made sail in a north direction ; at four o'clock on Sunday morning we lay east-north-east.

18,424. You held your own well till Saturday afternoon at four o'clock ?—Sunday afternoon.

18,425. (*Chairman.*) Do you know of a French brig which ran in at low water, and the crew saved their lives in their own boat, on that 4th of January ?—Yes, it was not a brig, it was a schooner.

18,426. Will you tell us about it ?—It was a vessel from Elsinore, laden with grain, bound, I believe, to Newcastle. After leaving the Scaur in Jutland, the

REDCAR.

Mr. T. Mackenzie.

distance to this coast being nearly 500 miles, the master proceeded on, and the ship sprung a leak. No sun, moon, or stars could be seen to ascertain whereabouts the ship was, and he was obliged to run in for this coast. He ran for the first land he made, or rather the sea breaking over the Salt Scars, with the unfortunate *Emma* lying on them. He saw comparatively smooth water, and so beaching over the ship he ran where it was smooth, and came into the harbour safe right abreast of the Swan Hotel. He deliberately put a boat out, took all the crew in, and they landed themselves without any help except a little from the inhabitants, and bringing with them, I think, six chickens.

Mr. CHARLES TROTTER examined.

Mr. C. Trotter.

18,427. (*Chairman.*) You reside at Stockton ?—I do.

18,428. You are Chairman of the Tees Causeway Commissioners ?—I am.

18,429. Will you now proceed to make to the Commissioners any statement which you wish to offer relative to the subject of their inquiry ?—As Chairman of the Tees Conservancy Commissioners I have appeared before you to-day to state that it is the wish of my brother Commissioners, and of myself, to give only such information as we hope may lead you to a just decision as to that course which is likely to save the greatest amount of life and property, whether that be by the improvement of the existing harbours, or by making one large harbour. All the wish and object we have is that the greatest amount of good may be done by the public money that shall be spent. On behalf of the Tees it was some few years ago here pointed out, I believe by an engineer connected with the Admiralty, that, by the construction of a breakwater of some two thousand two hundred yards, the mouth or entrance of this harbour would be permanently fixed or placed, and it would be then equal for the reception of the trade which usually frequents the coast, at all times of the tide, and even of the very large class of vessels that have been alluded to. There would not be a depth of less than 16 feet water at the lowest time of tides. We therefore anticipate, from the information we have, that it would be more than that. The Admiralty themselves, I think, have considered this, as I dare say will be brought before your notice by other witnesses more conversant with the subject; the Admiralty, I say, themselves have given some notice of this, as, when the Bill of 1852 was before Parliament, at the instigation of the Admiralty, a clause was introduced into that Bill giving power for the construction of this very breakwater, the breakwater sketched out by Mr. Bald the engineer; and it has been our opinion, and is our opinion, that the greatest amount of life will be saved by the improvement of the existing harbours, and the improvements proposed need not be very expensive, because these harbours are now partly at this time harbours of refuge. I might also state that, suppose a large harbour were constructed in the Tees Bay, should that be on the north side of the Bay that would afford shelter to the mouth of the Tees to some extent, and will be of use to the entrance of the Tees; but from the opinions and information we have before us it will then be necessary that—the Tees Conservancy themselves, not having it within their power—it will still be necessary for the Government to put up the breakwater of which I have made mention, otherwise it will always be a source for carrying down silt and refuse to damage the harbour on the north side; and unless the mouth, the entrance of this river, was fixed in such a position as would prevent that, we consider that that would do injury to a harbour that might have been formed at a very considerable and enormous cost. I believe that, probably, that is all the statement that I have to make. I appear simply before you, not as a nautical man or particularly acquainted with these matters, but simply from my position as being Chairman of the Commissioners. We do not say one word against any other parties that are applying for the assistance, but simply with the view of assisting you to form the best possible judgment to judge of it.

18,430. You have obtained plans and estimates prepared ?—Yes, the estimate of this breakwater we propose will be under 80,000*l.* with a contractor that has had very great experience, and will undertake to do it; and we have one very great advantage, it will afford shelter from within a year of the time the work will commence.

18,431. (*Mr. Lindsay.*) There will be witnesses who will be able to speak both nautically and engineeringly on this subject ?—The witnesses are all here.

Mr. JOHN FOWLER examined.

Mr. J. Fowler.

18,432. (*Chairman.*) You are resident engineer to the Tees Conservancy Commissioners ?—I am.

18,433. You are prepared to lay before the Commissioners any plan and estimates for the harbour of refuge to which the previous witness has alluded ?—Yes, I am.

18,434. Will you now proceed to do so, making any statement which you may consider necessary to a full explanation of what is proposed ?—[*Plan put in.*] I may state that, having given evidence in London before the Select Committee of the House of Commons, there are several matters which I will not go into. I stated there that I preferred the mouth of the Tees for a harbour of refuge, because it was the most leeward point of this most leeward part of the coast. The greatest depth of water I have known upon the Tees Bar at low water is 12 feet 6 inches, the average depth is from eight to nine feet. When the wind is on shore there is always from three to four feet more water than is due to the state of the tides; hence, at such times, the average depth at spring tides is from 12 to 13 feet, and at neaps from three to four feet more. Were the position of the bar fixed, the depth of water over it permanent, and the position marked out by a breakwater, with a conspicuous lighthouse on its end, it is clear a good harbour of refuge would be provided, even if no more than the average depth of water is obtained. I am quite certain that several feet above the maximum will be obtained when the whole contents of the estuary are received and discharged through a permanent and properly defined channel. The general draft of merchant vessels trading on the coast varies from six to 15 feet, a few draw as much as from 18 to 20 feet, but the average draught of vessels seeking shelter is not more than from 10 to 11 feet. Looking, therefore, at the amount of scouring power which the Tees possesses, and at the depth which it sometimes produces upon the bar even now, when it is broken up, and its force diffused over a large surface, with its line of greatest action sometimes in one direction and sometimes in another, I am quite certain that if the entrance were curtailed, and the force concentrated in one permanent channel, the result would be such as to render the Tees available as a harbour of refuge for the mercantile shipping frequenting the coast at almost all times of the tide. To effect this object I propose to construct a pier from Seaton Snook across the North Gare in a circular direction, as shown on the accompanying chart, for the purpose of arresting the water passing to and from the Tees over the North Gare, and of directing the whole of the flood and ebb tides in one direction, which will have the effect of maintaining a well-defined channel more to the southward than the present channel generally is, and conse-

quently easier of access in an embaying wind. For the purpose of assisting the direction of the tide outwards, and to get clear of the scarps at the seventh and eighth buoys, and also to obtain a more yielding bottom for the enlargement of the anchorage within by scourage, I propose to construct an inner work or guiding wall from a point near "Jack-in-the box," as shown on the plan to the fifth buoy pool, by which I propose to conduct the channel by an uniform and gentle curve to the westward of the ninth buoy rocks, and into the fifth buoy pool in such direction as shall scour it out on the side in which it is capable of enlargement, without artificial means. The form of the channel and the nature of the bottom leave no doubt in my mind that the depth at low water will be from 12 feet at the upper end to 18 or 20 feet at the commencement of the lower pool, in which the depth would remain as at present, from three to six fathoms, but the area would be greatly extended, an anchorage would be obtained of three miles in length, with a depth at low-water springs of two to six fathoms. Another advantage obtained by the avoidance of the rocks would be a depression of the low-water surface, a more speedy transmission of the tidal wave, and a greater range of tide in the upper reaches of the river. The pier being projected parallel to the direction of the wave and also of the flood and ebb tide, will not injuriously affect either the wave or the current; the wave rolls in from the main sea, and will simply be cut in two by the pier, the portion going into the river and being dispersed upon the beach at either side, and the flood being drawn from all parts of the bay only attains force when it collects within the pier. The ebb of the sea passes with considerable force along shore from south to north, but the river ebb being always the strongest, their junction does not take place until beyond the pier head. In connection with the accommodation to be afforded when the works have fully developed their effect, it should be stated in the first place, that the number of vessels which can be accommodated in a given space is much greater in a river or harbour removed some distance from the sea than in a harbour separated from the ocean only by piers, for however well the piers may be arranged to prevent the inroll of the waves, still, unless the entrance be so much contracted as to render access to the harbour dangerous in stormy weather, a large space will be totally unfit for anchorage, and a still larger space will be but partially sheltered. In north-east gales four miles, and in south-east gales three miles, of the Tees will be sheltered from the storm, with a depth of 12 to 40 feet at low water, quite sufficient, with moderate regularity in berthing, to accommodate all the vessels that are likely to require shelter during one storm; for it should be borne in mind that neither the number nor the draught of vessels is likely to increase for many years, in consequence of the substitution of screw steamers for ordinary sailing vessels. The quality of holding ground in the Tees is excellent, being of clay; and even where the clay is overlaid with sand, as it occasionally is, ships never drive in it. The approaches to the bar and the lower reaches of the river are well marked out by the three pairs of leading lights; two pairs are moved from time to time to suit the alterations of the bar. Should the proposed works be carried out, two pairs of lights would be sufficient to lead up to the same point, and being permanent an ample fund will remain for the erection of a first-class light on the pier head. The situation of the pier and the nature of the ground do not admit of its being constructed of masonry. It should either be constructed of rubble incased in timber, as at Blyth, or the material may be discharged from a staging of timber allowed to find its own level and slope, and afterwards be paved from low water upwards. The pier being, as already stated, projected parallel to the direction of the wave, the head only would be exposed to the force of the sea. The objection therefore that exists against long slopes and random rubble breakwaters placed at right angles to the direction of the wave would not be applicable to the present case. The facility with which slag may be obtained in large quantities, and in blocks of three to five tons, renders it very desirable that it should be made available for the construction of the work. I have paid much attention to it, and have had it at the fifth buoy for the last five years, and find that the salt water has produced no chemical change upon it, and that from its great hardness it resists the mechanical action of the waves, and maintains its angular surface where whinstone and sandstone have become round like beach pebbles; it has combined firmly together and not been moved by the force of the wave or current. The slag runs from the furnace in a small continuous stream, generally into metal frames placed on waggons; when the frame or box is full it is almost immediately taken away and turned over the slag bank. While the slag is in a semi-fluid state the continuous but small stream fills up the box, layer after layer, and gives to the block a laminated character; whilst turning it out when hot breaks it up into fragments. In the centre of the block where it remains fluid, if it be not turned out too soon, or when the slag is run into moulds in the ground, and allowed to partially cool before they are removed, the block is more solid. Were moulds built in the ground, and the produce of two furnaces run into one mould, and the slag retained in the mould for an hour, all of which can be done at trifling expense, blocks of nearly five tons may easily be cast at once, and if allowed to cool would be perfectly solid. From repeated observations on different furnaces I find that the average yield of each furnace is 38 feet per hour, and that $17\frac{1}{2}$ cubic feet of solid slag weighs one ton. In the course of a few weeks there will be 36 furnaces in blast on the banks of the river, which will yield sufficient material to construct the pier on the Blyth plan in 11 weeks, and on the other plan in 39 weeks. The timber work, however, could not be prepared in the time mentioned in the first case, and a longer period would be required for the material to consolidate in the second; but it might be so far completed in 12 months as to shelter from the storm, properly direct the current, and be sufficiently conspicuous for vessels to run for during gales. Should slag be objected to for the outer upper face of the work, abundance of stone may be obtained at Eston, Upleatham, and Marske, which would not materially increase the cost. The cost of constructing the north pier of slag, paving its surface, and forming a platform and parapet of timber on piles, will be 70,000*l.* Considering the great amount of life and property annually lost upon the coast, and the immense improvement which could be effected in so short a time, and at so little cost, in the entrance to the Tees, I think that that work ought to be the first step taken in providing shelter for the tempest-tossed mariner on the north-east coast. The original proposition for the improvement of the mouth of the Tees was to carry the north pier beyond the South Gare, ending in about five fathoms at low water. A closer examination of the power of the estuary, backed by the opinion of several intelligent seafaring men belonging to the locality, having convinced Mr. Bald that by its being carried a much less distance very great improvements could be effected, and the cost of carrying the work out to five fathoms, a distance of about 3,000 yards, being so much beyond the means that was then likely to be at the command of the conservators of the river (no furnaces being in operation at that time), he ultimately resolved to construct the pier about one mile in length only, being convinced that by that length the low-water depth upon the bar would be increased to 16 or 18 feet, which would be quite sufficient for all purposes of refuge required upon the coast. Being of the same opinion, I thought it unnecessary to project any further works, except the guiding wall within; but having always been of opinion, that by more extended works greater depth of entrance, and the entire removal of the bar, with a large sheltered area, being considered necessary by some, I have projected the north pier out into five fathoms at low water;

REDCAR.

Mr. J. Fowler.

20 Oct 1858.

and for the purpose of giving greater shelter, and also checking any movement of the sand from the southward, I have also projected a south pier in a north-by-east direction, also into five fathoms, leaving an entrance between the piers 700 yards in width. If the works are carried out to the extent I have shown upon the plan, I am decidedly of opinion that the bar would be entirely removed, and that it could not form again outside the works, for the following reasons:—1st, The bar can only be maintained at its present height from the alluvial matter brought down by the upland water and from the sand, and shingle abraded from the land on both sides of the mouth of the river. 2d, The Tees is not at any time heavily charged with solid or alluvial matter; little sand and no gravel ever reaches the sea, even during the greatest floods. The great bulk of the grosser substances brought down being decayed vegetable matter. is not likely to accumulate outside the piers, and the force of the current will not allow it to settle within. 3d, The present bar is composed, not of material brought down from the interior, but from land gradually being washed away on both sides of the Tees mouth, but the supply from all sources does not equal the loss sustained by friction, for the bar is advancing westward. 4th, The action of the wave (the principal cause of bars) is almost entirely confined to the foreshore between high and low water, and diminishes very rapidly as the depth increases. Shingle, gravel, and sand may be moved at any depth by the current, but is not affected by the wave at a greater depth than two fathoms, as is satisfactorily proved not only by the angle at which rubble works permanently stand, but also by the fact that persons who go down in diving bells do not perceive any extra motion during storms, and are often surprised on being raised up to find the surface so violently agitated. Pieces from wrecks lying in deep water having been known to come on shore during storms, only shows that time breaks up the wreck, and head winds, by retarding the surface current, increases the force of the bottom current, and enabling it to lift and carry with it material that in the ordinary state of the weather would remain unmoved. This action, moreover, is more likely to remove than to cause the formation of bars. Whatever sand and gravel is abraded from the land on the sides of the entrance to the Tees, and carried along the shore, would be checked in its progress by the piers, and would not be carried by the wave into five fathoms. The continual action of the wave would prevent any material accumulation from taking place behind the piers; but even if the sand edge was to advance as rapidly as the land recedes, nearly 900 years would elapse before it had advanced as far as the pier head, and when there it will have to go as much further before it is in the same relative position to the gorge of the estuary as it is now. Lastly, I agree with Mr. Calver in his opinion that a bar cannot form at the narrow entrance or gorge of an extensive basin, such as the entrance to the estuary of the Tees will be when the projected works are constructed. Where works at the mouths of harbours have been unsuccessful in removing bars, it has been because they were too limited in extent, generally ending about or a little beyond low-water mark. I am not aware of a single instance where such works have been carried out in clear ground into such a depth as to give any reasonable ground to expect that the bar would be removed. The small cost at which works in the Tees have been carried out, compared with the original estimate, and the facility with which slag may now be obtained at a low cost, convince me that works at the mouth of the Tees will be constructed at much less expense than similar works on other parts of the coast less favourably circumstanced. Accordingly I find that they will be constructed on the plan adopted by Mr. Abernethy at Blyth for the following sums:—The south pier 150,000*l.*, north pier 126,000*l.*, inner guiding wall 9,500*l.*; total 285,500*l.* Gathering from what has come to my knowledge of the various circumstances in which vessels are placed at the commencement of a storm, and from the frequent sudden change in the force and direction of the wind, I am decidedly of opinion that no single harbour, however large, deep, or easy of access, will meet the requirements of the coast between Flamborough Head and North Sunderland. Should one large harbour, however, be decided on, I have no doubt but Tees Bay is the site that will be most available, and the only question is, whether within or on which side of the Tees mouth such a harbour should be constructed. I have lately given very great attention to this question, and am fully convinced that if the north side of the bay is even partially sheltered, it will fill up more or less rapidly, and this in proportion to the amount of shelter given. Under present circumstances, prevalent east-south-east to east winds cause large accumulations of sand on that side of the bay, while north to north-east winds have a contrary effect. With the former wind the sea and river current are forced close inshore. In the latter case the wind is nearly directly opposed to the seat ebb current, and at right angles to the river ebb. After crossing the bar the current is turned entirely by the force of the wind and sent more direct out to sea, while the back sweep or under tow of the wave on the Seaton and Hartlepool foreshore carries the sand deeper into the bay. Again, the set of the ebb tide out of the Tees when not affected by the wind, is seldom more easterly than just clear of Hartlepool Heugh, and it is often directly across the Long Scar, carrying with it whatever sand or silt is brought down by the river water, as well as the heavier matter taken up during storms about the mouth of the Tees, and on the foreshore and shoals between the North Gare and Hartlepool; this being partially suspended is carried forward by whatever current there may be, until beyond the influence of the wave, where all that is heavier than the rate of current will move is deposited. I have compared the old charts with the present depth, and find that southward of the Long Scar Rocks there is from two to three fathoms less water than there was in the latter part of the last century; and between the Long Scar and the Heugh there is a decrease of one fathom in the last 20 or 30 years. This is confirmed by the unanimous statement of the old fishermen and pilots in the locality. A comparison of the charts also shows that the Tees mouth has been gradually moving more in the direction of Hartlepool, and is periodically close inshore in front of Seaton. That this is the cause of the shoaling in Hartlepool Road there can be little doubt, and that such shoaling has not proceeded more rapidly is in my opinion entirely due to the open state of the bay, which allows the free action of the north and north-east wind. The position of the bar being the balance for the time being of the forces acting upon it, it is clear that if one of the most active of these forces, viz., the north and north-east wind, be destroyed or lessened in degree, the position of the bar must yield to the opposite forces, and be kept close inshore, the worst position for Hartlepool that it can have. The first step, therefore, in constructing a harbour at Hartlepool ought to be to fix the outlet of the Tees, and turn its discharge as much southward as possible. I find that the south side of the bay between the Tees mouth and the Salt Scar Rocks has slightly increased in depth, while the low-water line has gone further westward. I have never observed nor understood that wind or storm from any quarter makes any alteration in the depth on that side, whilst the bottom is clear level and good holding ground. In the present position of the entrance to the Tees it is quite impossible for any detrital matter to be carried from it in that direction, the ebb tide of the sea passing close inshore, with a velocity of from one to two miles per hour northwards, and carrying the ebb of the river with it, while the flood radiates from the south as well as from the north side of the bay to the Tees mouth, and may be seen rushing through the washway between the South Gare and the Bransand with considerable velocity. A line drawn north-west from

REDCAR.

Chairman.

the Salt Scar buoy will shelter a square mile of surface for every mile of breakwater, with the depth gradually decreasing from seven fathoms to two fathoms. The Salt Scar rocks considerably reduce the size of the wave in gale from east-south-east, and might, if found desirable, be raised so as to produce still greater shelter. The abundance of slag which can be obtained, as well as the extensive beds of freestone that exist in the immediate neighbourhood, leave nothing to be desired in the way of material, and will form an important consideration in the cost. Both slag and freestone may be run direct from the furnace or the quarry to the place of deposit. Looking therefore at both sides of the bay, I am decidedly of opinion that a protected anchorage sufficiently large to accommodate the mercantile shipping, and also to be used as a naval station, cannot be formed upon the north or Hartlepool side of the bay without considerably sheltering the Tees mouth, reducing the swell upon the bar, and increasing the depth over it; yet the ebb of the Tees passing over sand-banks lying in an exposed situation, where the rate of the current will be from two to three miles per hour, and then through a sheltered harbour with only half the velocity, leaves but little hope that the depth of water in such harbour can be maintained. On the south side, the shelter given to the Tees would scarcely be felt, but the unvarying depth, with the natural set of the tide of the Tees in the opposite direction, gives far greater certainty for the depth being maintained, while the position of the harbour would be improved, for many vessels running for the south with a scant wind could enter here that could not make Hartlepool, while vessels coming from the north, if able to round the Heugh, would have the wind free to the north entrance of a harbour on the south side of the Tees mouth. (Witness quoted the following extracts from the Admiralty Report of April 28, 1851 :—"It appears "further from the inspector's report, that at the time of "the inquiry there were 11 feet of water on the bar at "time of low water, and that the tidal area within the "entrance amounted to nearly 9,000 acres, and the "tidal flow extended to 20 or 21 miles, while the depth "of water on the bar of the Tyne was only from 7 to 8 "feet, and the tidal flow 16 miles. Such an extensive "tidal area presents an immense power to scour a deep "channel and entrance, if judiciously regulated and "applied, and it seems well deserving the attention of "those locally interested, the importance of taking "advantage of the resources which nature offers for "constituting in the Tees not only a good mercantile "navigation but a deep-water harbour, to which vessels "might run for shelter at all times of the tide." From Mr. Bald's report to the Admiralty, of March 1851 :— "That the natural pool at the floating light, where "200 ships could formerly anchor in safety, might be "regained to any extent and depth required, offering a "safe asylum harbour to ships to run to when overtaken "by tempestuous weather. The anchoring pools of "7½ acres and 4 acres, situated at the eighth and ninth "buoys, are also valuable places for ships to lie and "anchor. I see no reason why a depth of five or six "feet of more water should not be obtained over the "bar of the Tees. The Tees is capable of any improvement as to depth of water to permit all kinds of "vessels engaged in foreign trade to navigate safely "up it." From Mr. Calver's report to the Admiralty:— of May 31, 1851 :—"In conclusion I would beg to "record my opinion, that were a north pier formed at "the mouth of the Tees to the extent indicated in the "parliamentary plan of the Tees Commissioners of "1852, and now recommended by Mr. Rendel, it would "be followed by the most beneficial results; it would "give certainty to the position of and depth over the "bar of an important river, possessing at present a large "trade, which promises to become greatly increased in "future years; it would render the entrance of the Tees "available for refuge purposes, and thus confer a great "boon upon the whole coasting trade; and it would "render unnecessary a large outlay at a neighbouring "site, to secure a similar advantage, and where there "are also physical drawbacks which do not exist in the "present case."

18,435. Have you any estimates therefore which you will lodge on a separate paper?—The contractor is here, and he will hand in an estimate for the work for the smaller scheme. I have not got a contractor's estimate for the other.

18,436. What is to be the expense of the smaller scheme?—The contractor's estimate is under 77,000*l.*

18,437. (*Sir F. Smith.*) I have listened to your lecture on river engineering with very great attention, and I am sure you will excuse my asking you some material question, inasmuch as it is quite impossible to carry that very interesting statement which you have laid before us entirely in our memory. Of course I shall read the documents with interest afterwards. You say the contractor will lay before us estimates. Is it not usual for the engineer to bring estimates before the parties who have to investigate the matter. Of the contractor we know nothing, but the engineer we know, and must know a good deal. I think the more ordinary course is, that the engineer should speak to the cost. The engineer will be an important element in the question; the contractor may not be. I have a detailed estimate myself; but I thought it better that the contractor should hand in his estimate. It is better that you should examine the contractor's estimate and be responsible for it, and for you to lay before us the scheme, because the individual who is the engineer is important. I understand your principle of construction has been adopted, and has been carried out at Blyth?—The principle adopted at Blyth is the principle upon which I have estimated. I have estimated for the long slope.

18,438. To be based on slag, is it?—Yes.

18,439. But one of your schemes is Mr. Abernethy's scheme at Blyth?—It is.

18,440. Are you aware of any other position like this where this scheme has been carried into effect?—No.

18,441. You never heard of its being tried at Nairn?—No.

18,442. And you are willing to adopt Mr. Abernethy's scheme upon his mere showing, without being aware if it has been tried and is successful?—I have seen it at Blyth.

18,443. But if you were told that the breakwater has not succeeded at Nairn, would you be disposed to adopt the same principle upon the experiments now making at Blyth?—Not for the large scheme, and I have not adopted it for the smaller scheme.

18,444. And for this smaller scheme you would use Abernethy's system, and for the larger scheme you would take the slag system?—The contractor's estimate given in was for the higher part of the stone.

18,445. But the lower part is of slag?—Yes; and I made an estimate of the price of slag, and I have no doubt the stone can be obtained; and it may be constructed of stone for the same money.

18,446. What is the length run from the quarry to the proposed breakwater or piers?—The quarry at Marske on the south side of the Tees from the south pier will be about five miles distant, and is situated at an elevation of from 300 to 400 feet above the level of the sea.

18,447. There will be no expense of the downward traction?—No; at Eston it will be about six miles on the north side.

18,448. Do the freshes run out very strong into the sea here?—No, they do not; and I will give you the reason why they do not. The area of the basin of the Tees is only 750 square miles, while the estuary of the Tees is 8,000 acres. I make it 7,000 or nearly 8,000, but Mr. Bald made it 8,800 acres. The area of the basin of the Tyne I find put down at 11,420 square acres, while the tidal area is only 1,694 square acres. That is published by Mr. Taylor.

18,449. Who is Mr. Taylor?—Mr. Thomas John Taylor.

18,450. Were you talking of square miles or square

acres ?—I gave the area of the basin of the Tees as 750 square miles, and the area of the estuary I make out nearly 8,000 acres. Bald gives it at 8,800. The basin of the Tyne is 1,142 square miles, while the estuary of the Tyne, or tidal portion, is 1,694 acres. We have an immense quantity of tidal water flowing into the Tees every tide. I made about 150 high-water cross sections in the tidal portion of the Tees by calculating from that with 16 feet flow. There is in the Tees, supposing it is high water at all parts of the Tees at once, upwards of 100,000,000 tons of water between high and low water mark. On an average the discharge from the Tees of fresh water is only 2,000,000 tons per 24 hours, so that there is 100,000,000 tons of water, only 1,000,000 of which is fresh or land water. I happened to take the velocity, and make an approximate calculation of the fresh water which came down the Tees. In December 1856, on the break up of the storm—I believe it was on the 8th, 9th, and 10th—the quantity of fresh water then was multiplied by 26, for there was 26 times the average quantity of water discharged in 24 hours. So that it brought up the discharge from the Tees to 52,000,000, or about half the quantity of salt water in a spring tide that is ordinarily thrown into the estuary. Now, that was a fresh, the greatest that had been known for 20 years. I have never known anything like it, and I have been 12 years on the Tees, that is, only one third. From the same authority as I quoted before, Mr. Taylor, I find the Tyne in floods is sometimes increased to 120 times the average discharge. Therefore there is so great an amount of tidal water thrown in, that the amount of fresh water is not felt. It is only about one per cent.

18,451. How far will the influence of your tidal water reach ?—The total length is about 27 miles from the .

18,452. What is the prevailing wind upon this coast ?—West ; another witness will give in a tabular statement.

18,453. When there is any easting, what is the prevailing wind then ?—I cannot exactly say what is the prevailing wind from easterly winds. I know what is the most destructive wind on the coast.

18,454. What is that ?—That is the north-east wind ; but the embaying wind is from east-north-east to east-south-east.

18,455. Do you leave your proposed harbour mouth open to the north-east ?—Exactly open to the east by north.

18,456. Will not the heavy sea set in ?—Yes, to a certain distance, but the anchorage will be above that.

18,457. You seem to apprehend there will be no, or very little bar at the mouth ?—With the smaller scale there will be 18 feet low water.

18,458. Will there be a bar or not ?—There will be from 16 to 20 feet upon the bar,—you may call it a bar. There is a bar at the Tay, and 22 feet upon it.

18,459. But will there be a bar at the mouth of your harbour permanently of greater or less height ?—I think there will.

18,460. Do you know an instance of a tidal harbour at which there is not a bar ?—There is not a bar in the Thames.

18,461. The Thames is a very exceptional case ?—The Humber is another. In rivers such as the Tees I do not.

18,462. Then I understand you to say there is an amount of sand from the mouth of the Tees towards Hartlepool ?—Yes, in certain winds.

18,463. What winds are those ?—South by east.

18,464. But have you had any particular means of ascertaining the exact amount of water, or is it from mere report ?—It is from many years' observation upon it that I have come to that conclusion. In front of the Low Light near Seaton, and at Seaton, I have known as much as five or six feet of sand thrown up in the course of a week or two.

18,465. What became of that ? Does it continue or move away again ?—It moves with a north or north-east wind towards the Tees mouth again.

18,466. Is it not likely to come back and help to form an obstruction to your harbour ?—Yes, it does come ; but when it comes to the Tees it comes by what is called the inner deep or swashway, and during the north-east wind it is carried in and lodged in the Tees.

18,467. Is it not as likely that the deposit will come with the tide from the north as with the tide from the south ? Is it not more frequent that the sand is moved by the water from the north than by that from the south ?—That is the general run upon the coast, I understand, but not on this part of the bight, because the flood tide is not the strongest until outside the Heugh.

18,468. Have you ever turned your attention to the formation of a breakwater, to inclose the rocks at Redcar ?—I have not paid any attention to that.

18,469. Then your scheme is entirely to make a harbour available for shipping ?—Yes.

18,470. As a refuge ?—My reason for not turning any attention to the harbour within the rock was, that I found by the chart that there is a considerable amount of irregularity in the soundings, indicating foul ground ; I therefore turned my attention to the north side of Redcar rocks.

18,471. I see you go out to five fathoms water ?—I do with the larger scheme.

18,472. And do you require that depth ?—Yes.

18,473. Then you apprehend, if you go into such depth of water, that you will never have any inconvenience from sand coming in ?—I think no sand is carried out to such a depth by the action of the wave on the inclosed piers ; there would be no current.

18,474. Then you think if the piers were carried out beyond five fathoms, it would be money thrown away ?—That would depend entirely upon the position.

18,475. So that if six fathoms be not necessary here, but five fathoms is sufficient, is it because there is more tendency to fill up ?—There might be a necessity to go further in a case where there is not such a scouring power as we have, which will drive all materials outside, and the tendency of the bay is to deepen ; that is the cause the line comes in towards the land.

18,476. Do you know from actual observation that the soundings are deepened ?—The coast line.

18,477. Or do you assume that to be the case ?—The soundings I know from actual observation. I know that on the south side by the soundings it is deepening, and on the north side they remain something similar until you come between the five-fathom line, or between the five and four. The first alteration I find is in the three-fathom line.

18,478. Is that a considerable alteration ?—No very considerable alteration.

18,479. But really, practically speaking there is no such an alteration as to cause any alarm, is there ?—Not so long as the bay is kept in its present condition.

18,480. Is there any set of sand from the south going past the Redcar rocks ?—I apprehend there is. The sand to the south of Redcar has gone away considerably.

18,481. What has become of it, do you think ?—I think some of it may have come towards the Tees.

18,482. But do you think any portion coming towards the Tees will come round your south pier head ?—I think not.

18,483. And you think if it did you would have power to drive it into the deep water ?—I think so.

18,484. Where do you propose that vessels coming in for refuge should come to ? How far do you propose that they shall come up?—They may come up as far as Middlesborough if we carried out the improvements.

18,485. Supposing you carried out the improvements, what depth of water do you expect to have at

REDCAR.

Mr. J. Fowler.

20 Oct. 1858.

Sir F. Smith.

Middlesborough ?—The least depth up to Middlesborough will be seven feet at low water.

18,486. That will not be for refuge for vessels coming in ?—That is the lowest depth.

18,487. What depth is there now to Middlesborough? —In some places 16 or 17 feet.

18,488. At low-water spring tides ?—Yes.

18,489. What is the mean depth ? — The mean depth where laden vessels lie will be about 10 to 16 feet.

18,490. At present ?—Yes.

18,491. But I thought I understood you to say you hoped to get seven feet ?—That is, seven feet over the shallows.

18,492. Seven feet of increase ?—No.

18,493. My question was what depth of water you will have at Middlesborough at low-water spring tides when the improvements are carried out, and you said seven feet. Then I understand you to say there are now 10 feet as the mean depth ?—Yes, and the improvements are entirely below Middlesborough.

18,494. I ask you how far vessels will come for protection, and you say some as far as Middlesborough ? — The smaller vessels might go as far as that.

18,495. And the larger vessels drawing 18 feet of water ?—They might go as far as the eighth buoy, which is immediately below some rocks shown upon the chart. Then there is another part of the channel, about half a mile above that, where there has been a considerable depth; our works have forced sand down to it, but it is again clearing out.

18,496. How many acres will you have between the eight-feet buoy pool and the mouth of your proposed harbour ?—In the fifth buoy pool I expect to have 150 acres.

18,497. Up to the five-feet buoy pool do you mean? —At a little above the ship.

18,498. Will you keep to one point, and give me the quantity of acres you will get up to the eight-feet buoy ?—There will be, I expect, about 180 acres.

18,499. From the harbour's mouth up to the eight-feet buoy pool ?—That will be available for shelter.

18,500. For vessels of 18 feet draught of water at low water spring tides ?—No; 150 for vessels 18 feet water up to the head of the fifth buoy pool.

18,501. At all times of tide ?—Yes.

18,502. For 150 vessels or 150 acres ?—150 acres.

18,503. What is the depth of water now upon the Bransand at low-water spring tides ?—It is dry at low water.

18,504. And that is a part of your anchorage, is it not ?—No, the anchorage is on the opposite side. The anchorage I expect to be scoured out by the action of the current where it was formerly; that is, towards Seaton Snook.

18,505. Do you mean to anchor vessels in the channel only, or keep the whole space between the south pier and the guide wall as anchorage ?—I do, leaving a channel for traffic of 100 yards in width.

18,506. Am I to understand that your anchorage is to be the westward of the guide wall near the Bransand—on the west entirely, and not to the south? —Yes.

18,507. Will you point out to me where your entrance to your harbour is to be ?—Close by the north pier ; the channel will be scoured out to about 700 yards in width.

18,508. Will not the scouring extend to the east pier, also to the south pier ?—Only at the outer end.

18,509. What is the reason for not carrying the same guide wall from your channel, from the eastern side of your channel, down to your eastern pier ?—I think it will not be necessary. I will construct the north pier to about 2,000 yards, and I expect the South Gare by that means will be washed away and lodged partly within the south pier, and form a well-defined low-water sand edge, but principally behind the north pier.

18,510. Then do you think the sand of which the South Gare is now composed will not go out beyond the harbour's mouth, but will turn round and lodge against the wall of the northern pier ?—If the north pier is carried out to that extent before the south pier is carried out beyond low water.

18,511. Have you bored the South Gare ?—Yes, it is composed of sand to the depth of 21 feet.

18,512. Is it hard compact surface, or has it a tendency to move ?—It has a tendency to move.

18,513. Are you prepared to say that the South Gare is shown upon this plan as an exact configuration? —I am not.

18,514. And are you prepared to give in a plan to show how far it deviates from the plan of the Admiralty of 1853 ?—I have not made a survey, but if I was to make a survey of the Gare to-day I might go a fortnight afterwards and it would be quite different, the changes are so frequent.

18,515. Does the North Gare change much ?—It changes, but not so rapidly and frequently as the South Gare.

18,516. Is the South Gare increasing or decreasing? —The South Gare is decreasing, that is, lowering in its surface. We always have an improved depth of water when the South Gare is high. It is now very low, and consequently our channel is nearly a mile in width, and we have a loss in depth of water.

18,517. Your channel is now to the west of the South Gare ?—Yes.

18,518. And you are going to form your wall over this channel, and form a new one ?—I am.

18,518*a*. Of considerably greater width ?—Something about the same width as it is now, about 100 yards wider.

18,519. What is the interval between the North and the South Gare ?—1,800 feet.

18,520. And what is the width between your pier head ?—700 yards.

18,521. Then that is wider than the present channel? —It is further out.

18,522. Then the estuary of the Tees will be enlarged to that extent ?—Yes.

18,523. (*Mr. Lindsay.*) I think you said the estimate of your plan was 280,000*l.* ?—Yes.

18,524. And that was for the construction of your piers upon Abernethy's plan ?—It was.

18,525. Do I then understand you to say, if an extended plan was adopted you would not consider it feasible to adopt Mr. Abernethy's plan in that case ? —I do not think I said that, but before I did not adopt it. I would make myself satisfied it was sufficient.

18,526. You are not satisfied now ?—After I have heard that at Nairn it has failed. I have seen it at Blyth, and I considered it was as much exposed there as it would be at the Tees, and I saw no indication of any failing there.

18,527. Speaking to you as an engineer of considerable experience in these works, what would be the cost of these piers constructed in the usual way ?— With the facilities for obtaining material which we have, they might be constructed for under 400,000*l.*

18,528. Now between these piers you have got the North and South Gares, the Bransand, the Seal Sand, and various other sands, and I think you said all the shifting sands ?—No, I said the South Gare only.

18,529. You have got within the limits of these piers, for which 400,000*l.* will be required, all the sands I have named. Now, speaking to you seriously, and looking on this chart before me, do you think it would be advisable to spend 400,000*l.* of the public money to enclose these sands, and make the site you have pointed out a harbour of refuge where ships could run to in the prevailing gales of wind, and there anchor ?—I do.

18,530. Now tell me how many ships drawing 18 feet water could anchor within the limits of these piers in a gale of wind which blows right in. Have you calculated that ?—That will entirely depend on the arrangements which are made ; I could lay down moorings in the anchorage as we have at present at a very little cost.

18,531. Where will you lay the moorings down ?—I have had applications to lay them down at the fifth buoy, and I would lay them down there.

18,532. And what anchorage would you have ?—I have no doubt, when the channel is regulated, 2,000 vessels.

18,533. What depth of water do you expect to get up to the fifth buoy at low-water spring tides ?—About 18 feet below the fifth buoy; the water is as deep as 7½ fathoms in some places.

18,534. You intend to sluice the channel, as I understand, through the South Gare ?—Yes.

18,535. Or cut the channel ?—Either way, sluice the channel.

18,536. Do you think you will be able to sluice the channel through that sand-bank and a depth of 18 feet water, low-water spring tides ?—Yes, to 30 or 40 feet in some places. I have seen it sluiced to that extent twice within the last 12 years. The channel to the fifth buoy pool, in the higher part of the fifth buoy pool, is nearly double the area it was when Mr. Calver's survey was taken, and it can be sluiced as much and as far as it has been in former times, to my knowledge.

18,537. What sand is there at the North Gare at the present time ?—The sand will range from three to six feet at low-water spring tides above low water level.

18,538. Then it is six feet dry at low water, consequently you will be obliged to sluice a depth of 24 feet to get 18 feet low water-spring tides ?—Yes.

18,539. I am ignorant of these matters ; I am no engineer, but I want to get some information, and I can only get it from such men as yourself; do you mean to tell me, looking at this apparently tortuous river, you can bring a force of water down this river that will drive through a sand-bank for a channel to the extent of 24 feet depth, and maintain it ?—I do; it has been done, and in more than one instance, in the Tees already. Not to that extent, but it was because it was not so well situated, and in fact, to do it we had not the same bottom, but I myself have constructed works which have had the effect of making the channel where the sand was 4½ feet, and these works were done above low-water level. We have now from 12 to 14 feet low water, which is 14 or 16 feet scour. And if you compare it with Mr. Calver's survey, you will see that a deepening of the channel, and a great straightening of the same, has taken place near Jack-in-the-box, and, reasoning from the effects which these works have already produced, I have no doubt that when the works are carried out as the Commissioners intend, the channel will be scoured out at the fifth buoy considerably beyond its present area.

18,540. Then you give it as your opinion, as an engineer, after calm consideration, that looking, to the course the river has to take, you have no doubt you can at the North Gare drive away the sand by scouring the river so as to make the channel 18 feet depth at low water, which is now dry at six feet ?—I have no doubt whatever.

18,541. I understand you do not think it prudent to give a roadstead ?—No.

18,542. (*Capt. Washington.*) You have been long a resident on the banks of the Tees, I think, Mr. Fowler ?—I have been 12 years here.

18,543. And you are well acquainted with the river ?—I am.

18,544. Within what limits have you seen the channel entrance of the Tees within 12 months ?—I think it ranges about one mile and a half.

18,545. Can you give it me in the points of the compass ; have you ever known it as far easterly as east ?—I have ; I have known it east by north. That was the most easterly.

18,546. And what is the most northerly point you have known it vary ?—I think it varies nine or ten points. I have seen it west by north, but whether it was west by north or north-north-west, I am not sure.

18,547. Do I understand you in the present state of the river you have seen it vary to east and to north-north-west, that is, eight points of the compass?—Yes.

18,548. Now, which of these points have you the best water over the bar ?—In 1847, the first year I was upon the Tees, the channel was to the westward. It was something in very nearly the same form as Hewitt's survey of 1832. There was as much as 12 or 13 feet at low tide.

18,549. What was the direction at that time ?—North by west, or something near that, was the direction. Then, where it was in its most southerly position, I have seen 10 or 12 feet. I do not remember what it was when the most water I have seen, but I have seen between 11 or 12 feet when in its most easterly position.

18,550. And also in its most northerly position ?—Yes.

18,551. Do you think the direction has nothing to do with the depth if over the bar ?—I think not. I believe it depends more upon the height of the Gare Sand on either side of the channel.

18,552. What direction do you propose to give your entrance ?—About east by north.

18,553. Is it so on the design you have laid before the Commissioners ?—I believe so.

18,554. And that was your intention ?—It was.

18,555. Have you adopted it purposely because it was in that direction you found the best water ?—Because that is the direction which will answer all the winds that are most dangerous along the coast.

18,556. East by north is the most prevailing wind on this coast between Flamborough Head and the Staples ?—It is.

18,557. I think you said you had had borings through the Seal and Bransand ?—There were borings taken, but not under my direction, on the Bransand, Seal Sand, and Tod Point. I also bored on the North Gare and South Gare.

18,558. To what depth ?—I did not bore below the clay.

18,559. At what depth did you reach clay ?—Starting from the inner end of the pier, clay is reached about five feet below the level of the sand, that is, from the land end of the pier. Then at low water the clay appears, and as we go out until near the channel on the North Gare the clay is at a depth varying from three to four feet. Then beyond the North Gare, at the edge of the channel, it is six or seven feet, and it deepens until outside the South Gare it is about 33 feet.

18,560. The depth of sand is 33 feet ?—Yes, outside the south pier in the bay.

18,561. Clay or sand ?—We get clay at 33 feet below low water spring tides.

18,562. And then how much sand do you get ?—Three feet.

18,563. I wish to know at what depth from the surface of the sand do you reach the clay generally ?—The sand shifts so much; there is about eight or nine feet of sand upon the North Gare; when it moves more to the southward on the outer end of the Gare there will be more sand and the clay is deeper. At the westernmost part of the Gare the clay is about six feet below the surface. On the north side of the pier it lies about 3 feet or 3½ feet.

18,564. Is it clay generally in the present channel ?—Generally it is clay.

18,565. Where vessels ride in the different pools ?—Yes.

18,566. Is it good holding ground ?—It is.

18,567. And it is through the sand you propose to scour, and not through the clay?—Not through the clay. There was another reason why I brought the channel more to the south, to clear that clay which is called the fourth buoy scarp.

18,568. You are not in favour of running out a pier or jetty from Seaton Snook Point in a south direction ?—No, I think not. I do not see what purpose it would serve.

18,569. Was that not a proposal made formerly by the Tees Commissioners ?—No, it was in an easterly

REDCAR.

Mr. J. Fowler.

20 Oct. 1858.

Capt. Washington.

direction that they proposed running it out. Originally the proposition for Seaton Pier by Mr. Bald, was running it in an easterly direction.

18,570. Can you tell the Commissioners the slope of the bed of the river Tees?—The difference of level at low water from the bar to the Bransand tide gauge is about six inches.

18,571. I think you have told us the tide flows up 27 miles?—Yes, taking the course of the river from the far-away buoy.

18,572. On the rise there is 16 feet?—Yes.

18,573. Will that not be nearly three inches a mile the whole way?—Yes.

18,574. Is that a very small slope for the bed of a river?—There are many rivers where the slope is much smaller.

18,575. Do you happen to know the slope in the neighbourhood of the River Wear?—I do not remember it. There are parts of the Tees where the slope is very great—13 inches to the mile; that is just in the gorge going over the eighth buoy pool. The lower part of the river, it is about six inches.

18,576. Is that before the improvements?—I have not taken the slope since then, but before the improvement commenced the slope was about three inches to the mile to the eighth buoy. Then again, from the Jack-in-the-box, the slope was about six inches per mile up to Middlesborough.

18,577. But take it from the bar to the source, the general average slope is about six inches per mile, is it?—Oh yes.

18,578. Of the rivers in the north-east coast of England, between Flamborough Head and the Farn Islands, has the Tees generally a greater depth over the bar than any of the others?—It has.

18,579. Do you attribute that in any measure to the small slope in the bed of the river?—Yes, and the estuary together. The quantity of tidal water that comes in is so large in proportion to the land water.

18,580. Is the approach to the Tees well buoyed and lighted?—Yes.

18,581. By the Tees Commissioners?—Yes.

18,582. Is there any one in the room, pilot or anyone, who can speak to that point?—Yes.

18,583. Are the lighthouses and buoys under your charge at all?—The buoys in the lower part of the Tees are not under my charge. (The Trinity Houses buoy agent will be here.) The lighthouses are under my charge. We move them as the agent of the Trinity House orders them to be moved.

18,584. They are kept up entirely at the expense of the Tees Commissioners?—They are.

18,585. Will you state the whole revenue derived from the river, at the disposal of the Tees Commissioners?—I cannot exactly state that. The next witness, I believe, will be able to do it.

18,586. Did you say the buoys were under your charge in some measure?—Above the ninth buoy, but the principal buoys in the river are not under my charge.

18,587. Why are the buoys coloured exactly the opposite colours to any other river in the United Kingdom, I believe?—Why are they black on one side and red on the other, do you mean?

18,588. No; what side is the black approaching seaward?—On the right hand.

18,589. And the red on the port end?—Yes.

18,590. Is that not contrary to the general buoying around the country?—I believe it is, but I do not know. I have not taken much notice.

18,591. Is there any particular reason for that?—Not that I know of.

18,592. (*Capt. Sulivan.*) What is the height on this South Gare above low water?—I think the greatest height I ever saw was 3 feet. Now it is scarcely visible at low water.

18,593. You said the mouth is moving towards Seaton Snook Point?—Yes.

18,593*a*. Do you fancy it moves more rapidly?—It goes from east to west periodically over a number of years, and then it breaks out at east again and continues to move to westward. The tendency for a number of years, however, has been to westward.

18,594. On the whole you believe the tendency is to throw the silt and sand on shore more in the direction of the South Scar and Long Scar at Hartlepool?—Yes.

18,595. You said the bay at the south of Long Scar Head silted up two fathoms in the centre, comparing it with the old chart?—Comparing it with the old chart in front of the stone, that is the case.

18,596. That is the bay south of the Long Scar rocks?—Yes.

18,597. Have you any old chart of that day, showing the depth on the Long Scar in Hartlepool?—The same chart shows the depth. There is only one sounding. Two or three depths are shown on the line.

18,598. Shown from the head to the end of the rocks? Can you give the name and date of that charter, in order that we may put it upon record?—Dobson's, 1787.

18,599. Does it state what the soundings are registered to?—Yes, it does.

18,600. The soundings are given from the half tide to the mean level of the sea?—Yes.

18,601. And you have reduced these in the calculations you have made?—Yes.

18,602. What is the depth given in Hartlepool?—Four fathoms at the place where the three is now.

18,603. Will you send me that chart? [*Chart put in.*] You say these are given at the state of the tide?—Yes.

18,604. And upon that, four, is marked in this chart as near as one can guess, for it is certainly somewhere near where the three, is marked on the other chart; but if there are so many references, you have got to look for more than one fathom?—Yes, on that chart; but here is one by Pallister Thompson in 1815, at low water spring tides, and this is from the original, at the Admiralty.

18,605. Are these soundings reduced to low water or mean?—Low water spring tides.

18,606. Can you make us the present of the chart?—I can.

18,607. The other I will not trouble you about, because I think it may be considered quite valueless. This one I think you can hardly put any dependence on?—Not for the feet, but for the fathoms I think it would be. I do not find the pilots are very much wrong in the soundings, although they may not come to a foot or an inch.

18,608. Will you look where it is four fathoms in Hartlepool Bay on the chart you are looking at?—There is about three at present.

18,609. And suppose the rise and fall to the same be then as now, it is almost certain there is rather more water in Hartlepool Bay than there was by this chart?—Yes.

18,610. (*Capt. Vetch.*) When you say Tees Bay proper, do I understand that which is enclosed by a line drawn from the Seaton Point to near Tod Point upon the other side. Is that Tees Bay proper, or the estuary?—That is the line I have measured the area of the estuary from.

18,611. Is the estuary, as you call it, about 3¼ miles wide at its mouth, viz., from Seaton Snook to Tod Point, and that Tees Bay proper lies outside; and does not the river discharge into the bay near No. 4 buoy? Is it not from Seaton Snook to Tod Point?—Yes.

18,612. Does the river discharge into the Bay near the fourth buoy?—Yes.

18,613. Is the channel of the river pretty constant?—There is very little difference in the width of the channel there.

18,614. Does it move to the east or west at all?—It moves from east to west.

18,615. How much do you suppose it moves in the course of a number of years?—I think within my own knowledge it has moved 80 fathoms. It is now

going back, and we know this because we have moved the light ship twice to the south, a distance 40 fathoms at a time.

18,616. Do I understand the channel at the fourth buoy has moved 80 fathoms within your knowledge? Can you state how far the entrance of the river has moved one way or the other in your knowledge?—About eight or nine points of the compass—a mile and a half in position.

18,617. I want to know the amount eastward or westward?—Looking to the chart, I think it would be about a mile.

18,618. But at the entrance has it moved a mile within your knowledge?—Yes.

18,619. Have you any buoy at the mouth to show the depth of water there?—We have.

18,620. At the outer buoy, I mean?—I suppose you mean the bar buoy.

18,621. I mean the bar buoy?—The depth of sand will be about 20 feet below the soundings that are given at this time.

18,622. Twenty feet of sand below the soundings, which are there about one fathom and a quarter?—From, I should say, rather 18 feet.

18,623. The sand exists from that down to about 20 feet?—18 feet.

18,624. I think you said that the South Gare Sand travelled from east to west, and when it got to the extremity it moved back again?—It does.

18,625. To what extent will that amount to?—The greatest distance will be about a mile. It moves from east to west, and when it moves west it breaks out in a new channel, and we have two channels.

18,626. But when it gets back to east or west, where have you the greatest depth?—I have seen it deepest in both extremities; on the whole, in the middle.

18,627. By what means do you propose to guide the stream out by the pier guide wall coming down to the point?—We give the ebb tide a set upon the pier.

18,628. Then that pier is to be constructed upon 20 feet of sand, is it not?—It is.

18,629. How will you effect that—by piling?—Yes. I will drive a staging, commencing at the inner end, and bringing the material upon the staging, turn it down.

18,630. Then you expect by running out two piers, one on each side, you will drive away the sand sufficiently to scour the mouth down to what depth?—16 or 18 feet. I do not know if the seven-feet bar would be identified in the smaller design.

18,631. Will you have one pier or two piers?—One pier in the smaller design.

18,632. Will one pier prevent the sand coming in from the opposite side of the narrow channel?—I believe the current out will counteract that tendency.

18,633. The amount of backwater will counteract it?—Yes.

18,634. Then you expect by means of this guide wall to drive out the sand with greater effect?—Yes.

18,634*a*. And to clear the entrance?—Yes.

18,635. May not the direction in which the sand is carried be diverted into Hartlepool Bay?—It will be diverted. The outflow of the tide will be diverted from Hartlepool roadstead.

18,636. From Hartlepool?—Yes, by the construction of the pier.

18,637. What will be the depth of the water at the pier head?—Very considerable at the right hand, approaching Hartlepool.

18,638. Suppose you succeed in driving the sand of the channel confined by the pier, would it not again deposit in front of the new entrance, and form a bank there?—I have no doubt it would, to a certain extent.

18,639. And that bank would be in the direction between the mouth of the Tees and the roadstead of Hartlepool generally?—Yes.

18,640. So that if a bank was formed there with strong easterly gales, that bank might be driven into the entrance of Hartlepool Bay?—I think the sand will ultimately lodge behind the north pier.

18,641. Now, considering that the north and south piers will be on banks of sand that run out nearly a mile from the mouth of the estuary, and which shift to the extent you say, do you think it at all likely that a mass of moving sand would settle and get firmly fixed at the mouth of the estuary?—The sandbanks near the entrance on both sides of the channel are low, and are consequently moved about by every wind and wave; but when the works have been constructed so as to guide the channel permanently, and prevent the action of the wind and waves, the sand becomes firm, and the sand edge well defined.

18,642. But after spending 200,000*l*. upon these sands, which at present are constantly moving, have you any conviction it would be effectual?—I am quite convinced it would be effectual. When I say I am quite convinced it will be effectual, I understood your question to refer to the channel and the shifting sand within the pier.

18,643. By-and-by we shall be able to see your plan, and consider it more at leisure.

18,644. (*Mr. Coode.*) Can you tell us of any place which has been similarly treated to this proposal of yours? Can you name a place where we can see anything of a similar mode of treatment attended with success?—Do you mean the inner or outer piers work?

18,645. I mean the mouth of a river such as the Tees, treated in a manner similar to that which you now propose, and I ask you if you can tell us of any instance, and what the result has been?—I believe the water has been considerably deepened at Harwich by certain works that have been constructed there. At Aberdeen, too, the water has been considerably deepened; but if your questions have reference to the extension of the piers in deep water, I am not aware of a single instance in which that has been so.

18,646. Then the only two instances you have named are Aberdeen and Harwich. Can you say Aberdeen has been attended with success?—To a certain extent it has.

18,647. To what extent?—I believe originally the water was four feet low water spring tides; I think now it is nine on the bar at Aberdeen. The mouth of that river is different from the Tees. The Dee is a large river with a great slope upon its bed, consequently it carries down with it a large quantity of gravel and rough sand, which is not the case in the Tees, and therefore there is a stronger tendency to form a bar than there is in the Tees.

18,648. Is there anything like a similar amount of material to form a bar in the river at Aberdeen that there is here?—At the north side there is.

18,649. Do you speak of the result of Aberdeen from your own knowledge, or from hearsay?—Not from my own knowledge.

18,650. Have you any doubt on the question of the benefit which has been obtained at Aberdeen? I want facts; I do not want your idea. Can you tell us the effects?—I have not sounded the bar, but from the vessels I know pass out and in, and from what could pass before, I know it has been improved.

18,651. You speak of vessels going in and out; do they go in at low water?—Very near low water. The London steamers are built to draw 10 or 12 feet, and they are the largest steamers trading to London. They were not capable of entering the river before the construction of the works.

18,651*a*. Has anything of a similar kind been done at Harwich, or has the deepening there been effected by means of dredging?—I believe by means of dredging.

18,652. Then that is not a parallel case to that you propose in the Tees?—Not exactly a parallel.

18,653. You spoke of the immense scouring power in the Tees. Are you satisfied there will be that enormous power which you referred to, two or three

REDCAR.

Mr. J. Fowler.

20 Oct. 1858.

Mr. Coode.

times ?—I do not see anything which will lessen the power. There is an immense scouring power now.

18,654. Have you measured the rate of the ebb tides in freshes ?—I have ; I have measured the rates of ebbs and flows as well.

18,655. Will you give us some results of your trials ?—Yes ; but in connection with this I would state that its connection with the rate of tide and what is produced by the current now has no proportion to what will be, because it is spread over a large surface. And when I speak of the rate, I do not think the rate will be materially increased because the channel is narrowed. It does not depend upon rate alone. A shallow stream with a great velocity has not great power for scouring sand away; a deep stream with less velocity has very great power. I have taken the rate of current in the Tees on several occasions and at nearly every part of it, and I find the greatest velocity at the narrowest part below the light ship was $4\frac{1}{2}$ statute miles. That was at the fourth buoy in the ebb, and half tide with a fresh.

18,656. What was the breadth at half tide?—It would be about 1,100 feet.

18,657. That was at the floating light ?—Immediately below it, at the fourth buoy.

18,658. To what extent do you propose to reduce the mouth of the estuary at that point ?—I propose to widen it very considerably. I want no more power there, because the last time I threw the lead over there I had 45 feet low-water spring tides.

18,659. Then the fact is, your pier might have the effect of widening the passage very much ?—I think it will, for it is kept narrow by the north-east wind bringing in the sand, and the pier, I expect, will have the effect of keeping that out. In fact I am quite certain of that.

18,660. Then the form of channel occasionally moves near the light ship, and sometimes the greatest depth of the channel is in one part and sometimes in another ?—By the inner work I propose to construct, the current will be guided permanently in one direction. Then I have kept out the sand which fills up the channel in gales from the north-east, so that all the force of the currents will be exerted to scour the channel out to the north. Then the force that has a tendency to fill it up is prevented from going upon it by the piers, and in that way I expect the channel will be widened considerably ; perhaps there may not be so much depth, but this depth is considerably greater than we require.

18,661. Do you mean to say the result of your works will not increase the stream in any way ?—I think it will not materially increase the stream ; I think it will equalize it more.

18,662. You say not materially, then you imagine there will be some increase ?—I would not like to say what effect these piers may have in increasing the rate on the bar.

18,663. You have $4\frac{1}{2}$ miles now ?—Yes, and I expect that will be reduced to three. As the rate and character of the wave upon the bar has been spoken of, I wish to state what I have found the rate upon the bar in spring tide to be.

18,664. Will you give the results, shortly ?—On 8th September last, the morning tide ranged 19 feet 6 inches, and at half ebb with the wind west-north-west, strong wind, the rate of current was 17 fathoms on the bar in 35 seconds, the average of two trials 6 feet below the surface, that is rather more than $1\frac{7}{8}$ mile per hour.

18,665. Is that the greatest velocity you have at any time ?—It is the greatest I have found.

18,666. How often have you measured it ?—That is the third time in spring tides.

18,667. What is the grestest velocity you have had at any time in any part of the site of the proposed works ?—Not $4\frac{1}{2}$ miles.

18,668. You say you propose to concentrate the force ; if you do, I do not see how you can avoid having some increase, at any rate ?—I might concentrate the force and not reduce the sectional area of the channel. If I reduce the width and increase the depth I obtain a greater force and a channel 16 feet deep, and half the width will only have about the same rate.

18,669. By reducing the channel you do not apprehend difficulty in keeping the current the same ?—No, because the power of scouring depends upon the rate, and depth.

18,670. You say the best of stone may be had ; where is that ?—At Marske, nearly five miles from here.

18,671. What kind of material will you obtain there ?—Red sandstone.

18,672. Will it stand the action of the water and the weather ?—Yes, well.

18,673. Do you get it in large sizes ?—Yes.

18,674. To what extent ?—I have not measured it, but I went round it. For in some places it appears at the surface.

18,675. I mean as to the size ; will you get blocks of large size ?—Yes, I can get blocks of seven or eight tons.

18,676. And at what rate do you expect to get these stones delivered on to your works, including everything ?—At about 2*s.* 6*d.* per yard.

18,677. And you will bring them five miles for 2*s.* 6*d.* a ton, will you, and get them delivered at the works ?—Yes.

18,678. Does that include the price of staging ?—No.

18,679. Perhaps you will send to the Commissioners transverse sections of the works which you propose, and also some general particulars of estimate under a few heads, not in great detail, stating where you propose to find the material, and at what distance from the works ; the Secretary will furnish you with the arrangement of scales which we require ?—Yes, I will do so.

18,680. Is the material on the Seal and Bran Sands, alluvial matter or sea-sand ?—It is sea-sand.

18,681. Without admixture of matter from the river ?—Well, I think there is a little alluvial matter on the top.

18,682. At what point does the material brought in from the sea meet the material brought down from the river ?—I have not observed any of the materials from the river lodge above half a mile below the Jack-in-the-box in this plan.

18,683. About half a mile seaward from the Jack-in-the-box ?—Yes, inside there is a deposit of vegetable matter brought in from the sea, but I do not mean to say no matter will lodge lower down that.

18,684. You said you proposed to adopt what you call Mr. Abernethy's system, as is done at Blyth ?—Yes, I do.

18,685. Do you know the level at which the piles terminate at Blyth ?—Yes.

18,686. Will you state to us what it is ?—I cannot tell within a foot or two ; they do not extend to low-water spring tides.

18,687. Have you made your estimate according to the rate named in Mr. Abernethy's statement before the Committee of the House of Commons ?—No, I have not ; I have made it according to my own rate.

18,688. You have made allowance for the different circumstances, have you ?—Yes.

18,689. Are you satisfied that it will be a permanent structure ?—No.

18,690. How will you propose to deal with it, if, after a few years, any repairs become necessary ?—I think it may be built in masonry. Almost the same plan has been adopted at Sunderland, West Hartlepool, and Leith.

18,691. Then your estimate does not include the total cost of the work, but only that which carry them on to a certain period of time. When do you expect it would be necessary to construct these masonry walls you speak of ?—Perhaps in 30 or 40 years. It would stand, except occasional repairs by creosoting, it might stand for 50 years.

18,692. Do you think it will stand 30 or 40 years

without repairs being necessary ?—I do not think it will without some repairs.

18,693. Then, when do you think the repairs will become so heavy that it will be desirable to build the masonry wall, remembering that these works will be exposed to a considerable depth of water, whereas at Blyth they have scarcely been carried to low water? —I should say not more than 30 years.

18,694. And you think they will last 30 years without the necessity for the masonry wall ?—I think in 25 years the repairs will not be heavy.

18,695. And you think they will stand the occasional gales and wind for 25 years ? And do you give that as your deliberate answer ?—I think it will, if fairly built.

18,696. Have you seen some works at Nairn which were constructed under Mr. Abernethy's direction ?—They are works on a similar principle, but were not constructed by him.

18,697. Have you ever seen them ?—No.

18,698. Do you know what their condition is at this moment ?—I do not.

18,699. You have not heard that they have been materially damaged ?—I have not, except just now I have heard that they have not answered as well as was expected. In giving in the estimate of the cost of doing it in permanent masonry, I made an error ; I should have stated 400,000*l.* to 500,000*l.* as the estimate, instead of 400,000*l.*

18,700. In your evidence before the Select Committee of the House of Commons, in answer to the question (4335), " This slag appears to be much heavier than any stone or rock," you say " Yes ; from the weight I have taken, it runs about 20 feet to the ton " ?—I stated that granite was between 13 and 14 feet. I had not taken the weight so correctly as I have done since, and I now find it is 17½ feet to the ton.

18,701. Then you mean to say you said " Yes," when you should have said " No " ?—I did not say " Yes." I said it was not, and said that the weight very much varied, and that granite only ran 13 or 14 feet.

18,702. I see no such weight in your evidence. I suppose you had an opportunity of correcting this ?—Well, the quantity was not reported, but I had an opportunity of correcting it.

18,703. Did you correct it ?—I did.

18,704. Would you answer the question differently now from what you did then ?—I did not answer the question, except in regard to weight. It was 20 feet.

18,705. You now say only 17½, and the rest of your answer will remain the same ?—Yes. I distinctly stated that the quantity very much varied, and that was not reported.

18,706. Does any stone about here require as much as 17½ cubic feet to make a ton ?—No ; I think it is heavier than that.

18,706*a*. You said you made your estimate for slagging so liberally, that stone could be obtained at the same money, you had no doubt. At what rate did you put down that slag ?—It comes to about 2*s.* 6*d.* per yard. I have taken it very much in detail, and taken everything.

18,707. Was that the same rate you named to the Select Committee of the House of Commons ?—Yes, taking everything, it was.

18,708. I see in Answer 4330, wherein you make reference to the cost of these works, you say the total cost will be 1*s.* 3*d.*?—Yes ; but I add the price for construction, the waggons, towage, and all the timber work, and 20 per cent. contingencies after all.

18,709. Then the cost you gave the Select Committee of the House of Commons was not the total cost ? —It was the total estimate of the price, but the other material was not detailed.

18,710. How much is that to the ton ?—17½.

18,711. In reply to Question 4335, you say, " Slag is 20 feet to the ton." How do you reconcile the two ? Was that a mistake ?—Yes.

18,712. Then the " Yes" in the other part of your answer will require correcting also. It does not weigh much heavier than any other stone or rock, not even when reduced to 17½ cubic feet per ton ?—It does not ; but I ought to explain that the slag is taken as it is run in. I have no doubt but that if run properly it would weigh heavier, where it was necessary to do so, but in the great body of the work I do not think any additional core would be required, because it was found to be less to the ton than 17½.

18,713. Did I understand you to state, in reply to one of the Commissioners, that 100,000,000 tons of salt water has run in and out over the bar every 24 hours ?—Yes, every 16 feet spring tide there was this within the estuary.

18,714. You reported to the Tees Commissioners on some improvements which you suggested for the improvement of the mouth of the Tees ?—Yes.

18,715. In that report I see it is stated 400,000,000 of tons flow over every 24 hours, which quantity is right ?—I misunderstood your question. I said every tide.

18,716. I ask you again. I read from your notes, which were " 100,000,000 tons of salt water every 24 hours." You said that ?—Every tide.

18,717. Then you mean there are 100,000,000 tons of salt water which will pass over the bar at every ebb and flow ?—Yes.

18,718. Spring tides rise 16 feet ?—Spring tides, and neap tides about half that quantity.

18,719. Now, as to the form of that deep water channel which you expect to produce within these proposed works, have you formed any idea in your mind as to the form the channel will be ?—I have.

18,720. What direction will it take towards the mouth or entrance ?—North, or in a northerly direction until it is beyond the light ship. That is the point where I expect the sand will be scoured away until it comes to hard ground. It will be conducted along the edge of the hard ground and along the edge of the north pier into the bay.

18,721. And the breadth of that channel at low water, what do you expect that to be ?—Perhaps from the light ship from 1,500 to 2,000 or 1,800 feet.

18,722. In breadth at low water ?—Yes.

18,723. How much greater will that be than at present ?—That will be about the average breadth of it, with the exception of a narrow gorge at the fourth buoy. The breadth of the channel below the fourth buoy will be 1,800 feet. and the breadth above is above 1,800 feet—about 2,000 at the narrows, in this chart about 1,900 feet.

18,724. You proposed to lay down moorings at the fifth buoy ?—Yes.

18,725. What was the object ?—To moor vessels to.

18,726. Vessels coming in in gales of wind ?—Yes.

18,727. You proposed that vessels coming in to take refuge shall use these moorings ?—Yes.

18,728. Do you not apprehend that vessels coming in on a dark night will not bring up at those moorings, and so prevent others getting up the channel ?—No.

18,729. You do not think if a man came in at night to take shelter, he would bring up as soon as he found himself in moderately smooth water ? You think he would run up the channel to make room for others ?—The small vessels would, I have no doubt. They always do run well up.

18,730. But if large vessels happen to come in first and bring up, that would prevent the smaller vessels getting further up ?—The large vessels would take the deeper water, and the smaller vessels could go where the large vessels could not.

18,731. And you think there would be a general understanding among them as to the appropriation of the channel ?—A vessel coming into the harbour requiring the greatest depth of water will take up a position, and the other vessels not requiring so much water would be able to put them to where they found a favourable position.

18,732. Then this improved channel of yours will be so arranged that each shall find accommodation,

REDCAR.

Mr. J. Fowler.

20 Oct. 1858.

Mr. Coode.

and there will be room for 2,000 vessels ?—I do not think that will ever be required.

18,733. Suppose a lot of large ships should come in first, which is more than probable, this being the nearest the mouth of the river, would they not bring up in deep water ?—They naturally do so. They run as far up as they possibly can, and in the Tees it is not like a harbour in a bay. There is no bight. A great many vessels prefer running on the ground to being off it.

18,734. You spoke of men taking up positions. From your experience, do you think that if a man came in and found sufficient water, he would run up the river because he had been accustomed to do it ? —I find the smaller vessels usually try to get up and leave room for the larger.

18,735. That is as matters are now ?—Yes.

18,736. Will you present to the Commissioners the results of borings you made over the bar and through the proposed channel ?—I will do so.

18,737. You spoke to one point near the fifth buoy where the water had been very much deepened ?—I have ; in the Jack-in-the-box I spoke to its having been very much deepened.

18,738. Not the eighth buoy ?—No.

18,739. What is the rate of water above that channel where the great deepening took place ?—Six inches per mile.

18,740. And the rate below that ?—About nine inches per mile.

18,741. But you think that the hole would not in any degree affect it ?—No.

18,742. To what would you attribute it ?—I attribute it to the fact that the current will spread over a large surface.

18,743. Do I understand you that the spreading of the current has the effect to make a deep hole ? —Not a deep hole, a deep channel.

18,744. A deep channel will be the consequence of the current being spread over a large surface ?— The consequence of the direction of that channel concentrating it. It originally spreads over a large surface, and the effect of our works will be to deepen it.

18,745. That was the effect of the works you were constructing. You said in answer to Captain Vetch that you had known the channel move to the extent of a mile within your experience ?—Yes, I have about one mile.

18,746. When you first knew it, was the mouth more in an easterly or a northerly direction ?—It was at its extreme north point.

18,747. And it worked back towards the east ?—No, it broke out at the east. It does not work from west to east, but from east to west; when it gets to the extreme west another channel breaks out to the east of that channel, and gradually becomes a principal channel.

18,748. What depth of water did you find at the bar when the depth of water in the two was about equal ?—Seven feet six inches. There was a greater depth in the old channel, but the new channel was straight, and when it had not a depth of seven feet six inches the line of buoys was removed into that channel.

18,749. At that time there was a greater depth than now in the old channel ?—There was, but it was corrected.

18,750. Did the seven feet six inches channel deepen rapidly over that period ?—It was in 1848. The lines were shifted, and when the Admiralty steamer was down in 1851 there was a depth of 11 feet on the bar.

18,751. There was a gain of between three and four feet between 1848 and 1851 ?—Yes, I think there was a shoal.

18,752. At what rate did the channel progress towards the north in the course of a year, or say over a period of years ?—In exactly 10 years ; and, very singularly, the buoy agent's letter was dated exactly on the same day 10 years, and it gave us notice to shift the lights to the same position.

18,753. And was the progress uniform over that same period ?—No; it took some moves back to the east, and the depth was sometimes a foot or two less, sometimes a foot or two more.

18,754. Varying according to the prevailing winds, I suppose ?—Varying according to the particular winds.

18,755. (*Chairman.*) Did Mr. Bald make any estimate of a breakwater at Seaton Snook ?—Yes.

18,756. What was the amount of his estimate ?— I think the full estimate was 100,000*l.* or a few thousands under ; about 97,000*l.*

18,757. Is the breakwater shown on the plan in the position suggested by the late Mr. Bald, the Admiralty inspector ?—The position, but not exactly the same form. Mr. Rendel was the first to suggest that form.

18,758. (*Capt. Sulivan.*) In giving a tracing of that chart will you insert the figures so that they may read to the southward instead of to the northward, as now, so that they may correspond with the Admiralty chart ?—Yes.

Mr. JOHN FRASER examined.

Mr. J. Fraser.

18,759. (*Chairman.*) You are a civil engineer, and reside at Norton ?—I do.

18,760. (*Sir F. Smith.*) For what object do you appear before us to-day ?—At the request of the Tees Conservancy Commissioners, to examine the soundings across the bay on one side and the other, and to give an opinion as to the best place that I imagine would suit for a harbour of refuge in Tees Bay.

18,761. Do you concur generally with the opinion expressed by the last witness ?—I do, quite.

18,762. Is there any difference between you and him ?—I cannot say there is.

18,763. Then I won't ask you any questions. Have you some soundings you brought with you, as shown on this plan ?—This plan shows the soundings that have been taken, and also the proposed harbour of refuge, with the section of a site.

18,764. Do these soundings differ from the soundings on the chart of the breakwater ?—Very little, except the three-fathom line in Hartlepool Bay.

18,765. I perceive this is not a corresponding plan or copy of plan of Mr. Fowler's ?—It has nothing to do with that.

18,766. Then you do not appear in conjunction with Mr. Fowler ?—No.

18,767. But with a rival plan ?—No, not a rival plan ; but I accompanied him to take the soundings, and give my opinion as to which was the best site in the bay.

18,768. Then this is a totally different mode of dealing with the subject ?—Quite so.

18,769. Then I am afraid I must trouble you with an examination ?—My plan does not refer to the drawn river, although it is there merely to show the entrance.

18,770. I perceive, Mr. Fraser, that you deal with the Tees as part of your scheme, and that you also enclose Redcar Rocks ?—Merely showing Mr. Fowler's plan as laid down in connection with the harbour itself. It is only to show the improvements when carried out in the Tees by Mr. Fowler.

18,771. Then your project is a project for a harbour of refuge at Redcar ?—Simply for that.

18,772. Now, Mr. Fraser, what is the extent of your outward breakwater ?—4,100 yards is the total length.

18,773. And in what depth of water is it to be placed ?—About 7½ fathoms.

18,774. Then that breakwater we will call the northern breakwater, if you please ?—Yes.

18,775. Pray will your harbour be open to the

west winds in any manner sweeping across Seaton Carew ?—It will slightly.

18,776. It will very considerably, will it not ? It is almost entirely open to the westerly winds ?—It is open, but that is a land wind.

18,777. It is ; but we were told by the last witness that the prevailing winds are west and west-north-west, and if so, coming from that low land, a vessel may be very much exposed in a harbour there ?—The land is a screen from the west wind ; no wave will ever be generated inside.

18,778. What is the style of construction you propose for the north breakwater ?—The section will show that.

18,779. I have not the section before me ?—There is one within the plan.

18,780. I thank you. Although this section gives a very general idea of the mode of construction, we want it in evidence, and therefore it is necessary that some such description should be given ?—It consists of a rubble breakwater, formed in 7½ fathoms water, having a base of 190 feet; sea slope, 1¼ to 1; harbour side, 1 to 1.

18,781. And on that do you propose to put a work of cut stone ?—An upright wall on both sides.

18,782. What is to be the total height of that upright wall ?—Forty-five feet the outside one.

18,783. What to ?—The 12 feet below low water.

18,784. And the inner one ?—Thirty-three feet.

18,785. That is to be in seven fathoms water ?—Seven and a half.

18,786. How do you propose to place your cut-work ?—By the diving bell—the lower course do you mean ?

18,787. Yes ?—That will be set by a diving bell.

18,788. And both by tide work ?—Yes, by staging.

18,789. Is the filling to be of rubble or concrete ?—The filling between the walls ?

18,790. Yes ?—Of rubble.

18,791. Can you tell me what will be the lineal cost per yard of that work ?—223*l.* per lineal yard.

18,792. Where do you propose to get your rubble material from ?—Principally from the Cleveland hills.

18,793. What will be the length of the run ?—It varies from five to six miles.

18,794. What will be the cost per ton ?—One and ninepence.

18,795. Where do you propose to get your ashlar ?—From the same hills on the upper lifts, which is freestone.

18,796. What will that cost per cubic yard, including traction ?—Do you mean dressed and set ?

18,797. Yes, complete ?—Twenty-seven shillings per yard.

18,798. And is there an abundance of that material ?—There is an unlimited supply.

18,799. Then you have to purchase that at a great cost at the quarry ?—The prices I have named include that purchase.

18,800. Now you have got another construction, which can hardly be called a breakwater, for it extends partly along the shore and out into deep water; what is the length of that wall ?—It is a pier to break the force of a south-east gale.

18,801. Is it to be the same section as the other ?—No, different ; an upright wall.

18,802. That is entirely of cut stone ?—Faced with it, and the interior built with slag, blocks, and freestone.

18,803. What price do you expect it will be got at,—the price set by the last witness, or have you got your own price ?—My own price.

18,804. Will you state what that is ?—5*s.* 8*d.* a ton, or 8*s.* 6*d.* a cubic yard.

18,805. What action of the tide do you expect will render this wall necessary ?—It is to break the sea from the entrance of the harbour, principally in rough weather.

18,806. Do you expect that if you do not place this wall you will have any accumulation of sand within your harbour ? Is any part of your object to prevent the sand from coming from the southward ?—Why, the wall has no object that way to stop the travel on either side.

18,807. You expect then, in fact, that you will have no sand within the harbour ? You heard the observation of the last witness respecting the shifting of sand at Tees mouth ?—Yes.

18,808. Do you object to that wall now ? Will it injure or assist your project, or not ?—I don't know it will assist my project at all, but my project will assist that at the Tees.

18,809. That is to say, you think your project will assist any portion of Mr. Fowler's in the improvement of the river, and that that wall of his will not at all interfere with this ?—None whatever.

18,810. Do you conceive if a harbour of refuge is demanded for Redcar interests, that the operations by Mr. Fowler are necessary so far as regards refuge ?—It is, if it is not the intention to make one large harbour for the whole coast.

18,811. If two large harbours were placed on the coast you would surely not contemplate forming one at Redcar and the other in the Tees ?—Certainly not.

18,812. And then which two would you prefer, laying out a certain sum of money, as proposed by Mr. Fowler, on the Tees, or the formation, at a greater cost, of your breakwater in front of Redcar Rock, as being the most likely to give the amount of shelter required ?—The greatest amount of shelter will be given by the proposal that is made by me.

18,813. And is it the best place for ships ?—Yes.

18,814. And do you think it more likely to be permanent than the improvement of the inside navigation?—I do.

18,815. Do you know anything of the shifting of sand from the Tees mouth towards Hartlepool ?—I cannot speak from my own knowledge.

18,816. Have you been long upon this coast ?—No, about three years.

18,817. Residing here the whole of the time ?—A little more than three years.

18,818. And how have you been employed ?—I have not been employed ; I have not been following my profession of late.

18,819. But still you have studied the subject ?—I have.

18,820. You give as your deliberate opinion that a harbour of refuge in front of Redcar will be superior to that proposed to be made in the Tees ?—It will if only one larger harbour is to be made.

18,821. It will be more suitable for vessels of all draughts of water ?—It will.

18,822. I dare say you have considered this plan for the improvement of the Tees. You would hardly come here without having done so ?—I have.

18,823. And don't you think it is expecting too much to suppose that if this improvement is made, with vessels seeking for refuge, that the small vessels will be so accommodating as to go into the shallow water to make room for the large vessels in deep water ? Is it likely that when a captain comes in from a voyage to save the lives of his crew that he will be so very cautious, and take care not to occupy that which will be useful to other people ?—The small vessels would generally run into the higher reaches of the river.

18,824. If she wanted to make her voyage as soon as possible, would she do that ?—That would depend on the captain.

18,825. We presume the captain will make the voyage as soon as possible ?—It would depend upon the harbour regulations.

18,826. Can you regulate this in a gale of wind ?—I think the harbour-master could, by being on the spot in a gale of wind in a steamer.

18,827. Is there a harbour-master ?—I am not aware.

18,828. I hope we shall have him to tell us how he

REDCAR.

Mr. J. Fraser.

20 Oct. 1858.

Sir F. Smith.

will arrange that. The total cost of your plan will be how much ?—About 1,105,000*l.*

18,829. One and a half million ! Then I will ask you no more ?—1,105,000*l.*, I beg your pardon.

18,830. (*Mr. Lindsay.*) Is that the cost of the upper breakwater ?—The cost of both.

18,831. Including the pier to be run out on Redcar Rock ?—Yes.

18,832. And have you gone very carefully into these calculations ?—I have, several times.

18,833. Are you quite certain that such a breakwater as you propose can be made for this sum ?—In my own opinion I am.

18,834. Have you had experience in the construction of breakwaters such as this ?—I was at Granton Pier some 20 years ago.

18,835. And did you built it ?—No, but I was connected with it.

1,836. You have not had under your superintendence the construction of any large work ?—Granton is the only large work similar to this that I was connected with.

18,837. Were you engineer for Granton ?—I was second there with my father.

18,838. You never have had experience in the construction of a breakwater in a depth of seven fathoms? —I cannot say I have.

18,839. For that sum what area of sheltered anchorage will you have in four fathoms and upwards ?—241 acres.

18,840. What will you have from three fathoms and upwards ?—Two and a half fathoms, I have no three fathoms. It will be 232 acres.

18,841. I think you misunderstand me. What area, what acreage, will you have from $2\frac{1}{2}$ fathoms and upwards ?—Shall I read it to you ?

18,842. I wish it in evidence. You began with 742 acres for six fathoms ?—Yes.

18,843. Do we understand by that that you will have 742 acres from six fathoms and upwards ?—Six fathoms line at low water.

18,844. I wish it in a different way in evidence; from six fathoms and upwards you will have 742 acres ?—Yes.

18,845. From five fathoms and upwards you will have 1,144 acres ?—Yes.

18,846. Then you will have from four fathoms and upwards 1,385, and from $2\frac{1}{2}$ fathoms and upwards 1,617 ?—Yes.

18,847. You mean to say you have that great area of shelter anchorage for 1,105,000*l.* ?—I do.

18,848. Would you be able to speak of the advantages, in a nautical point of view, of a harbour at that site, compared with a harbour in Hartlepool Bay ?—Not well.

Therefore I will reserve my questions on that point to a nautical witness.

18,849. (*Capt. Washington.*) You said the soundings in this chart were taken by yourself ?—In connection with Mr. Fowler.

18,850. And you found very little change from the Admiralty chart of 1848 ?—1853, Mr. Calver's.

18,851. Very little change from that ?—Very little, except the three fathoms line.

18,852. Where is that altered ?—Between the Long Scar Rock and the Heugh.

18,853. Will you state what changes you found in Hartlepool Bay ?—The three-fathoms line seemed to have advanced a little seaward.

18,854. To what datum have you reduced your soundings ?—To the datum of water in Hartlepool tide gauge.

18,855. The same as that used in the Admiralty chart ?—Yes.

18,856. Are you quite sure of that ?—I have no reason to doubt it. It was the datum that was given me in those reduced in the Admiralty chart.

18,857. Were you actually sounding, yourself, in the bay ?—I was there in the steamer.

18,858. How many days did you occupy in sounding Hartlepool Bay ?—We were not quite one day. We were several hours.

18,859. Did you sound it in sections with the line and rod ?—Yes.

18,860. But did you run out sections from the shore, or sound promiscuously ?—I sounded on the lines shown there, from the far-away buoy to the Heugh.

18,861. Then across from the Heugh to the Long Scar ?—Yes.

18,862. Altogether five sections ?—Yes.

18,863. Would you consider these sufficient soundings to enable you to say there had been a change in the depth ?—Looking to the contour line that is put down, and that is a copy of Mr. Calver's chart, and drawing our line from the point we took, there is only $2\frac{3}{4}$ fathoms.

18,864. What is the decrease ?—About 18 inches.

18,865. Do you know where the silting comes from of what we see is this large mass of the estuary of the Tees ?—From the sands around Tees mouth, and what is brought out of the Tees.

18,866. Do you mean the sandy beach, east and west of the entrance ?—On either side of the river Tees.

18,867. Is there a large amount of sand floating about in that bay ?—The water is highly charged.

18,868. It is ?—It is; I have seen it.

18,869. And would you not fear any of that depositing behind the breakwater you have designed ?—I think not, on account of the shore current. As long as that was not impeded, there would be no fear.

18,870. Do you propose a jetty to run out over the Salt Scar, which will stop this scour ?—That will not interfere with the current at all.

18,871. Then you have no reason to fear there is as much sand floating about in the bay as would harm a refuge harbour as you have placed it ?—I think not. In my own opinion I have no doubt.

18,872. Have you been long connected with river works, or with works in the sea ?—I have for several years. I cannot call to mind the date.

18,873. Have you been in the habit of sounding ?—Not much.

18,874. (*Capt. Sulivan.*) Will you explain a little more what you stated about the current keeping the harbour clear ?—The natural set of the current is round the point of the Salt Scar Rock.

18,875. What tide are you alluding to ?—The ebb tide.

18,876. The northern tide ?—Yes.

18,877. That sets round the end of the Salt Scar at present ?—It does.

18,878. And then does it sweep along the shore in the direction of the three and four fathoms line ?—It sweeps towards the Tees mouth.

18,879. Parallel with the sand of Tees Bay ?—Rather in a line with the sand.

18,880. But parallel with it ?—Yes, parallel with it.

18,881. Do you know, does the tide running from the southward with a north-east or northerly gale accumulate any sand where you propose putting your harbour, and the west of the Scar ?—It does at the west end of the Redcar Rocks, and immediately to the southward of that.

18,882. Is there any deposit of sand brought in by the flood tide, or north-east or northerly gales ?—Do I understand you on the south sides of the pier ?

18,883. The west side of the Redcar Rocks, that is, in the corner of the bight, inside your proposed breakwater ; is there any accumulation of sand there brought from the northward by the tide or gale ?—I should say not.

18,884. Then you have no fear of this harbour silting up by the sand brought opposite the mouth of the Tees from the northward into this corner ?—It cannot well come there.

18,885. Is there any accumulation of sand at present at the back of the Scar Rocks, on the south side of them, brought by the southerly gales, or by the ebb tide ?—Over the rocks ?

18,886. Is the back of the rock, on the south side, filling up with sand ?—I cannot speak of that from my own knowledge.

18,887. You have not examined the Redcar Rocks ?—I have examined the Scar on which the pier is shown.

18,888. Very near where you propose putting, on the south side, do you see any accumulation of sand collected from the south-east ?—Yes, there is sand there.

18,889. Do you see any change except in that one place that you remarked in Hartlepool Bay,—the three-fathoms line ?—No.

18,890. I think, by the way you have drawn the three-fathoms line, you have taken the three-fathoms line of 1846 with that of 1853, which by the other plans has been shown to have extended out a little to that ?—It was a copy of a chart similar to this.

18,891. You see a little bight in the three fathoms line ?—There is a kind of gap.

18,892. If you examine the plans made later than the one of 1838, even, I think, the plans made in 1846 and 1849, you will find that that is already filled up, and was known to have filled up, to 1846 and 1849 ?—I have not seen that that is the case.

18,893. If we have charts showing that up to 1849 this little gap, called the three-fathoms line, has been filled up, would that do away with the result of your observations, apparently showing a growing out of the three-fathoms line ?—Of course I cannot prove more from the chart. We had none of them.

18,894. In the line you have drawn here from the north buoy across to the Long Scar, did you find that agree with the chart you compared it with ?—As nearly as possible.

18,895. (*Capt. Vetch.*) I want to ask you what is the particular object of placing this breakwater where you have placed it ?—My reason is because I think it will enclose the largest area and give the greatest depth of water with the least expense.

18,896. And is that for commercial purposes, or for the purpose of refuge ?—For the purpose of refuge.

18,897. Now, considering that Redcar appears to have little or no commerce, whereas at Hartlepool there are immense docks, very nearly the first or second in the kingdom, do you not think that if you manage to supersede a shelter at Hartlepool by one at Redcar, you should show that it would be more beneficial to trade ?— I don't know that the trade of a port ought at all to interfere with the position of a place for a harbour, if such place is shown to have deep water. It is the object of saving life and property that I look to.

18,898. You would not take into consideration the immense trade that comes into the bay of Hartlepool and the docks, but would leave that exposed to the same casualties they are now exposed to ?— I don't understand your question.

18,899. Do you mean by your harbour of refuge on the south side of the bay to make it unnecessary to construct one on the north ?—Certainly.

18,900. And that you would expose the trade on the north of the bay unsheltered to the winds and storms of this part of the coast ?—No, it would not, because the harbour here would not interfere in any way. Ships could take refuge in this harbour of Redcar, and proceed to Hartlepool if they pleased.

18,901. How are vessels to get into the dock at Hartlepool in an off-shore gale ?—They would never think of going to Hartlepool if there were a harbour of refuge at Redcar.

18,902. Is it not necessary for the purposes of trade that a fleet of vessels going out and into the dock at Hartlepool should be protected at all times in the bay ? Is that not necessary ?—It is so ; but they would get to sea more easily from Redcar at the flow of the tide, if the gale had ceased.

18,903. If all things were the same, and there was also trade at Redcar as in the docks at Hartlepool, there would be the choice between the two, and I think you ought to consider the magnitude of the trade and the shipping at the other side of the bay, and that it would be very strangely placed at Redcar in comparison with the trade of the two places ?—It would be an inducement, certainly.

Great ingenuity is due to you for this proposition, but if it is meant to supersede the necessity of one on the other side of the bay, it appears a very grave question.

18,904. (*Mr. Coode.*) If you had to choose between two sites in the same bay within four miles of each other, would the fact of there being docks already formed at one place, and not at the other, induce you to select that site where the trade was, rather than where the trade was not ?—Not if there was an insufficiency of water.

18,905. Don't you think it possible that at any particular place, where a trade already exists, it might grow up to such an extent that vessels trading to that place might eventually interfere with those going there for refuge ?—No, I don't think so.

18,906. You don't think that vessels occupying a harbour where trade exists might increase to such an extent as to interfere with those going in to take refuge ?—Of which site do you speak ?

18,907. I assume that you select a site where there already exists a great and increasing trade, then I ask you whether, if that site were adopted, the trade at that site might not eventually grow to such an extent as to occupy that harbour for trade purposes, and so curtail the use for refuge purposes ?—I quite agree with you.

18,908. You did not understand my first question ?—I did not.

18,909. The length of the breakwater you propose is about 4,100 yards ?—Yes.

18,910. The average depth of water is about seven fathoms, if I read your plan right ?—Yes.

18,911. And the price per lineal yard is, I think you said, 223*l.* ?—Yes.

18,912. Can you tell me of any similar work constructed in the way you have described, at anything like the same amount ?—No; it is a low figure. That arises from the material to be had easily.

18,913. Tell me the work you referred to, as you seemed to make reference to some work ?—I cannot. Take the total length of Mr. Rendel's plan of Hartlepool, and it will be 190*l.* a yard ?

18,914. Are you aware that at least one third of Mr. Rendel's design contemplated the erection of a work on the rock, above the level at low water ?—But it was an upright wall breakwater, was it not ?

18,915. That is true ; but are you aware of the fact that Mr. Rendel contemplated the erection of works above low water to the extent of one third of the whole design ?—I cannot say I knew it was one third, but I knew it was some distance.

18,916. Is it not for a considerable portion of the distance ?—It is for some portion of it.

18,917. Therefore you made reference to Rendel's design ?—My answer had reference to the works actually constructed.

18,918. Do you know any similar work constructed at anything like the same rate ?—I do not.

18,919. You say you propose obtaining the material from the Cleveland hills ; what distance will that be from the site of the works ?—Varying from five to six miles.

18,920. And the price per ton of that rubble put into the work will be what ?—About 1*s.* 9*d.* per yard.

18,921. Put into the work ?—Yes.

18,922. And the yard will be in weight ?—About $1\frac{1}{4}$ ton.

18,923. What have you allowed for the cost of the material raised at the quarry ?— a load 3*d.*

18,924. Per ton ?—Per yard.

18,925. What is the nature of the rock ?—It will be freestone, and alum shale and slag for the rubble.

18,926. Is that freestone hard or soft ?—Hard.

REDCAR.

Mr. J. Fraser.

20 Oct. 1858.

Mr. Coode.

18,927. Have you ever seen any of the same material exposed to the action of the sea ?—From that district?

18,928. Yes. I mean alum shale ?—Both the alum shale and freestone seem to harden with exposure.

18,929. Can you speak of any place where it has so hardened ?—At Granton.

18,930. Have both materials been used there, or only one ?—Chiefly the liver rock.

18,931. If I rightly understand you, they were put in together ?—Only one, I beg your pardon.

18,932. One was used then at Granton Pier ; which was it ?—Sandstone.

18,933. Was it of a similar kind to the one you propose to adopt in this instance ?—No, it was of a different kind and a closer grain.

18,934. If the sandstone hardened at Granton pier, it does not follow it will harden here ?—No ; but we have specimens of that on the beach, and to be seen.

18,935. I presume the same kind as you propose to use ?—Yes.

18,936. Does that stand the action of the sea well ? —Yes, it hardens.

18,937. And it is to cost 8*d.* a yard put into the waggons ?—Yes.

18,938. Can that be done ?—It can.

18,939. Has that ever been done ?—I cannot say.

18,940. Do you think, in your judgment as an engineer, that that material can be raised for 3*d.* a cubic yard, and put into the waggons ?—At the top of the incline, you must recollect.

18,941. It can be quarried and put into the waggon at the rate of 3*d.* a cubic yard ?—It can.

18,942. And you have allowed how much for leading,—3*d.* for the incline ?—Twopence.

18,943. An incline from the quarry is there ?—Yes, down to the railway.

18,944. Is it a railway incline, or a road ?—It will have to be a self-acting incline.

18,945. What length will that incline be ?—I have never measured the distance.

18,946. What is the distance by railway, the whole distance ?—From Easton six miles, and from Marske and Upleatham five miles.

18,947. What price have you allowed for conveyance ?—About 3*d.* to 4*d.* per ton per mile.

18,948. We'll keep to yards, if you please. How much will it be ? I would rather take the delivery in the waggons first ?—It would be 4*d.* per yard for delivery.

18,949. Having arrived at the beach, how do you propose to deal with it ?—Either by staging or by boat. The former I would prefer.

18,950. From what point would you carry your staging ?—Along the rock, using it for the work, putting a line down till we come to the opening, and then bridging it across, and carry out the breakwater.

18,951. Would you use staging for the whole length ?—I would.

18,952. But that is not entered in this price ?—This is for boating.

18,953. With regard to that, how would you deal with it, having arrived at the beach ?—You have it, you know, in the waggons on the shore. I would run on the waggons as they came from the quarry, into boats made suitable, so that they may be towed out and the material tipped from the waggons or dropped from the bottoms of the waggons over the work.

18,954. If the waggon is in the boats, how would you manage that ?—By having a side-lift through the barge, so as to lay over the side.

18,955. You would lower down the side by the barge and turn it over ?—Yes.

18,956. You have allowed for conveyance of boat from the shore to the side of the breakwater, at how much ?—3*d.* per yard.

18,957. And for tipping, how much ?—3*d.* more; that will include the expense of taking the boat out and in.

18,958. I presume that in all cases the amount you give for haulage will include taking back the empty waggon ?—Yes.

18,959. Then we have 3*d.* for putting into the waggon, 4*d.* for delivery, 3*d.* for taking out to the site of the work, and 3*d.* for discharging, and 5*d.* for the incline will be 1*s.* 6*d.*, royalty a penny, and the remainder for wear and tear, which will be 2*d.* The royalty is demanded now, is it ?—Yes.

18,960. Do all these prices include the use of plant in every case ?—It includes the whole.

18,961. Now as regards the stone for the masonry, where will you get that ?—From the upper lift. It is about 50 feet thick sandstone.

18,962. Large sizes ?—Yes; five or six tons can be got out.

18,963. What particular geological formation does it belong to ?—It is the upper sandstone above the alum shale.

18,964. And you are satisfied that will withstand the action of the sea ?—Fully so.

18,965. What number of cubic feet will be required to make up a ton ?—I should say about 16 or 16½.

18,966. You say your ashlar dressed and set will be 27*s.* per cubic yard. Is that for work under low water ?—Yes, both on the pier and breakwater.

18,967. At what rate would you expect to construct the part under low water ?—I think that price would cover the whole for freestone.

18,968. But I should like, instead of lumping it, to know at what rate you would expect to construct the work under low water ?—I have taken the whole of that in the breakwater at 1*s.* per foot, knowing the one would counterbalance the other. It is only 12 feet below low-water mark.

18,969. Only 12 feet below low-water mark. Have you ever constructed works below low-water mark ? —I have set in seven or eight feet.

18,970. By what means ?—By rods and bars.

18,971. Do you propose to set this in low water by these means ?—No, because it is out in the sea.

18,972. In what case have works under low water been set at anything like that rate ?—I cannot say at the moment.

18,973. You say it is only 12 feet under low water. If at six or seven feet at low water would that tend to reduce the rate ?—Certainly not much.

18,974. As compared with 18 feet or 20 feet ?—It would reduce it.

18,975. Do you propose to use cement under low water ?—No.

18,976. What size blocks will you use ?—As large as they can be got for the outer facing.

18,977. When you say that, I presume that in framing this estimate you formed some idea of the size of the blocks; how much is it ?—From five to six tons for the lower course.

18,978. How would you set these in the breakwater ?—From the staging above.

18,979. And notwithstanding that you boated the rubble, you would run a staging to set the masonry? You said you would convey the rubble from the shore by boats. I asked you how you would propose to set the masonry; and you said you would use staging for that ?—Most decidedly, there must be staging made after the rubble was brought up.

18,980. Would not the staging be connected with the shore ?—It would in that case.

18,981. Do I understand you would construct staging after the rubble was deposited ?—Yes.

18,982. How would you place the uprights or piles of that staging ?—Either by a frame, or I would put the uprights in the rubble itself, and bury the foot of them.

18,983. How would you support that frame when you put it in the rubble, because when first put down it would require some support ?—I would stay it.

18,984. How would you do that ?—Put anchor blocks in, and pick them up afterwards, the same as the staging at Dover.

18,985. Is not that constructed directly from the

land, and does it not proceed step by step from the land ?—It does.

18,986. Then you would construct it by staging similar to that at Dover ?—Yes.

18,987. But it makes a considerable difference whether it is attached or detached, does it not ?—It makes some difference.

18,988. Will it make a material difference ?—Not very great, except in storms.

18,989. What will be the difference in case of storms ?—I am not prepared to say ; no man can.

18,990. In what direction will that difference lie? May it have the effect of sweeping away the approach to it ?—Most decidedly.

18,991. And if it has that effect it will add most materially to the cost ?—It does.

18,992. Will it do so to a greater or less degree when detached ?—I do not think there can be any material difference.

18,993. Will there be any difference?—There may be.

18,994. Will the risk to the staging be greater or less in the case of a detached breakwater ?—It will be greater to a slight degree.

18,995. (*Sir F. Smith.*) I don't think we have got from you the time you would require to complete your breakwater ?—Seven years.

18,996. Have you any knowledge of any work of this kind having been completed in seven years ?—I cannot. I make no reference to that period for any similar work.

18,997. Then on what do you ground the estimate of time ?—Looking to the rate at which other works are constructed, I have taken the average of 3,000 tons a day being deposited.

18,998. What other works of the same kind are done at that rate ?—I don't know from my own knowledge ; but from what I have heard and believe, Holyhead does that.

18,999. Do you know the rate of work at Alderney? I think if you would inform yourself on that head, you would see that you could not complete it in this time ?—I do not say complete it, but it would answer the purposes of refuge.

19,000. What height would be sufficient to do that? —My height is about 78 feet.

19,001. What will be the height of your rubble work to afford sufficient protection for vessels coming in in gales of wind at all times of the tide ?—If it was brought up within 12 feet of low-water mark, it would afford great protection.

19,002. You imagine you would complete it in height in seven years ?—I do.

19,003. You have two schemes for forming your work,—one by staging, the other by boats. Do you give a decided preference to staging, or to boats ? If you use boats, I presume you would depend on the state of the weather for the progress of the works ?—Much.

19,004. At times there would have to be a cessation of the operations of throwing in the material ?—There would be.

19,005. Have you taken this into consideration in your calculations, and that the detention of all your workmen would increase vastly your cost ?—I have only assumed 250 as working days in the year.

19,006. And have you put your prices at each place for the work at 300 days instead of 250 ?—Yes ; workmen as soon as not wanted are discharged.

19,007. If you discharge the workmen, you must either lose these workmen altogether, or must pay the rest increased wages ?—It is the general rule to keep the principal workmen. If there is a storm you do not discharge them.

19,008. Your prices are ample for that ?—I believe they are.

19,009. (*Capt. Sulivan.*) Were these soundings taken by yourself ?—The lead was not thrown or the rod taken by myself ; the men belonging to the Tees Conservancy were there.

19,010. I am speaking of those soundings inside your red breakwater ?—Yes.

19,011. Taken by yourself ?—I was on board the boat, and saw them taken.

19,012. Were they reduced to the same datum as the Hartlepool soundings ?—No; the Tees gauge was taken for those.

19,013. Does that agree with the Hartlepool ?—I think there is between four and five inches difference between them.

19,014. Does it agree generally with the datum on which the Admiralty chart is made ?—I believe so.

19,015. Have you compared them with the Admiralty chart ?—I am not aware of that.

19,016. If so, if there is a fathom less water there at present, that corner of the bay must be silting up, if your soundings and the Admiralty soundings are correct ?—(No answer.)

You had better compare them again before you make too sure of that.

19,017. (*Mr. Coode.*) Are you aware of the nature of the works being constructed at Alderney ?—I am not.

19,018. If told that the system is just the same that you propose to adopt, and that they have been hard at work for 11 years, and have done 960 yards, would that shake your confidence in the time you have allowed yourself for the completion of these works ?—It would not, because there may be circumstances there which we would not have to combat with here.

19,019. The only respect in which I know the circumstances will differ from those here will be, that at Alderney they run directly from the shore with staging : the staging there is attached to the shore ; now, would that facilitate the progress, or would it retard the progress ?—I should say it would facilitate it.

19,020. Then being acquainted with these facts, would you still remain of the same opinion ?—Not knowing Alderney, I cannot make the comparison.

19,021. Now that you are aware of the fact, that they have been at work for 11 years, and 960 yards of that work have been run out by staging from the shore, would that shake your confidence in the time you have allowed yourself for the completion of this work ?—I am not aware of the quantity of material they deposit per day.

19,022. The work is in all respects the same, with the exception that there they have the advantage of being connected directly with the shore, and the greater part of the water within which their works are constructed is only about 3½ fathoms ; they this year came to a place with 10 fathoms. Now being made acquainted with these facts, do you still remain of the same opinion as to the time you would require to complete these works ?—It would not alter my opinion.

19,023. You still think you can construct these within seven years ?—I do not say I could complete these. I believe protection will be afforded in that time ; the breakwater can be carried out sufficiently.

19,024. And how could you afford that protection ? —The deposit of rubble.

19,025. You said that bringing the rubble up to 12 feet at low water would answer all the purposes of a harbour of refuge ?—I think it would.

19,026. Then why do you put the masonry above the rubble ?—I do not say it would in all weathers, because if left unprotected the rubble would soon be breached through.

19,027. To what extent do you intend the answer to apply ?—I would break the force to a certain extent, and ships would be able to enter it.

19,028. Would not the effect of a disturbance in the water be, that a vessel would run the risk of dragging her anchors and driving on shore ?—She would not.

19,029. Do you believe that a rubble bank such as you have described would answer all the purposes of a harbour of refuge ?—I beg to withdraw the word "all." I did not intend to use it.

Well, it is right that you should have an opportunity of withdrawing it.

REDCAR.

Mr. John Anderson.

20 Oct. 1858.

Mr. John Anderson examined.

19,030. (*Chairman.*) You reside at Edinburgh ?—I do.

19,031. And are by profession a contractor ?—A contractor and engineer.

19,032. (*Sir F. Smith.*) You are an engineer and contractor ; that will be the right way to put it ?—Yes.

19,033. Have you had anything to do with either of the designs we have had before us to-day ?—I was called in 12 months ago to give an estimate, by the Tees Conservancy, for the jetty at the mouth of the Tees, on the north side, and I did so, and I have got the estimate here, prepared according to the engineer's plans, and I propose to extend that 2,000 yards for the improvement of the mouth of the Tees, at a cost of 76,700*l.*

19,034. What section is that wall ?—Do you mean the angle or its base ?

19,035. The general height and depth ?—Twelve feet above low water.

19,036. Have you the section before you ? Has Mr. Fowler any section of that work ?—I had when I made the estimate, but I have not seen one since.

19,037. Then perhaps you will tell me what is the total height of the work at the eastern extremity ?—I don't recollect in the absence of the plan.

19,038. Is it in 4½ fathoms water, or rather more ?—At the very end it appears to be four fathoms water.

19,039. I see in the plan that a portion of the work is coloured red and another portion is coloured yellow. What does the difference mean ?—It is all coloured red on the north side ; my estimate only refers to that on the north side.

19,040. How long is that portion ?—About 2,000 yards.

19,041. The portion coloured yellow you have no estimate of ?—I have not ; on the south side I have not estimated for.

19,042. Then it is the curved breakwater of 2,000 yards you estimated for ?—Yes, I have estimated for that.

19,043. And the cost of that is what ?—76,700*l.*

19,044. Will you be so good as describe the character of this work ?—There is a great deal of timber, 19,000 feet of creosoted timber; 1,000 tons of malleable ironwork to bind it together ; there is 757,000 tons of slag stone for a foundation, and that is three items marked upon the entrance of the breakwater here.

19,045. The sum of 76,700*l.* is for a length of 2,000 feet up to 2½ fathoms water; what will be the probable cost of the other portion of about 800 feet in, say, 2½ fathoms to 4½ fathoms ?—The water is then so deep that you would be obliged to have a different description of breakwater ; timber would not do.

19,046. Then you don't approve of continuing from the published soundings the distance of 2½ fathoms ?—No; you cannot get the timber long enough.

19,047. How do you propose to construct the remainder ?—I would do it in the usual way by tipping in rubble stone, and getting up a proper heart above high water.

19,048. May I ask you, from your experience as an engineer and contractor, what slope is that rubble likely to take, and stand the wear it will have ?—I know the Granton breakwater very well, and the angle there is 2½ on the seaward side, and 1½ on the inward side.

19,049. Would 1½ do on the seaward ?—No.

19,050. Then if we had a project showing 1¼ slope, you would think that, not a judicious slope ?—No; I think that would not stand on the seaward side.

19,051. How would you propose executing that portion of the work you have estimated at 76,700*l.* ? We'll take it from the beginning, and suppose the breakwater going out, how would you give the orders for the work ?—I begin at the shore end and drive piles into the ground 12 or 14 feet, and then put in fastening irons and drop the material among the piles.

19,052. Some go beyond the piles and some within it ?—Just where it likes, and let the sea take it to the proper angle.

19,053. And you would confine it with planking, because if you don't what would become of your slag, because that is to confine it, is it not ?—If there is planking in it would be, but I am not sure there would be ; the planking gives a little, but not far ; there is planking on both sides.

19,054. At the part with slag it is not laid with any timber ?—The timber is all at the outer end.

19,055. What am I to understand, that there is to be planking or not ?—That there is to be planking for a small portion at the outer end only.

19,056. What length of that portion ? There are no figures on here. What is it ?

(*Mr. Fowler.*) 100 yards of timber at the outer end.

19,057. Have you details of that before you ?—Yes.

19,058. Surely you can tell, by looking at your quantities, which are the lengths, without referring to Mr. Fowler ?—I cannot tell the quantities of the wall running on it, because they have not been brought before me.

19,059. I regret very much that it is so, because when you were brought before us to give evidence I thought we should get all the details which Mr. Fowler would not volunteer to give ?—There is no timber to 100 yards at the outer end.

19,060. Then the remaining portion towards the shore has no planking ?—None ; it is slag and stone, and they are to find a position as they may, and the only way to make a staging has to be the means of depositing that material.

19,061. It is not to be used for any other purpose, except for 100 yards at the outer end ?—That is to be the permanent.

19,062. But we have been told that the plan now submitted to us is based upon a scheme adopted by Mr. Abernethy at Blyth ? The material is, to a certain degree, and the very commencement. Can that be an accurate statement ?—I know nothing of what Mr. Abernethy has done.

19,063. Then I can tell you, and this is very different. Are you disposed to think that the construction of this outer portion that is enclosed in timber will be durable, without any other application whatever ?—If it goes through the process of creosoting it will preserve its life.

19,064. How long do you expect the timber erection will remain ?—Twenty years good. I have put a great many jetties in the river Tees without creosoting, and they are good and existing yet.

19,065. You have not had occasion to renew any one of them ?—No. Fifteen years ago I put up a timber bridge creosoted. I had occasion to take it down the other month, and no one could tell but that that bridge was put up yesterday.

19,066. Very well-seasoned timber and not creosoted, do you say ?—Yes, creosoted.

19,067. It is contemplated by the engineer of the Blyth breakwater to enclose it with masonry, of solid ashlar masonry, because it is contemplated that it will last 40 or 50 years yet?—This here is only a small portion, and suppose it only lasted 40 or 50 years, yet it is only 19,000 yards.

19,068. You think it is quite unnecessary to do anything towards it during 40 years ?—Yes.

19,069. That is, to case it in with solid masonry ?—I do not think there is any occasion to do anything but slight repairs, beyond what is provided for on the plan.

19,070. You know Blyth breakwater, I presume ?—No.

19,071. Then at Blyth harbour, where the pier is constructed, a great portion is not so much exposed

as yours ; therefore you may estimate that you would require some explanations here that that does not ?—Yes.

19,072. Then this system of constructing the breakwater is applicable to general purposes, so far as 4½ fathoms water ?—There is only a small portion of that in this deep water. It is only 100 yards; the other is in very shallow water indeed.

19,073. How would you do in deep water ?—By driving piles and binding them together with iron, and putting in the slag for a foundation for that part.

19,074. Have you given an estimate of Mr. Fowler's scheme ?—No, only for the north side.

19,075. And that is to cost what ?—76,700*l.*

19,076. If you were required to give off-hand a rough estimate for the extension to 800 yards more, what would you say that 800 yards would cost extending to 4½ fathoms water, and commencing where your estimate ends ?—I begin at 2½ fathoms water ?

19,077. Yes ?—150*l.* or 160*l.* a yard.

19,078. What would it amount to for 800 yards ?—128,000*l.*

19,079. That would make how much altogether ?—204,700*l.*

19,080. It has been remarked to me by one of the Commissioners that I am in error in supposing that that part of your work which is to be in connection with the shore was formed on Mr. Abernethy's principle. Am I wrong in supposing that ?

(*Mr. Fowler.*) You are.

19,081. (*Capt. Sulivan.*) You made a little mistake in these figures?—120,000*l.* is the sum.

19,082. You wish to correct that ?—Yes.

19,083. Making 196,000*l.* in all ?—Yes.

19,084. Including your 76,000*l.* for the breakwater? —Yes.

19,085. (*Mr. Coode.*) What price do you allow for the creosoted timber ?—3*s.* 6*d.* a foot.

19,086. Is it to be creosoted both in the piles and upper work ?—Yes.

19,087. You said you intended to use slag and stone in the work. Is that so ?—Yes.

19,088. In what proportion ?—It is only in case slag cannot be got in sufficient quantities that the sandstone would be used.

19,089. Do you think that you could get sandstone for the same price as slag ?—A little more; but I don't apprehend it will be necessary to use any slag for the 757,000 tons.

19,090. Did you hear the evidence given to the Commissioners by Mr. Fraser ? Do you know the quarry to which he alludes ?—I know these quarries very well.

19,091. Do you know the nature of the rock ?—Yes, it is of very firm quality.

19,092. Did you hear the price he stated for quarrying and putting into the waggons ?—Yes.

19,093. Do you consider that price sufficient ?—No.

19,094. What do you consider it will be ? The cost of working and putting in the waggons ?—Yes, I am doing that work daily with a large number of men, and I think 1*s.* 6*d.* per yard is not too much for working and putting into the waggon.

19,095. 1*s.* 6*d.* a cubic yard ?—Yes.

19,096. And in that you include the material ?—No.

19,097. You include nothing but the men's labour ? —No.

19,098. Not the cost of superintendence, or plant, or contractor's profit ?—No.

19,099. You mean to say you are doing work of a similar kind, and it costs you 1*s.* 6*d.* cubic yard for labour ?—I do.

19,100. Is the stone of the same kind ?—Very similar.

19,101. Is it so similar that the difference in character will make no material difference in the cost? —This is in favour of the latter.

19,102. In favour of the stone mentioned by Mr. Fraser ?—No, in favour of the stone I am working now, and it is costing me that.

19,103. If I rightly understand you, your answer is that which costs you 1*s.* 6*d.* per cubic yard for labour alone, will, if you had to do the same thing at the quarry named by Mr. Fraser, be done for a little more ?—To do it here would be a trifle less.

19,104. How much less ?—A penny a yard.

19,105. Would it make a difference of 2*d.* a yard ? —No, and I am not sure I have any profit at what I am doing.

19,106. Do you pay any royalty for what you are doing ?—No.

19,107. You spoke not of anything more than the labour of quarrying the stone and putting it into the waggon ?—Yes.

19,108. Do you agree with Mr. Fraser as to the 3*d.* a yard ?—Oh dear no.

19,109. Do you agree with him as to the 3*d.* to 4*d.* a yard per mile for haulage ?—Well, it is low; I put down myself more than that.

19,110. And what would you put down if you had to include royalty, and if you had to include the construction of a railway, and the delivery of the stone, which we call leading. Do you consider 3*d.* to 4*d.* per yard per mile would be sufficient ?—No, I think 1*d.* for the use of the plant, construction of railway, interest of money, maintenance, and locomotive power.

19,111. Do you not think a penny a bare price ?—A penny is a bare price.

Mr. Joseph Dodds recalled.

19,112. (*Mr. Lindsay.*) You have undertaken to take charge of the proceedings here to-day ?—As respects the case of the Tees Conservancy merely. Simply as regards the case of the Tees Conservancy, not the Redcar case.

19,113. The reason I address you is, that I was under the impression that you had taken charge of the whole of the proceedings here, for I find so many plans brought before us,—one by Mr. Fowler, one by Mr. Fraser, and various other plans floating about for different modes of constructing a breakwater,—one on the Long Scar Rocks, one to the west and one to the east of these rocks—that I am anxious, for my own guidance, for you or some gentleman to undertake to put down on one of those charts the various plans that have been brought forward for our consideration, so that to-morrow, when we come to examine the nautical witnesses, we may really know what we are examining them upon, and ascertain from the nautical witnesses if any of those various propositions would suit the object we have in view, and if so, which in their opinion would be the best plan ?—I should be very glad to endeavour to find some surveyor who will do that, and I am sorry I cannot assist or inform you of the number of plans which are to come before you for Redcar. I can only say I have heard of three more. I have seen them exhibited in this room, and I believe one or two of them are nearly on the site suggested by Mr. Fraser. I have not seen these plans, nor was that any part of my case.

While addressing you I am also addressing the parties interested in the various plans we have had, and it would facilitate the proceedings to-morrow, so far as I am concerned, if these gentlemen will give to you their plans, or will put on this one plan a rough sketch of all the others, so as to give one some idea of the various plans to come before us.

Mr. Fowler recalled.

19,114. (*Chairman.*) You have heard what is wanted. There are several plans which have been laid before us, or perhaps will come before us, and it would be convenient for us to have them on one

REDCAR.

Mr. J. Fowler.

20 Oct. 1858.

chart. Will you be good enough to take charge of the matter for us ?—I will.

(*Mr. Dodds.*) I have found a gentleman who will place the three upon one chart to-morrow.

Mr. LISTER examined.

Mr. Lister.

19,115. (*Chairman.*) You are a resident of Seaton Carew ?—I am.

19,116. And you have been 30 years a pilot ?—I have.

19,117. And are you perfectly aware of the object of the present inquiry ?—Yes.

19,118. Will you give me your opinion as to the best site for a harbour of refuge for this north-east coast ?—I consider it would be a great improvement to the entrance of the Tees if a breakwater was constructed of the west side of the bay, running in a west direction and enclosing an area for 150 sail. That, in my opinion, would meet all the exigencies of the case.

19,119. (*Mr. Lindsay.*) Is the plan one of your own ?—It is.

19,120. Will the breakwater have nothing to do with the roadstead ?—It will not. It will be a protection from a north-east sea, and give a better lead both in and out, and I expect that it will deepen the channel.

(*Mr. Dodds.*) The plan proposed is the same as that proposed by Mr. Bald.

(*Witness.*) It was proposed many years before Mr. Bald came to this neighbourhood.

19,121. (*Capt. Washington.*) Do you consider that your breakwater will deepen the bar ?—I do ; the channel at the entrance to the river is $2\frac{1}{2}$ miles ; if reduced to $1\frac{1}{4}$ it will have a greater power, because it is now spread to such an extent that it has lost its power upon the bar.

19,122. Do you think what you propose would be sufficient ?—I would not have anything more done ; I think it would be quite sufficient.

19,123. I see you are buoy-master of the river ?—Yes.

19,124. Are the buoys in good order, and are there enough of them ?—Yes.

19,125. Do you know that the buoys are coloured differently in other rivers ?—I don't know that.

19,126. How long have you known the Tees Bay ?—Forty-six years.

19,127. Could anything else be done to improve the Tees Bay, as well as to construct a breakwater ?—A pier or breakwater might be made from Hartlepool Heugh to the Seaton buoy. I would advocate a good pier from the Heugh. The Tees is a natural enemy to the Hartlepool road and to the Tees Bay generally, for whatever comes out of it goes into the bight.

19,128. Do you think it would be desirable for any work to be constructed at Hartlepool to keep out the sand ?—I do.

19,129. There are two life-boats at Seaton ?—Yes.

19,130. Have they put out to sea for the purpose of saving life ?—Yes, but I never helped to man them.

19,131. Have they been the means of saving many lives ?—Not many.

19,132. I suppose a great many vessels have been wrecked upon the Long Scar and the Heugh ?—Yes.

19,133. (*Mr. Coode.*) Is there a great deposit to the north of the Tees, generally settling upon the Seaton beach and the north end of it, which is south of the Long Scar Rocks ?—Yes.

19,134. And a great deal goes into the west dock at Hartlepool, and they have to dredge it out ?—Yes ; the docks, at all events, silt up, and the silt looks a very great deal like the stuff that comes out of the Tees. I have seen some of it near the Cliff House that has been taken out of the dock.

19,135. Do you know of your own knowledge that that was taken out of the dock ?—I don't know of my own knowledge, but I have been told so.

19,136. Have you any reasons to disbelieve the statement ?—I have not.

19,137. (*Capt. Washington.*) Do you know anything about the silting up in Hartlepool Bay ?—There was a good specimen of the silt in Hartlepool Bay when the old harbour was opened. The depth of water at that time, and the depth of water they have now, prove that there is a silting up.

19,138. Has there been any decrease in the sand on the beach ?—No.

19,139. Do you think there has been any increase ?—I will not say that there is. The Hartlepool pilots have told me that there has been a silting up in the bay of five or six feet within the last 20 years.

19,140. We know from accurate soundings that that is not the case. Do you know Mr. Mossman, the haven-master ?—Yes.

19,141. I dare say you know he is an accurate man; a careful sounder ?—I don't know anything to the contrary.

19,142. Then you will be glad to know that, from his certain knowledge, during the last 10 years there has been no increase ?—Then the pilot's statement must be untrue.

19,143. (*Mr. Lindsay.*) Have you ever had any conversation with the West Hartlepool pilots on this subject ?—No.

19,144. (*Capt. Sulivan.*) In order that you may not seem to put in what is not correct, I will ask you, if that silting up has gone on from 20 years ago to 10 years ago, would it not partly confirm the statement made to you, although the silting had not taken place during the last 10 years ?—True ; that is correct.

Thursday, 21st October 1858.

PRESENT :

Admiral HOPE (Chairman).

Sir FREDERIC SMITH.
Mr. LINDSAY.
Captain WASHINGTON.
Captain SULIVAN.
Captain VETCH.
Mr. COODE.

Mr. EVANS, Secretary.

21 Oct. 1858.

(*Mr. Dodds.*) With reference to the observation which fell from Mr. Lindsay last night, as to the plans which were before you, I hope Mr. Fallowes will be able to clear up some little confusion which has arisen from plans not intended for the Commissioners being handed up. He will explain that what the Tees Commissioners promote essentially is the new breakwater shown upon the Plan No. 7, in the Blue Book of 1857. That was suggested to Captain Washington by Lister, the last witness of yesterday, upon the occasion of an inquiry before the Commissioners on Tidal Harbours, in the year 1845. Lister's evidence was taken on the 29th October 1845, and will be found in the Appendix to the Second Report of the Commissioners, page 362. Since then, the subject was brought under the notice of Mr. Bald, who was the Admiralty engineer appointed to make an inquiry into the Tees, upon the occasion of a Bill

being introduced for the purpose of transferring the Tees Navigation Company to the present public body, the Tees Conservancy Commissioners, the conservancy of the river. Mr. Bald then sanctioned what had been originally suggested in the year 1845, and upon his recommendation to the Admiralty in the year 1852, a clause was inserted in the Tees Conservancy Bill a copy of which I will hand in—Clause 53, which enables the Admiralty to construct this particular breakwater; and upon the Parliamentary plan of that year, Mr. Bald laid down the particular breakwater in question. That is the work which Mr. Fowler estimates will cost somewhere about 70,000*l.* to 80,000*l.* Subsequently, in the year 1854, I believe, Mr. Rendel, at the request of the Admiralty, also reported upon that scheme, and sanctioned the form of it, with some trifling alterations. Again, after that, in the year 1855, Mr. Calver reported upon it very strongly. He improved upon it, and made some little alterations in its form and extent; and upon these various opinions expressed by Mr. Bald, Mr. Rendel, and Mr. Calver, Mr. Fowler laid down the particular breakwater to which I have already referred, as given on the Plan No. 7, annexed to the Report of the Select Committee of the House of Commons in the year 1857. That is the plan which I, on the part of the Tees Conservancy Commissioners, am anxious should have the consideration of this Commission. That is the plan put in by Mr. Fowler, where the breakwater is shown in a deep red colour. In the year 1857, Mr. Anderson was called upon to give an estimate of a sum for which he would undertake the construction of that breakwater. All the details were then before him, and he gave the estimation, which he submitted to you yesterday. That was upon the original plan, upon the plan coloured red, put in yesterday, the cost of which he estimates, according to the Abernethy system, would be about 285,000*l.*, according to some other systems, about 460,000*l.*, which, from his evidence, I think you will find he is of opinion, would make Tees a safe harbour at all times of the tide. Mr. Fraser was called in to assist Mr. Fowler with reference to this matter. When he was called yesterday, he was called for the purpose of confirming Mr. Fowler's estimation and plans, with reference to the small breakwater, the cost of which will be 70,000*l.*; and secondly, with regard to the larger plan for the improvement of the Tees; and thirdly, to state his opinion as to the best site in the Tees Bay for a harbour of refuge, in the event of the Commissioners deciding to recommend one large harbour instead of improving the existing Tees harbour. Hence the plan Mr. Fraser put in, for the construction of a large harbour on Coatham Sands. There are two other gentlemen with whom the Commissioners had communicated, who have similar designs, varying in the slightest degree from Mr. Fraser, and constructing the harbour at the same spot. Perhaps, with this explanation, what appeared a little confused yesterday, may now seem a little more systematic to the Commissioners; and they will, perhaps, be better able to understand the evidence. The evidence which I shall adduce will be principally in reference to the shorter breakwater, the 70,000*l.* breakwater, which was brought under the notice of Captain Washington by Lister, and to which the Tees Commissioners have constantly adhered, having seen no reason whatever to alter their opinions which were formed by their predecessors, the Tees Navigation Commissioners, and have since been sanctioned by authorities of such eminence as Mr. Rendel, Mr. Calver, and the late Mr. Bald.

19,145. (*Chairman.*) Then I distinctly understand that, as regards the Tees case, it is the smaller of those two plans, which appear on the chart?—Just so.

19,146. The estimate of which was, in round numbers, 70,000*l.*?—The larger work, which we have also submitted, would give from 18 to 20 feet water at low water, spring tides, and of course would be very much above 20 feet at high water. No doubt we should very much prefer this to our own original plan of 70,000*l.* Nevertheless the 70,000*l.* project would, in our opinion, be everything that could be required for the local shipping connected with the Tees, and would indeed afford a considerable refuge for the ordinary colliers frequenting the coast, because we have already 10 feet of water over the bar. All, therefore, that we require is, a breakwater which would limit the entrance to the Tees, which is now two miles and a half across, fix it and make it certain. With a lighthouse at the end of the pier, vessels would be able to run to it. Now they cannot run with any certainty, on account of the sandbanks which are constantly moving about. Subject to the observation as to the preference for the larger scheme of improvement, we advocate the 70,000*l.* scheme.

19,147. The Tees Conservancy case is primarily the reduced plan of 76,000*l.*; and secondarily, the more enlarged plan that we see on the yellow line—the extended breakwater?—Just so.

19,148. The great harbour you take no charge of?—We take no charge of. If it is constructed anywhere in the Bay, it must of necessity be of great advantage to the Tees. Our only wish would be to have the best site.

19,149. Before proceeding with the evidence it would be convenient for the Commissioners to have the several plans handed in. If there are any plans connected with Redcar, we should like to have them simply handed in?—My observations as to the large harbour on the south side of the Tees, apply to the portion shown by the red lines.

19,150. Mr. Fraser's?—To the harbour proposed to be constructed between the Tees mouth and Redcar, irrespective of that which will be put before you by Mr. Brookes.

19,151. That is Mr. Fraser's plan, which is already in evidence?—Yes.

Mr. William Alexander Brooks handed in the plan of the Commissioners.

Mr. JOHN DUNNING examined.

19,152. (*Chairman.*) Are you by profession an engineer?—Yes; an engineer and surveyor.

19,153. Where do you reside?—At Middlesborough.

19,154. Do you appear on behalf of any parties, or simply on behalf of yourself as a projector?—I appear on my own behalf. I had the honour of giving evidencee before the Select Committee of the House of Commons in London in the year 1857, and have prepared a plan for a harbour of refuge, which was handed to Captain Washington last evening, and which I now propose to put in. [*The plan was put in.*]

19,155. I find on this plan No. 1, there are sheltered in gales from the north, having a depth of above five fathoms of water, 475 acres; above three fathoms, 673 acres; below three fathoms, 96 acres; making in all 769 acres. I find also there are sheltered from the north-east winds 535 acres, with above five fathoms water; 855 with above three fathoms water; and 302 with below three fathoms water, making a total of 1,157 acres. I find also there are sheltered from the east winds 605 acres, with above five fathoms water; 1,075 acres, with above three fathoms water; and below three fathoms water 592 acres; total, 1,667 acres. That, I presume, is correct?—That is correct.

19,156. I see that the breakwater is divided into two portions, the outer portion, which is parallel to the shore, and the inner portion, which runs off nearly in a perpendicular direction from the shore?—Yes.

19,157. Will you state to me the cost of each separately; first, the cost of the outer pier; and secondly, the cost of the inside portion?—The cost of

REDCAR.

Mr. John Dunning.

21 Oct. 1858.

Chairman.

the outer breakwater is estimated to be 816,000*l.*; the cost of the other 84,000*l.*

19,158. Have you any written statement which you can lodge with us which we can consider hereafter as explaining your plan?—I have not any such statement, but I can prepare one.

19,159. Would you be good enough to prepare a written statement, showing what you suppose to be the advantage or necessity of this plan, and forward it to our secretary for consideration in London?—I shall be happy to do so.

(*Chairman.*) If it does not suit the convenience of the Commissioners to examine you as to your plan here to-day, it will always be in their power to call you up to London at a subsequent period for that purpose.

Mr. William Alexander Brooks examined.

Mr. W. A. Brooks.

19,160. (*Chairman.*) Are you an engineer?—Yes.

19,161. And reside at Newcastle?—Yes. I am engineer to the Tyne Improvement Commissioners. I was engineer for a long time for the River Tees. Most of the large works there were executed by me. Besides the plan I have handed in, I have another plan, as to which I do not intend to go into any details to-day. A copy of it was lodged with the Admiralty about two years ago. Here is another plan, an old plan of Runswick Bay, which I think will be valuable and interesting to you. There are some lines drawn upon it by myself a great many years ago. I have also an unfinished copy with soundings, and an outline of the coast, which is at the service of the Commissioners. [*The plans and sketches were handed in.*]

19,162. Mr. Brooks, you term the breakwater which I see on the plan before me, the Marske breakwater?—Yes. It is the plan of my old scheme of Redcar harbour, with a detached breakwater abreast of Marske, when I thought there was a call for a very large harbour.

19,163. I am dealing with this Marske breakwater which will shelter, with the wind at the east, 870 acres of good holding ground, having a depth of five fathoms and upwards at low water spring tides, and 1,000 acres having above four fathoms?—That is the fact.

19,164. The Redcar pier will shelter during all winds 330 acres, having a depth of from four to six fathoms at low water spring tides?—Yes.

19,165. The construction of the Redcar pier, 6,200 feet in length, will take place on a rock called the Salt Scar Rock, bare at low water, 2,500 feet in from 1 to 12 feet, and 6,000 feet in from two to seven fathoms at low water. That, you think, is correct?—It is correct, taken from the soundings by Mr. Calver. The smaller plan is all from the survey of Captain Hewitt from tracings furnished by the Admiralty a great many years ago.

19,166. Your breakwater is divided into two portions; the Redcar portion, and the Marske portion. What is the total cost of the Marske portion?—I am hardly prepared to give that without looking at the papers.

19,167. What is the cost of the Redcar portion?—I should make the same observations with respect to that portion.

19,168. Will you, at your convenience, draw up a statement for the Commissioners to be forwarded to our secretary in London, showing the cost and the advantage and necessity, in your opinion, of the proposed breakwater, and all the other requisite information connected with them?—Certainly.

19,169. Do you wish to lodge the large plan which you have handed in?—I would rather keep it, because there is already a copy at the Admiralty.

19,170. Then that is not lodged. Do I understand that the plans containing the soundings are lodged for our use?—You can keep them if you please. One is an unfinished copy, but the other is a finished plan.

19,171. (*Chairman.*) We will keep these to refer to, but will not put them in evidence. Are there any other plans coming in to us?

(*Mr. John Anderson.*) This is the plan for a large harbour at Redcar [*handing in a plan*].

Mr. John Anderson re-examined.

Mr. John Anderson.

19,172. (*Chairman.*) Mr. Anderson, have you any details, plans, or estimates to lodge with us respecting these breakwaters?—Yes, I have.

19,173. (*Sir F. Smith.*) Are the figures in this plan in pencil?—Yes.

19,174. (*Chairman.*) Everything must be put in in ink. Are your estimates prepared for this plan?—Yes.

19,175. Can you hand them in at once?—They are not in a state to be handed in at once. They could be got ready to-day.

19,176. I think it would be better for you to take a little more time for consideration; that you should do as the other gentlemen will do, and forward to us, at your convenience, to London, well, considered estimates, if you are prepared to do so?—Certainly. I will.

19,177. You say that your plan is divided into two parts; a breakwater running from the Heugh at Hartlepool?—That is not my plan.

19,178. It is on the plan which you have handed in?—It was on the chart when I bought it.

19,179. We cannot accept plans in this manner. A great deal of time has been occupied. We cannot take in plans in this crude, unprepared state?—I will remove that.

19,180. I think it would be better not to receive any plan from you at present, but for you to forward to us, in London, prepared plans and estimates at your convenience?—I shall be most happy to do so.

19,181. With a statement of the supposed advantage and necessity of what you are going to propose?—Yes.

[*The plan, and also a section which had been handed in, were returned to the witness.*]

Mr. John Fraser re-examined.

Mr. J. Fraser.

19,182. (*Chairman.*) Mr. Fraser, I understand you want to correct what appears to be an inaccuracy of your statement yesterday, respecting the price of rubble?—I fear it will be thought that I said that the rubble would only cost 3*d.* per ton for getting. I meant to say that it would cost 8*d.* It is 8*d.* instead of 3*d.*; 5*d.* for the expense of loading and the incline, and 3*d.* for simply raising the rubble, which would make 8*d.*

19,183. (*Mr. Coode.*) It is desirable that Mr. Dunning and those gentlemen who are about to forward plans and statements to London should comply with the memorandum which will be handed to them by our secretary. That memorandum has reference to the scales on which the plans and sections should be drawn, and also to the calculation of the areas. The object of this is that we may have them all on the same scale, and that the areas should be compared with one standard as regards depth. (*To witness.*) Will those corrections which you have now made affect the total amount of the estimate?—No, the total of 1*s.* 9*d.* still remains as the price.

19,184. (*Mr. Coode.*) The total will remain as you stated yesterday?—Yes.

19,185. (*Chairman.*) You are going to remain during the rest of the proceedings?—Yes.

(*Mr. Dodds.*) If it would be agreeable to the Commissioners, Mr. Fraser will be willing to send

a written report which was addressed to the Tees Conservancy Commissioners, and which will substantiate the evidence he intended to give yesterday. Perhaps there would be no objection on the part of the Commissioners to allow that to accompany his plan? (*Chairman.*) None. Let it be forwarded.

Mr. BROOKS re-examined.

19,186. (*Mr. Lindsay.*) You stated that you are the engineer to the River Tyne Commissioners. I do not remember seeing you there when we were examining the witnesses at Shields. Why were you not there? Were you not summoned by the River Commissioners to give evidence?—That was the fact.

19,187. Were you not in attendance at all?—I was not in attendance.

19,188. A plan has been laid before the Commissioners for the extension of the piers which are in the course of construction at the mouth of the Tyne, so as to carry those piers out to about 30 feet at low water, with the view of converting the mouth of the river Tyne, and the Tyne itself, into a harbour of refuge. Do you know anything of that plan, and if so, could you state to me your opinion respecting it?—I have seen a rough copy of it, a very rough copy, but it has not been formally brought before me to give my opinion upon, as a finished plan by Mr. Walker. I should like to hear his evidence upon his own plan before I give any opinion upon it.

19,189. Mr. Walker was unfortunately unable to attend before us, on account of a great family bereavement, the loss of a daughter; we had not his evidence, but we had the whole subject brought fully before us. As you were not there, I had no opportunity of seeing you. I may not have another opportunity of seeing you again, and should like to ask you if you have formed any opinion about that plan, and if you have, if you will give it me?—If you will favour me with a sight of the plan, I will give you an opinion upon it.

19,190. You have not studied it sufficiently to be able to give an opinion upon it?—I think I can, if you will put the plan before me.

19,191. I don't think we have the plan with us in this room?—It would hardly be justice to Mr. Walker for me to give an opinion upon his plan, not having heard his own description of it. It would be unfair to a brother professional man.

19,192. For reasons which have been suggested to me, I will not ask your opinion with regard to that particular plan; but while you are in the witness box, I should like to ask your opinion with regard to the advantage of constructing harbours, so called, of refuge, at the mouths of tidal rivers?—There are some rivers, that are capable of very great improvement. There is no doubt of that. But there are other rivers,—if you put the question generally as to the rivers on the coast, I should say there are one or two capable of improvement, such as the Tyne,—but there are others that I know of, where there has been an expenditure of a quarter of a million, or 300,000*l.* or 400,000*l.*, upon them, and they have been made no better. We know that in the river Wear there has been a large expenditure. They have spent 20,000*l.* a year for many years, and have only two feet of water on the bar. Now I certainly should not like to commit myself as a professional man, and say that I would recommend a large expenditure of public money upon such a work as that. With regard to the Tyne, it is different. There is over eight feet at low water. I feel satisfied that it can be greatly increased in value as a refuge harbour, although not so as to make it equal to the Humber or the Thames.

19,193. What I want to know is this; speaking generally, so far as the Tyne is concerned, and not alluding to any particular plan, say that they do carry out piers to a depth of 30 feet at low water at the mouth of the river, suppose at the Tyne or any other large river, do you think they would be able to maintain that depth?—I have no such opinion. It may be matter of experiment, but I don't know whether it has been tried. I have no certainty that if you carry out the piers to 30 feet water you will necessarily maintain it. If that were so, you might do the same at Whitby, or the Wear, or any other stream. If going into the sea procured deep water, any stream could get it.

19,194. You have doubts in your own mind of being able to maintain the depth, even if the piers were carried out to 30 feet at low water?—I have no doubt upon the subject; that is, I don't think it possible to make and maintain 30 feet of water. I don't think you destroy the cause of the existence of the bar by merely extending the piers.

19,195. It has been suggested if you carry the piers out, so as to meet what is called the ocean tide, running directly north, south, east, or west, whatever the line of the coast, that these bars might be destroyed. I am asking for your opinion upon the subject, as it is a matter on which I am entirely ignorant; would the carrying out of the piers sufficiently far into the sea to meet the ocean tide tend to remove the sand which otherwise collects at the ends of piers not carried so far out to sea?—If the piers were carried out beyond the bar, so that there was a very much stronger tide, say such as that running in the Bristol Channel, where we know it makes four or five knots an hour, I think you would have a very reasonable hope of greatly improving the bar, or getting rid of it. But the tide does not run with that speed on this coast. The general rate of spring tides in the strength of the tide at half and three-quarters flood, is only about one knot an hour. I don't find that by going out you get any greatly increased strength of the tide; I know that it does not increase.

19,196. Then you think that the carrying out of the piers to the distance I have named would not produce any change in the accumulation of the sand which takes place and forms a bar somewhere about the end of the piers, if they are much nearer the shore?—I think the piers as originally planned go into an equally strong tide and get the same benefit by that length as if you went out further. You get into the true stream of the tide; further in there is, of course, more eddy, because the points overlap and produce an eddy on the flood tide. By carrying out the piers according to the plan which is now being acted upon, you get into the true tide. I think with the river improvement we should get perhaps 16 feet of water. With the sixteen feet flow of the tide that would make the Tyne a very good harbour of refuge.

19,197. Do you think that when these piers are carried out as now suggested, to get 16 feet at low water, that you can maintain that depth?—With the river improvements which are intended to destroy the cause of the existence of the bar, I look upon it that the improvement of the bar is more likely to be effected by internal river improvements; I regard the piers more as giving shelter to vessels going in and out. I know that eminent engineer, Mr. Robert Stephenson, entertains the same views. We must remove the cause of the obstruction which now exists.

19,198. Tell me the force of the tide in the Tyne. At what rate does it run out?—It varies in different places. At Shields Harbour it runs about two knots an hour.

19,199. Have you ever known the ebb tide in an ordinary spring tide run at the rate of five knots?—No.

19,200. It was so given to us in evidence.—It runs very sharp through the Narrows, about three and a half or four knots an hour. With a great land flood in some parts of the harbour that would be the rate; but on the bar the velocity is very different

REDCAR.

Mr. W. A. Brooks.

21 Oct. 1858.

Mr. Lindsay.

indeed. The velocity there in these land floods would not be more than a knot and a half per hour.

19,201. If a witness stated to us that the tide ran out at the rate of five knots an hour, and that he has known the freshets from the Tyne to run five knots, making together 10 knots an hour, would you think that an exaggerated statement ?—He would not say the tide ran five knots and the freshets five, making 10. I think that must have been a misconception.

19,202. He did state that, so far as I understood him ?—I don't think he meant that, whoever he was.

19,203. Then you think the greatest speed at which the stream runs out with a freshet would be five knots an hour ?—I don't think it would run so much as that. We had the flood measured in a narrow part of the river abreast of Newcastle, by Mr. Calver, with a very capital section for it, and the rate he made was only four knots. I don't believe that you would find a greater velocity than that in any other part of the river.

19,204. At the ordinary spring tides what do you think is the greatest velocity on the bar ?—The tidal observations which we have show only one knot per hour.

19,205. During spring tides ?—During spring tides.

19,206. In neap tides ?—In neap tides, at the end of the proposed extension, it runs out one mile in an hour and a half.

19,207. In neap tides ?—Yes ; that is, going well out to sea, going into 30 feet at low water.

19,208. Do you think the running out of the tide from the Tyne would, as a usual rule, offer obstructions in the way of a ship entering the river when it was blowing a strong easterly gale, and seeking refuge during the ebb tide ?—I have just said that the rate being only one knot an hour, would not offer a serious obstruction, yet it would be better without it.

19,209. But in the case of freshets, would it offer an obstruction ?—There would be a greater obstruction ; there would be a heavier sea from the running of the tide against the wind.

19,210. Are freshets of common occurrence in the Tyne ?—Not those very heavy ones. Perhaps there are six or seven in a year, but years vary very much.

19,211. (*Capt. Washington.*) I believe you have had a good deal of experience in dealing with tidal rivers ?—I have, for the last 30 years.

19,212. You were, I believe, resident engineer in the Tees during nearly all the time that the works above Cargo Fleet were going on ; after that, you left the Tees, and went to the Tyne ?—Yes, for 16 years.

19,213. Did you, about that time, make it your business to examine the different harbours of England ? —There are very few on the English coast that I have not examined.

19,214. Did you, about 20 years ago, publish a work on the subject ?—I did.

19,215. And before writing that work, I suppose you studied the subject ?—I had had considerable experience before I wrote that work.

19,216. Do you consider that any tidal river in this country has ever been treated in the best engineering way, and with abundant means at the disposal of the engineer ?—I don't think any one has. I know of no river where we may say the experiment has yet been fairly tried.

19,217. Do you not consider it desirable that that experiment should be fairly tried ?—I think it is.

19,218. Do you know any river in the United Kingdom which offers a better opportunity or a better field for trying it than the river Tyne ?—I know no river so capable. It is a good river in its course, and at the mouth there is not any danger of the entrance shifting after works have been carried out. In some cases, perhaps, after you had constructed works, the river would make a new sea reach. In some rivers you might carry out piers, and then at the end of them you would perhaps have a new sea reach formed by the banks expanding right and left.

19,219. Is Mr. Walker chief engineer of the Tyne ?—No, he is chief engineer of the pier. I am engineer of the Tyne. Mr. Walker is simply engineer of the piers. It is well known that Mr. Walker merely adopted one of my designs for the Tyne piers; the piers are in form precisely the same as those which he copied from my plan, with the exception that the pier heads are several hundred feet nearer to each other than in my design, so that, in fact, they are so close that I am satisfied that if built according to his design the bar would be formed seaward of the pier heads [and I wish that this opinion of mine may be recorded in evidence].

19,220. He is engineer of the experiment now being carried out ?—Yes.

19,221. In his absence I would not ask an engineering question ; but do you think it desirable that the experiment should be tried on a proper scale ?—What experiment ?

19,222. The experiment of improving the entrance of tidal rivers ?—I think it ought to be.

19,223. (*Capt. Sulivan.*) Will you explain why, if the Tyne with eight feet and its current can be deepened to a certain amount, by piers being carried out, and by narrowing the channel and confining it at the mouth, the Wear, with its $2\frac{1}{2}$ feet and its smaller current, could not, by similar means, be deepened in a relative proportion ; the methods being something similar, and the piers of the Wear answering to the Narrows of the Tyne : why should not a relative advantage be gained by carrying out piers from the Wear, the same as from the Tyne ? —I must do justice to the Wear as well as to the Tyne. I must tell you that the Wear generally has had four feet at low water on the bar ; and if proper treatment is pursued, you have a right to expect that the river Wear also would be improved.

19,224. I understand you to say that the works at the Wear had all failed, and that you could do nothing to the Wear to improve it ?—Not to make it a harbour of refuge, the river being so small, but it is still capable of improvement.

19,225. From what you know of tidal rivers, could you conscientiously recommend any outlay of public money, with a certainty of producing the desired results, if it included within the works a tidal river and its bar ?—Yes ; but not to make a perfect harbour of refuge, but to give an easy refuge. I could not perhaps recommend the expenditure of a million of money, but I should recommend a moderate sum to be advanced ; not a very large sum, like a million of money, or the capital which would be required to make a complete harbour of refuge with 30 feet at low water.

19,226. I believe they expect to get 15 feet at the Tyne at low water, by means of their piers ?—I expect to get it rather by natural improvements. I look upon the cause of the formation of the bar differently from some people.

19,227. Do you believe that the piers being extended outside the entrance will be the cause of getting the 15 feet, or would other works up the river be necessary ?—Other works in the river in connection with it, but mainly from internal improvements in the navigation.

19,228. (*Capt. Vetch.*) You have been long acquainted with the river Tees ?—Yes.

19,229. Can you tell us anything of the shifting of the channel near the floating light ?—I don't think there is a very great shifting there ; the shifting is more in what we call the sea reach, which you will see, from the Admiralty chart of the Tees, runs west of north.

19,230. Has the light-ship never been altered ?—I once made a survey of the mouth, and it then run about north-east, but I have seen it west of north. It was so in Captain Hewett's time.

19,231. Have you got lights on the Bran Sand ?—Yes.

19,232. Have they been altered ?—Yes, they have frequently been shifted ; they were changed during my time.

19,233. First to the east and then to the west ?—Yes.

19,234. How much did that amount to in your time ?—I think from west of north to north-east.

19,235. What distance ?—About an angle of 50 degrees.

19,236. That is to say, the bar has shifted in that direction ?—The plan which I have put in is Captain Hewett's survey of the river. If you refer to that you will see that the channel comes west of north, but in the plan of a recent survey I think it is shown as north-east.

19,237. Can you tell me if the channel at the inner leading light moves from eastward to westward ?—I believe it varies, but not to a great extent.

19,238. A hundred yards ?—It may be so, but I have taken no measurement, and should not like to give any more direct statement.

19,239. (*Mr. Coode.*) Did you hear the evidence given by Mr. Fowler with reference to the proposed improvements within the Tees ?—Yes.

19,240. Do you believe that the measures proposed by him will be attended with the results which he anticipates ?—His pier terminates upon the South Gare Sand, where there is only about three feet at low water. I think it went out to a much greater depth at first. It shows dry there.

19,241. I should like to have your opinion as to the probable result of the pier as proposed by him ?—I think it will be beneficial to the river ; I think it would give the current a more easterly outset. There would still be sand banks right and left of it, further out, in fact, than his pier head, but the river would be in a better state. It would be an easier course in from the sea.

19,242. Do you think the channel would be permanent as far as regards position ?—I think they would have the effect of making it permanent. I should say that is very near what was the plan of Mr. Lister, the pilot, many years ago. They all come to the same point.

19,243. Do you, or do you not, think that the channel would be permanent as regards position ?—I think it would at all events be a great deal more permanent than it is at present. I don't say it would be permanent, keeping merely north-east and south-west.

19,244. Would it be very much better than it is at present ?—Yes.

19,245. What is your idea regarding the depth of water that would be obtained ?—I think it would improve the depth of the channel.

19,246. To what extent ?—They have now about seven feet six inches on the bar at low water spring tides by the Admiralty chart. I should think they would maintain 11 or 12 feet.

19,247. Permanently maintain that ?—I think it would have that effect. It would concentrate the power of that great body of water upon the bar, a great deal of which is now wasted.

19,248. In giving that answer are you assuming a guide wall to be constructed inside the small piers, as shown upon the chart put in ?—If there were no guide walls, still there would be, as it now stands, a great body of water falling on the north side of the estuary, and, with the entire body from the south side, it would take a more easterly outset. It would give you perhaps a stronger outset to the sea than if you were to enclose the channel as it now lies with guide walls.

19,249. You see on this plan which Mr. Fowler has put in, one guide wall within the estuary of the Tees ?—It is on a convex shore. Now a convex line of wall is not a guide wall. To be a guide wall it should be a concave one. I think the river would still have full power to meander away to the north.

19,250. Assuming these works to be constructed, do you think that the channel within the bar would be permanent ?—No, I think it would vary, and vary considerably.

19,251. Would it vary in position ?—I think the effect of that guide wall would be to throw the channel more away to the north, but that would rather be an advantage, because if you had the channel more away to the north, and towards Seaton Snook, there would be a better chance of a more easterly outset.

19,252. With the guide wall and the north pier you think there would still be a variation of the channel ?—With the guide wall as shown on the plan, yes, sir.

19,253. To any extent ?—Yes, to a considerable extent. I think it would send the channel more away towards Seaton Snook, but I think that is rather an advantage.

19,254. Having sent it there, would it then remain ?—It might be made permanent. It would be more permanent then. You get upon hard ground, on the clay bank. I know there is such a bank there. I have tried the ground on the north side, and know there is a clay bank there. That would render it more permanent.

19,255. You think the channel would not be liable to return to the guide wall. I understand your answer to be to the effect that the channel would be driven away from the guide wall ?—Yes. It would make a channel more to the north. Then I think it would be more permanent ; but it might drive it over the shallow ground. I think I heard some observation about there being only three or four feet on the clay. That would have to be deepened. If it drove the current over the clay ground that clay ground must be dredged out.

19,256. You have some doubt whether the channel would remain permanent by along the guide wall ?—The channel, I am sure, would go away to the north from the guide wall. It would not be there.

19,257. Having left the guide wall, would it or would it not be more subject to variation, according to the state of the winds and the floods ?—There is a considerable space for it to range about, and so it would be liable to vary.

19,258. Would it or would it not, be more liable to variation ?—It would be more liable to variation ; but I don't look upon that as a guiding wall, a wall having a convex form.

19,259. I ask your opinion upon this plan, as you now see it ?—If there was a concave wall on the opposite side it would be a good wall and a permanent one.

19,260. The water would still be free to distribute itself over a large area, and the result would, in your opinion, be somewhat doubtful ?—Certainly.

Mr. William Fallowes examined.

19,261. (*Chairman.*) You reside at Middlesborough and are a Commissioner for the Tees Conservancy, and a shipowner ?—Yes.

19,262. I understand you have some statistical information which you which to lay before us. Will you now be good enough to give it in ?—This is a matter to which I have given some consideration. I am not quite aware whether you wished our chairman yesterday to give you any statement as to the expenditure which had taken place on the river during the time of the late conservators, when the matter was in the hands of a joint stock company, and since it came into our own. If you wish to have that information, we will prepare it, so that you may have a full statement as to the expenditure which has taken place in the river, with all the improvements that have been made by means of groins and guide walls. We can prepare a statement of that kind, if you wish to have it.

19,263. Will you forward such a statement to our secretary at your convenience ? — We will, The explanation given by our clerk yesterday is

REDCAR.

Mr. W. Fallowes.

21 Oct. 1858.

Chairman.

that which we wish to have brought before you. Now, with reference to the plans which have been submitted, the plan which was first submitted by Lister has, as Mr. Dodds, our clerk, explained, had the approbation of the Commissioners ever since they came into office. They have devoted their attention to making it well known, and endeavouring to see it carried out, if they can. It is a very modest plan, the sum is so small. You would hardly think that for so small a sum so great a good can be obtained; but the Commissioners are fully convinced, that if the money of the Government is expended on the different ports, a large amount of property and of life will be saved. I speak advisedly on that point, having given some little attention to the subject. I have calculated from the Admiralty register the wrecks for the two years 1852 and 1854. If you will allow me, I will put these papers in. (*The paper was put in.*) This is a list of ships registered at the ports of Stockton, Hartlepool, Sunderland, and in the Tyne, giving the names of them and distinguishing between those which were proceeding to those ports, as belonging to them, and those which were passing, as merely being bound for them; also showing those which were seeking refuge. And where there is any wrecked, as to where they were proceeding. The first return is for 1852, showing at Sunderland five ships seeking refuge, and 15 belonging to the place; at the Tyne, 17 belonging to the port and 22 seeking refuge; at Hartlepool, 15 seeking refuge, and four belonging to the port. The next return is for the year 1854. That was a year of great casualties, and there were several heavy gales. This return shows 40 vessels at the Tyne, either bound for or belonging to it, and 22 that were seeking refuge, of which there is no account as to where they were proceeding. At Hartlepool, there were 36 seeking refuge, and 12 bound to or belonging to the port; at Sunderland, there were 24 as belonging to or bound for the port, and 14 seeking refuge; at Stockton-on-Tees, there was one seeking refuge, and two bound for or belonging to the port. We think that this statement shows that if the larger number of ships were wrecked or stranded at these places that these are the sites which really require improvement.

19,264. Before you proceed further, will you state why you selected the years 1852 and 1854?—I happen to have the registers myself, and I had no others; but, if you wish it, I can calculate the others for five or seven years.

19,265. That is all; I only wished to know the reason.—We have always been persuaded that the Tees would have been more used, and would have been considered a place of refuge and safety if it had been better known. Those of us who are old enough, remember, that before Hartlepool was a port, colliers, when they had to bring up before making the ports in the north, did generally run for the Tees, and generally got in with safety and without much casualty. I produce a list of vessels wrecked and stranded at the Tees mouth, from the 1st of March 1839 to the 9th of February 1858, showing that when we had 10,000 ships into our port, two vessels were wrecked; that in 1849, we had 9,192 vessels entering our port, and that one vessel was wrecked and one stranded, and so on during the whole period. Our port, you will observe, has undergone a most extraordinary change within the last few years. In the years 1854 and 1855 we were what we may call almost in a state of collapse. We were passing from a large coal trade into an entirely new one, the iron trade. The coals which we were formerly in the habit of exporting began to be used in our furnaces. Our iron is now being exported, and the quantity is gradually increasing every year; so that in the course of time our new trade will almost be equal in extent to the old one. I now beg to put in a statement, showing the number of losses which have occurred in the Tees over the time I have mentioned. (*The statement was put in.*) I would further beg your attention to a chart which was, I believe, submitted to the Harbour of Refuge Commission of the House of Commons in the year 1857. It was prepared by Mr. Calver, and, I believe laid before the Committee, and is No. 2 in the Blue Book. From that I can show, that of all the casualties which occurred on the coast between the Humber and Warkworth, there has been the least damage in proportion to the number of ships entering and departing from the Tees of any port on the coast. The statement which I have prepared, abstracting it from that chart, shows that the average annual traffic to the Humber in shipping is 22,000, and they had 16 vessels wrecked. In the Tees, with 6,355 vessels, our wrecks were only $2\frac{2}{5}$ per annum. (*The statement was handed in.*) A great deal of evidence was submitted to you the other day at Hartlepool, as to the gales which have prevailed, and the losses resulting from them. I have prepared a statement showing the number of gales which have prevailed in the Tees Bay in each wind from the year 1843 to the year 1857, with the direction and force of the winds, also the reading of the barometer and thermometer from a certain time. The register of winds begins in 1843, but the register of the thermometer, I believe, not till 1856. I had these prepared from the tidal register which is kept at the Middlesborough Dock Lock, and that which is regularly kept on board the light-vessel, lying at the fifth buoy in the river. It is perhaps too voluminous for me to put in, but it shows the number of gales which prevailed on all parts of the coast every year from the year 1844, and these gales are generally of the force of eight up to, perhaps, 11. A question was asked yesterday as to the prevailing winds. I have a prepared statement here, showing what winds have prevailed each month during each of the last 15 years. I have also a statement of the statistics of the iron trade at the present moment. I may remark that the nautical gentlemen fully acquainted with our port are fully persuaded that had the works which we suggested, and which, as our clerk intimated, is so much approved of by various engineers, been constructed some years ago, the whole loss which has occurred in Hartlepool Bay, or the greater part of it, might have been saved by finding refuge in the river Tees. A witness who was examined yesterday, Mr. Lister, has given a great deal of thought and care to the soundings, but he is not one of those who can explain his views so clearly as he should; but he is fully persuaded, from his own soundings and the bearings of the bar at present, that were that work constructed there would not be less water than 24 feet at low water, spring tides. That is his decided opinion, and I believe it to be the opinion of many others who have thought carefully upon the point. Bringing a great weight of water permanently upon one particular place, and guiding it by the walls which the Conservancy Commissioners have constructed within the harbour, so that the whole weight of water would be carried over that one particular place, coming from a river of perhaps the largest extent of any upon the coast, except the Humber, there can, I think, be no doubt that we could obtain about the depth of water I have mentioned. I don't know that there is anything further with which I need detain the Commissioners. We are exceedingly anxious that what we recommend should be done.

19,266. With reference to your account of the winds, are you able to state, or have you reason to suppose that the winds which are noted at the light vessel are the same as the winds which blow outside at sea?—The light vessel is stationed at so short a distance from the bar that there can hardly be any difference whatever. It is not more than three quarters of a mile or a mile from the bar to where the light vessel is stationed.

19,267. Are you able to offer an opinion as to whether the winds up at the top of the bay are the same as those blowing out in the offing?—I believe so, generally. But we will produce the master of the light vessel, who will state to you from what quarter

the heaviest gales rise, and the course which they generally take.

19,268. (*Sir F. Smith.*) Have you examined this return of the winds carefully ?—Yes.

19,269. Is it not the fact that the great majority of the gales of wind occur from east-north-east to north-east?—So far as I can ascertain from examination, they begin, perhaps, from the south-east, and so proceed and get round to the points I have mentioned. Our light-master will state how that matter stands. He has noticed many times that they rise at south-east, proceed quite round, and almost invariably, in a day or two, come back to the same point.

19,270. The return scarcely shows any westerly winds ?—I did not insert the westerly gales, inasmuch as they are not the destructive winds. I have simply extracted these to show the gales of wind which have arisen during these years, and which have generally been so destructive on our coast. These generally have been from east or east-south-east.

19,271. You have purposely omitted the westerly winds ?—I did so. But if you wish it, I can give you a copy of the entire register.

19,272. (*Mr. Lindsay.*) Now that the question, so far as this district is immediately concerned, is fairly before us, which was not the case yesterday, I want to ask one or two questions : is it the general opinion of those interested in the shipping at Stockton and Middlesborough, that the improvement of the existing harbours, those to which you refer, would do more to save life and property than the construction of any one great harbour in any one site along this coast ?—So far as our own vicinage goes, I believe that those whom I have conferred with are undoubtedly of opinion that if our harbours were improved it would be the means of saving a larger amount of life and property than the construction of any one larger harbour, inasmuch as the documents which I have put clearly show that the vessels which have been wrecked at these ports could not have got back to this large harbour of refuge. But there is one element that I might perhaps notice in replying to the question, and that is, that we do not raise any question individually as to any protection which may be needed between this and Flamborough Head, because we do know that there has been a great destruction of property on that part of the coast. We do not raise any question about it. But we say, that if it be needful that some harbour on that part should be constructed, it might really be a useful harbour for laden ships.

19,273. I ask this question because, from your connection with shipping, you have perhaps more opportunity than any other gentleman who may be called, of seeing shipowners and shipmasters, and conversing with them on this subject. Do you think the primary object should be the improvement of the existing harbours ?—I do.

19,274. Do you think that the improvement of the existing harbours, so as to admit the usual description of vessels trading along the coast at all times of the tide, and the construction of a harbour somewhere near Flamborough Head—say off Filey Bay—that these two works would meet all that the shipping frequenting these places require ?—I do think so, It is, in fact, the opinion of the nautical men, of those connected with shipping with whom I have conversed, that by adopting this course you would have several places in which ships might obtain refuge in case of not rounding from Flamborough Head, presuming that you should recommend the construction of one ; seeing that you have Bridlington Bay, which is a very valuable place, and which can be used by shipping without cost. From Bridlington Bay down to the Tyne you would have places spread over all this distance where ships might easily obtain refuge, and to which they would approach and be near, while they might have much difficulty in getting back to a great harbour at any one site.

19,275. Tell me a little about your own proposed improvements ?—The plan which I brought before the Committee of the House of Commons in 1857, is this plan which I see upon the walls.

19,276. What depth of water will you have at the end of the proposed pier at low water ? I refer now to your 76,000*l.* plan ?—Mr. Bald reported that we should have 16 feet, and I believe Mr. Calver is of the same opinion. Mr. Calver, in his report of May 31, 1855, says, with reference to this plan—" In conclusion, I would beg to record " my opinion, that were a north pier formed at the " mouth of the Tees to the extent indicated in the " Parliamentary plan of the Tees Commissioners of " 1852, and now recommended by Mr. Rendel, it " would be followed by the most beneficial results ; it " would give certainty to the position of, and depth " over the bar of, an important river possessing at " present a large trade, which promises to become " greatly increased in future years ; it would render " the entrance of the Tees available for refuge " purposes, and thus confer a great boon upon the " whole coasting trade, and it would render unneces- " sary a large outlay at a neighbouring site to secure " a similar advantage, and where there are also phy- " sical drawbacks, which do not exist in the present " case." I do not know that I can say anything further.

19,277. Your harbour, if made in accordance with the plan laid before the Select Committee of the House of Commons, and at the cost of about 76,000*l.*, would afford shelter at all times of the tide to the usual class of vessels frequenting this coast ?—We are of that opinion.

19,278. What depth of water would you have at the entrance if you extended these piers to the extent Mr. Fowler proposed in his plan yesterday ?—I believe a depth of somewhere about 30 feet. I am not quite certain. Perhaps 24 feet.

19,279. The first plan would cost 76,000*l.* The extension of these piers, to get 24 feet of water, would cost 260,000*l.* if carried out upon the Abernethy plan ; and if carried out in the usual method of constructing breakwaters, would cost about 460,000*l.* Do you think, considering the class of vessels which frequent this coast, and considering that the limited plan would admit these vessels at all times of the tide, do you think it would be advisable to incur so very great an expenditure as the difference between 76,000*l.* and 460,000*l.*?—We are content to take the smaller scheme, sir, because we have been advised, for a number of years past, by Mr. Rendel, Mr. Bald, Mr. Calver, and other engineers, that we should still obtain a very large increase of depth of water, and it would answer all the purposes of the trade of the district.

19,280. Then, looking to the vessels which would be caught in the bight of this bay in easterly gales, and to the safety of the vessels belonging to your own port, you think that the more limited plan would meet the necessities of the case ?—I do ; and I believe this, that vessels of any size may then arrive and depart from our port up to 20 or 21 feet or more water.

19,281. We don't look to the departure. Commercial questions have merely a secondary consideration with us. It is a question of saving life. Say the Government should arrive at a different opinion from that which you entertain, and that they should think it fit that one great harbour would be better than the improvement of the existing harbours. Say there was only to be one harbour of refuge on this coast between Flamborough Head and the Farn Islands, at what particular part of the coast do you think such a harbour would do most to save life and property ?—If we had to choose in this respect, there could not be two opinions in the mind of any one on this coast, that the Tees Bay is the site where that great harbour should be fixed.

19,282. In looking at the great harbour laid down on that plan of 1847, and which very much resembles the plan handed in by Mr. Fraser last night, for a harbour of refuge at Redcar, do you think that a harbour at that particular site, or a harbour

REDCAR.

Mr. W. Fallowes.

21 Oct. 1858.

Mr. Lindsay.

on the other side of the bay, under Hartlepool Heugh, presuming that the area of water was the same, and the depth the same, do you think that a harbour at that site or one near Hartlepool would do most to save life and property?—I can scarcely answer the question. It is almost an engineering question as much as anything else.

19,283. I am speaking of the matter as connected with shipping?—I should say that you will maintain a greater depth of water on this side of the bay than you would be able to do on the other,—that if these piers are constructed sufficiently high and expensive enough, they will also protect you from the heavy north-east gales. We cannot disguise from ourselves the fact that the Heugh and the high land there are the best shelters that can possibly be made from north-east or north gales, but still we do think that if you do decide upon a point of that kind instead of confining it to the locality immediately under the Heugh, a breakwater laid in the full face of the bay would be better.

19,284. What do you mean by the full face of the bay?—Extending right across the bay, that is, in the most direct line from the Heugh leading to Redcar, something like two and a half miles long. You enclose the whole bay and then obtain your whole object.

19,285. What I want your opinion about is this. Do you think the site of this particular breakwater would do more good if it were at Redcar than if it were at Hartlepool?—It is a difficult question to answer, seeing that vessels could obtain an anchorage and safety in the one equally as well as in the other.

19,286. You are not a sailor?—No.

19,287. Then I will not go into that matter minutely. Now, say that Redcar were put out of the question altogether, and the matter rested between Hartlepool Bay and Filey Bay,—that there was only to be one harbour, and that it rested between these two points;—which site do you think would be the best?—If you put all the others out of sight, I should certainly say that Hartlepool would be the better site, inasmuch as you have down here at the Tees no refuge, and it is really needful for a large class of light vessels which have not the means of getting refuge in any other places so well.

19,288. They are caught in the bight of the bay?—Yes; they are caught in the bight of the bay, and cannot help themselves.

19,289. (*Capt. Washington.*) In your very useful statement of the gales of wind which occurred between the year 1843 and the year 1857, are you aware that in the title you have not said they are only those which blow upon the coast?—I am aware that I have not said so, but I ought to have done.

19,290. Perhaps you will alter it?—Yes.

19,291. You mentioned that you were prepared to put in accounts respecting the River Tees?—Yes.

19,292. Can you tell the Commissioners in round numbers what is the revenue of the Tees Commissioners?—I have a statement as regards the income and expenditure since we came into power.

19,293. Will you mention it?—The first year we came into office we had an income of 8,600*l.* That was derived from the lease of the tolls. The tolls were leased at that time.

19,294. I do not wish for details, only the total amount for last year?—The total income for last year was 6,266*l.*

19,295. Of that sum, how much was available for improvements?—We can only spend a certain sum per annum out of it for maintenance. Our improvements must be made by borrowing a further capital, which we have been doing since we came into office. We have expended in improvements, in the purchase of a powerful dredger and other matters, somewhere about 18,000*l.*

19,296. I think you say you have expended somewhere about 18,000*l.* in improvements?—Thereabouts.

19,297. You have a steam dredger?—Yes.

19,298. One or more?—One; a very powerful one.

19,299. Are you at present carrying out further improvements within the River Tees?—We are constructing guide walls down. We are going on with the work in leading down to the eastward of the eighth buoy scarp, on which we are expending somewhere about 1,600*l.* or 2,000*l.*

19,300. When will this work be finished?—About the middle of next month.

19,301. (*Capt. Sulivan.*) You said that if you get 16 feet of water at the mouth of the Tees, it would be available as a harbour of refuge for most of the vessels trading on the coast, and caught in the bay?—I don't know that; I won't go so far as that. I think I stated that some of the engineers said we should have 16 feet; some more, and some less. But this I believe: that if the work were constructed, it would then become a harbour of refuge for vessels trading on this coast, because we are fully persuaded we shall have a greater depth of water than that.

19,302. If your hopes are realized respecting this bay, and if the hopes respecting the Tyne are realized, and they get 15 feet at low water into their harbour, would you then say that a harbour for laden vessels near Flamborough Head would be better than another one down in the bight of this bay?—I stated my reasons why I thought it would be better if works were constructed at the entrances of the three large rivers. You would thus provide a refuge for the large amount of vessels that are generally in these localities, and in danger of the gales, and which generally suffer. I stated that in that case I thought sufficient refuge would be provided for them, but that some refuge ought to be provided for vessels that have made the Head so far, and are caught in the gales off the Head, and cannot get round.

19,303. Then am I to understand, leaving out the Wear, supposing that cannot be made deep enough for refuge, that if your depth and the Tyne depth were obtained, so as to have a refuge here for those embayed, and a refuge at the Tyne, principally for light vessels, that you would propose next to have a refuge for laden vessels nearer the Head?—I would say so. I don't indicate the locality, because I think there are one or two points which require grave consideration.

19,304. You said something of Bridlington Bay?—Yes.

19,305. Bridlington Bay is, I think, now a good refuge for light vessels to the north, is it not?—It it so.

19,306. But on the wrong side of the Head to be a good refuge for the vessels caught off Flamborough Head bound south?—If they could get round the Head with a north-east gale, they must be protected; but they don't want to go in there.

19,307. It is the south-east and the east gales off Flamborough Head, the south-east more especially, that prevent the laden vessels from going on their voyage, is it not?—Yes.

19,308. Then for those vessels would a harbour on the north of the Head be better than on the south?—A harbour between here and the Head would be the means of preserving much property on that part of the coast, inasmuch as we know that laden ships are there; and we know from the register, which is annually published, that a number of laden ships are lost in these parts.

19,309. Is it the case that a much greater loss of property takes place in laden vessels when wrecked, than in light ships?—That is about the most dangerous part of the coast for vessels going ashore, inasmuch as I am not aware that there is a beach of any kind, except one or two little bits, that they can get to.

19,310. But, supposing laden ships to be driven back and wrecked where the light ships are; is it the case that a greater loss of life takes place on the average in laden ships, in consequence of their not going so far up the beach?—I have not given suffi-

cient attention to the subject to answer that question; I can scarcely say.

19,311. Supposing it were considered that these tidal ports could not be improved, and that for a moment you exclude these ports from your consideration; I think you said that the preference between Hartlepool and Redcar as a harbour of refuge was very much an engineering question?—I think it is. On both sides it is a matter that might fairly be left for the consideration of either nautical men or engineers. I don't pretend to decide, but, as I have said, if we are to have the chance of one harbour only, the Tees Bay is the site that ought to be chosen.

19,312. When you say it is an engineering question, do you mean that the one of these sites at which the greatest depth of water and the largest amount of accommodation could be provided for an equal sum would be the best position in which to place a harbour?—No doubt about it.

19,313. I think you said that if 24 feet water were obtained here, you would have no doubt then of nearly all vessels being able to take refuge?—I have no doubt whatever that if a much less depth of water was obtained, that all light vessels, and even laden ones as well, might obtain shelter, because they have only to wait a little while for the flood to bring them in. Many vessels come into the bay, and great numbers do come in in those gales, and are preserved.

19,314. Would you consider that, for the coasting trade, a harbour of refuge which would take vessels in at low water through a channel of five fathoms water, ample depth for the calls of the trade we have in view?—Yes.

19,315. Supposing you had the choice of constructing a large harbour, say extended to seven fathoms, in this bay, or a harbour here extending to five fathoms, and another extending to five fathoms further south for laden ships, which would you prefer, the two moderate ones, or the larger one?—I think I could answer you as the lad did when he was offered two apples, and asked whether he would have one or two. I think this is a question which may be answered in the same way.

19,316. That the two would be decidedly preferable—that two would be better than one, though smaller?—Though smaller, I think a five-fathom harbour would not be a bad one now.

Mr. Robert Coulson examined.

19,317. (*Chairman.*) You reside at Coatham?—Yes, close to Redcar.

19,318. You are receiver of wrecks, and have for a upwards of 30 years been the receiver of the droits of the Admiralty?—I am.

19,319. You have been present during this inquiry?—I have.

19,320. Will you now proceed to offer to the Commissioners any statement you have to make relative to it, from information which you may have received, and from your official knowledge as receiver of the droits of the Admiralty?—I have kept a record of wrecks and stranded vessels, which record I should wish to put in. (*The record was handed in.*)

19,321. State the authority from which you get it?—The authority is the statement I have received from the parties at the time the wrecks take place. For instance, when a vessel is wrecked I take an account of the state of the wind, and examine the master as to why and wherefore he came into this situation.

19,322. In what capacity?—As the receiver of wrecks. Since my appointment to that office, and previous to it as Lloyd's agent, having to report to Lloyd's the accident and the wind from time to time, and having kept a record, I put that in as information.

19,323. As holding these offices?—Yes; I will read the heading of my book: "Date. Description "of vessel. Vessel's name. Burthen. Master's "name. Port where from. Where bound to. De- "scription of cargo. Wind. State of the weather. "Time of the tide. Where stranded or wrecked. "When got off. Whether wrecked or not. Lives "lost. Lives saved by Redcar life-boat. Estimated "loss on vessel. Estimated loss on cargo. Re- "marks."

19,324. Is the book which you hold in your hand the book from which the document you have handed in has been abstracted?—Just so.

19,325. Will you forward to our secretary, at your convenience, an abstract showing the heading of your book?—I will do so.

19,326. And describe the way in which it is kept?—I will do so.

19,327. And by whom?—Yes. I have also prepared another abstract from my book of laden and light vessels, where from and where to, and put that in. (*The abstract was handed in.*) I have a district from Starther to the river Tees, about 19 miles.

19,328. We have now two returns; have you any more?—I beg to hand in another; a return of the opinions of masters of vessels, as given to the receiver of wrecks at Redcar in filling up the wreck return. (*Return handed in.*) 97 might have been avoided, had there been an accessible harbour in the vicinity. This return contains the answer to the query as to where they would place a harbour of refuge.

19,329. This refers to Redcar?—Wholly.

19,330. Then please to take back the book. Anything connected with Redcar keep for a future occasion. Have you any further statement to hand in respecting the Tees case?—No, not any.

19,331. (*Sir F. Smith.*) You state, Mr. Coulson, in the return you have given in relative to the wind, when the wrecks occurred, that the number of wrecks with east, south-east, and north-east winds amounts to 168?—Yes.

19,332. While those with westerly winds amount to 96?—Very few, you perceive, from the west.

19,333. Ninety-six, taking the wind from south-south-west to north-north-west?—Yes, 96.

19,334. What I want to know is this; whether we shall have anything before us showing under what circumstances the wrecks took place with west winds?—I could explain by referring to the book.

19,335. There is nothing before us at present to show how they occurred?—They very frequently occur in vessels coming from the north or south getting on the rocks that come close into the coast.

19,336. On what rocks?—The Redcar rocks.

19,337. (*Mr. Lindsay.*) Then a harbour of refuge on this coast would not have saved any one of these 96 ships?—I should think it would.

19,338. How do you make that out; because a west wind is right off the land?—They would not have gone on the rocks; they would not have been there, if the rocks had been risen up with piles.

19,339. But if they got on to the rocks, they might as likely have got on to the pier in thick weather?—Not quite so soon as that.

19,340. You don't think it would be advisable to cover rocks with piers at the public expense, so that they might be better seen in fogs and thick weather?—Not without you can make them available for the purposes of vessels coming in.

19,341. As a refuge, the construction of a harbour would not, in fact, have saved any one of these 96 vessels; I suppose that is clear?—I think differently from that.

19,342. Tell me how it would have saved them?—If there had been a harbour of refuge there, they certainly would have availed themselves of the place, or have seen the light in the night time.

19,343. Would not a light have been better for them than a refuge harbour?—A light, unquestionably,

REDCAR.

Mr. Robert Coulson.

21 Oct. 1858.

Mr. Lindsay.

would have been of service, if it had been placed there for some years gone by. No mistake about it.

19,344. You think a light somewhere there would have been of service, and have saved, at least, a portion of these 96 vessels?—If a light had been there, no question a number of these vessels would have been saved.

19,345. A lighthouse, which would be like a beacon at night, and a beacon by day?—Just so.

19,346. A refuge harbour, in the proper sense of the word, would not have saved any of these vessels?—I think it would.

19,347. Tell me how?—If a refuge harbour had been just at the place, or near it, there would have been lights, and I think the vessels would have been saved.

19,348. But putting a light without a refuge harbour, would not that answer perfectly as well?—I don't think it would answer equally well. It would answer, no question, to a certain extent.

19,349. Were you brought up to the sea?—No.

19,350. Then I will ask some sailor how a harbour of refuge would have saved these 96 ships which were lost during these westerly winds.

19,351. (*Capt. Washington.*) In the year 1851, were there 16 vessels lost with north-east winds?—There were.

19,352. Can you, briefly, give any account of that gale?—There were 16 vessels came ashore here in the gale of the 25th September 1851. This is a minute made at the time: "Great storm and "high tide, which came on to blow on the 25th Sep- "tember 1851, about 3 o'clock, p.m., from the north- "north-east, when the following vessels were driven "ashore. Some of them were total wrecks, and "others got off at considerable expense, and much "damage. The gale came on very suddenly, when "the vessels were close in the Tees Bay, and could "not get off. Total of the gale, 16 vessels on shore, "8 wrecks."

19,353. Whereabouts were the vessels on shore?—Just close at hand here, close to Redcar. One was a steam tug; she could not get to the Tees, and went on the Brand Sand. Another was a galliot, near the Tees, on the Brand Sand. The *Cleveland*, galliot, went on shore on Coatham Sand. The *William and Mary*, from Lynn to Hartlepool, went on shore. The *Two Sisters*, the *Whitfield Grange*, the *Meridian*, and a Prussian called the *Apollo*. All these vessels were embayed here. It was not possible they could get out, they were actually driven ashore, forced ashore by that gale.

19,354. The whole of these wrecks occurred to the eastward of the Tees entrance?—Yes; from the Tees Bay to Skinningrave.

19,355. What is the extent of the district?—It is a district of about 19 miles.

19,356. Between the Tees mouth and Starther?—Yes; somewhere there or thereabouts.

19,357. It appears that, in the year 1849, there was a disastrous gale from the north-east, when 11 vessels were wrecked. Can you tell the Commissioners, very briefly, any special feature of that gale?—In 1849, in the autumn, there was a great gale and a great number of wrecks. One vessel, the *Albion*, of Newcastle, a laden vessel, just cleared the rocks at Redcar, and did not go on shore there, she cast off and went right on to the South Gare, and was lost, with all hands.

19,358. With the wind at north-east, she could not have got off the shore?—The wind was at north-east. The captain tried all he could to keep the vessel off, but without effect. She was heavily laden with lead and other general cargo. I found her at the bottom, hard driven, and got up about 1,000*l.* worth of lead. The cargo was insured at Lloyd's.

19,359. Is there any other special feature of that gale?—The *Frankfort* was on the Redcar Rocks, and the crew were saved.

19,360. In the year 1856, I observe that nine vessels were lost with a south-west wind?—Yes.

19,361. Was it a fog, or what circumstance led to the wrecks?—A very heavy gale.

19,362. Where were the vessels lost? On the Redcar Rocks?—Yes; chiefly on the rocks here.

19,363. Was it foggy weather, or what led to nine wrecks in an off-shore gale?—The gale of wind.

19,364. But it was an off-shore gale?—It was a south-west wind when they went on shore.

19,365. Is not a south-west gale off shore?—Yes.

19,366. How could nine vessels so contrive as to get upon a weather shore and be wrecked?—That is very frequently the case. Vessels coming close on shore with a south-west gale, we frequently have them on the rocks.

19,367. Were all these vessels insured?—I cannot say that. Sometimes the master cannot give us that information, or will not.

19,368. In the heading you have read, you have exactly followed the Admiralty series of queries issued about the year 1847?—Yes, in 1847.

19,369. But why have you omitted the column of insurance, which is inserted in the Admiralty directions?—For this reason: I very frequently could not get the information. A number of masters either will not or cannot tell what their vessels are insured for. Perhaps some are not insured at all.

19,370. Have you had occasion to look at the Admiralty wreck register published? If so, I think you will find from that printed register that you might fill up that insurance column, if you wished to do so. Of these vessels I see that 189 were light?—So it appears.

19,371. Then were 27 laden vessels from ports south of Flamborough Head?—Yes.

19,372. Ninety-two laden vessels bound to ports south of Flamborough Head?—Yes.

19,373. Of these 189 light vessels, and about 157 laden vessels, 116 were total wrecks and 168 lives were lost?—Just so.

19,374. Would a refuge harbour in the Tees Bay have saved the greater portion of these vessels?—I am of opinion that it would.

19,375. (*Capt. Sulivan.*) The greater portion of the wrecks with on-shore gales occur with gales to the north of east?—Yes.

19,376. Is it the case that with gales to the south of east a very much larger portion are lost in the neighbourhood of Hartlepool?—I am not conversant with the number there.

19,377. In the year 1857, including that very heavy gale of which we have heard, you have only five vessels with east-north-east gales. Is it the case that very much the larger number were lost in Hartlepool Bay?—They will make for a port.

19,378. I don't say from what cause, but your return shows that the larger proportion of vessels are lost in that bay with east-north-east winds, which happen to be the on-shore winds on your part of the coast. With the wind from the southward of eastward, would not a much larger portion be lost on the other part of the bay?—I presume it would.

19,379. Your return of wrecks is deficient in one thing. You give us the number of laden and light vessels all very distinctly, but when you come to the vessels which are total wrecks, you have not divided them into laden and light. If you could have so divided the returns, and particularized whether the lives lost were lost in laden vessels or in light vessels, it would have been much more valuable. Can you amend that list, by dividing the two columns to which I have referred, or give another small return, dividing these columns with respect to laden and light vessels, both as to total wrecks and the loss of life?—I will do so. I can soon do it.

19,380. (*Mr. Coode.*) You are aware that there was a very destructive gale in January 1857?—Yes.

19,381. And that very many lives were lost on this district of the coast?—Not in my own district.

19,382. But along this line of coast?—Yes, I have been given to understand so.

19,383. That the loss of life in that gale of 1857

was more than usually large ?—Yes, on the other side of the water.

19,384. Will you refer to your list; the account showing the vessels wrecked and stranded in each year. In the year 1857 you have not a single life lost in your district. Is that so, or not ?—No, not one.

19,385. How do you account for that, when so many lives were lost north and south ?—They had made for the other ports, and the wind had been such that they got into the ports and got to them.

19,386. (*Chairman.*) In the gale of September 1851 did 16 vessels come ashore on Coatham Sands, between Redcar and the Tees ?—Yes.

19,387. You are answering from your official record ?—Just so.

19,388. Five between Redcar and Marske ?—Yes.

19,389. Two near Saltburn ?—Yes.

19,390. Three near Skinningrave ?—Yes.

19,391. How did the gale come on ?—The wind was north-north-east the whole of the time.

19,392. Could these vessels, or any of them, have been saved by a harbour of refuge near Hartlepool ?—I could not answer that, I am sure.

Mr. Thomas Brown examined.

19,393. (*Chairman.*) You are a resident of Middlesborough ?—Yes.

19,394. You are a shipowner, and formerly followed the sea ?—Yes, all my lifetime.

19,395. How many years were you at sea ?—I should say 26.

19,396. Of this time how many years were you in command of vessels ?—Fifteen.

19,397. In what trade were the vessels employed generally when you commanded ?—The first nine years I traded to Sunderland, with the exception of a voyage or two to the Baltic, and afterwards I was in the American and Baltic trade in the winter, and the coasting trade to London; seldom anywhere else.

19,398. Are the ships you at present own belonging to Middlesborough ?—To Stockton, and some of them to Whitby. My brother-in-law and father lived here. They traded out of this place generally, and sometimes out of West Hartlepool.

19,399. (*Mr. Lindsay.*) I will ask you some questions, as you and I used to be sailors. Looking to the whole range of the coast as shown in the chart published in the Report of the Select Committee of 1857—looking to the whole range of coast, Mr. Brown, say between Flamborough Head and the Farn Islands, and considering the description of vessels which go along the coast, and considering the course which those vessels usually take—whether do you think the improvement of the existing harbours, that is, the Tyne, the Weir, and the Tees, either at Hartlepool or the Tees, or both—whether do you think the improvement of these harbours, so as to admit the usual description of vessels frequenting the coast, would do more to save life and property than the construction of any one harbour, however large, within the limits which I have named ?—Most decidedly so.

19,400. Which would do most ?—I think the improvement of all the small harbours.

19,401. You are decidedly of that opinion ?—Quite of that opinion.

19,402. Now you have seen the plan which has been proposed for the improvement of the Tees ?—I have.

19,403. In which we are told that there will be 16 feet at low water. Now, speaking to you as a sailor, and supposing that yours was one of 20 ships bearing down on this bay, with an easterly gale of wind, and obliged to run for shelter, and that you all run for that point, each of you, of course, trying to get in soonest for refuge, would you have any hesitation to be one of 20 running in a gale of wind for the mouth of the Tees ?—None whatever. I would make it sooner than any other place.

19,404. Say 50 ships were running for it at one time in the usual way, each trying to get in first, would you then have any hesitation in running ?—Even now as it is I should not.

19,405. Where could you cast anchor, or how would you act running for refuge with a laden ship, supposing the improvement which I am speaking of, the smaller improvement proposed at the Tees, were carried out, if there were 50 of you running for it, where would you anchor, or would you anchor at all ?—About the fifth buoy, and in the buoy hold there.

19,406. How many ships would anchor there ?—I have seen 30.

19,407. Could 30 enter there safely ?—With the improvement twice that number.

19,408. Could 60 ?—Yes, 60. There are moorings laid down where 60 could anchor.

19,409. I speak now as being obliged to drop anchor in a gale of wind ?—It would depend on the size of the vessels.

19,410. I am speaking of the usual kind ?—I should say 60 very well.

19,411. Sixty could drop anchor there without much fear of damaging each other ?—I think so.

19,412. You would not be prepared to say a larger number ?—No, not all at once at anchor.

19,413. Is there any place above the fifth buoy where in such a gale you could run ?—Yes, at the eighth buoy.

19,414. That is further up ?—Yes.

19,415. How much ?—About three quarters of a mile.

19,416. How many could anchor there ?—I should say I have seen 25 there. It is always smooth there.

19,417. Could 25 ride there with safety ?—Quite well.

19,418. Is there any place further up ?—If the improvement is carried down to six or eight feet, they would run right up if the tide was going. If not, they would no doubt get under weigh, trip their anchors, and go further up as the tide would allow.

19,419. Say the tide was an ebb tide ?—Then more ships could take refuge.

19,420. During an easterly gale of wind and an ebb tide would you have any hesitation in running for Tees mouth ?—No, none whatever. I have done so before in very heavy weather.

19,421. Would you think it any greater danger in running for it if the tide were running out than it would be with a flood tide ?—With a deep laden or very small vessel there might be more danger of the sea striking her because she could not get so fast from it.

19,422. With what strength does the tide run out ?—Three to four and a half miles an hour. With heavy weather and gales on shore, it is generally checked, and there is very little tide at all. I have seen as much as six feet of water stopped, checked by the hard blowing.

19,423. Have you known it run after freshets with greater force than four and a half miles an hour ?—That is the most, I should say. I never measured it. I fancy from other harbours that would be about it.

19,424. Having heard your opinion about the improvement of existing harbours, which is valuable from your experience on the coast, tell me now, Mr. Brown, if the Government should decide upon having only one harbour between the limits I have named, Flamborough Head and the Farn Island, what point do you think would best serve to save life and property ?—Decidedly in the Tees Bay.

19,425. What side in the Tees Bay ?—On the western side.

19,426. That is to say —— ?—From Hartlepool Heugh to opposite the Tees.

19,427. Do you mean a breakwater between Hartlepool Heugh and the Long Scar, lying opposite West

REDCAR.

Mr. T. Brown.

21 Oct. 1858.

Mr. Lindsay.

Hartlepool ?—In a direction towards the south-east by east, keeping the line of six or seven fathoms.

19,428. Do you think a harbour there would be a better place than that which was proposed by Mr. Fraser ?—I think it decidedly better if you would make it long enough.

19,429. I am speaking of enclosing Hartlepool Bay between the Heugh on the one side and Long Scar on the other, Hartlepool Bay proper. Do you think that the harbour, if constructed between the two points mentioned, would do more to save life and property than a harbour such as that proposed by Mr. Fraser for Redcar ?—I do not know that it would do much more to save life, because I think one would be as good as the other.

19,430. Looking to the prevailing winds on the coast, which I understand range from south-east to east-north-east or thereabouts—looking at the saving of life—you think that one site would be equally as good as the other ?—For the saving of life only.

19,431. But taking into consideration life and property, and taking into consideration the facilities to commerce, which is a very secondary consideration compared to that of saving life; taking into consideration first, the saving of life as all important ; secondly, the saving of property, the saving of ships, which is next in importance ; and, thirdly, the facilities to commerce, which, compared with the other two, is of minor importance, which site should you prefer ?—The west side still.

19,432. Give me your reasons ?—You ought to begin at Hartlepool Heugh, in five or six fathoms, carrying the breakwater in an easterly direction, make an opening to the north end, then start again in some seven fathoms, coming in south and by east direction, curving the sternmost part, and making it two and three quarter miles long. I think the distance would bring the Tees mouth about south-east and by east.

19,433. You are talking of a plan much larger than any that has yet been proposed. I want you to banish the Tees mouth altogether for the present, and say the breakwater was to be so limited that it would not enclose any part of the Tees mouth in its proper sense, but extend between the Heugh and the Long Scar. I want your opinion on that point ?—I think it would be too small. The tide of the Tees would help to fill it up if it were too small. I think, through the ebb tide coming out of the Tees, the direction being entirely as the tide sets, if the harbour was open at both ends the tide coming from the Tees would help to keep it clean ; the ebb tide coming out of the Tees would help to keep it clean. But if it was made close, I think the tide setting in would bring a sediment down and help to fill a small place up. But I think the tide out of the Tees, when other improvements are made in the river, coming down would force the sea water out into the harbour, and so would help to preserve it from filling up. Even now, I do not think so much sediment goes out of the Tees as some people would imagine.

19,434. Considering the Tees, and the trade of the river Tees, as one point to be considered, as well as the trade and shipping of Sunderland and the shipping and trade of the Tyne and the other ports, and putting out of the question the breakwater at the Tees mouth, say there was completed at West Hartlepool a breakwater extending out to sea to give an area of four fathoms and upwards, equal in extent to a harbour constructed at Redcar, such as that proposed by Mr. Fraser, tell me, all considered, which you think would do most good ?—I think still the west side.

19,435. You still think Hartlepool would be the best site ?—It is the best site.

19,436. Tell me what you think of Filey as the site for a harbour ?—I think it very good, but I think it too far south if there were not another anywhere else.

19,437. But would the harbour at Filey not be the means of saving the lives of a great many who are lost in laden ships ?—It might be the means of saving some ; but, unless on the 4th of January last, I never heard of many being lost on the coast.

19,438. Then are the losses on the coast from Whitby to Flamborough Head small in comparison with the losses between Whitby and Hartlepool ?—From what has come under my notice there have been less.

19,439. Of laden ships ?—Yes.

19,440. Then if you think Filey too far south, can you tell me where further north a harbour could be constructed ?—Runswick is a better place.

19,441. Do you think a harbour at Runswick would do more to save life and property than a harbour at Filey ?—I think it would.

19,442. How ?—Because there are many wrecks so far south, and consequently they would bear up. I can give an instance. I remember, about five years ago, riding with about 270 sail of laden vessels with the wind from south-east. The weather was not bad, or they would have gone into Runswick Bay. Had it been winter, no doubt half of them would have gone into Runswick Bay, had such a harbour been made. If there had been a gale coming on many would have been wrecked. The larger vessels seldom run for harbours except when hard pressed ; in fact, I never run for one in my life.

19,443. If you think Runswick Bay is the best site, is Runswick Bay suitable for the construction of a harbour of refuge ?—I think it is, so far as its capabilities for holding ships are concerned.

19,444. Do you know that there are any parties who intend to bring Runswick Bay formally under our notice ?—I believe there is a party at Whitby who will give you a plan. He has sent me one [*handing up a plan*]. I think a little improvement might be made in the piers, as shown there.

19,445. Is this a copy of a plan that will be brought under our consideration ?—It is a lithographed plan projected on the Ordnance maps.

19,446. I should like to ask you some questions, as a sailor, about it. What description of shore is it ?—A rocky shore, but part a fine sandy beach.

19,447. What part of the bay ?—It is in the middle of the bay. From Runswick town south, about one third round the Kettleness is all sand.

19,448. What extent ?—About a mile and a half.

19,449. Are there no rocks between the sandy beach and deep water ?—There are some stones at low water, but they would be required to build the breakwater.

19,450. The sandy beach is close to Runswick village ?—Yes, round by the south.

19,451. Do you know what area of water there is of three fathoms and upwards ?—I do not know what water there is, but I should think 400 acres. I have not seen any particulars.

19,452. If the harbour is to be made south, speaking as a sailor, what size do you think ought to be given ? I say what size, meaning what number of ships of the usual class frequenting the coast do you think the harbour ought to be able to contain to ride safely at anchor during the most dangerous winds ?—I should think 200.

19,453. You think a harbour sufficiently large to afford anchorage for 200 would meet the wants of the trade ?—I think so.

19,454. Were you ever in the Baltic ?—Yes.

19,455. Do you know anything of the east coast of Scotland ?—I have been all round the land.

19,456. Looking at the coast, say from Aberdeen to the Pentland Firth, do you think a harbour of refuge is necessary there ?—From what I read and hear I think it highly necessary.

19,457. Do you think it would be a great convenience to ships passing along the coast ?—Not so much as a benefit to fishermen, especially in the herring season.

19,458. Your opinion is that a harbour is not so much wanted for the saving of the lives in and the property of passing ships as for fishermen ?—I think not.

19,459. Say there were no fishermen along the coast, would you consider a harbour of refuge necessary ?—No, I don't know that it would be.

19,460. Looking to the coast, at what point do you think, if a harbour is to be made, and only one—at what point would it be most desirable to place it ?—If for passing ships, at Peterhead ; if for fishing vessels, at Wick.

19,461. Now, supposing the case to be as it is at present, of fishing and passing trade, and looking at the passing trade, and looking at the fishing trade, and taking into consideration the trade going to the Baltic and to Archangel ?—It is not wanted for them.

19,462. All things considered, say that it rested between Wick and Peterhead ; which point should you prefer then ?—I should prefer Wick.

19,463. Why ?—Because I think it the more dangerous place.

19,464. Would the same gales of wind that carried you into Wick carry you through the Pentland Firth and to Longhope ?—Yes.

19,465. Is there good anchorage there ?—Very good.

19,466. Then why do you prefer Wick ?—I don't prefer Wick in a ship. I think you said both the passing trade and the fishing together. I think there is less danger in ships. It is seldom that it is wanted at all for ships, because there is the Moray Firth to go round to, or, if not, when you get to Kinnaird's Head, if you don't go one way, you can go the other, if you have any offing at all. My offing when off Peterhead was five miles off ; when I could not get one way I got the other. It is no great distance to get round Kinnaird's Head, or round Buchan Ness, or through the Pentland Firth.

19,467. Would you have any hesitation in running through the Pentland Firth in an easterly gale ?—None whatever.

19,468. With a flood tide and an easterly gale ?—I once tried it with a flax-laden ship bound for Liverpool. I had great difficulty in keeping her straight and making her steer ; she was making about nine knots sail, and stood as still as possible. The wind from Duncansby Head and from the east drove out against the Skerries so strongly, it was blowing so hard, that we could not do more than keep her steady ; as she held her own we kept her holding on, until the moment the tide slacked, when she went through the firth like a shot.

19,469. What size was she ?—A brig, of 300 tons register.

19,470. After having had this experience, would you, if caught there in a similar sized vessel with a strong easterly gale and flood tide, and thought it advisable to seek shelter in Long Hope—would you have any hesitation in running for the Pentland Firth again ?—None whatever. I should try to stop the ship getting into the flood tide if possible, particularly if she were deep laden.

19,471. How would you do it ?—I should not run down directly. You generally can see the lights, and can't drive so fast, but you might wait an hour or two. If you can drive to it at the last moment, you can then wait and take the chance and go through, if you can't keep her any further to windward.

19,472. In fact, you would dodge it ?—As long as I could. If the tide had done flowing I could get through ; if not, I must take my chance.

19,473. All things considered, and looking at the passing trade of ships obliged to go through Pentland Firth on their course, and the ships that are obliged to seek shelter at Longhope and off the shores of the Orkneys, do you think a harbour necessary at Wick ?—I don't think one necessary for ships at all.

19,474. (*Capt. Sulivan.*) You said you thought Runswick a good place for a harbour ?—I think it is.

19,475. Were you then including in your ideas another harbour in the Tees Bay besides ?—No.

19,476. Let us suppose that the Tees was so improved that you could run in for it at any time of the tide and in a gale of wind, why would you then prefer Runswick ?—Because I think there wants a harbour of refuge for the south there or at Filey Bay ; but as Filey is the extreme point, I think Runswick would be a better place than Filey.

19,477. Would a vessel in an east or east-north-east gale off Runswick be able to fetch a harbour of refuge in the bay ?—If the wind did not fetch to the northward.

19,478. How with an east-north-east gale ?—With an east-north-east gale she would come down, if she were a ship that would sail anything like.

19,479. If she were the other side of Runswick, a little further south, there would be more danger in weathering the land and getting back to Hartlepool ?—I don't see it. From Whitby Rock the bend of the land is the same ; the point is about the extreme east.

19,480. Vessels caught off Whitby Rock would fetch anywhere into Tees Bay ?—Yes ; but they would fetch Runswick better.

19,481. Yes ; but suppose they were the south side of the turning point, then, from there to Flamborough Head, Filey Bay would be a better place ?—I should say it would, if the wind was east-north-east ; but if it were east, Runswick would still be better.

19,482. If you had two harbours of refuge on 100 miles of this coast, would you have them 20 miles apart ?—I would rather have them both at the quarters.

19,483. You would rather not have the two close together ?—No.

19,484. If this place was deepened to what you said, that is, 16 feet, or from that to 24 feet, would all light colliers be able to run for it at all times ?—No doubt of it.

19,485. If 16 feet water, would you venture in an easterly gale to try to get over the bar ?—Sixteen feet at low water ?

19,486. At low water ; would you venture to run over it if there were 16 feet on the bar, and you were caught in such a gale that you could not keep off the shore, say at dead low water, what draft of vessel would you attempt to take over the bar ?—If the wind were east-north-east there would be three or four feet water, or 'perhaps five feet in an excessive gale, like that of the 4th of January 1857, and a vessel drawing 16 feet water would go over.

19,487. First, leaving any rise of tide by wind out of consideration, how much do you consider that your keel ought to be clear of ground to take the bar in an easterly gale ?—It ought to be clear, that is sufficient. I should not want more than that. I should think there would be four feet more in a gale.

19,488. Leaving that out of consideration —— ?—It could not but happen that the tide must be checked.

19,489. Supposing the bar you have to run over with 16 feet of water, what draft of vessel would you venture to take over, allowing for the lift of the sea ?—If there was six-feet sea, I should not take more than a 10 feet ship.

19,490. I say under your bottom, what between the keel and the bottom ? Would six feet be enough for you taking any of these bars from what you know of the sea in gales of wind ?—Most decidedly.

19,491. If there was six feet on this bar at low water, would you run for it with a ship drawing 10 feet ?—Yes, I should run for it with more.

19,492. Would you then with 11 or 12 ?—With less than that.

19,493. In a gale ?—Yes.

19,494. If you draw 15 feet in a laden ship when a gale was blowing on shore and raising the water, would you run for it if there was 16 feet on the bar at low water in ordinary times ?—I think I should.

19,495. Do you know the Tyne well ? Does the water rise at all in proportion in the Tyne with easterly gales ?—I don't know that it would rise so much as here, but it may rise from two to three feet. It can't rise so much, in my opinion.

19,496. If this port was improved to 16 feet, and the Tyne to 15 feet, would you consider that most

REDCAR.

Mr. T. Brown.

21 Oct. 1858.

Capt. Sulivan.

colliers could run for them with a gale of wind dead on shore at nearly every time of the tide ?—I am quite certain they would without much danger, with very little risk of loss.

19,497. Have you ever experienced a freshet and ebb tide from the Tyne in such a gale ?—I never did ; but I have stood seeing the vessels come in.

19,498. Would you fear it ?—Most decidedly, if there was not plenty of wind.

19,499. But speaking of a gale ?—With a gale, not at all.

19,500. You said you had known a four knot current ?—Yes, from three to four and a half.

19,501. Is that usual—No.

19,502. If there was a freshet in the harbour with an easterly gale so strong as to make vessels run for shelter, how much would it retard this tide ?—If not more than an ordinary tide it would draw it up to six or seven feet.

19,503. With a freshet, to what extent would it check the stream ?—Quite as much as to make it only an ordinary tide.

19,504. What is that ?—About three knots.

19,505. If the harbours of Tyne and Tees were improved so as to take the vessels that you say, then, for loaded ships bound south, where would you put a harbour of refuge ?—I should like to have it, if I could, by the south of Whitby ; but you can't get it there. In my opinion, Filey is too far south, and there is no other place to make it but Runswick Bay.

19,506. And for vessels caught off Flamborough Head, where would you put in ?—I should say Runswick Bay, but that is in the bay.

19,507. I am speaking of south of Whitby ?—It is no use having it at Flamborough Head, that is further south still.

19,508. How about Filey ?—Filey would make a good place for all vessels south of there.

19,509. For vessels caught off Flamborough Head in south-east gales ?—Yes ; but there are more, in my opinion, caught from the north.

19,510. You were asked on which side you would rather have a refuge harbour at Redcar or Hartlepool. Which would you rather run for with a number of loaded ships seeking refuge, a harbour where there was no trade to interfere with the place, a purely refuge harbour, or a harbour where you would have vessels to a large number engaged in the trade of the place ?—I think of one side as much as the other ; one side is as good as the other.

19,511. I asked you which you would prefer to run for as a harbour of refuge ?—One as well as the other.

19,512. Why ?—Because I don't see much difference.

19,513. Which would you prefer, a harbour which was purely for refuge, and where only ships that went into it for refuge or to save being driven back would enter, and where there was no trade to the port, or a harbour of the same size where there would be a large trade in addition to the refuge ?—I should rather have it where the trade was.

19,514. And for the convenience of the trade of the port ?—Yes, both.

19,515. For your own ships running in would you prefer a harbour where a number of vessels engaged in trade would reduce the space provided for refuge ? —I don't think it will reduce the space. If one harbour of refuge is made there will be two or three harbours more, and all will get in, and it will improve the harbour of refuge as well as themselves.

19,516. I am not talking of the trade of the port. I ask you, if there is a harbour, say of 500 acres of good anchoring ground, would you rather, for the passing trade, run for such a harbour if you knew it would only be frequented by vessels seeking refuge and having nothing else to interfere with them, taking up their place, or would you rather run for one, knowing there would be a large trade likely to fill it up ?—If that was the case I should run for the one where there was no trade, because I should be afraid of obstruction.

19,517. (*Capt. Vetch.*) I think you are well acquainted with the north-east coast of Scotland and the Pentland Firth ?—Yes.

19,518. Are you aware that the harbour of Wick is in a creek or cove ?—Yes, I was once ashore there.

19,519. Are you aware that in the creek there sometimes are 1,400 fishing boats going out or coming in ?—I saw as many as I could count, and I gave up counting ; they were coming out as I was passing.

19,520. Manned generally by four men each ?—I know it.

19,521. And they are exposed to gales, and have no very sheltered place to run to. Do you know about 900 vessels arrive at and sail from that port ; and, considering that this Commission has chiefly in view the saving of life and property, do you consider Wick a fit place at present to afford protection to life and property ?—I don't think it is at present.

19,522. Therefore you think it would be desirable to make it so ?—I think so.

19,523. Coming down from the north-east coast of England from Blyth to Whitby is there a considerable embayment ?—Yes.

19,524. Suppose the weather is favourable, and that vessels leave the ports of Tynemouth, Sunderland, and Hartlepool, and take their voyage to the south, the vessels putting to sea about the same time with a favourable wind, and that these several fleets sailing from these several points reached near Flamborough Head, and were there taken by adverse winds, where do you conceive most of the shipping would require shelter between ; these points down near Flamborough Head, or further back near Hartlepool ?—They would not all get so far as Flamborough Head, because one does not sail so fast as another; some would be at Whitby and some very near Filey, starting from this together.

19,525. Where would the greatest number find shelter ?—I don't think there would be any for them till there was a place made.

19,526. Now where would you make a shelter for them ?—The largest ships seldom or never except in such gales as that of the 4th of January 1857, bear up at all. It is the smaller vsesels, and those that are old and get leaky, and whose crews are small.

19,527. There is no shelter at present ?—No.

19,528. And where would you provide a shelter to give the greatest benefit to the greatest number of ships ?—If we could always make sure of vessels being at Flamborough Head, Filey would be the best place, because they would not have to come back. If they were to the leeward of Filey they must come down here and make for the place where we could make it best, wherever that may be.

19,529. I understand you have not exactly made up your mind where you would propose to place a sheltered harbour to receive the greatest number of vessels that might be driven back ?—If it is only to be a very small one, I should say Runswick Bay, but we can't make a large one in Runswick without going into sea very largely, and at a very great cost.

19,530. Where else could you make a large one ?—No place but Tees Bay.

19,531. (*Chairman.*) You knew Yarmouth Roads very well formerly ?—Yes ; I have been there frequently.

19,532. What is the largest number of vessels in the roads and its vicinity ?—I have seen 1,000. I never counted them, but I dare say there are full that.

19,533. I think you just stated that you consider this harbour of refuge not much required for the larger description of vessels. Taking that into account, what is the largest number of vessels a harbour of refuge should be calculated to provide for ?—I should say 200.

19,534. You still think that would be sufficient ?—It is a chance if more than that get to bear up to one place at once.

19,535. Don't gales that cause vessels to bear up frequently last on and off for a week?—Yes, they do, particularly in February.

19,536. And is it the case that the sea, the result of these gales, frequently prevents vessels getting out when they have a chance of doing so?—No doubt.

19,537. With these considerations, would you still think that under these circumstances which might occasion a considerable accumulation of vessels that a harbour for 200 would be sufficient?—I was asked what I thought the smallest number that would be safe, and I thought 200 would be.

19,538. You put 200 as the smallest number?—Yes.

19,539. You described an occasion on which you passed through Pentland Firth; do you recollect the sail you were under? Were you under close-reefed topsails?—No; when we were caught by the wind we had made Buchan Ness, the wind from the eastward. We had close-reefed and two-reefed courses. As soon as we put the ship before the wind we let two reefs out of the maintopsail and loosed it, and set the maintop-gallant sail, thinking she would drive astern.

19,540. When you were holding on against the tide in the way you mentioned, what sail were you under?—Single reefed maintopsails and the maintop-gallant sail sheeted home, and not hoisted up for fear of blowing the mast down, and a reef set of the foresail. The foretopsail was close reefed, and we nearly had a man overboard in letting out a reef of it; some of the men nearly lost their footing.

19,541. It was blowing hard?—Terrific. It was in the month of November.

19,542. Was the sea very bad?—The sea was not very bad to us, for we were hemp laden, with a little tallow in the bottom for stiffening, and she rode a long way out of the water; we had about 100 casks of tallow for stiffening, and a little iron.

19,543. Therefore your vessel was very high?—Yes; high out of the water.

19,544. You know the description of the sea; I want you to tell me if it was bad?—Very bad; it tumbled up and about her just as if was on a sand breaking on all sides.

19,545. Supposing a heavily laden vessel had been there, how would she have come off?—I think she would have been swept on all sides.

19,546. Can you tell me how far this bad sea extended from the entrance of the firth; when did you get into it?—We did not get into it until we were close to the point which comes up by Duncansby Head and takes you out for the Skerries. Just as we turned the head the wind headed, she sheered over to the Skerries, and was going astern in a very little time.

19,547. Do you limit the bad sea to three or four miles from the entrance to the firth?—Yes; I should.

19,548. When you ran into this sea, I think you said you did not know the firth?—I never was there before.

19,549. You did not advert to the possibility of your being caught in this ebb weather tide?—I thought that she was so light and the wind blowing so hard, that she would run over the tide. I was quite disappointed when I got there and she only held on.

19,550. You are well acquainted with the general class of coasting vessels, are you not?—Yes.

19,551. In such a case, supposing the master had, to incur this danger, a flood tide running out to the south, would there be any difficulty in bringing his ship to the wind, or heaving to so as to wait for the other tide?—I think not.

19,552. From your knowledge of coasting vessels, you think it could be done with safety in a heavy gale?—Not with safety, but it would be safer than running in.

19,553. You are disposed to think that heavy laden vessels can't round to with safety?—Not with safety.

19,554. And therefore it would be a choice between running into the firth under very dangerous circumstances, or, on the other hand, of heaving to in a bad sea, which you say is not a safe thing?—Not at all.

19,555. How about shortening sail for a time, and waiting for a tide?—Twenty or thirty miles before you arrived you would have calculated what time it would be high water, and then make for Duncansby Head. There is no danger in going through the firth with an ebb tide.

19,556. So that in all cases in which a prudent master could shorten sail in time, to wait the right time of tide, he would then run through without any danger?—I don't see any danger if it is clear weather.

19,557. You say there is no danger if there is clear weather. Is there any danger in the firth when the weather is not clear?—Most decidedly. We don't know where we are going to, and the tide comes so strong that you are wrong in a crack. I once drove through it in a calm; the weather was thick, and we very near ran upon the island of Stroma. The vessel breasted to it. We could not let go the anchor, and seemed to be in great danger of going ashore. However, as soon as we came actually to the land, the weight of the tide ran so strong that it would not let her go to the land; she turned off and we came out all right.

19,558. From your knowledge of the firth does the tide run fair?—Very fair.

19,559. How far do the eddies extend from off the shore?—The eddies generally extend out into the sea, and not near the shore.

19,560. Then, so far as your knowledge goes, there is a fair tide right through?—Yes; but it wheels about and makes an eddy and then breaks.

19,561. Do you call that a fair tide?—It sets fair. It is the strength of it breaks the water.

19,562. Is it most dangerous to go through in a calm or in a gale of wind?—I think in a calm with the tide running nine knots that a ship can't be brought up with the anchor, the cable would break.

19,563. (*Capt. Washington.*) From the early part of your answers respecting the Pentland Firth to Mr. Lindsay, it is difficult to gather whether, as an experienced seaman, you would recommend vessels to go boldly through it, or whether they should avoid it if possible?—I would never avoid it if it was clear weather.

19,564. You would recommend other vessels not to avoid it?—I think it well for going round by the Orkneys.

19,565. Nothing was said about going round by the Orkneys?—I alluded to it myself.

19,566. You said you would recommend vessels going through Pentland Firth?—It is question whether they are ships.

19,567. You would not recommend them to hesitate?—Not at all, if they were so confined by the wind, or even if the wind was south-west or west. The tide would take you through in a tide, and when you got through, if the wind was west, you would tack away to the northward and leave the tide.

19,568. You mentioned, that vessels sometimes got into difficulties?—It was a vessel that I was in myself that got into the difficulty.

19,569. Do you know of any case besides that?—I do not.

19,570. Are you aware, from public report, that vessels do founder there?—I have known a vessel or two drive to the St. James's Point in a calm.

19,571. Did not you mention about vessels getting their decks swept?—I think vessels might get their decks swept.

19,572. You don't recommend vessels to run through?—I don't recommend them to attempt to run through against the tide when it is running strong against them, but, with a fair tide, there is no danger whatever, in my opinion; the land is so high, and there are no shallows in the firth.

19,573. Did you see in the papers, that, within only 10 days ago, a vessel had her decks swept, and

REDCAR.

Mr. T. Brown.

21 Oct. 1858.

Capt. Washington.

eight of her crew washed overboard and drowned?—No; I did not see it.

19,574. I am sorry to say it is a fact. I wish to give you the opportunity of saying distinctly whether you wish it to go forth to all sailors that you recommend the passage of the firth?—I do, under the circumstances I have mentioned.

19,575. (*Capt. Sulivan.*) I understand you to say that vessels bound west might go through Pentland Firth; do you mean to say you would recommend them to touch it when able in gales from the east, and when the tide was running east?—No; not when the tide is running to the east; I spoke against that proceeding.

19,576. Then, at one time of the tide, the half tide, it is a dangerous passage?—There is no question it is.

19,577. You were asked, if vessels running before the wind, and in a bad sea, could regulate the time by shortening sail?—I think I understood the question to say, running with the wind.

19,578. You were asked whether, if a vessel could not round to, could she 30 or 40 miles off regulate speed by shortening sail?—I think I did not say it would be dangerous to heave to there.

19,579. If a vessel were running for Pentland Firth in a heavy south-east gale, scudding in a heavy sea, would she have to carry such sail as she could to keep her before the dangerous sea in order to prevent being pooped?—Before she comes to the firth the sea is the same as the other parts of the sea.

19,580. Generally speaking, with deeply laden colliers and others running before a heavy sea, is it necessary to carry as much canvas as possible to prevent the sea breaking over them?—Yes.

19,581. In a case like that, would you consider it safe to shorten sail with a heavy flowing sea, and go slowly down the place before the wind?—I should heave to, for if you run with sail she would get there too soon.

19,582. The sail would be already shortened if there was a heavy gale, with the exception, perhaps, of a reef in the topsail to heave to?—I should heave to.

19,583. In such a case as this, with heavy south-east gales, the flood tide, and, perhaps, night coming on, if the vessels were caught there, bound to the westward, would Whitby be a good place to go in, if there were a harbour there?—I should say it would.

19,584. Have you heard that there are above 1,000 vessels take refuge in the Scrabster Roads on the other side of Pentland? Should that you think if there was a similar harbour at Wick on the east side that that also would be used by a large number?—There is no doubt of it.

19,585. (*Chairman.*) Supposing you had a harbour of refuge established at Wick, and you were going to make a passage to the westward, and under the circumstances of your having a heavy gale from the south-south-east, would you prefer taking the harbour of refuge at Wick and running the chance of delaying your passage, or would you run round the Orkneys if you feared to go through Pentland Firth?—That would depend upon the circumstances of the ship. I should like to proceed if I thought there was no danger; if the weather was not so bad that a ship could not live, I should go on. If I thought there was danger of losing the ship and men, I should put into Wick.

19,586. So long as you could keep the ship at sea and make the passage, you would prefer going round by the Orkneys to taking refuge at Wick?—I think I should prefer taking the harbour of refuge and going through when the weather was fine, to going round by the Orkneys.

19,587. You would prefer a harbour of refuge at Wick to going round by the Orkneys?—Decidedly.

19,588. Supposing you had a harbour of refuge at Wick, would or would you not make the passage through the firth if you could possibly do so?—Certainly, I should.

19,589. Would you, or would you not, be afraid of losing a fair wind?—I should.

19,590. Would you lose a fair wind by going into Wick?—No question I should.

19,591. (*Mr. Lindsay.*) Say that a harbour of refuge was made at Wick, and you were caught with an easterly gale of wind at night, and were in a position to find it necessary to go into a harbour of refuge, and assuming that you were from Tees and bound for North America, whether would you run for shelter to Wick, or go through the Pentland Firth to seek shelter at Longhope?—I should not want to seek shelter if I was going to America.

19,592. I am speaking of a case where there is necessity for going in. Considering your position as bound from here to America, and caught off the Pentland Firth, say that you could either go into Wick or through the Pentland Firth to Longhope, and found a harbour of refuge desirable for some cause or other, which would you take?—Wick, if the tide ran towards the east; Longhope, if it ran towards the west. Any person can go into Longhope if it is a fair tide.

19,593. (*Capt. Vetch.*) Supposing you were coming to the east through the Pentland, and got disabled, would you not find it very convenient to have a place at Wick to put into?—I think Stromness would answer my purpose just as well.

19,594. Supposing you had just got through Pentland Firth, and had arrived in the North Sea?—That is another question. I should not like to go back, and would go to Wick if it were available for me.

Mr. Henry Hestead examined.

Mr. Henry Hestead.

19,595. (*Chairman.*) You reside in Middlesborough?—I do.

19,596. You are a pilot by profession?—I can hardly say so; I have only been so for a few months.

19,597. You have been for a few months. Previous to that time did you follow the sea?—Yes.

19,598. How many years?—Thirty.

19,599. How many in command of vessels?—Fifteen.

19,600. In what trade were they chiefly employed?—The Stockton and Leeds trade.

19,601. (*Mr. Lindsay.*) Were you in a collier or in one of the traders?—One of the traders.

19,602. You know the object of this Commission, to place harbours of refuge along the coast, with the object of saving life and property. Tell me whether would one great harbour in any one site, or the improvement of existing harbours to take the usual vessels at all times of the tide, would do more to save life and property?—Gentlemen, you will have to excuse me; I am not a learned man.

19,603. Say what you think?—But I am of opinion myself, that, representing things as they are at present, many places, if there were improvements made at the Tees, as well as other improvements, a great many would be saved that are now frequently lost; and, of course, if that there was a refuge harbour in the neighbourhood of where we are now, there is no doubt but what it would be the means of preventing a deal of property, as well as lives, being sacrificed.

19,604. (*Mr. Coode.*) Where, in your opinion, would be the best site for a refuge harbour?—The Tees.

19,605. You would prefer the improvement of the Tees to the construction of a harbour elsewhere?—Yes.

19,606. Why so?—Because it is the most leewardest point. The point where most ships are taken in gales of wind.

REDCAR.

Mr. THOMAS POUNDER examined.

Mr. T. Pounder.

21 Oct. 1858.

19,607. (*Chairman.*) You are a resident at Seaton Carew ?—I live at the High Light at Seaton.

19,608. How long have you been light-keeper there ?—About 20 years.

19,609. Were you a seafaring man?—I began my life, as a fisherman, when about 16 years of age, at Hartlepool, and I followed that occupation for 30 years at Hartlepool, my native place.

19,610. Were you ever at sea as a sailor ?—I was, a very little time.

19,611. You don't know much about this coast as a sailor ; all along this coast, between this and London ?—I have been to London, but I don't know much about it, because I was only a voyage or two there ; but I have been at Hartlepool almost all my life, and understand about the Tees Bay, and likewise Hartlepool Roads, well.

19,612. Do you consider Hartlepool would be a good place to make a harbour of refuge ?—I wish we had plenty of places of refuge, the more would do more good. Every harbour should be improved, but I think my opinion is, that the Tees is a preferable place to Hartlepool.

19,613. Tell me why you think that ?—I think that if there was a breakwater constructed upon the North Gare, near the Snook, it would soon make a deep channel at low water, and a good deep-water berth from the sixth buoy to the Snook, which we generally call the Low Hole. I remember when there was a great deal of water in the Low Hole, and I fully believe that there will be no lasting sand or any other kind of bar formed out of the contemplated pier, because I think that the ebb tide from the south to the Tees would be so strong as to carry it towards the shore or outside by Hartlepool.

Mr. ROBERT CHILTON examined.

Mr. Robert Chilton.

19,614. (*Chairman.*) You have charge of the Tees floating light ?—I have.

19,615. How many years have you had charge of the light-vessel ?—14 or 15 years.

19,616. Before that did you follow the sea ?—Yes, sir.

19,617. For how many years ?—I went first in the month of August 1822.

19,618. Were you in command of vessels any time ? —No, I was not.

19,619. You keep a register of winds, do you not? —Yes, I keep a log.

19,620. In which the winds are registered ?—Yes.

19,621. From your observation do you think that the winds which are registered in your log are the true winds out in the offing when it is blowing hard ? —In the winter season I believe they are, but not so in the summer. In a heavy gale of wind I find there is very little difference. There may be a quarter or half a point.

19,622. Therefore in heavy gales of wind during the winter there is no difference ?—In summer time there is a difference—baffling winds sometimes.

19,623. In a gale of wind in summer is there or is there not any difference, in your opinion ?—There is not.

19,624. (*Capt. Sulivan.*) Do you keep any register of soundings at low water ?—Not a regular one, but I generally do keep soundings.

19,625. Can you speak as to any increased depth of water caused by easterly gales ?—No ; with our vessel we lie in about 20 feet.

19,626. At dead low water ?—At dead low water. When we first moored here as a light vessel we had the harbour anchor in 27 feet ; that was in 1837. Five years afterwards the buoy in the channel anchorage was dry. I visited them this morning.

19,627. I wish to know from your observation whether a heavy gale blowing on shore causes the water to rise in the mouth of the Tees, so that a vessel can venture to run for it better than she could at ordinary times ?—With a northerly gale we always have a great deal of water.

19,628. North-east the same ?—Yes, from north-east and north, and on the north-west.

19,629. Would a gale like the east-north-east gale of January bring you higher water on the bar ?—Not a bit.

19,630. (*Capt. Vetch.*) Will you tell me from your own observation whether the sand sometimes extends more to the eastward, and then returns to the westward, or whether it is pretty stationary ?—I don't hear what you say rightly.

19,631. Where are the guiding lights fixed ?—The leading lights ?

19,632. On the north or south shore ?—On the Bran Sand.

19,633. Yes ; are you aware whether the sand sometimes extends more into the channel at one time, and whether at other times it recedes more to the south-east again ?—I am not.

19,634. Does it remain quite fixed ?—I believe it remains a fixture.

19,635. It does not shift its position ?—It shifts more down to the north side.

19,636. Further out ?—Sometimes out and sometimes in. At present it is going in. For the last year it has been going out, and they appear to be very near the channel.

19,637. By the fourth buoy did you visit ?—Yes.

19,638. The sand is going back ?—During the last summer it has been coming over towards the channel,

19,639. Could you undertake to say what is the greatest change you have ever known to take place ? —In what respect ?

19,640. In respect to the shifting of the channel. How far have you known it to move eastwards or westwards ?—Is it the shifting of the sand you mean ?

19,641. I am speaking of the channel near the Bran Sand ?—The Bran Sand is nearly a fixture.

19,642. Are you sure there are never any alterations there ?—The change is on the opposite side.

19,643. On the Seaton south-west side does the sand ever advance towards the channel ?—It both advances and recedes. It has been receding all last year.

19,644. Can you tell me the greatest amount it recedes ?—I took up an anchor and cable that we left 14 years ago, that we were obliged to leave, on account of the sand approaching the sea. This summer I took the anchor and cable up dry, which when they were put down were in 27 feet at low water.

19,645. Then the shift must have gone on to a great extent ?—It takes about four or five years, I believe.

19,646. (*Mr. Coode.*) Have you paid attention to the set of the tide outside the Tees mouth ?—Into the bay ?

19,647. Yes.—I have not paid particular attention to it, but it sets towards the northward in a north-north-east after it leaves the Tees ; after that it goes more to the north and north and by east.

19,648. Does the whole of the ebb set in the same direction ?—The ebb comes from the southward, and turns out again from the Tees.

19,649. After joining the ebb as it comes from the Tees ?—After joining the ebb from the Tees in a north-north-east or north and by east direction.

19,650. That is the best information you can give on the point ?—Yes, it is.

19,651. And you never had occasion to measure the strength of the tide ?—I have not.

19,652. In times of flood or freshets does it bring much matter from the country ?—Yes.

19,653. Is it much discoloured ?—I have taken a bucket of water and let it settle for two hours, and the sediment covered the bottom of the bucket.

REDCAR.

Mr. Robert Chilton.

21 Oct. 1858.

Mr. Coode.

19,654. To what extent ?—One eighth or one sixteenth.

19,655. Is that a common occurrence ?—It is only in heavy freshets.

19,656. What material was it ?—Mud.

19,657. Did it come from the sea ?—No, from upwards. This was in heavy freshets.

19,658. You are quite sure it was not sea sand ?—Not sea sand ; a muddy substance.

19,659. Do you ever trace the current, when so changed, to see how far up the bay it is discoloured ?—It goes out into the bay, and passes by the Heugh.

19,660. Have you ever seen it pass the Heugh in the discoloured state ?—Many times.

19,661. You don't think the matter is deposited in Hartlepool Bay ?—No, it is drained from the land, I suppose.

19,662. You are quite sure you see it pass on round the Heugh ?—Yes ; at least I will not be positive to say I was on the Heugh and saw it pass, but it passes to the north.

19,663. You can't say how far ?—No, I can't say how far.

19,664. (*Capt. Vetch.*) Did you observe the state of the water this morning at the Bran Sand ?—I did not come from there this morning ; I was summoned to appear here, and have been here since yesterday.

19,665. You will be surprised to learn that when I went down this morning I could not see three inches into the water, it was so thick ?—What part was that ?

19,666. The channel opposite the leading lights.—Was you within the South Gare ?

19,667. I was on the shore of the Channel between the two leading lights. The water was there so turbid that I could not see to a greater depth than three inches. I ask you if you would be surprised to find that that is the case ?—We have had heavy rains lately, and I don't doubt that there is a freshet down.

19,668. (*Chairman.*) You have prepared a short statement ?—I have a statement of the wind.

19,669. Is that statement of the wind in the form of a table ?—No, not in the form of a table.

19,670. Is it remarks upon the shifts of the wind ?—Yes.

19,671. Will you read it to us ?—Yes.

The witness read the following statement :—

" The most destructive gales in the Tees Bay, or on this part of the coast, is when the wind is from the east-north-east and east, and east-south-east.

" Highest seas on the coast are when the wind is from the north and north-east ; and when it blows heavy gales from the north-east the sea rises more perpendicular before it breaks than it does when the wind is from the east, or from that to south-east. I have frequently observed, during a gale from the east, that the wave rolls in quick succession, and drives a deal of broken water before it. Not so with the wave from the northerly gale, it rises almost to a perpendicular, and then breaks with an overlap and with a fearful force.

" The heaviest gales, to the best of my knowledge, on this coast, are from the south-west and west-south-west.

" South-east gales.—I have frequently noticed that they generally spring up after a calm, or light variable winds, and increase gradually to a gale, and during the gale to vary from that to east-north-east, especially if attended with rain or snow, which they frequently are. I have known south-east gales to last one or two days, that is to say, the height of it, and continue to blow afterwards with strong blustering winds for a week or ten days, varying between south-east and east-north-east.

" North-east gales.—I have frequently observed, for the last nineteen years, that when the wind prevails from the south-west, and with wild unsettled weather, that it suddenly changes to the north, and from that to the north-east, generally with a heavy gale ; after it moderates, falls back to the north, and from that to north-west ; ultimately to the south-west again.

" The height of those sudden gales last from 12 to 24 hours.

" With a breakwater on the north side of the Tees, all vessels lying in the Tees would be sheltered from the north and north-east winds. The Bran Sands shelters from the south-east, and a short pier on the Bran Sands would shelter vessels from all winds and seas. I have always found the floating side the best, when the winds are from the south-east there is a slight swell on at high tide, but nothing to injure any vessel riding in any respect.

" (Signed) R. Chilton.

" Tees Floating Light, Sept. 26, 1858."

Mr. John Rig Burdon examined.

Mr. J. R. Burdon.

19,672. (*Chairman.*) You reside at Stockton, and follow the sea ?—Yes.

19,673. How long have you been at sea ?—Forty-six years.

19,674. How long in command of vessels ?—Twenty-nine years.

19,675. In what trade chiefly employed ?—In the coasting trade.

19,676. (*Mr. Lindsay.*) From your long experience of the coasting trade, tell me what you think of a harbour of refuge along this coast—first as to the necessity, and where you consider it ought to be ?—No other place but Tees Bay for a general harbour of refuge, to my thinking.

19,677. What part of the Tees Bay ?—I would have it right across ; at least not right across, but leaving a sufficient entrance for ships from the north and south, protecting Tees altogether past Hartlepool, Tees, and all the lights.

19,678. Are you in favour of a harbour that goes right across from Redcar to the Heugh ?—I am in favour of a breakwater going south to Long Scar Buoy to, perhaps, a little way from Hartlepool Heugh to the northward, but leaving sufficient entrance, perhaps 1,500 or 2,000 feet at each end. Then it would be a grand harbour.

19,679. Supposing the Government should not be disposed to make so grand a harbour as that, but limited the expenditure to sufficient to make a smaller harbour than that which you propose, whether do you think the harbour made in Hartlepool Bay, with a breakwater extending outside of the Heugh, between that and Long Scar,—do you think a harbour made in that situation, or one over at Redcar, somewhat the same as that suggested by Mr. Fraser, which do you think best ?—My impression is, that if we can't get a grand one let us have one where there is no trade. If a fleet of ships is at sea and must take refuge, let us go to a place where there is use or trade.

19,680. Therefore do I understand you would rather have it at Redcar than at Hartlepool Bay ?—I would.

19,681. Can you tell me any other reasons why you think a harbour at Redcar such as I have mentioned would be better than one of a similar size at Hartlepool ?—My impression is this, that if you have a refuge harbour at a port where there is a great trade there would be a great accumulation of vessels ; there would first be the light ships accumulating at east-south-east, and all those sorts of winds, and then there would be the laden ships bearing up that can't keep at sea, and also the ships coming to the port for purposes of trade. The light ships when they go into the harbour of refuge must bring up at the tide time. The line ships accumulating from the south must come to the same place, and therefore there would be a double accumulation, and great danger of damage occurring to the vessels which are taken to the harbour.

19,682. The most dangerous winds, I believe, are those ranging from east-south-east to north-east ?—I think they are.

19,683. Do you think a harbour of refuge at Redcar, or one in Hartlepool Bay, would be easier reached in these winds, or would there be any difference?—If the wind be at east-south-east it can be reached easier; and, of course, it can be reached easier.

19,684. So far as regards site there is not much difference, in your opinion?—No.

19,685. Tell me what you think of a harbour further south than this? Do you think a harbour wanted on this side Flamborough Head? Do you think it would do much good?—I think a harbour further south would be of some use; but not so great use as the harbour in the Tees Bay, right in the bight. When ships are caught between Flamborough Head and the Farn Islands with a heavy gale from the east they must drive on. They can't fetch the Head, and can't fetch Filey Bay, if there was a refuge there. Filey Bay, though, is a nice little harbour of refuge, and would be very handy for ships placed in that locality.

19,686. During your long experience of the coast have you known many vessels beat about Flamborough Head, detained by baffling winds?—I have.

19,687. What is the greatest number you have seen at one time?—I have counted 600 sail with a telescope. That was with a northerly wind. As soon as the wind is southerly you must be out of it.

19,688. Say that the wind was dead south, and beginning to blow very hard, and that you were one of these vessels, what would you do then?—Get under weigh and make the best of it.

19,689. What would you do if there came a sudden change of wind so that you could not weather the land on either tack?—I should take a sandy beach for it.

19,690. If you could not get a sandy beach?—South of Bridlington, all the way to the Humber there is nothing but sand.

19,691. Say you could not weather Flamborough Head, if the wind was strong from the south?—I should lay in Bridlington Bay if I could not get round Flamborough Head. I could always get a safe beach on the larboard tack.

19,692. Have you seen many vessels bound north off Flamborough Head?—Many.

19,693. Not able to get round the head?—Many hundreds.

19,694. Say that these vessels were caught with a heavy easterly gale, and could not weather Flamborough Head, what would you do then?—I should try to get to the northward as fast as I could.

19,695. If the wind came east-north-east, whence we are told it occasionally blows strongest, if you were close in on the head, and caught with the wind, could you fetch a port down here?—With the wind east-north-east I could, certainly, go round the head, if I had the least offing in the world.

19,696. Say you were so close in that you had not sufficient offing to weather the head?—Then I should be obliged to go into Filey Bay. There is no other alternative.

19,697. Looking at all the consequences now, and saying that it is decided to have a harbour of refuge further south than Redcar, what point along the coast between Redcar and Flamborough Head—at what place do you think a harbour of refuge would be best, all things considered?—There are only two places I should have the least opinion of,—Filey Bay and Runswick Wyke or Bay.

19,698. After your 27 years' experience as a master on this coast, I want to know if the money was left in your hands to make a harbour of refuge to save the lives of the sailors, and to save ships, and to afford facilities to them; and that you were bound to spend it on one of these two points, would you spend it at Runswick Bay or Filey Bay?—I should spend it at Filey Bay; but in preference to either of these places I would take the Tees.

19,699. I quite understand you said that before. I want to ask you, as an old sailor, do you know the navigation of the Tees at Stockton and Middlesborough well?—I have gone many times up and down; but I am not in the habit of seeing it at low water. My occupation is to take a ship up or down at high water, and therefore I don't know much about it at low water.

Mr. JOHN HUDSON examined.

19,700. (*Chairman.*) You reside at Stockton, and followed the sea formerly?—Yes.

19,701. How long were you at sea?—Thirty-seven years.

19,702. Of that period how long were you in command of vessels?—Twenty-seven.

19,703. In what trade were the vessels chiefly employed?—In the coasting trade.

19,704. Between here and London?—Twenty years between here and London; previous to that in the Baltic trade.

19,705. You have heard the evidence of the witnesses examined both yesterday and to-day. Give me your opinion, which would be the best to improve the three ports, Tees, Tyne, and Weir, or to make a single harbour of refuge somewhere else?—I think a harbour of refuge, if sufficiently large, would be better than the improvement of the ports.

19,706. Where would you be disposed to put it?—In the Tees Bay; that is, at the deepest bight.

19,707. Are your reasons the same as those of the previous witnesses?—My reasons are these, that the tide drives the vessels into this bay, especially with a north-east wind. A ship curves to the northward with the wind from east-north-east, has the tide upon the beam, and it fetches her right into the bay.

19,708. You consider one reason why we should have it here is the great drift into the bay?—Yes; there is no doubt of it.

19,709. (*Mr. Lindsay.*) Do you know much of the navigation of the Tees?—I have been trading out of it a long time.

19,710. Do you know the smaller plan which is proposed by the Tees Commissioners?—Yes.

19,711. You are aware that they expect to obtain 16 feet at low water?—Yes.

19,712. Say that you were off the coast, and caught by an easterly gale of wind, and were one of 50 ships that ran for shelter, and that all these ships were running for the harbour so constructed, would you think you were placing the ship in great peril in running for it or not?—Certainly not, if the wind was blowing in. I have come in in all weathers, in the worst gales that ever blew.

19,713. Speaking of laden ships, would you find a safe anchorage for 50 within these limits?—I have not been in the Tees lately, but there used to be room certainly for 50 sail.

19,714. You cannot speak on the point?—I have not been at sea for nearly two years now.

19,715. Putting the Tees out of consideration altogether, and saying that such a harbour was to be placed south, do you think a harbour at Runswick or Filey would be of most service?—I think I could tell a better place than either.

19,716. But between these two?—I should prefer Filey Bay to Runswick.

19,717. Tell me your reasons?—With the wind how?

19,718. Of course it can only be with the wind on shore that a harbour is wanted, unless the ship springs a leak, or something of the kind?—The reason I prefer Filey Bay is, that there is not so much water as at Runswick. A little way out of Runswick there is 20 or 25 fathoms. In Filey Bay you can go into any water you like, five fathoms, or three feet, if you like.

19,719. Say a harbour could be made at Runswick to afford shelter for 200 vessels, and that a similar one

REDCAR.

Mr. J. Hudson.

21 Oct. 1858.

Mr. Lindsay.

could be made at Filey, which do you think would be the most good ?—I think Filey.

19,720. You consider that as a site Filey is better than Runswick ?—Yes.

19,721. Say it rested between Hartlepool Bay—I mean between the Heugh and the Long Scar, with a breakwater outside—say it rested between Hartlepool and Filey, and there was only to be one harbour, which point would you consider the better, all things considered, laden ships, light ships, and all things considered ?—I should decidedly prefer Hartlepool Bay.

19,722. Say that it rested between Hartlepool Bay, and a harbour to be constructed at Redcar, that proposed by Mr. Fraser; which would you prefer ?—I should prefer the plan at Redcar.

19,723. Why ?—In Hartlepool Bay the water is shallow, and we always know that in shallow water the sea is rougher than in deeper water. Here you have plenty of water, and there is a fair set of tide each way, which in Hartlepool Roads there is not. The flood tide comes in a south and south-west direction right towards the Redcar Rocks, which causes the ships to come in here. In Hartlepool Bay a ship will never go to the northward to enter upon the flood, because the water coming out meets the south tide and takes a curve to the northward, upon the flood the tide takes a southerly direction from the back of the Heugh.

19,724. Is there any other reason besides ?—I think at Redcar there would be no fear of silting up. It is good holding ground. You can go into what water you like between the Redcar Rocks and the Tees.

19,725. What is the nature of the ground ?—A kind of stiff sand.

19,726. Is it good holding ground ?—Very. A ship will ride there until she pulls her windlass out.

19,727. Is sand as good holding ground as clay ?—Sometimes better than clay. Some clay is hard, and you cannot get the anchor into it. Look at Yarmouth Roads, that is sand.

19,728. Is the holding ground better at Redcar than in Hartlepool Bay ?—I will not say that the Tees Bay is generally good ground all over.

Mr. Alexander Petterey examined.

Mr. A. Petterey.

19,729. (*Chairman.*) You belong to Middlesborough ?—Yes.

19,730. And are master of the Tees Conservancy dredger ?—Yes.

19,731. By whom are you employed at the present time ?—By the Tees Commissioners.

19,732. Are you employed dredging for them at present ?—Yes.

19,733. Have you at any time been let by them to any other company ?—Yes ; the West Hartlepool Company.

19,734. Were you the master of the dredger during the four and a half months she was employed at West Hartlepool ?—Yes.

19,735. Was that during the present year ?—Yes, from April to September.

19,736. When the weather was moderate and fine, where were you generally employed dredging ?—Outside the piers.

19,737. When not working there where were you dredging ?—Inside the piers and on the slope.

19,738. Have you any information to give when so employed ?—There was a considerable accumulation of sand on the bar when there was any swell on.

19,739. How far does the bar extend without the piers ?—I should say nearly 200 yards.

19,740. Have you ever seen any vessels lying on it ?—I have seen steam tugs.

19,741. (*Sir F. Smith.*) How long have you been employed by the Tees Commissioners ?—I have been 10 years under the Navigation Company and the Tees Commissioners.

19,742. Was the time you have just mentioned the only one in which you were employed at Hartlepool ?—Yes, that was the only time at West Hartlepool.

19,743. Do you know of any other machines being employed dredging besides yours ?—They had one of their own.

19,744. Was that dredge employed at the same time that yours was ?—No.

19,745. Do you know the reason of that ?—She was under repairs at the time we were there.

19,746. You merely went to supply her place ?—She could not take up the material we were taking up ; she has not power enough.

19,747. How much more power have you than she has ?—Three times as much.

19,748. What were you taking up ?—Principally clay.

19,749. No sand on the top of it ?—Yes.

19,750. What depth of sand ?—Eighteen inches.

19,751. At what part of the bar was that ?—A hundred yards out from the piers.

19,752. What was the general extent of the bar in both directions ?—I don't know how far it would extend. Across longwise we would go 200 yards out from the piers before we deepened two feet.

19,753. How much did you deepen altogether ?—Three feet at a time, or every time we went across we made it three feet deeper.

19,754. You made it three feet deeper over the bar ?—Yes.

19,755. Was that the only time you were employed ?—I went over it a vast number of times.

19,756. But you only were employed once on that ground ?—A good few days on that ground.

19,757. Did you go only once from Tees to West Hartlepool to clear away their bar ?—Only once.

19,758. How long were you employed ?—Between four and five months.

19,759. Continually employed ?—Yes, continually.

19,760. Can you tell me what length of time had elapsed between the time you were sent and the time the other dredger was employed in the same place ?—I believe she worked up to the day we went.

19,761. How long was she employed there ?—I believe she works when the water permits constantly.

19,762. And does so now ?—I think so. I have not been there since we left, but I expect she was going to start the day we came away.

19,763. Are you of opinion that a dredger must be constantly employed on the bar ?—Yes, to keep good water on it.

19,764. From year's end to year's end ?—Yes.

19,765. The weather will not permit constant working on the bar, but as far as the weather will permit from year's end to year's end a dredger must be employed on the bar ?—Yes.

19,766. You are quite confident of that ?—Yes.

19,767. Can you give us any information as to the cause of the increase of the bar ?—The swell brings sand on to it.

19,768. From whence ?—From the same direction where the sand comes.

19,769. It is brought in by the swell ?—Yes.

19,770. You don't think it is taken up by the tide from the Tees' mouth ?—I think there is more comes from Old Hartlepool. When they are sluicing it a great deal comes to West Hartlepool.

19,771. You think so ?—I have seen it.

19,772. No doubt ?—No doubt. I have always found that the West Hartlepool bar rises when they have been sluicing out the old harbour, and the water comes round quite thick.

19,773. Where are you employed by the Tees Conservancy ?—Just before Cargo fleet.

19,774. This will be the third or fourth time you have been upon the Cragpool scarp ; how much have you lowered that ?—We take a three feet cut every time.

19,775. How often do you take these cuts?—Probably two every day.

19,776. How often in the course of the year are you in the habit of lowering the scarp three feet?—We have never gone over the same ground twice. We always go over fresh ground.

19,777. You think you will not have occasion to go over the same ground twice?—No.

19,778. Why do you think so?—Because I think there will be plenty of water.

19,779. And you will keep it?—Yes.

19,780. There will be no fresh accumulation on the spots you have cleared?—I think not.

19,781. (*Mr. Lindsay.*) I understand you to say, you have been employed by the Tees dredging at West Hartlepool Harbour?—Yes.

19,782. What was the nature of the soil that you lifted there; was it altogether sand?—Mostly clay.

19,783. What proportion of sand would there be?—One tenth to nine tenths, or one third to two thirds. We were dredging in some parts where there was bare clay, but on the bar there would be about 18 inches of sand upon the top of the clay.

19,784. If you were dredging in some places where there was bare clay it shows there were no silting?—That is not on the bar.

19,785. I am speaking of the bar?—There is no bare clay on the bar.

19,786. What proportion of clay and sand, or was it all sand that you took from the bar, 18 inches of sand to 18 inches of clay?—There was 18 inches of sand on the top of the clay.

19,787. (*Capt. Washington.*) Besides dredging on the bar, I think you said you dredged in the channel?—Yes.

19,788. What was the nature of the soil?—Mostly silt, and sand.

19,789. In the channel?—Yes.

19,790. Inside?—Yes.

19,791. Are you speaking of West Hartlepool or the old harbour?—West Hartlepool.

19,792. Were you ever dredging in the old harbour?—In the dock or mouth, but never in the harbour.

19,793. What was the nature of the soil you dredged?—It was all silt in the dock.

19,794. Do you know what depth there was?—About four feet.

19,795. Were you ever there but once?—No.

19,796. What is the dredge they keep at West Hartlepool, is she a powerful one?—The one they have at present is not very powerful, but it will be made more powerful.

19,797. At present it is not so powerful as that in the Tees?—No; but with the improvements they expect it to be very powerful, because she will have two ladders, and 50 horse engines, I expect.

19,798. What is the power of that in the Tees?—Twenty-five horse power, I believe.

19,799. You are constantly employed in favourable weather?—Yes.

19,800. Do you know how much you can dredge up in a day?—That depends upon the material.

19,801. The usual material?—I don't know what you call the usual material. You can dredge more gravel than anything else, such as clay or sand.

19,802. Do you dredge most gravel or most clay?—Most clay; I think, upon an average, about 48 tons, the time we were in West Hartlepool.

19,803. You kept an account there?—Yes.

19,804. You don't keep an account in the Tees?—Yes; I do.

19,805. About what quantity did you dredge?—Not quite so much as at the other place; we are not quite so long in the Tees.

19,806. In gravel, how much can you dredge up?—Three hundred tons more a day.

19,807. Suppose it was all sand and silt, how much could you dredge up?—I could not dredge up so much of it as gravel, it is not so heavy. We could go over as much ground, but it would not weigh so much.

19,808. Is there any great difficulty in dredging from the Hartlepool Bar?—There is a vast of rough stones; that is the only difficulty.

19,809. A number of loose stones?—Yes.

19,810. Loose stones?—Not all loose; a vast of them are fixed in the clay.

19,811. Not rocks?—No; round wind boulders, from a quarter to half a ton weight.

19,812. Where do you think they come from?—I can't say. I think they have been there originally.

19,813. If ever you go back to dredge the bar, do you think you will find them again?—I know we have left a good few there.

Well, I hope you will be employed to remove them.

19,814. (*Capt. Sulivan.*) When you first went to West Hartlepool, had you any larger accumulation of sand to work through to get to clay than you found afterwards; that is to say, did it afterwrds accumulate with the action of the sea?—Much about the same.

19,815. When you first went there what water was the spot you were working at?—Do you mean at low water?

19,816. What water at low water was there when you were working?—Perhaps three feet.

19,817. What depth did that give at high water?—Nineteen feet at high water.

19,818. Do you know what the height of the water is on the dock sill at high water?—No.

19,819. Were you working away to the level of the dock sill?—I believe they wished us to make it as near level with the dock sill as you possibly could.

19,820. You say you cut down three feet at a time. You mean by that, that, before shifting the vessel, you work down three feet?—Yes.

19,821. How often did you ever go over the same ground again after you had taken the three feet from it?—Upon the bar we went over it again, perhaps, a week after.

19,822. How high would it be again?—It would be level across.

19,823. The same height as when you worked at it before?—Our old workings would be level across with the original bar.

19,824. How many times had you to work on that bar during the $4\frac{1}{2}$ months?—I can't say, I am sure.

19,825. Did you go on an average once a week?—We have been on it for weeks together, when the weather was fine.

19,826. When you had taken it down to three feet on the bar did you go on deepening it any more?—No; we did not cut it any deeper, we only took the sand away when it filled up.

19,827. You would remain there continuing to take up sand?—Not on one particular spot.

19,828. But over the bar?—Yes.

19,829. How soon do you think three feet of sand accumulated after you had taken that quantity away?—That depended on the weather. If there was a sea on, it would be level across, perhaps, in two days.

19,830. Do you mean to say, that after you left dredging on account of the weather, you came back in two or three days, and found it level across?—Yes.

19,831. Does that happen often in the year?—There was not much bad weather there in the time we were there.

19,832. Was that in the summer?—Yes; from April to September.

19,833. It was in the summer season, you tell us, that all accumulation of sand was occurring?—Yes.

19,834. Would it be much greater in the winter?—I should think so, owing to the heavier swell.

19,835. Where you were taking up 18 inches of sand and 18 inches of clay together, was that away from the place where the sea brought in the sand? There was no accumulation of clay on the bar when you went there?—No, no clay comes there.

19,836. Then where were you taking the 18 inches of sand, and the 18 inches of clay under it?—It was when we were on fresh ground; when we got on the

REDCAR.

Mr. A. Petterey.

21 Oct. 1858.

Capt. Sulivan.

bar we found three feet of sand, and no clay at all.

19,837. You never went deeper than three feet ?—No.

19,838. You kept working out to the depth of three feet ?—Yes.

19,839. Could you give an idea how many times you took away three feet of the bar in four months ?—I can't say.

19,840. Once a week, on the average ?—No.

19,841. Twice a month ?—More than that.

19,842. Three times a month ?—Yes ; more than that comes to, once a week.

19,843. On the average once a week, do you think you did it ?—I don't think it would be on the average once a week.

19,844. Three times a month ?—Yes.

19,845. From 12 to 14 times during the time you were there, did you remove that amount of sand ?—I can't say.

19,846. You told me you perhaps removed three feet of sand on an average three times a month ; that is, you had to dredge over the same place and take three feet of sand, where you had previously removed that quantity, on an average three times a month ?—It would be more than three times a month.

19,847. Now, saying 12 times in four months, is that over the mark, or under ?—I should say we were six weeks on the bar.

19,848. How many days did it take you to take it down three feet ?—It was not all brought down to three feet when we came away.

19,849. In working at the same spot where you at first dredged over, you say you found it filled up with sand. How many days elapsed between your going over the ground which you dredged ?—In a few days we passed over the same ground.

19,850. Did you each time take three feet of sand ?—Yes, after the first time going over.

19,851. Did you take any notice of the beach on either side of the channel above where you were working, to see whether, when these accumulations of sand came on the bar, there was also an additional quantity of sand thrown up on the beach ?—Outside the bar ?

19,852. Yes.—No, I did not take any notice of the bar outside the piers.

19,853. The low-water line was a little outside you ?—Yes.

19,854. From the low-water line up to the pier heads on either side of the channel, had you any accumulation of sand when gales threw up sand on the bar ?—I did not take any notice of it. I have got a log, and can give a copy of any particulars you require. There is an account of each day's working.

19,855. Will you procure a copy, and let us have it ?

(*Mr. Dodds.*) I will take care to supply it.

19,856. (*Capt. Vetch.*) I wish to ask, when you speak of the bar and channel which you dredged, if you refer to West Hartlepool ?

(*Witness.*) Yes.

19,857. Inside or outside ?—Inside and outside the pier of the west harbour.

19,858. (*Mr. Coode.*) What was the greatest depth at low water that you dredged in ?—Seven feet, and we made it 10 feet.

19,859. You had seven feet when you commenced, and 10 feet when you left off ?—Yes.

19,860. How long had the West Hartlepool dredger ceased working when you went there ?—She ceased from the time we went until we came away.

19,861. Was she dredging at the time you arrived ?—Yes, she had dredged the day before we arrived.

19,862. Was she ready to take your place when you left ?—Yes.

19,863. Do you know that of your own knowledge ?—Yes.

19,864. I think you said you dredged within the dock at one time ?—At Old Hartlepool.

19,865. What material was it you took out ?—Silt.

19,866. Have you any idea where it came from ?—It would be continually settling in the water, I think.

19,867. What colour is it ?—A dark colour. Perhaps there would be a good deal of coal dust.

19,868. Do you think it all coal dust ?—I should not say quite.

19,869. Did you preserve any of it ?—No.

19,870. You said something about the hours you worked. Did you make extra time at Hartlepool ?—Yes.

19,871. During what hours did you work ?—We worked according to tide, at six hours at a time, for a tide's work.

19,872. Under whose directions ?—Mr. Caseman's.

19,873. How far from the pier did you take the dredger towards the south-east ?—A hundred yards out.

19,874. Is that the greatest distance you went at any time ?—Yes.

19,875. Was it generally a sea sand ?—No.

19,876. What was it ?—Part clay and stones.

19,877. You told one of the Commissioners that you took part sand and part clay at the first cut. After that was it all sand ?—Yes.

19,878. Such as you see along the beach ?—Yes.

19,879. Did you notice whether the water in the bay, when you were dredging, was thick at any time, or was it always clear ?—It was not very clear when they were sluicing at Old Hartlepool.

19,880. Do you think that generally much of the material you dredged in the channel came from the West Hartlepool shore ?—A good deal when they were sluicing at Old Hartlepool the water all round the north pier head was quite thick.

19,881. Did they sluice daily ?—No.

19,882. At what intervals ?—I believe only at the spring ebbs. Once a fortnight or month.

19,883. How is the small dredge employed that they have at West Hartlepool now ?—I can't say where she is employed. I have not seen her since we came away.

19,884. Is she much employed in the dock ?—She is always employed outside in the harbour. I don't think they have had a dredger in the docks since they were made.

19,885. You dredged in the dock ?—At Old Hartlepool, two or three years since.

19,886. Does your log record the places you were working in ?—Yes.

19,887. (*Capt. Sulivan.*) When you cut this channel through, you left 18 inches of sand on the part beyond the cut right and left ?—Yes.

19,888. May it not have been the case that the channel filled up in a great measure from the shift of the bank right and left ?—It could not. We still find the 18 inches of sand on the clay whenever we go on to fresh ground.

19,889. Right and left ?—Yes. The 18 inches were there.

19,890. (*Mr. Coode.*) You did not find more than 18 inches after a swell ?—I know there would not be above two feet ; from 18 inches to two feet.

19,891. There might have been an increase after a swell ?—I never found any more than two feet at any time.

19,892. You never found more than two feet at any time ?—No.

Mr. Andrew Ditchburn examined.

Mr. A. Ditchburn.

19,893. (*Chairman*). You reside at Redcar ?—Yes.

19,894. You are a pilot by profession ?—Yes.

19,895. How long have you been so ?—About 20 years.

19,896. Previous to that how were you employed?—I was brought up a sailor from the first up to 1837. I was bound to the sea when 12 years of age, in 1806, and I remained there till 1837, when I was made a pilot.

19,897. (*Mr. Lindsay.*) Do you know the anchorage in Hartlepool Bay?—Yes. I used to know it in former days, before the new harbour was commenced. I know nothing of that. Old Hartlepool I remember very well, and good anchorage there was.

19,898. A good holding ground?—Yes.

19,899. What is the bottom?—Sand and clay it was before the present Victoria Dock was made.

19,900. You don't know much about it since that time?—Only as a pilot. The anchorage is good.

19,901. A pilot to this place?—Yes, but to Tees and Hartlepool.

19,902. Do you know the plan for the improvement of the Tees?—I have not seen any one but that on the wall. [The plan of 1847 for a harbour of refuge at Redcar.] I have often, in my younger days, when going to sea on a dark and stormy night, said that I should like to have had such a place as that for refuge to come to when returning from the Baltic.

19,903. Would you have any hesitation in running for that place if you were one of 50 or 60 ships obliged to seek refuge?—No, I would not.

19,904. Where would you anchor?—I would come along and bring up in what water I liked.

19,905. At what part of the proposed harbour would you anchor?—Inside, in six or seven fathoms of water.

19,906. I am speaking of the Tees, the place proposed for a pier at the entrance of the Tees?—I beg your pardon, I have never seen it. I know the Tees perfectly well as it now is.

19,907. Is there a good anchorage ground within the mouth of the river Tees?—There is from what we call the fourth buoy to the floating light hard clay.

19,908. How many ships could find good anchorage there?—Well, a great number of small vessels can anchor, but I think there is not a berth for more than four large ships when they are lying together, such ships as hold 42 keels of coals and draw 18 feet of water, as a ship of that description will do; such a ship as that requires a vast of room to turn.

19,909. You think there is not space at the fifth buoy for more than four large vessels to ride at anchor. How many ships of 12 or 13 feet water could anchor there?—I should say it would hold 30 or 40.

19,910. You think the anchorage at the fifth buoy, giving room to swing, would hold four 40 keel ships and about 30 smaller vessels?—I am satisfied that the ground just below the floating light would, and better clay cannot be found; if you will let go the anchor and heave it up again it shows up to the very stock all hard clay.

19,911. I am speaking more of the space?—There is plenty of water down below the fourth buoy; but the stream is very strong, and I do not think there would be above four berths for large ships as I speak of.

19,912. How many for ships drawing 12 feet up to 15 feet?—Well, 15 feet is a vast of water.

19,913. Say, then, from 12 to 13 feet?—There is quite plenty of room for 30 vessels at least. I am quite of opinion that there is some little more room at the other end, and the fifth buoy is getting something better.

19,814. From your knowledge of this particular part, say that it rested between making a harbour of refuge at Hartlepool Bay, between the Heugh and the Long Scars, with a breakwater outside, on the one hand, and such a place as that at Redcar, which do you think would do the most good—where would you rather have it?—If I was at sea in a dark stormy night, with the wind east-north-east, I should make for this.

19,915. With the wind east-south-east?—Well, I should do the same. I would not venture my life or ship into Hartlepool.

19,916. With a breakwater?—If there is a breakwater or anything done ——. I can't speak but as it is.

19,917. I am supposing a breakwater as proposed there, and another breakwater made here, which would you rather have to run to in an easterly gale?—I should not have a great deal of choice; if possible I should come to this.

19,918. Why?—Because I think there is more room, and if it was thick and hazy there is good soundings to make out, and deep water. It is broken water at Hartlepool Heugh.

Mr. Robert Stoker examined.

19,919. (*Chairman.*) You reside at Stockton?—Yes.

19,920. You have followed the sea?—I have.

19,921. For how many years were you at sea?—Thirty years.

19,922. How many in command of vessels?—Somewhere better than 13 years.

19,923. In what trade were the vessels which you commanded chiefly employed?—In the coasting trade, between Stockton and London.

19,924. (*Mr. Lindsay.*) Were they traders?—The goods trade.

19,925. Now tell me whether you think, looking at the number of wrecks along the coast, and all things considered, whether you think the improvement of the existing harbours, so as to make them accessible at all times of tide, would do more to save life and property than one great harbour?—I think the improvement of the three tidal harbours would be better than a colossal harbour.

19,926. Say there was only to be one harbour, looking at the whole range of coast from Flamborough Head to the Farn Islands; tell me on what site you think that harbour ought to be made?—The Tees Bay.

19,927. What part?—I think the south part.

19,928. Here at Redcar?—Yes; off Redcar, between the Redcar Rocks and the Tees mouth.

19,929. You would prefer such a harbour as that to a somewhat similar breakwater carried outside off Hartlepool?—Yes.

19,930. Why?—I do not know, speaking for that properly; it would depend upon the wind altogether.

19,931. I want you to consider the prevailing and most dangerous winds from the south-east to east-north-east. All things considered, tell me why you would prefer a harbour of refuge at Redcar to one in Hartlepool Bay?—There is more water, and it is good holding ground, and not so apt to silt up.

19,932. Any other reason?—I cannot say any other.

19,933. What do you think of a harbour further south? Do you think we require one further south?—I think there ought to be one somewhere near Flamborough Head. There are frequently a great accumulation of vessels about the head.

19,934. On this side of Flamborough Head?—Yes.

19,935. Do you think Filey Bay would be a good place?—It is the most eligible one of all.

19,936. Do you think it would be of more value than Runswick Bay?—Decidedly.

19,937. Again, saying there was only one harbour to be made, and it rested between Filey Bay and Hartlepool Bay, which of these two would you prefer?—I should say Hartlepool, in preference to Filey; it would be the means of saving more life and more property.

19,938. Then your opinion is, that Redcar would be the best site for one great harbour, Hartlepool the next, and Filey the next?—Yes.

19,939. (*Capt. Sulivan.*) If you had your choice between this one great harbour at Redcar, or rather a smaller one at Redcar, and another smaller one at

REDCAR.

Mr. R. Stoker.

21 Oct. 1858.

Capt. Sulivan.

Filey, which should you choose ?—I should choose the one at Redcar in preference to one at Filey.

19,940. Suppose you had to decide between one large one—say to seven fathoms water, at Redcar ; and, on the other hand, two of five fathoms water, one at Redcar, and the other at Filey ; which would do most to save life and property ?—I think one large one.

19,941. Why ?—Because the vessels all drive down Tees Bay with an east wind all round to Sunderland, or Shields Bay, to get to the northward, and are frequently caught short off Sunderland, when they are obliged to bear up, and come in here.

19,942. That would show that the greatest number of vessels would come into Tees Bay ?—Yes.

19,943. But you also said that one was desirable off Flamborough Head ?—Yes, because loaded vessels often dodge under the head, and are caught.

19,944. For those vessels, would it or would it not be better to have it at Filey, and another here, though neither had more than five fathoms water ? —I should prefer the southern harbour.

19,945. That is Filey harbour ?—Yes.

19,946. For the safety of all the colliery trade, and putting aside the local trade, for all the passing trade, and the coasting trade, should you consider a harbour, having five fathoms water at dead low water, which they could enter day and night, sufficient ?—I should think it was.

19,947. If you could have two such harbours, one in Tees Bay and another at Filey, would that be better than one harbour in Tees Bay, though with deeper water ?—I think that it would.

19,948. (*Mr. Coode.*) Have you often seen fleets of loaded vessels dodging about Flamborough Head, and trying to get to the south ?—Yes, they generally wait for a flood tide to set them round.

19,949. Is that a matter which often occurs ?—Yes, very frequently.

19,950. What is the largest number you have seen ? —I have seen 500 sail.

19,951. How often ?—A great many times.

19,952. Have you ever dodged there yourself ?— Frequently.

19,953. What is the longest time you have been detained there ?—Perhaps 24 hours.

19,954. Have you ever been driven back from there ?—I have been driven back, and have taken Shields Bar.

19,955. Has that happened more than once ?—Only once.

19,956. Have you ever been driven back, and taken any other port ?—Never.

19,957. Have you ever been driven back, and still kept the sea ?—Yes.

19,958. Can you give us any idea of the number of times you have been driven back ?—No.

19,959. (*Chairman.*) Of course you know Yarmouth Roads very well ?—Yes.

19,960. What is the largest number of vessels which you have ever seen there at one time ?—About 800 sail.

19,961. Supposing we had one harbour of refuge, what number of vessels would you say it should contain—what would be a sufficient provision ?—One colossal harbour.

19,962. One large harbour ?—I should say 1,000 sail ; it could not be less.

19,963. You would be disposed to say not less than 1,000 sail ?—You often see the coast completely covered with fleets of vessels, and very frequently the chief of them are caught.

19,964. Do I understand you to say that you consider Filey Bay would be advantageous chiefly as a convenience to trade, to prevent the vessels having to run back, and losing time ; or that you view it in the light of saving life ?—Taking it both ways.

19,965. Would you say that a harbour at Filey Bay would be as useful to save life, as it would be down in the bay here ?—Quite. I always fancy more vessels accumulate about here than there, all endeavouring to get home—light vessels.

19,966. Do I understand you to say that the harbour at Filey Bay would be as necessary for saving life as a harbour down in the bay here ?—No ; I cannot say it would. I think this would be preferable in case of saving life.

19,967. (*Sir F. Smith.*) Supposing a grant of two millions of money were made for harbours of refuge for the saving of life and property on this coast, and that for one million you could make a very good harbour of five fathoms waters here, and another with the same amount of money, and the same amount of accommodation at Filey ; would you not think that very much better than employing the whole of the two millions here to get deeper water, and more space ? —I think it would be better to employ the money upon two harbours than one.

19,968. We have been told that a great many wrecks are taking place here with south-west winds. Can you easily account for that in any way ?—I cannot ; I think there is a great deal of mismanagement in that.

19,969. Do you imagine vessels coming for the Tees at night often hug the iron-bound coast too much ?—That is very frequently the case.

19,970. Will you tell me, whether or not, you have a good light to make Redcar ?—No ; you cannot see any. There is a very good light on Hartlepool Heugh. That is nearly the only guide until we get abreast of Redcar, and then we get the Seaton light.

19,971. In thick weather, can you see the Hartlepool Light ?—No ; then we take to the lead.

19,972. Would a light near Redcar be of use ?—I think a light on Redcar Rocks would be of great use.

19,973. You have nothing to guide you, but the gas lights on shore ?—Nothing.

19,974. (*Mr. Lindsay.*) I understand you to say, that two millions could be spent to greater advantage in saving life and property in the construction of one harbour at the expense of a million at Filey, and another harbour at the expense of another million in Tees Bay, than expending it all on one place ; was that your opinion ?—Yes.

19,975. Now suppose the Government should give two millions of money for the saving of life and property on this coast, whether, do you think, that which you have recommended, or the expenditure of a million at Filey, and the other million in the improvement of the harbours down in the bight of this bay, so as to make them accessible at all times of the tide ; which distribution of the money do you think would tend most to save life and property ?—The Tees Bay.

19,976. You think that two millions spent in two harbours, one in Tees Bay and one at Filey, would do more to save life and property than the spending of one million at Filey, and the other million in the improvement of the existing harbours in the bight of the bay ?—If you take half a million off Filey, and put it to the Tees, it would be better.

19,977. Perhaps you have not clearly understood the question, because you commenced by saying that the improvement of the existing harbours would do more to save life and property than one harbour ?— Yes.

19,978. Having expressed that opinion, do you think that the expenditure of one million in Tees Bay, and one million at Filey, would do more to save life and property than an expenditure of one million at Filey, and another million distributed over the Tees Bay, the Wear, and the Tyne, in making these harbours accessible at all times of the tide ?—I think they had better be made accessible than the money expended at Filey.

19,979. (*Capt. Sulivan.*) What kind of a buoy is this off Redcar Rocks—the Salt Scar Buoy ?—A large red buoy ; it was so the last time I was there.

19,980. Is there any beacon on it ?—I have not seen it for a length of time.

19,981. Because nine vessels ran ashore on that

rock with a gale off the land?—It has long been complained of as wanting a lighthouse, or something of that description.

19,982. Has anything been said about getting a beacon or a beacon buoy?—I cannot say I have ever heard anything said about it; it is only of late years that a buoy has been on the rocks.

19,983. If a good beacon buoy, or a beacon, had been placed at the end of the Scar, do you suppose it would have saved these wrecks?—I think a good beacon would be very useful.

19,984. Or a large beacon buoy?—Yes; that might be useful.

Mr. John Anderson recalled.

19,985. (*Chairman.*) Can the bed of freestone in the Cleveland Hills, immediately adjacent to the south side of the Tees, be worked against the face of the hill, to a thickness of ninety feet, or thirty yards?—It can.

19,986. Does this give fifty tons per square yard, or 232,000 tons per acre?—It does.

19,987. How many miles in length are the Eston Hills, immediately on the south side of the Eston Blast Furnaces?—About two miles.

19,988. Will a breadth of 100 yards in that length contain near 7,000,000 of tons?—Yes; there is any extent of stone there.

19,989. Are the Upleatham Hills about a mile in length, and will the same breadth contain about 8,500,000 tons?—It will.

19,990. Has a line of railway been laid down to both hills, up the ironstone works?—Yes.

19,991. (*Sir F. Smith.*) Did you expect these questions were to be put to you?—Yes.

19,992. You made your calculations, and were prepared with answers?—Yes.

19,993. Not off-handed answering?—Oh dear no.

19,994. (*Mr. Lindsay.*) Do you know this district well?—Yes.

19,995. Are there good stone quarries in the neighbourhood of Hartlepool?—No freestone quarry; none nearer than twenty miles.

19,996. Is there no stone nearer than twenty miles suitable for the construction of piers and breakwaters for a harbour of refuge?—There is limestone found in the neighbourhood of Hartlepool, but in my opinion not suitable for a breakwater; that is, at Hartlepool.

19,997. Why is it not adapted for these works?—It works in too small pieces, not large enough blocks; and for the first fifteen or twenty feet it is very soft indeed. It would not stand the action of the water. I know Hartlepool Rocks have diminished in my time a great deal with the action of the sea.

19,998. (*Capt. Vetch.*) The stone which you speak of as occurring about five miles from this, could not that be conveyed to Hartlepool?—To take it by railway it will be twenty miles.

19,999. If taken across the river?—Still twenty miles.

20,000. Five miles from Redcar, and twenty miles from Hartlepool?—Yes, very little less than twenty miles.

20,001. (*Mr. Coode.*) Have you heard anything of the quarry said to have been discovered within two miles of Hartlepool within the last fortnight or three weeks?—I have not heard of that. I made one of the greatest railway cuttings made in the county of Durham, and found no such thing there within three miles of Hartlepool.

20,002. Is there a place named Pensher near this?—That is twenty miles off.

20,003. You do not know of any discovery said to have been made within two miles of Hartlepool within the last fortnight or three weeks?—No; I do not think it is possible.

20,004. Have you been in the district during the whole of the last fortnight or three weeks?—Yes.

20,005. Is it likely you would have heard of such a thing if it had occurred?—I think so. We have stone at Middlesborough, and we are nearer Middlesborough than Hartlepool is.

20,006. But at a greater depth?—It is a hundred feet from the surface, so it is impossible to work it.

20,007. (*Sir F. Smith.*) You stated there was some stone near Hartlepool, but you thought that it was not suited for the purpose?—It is what Hartlepool stands on; it stands on limestone.

20,008. You mean round the Heugh?—Yes; and New Hartlepool stands on limestone also.

20,009. You would quarry it there?—Yes, if it is to be got, I would quarry it there.

20,010. But judging from the wasting away of the headland, you think that it is not suited for the purpose of harbour constructions?—It is not suited for the purpose; the headland is wasting away very much.

20,011. A great deal?—I have no doubt in twenty-five years it has disappeared a great deal.

20,012. Has it not once been in contemplation to strengthen it by artificial means?—I believe so.

20,013. By Mr. Rendel?—By Mr. Rendel.

(*Chairman.*) This finishes your witnesses, I believe, Mr. Dodds?

(*Mr. Dodds.*) It does.

(*Chairman.*) Mr. Oxley, I understand you manage the case for Redcar; have you any wish to make a statement?

(*Mr. C. C. Oxley.*) I am afraid we are not in so good a position, having no professional person employed; but I wish to offer a few remarks, having lived here permanently for the last 22 years, and known a good deal about it before, having been on the Committee of the Life-boat, and during the whole of that time the place is well known to me. You have it in evidence that the population is increasing, and the mineral wealth is increasing most wonderfully; but that I do not look at; I merely look at it as a place for the saving of life, which I have seen lost in many instances during the last 22 years, being frequently on the shore, and always anxious to assist to the best of my endeavours at any wreck. I have seen vessels dragged past the mouth of our rocks when, if there had been a harbour, they could have come in; and with a telescope we have seen them go on shore and several founder, which, if there had been a harbour here, they need not have done. To my mind, taking merely a common sense view of the matter, this must be a good situation for a harbour of refuge, as there is high land about it, as these sketches will show, which is easily made out. It has very frequently happened here that a great many ships have come upon the rocks in the day-time, and at night may have also struck in the fogs here, of which, I believe, we have no report; but I have no doubt that there are a great many which have struck upon the rocks here, and after doing so have gone away, and we have heard no more of them. I have seen the places where they have struck, even with a small harbour, and I only go upon the means of saving life. If there had been a small harbour here it would have been the means, during the time I have known Redcar intimately, of saving an immense quantity of property and many lives that have been lost upon the rocks of Redcar, and on the other side of Seaton and Hartlepool after dragging past. I saw the *Albion* in a fearful storm in October, 1849; I was out with the life-boat; I did not go in her, but was endeavouring to do what I could. That ship came completely past. I believe evidence will be given that she could not by any means have got to Hartlepool, or anywhere, and she did founder upon the Gare. I thought from the track she made, coming so closely past, she might have come here, if the place had been properly known, and the crew might have saved their lives. I believe that two Committees of the House of Commons in

REDCAR.

Mr. John Anderson.

21 Oct. 1858.

1829 and 1839 have both recommended harbours here. I have known Mr. Brooks for many years; he lived here for five years during my residence, and he certainly was the father, if I may so call it, of the projectors of harbours of refuge on the north-east coast, for I have no doubt he projected the first, which was Redcar. Captain Hewitt testified in favour of Redcar Harbour. Mr. John Colson and his father, an engineer, kept a correct list for many years, putting down exactly where the wrecks happened and the circumstances attending them. This is an abstract of that account which I will hand to the Commissioners. I have a return which shows an account of wrecks and stranded vessels between Staithes and the Tees Bay from 1801 to 1808. It appears that there have been wrecked on the Redcar Rocks 45 vessels and 194 stranded, making 239. I believe there were many more which have touched on the edge of the rocks, and then gone away. On the Cotham Sand 9 vessels wrecked, 21 stranded; total, 30. The South Gare, 33 wrecked and 54 stranded; total, 87. On the Marske Sand, 10 vessels wrecked and 14 stranded; total, 24. On the North Gare, 18 wrecked and 11 stranded; total, 29. On Redcar Beach, 38 wrecked and 21 stranded; total, 59. From Saltburn to Staithes, 36 wrecked and 17 stranded; total, 53. Total of vessels wrecked, 189; total of vessels stranded, 322; total of vessels wrecked and stranded, 511. There have been 281 lives lost, and 173 lives saved by the Redcar life-boat.

20,014. (*Capt. Sulivan.*) Do you put in any plan which you suggest as the best for a harbour of refuge off Redcar?—No; we have always looked upon Mr. Brooks' plan as the best, but I do not go upon plans; I do not understand them. What I should like would be to see the best harbour in the best place. I have always gone a good deal about the coast to Scarborough, Whitby, and a good way along, and always used to go out in boats, and I have always thought that there were more wrecks here than at any other part of the coast that I am acquainted with.

20,015. (*Mr. Coode.*) Does the statement of wrecks contain the number of lives lost?—It is Mr. Colson's. He will hand it in to you.

Lieutenant PACE, R.N. examined.

Lieut. Pace, R.N.

20,016. (*Chairman.*) You are a lieutenant in Her Majesty's Navy, and in command of the coast guard?—I am.

20,017. Will you offer any statement you have to make relative to the advantage or necessity of a harbour of refuge on this district of the coast?—I should be very happy to do so. In the first place, the period of my service in this neighbourhood has altogether been about 10 years, three of that I have been in this district. The plan which is before me, and which I have seen as Mr. Brooks', on a former occasion, was so limited, that my opinion was that there could be no chance of succeeding in making a harbour of refuge on the Scars of Redcar; but lately I have been favoured with a view of an extension, which, in my humble opinion, will be all that a harbour of refuge would be required to be. It would contain about 120 ships, with sufficient water to enable them to swim, and to be in plenty of depth at low water. The other plan which is before me, is one enlarged towards Marske; and, as I say, must be still more eligible for that extension, being a much larger place for refuge. I am of opinion, and so far my experience bears me out, that a harbour of refuge is much wanted, and so far as my knowledge goes, seeing the disasters and loss of life, I should decidedly prefer what I have seen of Mr. Brooks' plan to those others which I have seen for a harbour of refuge at Redcar. The opinion I am giving is almost totally a local one, because I have no particular knowledge to the southward of Huntcliffe, or to the northward of Hartlepool or Souter Point. The damage that has been sustained in my time makes it positive that it should be somewhere. The wrecks which you have already identified will form an indication of what is suffered by the shipping on this coast. You are well acquainted with the gale of January 1857. I believe it is before the Commissioners from Captain Mackensie, that the Bark *Emma*, and the vessel called the *Marie Louise*, drove over the rocks, and, being protected, the crews were enabled to land in their own boats, save their clothes, and come on shore dry. I should state that, in my opinion, I know of no place which is more suitable for a harbour of refuge than this, which is completely embayed from the wind at east-north-east, the prevailing wind being from south-east and north-east. I have seen many ships which cannot attempt to get into Hartlepool; if they get at all to the leeward of the Huntcliffe, or between that and the Salt Scar, if the wind is east-north-east, and the ship will lay north, and pull north and by west, a laden collier or a light ship will drive very fast to leeward, perhaps go as much to leeward as she goes ahead with all the sails which they can carry in such a gale. I was witness to the gale of 1857, and have witnessed others. At Saltburn, I think in September 1851, there were not less than nine vessels ashore between Saltburn and the Redcar Points, one, which turned out to be a French vessel, could not run, and was drawn upon the Saltburn Beach. They came as far as they could, and made signals of distress. I went with a lifeboat and crew, and had the opportunity of throwing a line so correctly, that the first went over the bowsprit and the second over the arm of the master; he made a hawser fast, and the men came on shore, and offered a hand. There were nine vessels on shore at that time, which was, I think, on the 13th of September, on a Sunday. It was a beautiful morning, with the wind south-west. The wind varied constantly during the afternoon, and at 5 o'clock it blew a gale, the sea and wind raging so suddenly, drove these ships, of course, very quickly upon the lee shore. They had not an offing, and the wind having backed to north-east gave them a worse position than they had before, and they were obliged, and did drive on shore, seven or nine of them, between Saltburn and Redcar Point. That a harbour was necessary on such an occasion must be pretty well acknowledged. I am of opinion that there is no place that could be offered so safe, and so secure, so advantageous to the mariner shipwrecked, to life, and to property, and more especially to life, than would be one placed in this immediate vicinity. There can be no question that this is about the best spot that can be selected upon the coast. You are well aware that this is the very bight of the bay. Ships coming in from the north with the wind east and by east-north-east cannot, with all exertions, reach Hartlepool or the other entrance of the Tees; consequently, the refuge which this would offer would be, I think, all that would be required. It would certainly be a great benefit, much more to life than to property, because we generally find that when the ships come ashore that most of them are light, and light ships drive on and find a place somewhere upon the beach; but heavy ships come on the Scars, and of course, run more risk, and therefore have more occasion for a harbour of refuge. The opinions which I have given are perfectly distinct, because I have stated that which, in my humble opinion, honestly and justly I believe. I hope the opinion which I have given will be taken into favourable consideration, Redcar Rock being the best spot, in my humble opinion, that could be laid down for a harbour of refuge in this vicinity.

20,018. Would you be disposed to say that one of the greatest dangers to which vessels are exposed in the winter arises from the sudden changes of wind?—Undoubtedly it is the sudden changes of wind; the sudden springing up of gales.

20,019. Are they frequent?—No, not frequent. I have never seen one so sudden as that in 1851.

20,020. Your experience is ten years?—Ten years on this coast.

20,021. (*Mr. Lindsay.*) These gales of wind to which you refer, do they usually begin to the southward of east, and back round to the northward of east ?—They do.

20,022. And when do they blow hardest ?—The heaviest gales that I have seen have been from the north-west and east-south-east.

20,023. Do you think it blows harder at east-south-east than east-north-east ?—I think about equal. The hardest gale is two points on each side of east. The most serious winds for ships, and of course for mariners, are from south-east to north-east.

20,024. You said you did not approve of Mr. Brooks' original plan, but you approved of the amended plan ?—Yes.

20,025. To what plan do you refer ?—To that which is close by Marske ; it is an extension of the smaller plan.

20,026. Do you mean the harbour between the rocks ?—From the rocks towards Marske.

20,027. You prefer a harbour extending from the East Scar to somewhere opposite Marske ?—In that direction, so far as the space of ground is carried out.

20,028. Why do you think a harbour in that direction would be of more value than one with the south-east piers running out on the West Scar, and the other pier towards the Tees Bay ?—I think the one in the Marske direction would have deeper water, and better holding ground.

20,029. It is on that account only you prefer it ?—And would hold a sufficient number of vessels in case of emergency and distress.

20,030. Why do you prefer a harbour at this particular point to one in Hartlepool Bay ?—I have given my opinion as to the locality ; if I was to go further, I should be going into that of which I have no knowledge.

20,031. As to a harbour between Redcar and Hartlepool, you tell me you know the latter ?—What I meant was, I know the district, but do not know any part of the soundings inside Hartlepool.

20,032. You are not prepared to offer an opinion whether a harbour at Redcar would be better, all things considered, than a harbour in Hartlepool Bay ?—The only answer I can give is, that I have seen a stress of weather on the bar, even with westerly winds, when a ship would be obliged to put to sea ; that sea has been very high. The harbour proposed by Mr. Brooks at Redcar would be a place of refuge, even with westerly winds ; ships could get in with the wind west-north-west and west, and would be enabled to bring up, and need not go any further.

20,033. Do you think a harbour necessary during west-north-west winds ?—No, not with west-north-west, because that is a wind off shore.

20,034. A harbour of refuge is generally wanted the most where there is the most danger ?—Quite so.

20,035. Whether do you think, with the most dangerous winds, which are easterly winds, whether do you think the harbour at Redcar or the one at Hartlepool would be the most advantage to the passing trade ?—I think that Hartlepool, provided that provision which is about to be made for a breakwater, would be better for the trade in respect of merchandise ; but as to the safety of life and protection of property for the light ships, and those bound to the south, Redcar would be a refuge both for those returning and those coming to the south. As an opinion, mine is but an opinion, and a candid one ; and I cannot offer any judgment as to the entrance of the Tees or Hartlepool Harbour. I do not wish to go beyond that of which I have knowledge.

20,036. As between these two points, do you give the preference for saving life and property to Redcar over Hartlepool Bay ?—Decidedly.

20,037. (*Chairman.*) Nothing further occurs to you to offer to us ?—Nothing, except to observe that it has been a very unpleasant part of my duty, especially when at night work, when I have seen shipping go off. I have known ships come south, and have seen them in the dusk of the evening, when they have been passing here, and I have known that there was no protection for them against the Salt Scars, not even a light for night, or a beacon by day ; and my opinion is this, that were there a light on the eastern part of those Scars, a revolving light of any colour you like, provided that this harbour is not brought into operation, which I trust it may,—there is only one thing to be done, that if there be a good feeling towards the sailors, there will be either a lighthouse or a light on the eastern part of Redcar,—a revolving light, or anything you like. If not that, let there be some beacon, a proper buoy placed on the north-east part of the Salt Scars, to show both fishermen and mariners that there is something to look at, because at present you could hardly see the buoy above the surface of the water ; and I do not consider it a guide for any vessel bound either north or south of Saltburn or Hartlepool. I am anxious to save my countrymen and ships, and I therefore wish to see a lighthouse upon the eastern part of Redcar, or upon the Salt Scars ; but I think one on the eastern part would be least exposed, and would, I think, answer every purpose, and would be better perhaps for the man who attends it, because there ought to be a cannon on one of the Salt Scars, a guide buoy with a flag, or something like the buoy going into the Tees mouth.

20,038. I see that Hartlepool lights are from five to six miles away ?—Six miles from the Redcar Buoy.

20,039. Can you tell me what is the nearest light to the south ?—There is no light to the south or east of Redcar.

20,040. I mean along the coast ; what is the nearest light ?—Whitby, and the western part is Hartlepool. The reason I suggest a light is this, which I forgot to mention, of ships coming from the southward, which I have generally known, hug the coast very much upon a southerly wind. That is the reason, in my opinion, that many ships are lost there in a south-westerly wind. My opinion is, they go so close to keep the ship in smooth water, and when it comes on a dense fog, they put up the helm, thinking they are outside the Scar, instead of inside, and run upon the Scars.

20,041. How would the Scars light be easier seen than Hartlepool ?—Because of the coast, they cannot see Hartlepool lights. That would be a guide both for fishermen and mariners.

(*Chairman.*) I will not enter upon the subject of lights and buoys in the absence of Capt. Washington, who takes a special interest in lighthouses and buoys, but only make one observation as respects lights—that you must be aware, as well as I am, that there is an objection to a great multiplication of lights on the coast. I do not mean to say that in this case it is a suitable objection, but still it is a consideration. I do not wish to enter more into the subject in the absence of Capt. Washington.

Mr. JOHN COLSON examined.

20,042. (*Chairman.*) Are you a resident at Redcar ?—Yes.

20,043. And you are a shipowner and agent for Lloyd's ?—Yes.

20,044. Have you any observation to offer to the Commissioners as to the advantage or necessity for a harbour of refuge at this particular point of the coast ?—I have a list of wrecks, from 1801 to the present time, which has been kept by myself and my father. I find that on the Redcar Rocks 45 vessels have been wrecked, and 194 stranded; making 239. On the Coatham Sand nine vessels wrecked, 21 stranded ; total 30. The South Gare, 33 wrecked and stranded ; total 87. On the Marske Sand, 10 vessels wrecked, and 14 stranded ; total 24. On the North Gare, 18 wrecked, and 11 stranded ; total 29. On

REDCAR.

Mr. J. Colson.

21 Oct. 1858.

Chairman.

Redcar Beach, 38 wrecked and 21 stranded; total 59. From Saltburn to Staithes, 36 wrecked and 17 stranded; total 53. Total of vessels wrecked 189; and total of vessels stranded, 322. Total of vessels wrecked and stranded, 511. There have been 281 lives lost, and 273 lives saved by the Redcar life boat. [*The witness put in this return.*]

20,045. Have you anything further to offer to the Commissioners?—I am of opinion that Redcar is the best place for a harbour of refuge, for the following reasons: there are more light vessels lost than laden vessels; and I prefer Redcar for the site for a harbour of refuge in preference to Hartlepool for this reason, the light vessels coming from London must pass Redcar before they can get to Hartlepool. Therefore if they could get into Redcar much sooner than they could to Hartlepool. If a harbour was formed at Redcar according to Mr. Brooks' plan, his original plan a little enlarged, it would be the means of saving many valuable lives. It would also be a protection to the fishermen of the place. At Hartlepool there is a harbour already formed. We have got no protection here for fishermen. There are about 50 fishing cobles at Redcar,—five herring cobles and 19 pilots. I think these men ought to be protected from stormy weather as well as sailors. If a harbour was formed upon the rocks, at least between the rocks, one off the pier heads, upon the Salt Scar, we should not have any vessels lost on the rocks at Redcar; but if a harbour were formed at Hartlepool, the Redcar Rocks would still be where they are. I have seen many vessels lost on this coast during my lifetime. On the 14th of November, I witnessed the *Susan*, of Stockton, wrecked, and nine lives lost. I also witnessed one lost off Marske, the *John*, of Saltcoats, and all hands lost. On the 26th of March 1808, there was a vessel lost on the rocks, and 17 of the crew perished. In 1812, there was one lost on the rocks and four of the crew perished. I consider that a harbour at Redcar can be formed for one half the cost that it can at any other place, because it is already nearly formed by nature.

20,046. (*Sir F. Smith.*) You think a harbour can be made here at one half the cost it can be made anywhere else?—I do.

20,047. On what do you found that opinion?—There is stone in the immediate neighbourhood, at a distance of only four miles, in abundance.

20,048. You mean to say that a harbour of the same capacity can be formed cheaper, than anywhere else?—It can.

20,049. In this immediate neighbourhood?—Yes.

20,050. Would that apply to Filey as well as to this neighbourhood?—I do not know.

20,051. You do not know anything about Filey?—I do not.

20,052. Do you think that a harbour to satisfy the wants of the coast could not be formed in Hartlepool at the same cost as at Redcar?—Nothing of the kind.

20,053. To what extent north and south does your knowledge of the coast extend?—Only this coast.

20,054. Do you know anything of Runswick Bay?—I do not know Runswick Bay.

20,055. You only know from Redcar to Hartlepool?—To Staithes and Hartlepool.

20,056. You think there are no advantages or conveniences at Hartlepool which would enable them to make an equally large harbour for the same sum of money you would have to expend at Redcar?—There are not the advantages that there are here, because we have good rocks for foundation.

20,057. Thereby saving so much of construction?—Immensely so.

20,058. And a great difference in the cost?—Oh, a great difference.

20,059. How high are the rocks above the level of the sand generally?—They are generally bare, the top part of them about half tide.

20,060. You mean to say that if these rocks did not exist, the cost of forming the harbour here would be much greater?—It would be cheaper even then than at Hartlepool.

20,061. I ask, whether if the rocks did not exist there would be a great difference of price; am I to attribute the saving of money chiefly to your having the rocks here?—Chiefly to our having rocks here, and stone.

20,062. Supposing you were to enclose a rather larger space, and to extend your pier beyond the line of your rocks, would the cost then be much increased?—It would be increased, but not to a very great extent.

20,063. Then the rocks do not do so much as you expect?—Yes, they must; it depends on the height. You must have a great mass of rubble, whether it is formed upon the rock or on the sand.

20,064. The only difference can be the amount of the actual mass that the rock is above the sand?—Yes.

20,065. That is not a very great height, is it? How much are the rocks above the level surface of the sand?—I told you the rocks were bare at half tide.

20,066. And you would save so much?—Yes.

20,067. You think there would be no tendency to silt into your harbour of refuge?—I do not think there would.

20,068. Does none of the sand coming out of the Tees come in the direction of your proposed harbour of refuge?—It goes from here, down to the Tees.

20,069. Then you have some sand which does move here?—Very little.

20,070. When you say, very little, to what extent is the movement?—I should think not a variation of six inches.

20,071. Whatever does move goes away from you towards the Tees?—Yes.

20,072. And none comes back to you?—No.

20,073. Where do you get it, if none comes back to you?—There are sand hills in the immediate neighbourhood.

20,074. I want to know where your sand comes from. You say it goes from here to the Tees, and none returns to you?—I cannot tell where it comes from.

20,075. But I want you to tell me—you are giving evidence—you tell me you cannot tell me a point you ought to know. If there is a movement of sand in this direction—you say it goes from here towards the north, and does not return—I want to know where the sand comes from that moves from here to the north; you have an iron-bound coast not far from here?—I cannot say.

20,076. You have an iron-bound coast; close to, what length of beach have you got to accumulate sand?—About five miles.

20,077. Then it comes along that five miles distance?—Yes.

20,078. Is it gradually decreasing along that five miles?—It is.

20,079. To your knowledge?—To my knowledge.

20,080. What length of time have you known it?—All my life.

20,081. If it has been coming from that quarter during the whole of your life, I think there would be great exhaustion in that time; how it is supplied?—I do not know.

20,082. You have not observed?—No.

20,083. (*Mr. Lindsay.*) Were you ever at sea?—Never at sea.

20,084. Have you had any conversation as Lloyd's agent with any of the masters of ships frequenting this bay?—I have.

20,085. What is their opinion with regard to running down to a bight of the bay in a gale of wind?—Their opinion is, that if a harbour was formed at Redcar, they could take it at all times of tide, and in any gale.

20,086. Would they be able to take it with greater facility, do you think, than what they would if a

suitable harbour of refuge was constructed in Hartlepool Bay ?—I think they would.

20,087. With greater facility, you think ?—I think so. We will suppose a vessel comes from London, and is caught in a gale from the east-north-east ; she can take the Redcar Harbour very easily indeed.

20,088. But could not a vessel take Hartlepool with such a gale ?—Yes ; if she is not too far in shore.

20,089. Have you had any conversation with the masters of ships with regard to the silting up or otherwise of Hartlepool Bay ?—I have heard it has silted up about three feet.

20,090. Who told you so ?—Different masters with whom I have conversed.

20,091. During what period has it silted up three feet ?—During a period of about twenty years.

20,092. We have nautical evidence a good deal bearing on that point ; have you any other nautical witness ?—I have no nautical witnesses.

20,093. (*Capt. Sulivan.*) You gave a list of wrecks, divided into six divisions. I have not the least idea to what extent they go along the coast, from the Tees mouth, or further ?—From the Tees mouth, for a distance of eighteen miles in the direction of Whitby.

20,094. What point ?—Staithes.

20,095. The same limit that was given in the other list ?—Yes.

20,096. (*Mr. Coode.*) When you said that more light vessels were lost than loaded, did you mean to apply it to the coast generally, or to the district you allude to ?—To the district I allude to.

20,097. Not to the coast generally ?—No ; not to the coast generally.

20,098. Can you give us the proportions of lives lost in laden vessels as compared with those lost in light ones ?—I should be happy to do so, but I did not understand you would require it. We can send it to your secretary in London.

20,099. If you have the means of doing so, it would be an advantage ?—I shall be very happy to do so.

20,100. From your own knowledge of wrecks, does the greatest loss of life take place in loaded ships ?—Oh, decidedly.

20,101. If the return showed that ten lives were lost in loaded vessels to one in light, would that surprise you, or would it be in accordance with what you have seen ?—I think it would be in accordance with my experience.

Mr. Robert Dodson examined.

Mr. R. Dodson.

20,102. (*Chairman.*) How long have you followed the sea ?—Nineteen or 20 years.

20,103. What port have you sailed out of ?—Out of the Tees, the Tyne, and Hartlepool.

20,104. In what trade have the vessels you have sailed in been employed ?—The coal trade and the Baltic trade.

20,105. You have been present all to-day ?—Yes.

20,106. And therefore know the object of our inquiry ?—Yes, part of it.

20,107. You know what we wish to find out. Will you give me your opinion, in the first place, whether one harbour somewhere in this neighbourhood would be better for saving life than the improvement of the Tyne, the Tees, and the Wear, so as to take vessels of 16 feet of water at low tide ?—Well, a harbour of refuge is very much required. In respect to improving the northern ports, I know very little about them; but a harbour of refuge is very much wanted in this bight of the east coast.

20,108. Will you give me your reasons for saying it is very much wanted ?—Because when dangerous winds prevail here it is a complete bight. There is no possibility of a ship beating out, whether light or laden. We have got no harbour here that can be taken except at high water, and not then at all times.

20,109. During the 19 or 20 years you have been knocking about on the coast, have you ever been in great risk for want of a place of this kind ?—Yes.

20,110. Do you recollect any particular instance that you could tell us of ?—Oh yes, I can.

20,111. Tell us one.—The last one was on the passage from Cronstadt to Stockton, timber laden, with a gale of wind from east-north-east or north-east ; I cannot tell to half a point or a point of the wind. We were bound to Stockton, and rather than go into Stockton we took Hartlepool for refuge, for fear of our lives, expecting to get in, but we were mistaken ; we were cast on one side, and got on shore to leeward of the port. That is where West Hartlepool is now—on the Stranton Sand.

20,112. In that case were any lives lost ?—Not from our vessel, but there were some lives lost belonging to others a few days before. We lost no lives, as it happened ; we were timber laden, and went well on the beach. It was high water at the time.

20,113. Do you recollect what year that was in ?—I could have told you if I had known I was going to be asked the question. I could have told it by my discharge; but some gentleman here may know. The *Celia*, of London, was lost in the same gale about three or four days afterwards ; it was the last day of the gale. I remember at about 8 o'clock it was as fine weather as now. That gale continued about eight days or more.

Mr. Colson (having referred to his journal) said: The gale occurred on the 2d November 1844.

20,114. Can you give any other instance ?—I was once served myself the same trick in coming from Hamburgh in a ship with a general cargo, wind south-east or east, or thereabouts. We were bound for Hull, and ran into Hartlepool for refuge.

20,115. That is a long way aside, is it not ?—Yes. The sea struck us on the starboard quarter. She ran broadside on outside the north pier, and broadside into the harbour. We lost command of her, and she got on the Heugh and knocked off part of her bottom—part of her keel. She beat broadside into the harbour, and damaged 50 tons of bark, 100 tons of oil-cake, and other parts of the cargo.

20,116. Were any lives lost ?—No ; we beat broadside into the harbour.

20,117. (*Sir F. Smith.*) Are you a native of this neighbourhood ?—Yes.

20,118. Was it by night or by day that this accident happened ?—By day, both times.

20,119. Was it very thick weather ?—The last time it was very rainy weather. We could not see far.

20,120. You could not see the Heugh until you were upon it ?—No, not before we were three miles distant, or perhaps four ; it was very heavy weather indeed.

20,121. If there had been a harbour of refuge at Redcar it would not have helped you much. Would it have been of any use to you on either occasion ?—If I had had my way, I would have come to Redcar as it was, before I would have gone to Hartlepool.

20,122. Why did you not have your own way ?—Because I was not in charge of the ship ; I was only before the mast.

20,123. I understood you were a master ?—No, I never was a master.

20,124. I am very sorry you were not a master then. You are the master of a vessel now, are you not ?—No, I am a fisherman.

20,125. But you know this coast very well. Being a fisherman, perhaps you know it better than if constantly engaged in going long voyages ?—Better by half.

20,126. Then you know the Tees very well ?—Oh, very well.

20,127. You are aware that we have got before us a project for the improvement of the Tees ?—Yes, I am aware of it.

20,128. You know pretty well what it is ?—Yes, I do.

REDCAR.

Mr. R. Dodson.

21 Oct. 1858.

Sir F. Smith.

20,129. Perhaps as an experienced seaman, you will tell us what you think of that project ?—I will, as far as I am able. In regard to the improvement of the Tees, I think it is an impossibility.

20,130. You think that is impossible ?—I do.

20,131. I am sorry to hear it ?—And so am I.

20,132. You think it will be quite useless to spend any money upon that ? — There is a great doubt about it.

20,133. You have observed it very carefully ?—Yes.

20,134. And considered how it might be done ? There are two or three improvements proposed. You think them all bad, do you ?—I do not know about that. As regards the Tees, it might be made a little better than it is ; but you can never make it to be accounted a harbour of refuge ; not a complete harbour of refuge, to be taken with very little danger.

20,135. Why not ? What should prevent your making it a harbour of refuge ?—You know there is a shoal water bay with a loose sandy bottom to start on, and all the piers must be extended to a very great distance to sea before you get them far enough for a ship to go in clear of broken water, because in this bay the sea breaks so far from land that it is dangerous to any ship coming in to take either the Tees or Hartlepool. They have to go through broken water for a considerable distance.

20,136. That extends all over the bay ?—Yes, here northward ; but to the south you get better water.

20,137. Does not the broken water extend a little south too ? — Northward from here is the worst place.

20,138. Would there not be a heavy break of sea in front of the proposed harbour at Redcar ?—You will observe, that when we have a storm, so far as we can see out in a northern direction from here, there is nothing almost but broken water. When you look in an easterly direction from here, there is always the Gare, which is not smooth, but not broken.

20,139. Why then have so many vessels been wrecked on this coast with a south-east wind ?—I can give you some idea on that point too. You know, when a vessel is going down along the land here for the Tees or Hartlepool, with a light wind, she hugs the land all she can for smooth water, and to cheat the tide. When she gets to Huntcliff, with the wind south, the flood-tide draws her in. When the captain thinks he is in a line with the rocks, he tries to edge off, but is perhaps mistaken, and gets on. Many vessels get on in that way.

20,140. Have you any remedy for that ?—I should propose the building of a wall or pier on those rocks, so that people could see it ; or else the erection of some light, or something to warn vessels off,—a lighthouse, or anything of that kind which you might think proper.

20,141. At present there is no light ?—They have lights to guide them on Seaton Shore, provided they can see them in the night time, but in the day time neither light nor lighthouse are of use.

20,142. What is the remedy in the day time ?—There is nothing but building upon the rock above high water, so that people can see it.

20,143. Would buoys and beacons be of no use ?—They would be of use, no doubt.

20,144. Is there any shifting of sand in this bay ? —I cannot tell of any shifting of sand that there is here. We have none under water, but plenty of sand above water, driven about in gales of wind from the west. We have no shifting of sand under water. It blows off our banks, but it never comes back again. That is the only shifting of sand that we have about here, as far as I know.

20,145. It is blown off the banks, and gets into the water ?—Yes.

20,146. Where does it take to ?—It goes away ; I do not think it ever comes back again. I cannot tell where it may go after it goes into the water. I think it remains there.

20,147. Does it go north or south ?—Neither ; it remains there.

20,148. Remains there ?—I think so.

20,149. It is deposited immediately ?—The tide does not take it either one way or the other. We have not tide sufficient.

20,150. Do you think any of thesand washed out of the Tees goes anywhere ?—There is none goes from here to the Tees, and there is none come from the Tees here.

20,151. If we have been told that there is a shifting of sand towards Hartlepool, you would not believe that ?—I would believe that, because I know there is.

20,152. You are of opinion that there is no shifting of sand towards Hartlepool ?—Not from Redcar.

20,153. Nor from any other part of the coast ?—There is, from the Tees towards Hartlepool ; there must be.

20,154. You told me just now, no. I am to understand you that you said all along that there was sand coming out of the Tees which washed towards Hartlepool ?—Yes.

20,155. Is the effect such that the washing of sand out of the Tees has deepened the water in the Tees ? —No, I think not.

20,156. That is not the fact ?—I do not think it has deepened the water at all in the Tees.

20,157. If it has washed out, what supplies its place ?—There is such a great quantity of sand along the Tees, on both sides of it, and in the country too.

20,158. Therefore, I presume that is the reason why you think the navigation of the Tees cannot be essentially improved so as to render it a harbour of refuge ?—I think there is too much sand, and too much broken water in the bay with north-east gales.

20,159. Do you think the sand comes in from the bay to the Tees in any quantity ?—I cannot say that. I do not think there is, but I cannot say. No doubt, in heavy gales of wind and a flood tide, it will wash out of the bay towards the shore ; but no doubt it comes back on the ebb, because it is all alive, and it must go with the tide.

20,160. The sand is all alive ?—Yes.

20,161. Is there any quantity of the "Bran" Sand ? —It is seldom covered with water ; it is dry sand.

20,162. Is it not occasionally covered ?—Yes, in spring floods it is.

20,163. Does any alteration take place then ?—I do not think there is with the tide. I think the "Bran" Sand remains pretty stationary. The "Gares" move to and fro, and are changing their shape. You cannot go twice a month and find them in the same position in winter time.

20,164. (*Capt. Vetch.*) You know the "Bran" Sand very well, no doubt ?—Yes.

20,165. There is one part higher than the rest, which is uncovered at all times of the tide. There is one portion of the "Bran" Sand which is not covered with the tide ?—Yes, there is one point not always covered ; it is in the spring tides, but not in the neaps.

20,166. Do you not think when the wind blows from the eastward that the surface of that sand is blown into the channel ?—I cannot say that it is.

20,167. When I was there this morning it seemed as if it had been blowing down. There were streaks towards the channel. The North and South Gare, I think you say, are quicksands ?—Yes.

20,168. Do you think it possible for any artificial structure to remain fixed there ; do you think you could construct a lighthouse there which would be likely to remain ?—Oh no, I do not think you could.

20,169. Then you think it would be throwing away money to attempt it ?—I do.

20,170. If you were told that it could be fixed, and that the water could be deepened to 16 feet at low water, you would hardly believe it ?—No ; I do not think you could get any water to remain for any length of time.

20,171. You would rather build a pier on the rock than on the sand ?—A rock for your life ; there is no variation there.

Mr. Joseph Webb Gerr examined.

20,172. (*Chairman.*) How long have you followed the sea ?—33 years.

20,173. How long in command of vessels ?—13, 14, or 15 years.

20,174. Are you still afloat ?—No, I am retired.

20,175. In what sized vessels were you employed ?—I have had them from 130 to 350 tons.

20,176. In what trade were you engaged ?—During the earlier part of the time in trading from Newcastle to London, say 13 years ; in the middle part of the time was engaged in the Baltic, the American, West Indian, and other trades ; and for the last 10 years in going from the Tees to London.

20,177. You have been present during this inquiry ?—During part of it.

20,178. Will you give me your opinion which is the best course to take for the purpose of saving life ; to have one large harbour established here, or on any other point of the coast, or to endeavour to improve the three ports of the Tyne, the Tees, and the Wear, so as to enable vessels drawing 16 feet to go into them at low water ?—One large harbour.

20,179. Will you state your reasons for holding that opinion ?—As a refuge harbour I distinctly want one which any shipmaster acquainted or unacquainted with the cost should be able to take by night or day, at high or low water, free from all obstacles in every sense of the word.

20,180. Where would you put this harbour ?—I know no better place than the site here before you, Redcar.

20,181. Give me your reasons ?—These rocks will be seen to run out into thorough deep water. The last witness stated that the water breaks over these rocks right across to Hartlepool in a heavy gale of wind, which is a fact of consequence. If a harbour were made in the bight of the bay in shoal water, even though it was sufficiently large to hold all the neighbouring ships, still a laden ship coming through that broken water would be liable to be swamped before she could reach the entrance. Here you have Redcar in the front, and by extending the rocks a little further out you have deep water with the sea never breaking before it, properly speaking, in the heaviest gales ; so that any vessel coming either north or south or east would run in and have no broken water to encounter, and could therefore take it with the greatest convenience and security.

20,182. Then you confirm the statement of the previous witness, that in heavy gales from the east, the water to the north of this is broken, while that east is comparatively smooth ?—Comparatively smooth to the eastward of the rocks. They fall in here from these rocks just at the upper end, and fall into about 12 fathoms ; consequently the water does not break as it does in six or seven fathoms.

20,183. As respects running for a harbour at Redcar, do you think there is anything in the nature of the approach to it, or in the land above it, which would make it preferable to any other place ?—I am not aware that you could make it preferable to run to.

20,184. Is there anything in the soundings or the lay of the land which you consider gives it an advantage over any other place ?—I do not know that there is anything in that shape. There is one advantage over Hartlepool, which is, that provided a ship should happen to miss the entrance, and drift behind the north or south pier, she would be certain of the safety of the lives of the crew, and almost certain of safety as to property, because she would be sheltered, and there is a finer anchorage.

20,185. Then you are disposed to say that in addition to the advantage to be derived from the harbour of refuge, there is this—that if a vessel is driven round the piers, the crew and perhaps the property in the ship would be saved ?—Both.

20,186. But as respects the land-fall, there is nothing here which makes it better than any other place on the coast ?—No ; I do not know anything of that sort.

20,187. What, in the rough, is the largest number of vessels that you have seen at anchor in Yarmouth Roads ?—I think I have seen from 400 to 500 sail.

20,188. For what number of vessels ought this harbour of refuge which you propose should be constructed, or for what number, if the harbour of refuge is constructed anywhere, ought it to provide a sufficient space ?—For 400 or 500 sail at the same time. I am of opinion that at no one time would the harbour at Redcar ever have reason to expect 400 or 500 sail. At Yarmouth Roads the circumstances are different. An accumulation of ships takes place at that point, by their being there for two or three weeks fighting north-west winds. But when once they leave the roads they never accumulate together, either in the Humber or in Bridlington Bay, or in any other place. They get divided.

20,189. Therefore the accumulation of vessels in Yarmouth Roads is not a fair test of what would take place down here ?—It is not.

20,190. Then would you be disposed to say that a harbour of refuge which would hold half of those which are accumulated sometimes in Yarmouth Roads, would be amply sufficient ?—I really think it would.

20,191. As respects Filey Bay, you have heard what has been said as to its being a good place to bring up the vessels which accumulate about the Head ; what do you say about that ?—It is decidedly too far south for any general purposes. It may answer the purpose of laden ships to take shelter in it in south-east winds, but for light ships I doubt very much whether it would be any benefit to them at all, or any convenience whatever, because to ships bound from Flamborough a wind from the east-south-east is a fair wind ; but, unfortunately, it always prevails more to the eastward, and as they go along the Yorkshire coast it goes from east-south-east to east by south and east, and they get upon the Tees. As they go on it gets a little farther, just another point or so to the northward, and drives the vessel round there, where they have Hartlepool to run to ; or otherwise in easterly gales in the winter months we stretch out to sea, instead of running along the coast. They get taken into the bight, and then they cannot get to Hartlepool at all ; the Tees they can get to, but it is not a proper place, particularly at any height of a gale, when it is very dangerous. Consequently they try here and there until they can get no farther, and they get either on the rocks or on the Gares. If they get on the Gares their lives are almost certain to be saved ; if on the rocks they have the security of the life boat, if the men can possibly get out to them.

20,192. (*Sir F. Smith.*) Will you do me the favour to tell me whether I am right in understanding you that there is no place between the Farn Islands and Flamborough Head at which a construction of a harbour of refuge would be more likely to save life and property than at Redcar ?—There is no place so likely to save life and property as at Redcar.

20,193. Between the Farn Islands and Flamborough Head ?—Between the Farn Islands and Flamborough Head.

20,194. There is no other place ?—Not so likely.

20,195. You have navigated this coast for a long while ?—I have.

20,196. Has it ever happened to you to be in very great peril, or have you ever been wrecked ?—Never.

20,197. Have you ever been in great peril of being wrecked ?—Never.

20,198. You have navigated this coast for a long while without having needed a harbour of refuge ?—I have too often wanted it, but have never been in such peril as to be lost for want of it.

20,199. It is a question in some degree of peril, I should imagine, if you want a harbour of refuge, is it not so ?—We have only the common peril of the sea. If I am in a good ship, and have the sea to encounter,

REDCAR.

Mr. J. W. Gerr.

21 Oct. 1858.

Sir F. Smith.

I would rather take a harbour, in order to save the wear and tear of property, as well as the distress of the men.

20,200. The view you take of a harbour of refuge is that of a harbour to save the wear and tear of your ship and the fatigue of your men ?—I consider it is meant to save both life and property, as well as the wear and tear and fatigue of the men. Both these things are highly necessary.

20,201. But you tell me, as having navigated this coast for a long while, that you have never been in peril of your life beyond the ordinary perils of the sea ?—Not beyond the ordinary perils of the sea.

20,202. Then surely a harbour of refuge was not immediately necessary for you ?—I might have been no more fortunate than my brother sailors, but it has not happened to me.

20,203. The object of the Legislature is to endeavour to save the great loss of life which has taken place on this coast. The Legislature think that the construction of harbours of refuge is a matter in which the public funds may to a certain extent be properly applied. You have had great experience, and your opinion will have great weight with us in coming to a right decision on this matter. If you have been in a position to require a harbour of refuge frequently, as you say, I should be glad to know on what part of the coast you were when you required it ?—The last time I most required it was from Flamborough Head.

20,204. Coming from Flamborough Head ?—I was there with a laden ship in a calm, and I was driven round the Head by the flood tide.

20,205. If at that moment you could by enchantment have conjured up a harbour of refuge at the very spot most likely to have saved you, where would you have had it ?—At Redcar.

20,206. What, when you were at Flamborough Head ?—Yes.

20,207. Have you never been in a position requiring a harbour of refuge in which some place other than Redcar would have suited you ?—In many instances. If there had been a harbour of refuge at Filey I have been in a position to take it, with 14 or 15 more ships.

20,208. And you would have saved running from Filey down to Redcar ?—I should.

20,209. Has it ever happened to you to be further north, and to require a harbour of refuge ?—I drove further north with that vessel. Now, so far as a harbour of refuge goes in the north, the more harbours there are the better ; but I want the most needful one done first.

20,210. I will take the most needful, which is Redcar, according to your opinion?—Which is Redcar.

20,211. Which is the next in importance ?—If you like to try Hartlepool, that is near enough. As for any other place, I cannot speak. As for the present tidal harbours, to attempt to make them harbours of refuge will, I think, be great folly, for those very reasons which cause our difficulty in the Tees. Both Sunderland and Newcastle are tidal harbours, bar harbours; and the consequence is when laden ships run for either of them with gales of wind the tide is over-topping them, and sweeping their decks before they reach the bar, and it very possibly swamps them, or gives them such a stroke that they run on a sand or rock.

20,212. What is the general draught of the coasting vessels ?—From 16 feet down to 10 or 12.

20,213. Sixteen feet being the maximum ?—Yes. These are the heaviest ships going.

20,214. Supposing the bar at the Tyne could, as a matter of certainty, have 18 feet of water over it, would not that appear to be an expenditure worthy of being incurred ?—Yes, it would be serviceable to Newcastle vessels alone, or otherwise to a stranger also if he got there, because he has lights to lead him in ; but, as I said, it is a tidal harbour, and a pilotage harbour, which a stranger does not like to take. If a stranger is thinking of going into a port he wants to see on the chart that the place is open and free of sand-banks. If he finds there are any dangers anywhere, he will keep out of it.

20,215. Is it dangerous for a stranger to run into the Tyne by his chart by daylight ?—It is with a heavy gale of wind.

20,216. Is not Tynemouth Head a good point to make ?—It is to be made. Yes, it is a point for vessels bound from the Baltic upon these shores.

20,217. Then you would be rather disposed to lay out money for the improvement of the harbours ?—If it is thought proper to improve the rivers or harbours we shall have no objection to all the improvements which can be made; but as for a harbour of refuge for the general object, I should say a good harbour, made free from all doubts or fears upon all these matters, would be the thing we really want made.

20,218. We are to assume that it can be so made at the Tyne. If it could be made at a moderate expenditure, would you think it worth such an expenditure? —It will be worth all the expense; the Tyne will.

20,219. But not to vessels seeking refuge ?—I should say not.

20,220. For a vessel in distress off the Tyne ?—In any heavy gales of wind—in heavy easterly gales—not for laden vessels ; light vessels might run in with great confidence.

20,221. You would apply the public funds only to Redcar and Filey ?—To Redcar ; and to Redcar and Filey if there was money enough for both.

20,222. But if you had a certain limit, say 2,000,000*l.*, —and if for 1,000,000*l.* you could get five fathoms of water at Redcar, and for the same sum the same depth of water at Filey, would you apply the 2,000,000*l.* in that way, or lay out both in getting deeper water in a larger harbour at Redcar ?—I have studied something about that, and can hardly come to a decision. I conceive from the plan before me (Mr. Brooks') this is an extensive harbour, to be made to answer all purposes, both for merchantmen and the Royal Navy ; but there is also a smaller harbour formed on the plan. I think that would make a sufficient harbour at present for coasting vessels.

20,223. I think you said that if you could get accommodation for 200 ships at Redcar you would be satisfied ? —From 200 to 300 sail. I think we average about one-half of what may be in the Roads. Some persons said they had seen a thousand sail in the Roads, but I never counted that number. I think 450 or 500 will be as many as are generally collected there.

20,224. (*Mr. Lindsay.*) If you had plenty of water in the Tyne, would you have any objection to run for it in an easterly gale with a flood tide ?—It would depend on the trim of the ship. If it was a laden ship and I could keep the sea, I should.

20,225. With abundance of water and a flood of tide what greater danger would you have in running for it than in taking any other place ?—The breakers I have to meet before I can get to the entrance.

20,226. What breakers would you have to meet ?— 18 feet is only 18 feet, and when the sea comes out of ten or twelve fathoms to a bank of 18 feet, the breakers are outside of it.

20,227. Say it was deepened to 30 feet of low water at spring tide ?—I should then object to it.

20,228. Why ?—Because it is not exactly free, as I before said, for a vessel to run to. In the next place, there are pilots and steamboats, and a man can get in, but can't get out at his pleasure, or without extreme expense in doing so.

20,229. You are speaking in regard to expense ?— Yes.

20,230. But you would have no objection, leaving expense out of the question, to run for it if deepened to the extent I have named ?—I should have my doubts about it, with a laden ship, for the reasons already mentioned. A light ship could run for it with all the confidence in the world.

20,231. Do many laden ships run back to the Tyne for refuge ?—There may be a few those, very well acquainted with it, who do run back ; but I think it is

not a general practice. But then I have been out of practice myself for the last ten years.

20,232. What is the force of the tide at the Tyne during the spring tides ?—I have known it in freshets to run inside four knots, and through the Narrows. I should think the ordinary run would perhaps be two or two and a half.

20,233. Would an easterly gale blowing in have the effect of setting back the tide ?—It would to a certain extent.

20,234. Would a two-knot tide and an easterly gale blowing in, cause much sea ?—The tide would not cause the sea ; the sea would be outside the tide.

20,235. You said that in these easterly gales of wind the whole sheet between Redcar and the Heugh was broken water ?—It is.

20,236. Speaking to you as an old sailor, do you think it is dangerous for a ship to run through that sheet of broken water if there is plenty of water under her ?—There is plenty of water under her.

20,237. But is it dangerous for a laden ship to run through that sheet of broken water ?—Yes.

20,238. Tell me why it is more dangerous for a ship to run through that sheet of water in a gale of wind than it is in the open sea, where there is no broken water ?—Where there is no broken water there is no danger; but where there is broken water every seaman must know that the danger is great.

20,239. Does the danger arise from the sea, or from the banks in the neighbourhood ?—From the sea.

20,240. Is it because the sea is in a more confused state, and not so regular as it is outside ?—Certainly.

20,241. Have you known many ships to founder in running for this bay through the broken water ?—I only know of one, and in that case I stood upon Hartlepool pier, and saw the accident. It was a sloop running for the Tees.

20,242. She foundered in broken water ?—She went down in a moment.

20,243. What depth of water would she have under her ?—Three or four or four or five fathoms. She had not got to the Fairway Buoy.

20,244. And you thought it was the troubled sea which caused the ship to founder ?—I am of that opinion, and that was the general opinion on Hartlepool pier.

20,245. That is one of the reasons why you would prefer Redcar as a site to Hartlepool Bay ?—I did not speak of Hartlepool Bay ; I spoke of the river Tees.

20,246. I will ask now whether you would prefer Redcar as a site to Hartlepool Bay ?—I should decidedly give the preference to Redcar before any other that I am acquainted with.

20,247. Why should you prefer Redcar to Hartlepool Bay ?—The reason is what I have before stated. In Redcar there is deep water before it altogether. If the proposed pier is made in Hartlepool Bay, I should have doubts whether it will not silt up with sand. Supposing that pier was made east-north-east, the wind runs right through it, and must drive in an extraordinary sea, which may break the outermost vessels from their anchors and drive them one on another, until they all get in a mass together on the Long Scar.

20,248. Would the land over Redcar be easier made out in thickish weather than that at Hartlepool ?—I should think pretty much the same. The land above Redcar is nearer than the hills here ; but in almost any weather these hills could be seen at any distance from the shore.

20,249. Say that a harbour of refuge was made here, and the weather was thickish, so that ships could not make out the land for many miles, as it often is in south-easterly gales, do you think the land about the entrance to this harbour would be easier made than that over the entrance to any harbour at Hartlepool ?—I think the land at Hartlepool would be decidedly easier made out than that here ; but at the same time vessels from the Baltic in all cases, if going southward, always make for the Yorkshire high land. If going northward, they make for Tynemouth. These are recognized points ; and in the same way, as soon as a vessel saw the Yorkshire coast, it would be a guide to Redcar. She would get hold of that, and might then easily come in.

20,250. You make the Yorkshire land at Huntley Foot ?—Yes ; I then come along the land, by the lead, if you cannot see anything.

20,251. (*Capt. Sulivan.*) Are you decidedly of opinion that we run a great risk in making any attempt to improve the tidal rivers ?—I think so.

20,252. That is, for a refuge harbour ?—I cannot call them refuge harbours, whatever moneys you may lay out upon them.

20,253. You said that a harbour at Redcar and another one near Flamborough Head would both be useful for the passing trade ?—They would.

20,254. Would it be the case that one at Redcar would be more especially useful for light vessels coming into the bay from the southward, and the one at Flamborough Head would be more es pecially for the loaded vessels caught off Flamborough Head ?—The Filey one would be highly useful for loaded vessels caught off Flamborough Head.

20,255. If two such harbours were made, though not on any grand scale, would it give all the accommodation and reasonable safety for life and property that the trade of this coast would require ?—I think so.

Mr. THOMAS THOMPSON examined.

20,256. (*Chairman.*) You live at Redcar ?—Yes.

20,257. You have been a fisherman all your life, I believe ?—Yes.

20,258. What have you got to say about harbours of refuge. Where should you like to have such a harbour ?—I should like to have it where it would save most life and property.

20,259. Where would that be ?—At Redcar.

20,260. Why should you like to have it at Redcar ?—Because there I think it would save most life and property. I have no personal advantage in it.

20,261. Why do you think more life and property would be saved by having it at Redcar than by having it at any other place ?—From what I have seen I think so. I have seen a vast of shipwrecks, and a vast go by which might have been saved. It has made my heart ache to think what such a harbour might have saved here.

20,262. That is the result of your long experience ?—Yes. I have been in and out of here for 70 years.

20,263. (*Mr. Lindsay.*) You and I had a crack on the beach this morning ?—Yes, I was down on the beach this morning.

20,264. You have been 70 years a fisherman ?—Yes, 70 years.

20,265. Have you often been about Hartlepool Bay ?—Yes, very often.

20,266. You said you would like to have a harbour of refuge where it would best save life and property ?—Yes.

20,267. And it did you great credit to say so. You think that if placed about Redcar it would have the best chance of saving life and property ?—Yes, it would, from what I have seen ; I speak from experience.

20,268. Tell me why you think a harbour at Redcar would be likely to save more life and property than if a harbour of the same size were made down at Hartlepool Bay between the Heugh and the Long Scar and with a breakwater outside ?—The harbour they talk of at Redcar would run out into plenty of water and would give good anchorage. I have never known any variation in the water in my time ; there never has been, and never will be, I expect. It lies well into the open sea. We don't want it inland. We want a place you can get at ; that is, a place you

REDCAR.

T. Thompson.

21 Oct. 1858.

Mr. Lindsay.

can get at at any time. If a ship will live at sea, she will be able to come into a harbour at Redcar any time of day or night, or at any time of tide.

20,269. Would not the same be the case if a harbour were made at Hartlepool?—I have been constantly looking out. It is a body of broken sea all the way before you come to Hartlepool. It is a foul sea from the Salt Scar to the Heugh.

20,270. Have you ever seen ships founder in that broken water?—Yes, a good many. One of the Newcastle colliers went past this harbour mouth.

20,271. Did she founder?—She brought up in the bay, and there she went down at her anchors, and all hands were lost.

20,272. Do you think there is greater danger in a ship running through broken water than in a heavy sea outside?—I do. It is a great shoal.

20,273. Is it because a ship might strike?—No, there is plenty of sea; there is no danger of that. I have been coming down here for refuge when the sea has been running mountains high. Two ships came ashore. I myself knew the best water, for I found it out for my own safeguard in going in and out long before it was talked of as a harbour.

20,274. Do you think these ships struck the bottom?—I saw one upset, upset with ease, bottom up.

20,275. Was she light or loaded?—She was light.

20,276. Did she strike the bottom?—No; the sea upset her, she had broke her masts.

20,277. Do you think that any of these ships which foundered struck the bottom before they foundered, or was it the sea which made them founder?—The Newcastle trader that brought up in the roads.

20,278. You told me about her. Cannot you tell me about any other ship that foundered?—At sea?

20,279. Out in this broken water?—I do remember one just now, one they called the *Scotia*, lying in Hartlepool Roads. She broke away, drove on the Gares, and all hands were lost.

20,280. Drove on to the banks?—Yes; I could name a vast of ships that have been lost on the rocks. They are all gone. We must look for better means to preserve the place if we can.

20,281. (*Capt. Sulivan.*) Have you ever known any difference in the depth of water between the Redcar Rocks?—Never in my time, nor in any man's I could ever hear tell of. Never any variation in the water since I can remember, which is between 70 and 80 years.

Mr. Addison Brown examined.

Mr. Addison Brown.

20,282. (*Chairman.*) Mr. Brown, you reside at Middlesborough?—No; at Coatham at present.

20,283. How long have you followed the sea?—Twenty-one years.

20,284. Are you still afloat?—When I choose to go. I have left the sea about three years altogether.

20,285. How long have you commanded vessels?—I commanded vessels of all sizes for nearly 15 years.

20,286. In what trade have the vessels you commanded been chiefly employed?—For the first three or four years I was in the coasting trade from Stockton to London. Since that, I have made voyages and have commanded ships across the sea to the Baltic, to America, and to China. The general trade, I might call it.

20,287. Give us your opinion as to a harbour of refuge?—I wish to offer a few remarks. My experience of the coast in that way is not so great. I have never happened with a misfortune on this coast, and I cannot, therefore, speak from anything that has happened to myself, but from what I have seen and heard from others. I wish to say a few words about a harbour of refuge. I think we want one at Redcar; according to my ideas, which is a very good place for one.

20,288. Why do you prefer Redcar to any other place?—In the first place, in this way, that it will take all the vessels coming down from Flamborough Head, all the light colliers. When they come out of Bridlington Bay, having been sheltered with the wind from the north, or the north-north-west, they come down in this direction. They get a distance down before it comes bad weather, because a man would not come out in the bad weather, and by the time they get that distance, probably it comes on a gale of wind from east-north-east. They put the ship under small canvas, say double-reefed topsails, and shove away to the northward. By having a prudent offing, as a prudent shipmaster will, he will weather Whitby Rock, and come down the coast. The ship is lying at north, with the wind east-north-east. He weathers Whitby Rock, and still the ship is not making over a north-west course. There are very heavy colliers, and under double-reefed topsails they will make three or four points lee way, and some a little more. The captain comes about; he can, perhaps, fetch in about Redcar, and when he gets there, the result is, he cannot get round Redcar Roads for a harbour of refuge at Hartlepool. If he gets round the rocks, he gets right into the bight. The ship is still making a north-west course, and what is the use of his looking for a harbour north, when he is only making a north-west course?

20,289. For which class of ships is a harbour required most, light or laden ships?—I think it is required for both, if it is put in a proper place.

20,290. To which class of vessels, if either, would it be of most use?—To both alike. It depends on where it is placed. If you tell me where it is placed, I will give an answer.

20,291. Place it at Redcar?—It will suit the one as well as the other. Vessels coming from the north won't come out of Sunderland, the Tyne or the Tees, except they can get an offing and have some sort of weather. Even if they have to shorten sail on account of a gale half an hour after they get out, which is very early, a vessel heading up with a wind east-north-east will lay south-east, and I will be bound she will fetch Redcar. It must be useful for them. That is why I think the situation of Redcar is preferable.

20,292. (*Mr. Lindsay.*) As you are aware, the proportion of loss of life in laden vessels is as ten to one compared with light vessels. Now, looking always to the saving of life, do you think a harbour at Filey or one at Redcar would do most to save life?—I think myself at Redcar, in both cases.

20,293. Is it or is it not the case that a great number of vessels get off Flamborough Head, and cannot get to the southward?—I think there is a vast there with the wind from south-south-east to south and south-south-west; but there is not a man can tell me, no prudent shipmaster will tell me, he has laid under the Head with a wind east-south-east. With such a wind he ought to put the vessel to sea, and then as the gale increased he would be a long way to sea before the heaviest of the gale came on, and before there was danger of coming in contact with the Durham coast he would have gone down to the Firth of Forth. Before he got there, a vast of changes in the weather might have taken place.

20,294. Say a gale came on very strong from the east, such as that of January 1857, and you had been caught to the west of Flamborough Head, and could not weather the Head, what would you have done?—If there had been a harbour of refuge under my lee it would have been very useful; but these are extraordinary cases.

20,295. Speaking of such a case as that which I have put, as an extraordinary one, did I understand you to say that under such circumstances a harbour at Filey would do more to save life than one at Redcar?—No.

20,296. In such a gale as that could you have fetched Redcar?—Yes, if I got my ship off to sea when I saw the gale coming on. However quickly

it slipped in upon us, we should surely have two hours or something like that. You are putting the wind at east-south-east, and if the ship were in good trim, had good canvas and things in proper order, and if she were handled in a ship-shape way, she would go away to sea. If she goes ten miles to the north-east, making perhaps a point leeway, she is making a very outside course. She is both coming down the coast and likewise going to sea, which, if the gale increases, makes your Foot with any wind you like, bearing probably about west-north-west, and gives two points more leeway to come to it.

20,297. Unfortunately, in such gales we find ships cannot get to sea. We have a return which states that in that gale in one morning 27 vessels were lost between Flamborough Head and Whitby Point, and that the crews of seven of those were lost. These were ships caught somewhere in the position which you describe, and evidently could not weather away the Yorkshire land. What good would a harbour of refuge be to any one of the ships which were lost between the points I have named ?—I quite grant you what you say, Mr. Lindsay ; but have you talked to any captains wrecked in that storm, and did they say that a harbour of refuge at Filey would have been of much benefit ? It might have been to one or two perhaps ; but do all of them say that they could have saved their vessels if there had been a harbour at Filey ?

20,298. We have not had an opportunity, Mr. Brown, of examining any of those that were wrecked on that coast ; but I am asking you as a sailor. Of course the masters of those ships would use their utmost endeavours to weather away the land on either side. Of course they could not weather away Flamborough Head, and it was in their attempt to weather away the Yorkshire land to the north of Whitby that they were wrecked along that iron-bound coast. Now I suppose that under such circumstances as these you will agree with me that a harbour of refuge at Redcar or Hartlepool Bay, or any point to the northward of Whitby, would not have saved any of these ships ?—I remember hearing that gale spoken about by some captains who were in it. I make use of the name of one of them, who had a son living here, a man of the name of Laverack, of Staithes. I heard him say the vessels were so close under the cliffs about Scarborough and Robin Hood's Bay, and the wind shifted so quickly that it did not enable them to get the ships placed under any command at all, and some of them actually blew on shore before the sails were double reefed or single reefed. I heard that myself. Therefore, what would have been the use of a harbour of refuge at Filey under such circumstances ? These ships caught off Scarborough could not have fetched a harbour at Filey, according to what I heard.

20,299. Nor have got into a harbour at Redcar ?—No.

20,300. Was the proportion of loss which took place between Flamborough Head and Whitby on that fearful morning larger than it usually is in easterly gales on that coast ?—Oh yes.

20,301. And that arose, in your opinion, from the ships being caught so close in upon the Yorkshire land, and the gale having come on so suddenly ?—Yes.

20,302. Say that it rested between Redcar and Hartlepool Bay for the construction of a harbour of refuge, would you still prefer Redcar to Hartlepool Bay ?—Yes ; I have given you one reason, and I will now give you another. In the first place, say a ship was coming across the North Sea from the Baltic, and on account of something happening, such as having sprung a leak or something of that sort, and required a refuge and must make for some port, if there is a harbour of refuge at Hartlepool, and it is dirty thick weather, with the wind east-north-east, in such weather as that she could come down to Redcar easily enough, but she durst not try Hartlepool, because there the land is so low she could not make anything of it ; but she would draw close in to Huntley Foot, taking care not to be too much to the southward ; will try to see Rosebery Topping, and the bearings of that will indicate where the harbour lies. If the captain uses his lead before he gets the length of the harbour, I'll be bound to say there will be some beacon or other on the pier, and of course that will enable him to fetch it. If he goes to Hartlepool there is the danger, if he gets to the southward, with the wind east-north-east and the ship making a north-west course, that he goes upon Seaton Sands.

20,303. But in bearing up for a harbour of refuge, say caught by a gale veering round to the southward, would you not, if the weather was thick, still consider it advisable to make the high land at Huntley Foot, and could you not take your departure from there and run for Hartlepool ?—Yes ; you could very easily, if the wind was so far south that you could get off again.

20,304. With the wind east-north-east and blowing a gale ?—Then you cannot go down and make that and then go to Hartlepool.

20,305. The gale would be too scant to fetch into Hartlepool ; is that your answer ?—If the wind was east-north-east I should never attempt to go in there to make land for a harbour at Hartlepool ; if I did, I should never get out.

20,306. You don't think you could weather Redcar rocks or the sands of the Tees ?—If I did weather Redcar rocks, if I ran on until Huntley Foot fetched off by the ship, and she was making four points leeway, if she heads she brings me to Coatham, or might get across the Tees ; but if I saw that, I would not let her do it, but run her upon the sand at Coatham, whether she was light or laden.

20,307. Do you think the construction of one large harbour of refuge on any part of the coast, or an improvement of the existing harbours so as to make them easy of access at all times of the tide, would do most to save life and property ?—What do you call a large harbour ?

20,308. The making of the harbour at Redcar on which your mind is set, and for which you have given very sensible reasons ; the making of a harbour at Redcar to hold 500 sail of vessels at anchor I should call a large harbour. Do you think that the construction of such a harbour as that at Redcar, or the improvement of the existing harbours, so as to give them 16 or 18 feet of water, if it were possible, at low water spring tides, would do most to save life and property ?—I consider a harbour for 500 sail only a little harbour for such vessels as draw only 16 feet.

20,309. Now, say there was made at Redcar a harbour capable of containing 500 ships—that that was one point ; and the next was the improvement of the Tyne, the Wear, and the Tees, so as to make them harbours with 16 feet of water into them at low water spring tides, so as to admit the usual description of vessels going along the coast at all times of the tide ; do you think that the one harbour at Redcar, or the improvement of those harbours to that extent, would do most to save life and property ?—I think one harbour, with the wind from east of north or north-east by east.

20,310. With all winds ?—For the general trade and the coasting trade, right up and down, and wherever they came. They could round Tynemouth headland, where I think the greatest destruction takes place. This would be a great benefit.

20,311. You think one harbour would do more to save life and property than the improvement of the other harbours ?—I think so.

Mr. William Potts examined.

20,312. (*Chairman.*) You are resident at Redcar ?—Yes.

20,313. And are a fisherman ?—Yes.

Mr. W. Potts.

REDCAR.

Mr. W. Potts.

24 Oct., 1858.

Chairman.

20,314. How long have you been employed in that way ?—Well, on to 40 years from first starting.

20,315. Always in this neighbourhood ?—Yes ; always in this neighbourhood.

20,316. Have you thought at all about this question of harbours of refuge ?—Yes, I have given a little thought to it.

20,317. Just be good enough to give me your opinion on the subject ?—My opinion is this : I think that Redcar is laid out almost by nature in a form to make some kind of refuge of it. If it was made even on a small scale, it would be still a very necessary place. Many vessels have gone past the place dismasted or disabled, and all hands have afterwards been drowned ; vessels which I think, if I had been in them, I could myself have saved most of them. I have seen vessels go past which might have taken harbour here when they could not fetch down to Hartlepool. I once saw a vessel belonging to Shields go past ; she was called the *Anne*, and was a timber-laden vessel. In taking the Tees bar she got on the North Gare end. If there had been a place of refuge here she would have come in. We got the life-boat down, and took the crew off at dark, but they would have been lost if we not seen them. In another case, a ship ran on shore near Seaton, but the crew escaped and were landed there next morning. If there had been a refuge the ship might have been saved from grounding. That was in the year 1829.

20,318. You have never been at sea, have you, in any of the ships in the coasting trade ?—No, but I have been at sea all my life together, out in the fishing boats.

Mr. W. Alexander Brooks re-examined.

Mr. W. A. Brooks.

20,319. (*Chairman.*) Are you prepared with any well-considered pla n for aharbour of refuge at Redcar ?—I am.

20,320. And are you prepared with any detailed estimates for carrying out that plan ?—Yes ; and I will give it in, fairly copied, before the Commissioners leave.

20,321. I see that Mr. Anderson is also to be examined ; will he be prepared to back your prices ?—I don't know.

20,322. Will you now proceed to state to the Commissioners what your plan is ?—It consists of two works. The most northerly is a pier on Salt Scar rocks, which is a natural mole that extends into the sea more than 10,000 feet in length, and it is also several hundred feet in breadth. It is in fact a breakwater, sheltering the space between that rock and another range of rock to the south called the East Scar. That is the northern work ; it has a return to the southward. Then about 3,500 feet to the southward there is a second work, which consists of a breakwater lying abreast of the shore between Marske and Saltburn. The first will shelter about 330 acres, having above four fathoms at low water ; and the Marske breakwater will shelter 1,000 acres having above four fathoms at low water, and 870 acres having above five fathoms at low water. The length of the southern breakwater will be about 9,200 feet. That I believe is all good holding ground. There is one great advantage in the formation of a harbour on this coast, arising from the clearness and purity of the water. If these works were made there would be no sands for many miles to the southward which would be likely to bring in sand by the occasion of on-shore gales of wind and south-east gales. I have often noticed the great difference between the purity of the water on the south side of Tees Bay and that of the water on the north side. In the former you may see the shells at low water ; I have seen sea urchins in 30 feet at low water. When the water gets mixed with the discharge from the Tees it is much discoloured. I believe there is no danger of any loss of depth of water in the harbour which I have proposed by any silting up ; that is one great reason why I select this site on the south side in preference to the one on the north side. In addition to this, there is an inexhaustible supply of stone to be had within a very short distance, and which you can run down by gravitation. Another great advantage is the high land in the vicinity, which will enable the harbour to be made much more readily than on any other part of the coast to the north. Burleigh Moor, immediately to the back of Marske, is, according to the Trigonometrical Survey of the Ordnance Department, 598 feet above the level of the sea, about one mile south-west of the shore, and its west end in a line with Roseberry Topping, which has an elevation of 1,000 feet, would lead directly for the north end of the breakwater ; and there is also the high range of Guisborough and Ayecliff Moor, which is about the same height of 1,000 feet. The outline is so bold that it is readily seen by observers a long way off at sea. I believe a small harbour might be made in this locality, at a moderate outlay, which would be the means of saving a great many lives. I don't think it is absolutely necessary to go to the full extent of this work as shown in my large plan unless it is considered desirable to accommodate many hundreds of ships. I believe if even the Salt Scar pier were carried out, without going so far to the south as is shown on the plan, it would afford shelter during all gales from the north round to the north-east.

20,323. Have you finished your statement ?—I think so. These are the principal points.

20,324. Will you tell me in round numbers what would be the total cost of the northern breakwater ?—574,000*l.*

20,325. Do I understand that the sheltered area will be in a line from the pier head perpendicularly to the coast ?—It will be nearly perpendicular to the coast.

20,326. What would the southern portion of the breakwater cost ?—About 1,000,000*l.* of money.

20,327. So that the total cost would be about 1,500,000*l.*?—Yes.

20,328. The area of the southern portion is that bounded by the lines running out perpendicularly from the coast ?—Yes.

20,329. I see that there are two patches of two-and-half and three fathoms, which lay about a couple of cables' lengths from the pier head. Could you get rid of these ?—These I have designed to cover with military works to defend the entrance, and include that in my estimate.

20,330. If it were considered better, instead of putting an obstruction in the way of the entrance of vessels by making military works there, if it were considered better to remove the patches, so as to enlarge the fair way, would that be possible ?—It would ; but it would be very expensive, and I think it would be enough to beacon them, because the space between those patches is so small. There would be more than two cables' length between them and the entrance.

20,331. Here is another patch of three-and-half fathoms which lies about half way, a little within the pier head. Would it be possible to get rid of that ?—In the same manner. From the four fathom line of that patch to the breakwater is 1,700 feet, so it would not be in the way.

20,332. If my compasses and the scale are right, you make that patch only two cables' length from the pier head ?—I have a scale of three nautical miles here, the nautical mile being divided into 10 cables. [*Plan handed in.*]

20,333. I see in this sketch, which you have handed in to me, that the three-and-half fathom patch is three cables' length from the northern pier head, and a little more from the southern one. Still, I must repeat the question whether they could be removed, because when you are spending 1,500,000*l.* for a harbour it would not be tolerated that you should have a three-

and-half fathom patch directly in the centre of the posts. Could it be removed ?—It could.

20,334. You say that from the southern extremity of the southern breakwater to the shore low-water mark is about a mile and two cables. That would be open, you see, to all winds from the south-east ?—Yes, round along the shore.

20,335. Would it not be a considerable objection to having that south entrance ?—There is a line drawn on that chart from Elwick Hill, in the county of Durham, which shows that Huntley Foot is outside the breakwater, so that the wind to which they would be exposed would only be along shore.

20,336. What is the distance of Huntley Foot ?—I think about 12 miles.

20,337. Would there not, with the wind blowing for 12 miles along the shore, be a considerable sea, with gales from the south-east and south-south-east, to which the anchorage is exposed ?—The wind would fetch in, but the sea tumbles in more directly. It is always the case that when you are unaffected by the shore the waves run in lines with the wind ; but when the waves are affected by the contour lines of the shore the wind comes more directly in. I have not pretended to make that design a smooth harbour. It is a roadstead or breakwater, and the water might be made smoother by extending it a little more to the south-west.

20,338. You suppose it would be sufficiently smooth to insure the safety of the vessels which anchored there ?—That is my opinion.

20,339. (*Sir F. Smith.*) I understand you that your estimate is not quite completed in full details ?—I should like to look at it again.

20,340. Have you any section to give in ?—I will put in a section by-and-by.

20,341. It is impossible to examine your project with no section and no estimate ?—I can give particulars so as to satisfy you that they are complete.

20,342. Are you prepared to give in to us a statement of your construction ?—Yes.

20,343. And the manner of construction ?—Yes.

20,344. And the material ?—I can do that at once.

20,345. Do it briefly ?—All the material below the level of 15 feet below low water spring tides, would have a slope internal and external of one-and-half to one.

20,346. Do you think that slope is sufficient for the external portion ?—This is only from 15 feet below the level of low water to the base. Afterwards the slope is materially increased. Thus, from 15 feet below low-water mark to nine feet below the same level, the external slopes are four to one. From nine feet below to low water at spring tides four-and-half to one. From low water, to half tide, or eight feet above low water, six to one. From half tide to 18 inches below high water seven to one ; and from 18 inches below high water to two feet above high water spring tides, ordinary spring tides, 10 to one. There, I believe there will be the greatest exposure.

20,347. Is the whole structure to be in rubble work ?—Yes ; on account of the great cheapness of material, and the great facility of obtaining an abundant supply.

20,348. What would be the total width of the bases of the southern breakwater ?—In seven fathoms of water 399 feet.

20,349. The distance from the shore is about a mile and a half, is it not ?—Yes.

20,350. How do you propose to transport your material from the quarry to the line of the breakwater ?—It will have to be barged across to the line of the Marske breakwater, carried across in barges, being shipped from Redcar pier, and the barges will discharge it on the site of the breakwater.

20,351. How do you get it to the barges ?—By a railway from the quarries down to Redcar, and going on the Salt Scar Pier, and there tipping it into the barges, just as we are now doing in the Tyne. We are there shipping stone at the Narrows and carrying it in barges of about 140 or 200 tons burden, the sides of which open and discharge the cargo in about half a minute.

20,352. In the Tyne you carry it from the shore ?—Yes ; but it is transported across to the northern pier, taken down the river, and carried across the bar to sea.

20,353. How long do you expect it will take to complete the southern breakwater, without reference to the northern one at all ?—If I propose to ship material from the Salt Scar it must have reference to the Salt Scar.

20,354. I am assuming that you had the northern one first. Having completed the northern one, how long would it take to make the southern one ?—I should say to complete it about 15 or 20 years, to put in the vast amount of material I have put on the section. There are 20,000 cubic feet for one foot forward. That is a much larger proportion than has ever been used in any case that I am aware of. One-half of that amount would produce shelter to a useful extent.

20,355. We are dealing with your project as a complete project. I want to know, without any lengthened statement, how long it would take, supposing the northern pier completed, before the southern breakwater would be finished. Supposing the northern part of the scheme to be completed, how long would it take from the completion of the northern, so that you can work upon that as a stage, before you could complete the southern ?—20 years, if I am not to commence till the northern one is completed.

20,356. I don't object to your commencing, but I understood you to say that you would use the northern pier as a gangway for the other ?—Yes ; but you could get sufficiently far advanced with that work to commence with the other within a year.

20,357. You would construct the southe n part entirely by barges ?—All by barges, so that both might be going on together.

20,358. They might ; so that in twenty years from the time you commence the whole could be finished ?—Yes.

20,359. May I ask why you require this very large enclosure ?—Originally my plan was upon a very much smaller scale ; but I have brought out this large plan, hearing that the Government were determined to have a very extensive work. I thought the Government would not be satisfied without having some extensive harbour.

20,360. How many vessels do you contemplate finding refuge for ?—That is more a question for a seaman to answer.

20,361. But you are the projector of a work for the purpose of sheltering vessels, and the extent of accommodation is one of the elements for consideration ?—I believe it will shelter 300 vessels ; the two together will shelter 300 vessels, so as to give them plenty of room.

20,362. Each would contain 150 vessels ?—About that number.

20,363. You say the southern breakwater is in $9\frac{1}{2}$ fathoms water ; it varies from 7 to $9\frac{1}{2}$?—Yes.

20,364. How many tons of material will there be in this southern structure ?—Nearly 11,000,000 tons, allowing nothing for voids.

20,365. 11,000,000 of tons of stone put into the work. How many millions do you expect to put in per annum ?—About 1,500 tons a day.

20,366. The statement you intend to give in will include all that information ?—I think I had a memorandum showing 20 years altogether. I think I said 1,500 tons a day.

20,367. You can get the material of large size ?—Of any size.

20,368. How do you propose to set the upper course of the work ?—It is to be all rubble.

20,369. It is not so shown in this drawing which you have placed before us ?—That is not a finished drawing.

20,370. It will be desirable to have your project a

REDCAR.

Mr. W. A. Brooks.

21 Oct. 1858.

little more complete before we can form any judgment upon it. At present it is in a very crude state.

20,371. (*Mr. Coode.*) Were you the original projector of a breakwater for Redcar in the year 1832?—The first plan projected was mine.

20,372. Is your estimate for the work now in any degree different from the work projected at that time?—It is a very different work.

20,373. I mean as regards the cost per ton of the material?—I almost forget, but there is not much difference.

20,374. At what rate per ton have you calculated on obtaining the rough material to put into the breakwater?—At 2*s.* per ton.

20,375. Where do you propose to obtain it?—From the Up Leatham quarries.

20,376. How far from the work?—About three miles, at an elevation of 600 feet to the top of the hill, 530 or 540 feet from the bottom of the quarry.

20,377. Is it a durable material that you propose to use?—It is sandstone.

20,378. Hard?—Moderately hard.

20,379. Have you ever seen sandstone of the same kind exposed to the action of the sea?—It has not been much used in this neighbourhood. They have a sandstone not much better at Whitby. It is about the same as the Whitby stone, I believe. I give very long slopes.

20,380. You don't use masonry or pitching in any part?—Giving these long slopes, and putting large blocks will not require it. With 7 and 10 to 1 where it is exposed, I think the stones will be perfectly at rest.

20,381. You imagine you can put in 1,500 tons a day by means of boats?—Yes, for a certain number of days in the year easily.

20,382. Have you in your estimate made an allowance for interruptions?—I have.

20,383. The estimate for the whole is 1,674,137*l.* The total number of feet in length is 14,400 on the Salt Scar, and for the south breakwater 9,000 feet; total 23,400 feet?—Yes.

20,384. Somewhere about four miles?—About that.

20,385. Do you imagine this work can be executed for 1,674,137*l.*?—I believe so. You will recollect that a great portion of it, that on the half-tide rock, the Salt Scar, is exceedingly light work. The Salt Scar extends 6,000 feet from the shore to the low-water line, and then there is a great length with from three to nine feet at low water. It is only that which enables so gigantic a work to be executed so cheaply. If you take Mr. Calver's survey and work from his soundings, you will find that the quantities that I have given would be very much in excess with the usual slopes given by engineers, very much larger than your own; about one third more, you will find.

20,386. You have allowed slopes of $4\frac{1}{2}$ to to 1 from nine feet under low water up to low water?—Yes. At Kingstown Harbour the general slope is 5 to 1 only up to high water.

20,387. Yours is $4\frac{1}{2}$ to 1 from low to nine feet below?—Yes. And then, if you recollect, in gales of wind when this will be exposed to severe action there will be from two or three feet more water at low water, so you may call that 12 feet at low water.

20,388. Assuming that the slope becomes 5 to 1 instead of 4 to 1, will not that affect the section all the way to the bottom?—I have got so large a body of material. There is the allowance for voids. If you take off a quarter or one-fifth from that quantity, you will still have a breakwater of the size shown in the section.

20,389. You calculate this in the solid?—Yes, without any allowance for voids, so you might fairly take off a large amount from the estimate.

20,390. Will you be good enough to send a section upon a scale according to the memorandum you will receive from our secretary, and in the manner there set forth?—Yes.

20,391. Then we shall be able more readily to compare the different plans?—The plan put in is two inches to the nautical mile.

20,392. (*Chairman.*) Suppose it blowing very heavily from the south-east dead on shore, would there be any lift of the sea under this enormous breakwater?—I think not more than two or three feet—say three feet.

20,393. If you look to your plan you will see at the end of the East Scar there is a kind of projecting point, with three and a half fathoms on it?—That is quite inside.

20,394. I understand that is not included in the area?—No, none of it.

20,395. I am aware that is not included in your sheltered area; but at the same time I think if you look at it, it renders the sheltered area of the most inconvenient description; because, will you tell me, with a gale blowing dead on shore, where would a vessel fetch after she rounded the pier? We understand that light colliers make four points lee-way?—If a vessel made the pier head, she would find herself in smooth water, round to, and bring up.

20,396. If she brought up in safety close to the pier head, the place would soon be choked?—A vessel can clear the pier head, and choose her position.

20,397. From the pier head to the extremity of this patch she would have to be within seven points of the wind. Now we have been told that light colliers make four points lee-way—that is 10 points of the wind; and so a vessel would go right on this patch?—If she rounded to for the pier head, she would find herself in smooth water, and be under the lee of the pier.

20,398. Do you consider, rounding to under the lee of the pier as well as she could, that she would weather the patch with an east-north-east wind?—I think not; she had better run for shelter under the lee of the breakwater.

20,399. To my mind this patch is an insuperable objection to the northern part of your plan. It is a kind of projection which cuts the sheltered area into two. It is for you to consider, but it appears to me you would give a far better harbour by running the pier out along the East Scar, and throwing the whole thing bodily southward, because your weather area is very good. You have a capital depth of water, six and a half or seven fathoms; you have capital water there, but on the northern side I think you will have a very bad harbour indeed?—One design was to carry out a pier upon that East Scar.

20,400. Perhaps you will be good enough to consider that at your leisure, and forward that to our secretary. Also forward to him a statement of the expense of removing these two patches of two and a half and three fathoms on which you intended to put forts, so as to have nothing less than four fathoms at the entrance?—I will.

20,401. (*Sir F. Smith.*) You stated, in reply to a question put by Mr. Coode, that you could dispense with a great proportion of the materials shown in your projects?—Yes, the quantity is unusually large.

20,402. But surely, in forming the project you have not taken the maximum but the minimum?—No, I have taken the maximum, and kept on the safe side.

20,403. I think it would be better if you would give us the minimum which you, as a professional man, can stake your reputation upon as being sufficient. You don't want more than is ample to give security for shipping, so as to swell the estimate up to an amount which renders the project inadmissible?—I see what you mean.

20,404. When you have determined what is the least amount which you as a professional man of great experience think sufficient, that is your project?—The estimate would be considerably reduced by making the pier on the East Scar, but it would not give so much ground.

Mr. Robert Reed examined.

20,405. (*Chairman.*) Where is your residence?—In Middlesborough.

20,406. You follow the sea?—Yes.

20,407. For what number of years have you been at sea?—For 30 years.

20,408. How many years have you been in command of vessels?—Twelve years.

20,409. In what trade have the vessels you commanded been chiefly employed?—Chiefly in the coasting, Baltic, and American trade, and occasionally the American.

20,410. In knocking about the coast, have you often, or on any occasion, been in want of a harbour of refuge?—Yes; on several occasions.

20,411. Will you state to the Commissioners what was the last occasion and the circumstances attending it?—The last occasion was on the 28th October 1852. I was from Carthagena half laden with lead; came round Flamborough Head, with the wind about east and by south, east-south-east. As I cleared towards the head, I began to ask myself a few questions, whether it would not be prudent to put the ship's head to the southward, and get the Humber under my lee. I fully expected that as I went north, the wind would draw more ahead, as I have invariably found to be the case. As soon as we get to Whitby Rock, the wind seems to head us. I consulted with a brother of mine, who was mate, and who was an older man than me, and had always been mate in the coasting trade, scarcely ever leaving it, and he thought the wind was not so heavy at that time, and being east and by south, and having the ship well ballasted, there was no danger. I pressed on as much canvas as I could do, having a very fair offing at that time, perhaps four or five miles, when I came round the head. By the time I got down to Whitby Rock the wind got to east and by north, and from that to east-north-east as I came down. I carried as much canvas as I possibly could. We had at first brought the vessel under close reefed topsails, mainstaysail, foresail, and double reefed trysails. I found that being well ballasted and well down in the water, for a collier vessel, we managed to keep a pretty good offing, so much so, that had there been a harbour of refuge either at Hartlepool or here, I could have suited my own convenience as to running for them. I found on calculating the tides that if I kept on my course for the Tyne, to which I was bound, there was a great doubt in the way, whether I should weather Souter Point or not. Another consideration was, that it would be dark. I thought I had the Tees under my lee, and at that time, being acquainted with the Tees, having been in it several times previous to this on similar occasions, I deemed it prudent to run for the Tees in preference to Hartlepool; I did so, and came into the Tees. At the same time there were several vessels followed me towards the Tees, and when they got near and saw so much broken water, I think they turned frightened; they hauled up to the north, and went to West Hartlepool. In that gale 18 vessels went on shore, at the two Hartlepools. Some were stranded, and some were wholly lost. Others received a good deal of damage, and I believe there were several lives lost at the same time.

20,412. Was there any other occasion on which you found the necessity for a harbour of refuge?—Yes, one in particular. I was coming down two years before, in 1850; I had run down along the coast at what I might consider a good offing, and having the wind a long way southward, varying from south and by west to south and by east. I run down as far as Huntley Foot; I was bound to the Tees; but when I came to calculate the tides, there was a doubt whether I could save my tide in. Therefore I shortened sail, double reefed topsails, with the intention of keeping the ship to windward, to wait for the flowing tide; but before I got my topsails reefed, the wind flew in from east-north-east, and I haled round the Redcar Rocks, and had very little to spare indeed; so much so, that I made all preparations for letting go my anchor. Had there been a harbour of refuge at Hartlepool, I could not possibly have fetched it. I went into Tees Bay, When I was clear of the rocks coming in, I saw Seaton Lights distinctly. I reached into Tees Bay, and made all preparation for letting go the anchor, took in spare canvas, and kept the main staysail, the topmast staysail, and the trysail; after that set close-reefed topsails, and having a very active little crew, I brought the ship's head to the wind, and let go the best bower anchor, and giving her 75 fathoms of chain, she rode, contrary to my expectations. I had some thoughts of cutting her masts down.

20,413. You had only one anchor down?—Yes. I found at daylight I was not five times my own length from the Fairway Buoy in the Tees. As soon as ever it was light, which happened about six o'clock in the morning, I slipped and run into the Tees.

20,414. Without giving the details of any more of these risks which you have run for want of a harbour of refuge, could you mention a dozen more instances of a similar kind?—Not so many as that.

20,415. How many would you say?—I think only three during my experience. They all happened to be within eight or ten years. All these happened since I have been master.

20,416. Of course in the coasting trade you are well up to the tides?—Yes.

20,417. You understand them well, and calculate them very closely?—Yes.

20,418. Then it is upon a close calculation of the tides that the safety of vessels frequently depends?—Certainly.

20,419. And you also make your passages by the tides very much, don't you?—It is one principal consideration to take advantage of the tides.

20,420. Therefore they are thoroughly well understood in the coasting trades?—Yes.

20,421. (*Mr. Lindsay.*) In the last case you have mentioned you could not have taken a harbour at Hartlepool?—I could not.

20,422. But in the first case you could have made either Hartlepool or Redcar?—I could.

20,423. Now if it rested between these two places, should you give a decided preference to Redcar?—I should.

20,424. Why should you so much prefer Redcar?—Because I observed on the second occasion when I was caught there that for three miles off Heugh it was nothing but a mass of broken water. I observed that time, when running into the Tees, that the vessels bound to Hartlepool, as soon as ever they hauled it, going round the Stone Buoy, were almost capsized. They became helpless, and drove right to leeward of their port. On both these occasions it was comparatively safe towards Redcar Rocks.

20,425. Then it is the case that going through that broken water you have not the same command over a vessel that you would have at sea?—No.

20,426. However heavy the sea would be outside?—Certainly not.

20,427. On account of the troubled sea?—Completely so. Sometimes the sea is as smooth as it can be, and the next moment nothing but breakers; heavy water breaking right over you. In running to the Tees a sea broke over my quarter, and very nearly broke the ribs of the man at the wheel. I believe it went right over the maintopsail yardarms.

20,428. Your objection to Hartlepool is on account of the large amount of broken water outside?—That is the principal objection.

20,429. (*Capt. Sulivan.*) On the occasion of your coming from Carthagena you say you had a doubt about weathering the Head, and thought at first of keeping the Humber under your lee?—I had no doubt. I did not say I had a doubt about weathering the Head.

20,430. But to head to the north is the question?

REDCAR.

Mr. R. Reed.

21 Oct. 1858.

Capt. Sulivan.

—No ; no doubt about that, so long as the wind kept east by south; but I know by experience, having been caught several times, that the wind always heads you as you draw northwards.

20,431. In that case, when you were off the Head, if there had been a harbour of refuge at Filey, could you have gone into it ?—Yes.

20,432. (*Mr. Coode.*) You spoke of the broken water at the Stone Buoy at Hartlepool ; how far out do you think that broken water extends ?—I should say it was breaking three miles out of Hartlepool Heugh.

20,433. Was it breaking more heavily three miles off Hartlepool Heugh than it was three miles off Redcar ?—Yes.

20,434. You are quite clear about that ?—Quite certain about it.

20,435. How far outside of Hartlepool Heugh would a vessel first meet with this dangerous heavy sea ; you don't mean to say she would meet with the broken water to a dangerous extent at that distance of three miles ?—A small vessel would.

20,436. How far would she be from the rocks off Redcar before she would meet with broken water of the same character ?—Not half a mile, I should think.

20,437. Are you speaking of a single occasion, or is this a matter which often occurs ?—I have seen it on two occasions. On one occasion I went into the Tees in the dark, and could not see the state of the water.

(*Chairman.*) Is there any other person whatever present who wishes to tender any evidence on this occasion ?

No answer.

(*Mr. C. C. Oxley.*) On behalf of Mr. Colson, I put in a copy of the answers given by masters of vessels in favour of having a harbour of refuge at Redcar, which have been given to him when taking their depositions as Receiver of Wrecks.

Sittings at Redcar closed.

WHITBY.

Friday, 22d October 1858.

PRESENT :

Admiral Hope (Chairman).

Sir Frederic Smith.
Mr. Lindsay.
Captain Washington.

Captain Sulivan.
Captain Vetch.
Mr. Coode.

Mr. Evans, Secretary.

WHITBY.

22 Oct. 1858.

(*Mr. Flintoft.*) I beg to tender a memorial signed by 320 masters and 28 mates of vessels employed in the Baltic, coal, and coasting trade, recommending the construction of a harbour of refuge at Whitby. (*This memorial was accordingly handed in.*)

Mr. Thomas Elliot Harrison examined.

Mr. T. E. Harrison.

20,438. (*Chairman.*) You are a civil engineer ?—I am.

20,439. In what way are you connected with the port of Whitby ?—I am professionally employed by the magistrates and inhabitants of Whitby to advise them upon this subject.

20,440. What plan is it now your intention to bring before us ?—I have prepared plans which I will now hand up, and on which I wish to offer you some explanation. (*The plans in question were here handed in.*)

20,441. I understand that there are two plans, one of a larger and the other of a smaller description ; is that the case ?—The plan is all one, but the part which the promoters of this scheme propose to lay before you, for your mature consideration, is a portion only of this entire plan.

20,442. Will you now proceed with any statement you may wish to make ?—In laying this plan before you, I wish to state that I have been instructed to prepare what would be a complete plan of a harbour of refuge. That is shown upon this plan, and is embraced by the three breakwaters. That scheme is one which on the assumption that a grand national harbour of refuge is a thing required, would embrace the whole of the requisites for it, inasmuch as it might be entered at all times of tide, and in all winds, with abundant depth of water, and having a good anchorage ground. The average contained within that plan within the two-fathom line is about 1,000 acres ; within the four-fathom line, 725 acres ; and within five to eight fathoms, it comprises an area of 600 acres. The cost of completing that work if finished in its entirety would be 1,750,000*l*. Of course, as to the question of a large harbour of refuge, you must consider that this plan is only laid before you as showing what are the capabilities of the bay for such a purpose. I may state that I am not here to advocate the construction of that harbour, inasmuch as if such harbour were requisite, there would no doubt be other considerations, besides those of a purely engineering character, on which I offer no opinion. My opinion of the plan is simply on the assumption that such a harbour is requisite. If that be the case, here is a plan by which the thing could be done. I will now proceed to that portion of the plan which the magistrates and inhabitants of this place do advocate ; that is, the construction of a breakwater running out from the Whitby Rock, as shown in the right-hand corner of the plan ; for that purpose the Whitby Rock, which is shown there, affords natural facilities to a great extent ; the rock is covered at all times of tide, but at low water of spring tides has on it a depth of water varying from two to five feet generally, and at the end up to 10 and 12 feet ; at that point it suddenly dips into deep water. The length of that breakwater would be about 3,800 feet, and the cost as I have estimated it would be 300,000*l*. I would point out, that if this work were constructed, it would still form part of the entire scheme, if that were ever carried out, and at the same time it forms an integral work in itself. It would afford a shelter in winds from the south-east of about 350 acres ; in winds from the east of 200 acres, and in winds from the north-east to the extent of 70 acres. With regard to the question of the shelter that it would afford, you will have evidence given before you by parties here who are well acquainted with the facts of the case, and who will lay before you the fact that the shelter is principally required when the gales come in from the south-east to east. These are the cases in which loaded vessels on

their passage southwards are caught here unable to weather Flamborough Head, and are driven back; upon that point, evidence will be given in full detail to you. In such cases there is at present no shelter whatever between Flamborough Head and Hartlepool, For these particular winds there is no shelter at all. Whitby is at present used to a considerable extent as a harbour of refuge; the number of vessels entering it for refuge purposes amounts to between 600 and 700 in the year. Upon that also you will have the facts given to you. Whitby harbour is one of exceedingly difficult access, upon that I think there can be no doubt; I therefore call your attention to the effect which this breakwater would have in facilitating the entrance into the existing Whitby Harbour; I think it would have the effect practically of deepening the bar, or rather the water upon the bar, to the extent of at least two feet, and what is now a harbour of difficult and dangerous entrance, would, under the shelter of the proposed breakwater, become one which vessels would then enter easily. I think that is a point which deserves a great deal of consideration. I think also that, in cases in which vessels might miss the harbour and be driven upon the bar, they would then be driven there with perfect safety as to life, and with a great amount of security as to property, that is in cases in which they could not enter the harbour; there is another advantage which they have here, which is the fact that there are steam-boats in this place which would always be able to assist any crippled vessels in the bay into the harbour itself. I should wish the Commissioners to take this view of it, that the plan would be in itself,—that this particular breakwater would be in itself—an integral scheme to the extent to which I have referred, and that it would also form a part of the more extended scheme, supposing that at any future period it was carried out. Supposing the whole scheme were to be carried out, or supposing that it were desired to carry out half of the long breakwater, that in itself, so far as it went, would still form a complete scheme, or rather, so far as it went, it would form a shelter of itself. And, therefore, this plan as proposed has, I think, this advantage, that every step which might be taken in its execution would be a step available for the time being in itself, and a step in the direction of the ultimate completion of the entire scheme, which if carried out would, I believe, be superior to any national harbour of refuge that could be formed on the east coast. I think that these are mainly the grounds upon which the Committee of magistrates and merchants of this place rest their claims. Having laid these claims before you, I shall be glad to answer, so far as I can, any questions upon the subject, merely stating that, as to nautical facts, you will have witnesses called who will give evidence much better than I can.

20,443. (*Sir F. Smith.*) I think it will clear the ground for us a little if you will answer some questions, that we may have recorded on our minutes exactly what is marked upon the plan. If I understand you correctly you have a larger project, which consists of a breakwater of 3,800 feet, commencing at the Whitby Rock and proceeding in a northerly direction?—Yes.

20,444. You have a space of 1,200 feet, you then have a long breakwater of 8,000 feet extending in a north-westerly direction; you have a second opening of 1,200 feet, and then a final portion of 2,750 feet to complete the enclosure at Sand's End Ness?—Yes.

20,445. What is the whole area enclosed? The whole area within the line of two fathoms and a half amounts to, as nearly as possible, 1,000 acres, and within the line of four fathoms to 725 acres?—Yes.

20,446. Then you may have in from five to eight fathoms an area of 600 acres; have you subdivided it?—No, I have not.

20,447. And you estimate the entire cost of the work at 1,750,000*l.*?—That is so.

20,448. Will you be so good as to explain to the Commissioners the style of the construction of the breakwater; what is the principle upon which it is to be constructed?—The facilities for getting stone at Whitby are exceedingly great. Immediately at Sand's End Ness there is a great abundance of stone fit for the purpose of constructing such a breakwater. This lies above the alum shale; it is about 20 or 30 feet in depth, and extends to a great distance. That would be within 400 yards of the commencement of the breakwater, and would be run down to it by an inclined plane.

20,449. You speak of the western portion of the breakwater?—Yes.

20,450. Where will you get the material for the eastern part?—With regard to that there is the stone from which Whitby Abbey is built, and which is found immediately above the breakwater. The extent to which that stone can be got I consider to be uncertain, inasmuch as the whole face of it is not visible; and in consequence of that I made a calculation for a southern breakwater on the assumption that the stone was to be brought to the spot by railway.

20,451. From what distance?—From a distance of about 10 miles by railway. There is good stone there to any extent.

20,452. What is the character of the rock of which you propose to construct your breakwater?—It is generally freestone, all of that stone which is at Sand's End Ness. There is a bed lying below that stone upon the top of the alum shale which is as hard as flint.

20,453. Is the freestone of a durable character?—Yes.

20,454. Has it been exposed in this neighbourhood to the action of the sea?—The piers here are built of that stone, and they will give you evidence of its quality.

20,455. How long have they been exposed to the action of the sea?—I believe more than 50 years—I am told 200 years.

20,456. Are they much acted upon?—No.

20,457. Therefore you have no doubt as to the durability of works constructed with that stone?—None at all.

20,458. What is the section of this work?—I have estimated it on two plans.

20,459. Have you a section to show us?—I have not; but I will explain it at once. In taking the estimate of the plan I have adopted the plan which was published in the Report of the Select Committee of the House of Commons as prepared by Mr. Coode, in which there are two modes stated; one by a perpendicular wall, and the other by a breakwater. At the rate at which the stone could be obtained here I don't think there would be any very great difference in the cost of the two plans when you come to the deep water. I have taken the plan which would be the most expensive; that is the one with perpendicular walls.

20,460. For the sake of the regularity of our proceedings it is desirable that you should give in detail the statement of how you propose to construct it without reference to other plans?—I can hand in a plan.

20,461. Will you describe the process, beginning with the 3,800 feet pier or breakwater?—The only mode, as regards that part which would have to be formed by deposit, would be to take out the stone in barges, and there deposit it in the water.

20,462. I thought you proposed to bring it by railway?—By railway down to the harbour, and from the harbour to take it then by barges and deposit it, so far as the bottom part of the breakwater goes.

20,463. You don't propose to use staging for the purpose?—I think that I could not conveniently get staging to the land for it unless the stones were got from the cliff above, which I consider to be doubtful. In that case I should put a staging across.

20,464. What is the greatest depth of water upon the souther pier or breakwater?—The extreme depth would be about eight fathoms.

20,465. Describe what the cross section would be in eight fathoms?—I have assumed that up to a level of 12 feet at low water spring tides the external

WHITBY.

Mr. T. E. Harrison.

22 Oct. 1858.

Sir F. Smith.

slope would be 1¼ to 1, and the internal slope I have taken at the same.

20,466. In what sized blocks do you propose to obtain the materials ?—I think the stone of the district would afford blocks up to 10 tons weight, which would make a perfect breakwater.

20,467. From that level what is the next process ?—From that level I should proceed to build upon it when consolidated,—to build the walls with ashlar face-work and mason work, and filling in the interior with rubble work.

20,468. Will the walls be vertical ?—Vertical walls.

20,469. And what height from 12 feet below low-water mark ?—The rise of the spring tide is about 17 feet, and I propose to carry them about eight feet above the level of the spring tide, high water.

20,470. Have you a parapet, or merely a mass ?—As a detached breakwater I don't consider a parapet would be a necessary work.

20,471. What would be the width on the top ?—Thirty feet wide.

20,472. Is the wall to be faced stone work, or do you fill the interior with concrete blocks ?—I propose to build the wall with mason work. Ashlar stone is delivered here at about 7*d.* a foot. At the same time, it is possible concrete blocks might be found cheaper.

20,473. Do you propose to use the same stone for the rubble as for the face work ?—Yes.

20,474. At what price can you get the rubble work done here ?—The rubble work would be at a different price for the southern breakwater and the northern.

20,475. Take the southern ?—That would be delivered on the spot for the work at 4*s.* per ton.

20,476. Delivered upon the breakwater ?—Yes, I am assuming that for that the railway company would be prepared, as I have no doubt they would for so large a quantity, to carry it down for 1*s.* a ton.

20,477. What would be the cost per cubic foot of the finished work ?—I have estimated the face work of that breakwater at 2*s.* a foot.

20,478. Is it proposed to construct the western-most breakwater in the same way ?—In that case the stone is in the cliff above it. That I should propose to construct by staging, because it is brought immediately down to it. If the whole scheme were carried out after completing the first portion of the breakwater, I should make a temporary gangway across the 1,200 feet opening, and so complete the rest of the breakwater.

20,479. Do you propose to make the centre 8,000 feet breakwater of the material taken from Sand's End Ness. Would it not be more economical to get that at the southern part also in barges ?—It is possible that it might be, but there is this difficulty, that there is no convenient place existing at which the barges could lie at all tides and get it. It is rather exposed. If the whole scheme were being carried out, then as soon as a portion of that breakwater was made it might be got more cheaply from the Sand's End Ness. But assuming this smaller part only to be made, I believe it would come more cheaply from the railway.

20,480. I think you said the shelter was merely from the south-east and east ?—It would afford partial shelter to the axtent of 70 acres from the north-east.

20,481. After having constructed the southern break-water, anything towards the west would be increasing the amount of shelter, and going towards the completion of the general plan ?—It would be so.

20,482. Are you inclined to think that the plan you now submit to us is more suitable for a general national haabour than any other plan at any other spot you have heard of along this coast ?—Looking at it in an engineering point of view I am decidedly of that opinion. As a matter of policy I do not offer an opinion upon it.

20,483. Your plan specifies that the whole enclosed space would be good anchorage grounds with the exception of the Upgang Rock ?—It is so. Upon that point you will have the evidence of the nautical witnesses.

20,484. You do not hold yourself responsible for that ?—No ; except to this extent, that I have made particular inquiries about it, and all the information I have obtained goes to that ; and moreover that it is constantly used as an anchorage ground, vessels even riding out gales there.

20,485. You have no doubt that the fact is as stated in the plan ?—From all the inquiries I have made about it, not the smallest doubt.

20,486. You say at present there is no shelter between Hartlepool and Flamborough Head ?—None that I am aware of.

20,487. You do not admit that the Tees afford any shelter ?—I look upon Hartlepool and the Tees (the Tees Bay) as being one.

20,488. Do you think this harbour is necessary for local or for national purposes ?—Purely national. I am not aware of any local purpose to which it would be at all subservient.

20,489. Except to make the entrance to Whitby Port more easy with the wind at north-east ?—Yes, which I also consider to be a national object, inasmuch as it would afford facilities for vessels taking refuge in that harbour.

20,490. Have you any bar between the piers ?—Not more than two feet six inches depth of water at low water spring tides.

20,491. What is the rise of the tide here ?—It rises 13 feet in neap tides, and 17 or 18 feet in spring tides.

20,492. Inside the bar what is the depth of water ?—A great deal of the harbour is practically dry at low water.

20,493. No dredging operations could make it a good harbour ?—Certainly not ; but I believe by dredging operations it might be greatly improved, and the bar might be considerably deepened.

20,494. You would not undertake to form a harbour for vessels of 16 feet draught of water at all times of tide without very costly operations ?—Certainly not.

20,495. Looking at this as you appear to do, merely as a national harbour to prevent loss of life and property, would you not believe that a well constructed and spacious harbour at Filey would answer all purposes along this coast ?—I do not think it would. Take the case of vessels which are off the coast in gales from the south-east. No vessels which are caught to the north of Filey could make Filey at all unless they had very extended offings. Therefore the utility of Filey would be merely confined to the distance between Filey and Flamborough Head ; and therefore, Whitby from its geographical position would be accessible to more vessels than Filey. Again, Whitby is as nearly as possible centrally situated between Flamborough Head and the Tees Bay.

20,496. Do you imagine that if there were a good harbour of refuge at Filey, and one at Hartlepool, Whitby would be serviceable to any vessels ?—Yes.

20,497. You think it would still be required if there were a good harbour at Hartlepool and another good one at Filey Bay ?—I think, as regards geographical position, Whitby is better situated for a harbour than Filey.

20,498. So that, if you had the disposal of the public funds, you would rather recommend their being applied to a harbour at Whitby than to one at Filey or Hartlepool ?—Yes ; I would make the observation with regard to that, that what I am proposing here now is upon the principle of improving the existing harbours, which is clearly the view that I take. With regard to Filey it must be an entire work. There is no part of the work at Filey that would be available unless the whole were completed ; that involves the question of a large outlay.

20,499. Is it not a fact that some hundreds of vessels are often found under the Flamborough Head,

the great proportion of which might take advantage of Filey ?—Of course.

20,500. If they are obliged to go into a harbour, would it not often take them much out of the course to come to Whitby ?—Those vessels which are at Flamborough Head it would.

20,501. Have you of late years had many wrecks off Whitby ?—Upon that you will have the information of witnesses who will give the exact facts. The fact is, that there have been ; but you will get the exact particulars from other witnesses.

20,502. Because in advocating this particular locality for a harbour of refuge, I suppose you base it upon some knowledge of these facts ?—Yes ; but I do not think it always is to be taken as a fact that the occurrence of a wreck is an indication that the harbour ought to be upon the spot where it takes place, because you will have evidence here as to vessels which have been off Whitby itself, and have been known to be wrecked before they were able to reach any of the northern ports, and which unquestionably would have been saved had there been a harbour here. That is a point on which you will have evidence as to the fact.

20,503. That would be an argument of general application, would it not ?—Yes.

20,504. So that, although it may be some guide to know where wrecks have happened, it is not a guide to be always fully relied upon ?—Clearly not.

20,505. What time would it take to form the southern portion of your plan ?—I think the southern portion might be formed in about three or four years. It would depend entirely upon the provision of the funds.

20,506. Supposing the funds were given with a liberal hand ?—I think I could undertake to do it in four years.

20,507. How long do you estimate it would take to complete the whole scheme ?—I should not like to say that the whole scheme could be done in less than, perhaps, seven or eight years ; although there are great facilities in procuring the stone here, which might be done to almost any extent.

20,508. What proportion does the southern breakwater bear to the whole scheme in mass ?—In mass it would not be more than one fifth part, hardly so much.

20,509. If you took three years for that, would it not probably take rather more than the time you say for the whole ?—I think the facilities for getting stone for the whole mass of the work are so much greater than they would be for that.

20,510. In point of fact, if you had the whole funds you might begin at both ends ?—At both ends.

20,511. (*Mr. Lindsay.*) By the plan which you have handed up, I find that, between the Whitby Rock and the Upgang Rock, there is a considerable space of apparently good anchorage ground. Have you ever considered a much more limited plan of a harbour of refuge for Whitby, without having any view to its extension ; that is to say, by running out piers, one from Whitby Rock, turning more in shore than the present harbour, and another out from the Upgang Rock ?—I have.

20,512. What do you think of a harbour, such as that, which would give close upon 300 acres of three fathoms and upwards ?—I think if called upon, I should rather spend the money that it would cost to make a breakwater running out from the Upgang Rock in extending the central breakwater. I think myself, the times in which the harbour would be useful would be in gales coming from the south-east and east. If the wind got round to north-east vessels would go to sea. It is hardly with such a wind you so much want protection. At the same time it is quite possible that a harbour of 400 acres might be made here by carrying out a breakwater from the Upgang Rock.

20,513. I ask your opinion, because you said you thought the improvement of the existing harbour would do more to save life and property than the construction of any one great harbour on almost any part of the east-coast ?—At any part of the east coast.

20,514. Well, with that object in view, I should have liked if you had, while handing in the large plan, at the same time given us an estimate for a smaller harbour, such as that which I have pointed out, because I am afraid Government will not be disposed to make many such harbours as you suggest upon this coast ?—I am not recommending that the Government should carry out the entire scheme.

20,515. Have you a separate estimate of the cost of the different breakwaters ? Have you an estimate of the cost of this pier, which runs from the Whitby Rock, 3,200 feet in length ?—Yes.

20,516. What would the cost of it be ?—300,000*l.*

20,517. Then a pier, such as I have suggested, run out from the Upgang Rock, would that be about the same cost ?—I think about the same cost.

20,518. You said the pier from Whitby Rock would cost about 308,000*l.* ?—306,000*l.*

20,519. Then for somewhere about 606,000*l.* you could get a harbour full 300 acres of three fathoms and upwards ?—Yes ; but I do not know that I should recommend that plan. I should not recommend that plan. The facts are, I dare say, as you have sketched them, and in all probability the cost would be as you state.

20,520. The principle which you laid down was, that you thought the improvement of the existing harbours along this coast, would do more to save life and property than the construction of any one great harbour on any particular site ?—That is my opinion.

20,521. You do not mean to tell us that your great plan would be an improvement of an existing harbour ?—Clearly not.

20,522. Do you go upon the principle that the great plan is an improvement of an existing harbur ?—Clearly not.

20,523. You make that as a national harbour ?—As a national harbour. I think I cannot have explained myself sufficiently, but my advocacy before you is, for the purposes of saving life and property, distinctly confined to the construction of the breakwater upon the Whitby Rock.

20,524. From Whitby Rock ?—Yes.

20,525. What objection would you have to running out another breakwater from the Upgang Rock, and there making a small harbour at a cost of 606,000*l.* ?—There is no doubt you might do it, but I do not think you would be justified in laying out money in that particular way.

20,526. Why not ?—I think if you had money to be laid out, it would be better expended in extending the breakwater more in the direction of the existing one.

20,527. But would a breakwater extended more in the direction of the great breakwater of 8,000 feet, as completely shelter the southernmost anchorage ground as a pier running out from the Upgang Rock would do ?—No, it would not ; but you must look, I think, for the case for which you require protection for life and property. Now, that would be a protection almost entirely in the cases of gales of wind from the north ; and I think that the great bulk of vessels would with a northerly wind run for Flamborough Head.

20,528. Would a limited harbour, such as that which I have shadowed forth, not tend more to save life and property on a limited scale, and to the extent of the anchorage, than would the large plan ?—The large plan is one which I merely lay before you to show what, as a great national work, might be done. But if you come to the question of saving life and property, I do not advocate it for that purpose, but as a great national harbour. I do not think that running a pier out and enclosing the bay from the north wind would be an outlay of money solely for the purpose of saving life and property, which I think would be justified.

20,529. Tell me why the small harbour would not

WHITBY.

Mr. T. E. Harrison.

22 Oct. 1858.

Mr. Lindsay.

save life and property to the extent of the anchorage as much as yours?—It would in the case of gales from the north.

20,530. But by the limited scale you can enclose the harbour from all winds as much as by a larger one?—Yes.

20,531. You cannot protect it more by the larger work unless you complete that plan?—You can make a harbour in there which can be sheltered from all winds.

20,532. By completing the small plan, cannot you give more shelter in all winds than you can do by expending the same money on a part of the larger plan?—I hardly think that you could. I think you would then protect a large amount of anchorage direct from the wind from the north-east by making that breakwater. If it were a mere question of a limited expansion, of course I should limit the area of that 1,200 feet for the opening.

20,533. If you limited the 1,200 feet entrance in the large plan, you could also limit the entrance of the smaller plan?—I am proposing to limit it in the smaller plan.

20,534. If you limit it in the small plan, you would get still more shelter than in the larger one?—So far as relates to breakwater walls, no doubt.

20,535. I am anxious to learn from your experience what your opinion would be as to the construction of a small harbour at this place; what your objections, as an engineer, would be to the construction of a smaller harbour altogether at this place, setting aside for a moment the very large plan, which would cost in round numbers two millions sterling? I should like to know your objections to a smaller harbour, such as that which I have suggested?—If you ask me in an engineering point of view, I do not see any difficulty in your making the smaller harbour. If you are going to do it, Upgang Rock is placed there by nature to assist you in doing it. But I am exceedingly doubtful whether you would find that it would be a matter of necessity to do it, looking to the question of saving life and property.

20,536. With your knowledge of the case, would the smaller harbour run out from the Upgang Rock be in any way liable to silt up? Are there any difficulties connected with it which would not apply to the larger harbour?—No, I do not think there would. I should leave ample room for the tide to pass through it.

20,537. In an engineering point of view, you see no objection to the construction of a harbour at this place in the way I have described?—No doubt a harbour in that way might be constructed.

20,538. It is more in a nautical point of view that you think objections may be raised? No objections in an engineering point of view?—No; I think it is all a question of money.

20,539. Is the plan laid on the table, your own design?—It is. But although I have prepared these plans, the idea as I have transferred it to paper is one of long standing with those who employ me. Therefore, though I am the medium of bringing it before you, I do not claim it to be an original design of my own, I am merely the medium of conveying it to you.

20,540. You said, I think, that the present harbour might be greatly improved by dredging?—I do not think there is any efficient mode of improving it except by dredging.

20,541. Are the piers sufficiently deeply founded to admit of dredging between them?—They are not; but I should have no hesitation in undertaking to underset the piers at the point, so as to enable the deepening to be effected.

20,542. Do you know the greatest draught of water the harbour will admit?—The depth at the bar is only two feet six inches. If you take the greatest rise of the tide at 18 feet, you get it at 20 feet 6 inches.

20,543. Once within the piers, what space is there for ships? For what number of vessels are there places?—That I can hardly tell you.

20,544. Can you give a rough estimate of the expense of deepening the passage so as to get eight feet of water over the bar at low water and deepening the harbour six feet within?—I cannot.

20,545. Would it be necessary to remove the rock? I think that the stratum there is alum shale, which I think might be lifted by a good dredging machine.

20,546. Alum shale is easily lifted, is it not?—Yes, assuming that to be alum shale.

20,547. All the Whitby Rock is alum shale, I believe?—It is.

20,548. Does the river Esk bring down much deposit?—Not in the ordinary state, and even in a state of flood not so much as other rivers. It passes through a great deal of uncultivated land. I have looked to that point, and I believe that the tide which sets strongly past the mouth of the present piers would carry anything that might be deposited there out to the south.

20,549. That tide sets to the southward?—Yes.

20,550. Are the freshets very heavy?—At times they are exceedingly.

20,551. Do you know how far up the tide flows?—I think within two miles.

20,552. Is that a natural termination of the tide or an artificial one?—It is an artificial one.

20,553. Do you know how much farther it would go?—No; there is a mill-dam which stops the flow of the tide.

20,554. Do you consider it a good measure for the improvement of the harbour to stop the upward flow of the tide?—No, I should not.

20,555. Do you know the slope of the bed of the river?—I have had a section, but I do not recollect.

20,556. Is it very rapid?—It is rapid.

20,557. More rapid probably than the Tyne or the Wear?—Yes.

20,558. Is there any bar of sand or silt formed outside the pier heads?—Very little, it does not lie much upon the rock.

20,559. The rock is swept clean at the time of the freshets, of course?—Yes.

20,560. (*Capt. Sulivan.*) Do you know if the tide flows above the mill-dam?—It is stopped at the mill-dam.

20,561. It is used as a mill-dam by the back water being kept up?—It is.

20,562. Do you know what distance above that it flowed before the mill-dam was made?—I cannot tell you.

20,563. (*Capt. Vetch.*) The position of Whitby is rather salient, and the track of vessels between Flamborough Head and all the northern ports seems close to Whitby. Do you consider a salient point of the coast the best for a harbour of refuge?—I have given my opinion that in this particular case it is desirable to improve the existing harbours, but I do not think there is any point at which you can place a harbour that would be available in all times. I think that for some purposes a salient point, but for others I should say the bight of a bay, is the best.

20,564. I presume this harbour which you have designed is entirely intended to save the lives and property of the passing trade?—I wished to separate the large plan as an entire plan (taking that as a harbour for some national purpose) from the smaller design of the breakwater, which I look upon as one for the purpose of saving life and property.

20,565. By national purposes, what do you mean?—Some objects which might be dictated by policy, of which I am no judge.

20,566. To hold a fleet of men-of-war you mean?—That would be one of the objects.

20,567. The chief object of the Commissioners is to establish a harbour or harbours for the saving of life and property. In that view of the case, I presume you would consider the harbour contained between the south-east breakwater, proposed by you, and the Upgang Rock would be a very sufficient area?—Abundant for that purpose.

20,568. I find within that distance that it is about a mile in length deep water ?—Yes.

20,569. And about 4,500 feet in width which would contain about 600 acres altogether ?—I think hardly 600 acres south of the Upgang Rock. I do not think you would find that it would exceed 400 acres of really available space.

20,570. But that would be quite sufficient for saving life and property from vessels passing such a port as this ?—I think it would.

20,571. Have you estimated the amount which it would cost to construct such a harbour as this ?—No; I have not.

20,572. The first part of the breakwater near the shore is chiefly shallow water ?—Yes; that is from two and a half to about 10 feet.

20,573. That is included in the 2,600 feet ?—Yes.

20,574. That would not be costly; there is another piece which is in 33 feet soundings ?—Yes.

20,575. That would be more costly; what would be the total cost of the pier ?—300,000*l.*

20,576. Is it to be a breakwater with a parapet ?—I propose that it should have a platform but no parapet.

20,577. It would be simply a breakwater ?—Purely a breakwater.

20,578. The bottom is good anchorage all over it, except just at the Upgang Rock ?—It is.

20,579. Are you aware that many vessels seek shelter in the bay ?—Great numbers.

20,580. There is some amount of shelter for small vessels at present ?—Yes; vessels constantly run under the shelter of Whitby Rock, not in the bay.

20,581. You would not recommend the harbour as shown upon this plan (*referring to the large plan*) ?—No, I don't at all. I have put it more as a plan showing you what might be done.

20,582. (*Mr. Coode.*) In your statement you said there were 1,000 acres having two fathoms water, and in your reply to Mr. Lindsay you said 1,000 acres of two and a half fathoms ?—If I said two fathoms it ought to be two and a half.

20,583. I see in this design which you have put in, there are only two soundings along the 8,000 feet breakwater; for about two thirds of the length there are no soundings; can you supply additional soundings for the outer breakwater ?—I have received instructions upon that point from the committee, and was to have had these additional soundings taken; but unfortunately, in consequence of the weather, we have not been able to obtain them; I believe I may state that in no part along there does the depth of water exceed eight fathoms.

20,584. You have tried it generally along the line of the work ?—There were some soundings taken, but I have not them recorded in a manner to put them down upon the plan; I propose to sound, as my instructions are to obtain additional soundings not only there, but also immediately round the Upgang Rock, and likewise to take some more soundings closer in shore, and to add them to the chart within a fortnight's time.

20,585. So far as your present knowledge goes, you believe the depth does not exceed eight fathoms ?—Yes.

20,586. Were the soundings in the chart taken under you superintendence ?—Not the whole of them. There are a good many of them taken near the Whitby Rock, which were taken by Mr. Comry; I had several checked, and finding that his soundings and my own agreed, I have adopted them. A great many, however, half of those on the plans, have been taken by my own assistant.

20,587. Are your soundings referred to the same datum as Mr. Comry's ?—To the same datum.

20,588. You said there was a good bed of stone at Sands' End Ness; do you mean one bed or a series ?—It may be stated to be one bed.

20,589. What is the thickness of the stone, such as is fit for harbour work ?—You may get it up to 10 tons in weight without difficulty.

20,590. What is the thickness of the stone ?—Up to five and six feet; four feet, five feet, and six feet.

20,591. Is there only that one bed of stone ?—It is 26 feet in thickness, but the thickness of the beds of stone in the mass will not exceed about six feet.

20,592. I want to know the total thickness of the beds united ?—20 to 30 feet.

20,593. Overlaid by how much soft matter ?—Not more than five or six feet.

20,594. Do you think that the whole of that is fit for harbour purposes ?—Fit for the purposes of the substratum of a breakwater.

20,595. Have you ever seen any of this stone exposed to the action of the sea ?—I can't tell you that that exact bed is exposed to the action of the sea; I mentioned also that underlying that, is a bed of stone which I can't describe; in character it is as hard as flint.

20,596. Is that met with immediately under the 25 feet ?—No; there is a bed of shale intervening, which would have to be excavated for the purpose of getting at it.

20,597. Of what thickness ?—Not above four feet.

20,598. What kind of construction would the "hearting" be which is above the rubble base and below low water; I don't know whether your explanation referred to all throughout the whole thickness, or simply to the face wall ?—The mason wall I calculated to be solid ashler, the interior between the two face walls I intend to be rubble.

20,599. Would that rubble be tipped in ?—Yes.

20,600. What price per foot do you put for the ashlar below low water ?—I have taken an average of 2*s.* per foot for the whole of it. If you take the ordinary case in the shallower part, it will cost 1*s.* 6*d.* per foot, which would be equivalent to 3*s.* per foot, below low water, so I have averaged it all at 2*s.*

20,601. Would you adopt the same kind of construction throughout ?—I do not know that I should. I think in constructing the pier a great deal might depend upon the cost of the stone. I think it not unlikely that the stone from Sand's End Ness might be got a good deal cheaper than I calculated. If that were so it might materially vary the construction of the breakwater. All that I have considered was to get an estimate of the cost.

20,602. What kind of construction have you calculated your estimate upon ?—In my estimate I have calculated that the bottom of the pier was built up to within a level of 12 or 14 feet from low water, and then perpendicular piers were placed upon it; but I am not at all certain that, if on experience it was found that, instead of the cost of the stone being 3*s.* per ton, it could be set into the work for 2*s.*, I might not vary it.

20,603. You might adopt rough rubble throughout ?—I think that is quite likely.

20,604. What time have you allowed yourself for the construction of the breakwater 8,000 feet long ?—I think that might be done in seven or eight years. I do not know that there is any limit to the quantity of stone which might be worked there. The face of the quarry is exposed by the working of the alum works to a great extent, and large quantities of the stone might be worked.

20,605. Did I understand that you had decided to adopt a staging throughout, or that you had some doubt about constructing the large work by means of staging ?—With regard to the larger work, the stone comes so conveniently in that I have no doubt that would be the better plan. With regard to the southern breakwater, what I stated was, that in making the northern breakwater, you would have found shelter for the craft, and it was possible that could be formed by conveying stone from that point in boats.

20,606. Have you allowed a sufficient amount for boating it in the estimate that you have made ?—I think so. I think it is principally a question of plant. As to the cost per ton and per foot for this work, I am so far confirmed in my views of it by the contractor, who is now executing works in docks for me,

WHITBY.

Mr. T. E. Harrison.

22 Oct. 1858.

Mr. Coode.

and who has had extensive experience, and had Government works to carry out in the Channel Islands, I think at Jersey, he said, he would undertake without hesitation to execute the work at the price at which I have put it.

20,607. You think that, in an engineering point of view, this would be more adapted for a national harbour than any other; will you state why?—I think that it offers a larger area of deep water; it is unobjectionable as to its capability of entrance at all times of tide and in all winds, and on these grounds I think it is superior to any plan that I have seen.

20,608. What is the nature of the holding ground?—The inquiries which I have made state it to be clay. You will have the evidence of pilots upon it.

20,609. Can you give us the rate of the flood tide you spoke of as setting strongly past the harbour?—I cannot, I have been out in a boat, and I should take it to be about 2½ to 3 knots an hour.

20,610. Is that at ordinary tides or springs?—I should think perhaps that that would be at spring tide. On that point you will have the evidence of the harbour-master.

(*Chairman.*) Where did this letter come from?

(*Secretary.*) It came by post.

(*Chairman.*) I see it is dated from Whitby. Be good enough to read it, and the memorial which accompanies it.

The Secretary here read the letter referred to, which was addressed to the Royal Commissioners and signed "George J. Watson Forsyth, Filey Bay," and which enclosed the petition of fishermen, masters, and mariners of the town of Robin Hood Bay, praying for the establishment of a harbour of refuge. The Secretary also read the memorial.

Mr. Gideon Smales examined.

Mr. Gideon Smales.

20,611. (*Chairman.*) Do you reside at Whitby?—I do.

20,612. You are a shipowner and chairman of the committee which has taken charge of this business?—A committee was appointed at a public meeting of the town, and I was appointed the chairman of that committee. I have been a shipowner for nearly 40 years, residing in this town, and am at present the owner of 26 ships, the greater part of which are employed in the coal trade. I have frequently turned my attention to the necessity of a harbour of refuge on the coast, as being a shipowner and having witnessed many wrecks; and, after carefully considering the evidence which was laid before the House of Commons and published in the last report of the Select Committee, it seems to me, from my individual experience and opinion, that there is not on this coast a more suitable place for a general harbour of refuge than Whitby; first, on account of its geographical position, being a promontory, with bold and high land. It would consequently be seen at all times; and it is not subject to the fogs which constantly occur in the bays on the coast. It would as well be a place of easy access for loaded ships having to bear up. If the large plan were adopted, no doubt from the depth of water, this would be a place more suitable than any which could be found on the coast. But even if the smaller scheme be adopted, it would afford very good shelter for a considerable number of vessels. Vessels frequently ride under Whitby Rock, and on extreme occasions have been known to ride out gales, not under Whitby rock, but in the anchorage ground, between the Upgang Rock and the proposed breakwater. No doubt the many fleets of large vessels which we see passing down here, would take advantage of the shelter in our bay, instead of running down into Hartlepool Bay, and other northern ports. We consider that we see more ships passing this port than, perhaps, any other on the coast, both light and loaded. Loaded ships almost always when they come out of their ports reach this place before the wind fouls; and both light and loaded ships invariably haul in for the land off Whitby. Consequently, we see probably more ships passing here than any port on the coast. We think, consequently, it is the most eligible situation for a place of shelter. Independently of that, many of the disabled ships which bear up for Hartlepool or the northern ports are first seen off here; and no doubt, if there were a harbour of refuge here, they would come in, instead of going further north. As a large shipowner, when I see these great fleets come down with south-east winds, I can almost always calculate that serious mischief must occur; for we know invariably that when fleets do run down into Hartlepool Bay, their damage is very considerable; and many times I have been most anxious for my own ships, on account of the consequences which must ensue. With respect to loaded ships bearing up, I can only say, my opinion of the northern ports is so indifferent, that I give one general order to all my captains never to bear up, with a loaded vessel, for any of them. I should consider the risk was so great. In nine cases out of ten almost the vessels would be lost. If we had an efficient harbour of refuge off Whitby these evils would be remedied, and no doubt there would be ample opportunity for vessels getting shelter there. I have very rarely had a case of a loaded ship taking refuge in any of the northern ports. When the ships have got out, I have had many vessels which were caught in severe gales from the east and south-east off the coast; but very seldom did any of them take refuge in any one of the northern ports. The only ship that ever I lost north of Whitby was in taking Hartlepool harbour. She was a light ship. I never lost a loaded ship north of Whitby. I consider that the loss of property on the coast is decidedly more in light ships than in loaded ones. Filey has been mentioned as being a likely place to form a shelter. I went over to Filey for the purpose of refreshing my memory of the place only very lately, and I certainly—though I have many ships often beating about Flamborough Head that would be very glad to take shelter—cannot say so much as that Filey Bay could be made available for purposes of that kind. The space with any depth of water seemed to be so very small, that I could not say there was sufficient room for any number of vessels to avail themselves of it. Besides, the difficulty of getting in with many winds is very great indeed. Here we have a natural advantage, our rock is formed by nature for a shelter from the very winds that we want most shelter from on this coast, whereas at Filey their natural shelter is on the opposite side, entirely from the north wind. If this breakwater were made no doubt the harbour of Whitby would be very much improved; independently of the roadstead for vessels riding, it is a harbour of refuge now to a very considerable extent, and would be very much more so if this breakwater were made. The ships that have entered the port of Whitby for refuge alone in the years 1855, 1856, and 1857 were, in 1855, 655; in 1856, 611; and in 1857, 585. The number of vessels light and loaded that have entered the port during the same years were, in 1855, 1,758; in 1856, 1,755; and in 1857, 1,877. I likewise have an account of vessels which have been wrecked in the immediate neighbourhood, and which sum up to a great many, with their names. These papers I will hand in. (*The Returns in question were here handed in.*) The port of Whitby itself I trust deserves some consideration from the Royal Commissioners, inasmuch as it possesses upwards of 70,000 tons of shipping belonging to it; we trust it will therefore claim your consideration. At present ships of considerable draught of water can come into the harbour; only about three weeks ago a ship of my own came in, loaded with 450 loads of timber from America, and drawing 14½ feet or rather more; she came in in one tide, and lay above the bridge in safety. A short time before another ship which drew 15½ feet of water came in with perfect safety. I agree that the harbour is capable of great

improvement; and we think that with a breakwater as proposed to be erected on the rock, and with an improved channel, it would become a very valuable harbour of refuge, even when the wind got as far as north-east, and from that to north, the beach would be so very small. In fact, I have no hesitation in saying it would be almost as good as Scarborough harbour is. If the works were carried out the beach would become so very small that there would be no fear of any loss of life or property. The object of these remarks is purely to facilitate the trade of the coast; I do not think the trade of the town would benefit at all, for, unfortunately, we have not a very extensive trade. But my principle desire is save life and property.

20,613. Have you any more remarks?—I think not.

20,614. Did you ever follow the sea?—I never did.

20,615. (*Mr. Lindsay.*) I should like to have your opinion on two or three points. Considering the number of vessels employed in the trade of the coast, and say that it rested between the construction of one great harbour of refuge and the improvement of the existing harbours (by which I allude to the harbours in the bight of Tees Bay, the improvement of the harbour of the Tees, of the Wear, and of the Tyne, if it were possible, so as to admit the usual description of vessels trading along the coast at all times of the tide), do you think that one great harbour, or the improvement of the existing harbours, would do more to save life and property?—Decidedly the improvement of the existing harbours.

20,616. And if Whitby was not one of the existing harbours to be improved, would you still think that was so?—I certainly should contend that Whitby has as great a claim as any other harbour on the coast.

20,617. But say it was confined, because I am afraid the House of Commons will limit the proposed means—say it was confined to the improvement of the harbours I have named and to the extent which I have named, or to the construction of one great harbour, what then would be your opinion? Should you prefer one great harbour, or the improvement of the harbours which I have named?—Of course one great harbour would depend upon the position of that harbour.

20,618. Whether do you think one great harbour, such as that which Mr. Harrison has laid before us this day, and which would contain a very large number of vessels; whether do you think the expenditure of 1,750,000*l.* here in the construction of such a harbour, or the distribution of that sum over the existing harbours would do more to save life and property?—I think, so far as some of the harbours are concerned, that they have means of improving themselves, which we have not here. I consider that from the funds which they have the Tyne, the Wear, and also Hartlepool are in a very different position from what we are, inasmuch as the funds which the trustees of the piers here have are very small indeed, consequently we can make no great improvements; but these other harbours are, I contend, in a position to make great improvements, therefore they have not so great a claim on the government for an advance of money as we have.

20,619. Putting aside the means which they have at their disposal, I invite your opinion as one largely engaged in the trade. I should like to have your opinion as to the construction of one great harbour, or the improvement of the existing ones; not considering the funds which the local harbours have at their disposal?—I should prefer the distributing of the money amongst many harbours.

20,620. You do?—Yes, I do.

20,621. In recommending Whitby as the site for a harbour of refuge, would you tell me why you prefer it to Filey as a site?—So far as light ships are concerned, I think Filey would be of very little use. The light ships come round Flamborough Head. We generally find when any large fleets are coming along the coast, that they get down on this side of Flamborough Head before the weather gets very bad. Indeed, they go out of the ports in the south with favourable weather, and generally reach something like Flamborough Head before the weather gets bad. When they get there and a gale comes on, Filey would be of no use for those ships taking shelter. But if we had a shelter here a great many would take it and not run to Hartlepool, Sunderland, and the Tyne.

20,622. Looking to the loaded ships?—There is no question many vessels are caught off Flamborough Head and Speeton Cliffs, contending with adverse winds. Of these, some would probably take Filey, but I think very few, because I do not think there is sufficient accommodation for any number of ships to go into the place.

20,623. But presuming we could for the same cost give the same extent of water, the same area of water at Filey as you could do at Whitby, tell me now whether you think under such circumstances as these Filey would do more to save life and property in loaded ships than Whitby?—No, I do not.

20,624. Why so?—I think that Whitby as a promontory is more likely to be available for ships running to. There is a great number of small vessels that would take Filey; but I think our bay would become quite as secure and would be more available for them running to than Filey.

20,625. But I think you said that loaded ships are very often caught with gales of wind off Flamborough Head; that they often have gales from the south. Would Filey not be a point to which they could run in a shorter time than to Whitby?—They would certainly reach it in a shorter time, but when vessels beat about the head it is generally in winds from the south-south-west and south-south-east. If the wind was to get far from the east they would not remain. I think they would stand out to sea, take the chance of its not getting more easterly, and not take Filey.

20,626. You know a harbour of refuge is meant mainly for vessels to take when in distress or when caught on a lee shore. I am speaking of vessels caught in such a gale as that to which reference has been made, the gale of the 4th of January 1857, when the gale came from the south-east going to east-north-east; when unfortunately the vessels could not weather off this coast. Do you think that then Whitby as a site would have tended more to save life and property than Filey Bay?—I do indeed. But from my remembrance of that gale I think the wind was not farther than east-south-east. I think the worst of the weather was from east-south-east.

20,627. I say from south-east to east-north-east because it was given in evidence by various shipmasters that they could not weather away this particular land; and hence, there were a great many wrecks between Flamborough Head and Whitby, and all the way to Hartlepool. Speaking of such a gale when they could not weather the coast either to the north or south, why do you think Whitby would be the means of saving more lives than Filey?—They could not get round. Of course, if there were a harbour here they would take it.

20,628. Therefore, for loaded ships, do I understand you to say there is not much difference in site between Whitby and Filey?—Under such circumstances as these Filey would not save as many ships as Whitby. I think Whitby is decidedly preferable to Filey.

20,629. How do you think that Whitby would be the means of saving more ships than a harbour at Filey?—Whatever rocks we have here are formed by nature for making smooth water, whereas at Filey everything is artificial, and from the plan of the breakwater which I have seen proposed to be erected there, there is no shelter whatever from the east-south-east and south-east until you get to a considerable distance in shore, and the danger would be to vessels coming round that point. Where they really could get into a place of safety would be only to a small extent. Looking at the plan showing the depths of water, it appears to me that the area where there is much depth of water is very small, and before they could get round with the wind from east-south-east and get shelter, there must be serious damage; it would be nearly as bad as running into one of the northern coal ports.

WHITBY.

Mr. Gideon Smales.

22 Oct. 1858.

Mr. Lindsay.

20,630. You object rather to the limited extent of the anchorage which could be obtained there than to the position ?—As well as to the position, I do not think the position is a proper one.

20,631. Why do you think that as a position Whitby would save more loaded ships than Filey ?—I think Filey is too near to Bridlington Bay ; ships would always go to that Bay. It is not an unusual case that vessels are caught with heavy gales from the north or north-east and take Bridlington Bay instead of running across the deeps, but I do not think if a harbour were made at Filey they would even take that place ; they would decidedly give the preference to Bridlington Bay.

20,632. Is it not the case that when ships weather Flamborough Head to the southward they can reach the Humber ?—But they do not do that unless the wind is fair from the eastward.

20,633. But if loaded ships can weather Flamborough Head they can almost invariably reach the Humber, can they not ?—I should doubt that. We have many instances of loaded ships taking refuge in Bridlington Bay in north-easterly gales.

20,634. I am speaking now of vessels which cannot weather away Flamborough Head in easterly gales and caught to the northward of Flamborough Head, and I want you to tell me why you think that Whitby would be the means of saving more of such ships than Filey ?—I say that ships are more generally caught off Whitby than there. The ships that would be near to Flamborough Head are generally ships that have been beating about there with the wind from the south for some time. The loaded ships that are generally caught after leaving the loading ports are, I think, more in our position than at the Head. There would be a greater number of loaded ships caught off Whitby than off the Head.

20,635. You are in favour of Whitby because, in your opinion, the loaded ships are oftener caught in gales of wind further north than Flamborough ?—I am.

20,636. And that being the case, they could easier reach Whitby during an easterly gale than Filey ?—Yes ; but upon that you will have an opportunity of questioning several nautical gentlemen, who, no doubt, will be better able to explain the point than I can.

20,637. Say that only one great harbour was to be constructed along the whole range of coast from Flamborough Head to the Farn Islands, and that it rested between Filey as a position and Hartlepool Bay as a position, which would you prefer as a position putting all other things out of sight ?—I should decidedly prefer Hartlepool, that is, provided works were carried out so as to make it a place of safety.

20,638. If it rested between Whitby and Hartlepool ?—Probably you may think I am giving an interested opinion, but I have already expressed my opinion to be in favour of a promontory, being a salient point I do think is the best position. I am not an advocate for ships running to leeward in a bight, I dread it exceedingly ; I have to a great extent ordered my ships not to do it. I should prefer, if it is possible, and as they are good ships, that they should go to sea, rather go to the Firth of Forth, than take one of these harbours.

20,639. Say it rested between Redcar as a position, on the one hand, and Hartlepool on the other, and presuming that a harbour equal in extent could be obtained for the same cost as it could be at Hartlepool, which of those sites should you prefer ?—I think the ships would more generally take Hartlepool on account of its being a place to which many of them are bound, and a place of great trade. For these reasons naturally a great number of ships would go there in preference to Redcar, but as to the capabilities of Redcar I cannot speak ; I do not know anything of them.

20,640. I think you said you lost a ship in Hartlepool Bay ?—It was in taking Hartlepool Harbour in a very heavy gale from east-south-east ; she was struck by a sea in running over the bar, and thrown behind the pier.

20,641. Old Hartlepool or West Hartlepool ?—West Hartlepool. It was a very heavy gale of wind.

20,642. You say that within the last three years, close upon 2,000 vessels have came into Whitby for refuge ?—Yes, the returns are taken from the Custom House.

20,643. What description of vessels ? — Various descriptions of vessels.

20,644. The vessels that are going along the coast; loaded vessels ?—Not so many as light. Frequently with gales we have a considerable number of vessels, holding as many as 15 and 16 keels of coals, take shelter here.

20,645. What is the largest vessel that can find shelter in Whitby at high spring tides in a gale of wind ?—As it is, I should not think that, in a very heavy gale of wind, a ship drawing more than from 14 to 15 feet of water could take Whitby Harbour.

20,646. Take the same amount of money which Mr. Harrison has named as the cost of the large harbour here, and which would be in round numbers two millions sterling, if instead of spending it all on this one site, there were about 500,000*l.* or 600,000*l.* to be spent here to make a limited harbour such as I have described to Mr. Harrison, giving about 300 acres of three fathoms and upwards, and if a similar harbour could be made at Filey for a somewhat similar sum, making in all 1,200,000*l.*, and if the remaining 800,000*l.* was appropriated amongst the harbours in the bight of the bay, the Tees, the Tyne, and the Wear, on the condition that the parties interested in those harbours should subscribe a given sum to improve and deepen them, so as to admit vessels at all times of tide, do you think the distribution of the public money in such a manner as that would do more to save life and property than the expenditure of two millions upon the plan which Mr. Harrison has laid before us ?—I have already told you that I approve of the distribution of the money amongst the harbours, and that I would recommend it.

20,647. You think that the expenditure of the public money in that way would do more to save life and property than the outlay of two millions of public money here at Whitby on one large harbour ?—I do, decidedly.

20,648. (*Capt. Washington.*) Would it be an advantage to the trade of the port to dredge the present harbour to a depth of eight feet over the bar ?—Yes ; we have many small vessels wrecked at the entrance of the harbour, not having sufficient depth to come in.

20,649. Are there any funds at the disposal of the Harbour Commissioners for such a purpose ?—You will have an opportunity of examining one of the trustees of the piers on that subject.

20,650. Don't you know in round numbers ?—I think 3,000*l.* or 4,000*l.* a year.

20,651. It would be a great benefit to you as a shipowner to have the present harbour made to that depth ?—I am a great advocate for the harbour being improved. I think the number of ships trading to the place would be very much increased if the entrance to the harbour was improved.

20,652. It appears there is no great engineering difficulty ?—I am not aware of any.

20,653. Simple dredging ? — In my opinion the channel decidedly wants directing as well. We have no works to direct the channel ; it is so circuitous that the power of the water running out is lost by the many circuits which it takes in the habour and the water, if properly directed, would, I think, take out any accumulation of sand that does come in.

20,654. I understood you to say that there were 70,000 tons of shipping belonging to the port of Whitby ?—Registered in the port.

20,655. At present vessels of 14 and 15 feet draught of water can come in ?—Yes, I had a vessel of that draught come in within the last month, and it passed through the bridge in one tide. There are upwards of 10,000 tons of shipping belonging to the port which are not registered at it.

20,656. How is that?—Many owners prefer registering from the port of London.

20,657. Ten thousand tons belonging to the port registered elsewhere?—Yes.

20,658. I think you said you could not give an opinion whether the Harbour Commissioners could contribute towards the improvements?—They would be very glad, I should think, so far as their means go—very glad.

20,659. Do they not receive some funds from passing vessels?—I believe the whole, or nearly the whole, of the funds is derived from a passing toll—a toll levied on coals shipped in the Tyne and the Wear.

20,660. Will that source of revenue continue?—The Act of Parliament is perpetual.

20,661. (*Capt. Sulivan.*) You are aware that at the Tyne they are endeavouring to get 15 feet of water by the erection of piers?—I am.

20,662. Will that, if successful give a valuable and secure harbour of refuge on the northern coast?—There is no doubt a large number of vessels would run there with more security with such an improvement. Accidents in the Tyne are very numerous now, owing to the critical navigation in entering the place.

20,663. You said, in answer to one question, that you would prefer Hartlepool to Redcar, because so many vessels would run there being bound to that port. But supposing the harbour to be built for the refuge of passing vessels for all ports, not to the trade of a particular port, would you still prefer Hartlepool to Redcar as a site, putting on one side the trade to Hartlepool, and looking to the best place for a vessel in distress, embayed with an easterly gale, to run to with safety,—a harbour that she could most safely enter and find refuge in?—I explained before that I was not acquainted with the nature of the conveniences which could be made at Redcar.

20,664. Putting on one side the engineering question, and supposing that at both places the same accommodation could be obtained at the same price, and considering it merely as a site?—I do not see that there would be much difference in that respect, the land round both places is alike. Probably the land about Hartlepool is higher than it is about Redcar. I do not think there would be much difference in that respect. I do not remember at the moment whether there is a great deal of difference in the line of embayment between Redcar and Hartlepool Heugh, therefore there would be no objection in that way.

20,665. Then the sites being so equal in that respect, would you be inclined to say that whichever place could get most accommodation, and the deepest water in the harbour would be the best site for a refuge?—I think a nautical man is more fit to give an answer to that question, inasmuch as I have no doubt it would be a difficult thing to get captains running to the old ports to take Redcar. I think, of the two places, they would go to Hartlepool not Redcar.

20,666. I ask which would be the best place for the construction of a harbour, setting aside the trade of Hartlepool?—I should decidedly say Hartlepool.

20,667. Can you give me any idea how many vessels would at one time require refuge in a gale?—I think it a very rare circumstance that more than 30 or 40 loaded vessels would require shelter at one time. I should more generally say about 30 sail of ships.

20,668. We have heard of some 60, 70, or 80 vessels being wrecked in the depth of the bight at once?—I never heard of so many as that.

20,669. If a harbour of refuge would take in good shelter from every wind 200 of the largest colliers that pass this coast, do you think that would meet the wants of the trade so far as life and property are concerned?—I think so.

20,670. We will put Whitby on one side for the present. Supposing you had your choice of one harbour at Hartlepool that would take 400 or 500 vessels, and would cost a very large sum, or one of half that size there for half the sum, taking from 200 to 300 vessels, and another near Flamborough Head taking the same number of ships, would you prefer the two smaller ones or the larger one in the depth of the bay,—each to take the deepest collier which passed the coast at all times of the tide and in all weather, by day or night?—That is a difficult question to answer. I think, decidedly, that Hartlepool would be preferable to either of the others.

20,671. Suppose you had one at Hartlepool, would you rather have a large one there or a smaller one there and another smaller one at Filey?—I think two are better than one at any time.

20,672. Though smaller?—Yes, I understand that. I think the two would have a greater chance of saving life and property than the one would.

20,673. (*Chairman.*) Will you state to me what wind you consider the most dangerous on this coast?—From south-east to east-north-east.

20,674. As a general rule how do the south-east gales commence?—They sometimes commence from the north, and indeed come on very suddenly; but I think the south-east wind does not; it frequently comes from south-east back to east-south-east, and from that to east. We generally find if ever the wind gets farther than that it becomes more moderate. If the wind backs from east-south-east and gets a point north, the weather is always better.

20,675. If a south-east gale backs round as far as north-east does it not blow hard generally? Will it not be a hard north-east gale?—No, we generally have the hard north-east gale when the wind shifts from north-west to north and north-east.

20,676. Are the changes of wind very sudden on this coast?—Very sudden indeed.

20,677. Do you have much swell on the coast without any wind at all?—We frequently have the swell before the wind. It comes often for a day before the wind, and then it shows that a gale is coming.

20,678. The masters of ships trading along this coast are well acquainted with all this. Are they careful about not going too near the shore in the fall of the year, and in the winter?—I am afraid not so much so as they ought to be. The ships generally come close into this place, both light and loaded. It is an almost invariable rule with ships, both light and loaded, to come within a very short distance from this coast.

20,679. Is the inducements to be in shore that they may be favoured by the tides and slants of wind in making their passage?—When the wind is not very fair they come in to catch the flood and ebb tides, as it may be; and if a large fleet comes out of the northern ports, they come very close in indeed, almost all the ships.

20,680. With respect to a general harbour of refuge on the coast, for what number of ships should you say it ought to be constructed?—One large harbour

20,681. Yes?—I think that from 200 to 300 sail is all it would ever be required to accommodate, though no doubt in the sort of a roadstead in Yarmouth Roads and Bridlington Bay, there is frequently a very large accumulation—very much more. But I think it would be very rarely, that in a single harbour of refuge that is now required, you would want to contain more than from 200 to 300 sail of ships.

20,682. In a former part of your evidence you said you gave instructions to your captains not to run into the bight of a bay. Do you give them any further instructions as to keeping the sea in bad weather, and attempting to make the passage, and not running into a harbour at all; or do you leave it entirely to their discretion?—My orders are, if possible, never to run back when loaded into the coal ports; to keep the sea if possible, and, if they cannot, to run for the Firth of Forth.

20,683. Will you state any cases that have come within your own knowledge of vessels which were off Whitby, and then wrecked in going north and endeavouring to reach the northern ports?—I think there are some persons now in the room who have kept an account of that, and who are able to give better evidence on that subject than I can.

BIBLIOTECA DEL C. N. A. M.

WHITBY.

Mr. Gideon Smales.

22 Oct. 1858.

Chairman.

20,684. Have you any decided opinion as to the improvements the proposed breakwater would effect in facilitating entrance into the harbour?—I decidedly consider that the entrance into our harbour would be always smooth; ships would come in even with the bar as it now is, drawing two or three feet more water than they now do.

20,685. (*Capt. Sulivan.*) You said there were 70,000 tons of shipping belonging to this port?—Yes.

20,686. Have you any number of vessels which do not trade from this port, but trade from other ports?—The trade of this place is very small; very few of the vessels trade here.

20,687. About what proportion of the 70,000 tons trade to this port?—I cannot say. The harbour master will give better information on that point. Of the ships that take refuge, I should say two thirds probably belong to other places, not to this.

Mr. Henry Robinson examined.

Mr. H. Robinson.

20,688. (*Chairman.*) You are a shipowner and reside at Whitby?—Yes.

20,689. How many years have you been at sea?—Twenty-four.

20,690. Of that period how many years in command of vessels?—Sixteen.

20,691. You are aware of the objects of this inquiry?—Yes.

20,692. State your opinion as to the advantage or necessity of any single national harbour of refuge on this coast; or whether you should consider it preferable, for the purpose of saving life, to improve the several existing ports along this coast?—I think it would be better to improve the ports along the coast for the present vessels that navigate these seas.

20,693. That being the case, give me your reasons for holding that opinion?—The vessels are in different localities between Flamborough Head and the Tyne; and of course if there were a harbour of refuge to the north and south, and here as well, it would be of much more benefit to them than it would be in one place.

20,694. State your opinion as to the position of Whitby as a harbour of refuge?—I believe it to be the best on the east coast between Flamborough Head and Tynemouth Castle.

20,695. What are your reasons?—There is more water to enter, and geographically speaking it is in the centre of the trade as nearly as can be. Loaded ships coming from the north invariably, in my opinion, get thus far before they are headed off with the easterly winds.

20,696. Do I understand you to say that loaded ships, after leaving the ports, as a rule, get down as far as Whitby?—Generally so.

20,697. Give me your opinion whether refuge is more required for light or for loaded ships?—With regard to life, for loaded ships.

20,698. Why is that?—They are less able to keep the sea.

20,699. Are you disposed to say, that if a light collier finds herself on a lee shore in this neighbourhood, she is more able to keep the sea than a loaded ship?—As regards life the light ship will go upon many sands, and not drown any one.

20,700. The safety, as respects life, in a light ship, is that she goes higher on the beach. Is that it?—That is one reason.

20,701. Do you know of cases in which vessels have been off Whitby, and been wrecked in endeavouring to reach the northern ports?—The *Amelia*, which was lost, with all hands, in the 5th of July gale was seen off here. The *Zephyrus*, bound here from London, was wrecked at Hartlepool. The *Stanley* was another; and there are others.

20,702. During the period that you were at sea, were you ever nearly wrecked yourself?—On this coast?

20,703. Yes?—I was principally in the foreign trade, and was never wrecked on this coast.

20,704. What is the largest number of vessels you have ever seen riding at anchor in the Bay with a gale from east-south-east?—We had about 70 here a very short time ago.

20,705. (*Mr. Lindsay.*) In what part of the Bay did they ride?—On the lee of Whitby Rock.

20,706. What kind of shelter had they?—They had broken water there and had a surf rolling in.

20,707. Are the Whitby Rocks covered at high water?—Oh yes.

20,708. Are they dry at low water?—Nearly so.

20,709. Is there not a very heavy swell from the east-south-east?—A heavy swell.

20,710. Have you known many ships to drive from their anchors in such gales?—I have not known them to drive, I have known them to slip and run.

20,711. In fact, these rocks form a refuge as it is, to a certain extent in this very dangerous wind?—Yes.

20,712. I understood you to say that you preferred the improvement of the existing harbours to the construction of a single harbour. If it rested between the construction of one great harbour at Filey or one at Hartlepool, all things considered, which would you prefer?—I think the northern port.

20,713. You think a harbour at Hartlepool would be of more value than one at Filey?—I think a harbour to the north of Whitby would be better than one to the south.

20,714. Do you think if only one harbour was to be made, that Whitby is the best site for it?—I do.

20,715. Tell me what are your reasons?—It is a promontory and it is a centre point from the Tyne to Flamborough Head. As Mr. Smales has stated, ships always come in here and pass nearer to Whitby than to any other port, and there is the greatest accumulation of ships off here.

20,716. In your experience the greatest number of ships are caught on this coast off Whitby?—Yes, I think if they can steer to Filey they will be far enough south, and if the wind varies, as it often does, they can go to the south.

20,717. They would prefer going to Filey to going south?—Yes, but the chances are they could go round the Head.

20,718. And would have the Humber on their lee?—Yes.

20,719. Leaving Whitby out of sight altogether, what is your opinion of Hartlepool as a site?—Too shallow water all round it in my opinion.

20,720. Do I understand you to mean by that that Hartlepool is not a good site for a harbour of refuge?—No, not on account of the shallow water.

20,721. Do you know Redcar as a site?—I have passed it.

20,722. You do not know sufficient about it to speak of it as compared with Hartlepool?—I believe the water is deeper; I should give it the preference over Hartlepool.

20,723. That is if the same expenditure would give the same area of water?—Yes, I should go to the place which had most water at the entrance. If it has more water than Hartlepool I would give it the preference.

20,724. What trade did you command vessels in?—I have commanded vessels to the north and south. I have been from Whitby with emigrants.

20,725. You have been in the Baltic or at Archangel?—I served my time in the Baltic, and commanded ships to Archangel.

20,726. What do you think about the necessity of a harbour of refuge on the east coast of Scotland, say between Aberdeen on the south and the Pentland Firth on the north?—I think the firths are so easy of access that it is not required.

20,727. You do not think that, looking to the saving of life and property, it is required?—I really do not

myself. I do not know that there is a trade passing and repassing that would require it.

20,728. Say that the Government should be of a different opinion, and should be resolved on constructing a harbour of refuge within those limits, and say it rested between three places, all things considered, the trade of the Baltic and that through the Pentland Firth to America, to which would you give the preference as a site, to Wick, Fraserburgh, or Peterhead? —I am not sufficiently conversant with these places to give an opinion; the situation of Wick looks to me very good.

20,729. You think, that if a harbour of refuge was to be made, you would give the preference to Wick from its position?—I think I should, but I am not inclined to give a positive opinion.

20,730. (*Capt. Washington.*) I think you said you commanded a ship for 16 years?—Yes.

20,731. Many years in the coasting trade?—One coasting voyage. I have passed this coast as master of a ship bound foreign.

20,732. How often?—Three times from the Tyne to the Mediterranean and other foreign ports.

20,733. Is that all?—That is all.

20,734. Were these your only voyages?—I have been from Whitby to America several times north about, and have come from the Baltic to Hull and Shields.

20,735. Returning late in the fall of the year, where did you generally make the land?—Flamborough Head if we could. I have known us make it down in Scotland.

20,736. How far north?—Buchan Ness, and down there.

20,737. Was that in a strong south-west wind?—Of course it would be a wind by which we could not get to the south.

20,738. Did you ever make the land further north than that?—No.

20,739. If the wind was fair you would steer for Flamborough Head?—If I were bound for London I should steer further south; but in the fall of the year perhaps it would show prudence to go to Flamborough Head, but I would go to the south in all seasons of the year.

20,740. You would endeavour to make Orford Ness?—I would endeavour to do so. If I were more familiar with the coast, I should perhaps come down to Flamborough Head.

20,741. Have you ever, when off Flamborough Head, seen a number of vessels congregated there?—I have seen many ships.

20,742. About what number?—Over 100.

20,743. Stopping there long?—I don't know; I passed them light; was coming down light at the time I am speaking of.

20,744. You have never been detained there yourself?—Never.

20,745. Would it be a great benefit to the trade of Whitby, to have the present harbour improved?—Oh yes; I think so.

20,746. Would it be of any use to light vessels running down on this coast?—Oh yes; I think if this breakwater were made, vessels coming round Whitby Road with a heavy gale might fetch into the pier heads; I believe such ships would come which have now been lost to the north.

20,747. What is chiefly wanted is protection from the east?—I think so.

20,748. Covering the entrance of the present harbour?—I think so.

20,749. (*Capt. Sulivan.*) If there were a harbour of refuge north of Whitby, and another south of Whitby, between this and Flamborough Head, would it be the case that the northern harbour would save most light vessels and the southern harbour most loaded vessels?—I think the northern harbour would be best in both cases.

20,750. I am supposing that there was one in each place; I don't ask which would be the best to have only one; I am supposing that you had one in the north. Would light vessels principally benefit by the northern one, and loaded by the southern one?—I don't know where they might be; I scarcely understand the question.

20,751. You said just now that loaded vessels suffered most?—In life.

20,752. If there were two harbours, one south of this and one north of this, deeper in the bay, would the loaded vessels most benefit by the southern harbour, and the light vessels by the northern harbour?—I think both loaded and light vessels would use the northern one; the light vessels would go back to Flamborough Head, and would not use a harbour of refuge unless they wanted to make a port of loading; that is the reason why many of them are lost, because they want to "hug" the land and make the voyages.

20,753. We have heard of many being wrecked, from their being driven into the bay?—I think they should not have gone into the bay.

20,754. But we have evidence that many could not get out?—They had run too far; they should not get themselves into danger.

20,755. Did you not say a harbour in Tees Bay would be a benefit to light vessels?—If I said so I did not think so.

20,756. Then what vessels do you think a harbour in Tees bay would be of use to?—None.

20,757. Did you not say it should be north of this?—Yes, if there is not to be one here.

20,758. And you said it would save the light vessels?—I think a northern harbour would be of most value to light ships.

20,759. I ask whether a northern harbour would be most valuable to light ships, and a southern to loaded ones?—I think the northern would be most valuable to both loaded and light ships.

20,760. If there were two?—No, if there were only one.

20,761. But if there were two, would the light vessels benefit most by the northern one, and the loaded by the southern harbour?—I think if there were two the northern one would be of most benefit to both.

20,762. You said there was an objection to Hartlepool on account of its being so shallow. Do you mean on account of the sea breaking?—Yes.

20,763. Does the sea break badly outside of Hartlepool?—I have heard so.

20,764. You don't know it of your own knowledge?—No.

20,765. Does the regular sea begin closer in towards Redcar?—I don't know that.

20,766. Would you think it a great object to have the harbour where the most regular sea could be carried up to the harbour's mouth?—Oh yes.

20,767. Even although there was not deeper water at the harbour's mouth, yet if there was deeper water outside, and the sea was quiet and regular, you would think that better than where breakers extended outside?—I think so.

20,768. When you spoke of vessels making Buchan Ness, did you allude to your own ship making it?—I have been on board a ship that has made Buchan Ness from the Baltic, with a very experienced captain.

20,769. In all other voyages, how far have you made the land north?—Flamborough Head most often; we were bound to the Humber.

20,770. Have you never been to the northward of Flamborough Head, except that one time?—Several times.

20,771. What was the farthest north next to that time?—I think Whitby; I believe I made the land once or twice down here.

20,772. Have you ever made it to the northward of the Firth of Forth, except that one time?—No.

20,773. (*Chairman.*) How many voyages have you made from the Baltic as master?—Two.

WHITBY.

Mr. WILLIAM TOSE examined.

Mr. W. Tose.

22 Oct. 1858.

20,774. (*Chairman.*) You are harbour-master at Whitby ?—Yes.

20,775. How many years have you held that situation ?—Seven years.

20,776. Previous to that did you follow the sea ?—Yes.

20,777. For how many years ?—Twenty-eight.

20,778. How many years were you in command of ships ?—Nearly 20.

20,779. In what trade were you chiefly employed ?—Chiefly in coasting.

20,780. Of what description of vessels were you in command ?—The first six years I was master of a vessel of nearly 300 tons and drawing 15 feet of water. Since then in one of my own ships drawing 14½ feet water.

20,781. Ships or brigs ?—Brigs.

20,782. For saving life would you prefer one large harbour, or that the several ports which now exist should be improved ?—The several ports to be improved.

20,783. Will you be good enough to give me your reasons for that ?—If there was a harbour at one of the Durham northern ports and a harbour at Whitby here I think it would be the means of saving a great many lives, more so than one large harbour.

20,784. Therefore you are in favour of one harbour to the south, somewhere about Whitby, and also of one somewhere to the north ?—Yes.

20,785. Explain what would be the use of a harbour of refuge at Whitby ?—It would be the means of saving a number of ships and a very great number of lives. I remember for several days, vessels coming close down here and going away again because there was no anchorage to take the northern ports and being wrecked. If the designed breakwater had been on the rock they would have come down to the rock and brought up in safety.

20,786. Why were these vessels down here ? Was there any necessity for their being so close in shore ?—There are frequently gales down here from the south-east. When they attempt to come to Whitby, when they draw the northern ports, they fall in with one third more sea than they have at Whitby.

20,787. How does the coast tend from Whitby to the north ?—Hartlepool Heugh bears north-west from Whitby buoy.

20,788. Then withthe wind at south-east why should vessels be so close to Whitby ?—They generally come close off Whitby, down along all the way. I remember the *Colony* lying in the roads five days and could not enter the harbour; she got up her anchor, and was wrecked in taking Shields The *Zephyrus*, bound to Whitby, could not attempt the harbour, she took Hartlepool—struck on the bar and was a wrecked.

20,789. Do I understand you to say that these were vessels making for the harbour of Whitby, or bound further north ?—The *Zephyrus* was bound for Whitby but the *Colony* for the south, laden here.

20,790. If you had a harbour further north where would you put it ?—I should think about Sunderland, if we had Whitby improved.

20,791. In fact the other horn of the bay ?—Yes, I approve of Sunderland.

20,792. What is your reason for choosing Sunderland ?—The land is much higher for vessels to make coming round down in a gale of wind, more so than Hartlepool. They make the back land about Hartlepool, and don't know where they are, or perhaps they slip to the north side of the Heugh.

20,793. With the wind how far to the eastward can a vessel, a light collier, fetch from the neighbourhood of Whitby to Sunderland ?—When the wind is about east and by north or east and by south.

20,794. What is the course from Whitby to Sunderland ?—About north-west and by north half north.

20,795. Therefore you require the wind to be to the eastward to enable a ship to fetch Sunderland ?—Some ships will fetch it a great deal better than others, some will go broadside to leeward almost, and some will make a straight headway. There is a deal of difference in colliers.

20,796. But taking into account that there is a great difference in ships, looking at the general run of light colliers, would they, when out at sea, fetch Sunderland under close-reefed topsails and foresail ?—Yes.

20,797. And that with the wind east-north-east ?—No ; to the east and by north. It depends whether the sea was athwart or ahead.

20,798. But does not the sea, as you get to the north, run into the bay ?—As you draw across the Tees you get it more favourably.

20,799. It comes round to the south ?—Yes, more favourably.

20,800. But the wind as you cross the Tees Bay with these gales on shore—does the wind come forward or aft ?—As you go to the northward it draws aft a little ; the wind from the south-east does.

20,801. You are quite sure of that ?—Yes, generally so.

20,802. Which do you consider the most dangerous wind upon this coast ?—From east and by south to east and by north.

20,803. Do these winds spring up suddenly ?—Sometimes they do.

20,804. But is that an ordinary occurrence ?—Not often. I think the wind rises out from the southward and westward, and then, perhaps, comes away to east before it begins to blow ; it frequently goes a little round before the force of the gale comes.

20,805. Having a vessel close in shore off Whitby with the wind from the south-east, would she have any chance of making an offing if she wished to do so before the wind went round to the east-north-east ?—That depends on circumstances. If the wind kept at south-east she would get an offing.

20,806. Do I understand you to say these on-shore gales begin at south-east, and generally go a little round, so that a prudent man would get off shore ?—At times they come very suddenly.

20,807. What is the greatest number of vessels you have seen riding in these roads with gales from the east-south-east ?—I have seen 75 sail, the wind blowing south-east and by east, about a fortnight ago.

20,808. Did they all hold on well ?—They all held on well until it came fine weather.

20,809. Was it blowing hard ?—It was blowing hard.

20,810. What cable had they out ?—Chain ; I should think 60 or 70 fathoms.

20,811. More than one anchor down ?—I do not know that any had more. They did not strike any mast or yard.

20,812. Was there much sea in the bay ?—A very rolling swell ; my ship rolled very heavily ; some of the outer vessels rolled very heavy.

20,813. From what direction did the sea come ?—It came round the rock and the sea broke heavy on the rock, which caused it not to break inside the rock.

20,814. Can you produce a statement of the number of vessels which have taken refuge at Whitby within the last three years ?—Yes. In 1855, 655 vessels entered the harbour for refuge ; in 1856, 611 ; in 1857, 585 ; and up to October this year, 358.

20,815. Does your statement show how many were light and how many were laden ?—It does not.

20,816. Could you give a statement to that effect ?—I cannot.

20,817. What is your authority for this statement ? Is it drawn from official records or taken by yourself ?—I keep an account of all vessels that come into the port for the trustees to see.

20,818. Will you sign that and hand it in to the secretary ?—Yes. (*Statement signed and handed in.*)

20,819. Do you corroborate the statements made by previous witnesses as to tonnage ?—Yes.

20,820. The returns already handed in are based

upon your returns to the Custom House; is that it?—Yes.

20,821. Will you state your opinion as to the improvement the proposed breakwater would effect to the entrance of Whitby Harbour?—As the rock is, when a vessel from the south with gales from the south-east hauls round the rock she will not lay so as to look at the harbour; they are steering for the piers, but they are not able to fetch the shore, and they come to. If the breakwater was on the rock, they would come round the end, come into smooth water, get the pilot on board, and proceed into the harbour with the greatest safety.

20,822. You say she would get a pilot on board, have the pilots great difficulty now in getting out in bad weather?—Yes, there is so much sea; they are unable to go out if it blows strong from the eastward.

20,823. Have you any statement of the wrecks at Whitby during the last six years, with particulars of the causes of those wrecks; if so, will you hand it in to the secretary, with any remarks you like to make?—I have those which were lost with all hands on the 4th January 1857.

20,824. Have you any further statement?—Yes. Here is a statement of all the vessels that have been stranded on the coast at Whitby during the last few years. (*The returns were handed in.*)

20,825. (*Sir F. Smith.*) How many years have you held your present situation?—Seven years.

20,826. Are you going to give a return for three years and three quarters?—Yes.

20,827. Can you give one for the whole period since you first became harbour-master?—I cannot.

20,828. You did not begin to keep an account then until 1855?—No.

20,829. What induced you to commence keeping such an account?—The trustees of piers and harbours wished me to do so.

20,830. You cannot tell me how many vessels were laden, and how many were not?—I cannot.

20,831. Can you tell us how many hours out of the 24 your port is accessible for vessels of the class which come in upon those occasions?—We have vessels come into the harbour sometimes six feet below high water.

20,832. For how many hours, either at neap or spring tides, can vessels, of the description you have taken record of, enter the harbour, or did they enter the harbour?—Sometimes at neap tides five hours each tide.

20,833. How many hours out of the 24?—That would be 10 or 12. It depends entirely on the weather.

20,834. Take the average?—From 10 to 12 hours.

20,835. That is for one half the day your harbour is accessible?—Yes.

20,836. How much do you think the harbour could be deepened by dredging?—I think about three or four feet.

20,837. For what expense could dredging be carried on?—I do not know what expense it would be.

20,838. If it were dredged out three or four feet, for how many hours then could you take in these vessels?—The smaller vessels would be able to come in at low water. It would always be accessible to them.

20,839. I am talking of the average of vessels that want to come in here, and not of any particular one. For how many hours would you offer accommodation to them then?—There would be 14 or 15 hours I should think.

20,840. That is for a great portion of the 24?—Yes.

20,841. For what number of vessels have you accommodation in your harbour?—We have accommodation in the upper harbour for about 300 sail, and in the lower harbour we have sufficient room I think for 80 and 90.

20,842. Do they all take the ground?—Yes.

20,843. Do I understand you to say that, if the public funds could be given out with a pretty liberal hand, you would prefer having a harbour of refuge here, and improvement of one of the harbours north of this? Is that what you propose?—If there was a large harbour here, and an improved harbour to the north, it would be the means of saving a great number of lives.

20,844. Do you think it would be the best means of applying the public funds?—I think it would.

20,845. You think it would save more lives than constructing a harbour at Filey, making a harbour here and improving one of the ports?—I should prefer a small harbour being improved.

20,846. To the improvement of the other?—Yes.

20,847. And the construction of a harbour at Filey?—That is to the north.

20,848. Is it the case that a great number of vessels are often off Flamborough Head?—Yes, with the wind from south-west or south-south-west.

20,849. Do you remember hearing of 500 lying there?—No.

20,850. You would not believe it if you did, perhaps?—No.

20,851. Well, if witnesses of high character and great experience, and several witnesses of that character told us they had seen upwards of 500 there very often, what would be your opinion?—I would not believe it. I have been on the coast too long myself. There is not room for them to be there. In Bridlington Bay I have seen 600, but not in Filey Bay.

20,852. What is the greatest number you have ever seen off Flamborough Head?—I have seen a great number lying in Bridlington Bay.

20,853. That is not an answer to my question. I want you distinctly to say what is the greatest number of vessels you have seen off Flamborough Head?—I think I can say about 250.

20,854. That is a considerable number, is it not?—Yes, it is.

20,855. Do you not think that for those vessels there are circumstances which would make Filey a very desirable harbour?—I think not. Vessels that are dodging about Flamborough Head generally come out of the wind south a little. If it got about east-south-east or east, as long as they can carry close-reefed topsails or reefed foresail, they will always go to the Humber.

20,856. You think a harbour would not be required there?—At times they might use it.

20,857. There are times when, perhaps, it might save life?—Yes.

20,858. (*Mr. Lindsay.*) Is Whitby a "bar harbour" in the strict sense of the term, with two feet water at low water?—We have 2½ feet at springs and six feet at neaps.

20,859. What is the rise of the tide?—At spring tides 16 or 17 feet. I have known it since I came to be harbour-master 22 feet over the bar.

20,860. Has the bar been silting up in your experience?—At times it does silt up a little, then we have a little land water comes and takes it away.

20,861. Where does this silt come from?—It comes along the sand a little; perhaps we have a little deposit from the river up above.

20,862. To what extent is the bar silted up?—It never silted up between the piers. It is always a little inside the piers.

20,863. Your shallowest water is within the piers?—Yes.

20,864. Since the alteration of the piers?—Yes.

20,865. Have you a dredger here?—We have not.

20,866. Have you any means of removing the silt?—We have two mud lighters at work, and they are taking out of the harbour each of them 30 or 35 tons a day, and as long as the weather is suitable to go on they work every day.

20,867. You said the harbour might be deepened by dredging to the extent of three or four feet?—Yes.

20,868. Do you think with a dredger you could maintain the increased depth?—The dredger would do very well to dredge the sand, but it is loose scar

WHITBY.

Mr. W. Tose.

22 Oct. 1858.

Mr. Lindsay.

within the piers. It must be picked up or blown up. It is scar within the piers.

20,869. What depth of mud or sand is there over that?—Sometimes it is right down to the scar, and sometimes there is a deposit of sand over it.

20,870. To what depth could you dredge?—I dare say three or four feet.

20,871. Then by dredging you might have four feet more water than you have at present?—Yes.

20,872. And could admit vessels drawing four feet more water than you now do?—Yes.

20,873. Therefore, if a dredger was employed, Whitby could for a similar description of vessels be made a more available harbour of refuge than it now is?—Yes.

20,874. Do you think deepening the bar to that extent would be a means of saving more vessels?—I have no doubt for small vessels it would.

20,875. Because Mr. Smales says, that during the highest spring tides, he has known vessels drawing close upon 14 feet water come in here?—I have known vessels come in, and that with very strong seas, drawing from 14 to 15 feet water.

20,876. Then if it was deepened four feet more, you would be able at high water, and in easterly gales of wind, to admit, in fact, all the colliers going along this coast?—Yes.

20,877. Therefore by this comparatively simple means, Whitby could be made to a much greater extent a harbour of refuge than it now is?—Yes.

20,878. Can you tell me why the dredger has never been employed here?—I cannot say.

20,879. Is it for want of funds?—I think it must be.

20,880. Is there any charge made upon vessels coming in here for refuge?—The largest vessels that enter the port for refuge only have to pay 3*s.* 10*d.* harbour dues, bridge dues, and manorial dues.

20,881. What are your charges for vessels entering here with cargoes?—The same harbour dues.

20,882. Then you charge the same on vessels seeking refuge, as to vessels coming here for the purposes of commerce and trade?—Yes, the harbour dues.

20,883. What other dues are there?—There are dues on coals and dues on cargoes.

20,884. I am speaking of dues on ships. Is there any difference of charge made between vessels coming here for purposes of trade, and vessels coming here for refuge?—Vessels that are loaded I think pay double manorial dues.

20,885. Those are payable to the lord of the manor?—Yes.

20,886. What is the amount of them upon each ship?—Eightpence.

20,887. A vessel seeking refuge here pays 8*d.* to the lord of the manor?—Yes.

20,888. And a vessel entering with a cargo pays 1*s.* 4*d.*?—Yes.

20,889. As Hartlepool has been recommended by a Committee of the House of Commons as a suitable place for a harbour of refuge upon this coast, tell us what you think of it as a site for a harbour of refuge from your experience?—My opinion is the water is too shallow. I remember on the 4th January 1857 vessels drove past Whitby and wanted to make Hartlepool, and that a great number of them fell to the north of the Heugh. As soon as they made that they had to clap them on the wind, and to come south, and as soon as they got into broken water round the Heugh, several of them were lost with all hands, before they got them wore round. Several of them capsized with all hands.

20,890. You do not think they turned over by the breaking of the swell?—Yes, the sea broke so unmercifully upon them they became unmanageable.

20,891. They would not answer their helms and therefore foundered?—Yes, they turned over and foundered before they got to the shore.

20,892. You said a number drove to the north of the Heugh?—Before they made the land. In gales from the east upon this coast the land is generally capped.

20,893. Did they drive because they could not see where they were?—Yes.

20,894. Are there any other reasons why you object to Hartlepool as a site for a harbour of refuge?—Only the shallowness of the water.

20,895. As a site you have no objection to offer to it. I mean as to its position?—It is rather too far north; I think the same as Filey is too far south.

20,896. Well, but you recommend Sunderland which if further north?—Yes, if there was a harbour at Whitby.

20,897. Presuming there was a harbour at Whitby and another was to be made further north, I understand you to say Sunderland?—Yes.

20,898. You mean Hartlepool is too far north if there is to be only one harbour?—Yes.

20,899. Say that there is to be only one harbour along the coast, what number of vessels of the usual description ought it to contain to meet the exigencies of the trade?—300 sail I should think would be quite sufficient. It is very rare we have that quantity on the coast at a time.

20,900. Looking at the size of the usual description of vessels trading along this coast, what number of vessels could anchor with safety in an area of, say, 300 acres of four fathoms and upwards?—I do not understand acres, but if this is 300 acres in Whitby Roads we could hold about 200 sail.

20,901. You were a long time in the Baltic trade?—A very few voyages, chiefly in the coasting trade.

20,902. Putting Whitby out of site altogether you are not in favour, as I understand you, of a harbour far south, and not in favour of Hartlepool, but all things considered and putting Whitby out of the question for a moment, say it rested between Filey and Hartlepool, at which would you construct a harbour of refuge?—I do not know how to answer that question. A harbour of refuge would be of great service at Hartlepool and one at Filey. If it was so placed no doubt many vessels would enter there, and if a vessel missed Filey in heavy gales and had to come all the way to Hartlepool Roads before she could get shelter, we are aware, we who have been on the coast for many years, that there is a number suffer in that way in gales of wind.

20,903. Say that Filey could be made a harbour so as to shelter, say, 300 vessels in all gales of wind, but more particularly when the wind is drawing eastward?—I think it could not be made to hold them.

20,904. But say that it could by an expenditure of money be converted into a harbour to contain 300 sail of vessels in safety during easterly gales of wind, and supposing that a harbour could be made at Hartlepool, between the Heugh and the Long Scars, also to contain 300 vessels where they would have sufficient water to ride in, to which would you give the preference?—I think as Hartlepool is so very close to the coal ports and the vessels leave them, that Filey would be the best site.

20,905. Do you know sufficient of Tees Bay to tell me your opinion of Redcar? Say that a harbour could be made there to afford shelter from the prevailing gales, at the same cost as it would be to make one at Hartlepool Bay, do you think a harbour at Redcar or a harbour at Hartlepool would be of most value?—I think Redcar. If a mariner were off it, say with a heavy gale and the sea very heavy, he has Huntley Foot to look for. If he makes that he steers in for the bold land and is sure to make the breakwater, but in going to Hartlepool its low ground and he can make out nothing. As far as he goes it is shallow water, but at Redcar he carries deep water up to the breakwater.

20,906. (*Capt. Washington.*) Where are you speaking of, the harbour of refuge to be made at Redcar. On the Scars south or north?—One on the Salt Scar and the other I place a little to the north of Huntley Foot.

20,907. You suppose the harbour to be to the south of the Scars?—Yes.

20,908. How far does the Scar extend off the shore?

—I don't know the distance ; I have been there some hundreds of times ; I should think somewhere about a mile.

20,909. Have you often been along that coast ?—Yes.

20,910. Where did you chiefly trade from ?—Every port to the north from this, Sunderland, Hartlepool, West Hartlepool, and the Tees.

20,911. Have you often been in Hartlepool Bay ?—Yes.

20,912. In what part of the bay was it these vessels were capsized in January 1857 ?—I was not there to see them. I was only informed they got a little to the south of the stone buoy and there fell in with broken water.

20,913. That would be something like three fathoms water, I think ?—It would.

20,914. Of course you are aware, if a harbour was made the piers would most likely be carried out in seven or eight fathoms water ?—Most likely ; they must go into that water.

20,915. With that water, might not ships safely run for the piers with an entrance of seven or eight fathoms of water ?—The sea breaks very heavy down there, and vessels leaving the Yorkshire coast with a gale of wind blowing from the south-east running down into Hartlepool Roads will fall in with above one third more sea than they will off Whitby.

20,916. Then you think Whitby is the place at which shelter should be given ?—Yes, in my opinion, it is.

20,917. I observe the southern breakwater in that plan does not join the shore. Do you know anything of the design ? Were you consulted respecting it ?—Yes.

20,918. The southern breakwater does not join the shore. Do you know why that is ?—There is a passage called the Sledway, and that passage is worth preserving.

20,919. What is the depth of water there ?—We have on it now about three feet at low water. It is principally for the flood tide that comes along the beach and goes opposite the harbour's mouth, a sort of wash.

20,920. The flood tide sets away south-east, does it not ?—Yes.

20,921. Does it carry much stuff opposite the harbour's mouth ?—Yes, in north-east gales.

20,922. Would that breakwater enable you to make the entrance of the present harbour better ?—Oh yes, we should have it smooth on the bar.

20,923. The swell would be kept off ?—Yes.

20,924. What number of vessels is there room for in the harbour ?—Above the bridge about 300, and in the lower harbour 80 or 90 more.

20,925. They could be in comparative safety ?—Yes, if the breakwater was made they would be safe in the lower harbour, but as the harbour is now if a heavy sea comes on we are obliged to have them all above the bridge.

20,926. They will not all be in the outer harbour ?—No, they jump and tumble about a good deal.

20,927. I think you said vessels could lie in Whitby Bay with strong east-south-east winds ?—Yes.

20,928. How much further east ?—As it is at present, when it gets east-south-east the vessels must move into the roads.

20,929. Are they able to get their anchors ?—Yes, they go to sea and knock about at sea and endeavour to get their passage.

20,930. Are you speaking of loaded vessels ?—Of loaded vessels.

20,931. They keep the sea ?—Unless it be a vessel makes water, and then she runs for a northern port—Shields or Hartlepool.

20,932. You were asked about vessels lying under Flamborough Head and on the north side, I think you say you have seen 250 vessels ?—I think I have seen as many as 250 there.

20,933. That would be with the wind at what ?—The wind about south-west.

20,934. Blowing hard ?—South-south-west blowing hard. I have been dodging there with the wind as far as south ; when it comes to the eastward of south we must go out of there. The sea rolls round the head.

20,935. What would a ship do then ?—Go out to sea and endeavour for her passage ; if the wind easted we should get the Humber if it came on to blow. If it once gets to the east, carrying close-reefed topsails or reefed foresail, the ship will go to the Humber.

20,936. Would they be able to hold their own at sea ?—Sometimes they drive to the north, and sometimes they hold their ground. It depends upon the weather entirely.

20,937. Suppose it is rather a strong wind ?—A loaded ship carrying single-reefed or double-reefed topsails will always be gaining ground if she is a good vessel, but if she is stripped with the wind south-east or east-south-east, she must drive to the northward.

20,938. With the ebb tide ?—With the ebb tide she would go very fast to the northward. She would not bear up at once, but would struggle against the wind, perhaps she would be days before she would bear up for a port, and then there is no harbour to the north which vessels can take unless they go to the Leith Roads.

20,939. In those days would she have travelled to the north ?—Yes.

20,940. If it came on to blow still more easterly what would she do ?—If the wind eastered and came from south-east and there was a harbour of refuge at Whitby she would come in, or if there was an improved harbour down at the north, anywhere at one of the coal ports, she would go there.

20,941. She must run somewhere ?—She must go somewhere on the shore if she could not go to the firth.

20,942. Could she fetch back to Filey Bay ?—No.

20,943. Whitby she could come to ?—She could.

20,944. Even with only this eastern arm of the breakwater carried out, would Whitby then be a shelter for her ?—It would be a shelter for vessels as far as east-north-east for ships to ride under the breakwater.

20,945. With all south-east winds ?—Yes, with all south-east winds it would be a very good shelter.

20,946. With which winds, if they did not come into Whitby, they must go further noth ?—They must go further north.

20,947. Generally speaking, how far do light vessels going down keep off the shore with the wind off the shore ?—We have them very close now we have those lights at the south.

20,948. That is a great benefit, I suppose ?—They keep a vessel clear off Whitby Rocks, and they can come as near into the land as they please when they get to the north.

20,949. Before these lights were placed there, Whitby Rocks picked up a good many vessels ?—Yes.

20,950. Is there a good buoy upon it ?—Yes.

20,951. Easily to be seen ?—Yes.

20,952. Are there any other rocks or shoals in this neighbourhood which are not buoyed ?—Not in the track of ships, I do no remember any.

20,953. When light vessels come in here to load, what becomes of their ballast ?—Some of them heave it at sea before they come into the harbour, and others discharge it in port. There are two companies here in Whitby having lighters to take it out and lay it on the mud a certain distance from the shore.

20,954. How far do they heave it out at sea ?—Away to the northward of Loft Hole.

20,955. Is there not a fear that they throw it in the roadstead ?—No doubt sometimes they come too close in.

20,956. Cannot you prevent that ?—By an Act I believe we could lay down buoys, but there is no power at present.

20,957. It is no use building a breakwater if you are spoiling your roadstead with ballast ?—But if the

WHITBY.

Mr. W. Tose.

22 Oct. 1858.

Capt. Washington.

breakwater was made, of course there would be proper ballast buoys laid down outside.

20,958. Does this ballast come into your own harbour ?—No ; it never comes in nearer than the piers.

20,959. Are there many boats fishing out of Whitby ? —About the neighbourhood, including Staithes, Runswick, and Robin Hood's Bay, we have about 240.

20,960. Would the breakwater be of any use to them ?—Yes, this breakwater would ; we have them come in here sometimes ; I have known 60 or 70 of them come in in one tide in the herring fishing.

20,961. Do they fish all the year round on this coast ?—The large boats go to the herring fishery in the summer season. They fish with large boats in the herring fishery; and in the latter part of the year they lay the large boats by, and fish with the small cobles, setting off every morning and returning during the day.

20,962. What number of pilots belong to the port ? —Eleven.

20,963. Are they under your orders ?—No.

20,964. Do they hold licences ?—Yes.

20,965. From whom ?—From the Trinity House of Newcastle.

20,966. Do you pay any dues to the Trinity House of Newcastle ?

(*Mr. Smales.*) There is the same charge here as there is at Sunderland and the northern ports.

20,967. (*Capt. Washington.*) Perhaps there will be somebody else who will speak to that. What money is paid to the Trinity House of Newcastle ?

(*Mr. Smales.*) The collector of customs receives the dues here. He is the only person who can speak to that point. I can state that upon a vessel of mine, which delivered a cargo from Quebec, the primage charge was near 6*l*.

20,968. You do not happen to know the whole amount paid annually ?

(*Mr. Smales.*) I do not. I could give you that to-morrow.

20,969. You said something like 600 vessels, on the average, take refuge here in the 12 months. Have give you that account from the Custom House, or do you it to them ?

(*Witness.*) I take my own account.

20,970. You do not distinguish whether the vessels were loaded or unloaded ?—No.

20,971. Could not the Custom House do that ?—I should think it could, but I do not know.

(*Mr. Smales.*) The only return they can give is the one I have handed in.

20,972. I think you said you were consulted about the present design for covering Whitby Bay by Mr. Harrison's breakwater ?—Yes.

20,973. Do you happen to know the depth of water in which the outer breakwater is laid down ?—The plan shows eight fathoms, seven, and six, and shoaling to five fathoms as you draw to the northward.

20,974. I see 60 feet at the outer end ?—I think that will be to the southward of the outer end.

20,975. Were you engaged in taking the soundings ? —I was in the boat with Mr. Harrison when they sounded all along.

20,976. Is there a life boat belonging to the port ? —There are two.

20,977. Where are they stationed ?—One on the pier, at the west pier ; the other in a shed at the Burgesses pier.

20,978. Are they often used ?—Yes.

20,979. Have they been the means of saving life ? —Yes.

20,980. Who manages them ?—Volunteers.

20,981. Are they under your charge ?—I have the management, I am always there to see that things go on right.

20,982. Are they in good repair ?—Yes.

20,983. Are there rockets and mortars for throwing ropes ?—The coast-guard have them.

20,984. (*Capt. Sulivan.*) You said that 1,800 vessels took refuge here ?—No, trading and refuge.

20,985. I think you said that 600 a year took refuge in three years, that is above 1800 ; is that refuge alone ? Those are the numbers you gave, are they vessels not bound to this port, but coming here for refuge ?—Yes.

20,986. These vessels pass the pier head and come inside ?—Yes.

20,987. What water have you over the bar inside from there to the bridge ?—I think it is nearly the same as on the bar. When we get above the middle buoy we have a little more inside than what we have at the middle buoy.

20,988. If you deepen the bar as you call it to give any refuge you would have to deepen it right up to the bridge ?—Yes.

20,989. You said that vessels would take the ground in the harbour ?—Yes.

20,990. The channel I think is very difficult to take, on account of its drawing towards the east side ? —Yes.

20,991. Have you never made any attempt to straighten it ?—We have not, but I think we are now going to commence, we commenced to do it last spring, but there came on rain and we were put off.

20,992. Is that channel caused by the stream being deflected over to that side by any projection on the west, or is it owing to any formation of the ground ? —I am sure I cannot say. I think that the current that comes down the harbour shows itself on the west side, which is above that place, and then it throws it over to the other side.

20,993. This projection which is shown upon the chart ?—Yes, I think it is.

20,994. You describe 250 vessels as anchoring under Flamborough Head ?—Not anchoring.

20,995. Well, off Flamborough Head ?—I have seen 250 vessels dodging to and fro there.

20,996. With the gale from the south-east they are forced to sea ?—If it got to the east of south they must go to sea.

20,997. Have you ever known vessels that were so situated having put back to the Firth of Forth ?— I have.

20,998. If we have been told by one person that he has been three times driven back to the Firth of Forth from Flamborough Head, would you doubt it ? —I have no doubt but what he may have been.

20,999. Would not all this have been saved if there had been a harbour at Filey ?—I don't know, I am sure, as to that.

21,000. Could these vessels, if they chose, when the gale came on from the south-east and forced them off from Flamborough Head, instead of risking being driven back, have gone to Filey ?—If they took it in time, but when the wind gets to the east of south they generally go to sea, expecting to go to the north and east, and then they get off, and can't fetch Filey when it comes on.

21,001. Do they go off because they have no shelter ?—They are afraid of losing their passage if they go into the harbour.

21,002. With south-west and south winds do they often anchor under the head ?—They do.

21,003. If there was protection equal to that which they now have with south-west winds, against south-east winds do you think they would risk being driven back or would they anchor ? — Some would take refuge in the harbour, and some would go to sea to see how the weather turned out ; if a gale comes on after they get out they can't get back.

21,004. Do you believe that any man knowing the chance of being driven back to the Firth of Forth if a gale came on from the south-east, would hesitate to run into Filey rather than be driven back ?—If he knew he was going to be driven back he would go in, but he can't know that.

21,005. If he knew the risk of it ?—Though he knew the risk of it, a man will not take the harbour when a breeze first comes on ; he will endeavour for a passage a little while before he will take shelter ; then the wind comes on heavy, a gale perhaps, and he can't fetch the harbour of refuge the next day. There is no doubt a great many masters on the coast,

who, the moment it comes a puff of wind, run into harbour directly ; others go to sea, and thrash about for weeks.

21,006. Do you believe a man who anchors under Flamborough Head, where it is naturally good anchoring ground, with the wind from the south-west, would neglect to use a harbour giving protection from south-east winds if it existed ?—Frequently with the wind south-west and south-south-west they will ride smoothly enough ; but if it once gets to the southward and eastward, they are unable to remain there, but if the wind goes to the east and towards the north they get their passage ; if however, they went into the harbour of refuge they could not get it.

21,007. If they took refuge in a harbour at Whitby from south-east and east gales, would there not be the same difficulty in getting out if the wind drew to east-north-east or north-east ?—All the same.

21,008. From Hartlepool or Redcar would there be more or less difficulty ?—I believe they would come out of Hartlepool better, with a wind from the north-east than from any other port.

21,009. Better than from Redcar ?—I don't know about Redcar, that lies away to the south, and perhaps they could come better out of that as they would not have so much broken water ; Hartlepool would be to windward and would give a better start.

21,010. I think Redcar would lie a little outside the pier at Hartlepool ?—Hartlepool pier lies a long way in the bight.

21,011. (*Capt. Vetch.*) I think you say you have been seven years harbour-master ; can you tell me, during that time, how many vessels have been stranded between the harbour's mouth and the Upgang Rock ? —I have known six vessels laid upon the sand all together.

21,012. In one gale ?—Yes.

21,013. Could you give a list of the whole numbers during the whole time you have been harbour-master here ?—Yes.

21,014. I suppose that the proposed harbour would save all these casualties ?—If this breakwater was made on the Whitby Rock, I have no doubt it would save them all.

21,015. Looking at the distance between the Upgang Rock and Sand's End Ness have you seen any wrecks ashore there ?—Yes.

21,016. How many ?—I think the most together was two, I might have seen three together.

21,017. Perhaps you can tell us how many wrecks took place in this district during the time you have been harbour-master here ?—Yes.

21,018. (*Mr. Coode.*) You have spoken of the material dredged in the harbour being taken outside ; can you tell us how much is taken out in the course of the year ?—I can't tell that but it can be given.

21,019. What material is it silt or sand ?—It is made up of silt and sand, a little of all sorts.

21,020. Muddy silt ?—Yes.

21,021. Where do you generally deposit it ? How far out ?—Outside the rock ; sometimes we take it a little to the southward of the high part of rock.

21,022. You mean Whitby Rock ?—Yes.

21,023. Do you discharge it at any particular time of tide ?—We always take it at half flood high water, or two thirds flood. It depends upon how the steam-boat is ready to take the boat off. We generally take it off at flood. There is always a strong flood going to the south when it is taken out, and the tide runs outside 2 or 2½ hours after high water.

21,024. What is the strongest rate of tide outside the harbour's mouth at spring tides ?—That depends on the weather. We have sometimes north-west and north-north-west gales. The tide will come past four or five knots, that is in gales of wind from the north-west and north-north-west. With the wind from the south-east we never have any flood come beyond the harbour's mouth.

21,025. What is the strength of the ebb tide during south-east gales ?—We have but very little ebb in Whitby Roads, perhaps 1½ knots, or something of that sort. It is the wind that heaves the vessels so far to leeward.

21,026. How far off the harbour's mouth does the strong flood extend ?—Perhaps outside of the rock you will find it strongest.

21,027. What would it be about a mile from the shore ?—On the rock buoy it would be about what I have said. About the rock edge the tide runs very strong at times.

21,028. Do you know of any deep sea fishing boats belonging to this place ?—Some go 30 or 40 miles from the land especially in the summer season. I believe they sometimes go 50 or 60 miles out—sometimes to the north and sometimes a little to the south. They go on to the Dogger.

21,029. Do they choose any particular points for fishing?—Sometimes they go into deep water, sometimes into shallow water.

21,030. You said you consider a harbour should have seven fathoms water. Have you seen the design for a harbour at Hartlepool ?—I have not.

21,031. You said you thought the harbour should be in from six to seven fathoms water ?—That is my opinion. I think it ought to be.

21,032. You spoke of some broken water in which vessels were lost inside the Heugh ?—Yes.

21,033. Do you think there is seven fathoms water in there ?—There are not seven fathoms there where the vessels were capsized.

21,034. The harbour would have to go beyond the Heugh to meet your views ?—Yes.

21,035. Supposing the harbour went far enough beyond the Heugh to be in seven fathoms water ?—If it went out into deeper water it would be better, but there is the great danger of Hartlepool Roads silting up.

21,036. Have they silted up ?—Very much since I first was there.

21,037. How do you know that ?—From my own experience.

21,038. Have you sounded there ?—Many a time.

21,039. When did you take the soundings ?—I have gone in about 18 years ago as master of a ship, when I used to let go my anchor in about six fathoms water, but I don't think that now on the same place there is more than 3½ or 4 fathoms water to be found.

21,040. How long ago is it since you found six fathoms there ?—Seventeen years, perhaps.

21,041. If you saw by the Admiralty charts that there was no material change in the water, should you believe it ?—I know by my own experience, by letting go anchors and soundings myself.

21,042. Had you any reference to the state of the tide at the time ?—There is a strong ebb tide goes out round the Heugh, but very little tide in Hartlepool Roads.

21,043. I am not speaking of the strength of the tide, but of the level of the water. Did you have any reference to the level of the tide at the time you sounded ?—We can't go so far in to bring up as we used to do, and so the place must have grown up.

21,044. When did you last bring up there ?—I went in the steamboat about a month ago. Where we used to anchor the steamboat got aground.

21,045. Do you give that answer deliberately, are you quite sure that you were in the same position ? —Yes ; where we used to let go the anchor, the steamboat came on the ground.

21,046. (*Chairman.*) Are you well acquainted with the vessels in the coal trade ?—Yes.

21,047. And have you known this place a considerable number of years ?—Yes.

21,048. Taking the vessels generally employed in the coal trade, are you disposed to say they are as good vessels as those of a similar description employed in the foreign trade ?—They have some good ships in the coal trade.

21,049. I am talking of the general run of ships in the coal trade, are they as good in general as ships engaged in the foreign trade ?—No, they are not.

21,050. Are ships in the coal trade generally well found—I mean well found in sails and running rigging,

WHITBY.

Mr. W. Tose.

22 Oct. 1858.

Chairman.

standing rigging, masts and yards, so as to enable them to work off a lee shore?—Some of them very indifferent, I am afraid, now as times are.

21,051. As respects the state of the hulls what are you disposed to say about that?—A great number of them as soon as they fall in with a gale of wind are sure to make a good deal of water.

21,052. Does the making a great deal of water arise from the circumstance of their being in bad condition, or from the circumstance of their being frequently on the ground, and, as vessels in that case are almost sure to do, straining when they get to sea again?—Chiefly from being in bad condition I should say.

21,053. Does the foundering of a laden collier at sea frequently happen?—It does.

21,054. Do you know from what circumstance that arises?—From the vessels being decayed a little, and when the sea breaks over them they make water and more, and before they get to the shore they sink. It is not long since we had a very large screw collier here. If we had a harbour of refuge down here, or this breakwater at Whitby, that screw collier would have come in, but she sank outside the rock.

21,055. She was very fully laden, I suppose?—She was loaded. The crew got on board a smack, I think—a part, not all.

21,056. From what you heard was she over laden?—I do not know; I made no inquiry of that.

21,057. I have been told that vessels in the coal trade have exceedingly good pumping gear, is that so?—They generally have. The captain looks out for that.

21,058. Does that arise from their being obliged to have frequent recourse to it?—No doubt of it.

21,059. Are colliers, generally speaking, sufficiently manned; I do not mean as to the abilities of the seamen, but as to their numbers?—Some are very well manned, others are quite the reverse.

21,060. Therefore in the winter, in the fall of the year, when there is a great deal of coarse weather, and these vessels are knocking about at sea, making a good deal of water, and what with pumping, and what with the work after four or five days of bad weather, are not the crews pretty well done up?—Yes.

21,061. Then, that being the case, would you be disposed to say if a harbour of refuge existed at Filey Bay, which would enable these vessels to anchor instead of thrashing about, would that be the direct means of saving life?—They would be very glad to get in after thrashing about and after many days pumping; no doubt they would be glad to get into any harbour.

21,062. And those who, when their people are done up—your good shipmaster who keeps the sea in order to endeavour to make his voyage with a crew up or down—does he not run considerable risk of their lives?—Yes, at times; but as long as the ship is good and everything holds on she is all right.

21,063. But I am speaking of cases where she is not good?—Then they are glad to get into any harbour, and sometimes they run upon the beach.

21,064. In that point of view would a harbour of refuge be of any use to the colliery trade, to get up so on their voyage and then to hold what they had made?—It would be of use. I have no doubt that a number of ships would take it at times.

21,065. And looking at the men who are good seamen, and who have the spirit which every good seaman has, of trying to keep out as long as possible at sea, and endeavouring to make their voyage, would it save them generally in these bad ships from very considerable risk of their lives?—In bad ships it would, certainly.

21,066. (*Sir F. Smith.*) I am anxious about the soundings in this proposed plan of Mr. Harrison's. As you talk about sounding in Hartlepool Bay, and that by a cable, I may ask did you take the soundings here in an exact line with the breakwater, because they are not so laid down here on the plan?—I have sounded for the breakwater. I often sound in Whitby Roads.

21,067. Are you quite certain of the exact depth of water in which it is proposed to form this breakwater?—About three weeks ago I went in the steamboat from Stone buoy to Sand's End Ness, and sounded all the line.

21,068. Was that in the exact line of the breakwater?—I think it was.

21,069. Then how is it that the soundings are marked some distance off, some thousand feet or so?—I do not know. Forty-seven feet touches the end of the breakwater.

21,070. I have only one sounding of 60 feet here?—There are none except the 47 feet along the line. The 60 feet is outside the breakwater.

21,071. That is not on the plan which is given to us; there is 60 feet and 47, and there is no other figure in the exact line of the breakwater?—This is the line that we run in the steamboat, where the marks are, where our soundings were.

21,072. That is not where the breakwater is to be. The breakwater is apparently to be in deeper water?—I do not know that there would be the least difference.

21,073. Have you the plan?—Yes.

21,074. Are there any soundings in the line of the breakwater except the 47 feet?—No, there are not.

21,075. Then these soundings do not give me any idea of what the depth of the water is to be at the breakwater, except the 47 feet?—It does not.

21,076. Then I will ask you whether the breakwater is to be in deeper water than is shown by these figures, or in shallower water?—I should think it would be about the same water as is shown in the chart.

21,077. Will you stake your reputation as harbour-master upon that fact?—I will go and sound it first.

21,078. You took these soundings?—I took the soundings on the line.

21,079. I ask you whether, in your opinion, the depth of water is the same, or more, or less upon the intended line than is shown here?—My opinion is, that it will be the same.

21,080. And yet as harbour-master of this port, having taken these soundings, you are not prepared to say positively?—I am prepared to say as far as I sounded. I did not sound where the breakwater is there.

21,081. You did not sound where the breakwater is to be?—I referred that to Mr. Harrison.

21,082. You being harbour-master, and saying that you took the soundings——I was along with Mr. Harrison, him and more gentlemen.

21,083. And the soundings were not taken on the line of the breakwater?—Only in one part.

21,084. Therefore, I want to know from you, whether you will stake your reputation on the soundings of the intended line of breakwater being exactly the same as those put upon this plan?—I think something about the same water, I am not quite sure.

21,085. You are not quite sure, and yet you have no doubt that in Hartlepool Bay there has been an alteration of nine feet?—I have been bringing up in Hartlepool Bay;—I never did here.

21,086. But you have been sounding here?

(*Mr. Harrison.*) The soundings are taken by my assistants. The harbour-master was present in the boat, but I do not look upon him as responsible for them.

21,087. (*Sir. F. Smith.*) They are not taken on the breakwater?

(*Mr. Harrison.*) I said I had already arranged to have soundings taken for you. From all the information I could get the depth of water is nearly the same. I have estimated the line of breakwater would be in eight fathoms, which is deeper than any shown here. I am going to have it laid before you carefully prepared. I quite feel, that in that respect, that is an imperfect plan.

21,088. (*Sir F. Smith.*) You must feel that when a man gives the dimensions of a distant port, and not of his own, one cannot place the same reliance upon his views as if he did know his own ?

(*Mr. Harrison.*) These soundings are taken by my assistants.

21,089. (*Capt. Washington to the Witness.*) You know the coast pretty well ?—Yes.

21,090. Do you know Runswick Bay ?—Yes.

21,091. Were you ever in it ?—Yes.

21,092. Is it a good bay ?—Well, it is a very nice little bay for the size of it.

21,093. Do you use it as a stopping place or what ? —At times we do ; vessels will ride in Runswick Bay.

21,094. Did you ever know a good many go there ? —I have known as much as a dozen sail riding there.

21,095. Do you think it would be useful to make a small harbour of refuge there ?—It would make a very nice little harbour for the size of it.

21,096. But it is small ?—Yes.

21,097. Is it good holding ground ?—Very good holding ground in the middle of the bay, but on each side there is a little rocky Scar.

21,098. (*Capt. Sulivan.*) Will you look at the chart—at the soundings laid down at the east of the breakwater, at the entrance of the harbour, I see there that you have very rapid changes—30 feet alongside 41 feet, and 55 feet inside of 41 feet ;—no regular depth over the whole of that space ?—That will be close up to the rock.

21,099. I am speaking of the whole space covered by the east breakwater. How can there be that irregularity of depth over the space proposed to be sheltered, if it is good holding ground ?—I think that will be on the rock.

21,100. On the east side of the space, in a line between the proposed eastern opening of your harbour—that is on the eastern part of Whitby Bay, which would be covered most securely by the proposed breakwater, and within which vessels would have to anchor, in order to avail themselves of the protection of the breakwater, if it is made ?—It is blue clay in, and very good holding ground.

21,101. Then what can make these sudden changes ? Look at the line running from the harbour directly upon the end of the east breakwater, it goes nine, 13, 20, 35, 33, and 55 ?—There are a great many large stones or loose pieces of rock. Perhaps the lead has happened to fall on one of these sometimes.

21,102. How can you call that a good anchorage ground which is rocky ?—We must keep clear of that in anchoring.

21,103. Yet the part of the bay which would be secure in east-north-east and easterly gales must be on that side of the bay ?—We must not come to the south of the pier to ride. We must come to the north.

21,104. I am speaking of a line directly from your harbour to the proposed entrance. Will you look at the line of the two 55's here ? That would be the best part for a vessel to anchor, if it was good holding ground ?—That is rocky altogether. I see 55, 55, 53, 35, 20 all in a row.

21,105. I want you to look at the side where there is 57 and 41 ?—Outside that there is 57 and two 41's.

21,106. The two 41's are outside the 57. That is about the best spot in the whole bay for vessels to anchor, if they are to have protection from the eastern breakwater. You will see 30 just to the west of this ?—Yes.

21,107. That is considerably outside the 46, 38, and 55 ; therefore, we must presume it is rocky ?—I am not aware it is rocky. I always found it good holding, and never remember a ship driving on the Whitby Rock.

21,108. That 30 is as far east as a ship could anchor to get good shelter from the breakwater. I want to know how all these differences of depth occur in that part of the bay, if you can depend on that holding ground ?—Vessels ride close down to the Upgang Rock.

21,109. They go so far south to ride ; but if the eastern pier is made, and a gale is blowing from the east or east-north-east, the whole of the west part towards the Upgang Rock will be perfectly exposed, and if there was no pier at all to get shelter from, vessels must anchor between the hard ground and the harbour, and it is in that corner that the soundings are so irregular ?—They vary, but I do not know how to explain it.

21,110. You cannot explain whether the irregularity is caused by the rocky bottom ?—I cannot, but I am aware that it is all good holding ground.

21,111. Do you not think, before any plan is decided on to be put forward as a plan to shelter that very corner of the bay for a harbour of refuge, or an auxiliary harbour of refuge, that care should be taken to ascertain whether these alterations are caused by a rocky bottom and what the bottom is ; do you not think that the bottom should be marked on the chart as well as the depth ? And would you not consider that that was very important to ascertain before any decision should be come to about that anchorage ? —I think it would.

21,112. (*Mr. Coode.*) You have said that vessels have anchored close down to the Upgang Rock ; if you look a little to the east of that, you will see 20 feet marked outside 30 feet ?—It varies.

21,113. So that if a vessel were anchored just to the east of the Upgang Rock, and it was blowing from the north-east, there would be a fall of 10 feet towards the south-west only 400 feet off ?—If the wind was in the north-east they would not anchor so far off as that.

21,114. Suppose the harbour were inclosed would it not happen that vessels anchoring there would have a hole of 10 feet within 400 feet of them ?—Where we have 30 and 38 on this chart is the best place for riding in Whitby Roads.

21,115. Supposing the harbour were made, would not a vessel be very much exposed to the wind from the east and south-east ?—No ; so long as they keep to the south of the Upgang Rock, they will have only a rolling swell. If the wind should veer to the east, they would be too much exposed, but so long as it keeps to the south-east, vessels would still ride.

21,116. (*Mr. Lindsay.*) You have been seven years harbour-master here ?—Yes.

21,117. Have you never satisfied yourself upon this very important question, what description of ground you have about here ?—Always when I have gone to sound in the bay I have found good blue clay.

21,118. I mean to the westward of Whitby Rocks, which in the easterly gales would be the best sheltered part of the whole of the proposed harbour. Do you mean to tell me you do not know whether there are rocks or stones there ?—I do not ; I have sounded, and if there are rocks there is sand or mud on them. I did not know that there were any to the north of the pier.

21,119. But speaking as two sailors talking together, and seeing such an irregular depth, jumping from 33 feet to 55, is not that a clear indication that there must be rocks ?—In sounding I have found seven, eight, or nine fathoms water, just about where the vessels ride.

21,120. Can you say positively there are not rocks in the bay where these soundings are marked ?—I never found any.

21,121. Have you ever known ships to lose their anchors there ?—I have known vessels ride there, and when the wind has got to the east, and the sea is coming in very heavy, I have known them slip their anchors.

21,122. Was it because they could not get their anchors ?—Yes.

21,123. It was on account of the suddenness of the gale ?—Perhaps they had been riding for days with the wind blowing down from the south-east. Perhaps it shifted a little and fetched out easterly. They have been rather afraid to ride and thought it better to go out to sea. I have seen several slip their cables, and many get their anchors and go out to sea.

21,124. (*Mr. Coode.*) Have you a chart of Whitby Roads ?—I have not one myself. I can get one in the morning.

Saturday, 23d October 1858.

PRESENT :

Admiral Hope (Chairman).

Sir Frederic Smith.	Captain Sulivan.
Mr. Lindsay.	Captain Vetch.
Captain Washington.	Mr. Coode.
	Mr. Evans, Secretary.

Mr. George Barrick examined.

WHITBY.

Mr. G. Barrick.

23 Oct. 1858.

21,125. (*Chairman.*) You are a shipowner and ship builder, resident at Whitby ?—I am.

21,126. Were you ever at sea ?—Oh yes.

21,127. For what period ?—About 20 years.

21,128. For what period in command of ships ?—About 12 years ; from 11 to 12.

21,129. In what trade were the vessels chiefly employed which you commanded ?—All parts of the world, I think. I first began in a little collier, and I finished as a commander in the East India trade.

21,130. Generally speaking, were you employed as a commander in the foreign or in the coasting trade ?—Generally in the foreign trade.

21,131. Give me your opinion as to the best locality for a harbour of refuge in this district of the coast, and your reasons for preferring this or any other site ?—I consider that the geographical position of Whitby is the most eligible position for a harbour of refuge, inasmuch as it is a promontory on the North Sea, projecting from 10 to 12 miles further out than the bight of Tees Bay, consequently, ships—more particularly ships that get into difficulty off this coast, would be able to get into the breakwater at Whitby, when they would not be able to reach further north. I do not mean to deprecate the forming of a breakwater at Hartlepool. Mind, I do not wish to do that on any account, nor to say anything against any other port.

21,132. Then are you disposed to say, that for the purpose of saving life on this coast, it would be better to improve all the ports if possible, so as to take vessels drawing 16 feet at low water ?—Yes, if you can get 16 feet at low water, but I am afraid you would only be able to get it in one part, of this part, of the coast, and that is in the Tyne. I do not think it is possible to get as much as 16 feet on any other part of this coast.

21,133. Supposing you could get 16 feet at the Tyne, and say 10 or 12 feet at the Tees and Wear, would you then, in connection with some improvements here, consider that the most desirable system to adopt ?—I would, in order to assist all.

21,134. As a system ?—Yes.

21,135. How do you view this plan of a breakwater here—merely as a small portion of the contemplated improvements ? I mean that which runs off on the Whitby Rock ?—It would be a very great shelter to ships with the wind from the south-east, or perhaps, even as far southward as south-east by south, and about to east by north. It would make a pretty good anchorage. But the northern part of the roads with the wind at east and by north would be subject to a very heavy sea rolling in.

21,136. So that even if the breakwater on the Whitby Rock was constructed, the vessels would be in a very bad anchorage, and would be exposed to a very heavy sea if the wind backed round to the north, east and blew hard ?—Certainly.

21,137. Do you think that the anchorage ground is sufficiently good, that in such a place they would have a fair chance of holding on ?—I have seen them holding on.

21,138. The roads are good anchorage ground ?—The anchorage is most excellent, until you come to the Upgang rock ; it is formed of blue clay.

21,139. Have you ever seen a considerable number of vessels lying in that anchorage ground in a heavy gale from the north-east ?—Yes.

21,140. What number would you be disposed to say ?—From 60 to 70 sail. Not lying there with the wind to the northward of east ?—Certainly not, because they endeavour to get away as soon as the wind gets to the north of east. They endeavour to get away if possible. Some of them go away, and others, if the tides suit, run for the harbour, and go into the port.

21,141. Can you recollect, during your experience of the port, having seen any considerable number of vessels caught here in a heavy north-east gale ?—I have seen hem sometimes obliged to slip and get away, and some come upon the shore even.

21,142. Under such circumstances have you seen any considerable number ride out the gale? Can you recollect any particular instance ?—No, I cannot, not with the wind at north-east.

21,143. Would you be disposed to say, that with the wind at north-east the sea is so heavy that the chance of holding on would be very bad ?—Very bad indeed, but there have been instances.

21,144. They are few in number ?—Very few in number.

21,145. As respects the more extended plan, what would you be disposed to say, taking the whole thing ? That, of course, would make a capital place; and capital anchorage, there is no doubt of that. I consider, as far as regards that, that by taking it out a trifle further than it is on the plan, it would be one of the finest refuge harbours in the kingdom. For if you take the area of water that you now have where a fleet of 200 sail can ride, you will find that you will have twice the area in any other port on this coast before you could get that anchorage. The ground, I believe, is considered very good ground. I cannot speak so much for the north of the Upgang Rock as to the south, but to the south I know the ground is very good. As indeed you will notice, the ground is pretty steep until it comes near the beach.

21,146. Have you any knowledge whether the ground close up to Whitby Rock is broken ground? If the soundings are correct, the ground looks like rocks and broken ground ?—I can only say that at very low tides during the springs, it sometimes shows a great deal of broken ground there. I cannot say that I have ever sounded to the south to ascertain that.

21,147. For which class of vessels is the harbour of refuge most needed, for light or laden ships ?—Decidedly for laden ships, for if a light ship comes here and is likely to go ashore, if she runs for any part of the beach, except the iron-bound coast to the north, the lives of the crew will be saved ; but laden ships sometimes strike on the ground a considerable distance from the shore, and there is a difficulty in saving the crew. I am very glad, however, to say that I can vouch for the life boats of this place being of as much service as any in the kingdom, wherever the others may be. I have had a good deal of experience, and when there has been any danger, we have always found that there has been no want of men for that service. On the contrary, we have been obliged to get constables to keep the people out of the boats.

21,148. That is very creditable. As respects the light ships, your opinion is, that wherever there is a sandy beach, a light ship can run ashore, get high up and save the people ?—With a few exceptions. There are some places between Runswick and Staiths where it is quite iron bound, and of course there the crew would perish if the ship were run upon the shore.

21,149. But wherever there is a sandy beach all along this coast from Flamborough Head to the Farn Islands a light collier can generally save her crew ?—Yes, she can.

21,150. Can you state any cases in which vessels

have been off Whitby, and have been wrecked in going north and in endeavouring to reach the northern ports?—Yes; unfortunately I had a vessel of my own wrecked some five years ago, on the 4th January gale. A ship of mine got as far as the south cheek of Robin Hood's Bay; after contending with the wind for four or five days, the master attempted to take Shields, and went ashore and was wrecked there upon the Black Middens.

21,151. Was that a large ship?—A large ship.

21,152. Was she a collier?—She was, and a very fine ship.

21,153. She succeeded in reaching the cheek of Robin Hood's Bay?—Yes.

21,154. Then she knocked about in bad weather for several days?—Yes.

21,155. And then she ran back and tried to get into the Tyne?—Yes; and went on shore.

21,156. Where she was lost?—On the Black Middens; the starboard land going in.

21,157. Do you know at what time of the tide the master attempted to run in?—I almost forget, but I think about three-quarter flood.

21,158. I presume the last quarter of flood is the best time for a vessel to run in?—She was struck by a sea just as she came to the bar, which damaged her abaft and carried away the wheel; I believe that was the reason of her going on shore; it was from nothing else.

21,159. So that even if we do improve these ports along the coast there always will be considerable risk in a heavy gale, in respect to laden ships running into them from accident, such as that you have mentioned?—Speaking of Tynemouth, I myself recollect some 40 or 50 years ago, when I was a very young man in command of a coaster, being taken by a gale of wind off Flamborough Head in going down; I carried an immense press of sail and succeeded in getting to the offing of Tynemouth; I hove the ship to, until daylight at five o'clock in the morning, and as soon as it was daylight we took the opportunity of about three-quarters flood, let two reefs out of the main top sail and set the main top gallant sail; all the people took to the rigging except myself and the man at the helm, and we went into Shields without any injury. There were 13 ships went on the Herd Sand, and five on the Black Middens the same tide. We had the greatest difficulty in rounding the piers and were surrounded by broken water on every hand; therefore I consider, that if Tynemouth could be got to have 16 feet at low water there would not be that danger that there may be now.

21,160. From your account of the matter, even when there is plenty of water for a ship to run into these bar harbours, yet in a gale such as you have described, running in, is a matter of considerable risk, particularly if you run in between long piers, is that the case?—Yes.

21,161. When you shook out the reefs and set the main top gallant sail, and bore up for this harbour, and sent all the people into the rigging, you must have thought it a matter of risk and very great danger in taking the harbour?—Yes.

21,162. Is that a reason for giving up bar harbours, and endeavouring to establish a harbour somewhere on the coast where we shall have no tide running out?—It might be.

21,163. Would you be disposed to draw that inference from it? Because, if we had a harbour such as is drawn on this plan for Whitby, running into a harbour of this kind in a gale of wind would be a very different affair from what you have now described, in reference to running into Tynemouth, would it not?—It would. I wanted to succeed in gaining the port, and having a good ship well found and everything of that kind, and well manned, I found, that by making those exertions I should gain my point, which I did. I think that there was the greatest wreck on this coast, in that gale, that ever was known; one or two keels out of Sunderland or the Tyne, I can speak of as having come upon Whitby Sand.

21,164. Do you recollect any other instance of the same kind, that you can tell us from your own personal knowledge?—I cannot.

21,165. You are decidedly of opinion, from what you know of bar harbours, that it would be a very difficult affair, indeed, to make them safe harbours to run into in gales of wind?—Yes.

21,166. Will you give me your opinion as to the most dangerous wind on this district of the coast?—The winds from the south-east, east-north-east, and north-east. Indeed, I consider that we have the wind blowing hardest and heaviest when it is from the north, which is almost along the land.

21,167. When the wind gets round to the north and north-north-east, as a general rule the vessels can manage to get off the land?—Of course, as far as north-east.

21,168. Unless under very peculiar circumstances and being very close in?—Yes.

21,169. Do you think that the sudden shifts of wind which we heard about are common on this coast?—I think the most sudden shifts are, when the wind blows very strong from south-south-east and south, and from that to south-south-west, and it rains tremendously. Sometimes directly the rain is over the wind goes right round to the north-north-west, very suddenly indeed, so much so that you may see the ships standing almost over-end after they get a fair wind to go to the south.

21,170. That shift of wind is not dangerous because it comes off the shore?—Of course not.

21,171. But is it usual for gales on shore to spring up suddenly?—They come on generally moderately.

21,172. A man who has experience on the coast generally has fair warning?—Generally, I should say. The shifts which I have described, the wind flying from the southward to north-north-west and north-west, are the most sudden shifts.

21,173. I am now talking of a breeze suddenly springing up on shore. Are there generally indications in the weather, which would enable a man who is accustomed to the coast, to know a few hours before hand what is likely to come?—I think it generally is so. It gives a little warning.

21,174. Does the sea frequently come in before the wind?—I have known it do so from 12 to 18 hours before the wind came on; it has come in very strong.

21,175. Is that accompanied by calms and light winds?—By calms, light and variable winds.

21,176. So you would say that it might happen that if a vessel was close in shore, although the master might know that he was likely to have a breeze, he might find a little difficulty in getting off the shore owing to the want of wind?—Yes.

21,177. Should you be disposed to say that a man who kept a sharp look out, could generally get off before the gale came on?—He would generally get a little off.

21,178. I think you have already given your opinion, but I will ask you again as to the distribution of harbours, whether that would be better than having one?—I think it would.

21,179. Do you still retain the opinion that a distribution of harbours would be better than one?—Yes.

21,180. But these must not be bar harbours?—There are no others.

21,181. You have given very strong evidence as to the risk you run with a good ship and a good crew, running into the best bar harbour on the coast, the Tyne, at the most favourable time of the tide?—Yes; there is a great risk.

21,182. Well, taking that into account, do you still think that the distribution of bar harbours would be more useful, because bar harbours I fear they must be, than having one single good harbour somewhere on the coast, which should not be a bar harbour?—I do think, that dangerous as bar harbours may be, a distribution of assistance and help, by improving them, would be preferable to having one monster harbour.

WHITBY.

Mr. G. Barrick.

23 Oct. 1858.

Chairman.

21,183. If an engineer could contrive outside these bar harbours to throw two projecting piers so as to make a little sheltered port for 20, 30, or 40 vessels to run into and find refuge on a pinch, would you consider that would meet the exigency of the case ?—Yes.

21,184. And that would diminish the danger of running in ?—Yes, because the sea would not be near so high and the steerage of the vessels would be much better going in.

21,185. (*Mr. Lindsay.*) Whether do you think that the expenditure of 2,000,000*l.*, which would be about the cost of the proposed harbour at Whitby, here, or the expenditure of half a million at Whitby, half a million at Filey, and half a million at Hartlepool, would do most to save life and property ?—A monster harbour would be most efficient, and most likely to save the most life and property.

21,186. You think the expenditure of two millions here ?—I think the expenditure is monstrous to look at, and it will take such a time to accomplish the work—10 or 12 years.

21,187. Do you think that the expenditure of two millions here would do more to save life and property than if divided between Filey and Hartlepool ?—I do not ; but I think that as a national concern, it is strongly to be recommended.

21,188. You think that as a national concern it is desirable to have the great harbour ?—Yes.

21,189. But looking to the saving of life and property, you think the distribution of the money between Filey and Hartlepool would be better ?—Yes.

21,190. (*Chairman.*) You said that the most dangerous winds were from north-east to south-east ?—From north to south-east, certainly from north-east to south-east.

21,191. Let us suppose the wind at east, and suppose a ship on this coast off Scarborough somewhere between Flamborough Head and Whitby which is nearly a straight line, with an east gale, she could not weather away Flamborough Head to the southward ?—No.

21,192. Nor could she weather away the North Cheek, or perhaps Whitby Rocks to the north ?—No.

21,193. Supposing a ship in this position, how would a harbour to the north of Whitby Rocks save such a ship ?—It could not be of any avail at all if she could not weather the North Cheek ; impossible.

21,194. Is not the difficulty upon this line of coast—does not the danger arise from ships not being able to weather Flamborough Head on the one side and Whitby Rock on the other ?—Yes, that is one of the dangers.

21,195. That is the real danger of this coast of which we are speaking now ?—Yes.

21,196. Therefore, for these ships a harbour as laid down before us, either on the large or the small scale, could do nothing to save them ?—No, sir, that is evident. If she could not weather the Head nor the North Cheek, she must inevitably go ashore between the two.

21,197. Is it the case that the danger arises from ships not being able to weather away Flamborough Head on the one side, and Whitby Rocks on the other ?—Yes.

21,198. That is the danger, is it not ?—Yes.

21,199. Therefore, one large harbour here at Whitby would not save ships caught upon the particular line of coast to which I have referred ?—No, it would not.

21,200. I think you have expressed an opinion that the distribution of public money in improving the existing harbours would do more to save life and property, than the construction of one harbour on any site of this coast ?—Yes, certainly.

21,201. Say, however, that the Government arrives at a different conclusion, and it rested between Filey Bay and Hartlepool (for those are the two great points that were brought before the Select Committee of the House of Commons), and that a harbour was to be made, and only one, looking at all the circumstances—the laden ships, and the light ships, and the prevailing winds—supposing that it rested with you to decide between these two points, would you spend the money upon Hartlepool or Filey ?—I should say Hartlepool, decidedly.

21,202. You would say Hartlepool ?—Oh dear, yes, certainly.

21,203. A great deal has been said about the shallow water about Hartlepool Bay. Do you think there is any real danger in running for Hartlepool Bay in a heavy gale of wind ? I mean greater danger than there would be in running for any other place ?—I have experienced it in regard to two vessels during the last five years, which attempted to take Hartlepool with the wind eastward. One canted her ballast and run ashore ; the other split her main topsail, and she went ashore too.

21,204. But in the case of the one shifting her ballast, was that caused by the heavy sea ?—By the heavy seas that take a vessel down in the bay. She suddenly changes from deep water into shallow water.

21,205. In the other case, when the vessel carried away her main topsail, that accident might have befallen her in any other place ?—Just the same.

21,206. Therefore, the latter case does not apply particularly to Hartlepool, any more than it does to any other place. But the other case does so, in your opinion ?—I think so.

21,207. What depth of water would the ship be in ?—From eight to nine feet only.

21,208. What depth of water would she have under her when she was outside the Heugh where she was struck ?—That would give her from five fathoms to six fathoms.

21,209. If the breakwater was run out there in six fathoms, would that in your opinion remove the danger, just look at the chart and say. (*Witness referred to the chart.*) You see the dotted line running 5, 5¼, and 5, that is called the five-fathom line. If the breakwater was run in that line, do you think the danger would be removed—the danger to which ships are subject from a cross and troubled sea ?—It would improve the navigation in taking the harbour very considerably. If this was carried out, there would not be so much of the direct water ; it would naturally obstruct the sea from coming in.

21,210. Do you think ships would be in danger in running for the harbour when they were outside of it, if the harbour was placed upon this site ?—No, I do not think they would.

21,211. Do you think the water would be so troubled outside of that line of the breakwater that it would make it dangerous for ships to pass through it ?—No ; there is not so great a suddenness in the depth of the water, as I expected. It runs off more gradually. It was only as it was explained to me.

21,212. Do you know Runswick Bay ?—I have never been that way, but it has always been considered to be a very nice little place ; something like a nice pond, and might be a very good shelter for small craft. I think it would be a very great acquisition for fishing vessels generally.

21,213. Speaking more particularly of them, you think it would not be a great acquisition for the passing trade ?—Not very great. If you notice, it is rather indented into the land.

21,214. (*Capt. Washington.*) What would be the best thing to do generally for saving of life from wrecks in ships between Flamborough Head and the Staples ?—To run out at a number of ports piers, or something of that sort.

21,215. To improve the existing harbours ?—Certainly.

21,216. In addition to that should you consider anything more to be necessary ?—It would be very desirable if a large harbour could be made anywhere on the coast. Within my recollection we were afraid of the Dutch coming here. I do not think there is

much danger of them now, but we might have the Russians if they could only get sailors.

21,217. Among the existing harbours you, of course, include Whitby ?—Yes.

21,218. Do you concur with the witnesses yesterday, that an increased depth of six feet at the entrance of the bar would be a great benefit to Whitby harbour ? —I think so, because if it was an increase of only four feet more than we have now many ships that have taken refuge under the rock would take the opportunity of coming into the harbour. The breakwater would not only give increased depth, but would cause the sea to be so much smoother.

21,219. I think you said you had been many years along the coast ?—Not a great many ; I was in the coal and Baltic trade, perhaps, five years. I commanded small vessels two years in this trade.

21,220. During that time did you trade between this and London ?—Between the Tyne and London.

21,221. Did you ever happen to be detained in a fleet of ships north of Flamborough Head ?—Never north of Flamborough Head.

21,222. South of Flamborough Head ?—I have been, more particularly when I was a boy 16 years of age. I was once there when we rode out a very heavy gale of wind. When we rode out a gale then we used to have the topmasts down, now they never see topgallant masts down.

21,223. Can you tell me the reason of the change ? —No ; I think it is greatly to be regretted that it has taken place.

21,224. Is it that chain cables are more secure than hemp ?—No, I do not think they are more secure, there was an elasticity in the old cables that you cannot get now with the chain.

21,225. Is it that the ships are under-manned now ? —No, I think it is for want of, I was going to say, on account of a fear of trouble, and a little want of energy on the part of the commanders of them.

21,226. You spoke particularly of Bridlington Bay ? —Yes.

21,227. Is not that a place in which there is a great congregation of ships along this coast ?—Certainly it is ; I have seen there about 120 or 150 sail, but we sometimes hear of monstrous fleets there of 400 or 500 sail, which I never saw.

21,228. It is a common stopping place ?—Yes.

21,229. Do you think anything could be done to improve it ?—It is very easy to improve it ; a very little expense would make a breakwater at Smithic Sands ; it could be easily done, I think so. I think that out of the ships that take refuge in Bridlington Bay there would be less loss in that neighbourhood than upon any other part of the coast.

21,230. What would be the use of a harbour of refuge at Whitby to a ship crossing between Flamborough Head and Whitby Rock ?—It would be of no assistance if she could not get round.

21,231. Where would be upon that line the best plan for a harbour ?—Ships frequently go ashore on Scarborough Sands.

21,232. Is not Scarborough the deepest part of the bight in that bay ?—I think about a mile off the sands is the deepest part, to the best of my recollection.

21,233. As it happens, it is the deepest part ?—Yes, a little to the south of Scarborough by the bridge.

21,234. Would that be the most likely place to catch ships that were embayed ?—I expect that if a ship were situated in that position, and could not get off the land, the first effort of the commander would be to try and make Scarborough, but if he did not succeed in getting into Scarborough she would go ashore on the beach.

21,235. Are vessels pretty safe in running ashore about Scarborough ?—Life would be safe ; it would scarcely ever happen that any lives would be lost in light ships. There have been some severe accidents at Scarborough with life boats in endeavouring to rescue lives.

21,236. After Whitby, I think you said Hartlepool Bay is the best place ?—I think so.

21,237. You were asked if the breakwater was carried into a depth of five fathom, but suppose it was carried out to eight fathoms beyond the usual breaking of the sea, should you think the benefit would be great and that it would make a great deal more room ?—It must make a great deal more room.

21,238. Should you have any hesitation in running for a refuge harbour at Hartlepool Bay in which the outer breakwater was in eight fathoms water, and supposing that inside there was room to contain 300 vessels ?—I should run for it if I could not keep at sea ; I should try to bring my ship to and ride her there rather than go to the shore.

21,239. Should you have any hesitation in running for such a shelter harbour ?—Certainly not.

21,240. The greater part of what we have heard about the sea breaking into Hartlepool Bay would be contained within a breakwater placed in eight fathoms water ?—I think it might.

21,241. (*Capt. Sulivan.*) I suppose you are aware that a harbour made in eight fathoms water is a much more expensive affair, and would be so costly that you could only have one on account of the expense ? —Of course.

21,242. Would you consider a harbour in five fathoms, enclosing water from two to five fathoms within it, deep enough to answer all the purposes of the collier trade ?—You mean the coasting collier trade ?

21,243. I am speaking entirely of our own coasting and collier trade ?—It certainly would be of great service even in $5\frac{1}{2}$ fathoms water.

21,244. If you had to choose between one of these large and expensive harbours in eight fathoms water, or two harbours made for the same money on the two best points of the coast that could be selected of five fathoms or $5\frac{1}{2}$ fathoms, which do you think would be the best for saving the lives of those engaged in the coal trade ?—I should decidedly say that Hartlepool must be one, and Whitby the other.

21,245. I am not asking you where they should be. You said in the early part of your evidence that two or three of the coal ports improved, would be better than one large harbour ?—I should decidedly say two.

21,246. Supposing those ports could not be improved, and you could come nearer to that by having two small harbours by artificial means on different points of the coast, both sufficiently deep to take in all the colliers that might run for them,—would that be better than having one large harbour only ?—I think two would be better.

21,247. Then if you had your choice between an eight-fathom breakwater in Hartlepool Bay, and a five-fathom or $5\frac{1}{2}$ fathom harbour in Hartlepool Bay and another of the same depth at Whitby, Scarborough, or Filey, you would prefer the latter to the one large harbour at Hartlepool ?—Certainly.

21,248. If the Tyne were improved to 15 or 16 feet by works going on there, would it be a valuable harbour for light ships further north ?—It is really a very valuable harbour for light ships now. It will take them in the first quarter flood and the last quarter ebb.

21,249. If it were improved to 15 or 16 feet would it become a valuable harbour for light ships at all times of the tide ?—I should say it would.

21,250. Then if you had the Tyne improved to that depth, and a comparatively small harbour in the depth of the bay wherever it could be placed, and a second small harbour further south, do you think the wants of the coast would be well supplied ?—Yes, I do.

21,251. Did you mention the name of the *Colony* among the vessels you named ?—She was driven back, I think she was driven back, and was wrecked in going into the Tyne.

21,252. Can you tell me where she was taken by the gale ?—She had been up to Flamborough Head and put back. I think she was driven first in the neighbourhood of Berwick, then thrashed to the south and bore up here. Afterwards she was obliged to

WHITBY.

Mr. G. Barrick.

23 Oct. 1858.

Capt. Sulivan.

take up anchor and run to Shields for shelter, and in going in she was wrecked.

21,253. Do you know how far down the coast she had been before she was driven back to Berwick ?—No, I do not.

21,254. Was she off Flamborough Head ?— She was to the south of Whitby, but how far to the south I cannot say.

21,255. Are vessels often driven back off Flamborough Head to Leith Roads ?—Yes.

21,256. Supposing that to have been the case in this instance, would a harbour at Filey have saved that vessel if she had been there ?—If she had been off the Head, and if the wind had been from the south-east, it might have saved her.

21,257. You said that ships used to take much more care than they do now in striking masts ?—Yes.

21,258. What was the size of the vessel you served in 50 years ago ?—250 tons. I served my time in a brig. In the Baltic we used to have three boys and seven men. That was making two or three voyages a year to the Baltic.

21,259. Were you in the coasting trade in those days ?—Occasionally I commanded vessels in the coasting trade.

21,260. Taking a collier of 200 tons—a brig, what was the usual crew in those days ?—From eight to nine hands.

21,261. Not more ?—Nine hands would be the outside, and two boys out of the nine.

21,262. Because we understand now that the crew of a brig of 200 tons to 250 tons, is a master, mate, four men, and a couple of boys ?—I have several vessels on the coast, of from 230 to 250 tons, and they have from nine to 11 hands for their crews.

21,263. Do you think from what you know of the work on board a collier, that four or five working men at the most, besides the master and mate—including boys perhaps—could generally manage in heavy weather to get the yards and masts down, and get them up if the wind shifted in Bridlington Bay, in time to get out ?—I do not think it is very much matter. Top-gallant masts and yards, they are of little consequence getting up after a gale of wind because it is soon done. It is only a quarter of an hour's job.

21,264. But the lower yards ?—I understood you to say the top-gallant masts. The lower yards are very different.

21,265. I understood you to say that ships used to strike their lower yards and top masts ?—No.

21,266. In a collier requiring to go to sea, if the wind shifted, and having to run somewhere else, do you think with the few hands they have, a man dare get his lower yards and top-masts down ?—No.

21,267. You were referring then only to the top-gallant masts and yards ?—Only those. On the contrary, they very seldom get top-gallant masts, as half of them have no top-gallant masts up.

21,268. (*Capt. Vetch.*) Referring to the north-east coast of England, between Flamborough Head and Tynemouth, with a view to save life and property, if you had to construct a harbour with that object, what site upon this coast would you prefer for that harbour ?—I decidedly would say, this plan here before me. (*Witness referred to the Whitby plan.*) It is the most likely place to pick up ships in distress.

21,269. You are speaking of Whitby ?—Yes, I am speaking of Whitby. It would be useful if anything happened—a top mast or anything of that kind was carried away, if they could come in here.

21,270. A harbour that would admit vessels at any time of tide ?—Yes.

21,271. Gentlemen are generally rather partial to their own ports ?—I would not speak partially of my own port.

21,272. I do not want to say anything about what you have said here, but supposing Whitby to be the best site in your opinion for that purpose, what other port do you consider to be the next best ?—I should say the Tees or Hartlepool Harbour.

21,273. Do you consider that a breakwater in Tees Bay, running in a depth of seven fathoms water, would be quite sufficient to receive all vessels which are likely to require such shelter ?—I think it would for all coal coasters.

21,274. Would a line of breakwater off the Heugh, running along the line of seven fathoms, in your opinion give effectual shelter for any vessels that are likely to run for that place ?—It would.

21,275. Which of the two harbours shown upon the large plan, south-east or north-west, is the best holding ground ?—I cannot speak of that, I know very little about the port to the north of the Upgang Rock. I can speak of the south of that, I have understood that it is very good holding ground. That is all I know.

21,276. It appears that the Sand's End Ness anchorage has very regular shoaling ?—As far as regards that ground, upon reflection, I recollect very well three ships coming ashore, having broken their chains and windlasses. That shows the ground must be good.

21,277. What are you speaking of ?—The north-west part of Sand's End Ness. The wind came to the eastward, and caught them. They rode until the windlasses of two of them were upset, and the other's chain parted. That was all in one gale.

21,278. You think that in Whitby Bay, or more properly the south-east part of it, the anchorage ground is sufficiently clean and deep to answer all the purposes of an anchorage ground ?—I think it is. So far as regards the discrepancy of the water it seems to be so near the rock, that it is of no moment because no ship would ever bring up so near to Whitby Rock as laid down there. No prudent man would do so.

21,279. Then if there should be funds for one of two bays only, which would you prefer for a harbour, Sand's End Ness or Whitby ?—I think I should prefer Whitby, as it would be the greatest protection against the winds most dreaded from south-east to east-north-east. There would be no shelter in Sand's End Bay against those winds whatever.

21,280. (*Mr. Coode.*) Are your vessels engaged in the coal trade ?—A great many of them in the coal trade, and some of them in the Baltic.

21,281. We have heard that the crew sail by the voyage—is that the invariable rule ?—The invariable practice in the northern ports.

21,282. Does that apply to the master as well as to the crew ?—Entirely ; the whole crew, master and all.

21,283. It is invariably the case ?—Yes, invariably the case.

21,284. (*Sir F. Smith.*) If I understood you rightly, you give a decided preference to a harbour of refuge at Whitby ? Great or small you give the preference to Whitby over all the ports on the coast ?—Yes, I do.

21,285. Whitby is No. 1. with you ?—It is not more No. 1. with me than Hartlepool Bay or Bridlington Bay.

21,286. Now do not misunderstand me, I mean your opinion as a sailor ?—Yes.

21,287. Now what is No. 2. ?—I would say next, Hartlepool.

21,288. What is No. 3. ?—As you have made out such a case, if we cannot weather the North Cheek of Flamborough Head there is nothing but Filey Bay. I had a ship lost on the 4th January 1857, in consequence of carrying away the mainyard just as she got the pitch of the Head ; she was not able to weather it, and went ashore on Filey Sand and was lost there. That vessel was called the *Ratcliffe*.

21,289. Whitby stands No. 1. ?—Yes.

21,290. And Hartlepool is No. 2. ?—Yes.

21,291. No. 3. is Filey ?—Yes.

21,292. Will you give No. 4. ?—I do not know. I have been told Redcar is a very nice place, but I cannot speak for it.

21,293. I do not want to know any man's opinion at present but yours. As regards Redcar you can give no opinion ?—No, I cannot.

21,294. (*Capt. Washington.*) You are a large shipbuilder ?—I have been, and am a little yet.

21,295. Therefore, naturally much interested in the shipping along the coast. And you are a shipowner also ?—Yes.

21,296. You are acquainted with the entrance into the Tyne ?—Yes.

21,297. You have heard that piers are being carried out now ?—Yes ; it is nearly 50 years since I went into the Tyne, 45 or 50 years since. I have not been there since. I then commanded a coaster.

21,298. At what depth of water did you go over the bar ?—Six or seven feet at low water.

21,299. You probably are aware that, with the piers now carrying out they expect to get from 13 to 15 feet at low water ?—Yes, so I understand.

21,300. Do you consider that that would be a great boon to the trade of the north and east of England ? —I do.

21,301. Do you think it would be worth a moderately large expenditure to accomplish that result ?— Yes, a moderately large expenditure.

21,302. (*Chairman.*) Are the vessels that are employed in the coal trade, as a general rule, vessels built for the purpose ?—Many of them are not, but many of them are. I own 25 sail of ships, and all of them have been built within the last 10 years, all have been built here and at Sunderland.

21,303. Do I understand vessels in the coal trade are vessels that have been built for that special trade, generally would you say so ?—They are generally what we call second-hand ships, that have come out of the West Indian or Mediterranean trade; but there are some of them very good.

21,304. So that the vessels employed in the coal trade are generally vessels that have been previously employed in the foreign trade, and have now become old ships—comparatively speaking old ships, and are turned over to the coal trade ; is that it ?—Yes.

21,305. I presume that one reason why vessels of that description are used is from the nature of their cargo—that it not being of a perishable nature, a vessel of an inferior description is sufficient for the purpose ; is that the case ?—Yes, that is the case. They find a difficulty in getting them underwritten at Lloyd's and elsewhere, they then sell them and get new ones. Many of the ships sold are bought by people on the coast and make colliers.

21,306. In that way they get a cheap ship to do the work ?—Yes.

21,307. Many of these ships which are obtained in this way are very good ships, and quite sufficient for the purpose, and in good condition; is that the case ? —Yes, more particularly those that are owned by sailors. They know what is wanted on board ship.

21,308. Are you disposed to think that vessels that are owned and sailed by men who have followed the sea, are better found and better vessels than those that are owned by men who have not followed the sea ?— I would not say better vessels, but certainly better found. A man who does not know anything of the sea may have as good a vessel as one who does.

21,309. Have you, as a shipbuilder, often had colliers under repair ?—Yes, very often.

21,310. Then you must have a good notion of the style of vessels they generally are ?—Yes.

21,311. What are you disposed to say about them as to their hulls ?—Generally the ships belonging to this port and to Robin Hood's Bay are of a very good class.

21,312. Those are the only ships of which you have personal experience ?—Yes.

21,313. Have ships from other ports been sent to you ?—Yes.

21,314. What is your opinion of them ?—They are not a bit better than our own.

21,315. But are they as good ?—I question whether they are as good, but not a bit better.

21,316. (*Capt. Sulivan.*) How long have you been engaged in ship building ?—We represent the oldest ship-building firm in the kingdom.

21,317. Have you been engaged in that business for the last 20 years ?—Thirty.

21,318. You say you have repaired a large number of colliers ?—Yes.

21,319. Have you ever broken up one ?—No never.

21,320. It has never fallen to your lot to break up a collier ?—No.

21,321. Do you know any people here who buy old colliers and break them up ?—I do not in my experience recollect more than one ship called the *Suffold* being broken up.

21,322. What becomes of the old colliers ?—That I cannot tell. I know one ship which left Hartlepool on the 23rd of January and was never heard of afterwards. A screw steamer run her down and all hands were lost.

21,323. What is your experience of the end of old colliers ? Are many of them run until they founder at sea ?—I hope not.

21,324. Or until they are so leaky that they are obliged to be run on the coast to save the people's lives who are in them ?—I do not believe it.

21,325. But there is no other trade they are put in after they are too bad for colliers, and you have not broken up one ?—I have seen one broken up.

21,326. Therefore, to your knowledge, there has been only one collier broken up in Whitby ?—I do not know that she was a collier. I think she was a ship in the habit of going to America.

21,327. Then you have not known a single collier broken up ?—No, I do not know that I have. They are always repaired. I have a vessel between 70 and 80 years of age, and as good a one as can be sent to sea.

21,328. (*Mr. Lindsay.*) I wish to know whether in you experience you have found vessels employed in the coal trade — 20, 30, and 40 years of age — as sound and strong as they were the first day ?—I cannot speak to their internal timbers. It is impossible to say how they are without skinning them.

21,329. But when you have opened them out ?— Whenever they have been opened out they have been put in proper repair.

21,330. Is it a fact that some of these old vessels, in the course of time, are repaired at different stages to such an extent that really, if you go back with a vessel of 40 years old, you will find very little of the original planking and timber ?—There is very little, if they have been properly repaired. They have a thorough repair at the end of five years, and then in the course of 10 years another repair.

21,331. So that, in fact, they are maintained and kept up good and safe vessels to a very old age ?—To a very old age.

21,332. (*Chairman.*) Would you be disposed in that way to account for the circumstance of their not often being broken up—that they go on repairing them, and keep them running in the trade ?—Yes.

21,333. That is the way you would account for it ? —Yes.

Mr. William Broderick Smith examined.

21,334. (*Chairman.*) You belong to Whitby and are a shipowner here ?—Yes.

21,335. You were master of a ship for 19 years, and were 27 years at sea ?—Exactly so.

21,336. And you sailed principally to the Baltic ?— Yes.

21,337. You have seen the plan of the proposed harbour of refuge. Will you give me your opinion as to it ? What do you think about it ?—I think as to the locality of the harbour of refuge, and also as to the plan before me (*that put in by Mr. Harrison*), a better one could not be made anywhere along the coast.

WHITBY.

Mr. W. B. Smith.

23 Oct. 1858.

Chairman.

21,338. We have a very large plan here. Taking, in the first instance the, smaller plan of a breakwater upon the Whitby Rock, do you consider that that would be of great advantage to the passing trade ?—Unquestionably as a refuge for laden vessels bound south.

21,339. So that vessels bound south could come in here in heavy winds from the east, and wait here for a fair wind to make their passage. Is that the mode in which you view it ?—Yes ; if the wind did not go too far to the northward and so prevent them clearing the land. But to carry out the extended scheme, it unquestionably would make the best harbour anywhere to save vessels both light and laden.

21,340. Are you acquainted with the entire ground which I see marked " good anchorage ground " southward of the Upgang Rock ?—I have often seen vessels riding there with the wind very strong from the south-east and south-south-east. I always understood they ride well, and never drive there except from carelessness.

21,341. In such winds they are sheltered to a great extent by the Whitby Rock ?—Yes, particularly at low water.

21,342. Have you ever seen vessels riding there with the wind right in and a heavy sea ?—No, I never did ; there have been cases where vessels have ridden that they have been compelled to come on the beach in consequence of riding too long.

21,343. They have been compelled to come on the beach for fear of foundering at their anchors ; from fear, in fact, of the heavy sea ?—That, perhaps, might be one case ; another case is that they sometimes come on the beach under these circumstances—it is advisable when they see no chance of riding longer to come in at high water, by which means there are better chances of saving lives.

21,344. You attribute their coming ashore as much to the reason of coming in, if possible, at a high tide, as to the fear of foundering at their anchors ?—I think so.

21,345. Why do you prefer Whitby as a harbour of refuge to any other place ?—Because vessels from the northern ports seldom leave without some prospect of getting south, and almost invariably they get as far as this, or even on to Flamborough Head, before the wind comes on, and then they might get in here.

21,346. Then would not a harbour to the northward of the Head, or Filey Bay be better for catching those vessels which are making the passage, because they would rather be to windward ?—But a great many vessels do not get so far south, and a harbour of refuge there, would be of no advantage to those vessels.

21,347. Whitby is just at the spot where it would catch the great number ?—With south-east gales it would catch even the vessels at Flamborough Head, because it would be a very hard matter if they could could not get back so far.

21,348. Do you consider a refuge is more wanted for laden or for light ships ?—For laden ships.

21,349. For the reason stated by the previous witness ?—Exactly so.

21,350. In your own knowledge, can you give me any case of a vessel which has been off Whitby, and which has been wrecked going to the north in endeavouring to reach the northern ports ?—I can, unfortunately ; we had one of our own lost in the January gale, the *Zephyrus* bound here ; she could not make Whitby, and ran against West Hartlepool Bar, and was there sold as a wreck. Then there was the *Colony*, of Whitby, in the present year ; she was somewhat south of this, and brought up in these roads; she weighed from these roads and was driven to a bay near Runswick ; the crew were taken off by fishermen, and the vessel after wards got into Runswick Bay. I went down to her for Lloyd's, got her brought in, and sold her for what she would fetch. She got up as far south as Huntley Foot ; the weather then became bad ; she made for the Tyne, and was eventually wrecked. The *Amelia*, a vessel belonging to this port, was south of this in the January gale, and was lost in Runswick Bay with all hands. There were two vessels belonging to the Staithes Shipping Company, one called the *Mary Anne*, and the other *Peter and Mary*, they were both lost with all hands in endeavouring to get further north. There are a great many more which could be named.

21,351. In your experience as a master of a vessel, have you ever been exposed to taking these bar harbours in gales of wind on shore ?—No. I was mostly engaged in the foreign trade ; I was occasionally coasting, but always happened to get down to this place with suitable weather.

21,352. What do you consider the worst winds on the coast ?—Unquestionably from the south-east and east-north-east.

21,353. Do you concur in the account given by the previous witness of the way in which they come on occasionally ?—Well, we frequently see the vessels leaving the Tyne and the northern ports with the wind from the west-south-west or south-west, and as they get further down the wind comes to the southward until it gets to east-south-east and south-east, when it goes on increasing until it increases to a gale ; that is what I have frequently seen myself.

21,354. When the vessels get to the Head when the wind is from the southward, does it come more ahead as they endeavour to round Flamborough Head? —That depends altogether on circumstances ; we almost invariably find, when the wind gets to east-south-east and east, that when we get south of the Head it becomes a little more favourable. When a ship gets to the Head with a wind from the eastward, in nine cases out of ten she will get into the Humber.

21,355. But when the wind is tending southward a little, how would you then expect it to be when you round the Head ?—That altogether depends upon circumstances. If the barometer was rising, I should think it would betoken the wind to go more to the eastward ; but if it was low, it would betoken the wind to go south. That would be the view I should take of it.

21,356. I think you say that the vessels generally start with a slant of wind from the eastward ; in making the passage do they keep in-shore ?—The colliers invariably keep close to the land.

21,357. For what purpose, to avail themselves of the tide, or the slants of wind off the land ?—They have smoother water if the wind at all hangs from the land ; they very seldom leave the northern ports unless it does. With an easterly wind they keep a distance from the land.

21,358. They try to make offing when they get out ? —Certainly.

21,359. Do you think this breakwater will improve the entrance into your own harbour ?—There can be no question about that, inasmuch as vessels bound to this port, and that might want to take it for other purposes, when they come round the rock with a south-east or south-south-east wind, find the sea is so strong that, in several cases, they cannot fetch the harbour, but go on the sand ; but with this breakwater the water would be quite smooth when they come to the leeward of it, and they would make way and fetch in.

21,360. What is the greatest number of vessels you have seen anchored under the rock with the wind at east-south-east ?—With the wind at that point they begin to get away ; we seldom find them here with the wind to the eastward of south-east ; it is time to get away then.

21,361. With the wind from the south-south-east ? —Upwards of 100 sail, repeatedly.

21,362. What is the greatest number of vessels you have ever seen off Flamborough Head ?—I never saw many vessels there, being in the foreign trade.

21,363. (*Mr. Lindsay.*) Do the colliers as a rule carry barometers ?—I believe not.

21,364. Do not you think it would often save them from being caught in a gale of wind on this dangerous coast ?—I should not like to go to sea without one, myself.

21,365. Do not you think it would be wise on the part of the owners of colliers—that it would be for their own advantage, without speaking of the safety of the lives of those on board—to put a barometer into each ship?—It certainly has that effect—the rising of the barometer with a southerly wind.

21,366. Do you think if each collier sailed with a barometer there would be the same fear of their being caught on this dangerous coast?—There might, or there might not. I cannot say.

21,367. As you have had great experience in the Baltic trade, do you think a harbour of refuge necessary on the east coast of Scotland?—For ships bound to Scotland it might be; but ships bound to England seldom make the land north of the Firth of Forth. I never myself, except in one case, made the land north of Whitby, and in that case we were driven down to the Firth.

21,368. Where did you make the land?—At the Farn Islands.

21,369. That is the furthest north you ever made the land coming from the Baltic?—Yes.

21,370. Do you know enough of the trade which goes along that coast of Scotland to form an opinion as to the necessity of a harbour of refuge there?—No; I have been from the Baltic to Liverpool several times, but we went straight to the Pentland Firth, so that I cannot give an opinion.

21,371. Say that there was to be one great harbour of refuge on this coast, and that it rested between Hartlepool and Filey, which would you prefer?—I think Hartlepool, because the trade of itself would induce vessels to go there and terminate the voyage.

21,372. Do you know Redcar as a site?—I do not know anything as to its capabilities of making a harbour.

21,373. Speaking to you as a sailor, suppose you could get there the same area of deep water as you could at Hartlepool, do you think a harbour at Redcar or one at Hartlepool would be of the greatest advantage?—I think in that case Redcar, because the land is bolder, and the place would be better to make. In the Tees Bay the land is low and difficult to make in the kind of hazy weather which there often is when the gales blow.

21,374. Say the public money was divided thus:—half at Filey and half at Redcar or Hartlepool, would that do more good than making a harbour on one site?—I think the improvement of two or three of the existing harbours would be of more advantage to the trade generally and prevent loss of life, more than making one large harbour.

21,375. Would you give the preference to the improvement of the existing harbours and making them accessible at all times of the tide?—Yes.

21,376. And would the second point be to spend part of the money at Filey and part down in the Tees Bay, and then to make a harbour suitable to receive laden vessels somewhere in this neighbourhood? That could be the second point?—Yes.

21,377. You think the first point would be to make a refuge for laden vessels somewhere in this neighbourhood?—That should be the first point, unquestionably.

21,378. Next, the improvement of the existing harbours?—Yes.

21,379. Say that it was put to you to decide between these alternatives,—that you had the money put into your hands to expend either upon one site, or that you were bound to spend it upon two harbours, one being the Tees Bay and the other Filey, could you pick out any site where the money would be better expended for the saving of life and proporty than either of these places?—If you made a harbour here and another at Tees Bay, I think it would catch the most of the vessels. If they could not get one way they could another. Vessels are often caught off Whitby, and if they could not get south they surely could get north.

21,380. Therefore you would be in favour of dividing it between the two points?—I should decidedly give the preference to two harbours instead of one. I think that there should be two harbours at the two best sites that could be found for them.

21,381. Looking at the land on the map, is it the case that when a ship during an easterly gale bound north can weather Whitby Rocks she can go three points to the westward?—No, there is not that difference in the coast.

21,382. What is the course from Flamborough Head to Whitby? From Filey point what will be about the course?—About south-south-east and north-north-west. It depends on how far you are from the land.

21,383. What would be the course from Whitby point?—I think north-west by north, but you must keep clear of Kettleness; you would not keep off more than one point.

21,384. You say that the course is north-north-west from off Filey to Whitby Rocks?—I cannot say exactly.

21,385. What course do you steer down in order to clear Redcar Rocks?—There I am pretty certain about the coast; it is only north-west by north.

21,386. Only keeping away one point?—That is about it.

21,387. It looks to me as if you have more than that. Look at the map of the coast, and tell me if there is not more. Suppose that you were two miles off to the east of Filey Brigg, and you were shaping a course down so as to clear two miles off Whitby Rocks and were bound to Hartlepool Bay, the course from there, I understand, would be north-north-west?—I understood you to say Flamborough Head. At Filey you are further in shore and must steer further out.

21,388. What course would that be?—Nearly north and south.

21,389. What would the course be from a mile to the east of Whitby down to the outside of Redcar Rocks?—North-west and by north.

21,390. That is about three points?—Yes; but at Filey you are a long way within the line of the course you would go from Flamborough Head. When you asked me before I understood you to say from Flamborough Head.

21,391. If a vessel was caught with an east gale down on the line of coast between Flamborough Head and Hartlepool, and if she could weather away Whitby Rocks she would be in comparative safety, compared to what she would be between Whitby Rocks and Flamborough Head?—She would certainly be able to keep away longer before she came to the shore, because the coast goes more away.

21,392. Tell me how it is that ships are driven ashore between Whitby and Flamborough Head. There were 27 in the gale of last year, and nine with all their crews were lost. What was the cause of these ships getting on the shore? Was it not that they could not weather the land on either side?—It blew so that they could not carry canvas.

21,393. They were so situated that they could not weather Whitby Rocks to the north, or Flamborough Head to the south; is that the fact?—Yes.

21,394. Would a harbour of refuge at Whitby have saved any one of those ships?—It would, because they could have got in before the weather came so bad. They tried to get north and contended with the weather until it came bad. A good number of them were light.

21,395. But if there had been a harbour of refuge here, tell me how it would have saved any one of these vessels?—Because they would not have gone past it, knowing the danger.

21,396. I am speaking of those unfortunate vessels that were lost between Whitby and Flamborough Head; would it have saved any one of those ships?—Perhaps not, because that was an extreme case—such a gale as I hope never to see again.

21,397. There was an equal, if not a greater number, lost between Whitby and the north of the Heugh?—I think we had most lost on this sand, until we come into the neighbourhood of Hartlepool. I do not think

WHITBY.

Mr. W. B. Smith.

23 Oct. 1858.

Mr. Lindsay.

that many were lost between here and there—that is, totally lost; we had a great many on Whitby Sand between here and Sand's End Ness.

21,398. And a harbour of refuge here would have saved all those ships?—Every one. It would have saved every one. Some of those that were bound here and saw no chance of getting in, were lost at Hartlepool.

21,399. Do you know the nature of the anchorage ground in the roads here?—It is good.

21,400. How do you account for these great alterations in the soundings, from 23 to 35 and from 35 to 50?—I think there is one of the old pilots here who will give better information than I can.

21,401. (*Capt. Washington.*) You were speaking of the gale of the 4th January 1857?—Yes.

21,402. Did I understand you to say that many vessels were lost on Whitby beach?—Yes.

21,403. Whereabouts were they lost? — Mostly within the line of the proposed breakwater.

21,404. Were they north or south of the entrance of the harbour?—All to the north. If they come in the south side it is sudden destruction; they never think of coming in on the south. All lost in Whitby Bay were lost to the north.

21,405. How many?—I cannot say.

21,406. What were some of the names?—The *Port Glasgow* was dismasted, and eventually drove on shore about the north end of the proposed breakwater—a little nearer to Sand's End Ness. She would have been saved to a certainty if the breakwater had been there.

21,407. Any other?—There was a brig belonging to London called the *Abema*. That vessel would have been saved.

21,408. Where was she lost?—Near to Sand's End Ness. There was also a laden ship called the *Amelia*; all of her hands were drowned; she would have been saved.

21,409. Where was she wrecked?—She foundered off Runswick Bay, but she went past here; she drove past in the gale. Two schooners belonging to the Staiths Shipping Company, one called the *Peter and Mary* I think, and the other the *Mary Anne*, though I am not certain about that name, were both lost. They both foundered with all hands.

21,410. Whereabouts?—Somewhere in the neighbourhood. They were seen off here.

21,411. Off where?—Off the port in the beginning off the gale.

21,412. Had they passed Whitby Rocks sufficiently to enable them to come into the harbour here?—Unquestionably.

21,413. When were they seen last?—There was one lost a little to the north of the harbour, and another away south. They both foundered.

21,414. You still think both could have come in here?—Yes.

21,415. How could the vessels to the south have come in?—They would have come in before the weather got so bad; they were both laden. They could do nothing but make the best of it.

21,416. Can you tell me of any more?—There were more but I do not remember the names.

21,417. You have no doubt these vessels would have been saved, had there been a refuge harbour?—There can be no question about that; it is quite certain.

21,418. On that day how many lives were lost?—In the *Amelia* I think nine or ten. In the two small vessels there were at least eight on board the two; and all these men were drowned.

21,419. How many altogether?—Taking the *Amelia* at nine, that would make 17 in these three vessels.

21,420. Do you think we might take it as a safe guide, that where the greatest number of lives are lost there the refuge should be placed?—Unquestionably so, I think.

21,421. Could any of those vessels have gone into refuge at Scarborough or Filey Bay?—I do not know that any of those three were so far south as Scarborough, although is was never known, because there was no one left to tell the tale.

21,422. You speak of those which foundered?—Those which came on the beach were light vessels, so that they must have come from Flamborough Head, but could not clear the land further to the northward, and so came ashore here on the sands.

21,423. After passing Whitby, if a vessel could not get in and is obliged to run to the north, where is the next best place?—It would depend where the harbour was made. The nearer the better, I should think. The next best place would be Tees Bay.

21,424. Did you make any voyages to or from the Tyne when you were at sea?—Only two or three coal voyages.

21,425. Are you acquainted with the shipping of the Tyne?—No.

21,426. You know it is very large?—Yes, I know that very well. I have been there several times.

21,427. Is it very desirable that an effort would be made to improve the entrance into the Tyne?—Yes, because it is notorious that in the prevalence of north winds the light vessels accumulate in Bridlington Bay or Yarmouth Roads. They run down there because they cannot, as it now exists, make the Tyne at all tides and in all sorts of weather. No doubt if the entrance to that river were improved to such an extent as may be proposed, it would save a large amount of property and some lives.

21,428. We have heard it often stated that, do what you will, vessels will try for the port they are bound for if possible?—I believe the men, being paid by the voyage, naturally endeavour to get to the far end of it if they can.

21,429. If a gale springs up the laden vessels will still hold their own in the hope of a slant of wind and in the hope of getting to the south?—Very many would avail themselves early in the gale of a refuge made anywhere between here, for instance, and Flamborough Head, especially in the winter season.

21,430. By so doing they would save a great risk of life as well as a great deal of property?—Of course they would.

21,431. (*Capt. Vetch.*) Suppose that the wind is fair for the voyage from the Firth of Forth to the Thames, but that when the vessels bound southward get off Flamborough they are headed by an adverse wind, where do you think the greatest number of these vessels would receive refuge by means of a good harbour?—For those caught off Flamborough Head unquestionably Filey would be the best, because there would be the least distance to come back.

21,432. I meant to say, that, suppose an adverse wind came on, where could these vessels be best able to receive succour by means of a harbour of refuge?—That would altogether depend upon where the ships were.

21,433. Suppose these scattered between the extremities?—In that case they would require three or four harbours to receive the whole of them.

21,434. Would not a harbour in the bight of the bay most likely be the means of saving the greatest number?—It would be in one sense of the word; but as a set off against that the land is bad to make, more particularly in bad weather, because it is low and very bad to make.

21,435. Filey Bay would catch those lying between Filey Bay and Flamborough Head?—Certainly.

21,436. Whitby would catch those which lie between Filey and Whitby?—Yes.

21,437. And Tees Bay would catch those between Whitby and Hartlepool?—Yes.

21,438. And what I want to ask is, which of these three places would be likely to save the greatest number of vessels?—That is a question I am hardly prepared to answer, because it would altogether depend upon where the greatest number of ships were.

21,439. Would Filey Bay or Whitby save the greatest number?—How is the wind?

21,440. The wind is such that you cannot proceed

beyond Flamborough Head. It is adverse?—If the wind was away from the south-east or east-south-east, an on-shore wind, I should say Whitby would be the best, because vessels which could not reach Filey would come here. If the wind was east-north-east, the vessels would go round the Head and get into the Humber.

21,441. After Whitby, which other place do you consider most likely to save vessels?—I think Tees Bay.

Mr. JAMES ELLIS examined.

Mr. J. Ellis.

21,442. (*Chairman.*) You are the pilot master of Whitby?—Yes.

21,443. You have been at sea 40 years?—Yes.

21,444. And of that period you have been 16 years master in the Baltic and coasting trades?—Yes, and in the Mediterranean.

21,445. Have your voyages been made chiefly from the Baltic or on the coast?—Well, I cannot say there is much difference. I served my time along the coast, and have been engaged in the Baltic trade as a master. I have been engaged in the Mediterranean trade as a master, and in the coasting as a master.

21,446. How many voyages have you made from the Baltic?—I have been three or four times to St. Petersburgh, and about the same number to Dantzic; perhaps a dozen or 15, I cannot exactly say.

21,447. Have you come home often late in the year?—Yes; not often, but I have come home late in the depth of winter.

21,448. Where have you made your landfall?—The fore part of the time I generally used to endeavour to make the Yorkshire coast—Flamborough Head.

21,449. I did not ask you what you endeavoured to make, but where you have actually made the land?—I have often made High Whitby, for one place.

21,450. What is the most northern point of the coast you ever made as a landfall in coming from the Baltic?—High Whitby, never to the north of that.

21,451. You have seen the plan of the proposed harbour of refuge here?—Yes.

21,452. Will you give me your opinion as to the position. Tell me what advantage you think there is in putting a harbour here at all?—I think the locality is the most suitable along the coast.

21,453. Why is it the most suitable along the coast?—Because ships from the northern ports generally take a favourable opportunity for coming out, and calculate on getting part of the way on the voyage, before they are caught. This is especially the case coming from Shields or Sunderland. They generally calculate that if they can get as far as Yorkshire, they may get to Whitby Rock. After going round that, perhaps they find the wind two or three points more southerly. These ships very often have to contend a long time with it, before they get to the Head.

21,454. Taking the passage from Sunderland or the Tyne, or the Tees, are you disposed to say that the most difficult part between the Head and those ports, is that between Whitby and the Head? Which is the most difficult part of the passage to the Head, between Whitby and the northern ports, or between Whitby and the Head?—If you come out of the ports you generally go away with a slant of wind, and get up to the Yorkshire land at Whitby. After you come to Whitby Rock, perhaps you fall in with very heavy weather. Indeed, ships often meet with a strong southerly wind after they get round the rock, that goes on increasing.

21,455. So that the slant of wind that brings them from the ports in most cases, gets them as far as Whitby?—Yes.

21,456. Taking the smaller portion of this breakwater on Whitby Rock, you have heard the reasons which the two previous witnesses have given for saying that it would be an advantage for saving life. Do you concur in these reasons?—I do.

21,457. And of course the larger would be so much better?—It would answer the purpose better.

21,458. Because you would get shelter from all winds?—Yes, it would do to take in all storms for any kind of vessels. The deeper the water at the entrance, the better it is for them to run in.

21,459. You have heard the evidence as to the most dangerous winds. Do you concur with the other witnesses in the opinions they have expressed?—Yes.

21,460. Which do you want the harbour for most—laden or light ships?—Laden ships.

21,461. For the reasons we have heard from previous witnesses?—I do not remember taking notice of them.

21,462. Then give me your reasons?—You can do with a light ship what you cannot do with a laden ship, and besides that, you can, from her not drawing so much water, go with her where you cannot with a laden vessel.

21,463. She can get into a harbour, or higher up on the beach than a laden vessel?—Yes.

21,464. You concur with the previous witnesses as to the advantages which this breakwater will be for ships getting into your own harbour?—Certainly.

21,465. (*Mr. Lindsay.*) Do you know the anchorage in Whitby Bay?—Yes, very well, indeed.

21,466. Is it good holding ground?—I do not think there is better anchorage along the coast.

21,467. Is it clean?—It is clean so far as I know. I never found any foul ground.

21,468. Never found any rocks?—I have often brought up amongst it, and never brought up on foul ground.

21,469. How do you account for these irregular roundings?—Perhaps, it will be a clay bottom. Where there is a clay bottom you never will find the ground so regular as sand, because if it once gets out it will not wash up.

21,470. Will you find so great a jump as from 33 to 55 feet?—I cannot exactly account for that. I never found any rocks, and have brought up in almost all parts where you could bring up a ship with safety, both in Sand's End Roads and Whitby.

21,471. Do ships often anchor in south-east gales just where the soundings are laid down?—I have seen ships drive close down with westerly gales where they have not given scope enough to the cable when a gale has come on.

21,472. Have you ever known ships to lose their anchors there?—They many a time lose them, having to slip their anchors, but they are invariably got again.

21,473. Do ships often lose their anchors because they cannot heave them up?—I do not think that; not to my knowledge.

21,474. Has the bay been deepening or shoaling in your experience?—I do not know that there is any difference at all in it. I had nine fathom water in the Soft Hole the other day when we were sounding, now I should think I brought up in the same water 15 or 20 years ago.

21,475. You found no difference?—None at all.

21,476. Is there much silt comes out of the harbour?—Very little, indeed.

21,477. In going over the harbour this morning, I saw an immense accumulation of sand and mud in the inner harbour, where does that come from?—That has been lying there for centuries almost, some of it ever since I knew what Whitby was.

21,478. Has it not been accumulated from silt coming down the river Esk?—I am sure I do not know; I do not suppose it was ever cleared since the memory of man.

21,479. But you are clearing it now?—Yes, they are taking away what has never been taken away since I have known the place.

21,480. Do you suppose there will not be another deposit?—I think not, because it is all rocky ground and not soft ground. There is no soil which could

WHITBY.

Mr. J. Ellis.

23 Oct. 1858.

Mr. Lindsay.

come down; the stream comes down from the moors; the water is very dark, but it is not thick until it gets well down this way.

21,481. Has that bank increased in size since you knew it?—There is a good deal of mud gets shot up, but where it comes from I do not know. A deal of it, perhaps, comes out of the Tyne and different places.

21,482. After an easterly gale have you known any alteration in the depth of the water on the bar?—It alters very much; sometimes there is mud nearly right across it; I dare say there is now.

21,483. To what extent have you known a silting up after a strong easterly gale?—I should think two or three feet of sand got there sometimes.

21,484. I speak of sand draughts from the sea?—It comes round the pier head with the flood tide.

21,485. Could the bar be deepened to any extent by means of a dredger?—I should think it could.

21,486. How many feet?—As many as we like if they could get down below the rock. I do not know to what extent it goes before we get to the rock.

21,487. You do not know the depth of the sand on the top of the rock?—I should think there will be two or three feet now.

21,488. Therefore if that sand was dredged away, and the harbour kept clear, ships of much greater draught could enter than can do so now?—Yes.

21,489. It was put in evidence yesterday that in three years about 1,800 vessels came in here for shelter. Are those the small vessels generally employed in the alum trade that chiefly seek shelter?—A great many of them; they run up from 45 to 50 tons register.

21,490. What proportion out of the 1,800 consists of vessels of that size?—I cannot say, I have only been here about three quarters of a year, so that I am not prepared to say.

21,491. But you as pilot master will see the vessels that come for refuge. Were they usually of that class?—There is a good part of them, and there are larger vessels come in occasionally. I have known several larger vessels come in when they have been caught with a northerly breeze suddenly, and a wind from the north-west to west-north-west.

21,492. Would there be one half or two thirds of these 1,800 vessels small vessels employed in the alumn trade?—No, I should think not; there are a great many loading iron stone, some load five and six, or six and seven keels of coals. There are more in that trade than in the alum trade.

21,493. Those were vessels of from 50 to 100 tons?—Yes.

21,494. (*Capt. Washington.*) We were told yesterday that vessels cast their ballast outside the harbour. Do you know is that the case?—I have seen that.

21,495. Is it your duty as pilot master to make a complaint of it?—I do not know that I have any right to interfere with it. I should think it belongs to the harbour-master.

21,496. How many pilots are there?—Twelve.

21,497. Do they hold a licence from Newcastle?—Yes.

21,498. Where do they pass an examination?—At Newcastle.

21,499. What have they to go to look for ships in?—Cobles.

21,500. And how far do they go generally?—Sometimes as far as Scarborough.

21,501. How far does their licence extend?—I do not know the particular limit. It is within any reasonable distance.

21,502. Are they not licensed for a certain district of the coast, or only for the harbour?—Only for the harbour.

21,503. Has great benefit arisen from the erection of the new lights?—Those new lights on High Whitby?

21,504. Yes?—I should think they will do good, but they have hardly been long enough up to show any great benefit, but I should think so by what experience I have had.

21,505. Before the land was lighted, did Whitby Rock pick up a great many vessels?—A great many at times.

21,506. Do you concur with the former witnesses, that the construction of the southern portion of the breakwater would be a great benefit to the roadstead and harbour?—I do.

21,507. Were you present at the gale of the 4th January 1857?—Yes, I was.

21,508. Did you hear the account of the former witness?—Yes, I did.

21,509. Do you know anything further with respect to the damage caused by that gale?—No, I do not.

21,510. You agree with the last witness, that a refuge here would have saved the vessels lost in that gale?—Yes, I do.

21,511. (*Capt. Sulivan.*) We had it in evidence yesterday, that there are two and a half feet water on the bar. Is there two and a half feet water between the heads of the pier at dead low water at spring tides?—Sometimes. I do not think that there is any at all, if it was taken down to the level of the ocean.

21,512. Is it not nearly dry at low water at spring tides—so far I mean as sea water goes?—It is when there is much sand there, but if the sand is away, then it is not.

21,513. Will there be any sea falling over that bar between the two pier heads?—At low water there will be none.

21,514. Inside the harbour where we saw the four small vessels aground to-day—is that part of the harbour dry always at low-water spring tides?—There is a small run of water down there.

21,515. But fresh water I expect. Let me ask you, is there a foot of water there to-day?—I should think that that is as much as there is.

21,516. If we were told that there was two feet and a half of water on the bar, and the same some way in——?—There will be two or three feet up along the sand.

21,517. But I am speaking now of the bar of the outer harbour?—I am speaking of that all along the pier side.

21,518. You mean, I suppose, where the two inner piers come?—Yes, I do mean that.

21,519. But between there and the place where we saw these small vessels lying aground, what do you say as to that?—There is very little water there.

Mr. Sampson Storm examined.

Mr. S. Storm.

21,520. (*Chairman.*) You have been 33 years at sea?—Yes.

21,521. And of those 33 years you have been 23 in command of a ship?—Yes.

21,522. How long is it since you came on shore?—Eleven years.

21,523. How have the ships which you have commanded been principally employed?—I think nearly half in the Baltic, and half in the coal trade.

21,524. How many voyages have you made from the Baltic?—I cannot exactly say, but for ~~three~~, four, or five years, I made three a year, and one year in particular I made four.

21,525. So you may, as master of a ship, have made between 30 and 40 voyages from the Baltic?—It may be not quite so much, nearly 30 altogether I should say.

21,526. In coming home late in the year will you tell me, not where you have endeavoured to make the land, but where you actually have made it generally?—I have made it from Flamborough Head

down as far as the entrance to the Firth of Forth, all along the coast.

21,527. Have you ever, out of 30 voyages, made it to the north of the entrance to the Firth of Forth ?—No, never.

21,528. Is your acquaintance very extensive amongst the masters commanding in the Baltic trade ?—Yes, it is.

21,529. Can you answer me this question : Has the result of their experience been pretty much the same as your own, that the Baltic ships crossing in the fall of the year seldom make the land to the north of the Firth of Forth ?—They will never make it there unless they are driven.

21,530. I am not asking as to what they tried to do, but as to what actually happened ; would you say as the result of your own experience, that generally the ships in crossing from the Baltic late in the year make the land to the south of the Firth of Forth ?—I should say that, in general, all ships going to the south make the land from the Firth of Forth to Filey Bay.

21,531. You have been present during the course of this inquiry ?—Yes.

21,532. Give us your opinion as to where the harbour of refuge should be, if we only have one upon the coast ?—If we have only one monster harbour, I should say that it should be here.

21,533. Do you think it would be better to have this one monster harbour or to improve the ports of the Tyne, the Tees, and the Wear, so as to enable vessels to get in at dead low water ?—If I am to say anything respecting that, I will give my best opinion, and I should say that pier harbours are always very dangerous to go to in bad weather, because there is sure to be a bar and a strong current.

21,534. Have you ever experienced the danger in your own case, in any ship which you have commanded ?—No ; I never risked going back to a northern port in my life, but I have been driven to the Firth twice.

21,535. Such was your opinion of the danger of taking these bar harbours in bad weather, that you preferred being driven to the Firth of Forth rather than try to take them with a laden ship ?—Yes.

21,536. You have heard the account the previous witnesses have given of the winds on this coast which are the most dangerous. Do you agree with that account ?—Quite so ; the wind from south-east to east-north-east is the most dangerous we have on this coast.

21,537. Can you tell us anything about the winds that we have not heard from other witnesses ?—No ; I think nothing.

21,538. You concur in the opinion that it is for the laden ships that harbours of refuge are chiefly wanted ?—Chiefly so.

21,539. And for the reasons we have heard from the other witnesses ?—Yes.

21,540. It is so obvious that this breakwater would improve the entrance to this harbour that I think it unnecessary to ask you opinion about that ?—Yes.

21,541. What is the greatest number of vessels you have seen lying off Whitby in south-east and south-south-east gales ?—I once counted 74 vessels ; several times I have seen 50 or 60.

21,542. When it is blowing hard is there any sea in the bay at high water ?—There is a roll, but the swell of the sea is not bad, nothing to hurt a ship with the wind from the south-south-east and south-east.

21,543. The Whitby Rock breaks it off ?—Yes, it does.

21,544. Have you ever seen a vessel riding off Whitby in a heavy gale from the north-east ?—I never did.

21,545. Can you give me any cases of vessels which have been off Whitby and have been wrecked in endeavouring to get to the northern ports ?—In 1844 I was going from St. Petersburgh with 70 or 80 sail. We all left the Sound together ; the wind drove from the southward, a good many of us made the land between Filey and Scarborough, and some down about Robin Hood's Bay. I made the land just a little north of Scarborough. Another ship belonging to our port, that was from the Baltic the same time, made the land a little to the southward of us ; we drove down nearly abreast of each other to Shields. The gale kept increasing and we had to go to the Firth ; we bore away at four o'clock in the morning, and got to the Firth of Forth between eight and nine o'clock. After I had been there some days I heard of the other vessel being lost somewhere near the Coquet ; Island it was quite a new vessel, her first year, and laden with wheat. That was one case that I recollect.

21,546. After taking your departure from the Scaw or the Naze what is a fair average passage coming from the Baltic in the fall of the year ?—It is very uncertain. I never was a week clear of sight of land in the North Sea, but I have not made my passage in a week.

21,547. You think you have been fortunate in making your passages ?—Very, very, indeed.

21,548. Would 10 days or a fortnight be a fair passage ?—Ten days is what we call a very fair passage from the Sound at the back end of the year.

21,549. How many days do you occupy in getting from the Sound clear of the Scaw ?—Perhaps a couple of days.

21,550. So that seven or eight days is a fair passage across the North Sea in the fall of the year ?—Oh yes.

21,551. What do you call a long passage ?—Some have been four or five weeks, and sometimes longer.

21,552. Have they been knocking about the North Sea all that time ?—No, they will not be so long knocking about. They principally get into some port in Norway.

21,553. (*Mr. Lindsay.*) Now if a monster harbour is to be made, you think this is the place for it ?—Yes.

21,554. Say it rested between making a monster harbour here and a small harbour here and another small one—I mean a comparatively small one here and comparatively small one at Filey Bay, or a comparatively small one at Hartlepool Bay—and that the sum required for the monster harbour was to be distributed over the three, which would do more to same life and property ?—To be sure ; the more harbours, the more life and property will be saved.

21,555. If now it rested between Filey and Hartlepool, which should you prefer then ?—I should prefer Filey.

21,556. Why would you do that, all things considered ?—Because we have principally to look to the laden ships for safety, and when they leave the harbours in the north they always leave with a fair prospect, and I think that if there is a harbour at Filey they might get there, or that if there was one at Whitby they might get there. We do not want to have harbours where we leave the ports of loading, because we have harbours sufficient to lie in until we want to go to sea. We never go out without a prospect of getting to the southward.

21,557. Is it your opinion that most of the vessels which are lost in the bight of the bay are vessels which have been a good way to the southward and have been driven back ?—I am quite of that opinion.

21,558. It is not generally the case that ships are caught immediately after leaving the loading ports and are then lost ?—It is not so. They almost always go away with a prospect of a good run.

21,559. Generally a man sees his way clear for a fair run ?—He will never go to sea without seeing a prospect of getting to the south.

21,560. As far south as Flamborough Head if possible—at all events as far south as Whitby ?—Yes.

21,561. Therefore you conceive that a harbour of refuge somewhere along this coast, even as far south as Filey, would be of more advantage than one in Hartlepool Bay ?—I am quite of that opinion.

21,562. Is there any other reason why you should

WHITBY.

Mr. S. Storm.

23 Oct. 1858.

Mr. Lindsay.

prefer Filey as a site to Hartlepool ?—I do not say Filey particularly. Either that or Scarborough, if there is a safe harbour made, would be most advantageous—more advantageous than any at the ports of loading.

21,563. You say you have objections to running for pier and river harbours, and give very good reasons why, I think. Now say that the Tyne could be deepened so as to have 25 feet of water at low water, would you have any hesitation in running to the Tyne for refuge in a gale of wind ?—I would sooner run for a harbour that was made without any tide in it.

21,564. You would have hesitation in running on account of the tide ?—Yes, with piers.

21,565. If the piers were carried out to the extent I have named, so as to give 25 feet at low water, would you then consider the Tyne valuable as a harbour of refuge ?—If it was carried out you would still want an entrance. If you take the piers out and make a narrow entrance there will be a very strong tide, and that will cause a very heavy sea in gales of wind, and when the tide is running out it would be very dangerous to take the harbour.

21,566. You think it would be dangerous during the ebb tide ?—It is what if I went to sea I should never attempt. I would sooner risk the ship going to the Firth.

21,567. Do you know anything of the coast of Scotland ?—Very little ; I have passed and repassed, but not to be near hand.

21,568. Do you know enough of it to offer an opinion whether a harbour of refuge on the east coast of Scotland would be of value ?—I have not that experience. I have passed and repassed perhaps 20 or 30 times, but never was in any harbour. I have passed through the Pentland Firth, and been in the Firth of Forth perhaps eight or ten times, but I never was in any of the northern ports, I never landed.

21,569. Then you are not prepared to offer an opinion as to the necessity or otherwise of a harbour north of Aberdeen ?—I think they do not require it so much as we do on the east coast of England, on account of the quantity of ships on this coast. They have more fishermen than we have, but we have a great many more ships passing and repassing, and a good few fishermen sail in the season, so I think there is more risk here than on the Scotch coast.

21,570. (*Capt. Washington.*) I think you said that vessels seldom leave the ports in the north without a fair prospect of getting north ?—Very seldom.

21,571. Leave, that is, the Tyne, the Tees, the Wear, and Hartlepool ?—Yes.

21,572. Of course it depends on the wind, but how far up do they generally get ?—As the last witness made the remark, they came out with a wind from the westward in general. They will come to Whitby, and when they get a little south of High Whitby we generally find the wind meets us there a point or two. Likewise coming the other way, just similarly the wind is more to the southward. It is a place we often come right up along the land ; when we get south of Whitby we get it south and south-south-west.

21,573. It is high land from the north cheek of Robin Hood's Bay to High Whitby ?—The north cheek is not so high. High Whitby is higher, but it is high land, and thereabouts they meet with a change of wind.

21,574. They generally meet with a change of wind there ?—Yes ; I attribute that to the drawing of the land both ways. The land falls in on both sides.

21,575. And does the wind drive them off ?—Yes.

21,576. What do they do then ?—Ply off to the eastward, according to the tide, whichever way the tide is running on them, to take advantage of it in order to gain the mast and lose the boat.

21,577. Do they still strive and struggle up to get as far as Robin Hood's Bay in Scarborough ?—Yes, sometimes they keep struggling on for days, as long as ever they can get a little ground.

21,578. If there was a shelter at Whitby would these vessels come here or still struggle on ?—Some would come here, and some would struggle on.

21,579. As long as they could carry moderate sail ?—Oh yes, with good ships.

21,580. Directly the wind increases they would run for some place ?—Yes, the nearest they could get for shelter then.

21,581. I suppose they would be scattered all along the coast ?—We generally see them scattered all along the coast ; when we do leave we generally leave in large fleets at back ends and springs. From one port to another there is a matter of 15 or 20 miles of vessels scattered along different ways.

21,582. Are there a great many vessels often seen off High Whitby ?—Yes, more than off any port of the coast.

21,583. Is there any telegraph or look-out there ?—No, nothing of the kind.

21,584. More than any part of the coast ?—They come nearer the land there.

21,585. A great many always congregate off Flamborough Head ?—Yes, there are ; that is another point where the land alters a little each way. When they get to the Head they often find the wind get a little round ahead. If it gets to south-west and west-south-west we dodge a little and sometimes bring up, but I never brought up but once there, it was near Speeton Cliff, between Flamborough Head and Filey.

21,586. You are speaking of laden vessels ?—Yes.

21,587. What do the light vessels do ; will Whitby shelter any of them ?—Not at present.

21,588. Supposing it was made a refuge ?—If it was made a monster refuge it would shelter them very much.

21,589. A monster refuge if you like, but I think we shall get a moderate one ?—I should like to have three or four instead of one.

21,590. And amongst these—— ?—I think Whitby should have one.

21,591. And then it would be the means of saving light vessels as well as laden ?—Yes.

21,592. Do you agree it would be a great benefit to improve the existing harbour—the harbour between the two piers ?—It is sure to be a benefit if you can make more water.

21,593. If you could get six feet at the entrance would that be a great benefit ?—Certainly.

21,594. It would take the most of the light colliers along the coast ?—Yes, if deepened six feet it would take the light colliers.

21,595. Do you mean that six feet would take a light collier in ?—If it was deepened six feet at high water it would take them.

21,596. But at high water it takes them now ?—Sometimes it does.

21,597. But even deepened there would only be six feet at low water ?—A light ship will seldom run more than six feet to eight and a half feet at the utmost.

21,598. From what you know of vessels on shore or in danger in all the gales we have had, will you say how many ships you think a purely refuge harbour would be required to take in any one gale ?—In heavy gales, in general, we have not so many ships out at sea as at other times, because they seldom come on so suddenly but what many ships can get into places before the force of the gale comes on ; so that generally we have not many at sea during the gales.

21,599. What should you think should be the accommodation provided in the harbour of refuge to take in all the vessels which would require to enter it in one of these dangerous gales ?—I think not more than 100, or 150 at the utmost.

21,600. If it was calculated to take 200 laden colliers, would that be sufficient for the shelter required in any gale of wind ?—I am quite of opinion it would.

21,601. Supposing a harbour made entirely by piers, would it be of great advantage for the colliers that you

should have an entrance both ways, so that you could run out at either end without working out?—Yes, it would be a great advantage.

21,602. Do you think that almost a necessity in connection with any harbour of refuge on this coast?—Yes.

21,603. Supposing a pier is run off the land, giving a good passage round one end, and having a small opening near the land to admit vessels in the other direction—how wide a space is necessary for a loaded collier to take? I suppose you have often run into these pier harbours?—Not often.

21,604. What width of space between two pier heads would you think it safe to run for with a gale on-shore?—I should like a place as wide as possibly could be permitted, because the wider the place is, the better they would go in, and there would be no danger.

21,605. But there would be more danger inside, would there not?—Yes, if there was not shelter.

21,606. Then the wider the space the more danger there would be to vessels at anchor—from the outside sea I mean?—Yes, there certainly would.

21,607. Then it would be an object to get the entrance as small as would be quite safe for vessels to take. I want to know how small such an opening could be made with safety for a loaded collier to take it?—I think it certainly should not be less than 50 fathoms at the least.

21,608. Would 100 fathoms be sufficient?—It would be sufficient, more than sufficient, I think, for any colliers.

21,609. An opening of a cable's length in width would be quite sufficient?—Quite sufficient, I think.

21,610. That is 600 feet?—Yes.

21,611. If it is made 400 feet in width, would that be safe?—It would, and less too.

21,612. Would you be satisfied with 400 feet?—Ye

Mr. W. B. Smith re-called.

21,613. (*Chairman.*) I omitted to ask you how many voyages you had made from the Baltic?—Upwards of 50.

21,614. Coming across from the Baltic in the fall of the year what was generally your landfall? I do not mean where you endeavoured to make the land, but where you actually did make it?—Almost invariably between Flamborough Head and the Humber in the winter season.

21,615. Did you ever make it to the north of the Firth of Forth?—I never made it to the north of the Farn Islands.

Mr. James Gudwood examined.

21,616. (*Chairman.*) You are a shipmaster, and have been 25 years at sea?—Twenty-three years.

21,617. Of that period, how many in command of ships?—Sixteen.

21,618. In what trade were the vessels which you commanded chiefly employed?—In the coasting trade, France and London, the Tyne and London, chiefly to Whitby in the trade I am in now.

21,619. You have heard the evidence of the previous witness as to Whitby being the best point on the coast for a harbour of refuge, is that your opinion?—Yes, for a single harbour.

21,620. Give your reasons for entertaining it?—In regard to leaving the Tyne we generally always get to the southward of Whitby (I am only speaking of my own experience); sometimes as far up as the Head, before we are caught with an adverse wind. Then if it comes adverse, we undoubtedly have to go off to sea.

21,621. It is your opinion, that a harbour at Whitby would catch the greatest number of ships that would require refuge in strong winds from the southward?—Yes, or from the northward. I mean that on a grand plan. I do not mean in a large scale, but as to depth of water so that there shall be shelter into 10 fathoms water. We frequently see the water break in eight fathoms. It can be observed from here. I am sorry I could not give my opinion with many of the witnesses that have gone before me.

21,622. Will you just state in what respect you differ from those who have gone before you?—They gave their evidence to eight fathoms and some as low as five, I believe, which in the gales of wind in which the breakwater or harbour of that description would be most required, undoubtedly would not be safe.

21,623. When have you seen the sea break in eight fathoms?—Frequently outside here.

21,624. Breaking heavily in eight fathoms?—Yes.

21,625. Anywhere else have you seen it do so?—I have seen it break very far out at Newcastle. I have been several times on Tynemouth Castle when a gale of wind has been blowing, and have frequently seen it break very far out and very heavily.

21,626. Anywhere else?—No, I cannot say, unless it is about the Head. Round the Head, if there is a strong easterly wind and a strong ebb tide, sometimes it breaks in 10 fathoms.

21,627. The breaking of which you talk, is it a real breaking of the sea?—It is.

21,628. Not the kind of break you see on the top of the sea?—No, it is a complete overlap; what you may call the first blow of the sea.

21,629. You entertain the opinion, that laden vessels are those which want refuge most?—I say Whitby is the place when it is wanted for light and laden equally in regard to property; in regard to life. I should say more so for laden ships.

21,630. Do you agree with the opinion of the previous witnesses as to which are the most dangerous winds here?—South-east, east-north-east, and north-east.

21,631. Do you consider that these onshore gales generally give a man a fair warning so that he can get off?—I cannot concur with that altogether.

21,632. Tell me about that?—I have been caught several times with the wind from the north, and have sometimes seen vessels caught with stun-sails set—caught all aback with a gale from the north, before they have had time to take them in.

21,633. The change of wind is so sudden?—Yes, it is.

21,634. But although the wind comes suddenly, is there any indication about the sky to enable an experienced man to see what is coming on, and to get in his sails?—I have seen it sometimes when there has been no warning.

21,635. It is absolutely necessary, that vessels that sail out of these ports should keep close to the shore in order to make the passage?—It depends on what the master thinks. If the wind is likely to east, he naturally draws off the land. If we come out of Shields with the wind from the eastward, east-north-east, and north-east, the first thing the master does is to get a proper offing if possible, and then if a gale comes on he is generally in a position, if he has a ship that can do it, to keep off, unless he is completely forced on shore, which causes him to run for Whitby. We know many instances when Whitby, in regard to laden ships, would be a saving of life and property coming from all ports of the north. For instance, a vessel coming over a bar in the north and touching the bar or springing a leak, often calls at Whitby for extra hands; if they can get them, they get them, and if not they have to proceed. Perhaps they are caught before they can get here. They cannot come in with the land, and the men have to pump or sink, or run on shore.

21,636. In westerly winds is it necessary to keep near the land to make the passage?—With that wind the closer in we get the faster we get on. If it falls

WHITBY.

Mr. J. Gudwood.

23 Oct. 1858.

Chairman.

calm, and you wish to stop a tide, you are in a position where you can better do it. If you are off, you most probably go to leeward and drive a tide.

21,637. Therefore it is necessary in off-shore winds to make the passage to keep close to the shore?—Undoubtedly.

21,638. During your time at sea, have you ever been in great risk of being lost in running into one of these harbours?—I have been in risk of being lost going into the Tees and going into the harbour.

21,639. Tell me about it?—When we ran into the Tees, we were bound northward loaded. We were in sight of Tynemouth; the gale came on from the north-east; I thought, rather than go back to Bridlington Bay, I would either take Hartlepool or the Tees, and calculated by running into Hartlepool to be there at daybreak. But I had overrun my distance, and laid to by the Tees. In hauling out off the Tees, a sea broke aboard and carried away the bulwarks, and washed a man overboard. When we got into the Tees it was just breaking daylight.

21,640. You managed to get into the Tees after considerable risk?—Yes.

21,641. If you had been prudent would you not have run for Bridlington Bay?—I considered that bad wind to eastward, and should have been as bad there, and my object was to get with perfect safety.

21,642. Therefore you ran for the Tees and Hartlepool that you might get perfect safety, not to save the loss of the ground you would otherwise have lost by running to Bridlington Bar?—That might have been combined with it, which I do not know that it altogether.

21,643. It was half-and-half, perhaps?—It might be.

21,644. Any other occasion on which you have been exposed to danger coming into these harbours?—I have shot into this harbour just by mere providence. We had been off here knocking about the whole night, sometimes with single, sometimes with double, reefed top sails, with the wind east and east by south, waiting for tide time. The tide that morning was just flood at daybreak. We came away for the harbour, and I calculated to be there at daybreak. The consequence was that we came to the rock. When we got there it fell as calm as ever it was in the heavens. Except for the flapping of the sails you could have carried a candle about the deck. I said to the mate "I believe there is going to be a shower." He replied "We had better let go the anchor then." I said "No, it is of no use, we are upon the Scar." I saw there was a chance for us at the next sweep of the sea. The first time the sea swept in, the ship lost steerage way. I said to the mate "I am afraid we are going to be lost." The next run of the sea canted us, and when it left us we lay with our head over for the long pier end. The ship lay that way until another run, and then she ran over for the north pier. My heart was as near out of my mouth as it could be. I believe nine feet further her bowsprit would have rested on the pier. Another run came and she ran up alongside the pier. The pilots could not get off, but one of them came down and sung out to me to run out the anchor, and give him a rope. We were then over by the buoy in the bight. We had coasted there as it happened. The pilot jumped on board after we had got a rope fast to the buoy. We were setting the sails; the men were setting the topsail and the mainsail, when the breeze came on fresh as ever. The pilot ordered the men to loose the topsail, and we ran up the harbour.

21,645. That happened in a lull of wind?—Yes.

21,646. After knocking about for weeks in thick weather, when you have not seen land for two or three days, is there much difficulty in calculating your position?—Sometimes I have had a good deal of difficulty. I have gone out of my course. I have sometimes gone from the east to the Tyne. We have steered down north and by east, and, before we have come in with the land we have been as far as Huntley Foot. Another time, when it was thick, I have steered down the same course and fetched Sunderland buoys.

21,647. Then you were considerably out of your reckoning?—Not more than by miles each way.

21,648. A man well acquainted with the coast and with the tide, can he generally have a good idea where he is?—Not if he is long out of the sight of land.

21,649. The most experienced men on this coast would have considerable difficulty in being certain as to this point, if he had been in a fog for three days?—Undoubtedly.

21,650. (*Mr. Lindsay.*) Do you carry a barometer?—No.

21,651. Nor ever did?—No.

21,652. Do many colliers carry barometers?—I cannot say as to that.

21,653. Do you think it would do most good to improve the existing harbours, so as to admit vessels at all times of the tide, or to erect one great harbour?—If the existing harbours could be made safe for a ship to go into in any weather, undoubtedly it would be a vast improvement; in my estimation the more of them the better.

21,654. If the Tyne were improved to 25 feet at low water, would you have any hesitation in running for it in a gale of wind with an ebb tide?—I should be very frightened then if there was a heavy swell, especially if there was any ebb out. I do not think I should take it as long as my ship was good.

21,655. You would still be frightened to run for it? Yes, if there was any ebb.

21,656. Say there was only one harbour to be made, and it rested between Filey Bay and Hartlepool, which should you prefer?—I cannot say. I think ships are so scattered, each port would be valuable to some.

21,657. Which do you think would do most good?—I should almost think Whitby.

21,658. Leave out Whitby and say it rested between Filey and Hartlepool?—I should prefer Filey.

21,659. Tell me why?—Because with Hartlepool as it is there might be some chance of saving life, but if Hartlepool were improved, undoubtedly it would be a good place.

21,660. Speaking as to position only, do you think the position of Filey or of Hartlepool would be the best for the construction of a harbour of refuge, if only one was to be made and it rested between these two places?—I should say Filey in respect of loaded ships.

21,661. And with regard to light ships?—Well, Filey would be a good place for light ships, and if there was an entrance for vessels at both ends, undoubtedly masters would look greatly at that; I mean the facility of getting out if there was a fair wind.

21,662. All things considered, if it rested between the two places, I think you would prefer Filey?—Yes.

21,663. Because when ships come from the northern ports they have a chance of being south?—That would depend upon how the gale came on and how soon it came. We often see a large number of ships leave in one tide; those that go fast get first, those that are slow are left last. If the gale come soon equal refuge would be wanted for both.

21,664. Did you ever leave harbour without seeing a fair prospect of getting a run to the south?—Sometimes with a very fair prospect.

21,665. I ask because I should like to know whether you think the ships which are lost in the bight of the bay have consisted principally of ships that have been lost shortly after they have left the harbours, or ships that have been caught on the coast to the southward and obliged to put back?—There are a great many of them that have put back.

21,666. Do you think the larger proportion consist of ships that have gone to the south and been obliged to put back?—I cannot say as to the larger proportion. I could name several that have been to the south of Whitby and then wrecked, and that would have been saved if there had been a harbour here or in this neighbourhood. I can name two or three that have foundered; if there had been a place sheltered from

the north and north-east about Whitby the lives of their crews might have been saved. The *Merchant* struck on Shields bar; the pilot was on board, she had to come away and could not stop. Had they known there was a place of complete safety at Whitby or any other place at hand, they would have run directly for that place. In my opinion, they had hesitated in running for the shore until they found they were forced to it. The vessel foundered short of the shore, somewhere not far off; the name board was washed up on Whitby sand.

21,667. That is a case in which a harbour at Whitby would have saved the ships?—Yes; and there is another that foundered to the southward, I cannot name the vessel, but she had gone past here and she would have been saved also. Several screws to my knowledge have foundered. Had Whitby been a secure place of refuge I have not the least doubt they would have been saved. Rather than let the vessels be foundered at sea they would have come to Whitby. There was the *Ann* of London; she passed Whitby and went into Robin Hood's Bay and drove ashore there. A life-boat was capsized going out to sea, and 12 hands were lost altogether. Had Whitby been a place of refuge that vessel would have been saved, part of the crew would have been saved, the lifeboat would not have been upset, and the crew of the life-boat would also have been saved. I can name vessels that the lifeboat has gone out to from Whitby, and fishermen also have gone to assist. The life-boat has been upset and several lives have been lost; this has happened on two occasions, if I remember rightly.

21,668. Were you out in the gale of January 1857?—No, I do not think I was.

21,669. If it rested between Whitby, or somewhere thereabout, and Filey for a single harbour, which do you think would be the means of saving most life and property, especially life?—It would depend on the position of the ships; I really cannot give an opinion; but in regard to the vessels that have gone ashore in Runswick Bay, several might have been saved had there been a port of refuge at Whitby. The vessels Mr. Smith named, the *Amelia*, the *Severn*, and the *Port of Glasgow*, had driven past Whitby; the *Port of Glasgow* went upon a small bit of ground, in such a position, that had she been a few cables' length either way all hands would most likely have been lost. Had there been a harbour of refuge, several light ships and property would have been saved, but very few lives are lost from light ships; if they don't go upon a very rocky place, if they can come to land such as Whitby, or find a good place in Robin Hood's Bay, or a good place in Runswick Bay, they may be almost always saved.

21,670. Suppose only one harbour of refuge to be made on this coast, what number of ships ought it to be made to contain?—I can't say, not seeing the number of vessels.

21,671. Would a harbour if it contained 200 sail of the usual description, and so as to allow them to ride at anchor, be sufficiently large?—I should almost think so, but it would depend upon the place that they had to go into; for instance, if they had plenty of water to go in, and had plenty of room to get out of each other's way, a very small place might do. But we know of cases of two or three ships running for a port together; they have completely blocked up the road, and the consequence has been property has been damaged and almost all destroyed; for instance, at Hartlepool, when there was so much damage done there, we had cases of ships that did not want to go there, light ships; part of them would have been here had there been a place of refuge, because the man who was prudent and thought bad weather was coming on would have stopped in Whitby Bay, had there been provision for his getting out easily and taking the tide at the proper time. A new ship belonging to Whitby, called the *Spring*, was run down, it was supposed, by a bark; I believe had there been a port of refuge, that vessel would have taken refuge; the people in the bark did not see the vessel until they struck her.

21,672. Say there is only one harbour to be made, and it is to be made at Whitby, if there was sufficient space to anchor 200 sail in water of three fathoms and upwards, do you think that would be enough for the wants of the trade?—I cannot say; it would depend entirely on the vessels that were on the coast, because sometimes off Whitby, with the wind away from the eastward, I have seen myself 200 or 300 light ships and laden ships coming up; if they were taken by a sudden gale, they would want a great deal of room.

21,673. If you have seen so many light ships off Whitby, how many laden ones have you seen?—I have seen perhaps 100 or 200 laden ships.

21,674. Then with the light and laden together, there would be fully 500 vessels?—Yes; I should think so.

21,675. (*Capt. Sulivan.*) You say that comparatively few lives are lost from the light ships; are by far the largest proportion lost in the laden ones?—Yes.

21,676. Should you consider it is the first importance, in choosing a site for a harbour of refuge, that it should have reference to saving laden vessels?—Undoubtedly in regard to lives.

21,677. You would make that your first object?—Yes.

21,678. You spoke of vessels running into a harbour two or three at a time and getting damaged, would you have any fear of running between two piers having an opening two thirds of a cable's length across?—In a gale of wind I should.

21,679. You think it would not be wide enough?—It would not, in my estimation. The openings of our own piers are not more than two thirds of a cable, and we have very great difficulty in getting in.

21,680. Do you think your opening is two thirds of a cable?—I think very nearly.

21,681. By the plan, the entrance between the piers is not half that?—Then I am mistaken.

21,682. If you had an entrance, not like the narrow channel you have here, but two piers coming to each other, so that the moment you passed the ends you would be inside; would an entrance of that sort, twice the width of the Whitby entrance, be safe to run for?—I think so. Undoubtedly the widest possible entrance is the best, so long as the sea does not get in.

21,683. Would you think it of great importance that there should be two ways in and out of the harbour?—Undoubtedly I would.

21,684. Would you consider it of great importance that there should be two openings, so that, whichever way the wind was, whether south-east or north-east, a ship might enter with a fair wind, instead of having to haul round to leeward and work in?—Undoubtedly, if that could be done.

21,685. Have you ever seen a large number of laden vessels under Flamborough Head?—Several times.

21,686. At anchor?—Some at anchor, and some laid to, driving about, making to windward.

21,687. Have you ever seen them with strong south winds?—Yes, strong south winds I have. I have been laid there at anchor, and forced to leave from under Speeton Cliff.

21,688. You mentioned that a life-boat was upset in Robin Hood's Bay, and another at Whitby?—Yes.

21,689. Were they the new sort or the old?—I cannot say.

21,690. I ask the question, because it might go forth to the public that life-boats which are now used on the coast had drowned the crews. I am anxious you should say whether they were of the old construction or the new?—I cannot say in respect of that.

21,691. How long ago did it happen?—It was on the 4th of February 1848.

21,692. It was long before the improved life-boats were put on the coast, was it not?—Yes, undoubtedly it would be.

WHITBY.

Mr. Thomas Douglas examined.

Mr. T. Douglas.

23 Oct. 1858.

21,693. (*Chairman.*) You have been a pilot at Whitby for 34 years?—Thirty-three.

21,694. Have you been present during this inquiry?—Yes.

21,695. You have heard what has been stated by the previous witnesses. Do you generally agree with them?—Yes.

21,696. If there is any point on which you differ from them state it?—No, I do not think that I do, unless you can remind me of them. There is one thing I have to state, I have not come to give an opinion on the coast; I am no coaster. I am here only to give an opinion as to the piloting of the port. I am not a practical man coastwise.

21,697. Perhaps you can tell us something about the anchoring ground. What is the nature of the bottom at the spot which is marked "good anchoring ground" on the plan?—It is sand.

21,698. What is under the sand? Is there clay?—The anchors are quite clean when they are brought up; they are bright; there is no clay.

21,699. In this plan you will see close under Whitby Rock some very uneven soundings; is it a rocky bottom?—It is rocky. I saw the steam-boat go off; the soundings were taken at the harbour's mouth, whereas they should have been taken at the north side of the pier. There the soundings are more fair; the side of the rock is quite clear.

21,700. So that, in point of fact, the uneven soundings in the neighbourhood of Whitby Rock are continuations of the rock under water?—Yes. I think the deep hole is made by the heavy sea coming over the north end of the rock and washing the sand away. There are 10 fathoms of water in it.

21,701. It scoops the sand out from between the rocks?—Yes. I have known ships come there at low water tides, and back off, there being such a slope.

21,702. How far does this rocky bottom extend from the outline of Whitby Rock which is marked on the chart—for a cable's length should you say?—It slopes away until you have fetched the north side of Whitby pier. It is foul ground until it slopes in that direction.

21,703. You see the outline of the north side of Whitby Rock marked on the plan. How far from that does the uneven ground extend—for a cable's length, or three quarters of a cable's length, or what?—I should think not for a cable's length before you come to good ground.

21,704. After half a cable's length have you a clean bottom?—Yes, we have a clean bottom.

21,705. (*Capt. Sulivan.*) I see, nearly two cables' and a half from the rock to the northward, 30 feet and 37 feet marked near it. If the bottom gets clean half a cable off, how can there be that sudden slope in the soundings about two cables off?—I cannot think how it is; but very few masters know of this hole, and not many bring up there. It is not what we call anchorage so close to the north end.

21,706. Is it where the 57 feet or nine fathoms and a half are marked?—There is 10 fathoms in the scoop of the hole.

21,707. I see 57 feet marked two cables from the rock. If that is so, the hole must extend two cables from the rock?—It is scooped out like a basin.

21,708. I want to know how it is that you say the clean ground begins half a cable from the rock when I see the hole marked in the chart two cables from the rock?—I don't see it, and I have been riding all over here from the northward to the hole.

21,709. How far is the outer edge of the hole from the rock?—I have not marked the whole distance; I mean the central point in the middle of the hole.

21,710. The deepest part of the hole marked here is 57 feet?—Sometimes the hole is deeper.

21,711. That depth is marked here two cables' length from the rock; how, then, can the ground be clean half a cable from the rock if the hole is marked two cables off?—I mean clean to the north of the hole.

21,712. (*Chairman.*) Do you think with a pencil you could mark on the plan the part of the anchorage which is unfit for vessels to anchor in?—All come to the north side of the north pier.

21,713. Have you any marks for anchoring, for keeping you to the northward, within which you now anchor?—We generally bring up as the wind and weather may prove.

21,714. What are your anchoring marks on shore?—We take the best marks we can by night.

21,715. By day?—We have our own ideas just according to the wind. If the wind is blowing strong westerly, we come close in the shore; if southerly, we get as close up to the rock as we can fetch.

21,716. You go by the eye?—Well, by our own judgment. All are guided by their own judgments.

Mr. Robert Foster examined.

Mr. R. Foster.

21,717. (*Chairman.*) You are a shipmaster?—Yes.

21,718. And have been 27 years at sea?—Yes.

21,719. Out of which how long have you been master of a ship?—Fourteen.

21,720. Have you traded exclusively betwen the Tyne and the Humber?—Yes.

21,721. Have you heard the evidence of the previous witnesses?—Yes.

21,722. Do you generally agree with the evidence which they have given?—I do.

21,723. Is there anything they have not told us which you can tell us?—I think not.

21,724. (*Mr. Lindsay.*) Do you think one great harbour or the improvement of the present harbours would be more advantageous?—The more harbours the better to save life and property.

21,725. Therefore, you think the improvement of the existing harbours would do more to save life and property than one great harbour, even if placed at Whitby?—I do.

21,726. Say there was to be one, where would you put it?—At Whitby.

21,727. Say it rested between Filey and Hartlepool, where would you have it?—In some cases it would answer at Filey, but not in all cases, because there are ships that never reach Filey that could make Hartlepool. If you wanted me to decide what place I would have it I should say Filey.

21,728. You must know a great deal about this coast, having always traded between the Tyne and the Humber?—Yes, I do.

21,729. You are no doubt aware that there have been a great number of ships lost in the bight of the bay, that is to the northward of Whitby towards Hartlepool, and off Sunderland. Do you think these ships had been caught with a gale immediately after they had come out of the harbour, and had been further south and been obliged to run back?—They had been further south in my opinion.

21,730. Have you seen vessels running down in gales of wind from the south for shelter in the bight? I have seen that. I have seen many that have been quite off here.

21,731. Have you ever gone to sea with your ship when you saw very little chance of working your passage to the south?—I cannot say that I ever did. The vessel I go in is a small one.

21,732. Before you put to sea you generally think, at all events, that you have a fair chance of getting south of Whitby?—I do.

21,733. When you do not see a fair chance of getting south of Whitby you keep in port?—Yes.

WHITBY.

Mr. WILLIAM PATTISON examined.

Mr. W. Pattison.

23 Oct. 1858.

21,734. (*Chairman.*) You reside at Whitby ?—Yes.

21,735. You have been at sea 51 years ?—Yes.

21,736. How long have you been on shore ?—Eighteen months.

21,737. You have been 16 years in the command of ships ?—Yes, of small ones.

21,738. Where have you principally been employed? —Between the Humber and the Tyne, and from Whitby to Sunderland and Newcastle.

21,739. Was the ship your own ?—No.

21,740. Have you been present yesterday and to-day ?—Yes.

21,741. Do you generally agree with the evidence which has been given ?—Yes.

21,742. Is there anything you would like to add to what you have heard as the result of your own observation and experience ?—No, nothing.

21,743. (*Mr. Lindsay.*) Did you hear the answers Captain Foster gave just now ?—Not exactly.

21,744. From your long experience, say there is to be one great harbour, and one only, where ought it to be put ?—Midway between Shields and the Humber, which is Whitby.

21,745. Do you think one great harbour at Whitby, or the improvement of the existing harbours along the coast, so that ships could get into them at all times of the tide, would do most to save life and property ?—The improvement of the existing harbours.

21,746. Even in preference to a great harbour at Whitby ?—Yes.

21,747. Putting Whitby aside altogether, tell me if it rested between Filey and Hartlepool, and there was only one to be made, and it were left with you to put it either at Filey or Hartlepool, looking to the saving of lives in laden ships and in the light ships, and the saving of the ships themselves, all things considered, where would you put it ?—There are more ships out of Shields and Sunderland than all the other ports besides. When the wind is south-south-east and south-east, and they are coming to the Yorkshire coast, if they are caught in a bad gale suddenly and there were a harbour at Hartlepool they would take it, and provided the harbour were filled up some of them could be put in Old Hartlepool and some in West Hartlepool. We have the same chance at Whitby, if the outside harbour were filled up, they could shift them back into the inner harbour, and so get more room for refuge ships to come in.

21,748. Should you prefer Hartlepool to Filey ?—Yes, I should, on that account.

21,749. Have you seen many ships that have got to Whitby running back seeking for shelter in a gale of wind ?—Yes, many times.

21,750. Do you think that those ships which are lost in the bight of the bay are caught by the gale immediately coming out of the harbour, or do they get south ?—We cannot tell exactly where they have been caught.

21,751. As a general rule ?—They get as far to the south as they can. If they cannot take Shields perhaps they cannot clear the Farn Islands, and are compelled to go on shore one way or other.

21,752. Say only one harbour was to be made, I think you said you would prefer Whitby as a site for it ?—Yes, because it is the deepest, and the soundings are most true.

21,753. You would prefer Hartlepool second ?—Yes.

21,754. What would be the next ; would Filey be the next ?—Yes ; because many ships are sometimes dodging off the Head with the wind south, and when it gets south and by east they have to run.

21,755. (*Capt. Sulivan.*) How wide do you think the entrance of a harbour of refuge which ships are to run for in a gale of wind should be, in order to take a loaded collier into it in a heavy sea ?—About three-quarters of a cable's length.

21,756. A cable being 100 fathoms long, you think that would be sufficient ?—I think so ; she would steer very badly if it was not.

Mr. MATTHEW BEDLINGTON examined.

Mr. M. Bedlington.

21,757. (*Chairman.*) You are a shipowner, and reside at Robin Hood's Bay ?—Yes.

21,758. You are secretary to the Robin Hood's Bay Insurance Company ?—Yes.

21,759. How long have you been secretary to the Insurance Company ?—Since March 1857.

21,760. How long have you been ashore ?—Two years.

21,761. You have been 25 years at sea ?—Yes.

21,762. You were master of a ship ?—Yes.

21,763. Chiefly employed in the coasting trade ?—Yes.

21,764. You have been present yesterday and to-day ?—Yes, nearly the whole of the time.

21,765. Do you agree generally with the evidence which has been given ?—Some of it I do not, but generally I do.

21,766. Will you state in what respects you differ from the evidence which you have heard given ?—I do not agree with that part of it that goes for the improvement of the existing harbours altogether, if you mean those harbours that are on the Durham coast. They would be all very well in their way, but I think something else is wanted.

21,767. You think the improvement of the existing harbours would not meet the exigencies of the case ? —I think not.

21,768. You are for one harbour somewhere ?—One or more.

21,769. Where would you put one harbour ?—If you are only going to have one, Whitby would be a very good place.

21,770. Is your name to the memorial from Robin Hood's Bay ?—No.

21,771. You would not think that Robin Hood's Bay is a place for a harbour ?—They were so late in beginning ; I did not know they were going to begin.

21,772. You have not had time to consider the question ?—I have had time to consider it, but I think there are better places, all things considered.

21,773. After Whitby which would be the next best place ?—Hartlepool, I think, if you can get sufficient water.

21,774. After Hartlepool which would be the next best place ?—I cannot say. I should like to have it in the bight if there is only to be one.

21,775. Will you state your reasons ?—Because I think you can always fetch there. Very often ships for the Tyne do not get any further than Hartlepool, or very little.

21,776. But frequently get up to Whitby ?—I was to suppose that Whitby was out of the question.

21,777. (*Mr. Lindsay.*) I think you said, you did not think that the improvement of the existing harbours so as to make them harbours of refuge would be sufficient ?—Exactly so.

21,778. Do you think that a harbour somewhere to the south, between here and Flamborough Head, together with the improvement of the existing harbours so as to make them accessible at all times of the tide—do you think that such a distribution of the public money as that would meet the demands of the trade ? —If you include Hartlepool with the existing harbours, I think it would.

21,779. Do you think that mode of spending the public money would tend most to the saving of life and property, or could you tell me of another mode which would save more life ?—I think if you were to have one here and one at Filey Bay.

21,780. You think that distribution of the public money, one at Filey and one at Whitby of the same size, and the improvement of the existing harbours, would be the best mode of saving life and property ? —Yes, I think it would.

WHITBY.

Mr. W. Jameson.

23 Oct. 1858.

Mr. WILLIAM JAMESON examined.

21,781. (*Chairman.*) You are a shipowner, resident at Whitby?—Yes.

21,782. And are one of the trustees of the pier and harbour of Whitby?—Yes.

21,783. How long have you been connected with the port in the capacity of trustee?—Since March 1854.

21,784. For what period as a shipowner?—Nearly 30 years.

21,785. Have you ever been at sea?—Yes.

21,786. For what period?—Twenty-four years.

21,787. In what capacity? In command of vessel?—Yes.

21,788. In what trade were the vessels employed which you commanded?—The southern trade; to South America, the Mauritius, and the Cape of Good Hope, altogether in the southern trade.

21,789. You have been present during this inquiry?—Yes, nearly all.

21,790. Give your opinion upon the question generally?—I can offer no opinion upon the general question of the evidence, because I never was on this coast in my life; I can only speak from books and what I heard, therefore I would rather not give an opinion, when you have heard so many practical men who have been so long upon the coast; I do not consider myself to give an opinion upon a part of the coast which I have never seen; I would rather confine myself altogether to Whitby, to which my attention has been drawn from the position which I hold; I would rather not give an opinion, which perhaps I should not be able to substantiate. Perhaps you will allow me to state, with regard to the plan before me, (that put in by Mr. Harrison,) that the Chairman of the Committee, accompanied by Mr. Harrison, waited upon the trustees of the piers and harbours of Whitby, and submitted this plan for their consideration; they explained it to us, and when I say this plan I will altogether confine myself to the breakwater at Whitby Rock, which is intended to afford shelter for laden vessels with south-east winds; that was the only part of the plan which we took much into our consideration, and upon which the discussion almost altogether turned; there was no extended plan, but all the discussion was upon the breakwater on Whitby Rock. The trustees approved of the plan of a breakwater on Whitby Rock. In their opinion, if it were made it would afford a very good place for ships to ride in safety with south-east gales. These south-east gales are the worst gales upon this coast, and of course those during which shelter is most needed. With the wind at south-east, according to the plan, I understand there would be a sheltered area of 350 acres, where 125 vessels could safely ride; with the wind at east there is an area of 200 acres, where 70 sail could safely ride. If the Government would construct this harbour out of the public money it would be the means of saving from shipwreck a great number of valuable lives and a great amount of property; therefore the trustees would recommend this plan to your kind consideration. I wish further to bring under your notice the advantages of having a harbour of refuge where supplies of all kinds might be readily obtained, and where repairs of vessels in case of need to any extent might be effected. I believe there is no part of the coast where they could be done better or cheaper. The general advantages of the plan would be to afford shelter from the south-east gales, which are the most dangerous on this coast for vessels weighing to go to the southward. I will put in Mr. Walker's plan of Whitby Harbour.

21,791. Will you forward to our secretary a tracing of this plan, authenticated before a magistrate?—It shall be done. I was going to make one or two remarks upon the advantages of this breakwater, as improving the present harbour. If it were carried out, it would cover the mouth of the present harbour of refuge from all winds from south round to north-east, and thereby cause much less swell on the bar with the wind from those points, and by as much as the lift of the water was exceeded so much would the depth of the water be in effect increased upon the bar; consequently, the harbour would admit vessels of a greater tonnage in safety. The second advantage to which I wish to call your attention, would be this,—that from the same cause, with the same winds, the harbour would be rendered available for the entrance of vessels seeking shelter and refuge for a longer period during each tide, both ebb and flood. The next point is, that if this breakwater were carried out, it would shelter the course of all vessels coming in with a gale of wind at south-east. With such a gale vessels frequently bear up from the southward to make Whitby Harbour. In attempting to seek refuge in the harbour many of them, especially strangers, not being well acquainted with the place, come along aback the rock. They are so much afraid of the rock that they give the north end too wide a berth, and when they attempt to haul up probably the wind will start, and they cannot work sufficiently to the windward to gain the entrance of the harbour. Therefore, they have no resource left but to come upon the sand to the westward of the west pier. If the breakwater was carried out, the water would be so smooth that they would come up under the lee of the breakwater; they need have no lee tide, and they would be enabled then to come up with a south-east wind, with a very little weather tide; while with a lee tide they would be enabled, by the smoothness of the water, to fetch up from the east to the breakwater—to Whitby Harbour, and which they would otherwise not be able to do. The last point on which I wish to observe is, if this breakwater were made, vessels coming into the bay in bad weather, and in a leaky state, or without anchors, not being able to bring up in the bay—coming in at low water, and at a time when they could not enter the present harbour of refuge, protection would be afforded to them, and the beach to the westward of Whitby pier, where the ships could be reached, is one where the preservation of life would be certain. Those are the points on which I think this breakwater would render advantage to the present harbour of refuge.

21,792. It has been stated to us, as one of the advantages of making a breakwater as you propose at Whitby Rock, that vessels might run into the harbour of refuge, and that if the harbour got crowded some of them might come into the existing harbour?—That would be an advantage.

21,793. What area of refuge would you calculate upon having inside the piers?—Do you mean in the lower harbour?

21,794. I mean in the lower harbour?—About 24 acres below the Swivel Bridge.

21,795. Would there be any available space above for refuge vessels?—Yes, nearly 45 acres.

21,796. Then in the tracing which you forward to us, will you have inserted the depth of the water in these two refuge areas, above and below the bridge, at quarter flood?—Yes.

21,797. By that I mean the soundings at quarter flood?—Yes.

21,798. (*Sir F. Smith.*) Have you seen any wrecks along shore?—I have frequently seen them. I am not so much in the habit of being on the shore as most of the witnesses who have gone before me.

21,799. Have you examined any of the wrecks?—Yes, I have seen some.

21,800. Have you ever found any in a lamentable state of disrepair?—I cannot say I did.

21,801. On the whole do you think the contrary? Would you say that they were in a fair condition?—I should consider the ships generally in a fair condition so far as I have seen.

21,802. I think you call Whitby a harbour of refuge?—A harbour of refuge.

21,803. Do you think you are justified in calling it so in the strict sense of the word?—I believe

it to be, if not a perfect harbour of refuge, certainly the best on this coast. If I understand you rightly, you mean to say, that I should not call it so unless vessels can enter at all tides, but I think it is the best that we have at present.

21,804. You think there are none to compare with it?—None to compare with it on this coast.

21,805. You do not include the Tyne on this coast?—The Yorkshire coast I mean.

21,806. Do you include Hartlepool, or what do you include?—I would rather keep at home, if you please.

21,807. You say it is the best on this coast?—It is.

21,808. You must compare it with something, what are the others with which you are comparing it. If you had rather not answer the question I will not press it?—I told you I only spoke from books, not from experience of ever being on the coast.

21,809. By being the best on the coast you mean better than any to the southward of Whitby. I think I am entitled to ask, what are the others as harbours of refuge?—I do not know any other one which can be called a harbour of refuge.

21,810. Whitby is the only one?—Yes.

21,811. I presume you think some other harbour of refuge to the south of this is desirable?—I would rather not give an opinion upon a thing that I know nothing of.

21,812. Have you in any of your voyages kept close to the Land's End?—No.

21,813. Have you run along the south coast of England? Have you ever stood in need of a harbour of refuge there?—No.

21,814. None would ever have availed you at all?—No, I never wanted one.

21,815. Not even as far as the Land's End?—No.

21,816. You never took refuge nor desired it near the Land's End?—No.

21,817. (*Mr. Lindsay.*) You very properly desired to confine yourself to the limits within which you are yourself acquainted, and therefore I will confine my questions to you within these limits. Do you think, if anything was done at Whitby, it should be limited to the construction of this south-east pier of 3,800 feet in length?—No; I think that that is the only thing to which my attention and that of the trustees has been directed. That is the point I wish to stick to, the breakwater upon Whitby Rock. There cannot be two opinions about that. If the large plan was carried out it would be a perfect harbour of refuge.

21,818. This pier I think you said would afford shelter to vessels with winds from the south to east?—I say that is stated by Mr. Harrison; I only mentioned the east; I said 350 acres south-east, 200 acres east. In the large area 172 vessels could ride, and in the smaller 120.

21,819. This pier of 3,800 feet would afford no shelter with the winds anything to the northward of east?—Not to the northward of east certainly.

21,820. Would it afford shelter to vessels in east-north-east winds?—That would be a fair wind to go away to the south. This shelter is for laden ships which want to proceed to the south. If the wind come to east-north-east, they would not remain there, because it is a fair wind to go away.

21,821. You are aware that the gales may be so strong that a vessel caught down in this place, which is comparatively a bight to Flamborough, the gale might be so strong, considering the leeway that colliers make, that a ship could not weather away Flamborough Head with an east-north-east gale?—I think you have it in evidence, that these were not the winds that occur on this coast. I am told that if a breakwater was made here, and vessels were struggling between this and Flamborough Head to make their passage to the southward, that no captain would ever hesitate to run into this harbour to shelter from a south-east wind under any apprehension of the wind shifting round to the north-east.

21,822. Unfortunately we have it in evidence that that gale of the 4th January 1857, commencing at the south-east, went round to the east-north-east, and then it blew as is described, a perfect hurricane. Therefore in that gale, would your pier of 3,800 feet have afforded any shelter?—I believe you have it in evidence that here the wind was not east-north-east when it blew the hardest.

21,823. We had it in evidence from other places further north, that the wind blew strongest at east-north-east?—It does not follow that it should blow the strongest here from that point, because it blew the strongest from that point 30 or 40 miles to the north.

21,824. Your pier would not afford shelter from east-north-east gales, would it?—To a certain extent it would.

21,825. Would it afford any shelter from these winds?—I have not given any attention to that. I take the figures from Mr. Harrison's explanation.

21,826. I want to ask something about Whitby itself, about the harbour. When was it constructed?—It is a very long time ago, I cannot tell the date. There is an Act of Parliament of 1702 for rebuilding and improving the piers and harbours. But when they were first built I do not know.

21,827. Where was the money found that rebuilt the harbour of Whitby?—The duty on coals raised it, at least that is the largest item.

21,828. It is raised by means of a tax upon the passing ships or upon the coals in these ships?—Not strictly so.

21,829. Then how is it raised?—There are other dues in that Act.

21,830. Just give them briefly?—The first is ½*d.* per Newcastle chaldron upon coals; the next upon coals delivered in the harbour; the next upon salt, corn, grain, and upon other goods, and the next upon ships and vessels.

21,831. What is the present amount of your revenue derived from these sources?—For the last year?

21,832. Yes, for the last year, or two years, if you have it?—The revenue of last year was 5,232*l.*

21,833. Separate the items?—The amount derived from the halfpenny a chaldron upon coal, was 4,990*l.*, and 240*l.* was from everything else.

21,834. That is on vessels passing here with coals?—That was levied upon the coals shipped.

21,835. Not from vessels coming in but passing?—From all the coals that are laden, not in all the northern ports, but in Newcastle, Sunderland, Blyth, and North and South Shields.

21,836. How is this revenue expended?—Entirely upon repairs and improvements to the harbour.

21,837. The whole 5,000*l.*, and upwards, is expended upon the improvement of the harbour?—There is a large interest on the debt.

21,838. How much is paid for interest?—In round numbers, 1,441*l.* That is the interest upon the capital borrowed for the construction of the harbour, that is the interest upon borrowed money.

21,839. Borrowed upon security?—Yes.

21,840. How is the remainder spent?—Entirely upon the repairs and improvement of the pier and harbour, the salaries of officers, and the expenses of lights. We have two tide lights.

21,841. Could you give the items of expenditure?—Interest is 1,441*l.*, salaries 468*l.*, rates almost 70*l.*, light keepers about 80*l.*

21,842. Does that make up the sum total of 5,000*l.*?—Then there is all the labour which is required for the repairs, and of course the materials, stones, and other things.

21,843. Used in maintaining and repairing the piers?—Yes.

21,844. What portion of the revenue is employed in deepening the harbour?—I cannot give it particularly. In this account it says "workmen's wages."

21,845. Is there a large proportion spent annually in deepening the harbour?—I cannot tell the quantity that has been taken out. There was 45,220 tons of mud taken out in the last three years.

WHITBY.

Mr. W. Jameson.

23 Oct. 1858.

Mr. Lindsay.

21,846. Could the harbour be greatly improved if you had a dredger there?—Perhaps; that is an engineering question. But if I might form an opinion, we do not want a dredger yet. It might be required if we could get what has been stated, six or seven feet water at low water; but at present, when the mud comes above the water at low water, it can be done by hand labour, and therefore it is a question of which is the cheapest mode.

21,847. My object in asking is, that it appears that the revenue of this harbour is chiefly raised by means of a passing toll, and I want to see if the ships that pay the toll cannot derive some benefit from Whitby as a harbour of refuge. Now, there can be no doubt that the only means whereby they can derive benefit, is to see if we cannot obtain a greater depth of water in Whitby Harbour than what there is now?—It can be done I should fancy. I do not know anything to prevent it.

21,848. Tell me why you think a dredger is not wanted?—Because I should think it is cheaper to work as it is, but I have not any experience. I really do not know what the cost of a dredger would be. But my idea is that the proper occasion for a dredger is when you cannot use manual labour. That is in working under water at a greater depth of water than that at which it can be done by manual labour.

21,849. Unless you have something that can work under water, as the bar has generally a little water over it at low spring tides, you cannot deepen it. You cannot deepen it if it does not dry, except for a very short time at low water spring tides?—There is no doubt it might be deepened.

21,850. Have you an engineer connected with the harbour?—Yes.

21,851. Is he here?—Yes.

21,852. And will he be able to state to what extent the harbour could be deepened, and at what cost?—Yes, he can.

21,853. (*Capt. Sulivan.*) Is the mud removed from the harbour by contract?—No.

21,854. All done by day work?—By tides work.

21,855. By paid labour?—Yes.

21,856. Have you any means of showing us what the removal of the 45,000 tons taken out has cost?—That would be more a question for the engineer.

21,857. The accounts would show?—In the account I have before me, it is included in the workmen's wages. The first item is the workmen's wages; that includes the cost of taking, or whatever you call it, out of the harbour.

21,858. Does the engineer superintend all their works, and has he superintended them during the past three years?—Yes.

21,859. (*Capt. Vetch.*) Is it the case that the upper part of the river above the bridge is capable of being converted into a floating dock?—No; that has not been so converted.

21,860. Would it not be very useful?—That is more an engineering question. I do not see the benefit of it.

21,861. I suppose if the mouth of the present harbour was sheltered by the south-east arm of the proposed harbour, then it would be more important for the trade of Whitby to have a floating dock?—The vessels that usually come here are vessels that are always lying on the ground in most ports.

21,862. But if you had a sheltered entrance by which vessels might come in, then a floating dock would become more useful I suppose?—It would be made at great cost, and the trustees have no money to undertake such a work.

21,863. Would anything want doing except putting up dock gates?—I am not engineer enough to reply. Probably you are aware there is a river stream. There is another thing would have to be provided for. There are a great many dry docks in the upper harbour. If you made a floating dock you would do away with the utility of all these, unless you had a stone wall all the way down inside, and then there would be another disadvantage. You will still allow me to call it a harbour of refuge. As soon as ever there is water in it, that is early in the neap tides and north-west winds, when light vessels principally come, the bridge must be opened at all times for them, as soon as there is water. If you had a dock above, you would in a great measure destroy the harbour of refuge.

21,864. (*Chairman.*) Are the accounts of the pier and harbour trustees printed annually for the use of the trustees?—They are, and they are always sent to the clerk of the peace at Northallerton.

21,865. Will you put in a copy for the last three years?—You shall have it.

21,866. Have you a copy there you could let me see?—I can (*handing up one*). I am reminded that they are also placarded upon the town hall annually, and are also sent to the clerk of the peace and published in the York county papers.

21,867. I see in this statement there is a charge of 2,025*l.* workmen's wages. Is the work not stated in more detail in the accounts? Could we get it in more detail from the books, and could we there ascertain the general character of the work?—I cannot immediately answer that question, but I will answer it if you will allow me time.

21,868. Will you ascertain at a later period whether from the books which are kept by the harbour trustees you could make such extracts as would show to us the character of the work which has been done?—I will.

21,869. (*Sir F. Smith.*) Mr. Harrison has proposed a breakwater of 3,800 feet in length which you think it is very desirable to construct, and he has given us the probable cost. Do you imagine that if the Government were to grant half of the amount required, the local authorities would raise the remainder?—We have no power; we are trustees for the pier and harbour of Whitby.

21,870. There are no means of raising any money?—We have none as trustees.

21,871. Is there any power in any other way? Supposing a grant of half would enable you to carry out the work?—Do you ask me as a trustee or as an inhabitant?

21,872. As an inhabitant?—I am aware of none. There are certainly no public funds that I am aware of.

21,873. In fact, you see no means of aiding the Government grant towards this desirable object?—That is the very reason we want help because we cannot help ourselves.

21,874. Supposing the Government are disposed to help you?—Allow me to make the remark that, I cannot exactly see that if this was made why the inhabitants of Whitby should subscribe towards making a breakwater on the Whitby Rock for the protection of all strange vessels.

21,875. Our ideas are that this breakwater is for the protection of all vessels passing the port, not like the northern ports for our own trade. We are now speaking of a harbour of refuge. That is the point to which I wish to keep your attention; it is not a trade question?—I do not say that it would be no advantage to the town as a town itself, or to the inhabitants of the town. The advantage that would be afforded by this breakwater would be in giving shelter and protection to life and property on board vessels passing along this coast, and as I observed particularly, laden vessels with coals from the north attempting to make their passage to the south and not being able to do so.

21,876. No doubt the great object is a national one, and therefore the nation might perhaps be put to the expense of defraying the cost of the national part of the object. But you do not mean to say that the town would derive no advantage from the vessels belonging to the town being able to get refuge and being saved from being wrecked?—Of course there must be some advantage, but the great national advantage, the saving of life and property, is the point.

21,877. You think there would be a local advantage of some amount ?—I think of some amount.

21,878. And in return for that you are able to contribute nothing ?—Voluntary contributions might be raised, but we have no funds.

21,879. (*Mr. Lindsay.*) You said that the great object of this harbour was to afford shelter to ships which passed. Would not the best means be to give more water ? In the account for the last year which you have handed up, I find a sum of 2,026*l.* balance in hand. Why was not that spent in deepening the harbour ?—We only get these accounts occasionally. It might happen that the returns from the north ports had only just arrived before it was made out. Perhaps you will allow me to observe, that in 1844 the bar was very bad and the entrance was wide. Mr. Walker, the engineer, whose plans you have before you, was appointed by the trustees to come down and examine the state of the harbour and report to them. You have his plan before you. Since that time, not that plan exactly, but a great part of it has been carried out—so far as this, that the east pier has been extended 325 feet and the entrance has been narrowed according to that plan. To get that work executed we had to incur a large debt, the interest of which you see in that account. We have so far carried out that plan. But it is not yet completed, and that is why we have not yet turned our attention to dredging the harbour. We are going on carrying out the plan, but I believe it will require some time before it is completed. There is also in the preamble of the Act under which this harbour is managed words showing that the money is granted to the trustees for the purpose of keeping the harbour in order. It says, "Whereas the piers and rocks of the "said harbour are much exposed to be injured and "demolished by the force of the sea and other inevitable "accidents so as to require constant repairs," &c. There has been a little defect on the outside of the east pier, which you see is exposed to the violence of these very south-east winds. Had it not been immediately attended to, a breach might have been made in that east pier and the cost of its reparation might have been enormous. The work might have been carried away. That accident occurred in the part of the old work near the foundation, and we are still engaged in repairing it. When these works are completed there is no reason why we should not turn our attention to dredging and deepening the harbour.

21,880. Was the capital on which you pay the interest of 1,446*l.* borrowed for the purpose of carrying out these more recent works ?—Principally so.

21,881. In respect to the surplus of 2,026*l.* which you have now here, are you allowing it to accumulate in the shape of a fund to pay off the debt ?—I do not know that ; it is very possible that it is accumulating, because it is very possible that when that balance was struck, the money had just come in from the north. There would be three or four months' wages and expenses going on, which would lessen it probably to something under 1,000*l.* We cannot always keep a balance. We only get the money occasionally, but the expenditure is going on daily.

21,882. I daresay the 2,000*l.* includes a great many open accounts not rendered. But are you allowing the surplus revenue to accumulate as a fund to pay off the debt which you contracted, or do you intend the debt to remain and use the whole revenue for the purpose of improving the harbour ?—We intend to use the whole revenue towards improving the harbour. We never have had too much yet, because whenever anything extra has occurred we have always had to borrow money.

21,883. (*Capt. Washington.*) Who is your consulting engineer ?—Mr. James Walker, the Admiralty engineer.

21,884. Has he visited Whitby since 1844 ?—I believe not.

21,885. You said that there was sufficient appliances for repairing ships here ?—Yes.

21,886. Is there a graving dock ?—There are several, seven I believe.

21,887. What is the largest sized ship they will take ?—600 tons.

21,888. Can repairs of steam machinery also be carried out in the port of Whitby ?—No, I think not. Of course there are smithies, but there are no means of repairing steam machinery to any extent.

21,889. What are the chief exports from the harbour ?—Stones.

21,890. Of which there is abundance ?—Abundance. I mean more than one kind of stones. There is a great quantity of freestone and a very large quantity of ironstone, and also a kind of stone, a blue whinstone, from the basaltic ridge, which is used as paving stones.

21,891. In the accounts you have produced is there any statement of the primage paid to the Trinity House at Newcastle ?—No, it does not appear here.

21,892. Is there any account of that ?—That will be at the custom house ; it will be easy to ascertain, and it shall be ascertained for you.

21,893. The pier lights are supported out of your revenue ?—They are supported by the trustees ; the tide lights, not the new lights. The expense of the two pier lights are paid by the trustees.

21,894. Is that a large expense ?—About 120*l.* or 130*l.*

21,895. Are the pilots any expense to the trust ?—We have nothing to do with the pilots. There is a board of sub-commissioners, as they are called, under Newcastle.

21,896. They are paid by their earnings ?—I believe so.

21,897. Does the Trinity House of Newcastle give you anything for the primage you pay in the shape of buoying or lighting the place—to the harbour ?—No ; the buoy at the end of the shoal is kept up by the Trinity House of London.

21,898. Can you mention anything the Newcastle Board does for you in return for your payment ?—No; except that the pilots have their licences from them, and are considered as their servants. The board of sub-commissioners only report to the board at Newcastle.

21,899. Is any portion of the money paid to them by you spent for the benefit of this port ?—Not that I am aware of.

21,900. Do any of the people of this port benefit indirectly in the shape of pensions, almshouses, or anything of that kind ?—I do not know any.

21,901. (*Capt. Vetch.*) Do all the ships which come into the harbour lie aground at low water ?—Yes.

21,902. (*Chairman.*) Have you read the report of the Select Committee of the House of Commons upon harbours of refuge ?—Well, I cannot say that I have not, but I cannot say that I have paid much attention to it.

21,903. Towards the close of the 26th paragraph, which is rather a long one, and I will not read it, the Committee point out that several of the ports along the coast being in possession of considerable funds, have done a good deal to improve their own ports, and it further goes on to suggest the advantage which would be derived from advancing sums to assist them in these local efforts to improve their harbours, on the same principle that the drainage money was advanced, the rate of interest not to exceed three per cent. and the debt to be payable by means of a sinking fund extending over a period of 50 years. I think it was at Swansea I read this paragraph to one of the witnesses who was chiefly concerned in the improvement of the harbour, and asked him what Swansea would be disposed to do if the Government oy way of a grant or loan was to offer some assistance ; his answer was, whatever other ports in this locality may do Swansea will not be behind hand ; now what will Whitby do ?—If you ask me as a trustee I must say, nothing.

21,904. I ask you as a gentleman residing in

WHITBY.

Mr. W. Jameson.

23 Oct. 1858.

Chairman.

Whitby ?—I am afraid I should have the same answer to give.

21,905. Do you think that no local funds could be raised to meet grants or loans from Government ?—Not to any extent, speaking of the outlay ; I presume you are alluding to the outlay on the breakwater on the rock ?

21,906. I allude to that, and also to the deepening of the harbour so as to enable ships to get into it at half flood or whatever it might be, which no doubt would improve your harbour for local purposes, as well as render it more valuable as a refuge ?—I understand you to say what sum would the Whitby people give towards any sum which might be granted by the Government ?

21,907. No, not what sum would they give, but what would the inhabitants of Whitby be disposed to do in order to meet any grant from the Governm —I do not know, I am sure.

Mr. Francis Pickernell examined.

Mr. F. Pickernell.

21,908. (*Chairman.*) You are the engineer of the harbour ?—I am.

21,909. How long have you held that situation ?—Nearly 37 years.

21,910. (*Mr. Lindsay.*) Have you much silt in the harbour ?—A good deal of deposit.

21,911. Where does it come from ?—From the river Esk, it is the alluvial deposit held in suspension in the water of that river.

21,912. Have you much silt upon the bar ?—A good deal.

21,913. Where does that come from ?—From along the coast, from the shore and the detritus from the cliffs.

21,914. What means do you take to remove the sand from the bar and the silt from the harbour ?—We seldom make any attempt to move the sand from the bar ; it is so rarely we get the boats on, and when we do we make so little impression that we do not consider it worth working there.

21,915. Have you had a dredger ? — A dredger would be considerably better than the means we have for that part.

21,916. Could you deepen the bar ?—I do not think a dredger would deepen the bar, because it is formed of strong alum shale.

21,917. What extent of sand is over it ?—Varying from two to sometimes four feet.

21,918. A dredger would deepen it down to the alum shale ?—Decidedly.

21,919. What means could be adopted to remove the alum shale, which is a species of soft stone ? Any other means but blasting ?—I do not think blasting would be desirable, because the entrance of the harbour is so narrow it would shake the foundation of the works.

21,920. Is there any other means you could suggest of deepening the harbour after the dredger had gone down as far as it could go ?—I am not prepared to give in any plan because I have not considered it on this point ; we have two feet more water between the two pier ends than we have 100 fathoms within.

21,921. I suppose by means of a dredger you could deepen the harbour there to the same extent as you have at the bar ?—Decidedly, because a little within the entrance it becomes a mixed strata of all kinds, gravel and different materials ; it is not rocky.

21,922. So that means could be found out for deepening the harbour to a greater extent than you could work the dredger, but would the foundation of your piers admit of a greater depth ?—Not a great deal.

21,923. How much ?—The work in which I have been concerned, 330 in length, is upon the alum rock and not very deeply founded ; it was taken down sufficiently for the security of the building, but not with any view of deepening the entrance between the two piers.

21,924. Could you with safety cut down to the foundations of the pier or to any depth in this alum ? —If two feet were taken out four feet might be taken out all the way up to the bridge, and I think it would not be prudent to go deeper.

21,925. You could take off about three feet of sand and two feet of alum shale without affecting the foundations of the piers ?—I think so.

21,926. That would be five feet. If you had that would not that be a great acquisition ?—Most decidedly.

21,927. And render it much more a harbour of refuge than it is ?—Yes ; because vessels could come in so much earlier and so much later of the tide.

21,928. To deepen it to the extent of five feet, would that entail a very heavy outlay ?—Yes, a very heavy outlay. The trustees have no means to meet it ; their funds would not pay the expense of a dredger.

21,929. Put aside the means of the trustees altogether. Could you tell me roughly about what the cost of getting five feet more water into your harbour would be ?—Speaking of something like analogy, I think at Sunderland the dredger costs about 5,000*l.* a year. If we had that at our harbour we could soon get a very excellent harbour. The harbour might be excavated above bridge so that ships could float.

21,930. How do you take out the mud above bridge ? —We have two boats made out of old keels ; we pay the men so much per ton to dig out the mud.

21,931–2. (*Capt. Washington.*) What is the whole amount you have dredged ?—Here is a statement of what has been taken out for the last 15 years. Since 1836 the aggregate amount is 114,954 tons. 45,220 tons the aggregate for three years.

21,933. 15,073 tons the average per year for the last three years. I do not understand whether that is only for three years ?—For three years.

21,934. You said you should fear deepening too much on account of the piers, what is the width ?— 150 feet in the narrowest part ; as you come in, it widens all the way.

21,935. I suppose the piers could be underset if funds were provided ?—They might be, but it would involve great expense.

21,936. If the piers were underset, do you know any other engineering difficulty in getting six feet additional ?—I know of none.

21,937. Would it be of great benefit to the harbour ? —Decidedly ; of course.

21,938. Do you know how far the tide would flow up if it were not stopped by the mill dam ?—Only a little above what it does now, and at the spring tides, perhaps once a fortnight, it is a good tide if it reaches to the foot of the dam.

21,939. How far is that from the pier heads ?—Two miles.

21,940. It would not reach half a mile further ?—I think not ; many days it does not reach the dam.

21,941. What is the rise and fall of the tides ?— From 15 to 18 feet ; ordinarily 15 or 16 feet ; a good spring tide 18 feet.

21,942. That gives a flow of eight feet to the mile ? —It will be nine feet a mile.

21,943. Is that not very rapid ?—It goes out very sluggishly.

21,944. Do the freshets come very rapidly ?—We have, comparatively, so small a quantity of water and so long a time for it to come in that it goes very slowly. There is no scouring power at all, in my humble opinion.

21,945. You think it would not be increased if the mill dam could be spurred ?—Only three or four days a month.

21,946. Do the freshets scour the shore ?—They do.

21,947. They come down very strong ?—Yes.

21,948. Does the Esk drain much country ?—17 or 18 miles.

21,949. Has it a very large basin ?—It is very small

at the beginning, and is widened by tributary streams as it comes along.

21,950. You spoke of the alum shale being very hard?—It is hard for the bucket of a dredger to scoop out; it is not hard for a man to pick.

21,951. Suppose you had a bucket armed with a steel lip and horns, would not that break it up?—I hardly know, having had no experience in dredging.

21,952. (*Capt. Sulivan.*) I do not quite understand whether the bar at present between the two pier heads has a deposit of sand on the shale, or whether the shale is the only bar?—I do not think there is much sand on it at present, nor does it come as much as it did before Mr. Walker's design was carried out. We had an opening of 290 feet then, it has now decreased to 150, and consequently the sea water is accelerated in passing considerably, and that which is held in suspension is brought, by the force of the north-west winds, into the harbour along between the piers.

21,953. It is nearly dry between the piers at low water; does the shale form the dry bed?—It does.

21,954. All you would have to take out between the piers would be shale. There is no depth of sand over the shale?—No, the sand is easily worked. It would be with the shale that there would be the difficulty.

21,955. You said the pier heads were founded about two feet in the shale?—About that.

21,956. Is the shale firm enough to make a cutting away some six or eight feet clear of the foundations?—I should not advise it. The action of the waves would soon wash it away.

21,957. You could not underset it with a coffer-dam which would partly block up the entrance?—You could work with a tidal coffer-dam only two or three feet beyond the work required.

21,958. Even with the depth you have at the entrance now, is it not the case that vessels which pass between the heads will ground at the turning of the shallows inside?—That is the great evil of the channel between the pier ends and the one called Scotch Head, and the other Burgess Pier.

21,959. Would not dredging clear away all that if you choose?—It would.

21,960. Would not that remove the greatest objection of all, at present, to the harbour, that vessels ground immediately inside? I saw four vessels this day ground almost together, if there had been any sea, they would have been likely to have had some damage. Would not deepening the inside enable vessels to be in greater safety, and remove the greatest difficulty you have at present?—I do not clearly understand.

21,961. Would not clearing out the outer harbour give more room for vessels when they have passed the entrance, to get space to get out of the way of others coming in? Would not that be a great improvement?—A dredger would take the whole of the mud away, but there is much silt sand, &c. comes in with strong north-west winds.

21,962. Is the bar to the north of the channel formed of sand?—The whole of it is formed from the beach, not from what comes down the river.

21,963. Does not Scotch Head throw the current more the other way, and so tend to increase the bar?—You have hardly any current. No back water in point of fact.

21,964. With a dredger could not you keep a straighter course and keep the channel nearer the pier?—A dredger might be made to take it away faster than it accumulates.

21,965. There is a great deal of sand comes from the seaward every day?—Yes.

21,966. (*Mr. Coode.*) You knew the harbour before the new works were carried out?—Before the extension of the east pier.

21,967. What has been the effect of that upon the silt and sand?—It has accelerated the stream, running through a narrow opening instead of a wide one, and instead of the sand depositing in the entrance, it is driven into the harbour, and accumulates about three hundred feet higher up.

21,968. Is the accumulation of sand greater at this point than it used to be?—Yes, it is, because of what would have been deposited in the entrance a part is brought by the strong flood tides into the harbour.

21,969. Have you any section of the surface of the alum shale, which would give us an idea of the level?—I have Mr. Walker's sections of the whole level of the harbour.

21,970. Upon the surface of the alum shale?—Upon what may be the bottom.

21,971. Can you give us a copy?—Certainly.

21,972. What is the depth of water at the first quarter of flood tide?—During that time we have very little water at all, none above the bridge. It comes in slowly at first, and rapidly afterwards.

21,973. The whole of the material between the outer end of the bar and the Scotch and Burgess piers comes from the sea?—All on the west side is from the sea. On the east side there is no deposit from any place.

21,974. Is the bottom there alum shale?—No.

21,975. Of what is it composed?—Of shingle, sand, and different matter.

21,976. Do you think that this deposit on Collier's Hope is brought from the river or comes from the sea?—I do not think any of the deposit below the bridge comes from above, but a good deal above the bridge, it does.

21,977. It is your opinion that that which is deposited below the bridge comes from the sea?—Yes, except a little that may be brought in spring freshets, but the great bulk comes from the sea.

21,978. (*Sir F. Smith.*) Do I understand you would have any difficulty in blasting the alum shale between the piers?—I do not expect any difficulty in getting down about two feet, that is as far as it could be required.

21,979. (*Capt. Washington.*) I think you said the entrance of the harbour had lately been decreased from 290 feet to 150 feet, that is nearly one half?—Yes.

21,980. Have you had any complaints from ship masters that they cannot make the entrance?—I have heard complaints that the entrance is too narrow now.

21,981. Has any damage arisen from it?—I believe vessels have come in contact with the east pier in consequence of the tide running so rapidly past; before they could make the entrance the tide caught the starboard quarter and threw them against the pier head.

21,982. A flood tide?—Yes, a flood tide. The spring flood tide sets very rapidly. It sets out and runs almost to the east, and if they are not very cautious they are sure to come up ahead to the westward, they lose their steerage way, and perhaps run against the pier end.

21,983. Would the construction of the south arm of the breakwater remedy that?—Decidedly, because it would take away the strong current of tide that runs past.

21,984. Is not there to be an opening between the breakwater and the harbour?—Yes, but I do not think it will run past thus rapidly.

Dr. GEORGE MERRYWEATHER examined.

Dr. G. Merryweather.

21,985. (*Chairman.*) Are you a resident of Whitby?—I am.

21,986. You wish to make some statement relative to the advantage or necessity of a harbour of refuge at Runswick Bay, do you not?—Precisely, as an introduction to the evidence.

21,987. Will you proceed with your statement?—The claims of Runswick Bay to be made a harbour of refuge are the great advantages which it possesses seaward by nature, which could not be similarly constructed by art for less than 10 or 15 millions sterling; it is naturally formed into a harbour; that from the

WHITBY.

Dr. G. Merryweather.

23 Oct. 1858.

immense quantity of freestone of a most endurable character which is close at hand at the end of each breakwater, a breakwater could be constructed in a comparatively short space of time, and give security to shipping, and life, and property, without much delay; that the comparatively small amount of money which would be required would be insignificant compared with the life and property that would be saved; and that it would greatly multiply the number of the fishermen, and thus form a nursery of seamen, and consequently be of great benefit to the nation.

Mr. JOHN BOULBY examined.

Mr. J. Boulby.

21,988. (*Chairman.*) You are an engineer and surveyor, and reside at Whitby?—Yes.

21,989. Make any statement you have to offer relative to the facilities afforded by Runswick Bay for a harbour of refuge?—In referring to that I would state by referring to the plan it will be seen that Runswick Bay, between the low-water mark and the breakwaters shown upon the plan which I produce, contains an area of 601 acres. The grounds on which it will be brought forward are, first, its geographical position; secondly, a sufficient capacity; and thirdly, the great facilities for the construction of breakwaters. If you will allow me, I will refer to a report which I have made, and which will sufficiently explain the grounds upon which it is brought forward. First, as to its situation; situated midway between the Tyne (which may be taken as the northern extremity of the coal shipping ports) and Flamborough Head, it occupies a superior local position upon the coast, recommended for consideration. The advantage of this towards rendering a harbour of refuge for vessels in the coasting trade equally available for both loaded and light ships is unquestionably of the greatest importance, for, as loaded vessels would not sail except with a prospect of commencing the voyage in safety, and without detention, then Runswick Bay, being placed exactly one third of the distance between the Tees (the southern extremity of the coal shipping ports) and Flamborough Head, is just where such a harbour would begin to be required, and when needed would prevent the danger and delay of vessels running back to the north, as well as the uncertainty, when upon a lee shore, of their being able to do so. The same advantages of situation equally apply in the case of light ships coming from the southward, which could make avail of a harbour in Runswick Bay, where in many cases one further north would be beyond reach. Taking the whole distance from the Farn Islands to Flamborough Head, it will be found that the greatest extent of coast totally unprotected, without a single place of safety for a vessel to run to in the north-east gales, is the Yorkshire coast, extending as it does from the Tees to Flamborough Head, a distance of nearly 60 miles. Along this line a great proportion of wrecks occur, and which would not be prevented by having a harbour of refuge to the northward of it. Second, the area of the bay from low-water mark to the position shown by proposed breakwaters contains 601 acres. The depth of the soundings, together with the complete shelter from all gales that would be afforded to almost every part of the bay, would give greater capacity, especially for ships of large class, than would happen in many places having a large acreage. The superiority of the soundings (taken at low water) will be at once evident upon reference to the plan, whilst the bottom, consisting of clay, is not to be surpassed as holding ground. Thirdly, the facilities for construction of breakwaters are very great, from the immense beds of freestone in the cliffs at each point of the bay, at Lingrow and Kettleness. These beds are sixty feet in thickness, and the very small quantity of cover resting upon them offers every facility for making them available. The suitable nature of the stone for sea works is evident by inspecting the immense blocks upon the beach, many of which have laid there for ages. The bay and adjoining coast are entirely free from sandbanks and other deposits. Those common and frequently difficult to be foreseen effects caused by breakwaters would produce little or no interference with the present course of the tide, which runs in a direction across the mouth of the bay, and is so little felt within that ships at anchor never swing with it. The rise at ordinary spring tides is 16 feet; the quantity of fresh water coming into the bay, though ample as a supply for shipping, is too small to cause any tendency to silt up with alluvial matter. A natural opening exists between Lingrow Knock and the shore, having a depth at low water of four feet, and, consequently, at high water of 20 feet; this, if required, might easily be deepened and enlarged, and without interfering with the shelter of the harbour, might be of frequent service. Although at present Runswick does not possess the facilities for repairing and refitting vessels, yet it is quite certain that along with a harbour of refuge, these would spring up as a necessary consequence. I was not aware until yesterday that particulars with respect to these breakwaters would be required, and therefore I must be excused for not being in possession of sections to lay before the Commissioners, but since then I have been enabled to give an idea, which I believe will be a very correct one, as to what quantity of material will be required, and the probable cost of breakwaters. In the two breakwaters the quantity of stone required would be 3,000,000 cubic yards, which I am perfectly satisfied can be procured and deposited at 3*s.* 4*d.* per cubic yard, which would make the total cost 500,000*l.* These breakwaters, as I have described them, will be eight feet above high-water mark, and will have a breadth at the top of 45 feet, with a slope towards the sea of one in three, and towards the shore of one in two.

21,990. Does that conclude your statement?—Yes. I shall be glad to answer any questions.

21,991. Is the statement which you have made printed?—What I have stated with respect to the breakwaters is not stated in the pamphlet at all. I have made the consideration this morning.

21,992. You are not prepared with any well considered estimates?—I have no doubt this is correct.

21,993. Five hundred thousand pounds is the total expense?—Yes.

21,994. What are the figures?—Three million cubic yards of stone at 3*s.* 4*d.* per cubic yard.

21,995. These are all the figures as to it?—Yes; but I believe that gives as far as I am prepared at present the expense of the proposed breakwaters.

21,996. (*Sir F. Smith.*) (*Referring to the pamphlet entitled "Plan and Soundings of Runswick Bay."*) I should have been obliged if you had sent us this pamphlet yesterday?—I was not aware but you had had it already with the plans; I was under the idea that they had been forwarded to the Commissioners.

21,997. I think you said you propose to give a slope of three to one externally, and of two to one internally?—Yes.

21,998. Are the breakwaters to be composed of rubble stone?—Entirely as taken from the quarry.

21,999. Where is the quarry?—Close beside, Kettleness on one side, and Lingrow on the other.

22,000. Close to the works?—Yes, quite close.

22,001. What is the character of the stone on both sides?—We have very good evidence as to the character of it, because there are hundreds of thousands of tons of it upon the Scar which have come from the same beds; the stone has laid there for ages, and there is no appearance of any action of the water upon them.

22,002. What is the stone, geologically speaking?—Freestone, lying above the lias formation, immediately above what is called in this neighbourhood "dogger" or oolitic ironstone.

22,003. Is there any strata of the stone exposed to the wash of the sea which we could observe to note

the effect of the sea upon it?—The bed of stone lies at a considerable elevation above the level of the sea, but the stone lying upon the Scar is stone that has fallen from it and been exposed to the action of the sea for ages.

22,004. You have given us an account of the acres between the breakwaters and the low-water line; can you tell us what acreage you will have of five fathoms and upwards?—I am not prepared to state that, because I have not the soundings near low water with sufficient accuracy to do it.

22,005. Of three fathoms and upwards?—I have not made any calculation.

22,006. In fact you can give us no information as to the soundings for vessels of a considerable depth of water?—I am not in possession of soundings to the depth to give it accurately.

22,007. Take it at two fathoms?—I believe it would deduct about 150 acres.

22,008. You are aware that this is a considerable element in the calculation?—Undoubtedly; I should have been prepared to furnish the information at the present time had it not been for this, that when a great part of the soundings were taken there was so much sea upon the coast breaking in the shallow water, that it was impossible to take soundings there.

22,009. How long was the project under your consideration?—In the first instance, when I commenced this plan it was for private purposes, it was not for the purpose of laying it before the Commissioners, and these soundings were taken by the bearings of the compass; afterwards, when I was told that there was a probability of the matter being brought before the Commissioners, I went into it rather more accurately, and therefore used a quadrant for taking the bearings, but when I did that it was impossible to get into the shallowest places in consequence of the sea breaking.

22,010. I ask you a simple question and you give a long answer; perhaps you will give a direct answer to the question; how long was this under your consideration for a harbour of refuge?—About six weeks.

22,011. And was it not a great element to know the depth of water, which you have not ascertained with accuracy?—The soundings marked in the plan are correct I believe.

22,012. You cannot tell me the anchorage you have got in any amount of depth?—I merely give with accuracy between the low-water mark and the breakwaters.

22,013. That is not what we want?—If you ask me what is the area at any particular depth, I am not prepared at present to give you it very particularly.

22,014. You had better ascertain it as speedily as possible and send it in to the Commissioners; we have invariably had these particulars given in by inquiries?—I am perfectly aware of that, and it would be done in the present case, but when I commenced this survey it was not with the idea of the plan being brought before the Commissioners, I was not acquainted with it, and I did not know it was for that object; afterwards when I took the soundings it was not possible to take them in the shallowest water.

22,015. You have had it under consideration for six weeks?—Six weeks since I first begun with it.

22,016. Under whose directions, and for what object did you first produce the scheme? Who employed you?—At first when I was requested to make surveys of Runswick, it was by the direction of the Marquis of Normanby; I was not told for what purpose they were required, and it was not for me to inquire.

22,017. The Marquis of Normanby was your employer?—Exactly, in the first instance.

22,018. How long do you imagine it would take to complete this work?—That would depend upon the amount of labour employed upon it, it might be done in a very limited time, if there were sufficient men employed; it might be proceeded with from both ends, both breakwaters at the same time.

22,019. Have you made any computation whatever as to the time it would take to complete both breakwaters?—That depends entirely upon the amount of labour expended upon it. I have no doubt that in two years it might be done.

22,020. Suppose you had unlimited supply of funds and labour, how long would it take to complete both breakwaters?—Not exceeding two years.

22,021. So that in two years, for 500,000*l.*, your breakwaters would be completed?—Undoubtedly, with an unlimited supply of funds.

22,022. Are you satisfied that the holding ground is good throughout the whole of the space?—I have every reason to believe that almost the whole of the ground is clay; there will be little of it that does not partake of that character, except in shallow water.

22,023. Only in shallow water. Then are you prepared to state that there is not deep water in which there is a made bottom?—According to the best of my opinion, in the whole of the deep-water soundings there is clay at the bottom.

22,024. And you have taken great pains to ascertain what is the matter of the bottom?—I have relied upon information I could get at; I have taken it from the evidence of those persons who are best acquainted with it.

22,025. What description of persons?—They are here to-day, and will give evidence.

22,026. (*Mr. Lindsay.*) What are the most dangerous winds on this coast?—I would rather a nautical man answer that question.

22,027. Is not the first element you have to consider, as an engineer, to ask yourself from what winds you have to provide shelter?—From my own knowledge, I say east-north-east and north-east.

22,028. Looking at your breakwater, does not the east wind blow right into the proposed roadstead?—It does.

22,029. So that your roadstead would be open to the most dangerous winds on the coast?—After you get into the entrance with the wind from the east, you get into comparatively shallow water where there is the worst anchorage in the bay; the best is to the southward of the south breakwater; where the deepest water is, is the best anchorage.

22,030. Would not an easterly gale send in a heavy sea between the piers?—There, where it is marked wreck-hills on the plan to the west, there is the most shallow water in the bay, that would not be the place where vessels would drive to.

22,031. Would there be much necessity for this north pier 1,450 yards long?—It would be a shelter from the north.

22,032. In fact north winds would be the only winds from which that pier would protect ships?—It would be so; yes.

22,033. Do you not think that some plan might be devised, with much less length of pier than that one you have laid down, to cover in quite as large an extent of anchorage from the most dangerous winds?—I quite believe that if a harbour of refuge was formed at Runswick, it would be desirable, instead of running out the north breakwater as I have put it, to have it not so far outside; that would reduce the area of the bay considerably, taking off 80 or 100 acres, but it would materially reduce the expense.

22,034. Cast your eye over this line of soundings, parallel with the bight of the bay between Kettleness and Wreckbill, it runs 40, 54, 41 feet; how do you account for 54 lying between 40 and 41?—Where the breakwaters are shown is not the deepest part; where the 54 feet is, is much the deepest part in the bay.

22,035. How do you account for it so suddenly deepening?—I do not know on what ground it may be accounted for, but the fact is it is the deepest; I believe it is named Kettleness Hole; in my opinion that is the deepest part of the bay.

22,036. Are you certain there are no rocks on 40 and 41? Is it all good ground for anchorage?—According to the best of my opinion.

22,037. As an engineer, it is an all important point, before you ask for public money for this work, to know whether you have good anchorage and if there

WHITBY.

Mr. J. Boulby.

23 Oct. 1858.

Mr. Lindsay.

are any rocks ?—I am informed by persons who know the bay that there is clay to the bottom there.

22,038. There are no rocks in the bay ?—Not where we are speaking of.

22,039. Are there any at all ?—There are Scars in the bay, but the soundings show that there are no rocks where the deep soundings are shown on this place.

22,040. Where are the rocks ?—They are not marked on this plan, but it is indicated here by the shallow soundings.

22,041. Is that where you have 15 feet in the lower part of the bay ; are there rocks there ?—There are persons here who can speak more to the point than I can.

22,042. But these are important points for you to consider before you submit the plan, with which you ought to have made yourself acquainted. Cannot you tell us in what part of the bay there are rocks ?—There, in the shallow soundings, as shown on the plan. There are 12 feet there, 14 feet, and then 15 feet.

22,043. Is it rock where these are marked ?—It is scar.

22,044. Consequently a small ship could not anchor in 15 feet, the anchor would not hold ?—I am told it is full of fissures and in some places an anchor would hold.

22,045. What is the nature of the shore ?—It is scar generally, except off Runswick, where there is sand and clay.

22,046. Is there any rock ?—At that particular part there are stones running right up in the very bight of the bay.

22,047. Could a ship get in from the anchorage ground to the sandy beach if obliged to run for it without coming upon these rocks ?—I am not quite able to answer the question.

22,048. Do you reside at Runswick ?—No.

22,049. Have you frequently been there ?—Very little here, except in making these surveys.

22,050. Is it much used as a shipping place by vessels ?—I cannot say from my own experience.

22,051. You have only had to do with this design ?—Exactly.

22,052. Why did you design the north pier to overlap the southern ?—Because it would be a shelter to the bay in northerly winds. If vessels took shelter in north-east winds and the wind came round more to the north there would be a protection for them.

22,053. Would not there be equal shelter if the pier heads came out into the same depth of water, and simply left an entrance between ?—In the same line it would be more exposed.

22,054. You think the overlap is necessary ?—Yes, so as to make the harbour of refuge everything that could be required of it.

22,055. (*Mr. Coode.*) Have you examined the beds of stone on the other side of the bay ?—Not to the same extent.

22,056. At what depth below the surface do you find the freestone fit for such a purpose ?—At 10 feet, but at some places less than that.

22,057. Would the stone be fit for such a work as you propose ?—Undoubtedly it would.

22,058. What depth of stone would you find there in the thickest parts ?—About 60 feet in thickness.

22,059. Is that all freestone ?—Sixty feet of freestone.

22,060. What level ? Is it 60 feet above the surface of the sea ?—I am not prepared to speak positively. About perhaps 200 feet.

22,061. How do you propose to get it to the works ?—By an inclined plane.

22,062. What distance from the commencement of the breakwater would the site of the quarry be ?—Not more than a quarter of a mile, and some of it nearer than that.

22,063. You propose to drop the 200 feet in something less than a quarter of a mile ?—About a quarter of a mile. The bed extends a long way along the cliff, so that where the inclined plane might commence further off, there is the choice of it.

22,064. You speak of hundreds of thousands of tons of stone at the beach, have you satisfied yourself that there is more than 100,000 tons there ?—Not having measured it, I cannot speak as to the exact quantity, but I should assume that.

22,065. Have you examined it pretty closely so as to enable you to form an idea of the quantity ?—Not particularly ; I have not made any calculation, and I am merely speaking my own ideas.

22,066. Were your soundings made at low water at a spring tide ?—Yes.

22,067. You took the depths yourself ?—No, I did not heave the lead myself ; the person who did it is here.

22,068. Were you present ?—I was present.

22,069. Did you reduce the soundings for the level of the tide at the time you were taking them ?—Yes.

22,070. How did you do it ?—It always was made according to how far the tide was from low water ; when the soundings were taken and the necessary deductions were made, I relied as to what the deductions were to be upon persons who knew the bed.

22,071. Had you a tide gauge set up ?—No.

22,072. Then those soundings are but approximate ?—I believe they are correct for all practical purposes.

22,073. Still you cannot say positively that they are corrected to low-water spring tides ?—They are corrected by the best evidence I can get.

22,074. You rely on the evidence you have heard coming from persons present ?—Yes.

22,075. You said the deepest place was called the Lobster Hole ?—I believe that is the name.

22,076. Why is it so called ?—I do not know, except it is a place where they find lobsters. I cannot tell.

22,077. Are lobsters in the habit of frequenting rocky ground ?—I cannot speak to that. The bottom of it is clay ; I do not know if they like that ground or not.

Mr. Richard Brown examined.

Mr. R. Brown.

22,078. (*Chairman.*) You are a shipowner ?—I am.

22,079. Where do you reside ?—At Hinderwell.

22,080. You were formerly at sea ?—I was, and commanded a ship 23 years, and was at sea altogether about 31 years.

22,081. In what trade were the vessels employed that you commanded chiefly ?—In the coal trade, the Baltic trade, and the American trade. I was round the Horn one voyage.

22,082. How many voyages have you made from the Baltic ?—I do not remember the number of voyages ; but I have made four in one year ; it is a considerable time back. Probably 20 or 30 voyages, or something of that kind.

22,083. Will you tell me, in coming from the Baltic in the fall of the year, where you generally made your landfall ?—We generally, if the summer was fine, endeavoured to make the Head ; in the winter time, I always took care to make the Yorkshire land ; and in all my experience I never made the land north of the Tyne. To the best of my knowledge I never made the land to the north of the Tyne. I have made the Tyne, but never to the north.

22,084. You have been north-about through the Pentland Firth ?—I have.

22,085. How many times ?—I cannot enumerate the times, but I have come several times that way from America.

22,086. Give me your opinion of that firth as a place to run through in bad weather ?—It is a very dangerous place.

22,087. Will you state your reasons for considering it so ?—On account of the strong tides. If you have the tide coming against you, you cannot go—you durst,

not go. I have been several times through, when we took the inner passage round the little island of Swona to cheat the tide and get through at once.

22,088. Have you ever been in the firth in a calm ?—I think I have on one or two occasions, but it is so far back my memory will hardly serve me; but I have been there when we were obliged to let the ship take her own way, and have fortunately got clear.

22,089. Have you ever been in Wick Bay ?—No; I have never been there.

22,090. You know it by the chart ?—Of course; it is a few miles on this side of the firth.

22,091. If there was a good harbour at Wick, enclosed by a pier, so that when you got in you would be safe, and you were running for the firth with a fair wind from the southward, would you take Wick, or endeavour to get through, or would you time your arrival so as not to meet the weather tide ?—I remember on one occasion running through, bound to America. The winds from the south and east are very bad winds, as it is always rainy and thick. I remember once instead of running for the firth I ran between the islands of Shetland and the Orkneys, giving a preference to going between these two groups of islands, rather than attempting to go through the firth. There is no doubt, when the thing is dangerous, it would be of great service to have a harbour at Wick.

22,092. If you had a safe harbour at Wick, would you, with a fair wind, make for that harbour, or go round about, or endeavour to make your passage by timing your arrival ?—I would go through as soon as I could rather than go to the harbour. I would not stop in the harbour if I had a fair wind, unless there was a strong sea. If it was blowing strong in the firth and I thought it was dangerous going through, of course I should take a harbour instead of going through the firth.

22,093. You have made the passage through the Firth from the westward, I suppose, coming home from America; give me your opinion as to that ? Was your vessel timber laden ?—Yes, and discharged in this very harbour.

22,094. Had you a deck load ?—Yes, we had.

22,095. At what time of the year ?—I have come through several times in that way.

22,096. Have you come through timber laden late in the year ?—I have so, at Christmas time.

22,097. More than once ?—Yes.

22,098. Give me your opinion as to the advantage, then, of a harbour at Wick for a timber vessel that had got through and as far down as Buchan Ness, and was there met by bad weather and a gale from the southward ?—On one occasion I did not come through the firth, I made the land about the Lewises; I only saw the bottom, and was so certain from my own knowledge, and reckonings, and other indications, that that was the Butt; I saw a portion of it and had to work my way through. It is very dark at that time of the year; and I had to make my way through where it was dangerous to attempt to find the firth; I worked away through the Shetland and the Orkneys, came round the Land's End on the Scotch coast, before I made any land but what I have told you of. At that time I was bound here to Whitby with timber. I was 21 days on that coast between Kinnaird's Head and the Firth of Tay, dodging about with the wind from the south-east round to south-south-west. Sometimes you cannot fetch up for weeks. I dodged about with it blowing tremendously strong, but kept the land aboard, and managed to dodge off and on. If there had been a place at Wick, of course I should not have stopped there, but should have gone into the place. If the wind had got farther out I should have been in danger, and must have got the Tay. If the wind had come farther still I might have risked Cromarty.

22,099. You would not have liked to go up the firths ?—No.

22,100. You are disposed to say that under the circumstances in which you were placed, a harbour at Wick would have been a great boon to you ?—I believe it would, and it would be a boon at all times.

22,101. As respects the saving of life, what do you say about that ? Were you ever in danger of your life during this time ?—I do not think so, merely driving through the firth when it is a calm.

22,102. In this particular case ?—No.

22,103. Did you ever consider you wanted a harbour at Wick, not simply for the purposes of hanging on until the wind came fair, but for the purpose of saving your life and the ship ?—Oh no; it could not be in that case. The wind was off the land.

22,104. Will you give me your opinion as to the necessity of a harbour of refuge on this district of the coast, and where you would like to have it ?—I think I have had a good deal of experience as master of a ship and otherwise. When this first came out, of course it was considered that there was to be one large scheme, and I paid no attention where it was to be, taking no interest, though we had a many ships. Though there are objections to the Tees, I consider there is no other place that ought to have it, inasmuch as it is the centre of all the coast. It is the leewardest place with the most dangerous wind on this coast. The most daugerous wind is the wind dead on the land at east-north-east. Place yourself in any position, wherever you like, you will find it at all times to be the most dangerous. There is an equal balance going either north or south. The ships all come into the bay if the wind is in that quarter; hundreds of ships come down there bound from various places. If a ship is caught on a lee shore she is as sure to come into that bay as can be.

22,105. Am I to understand you, that you consider the best place for a harbour to be the bottom of Tees Bay, if one is made upon a large scale ?—I should recommend only one breakwater. I lived two years at Hartlepool; I would not have a southern breakwater at all. I would carry the breakwater from the Heugh, leaving an entrance if you like. Carry the breakwater out there, and have one entrance, carrying the breakwater sufficiently far, and turning it to Redcar Rock, leaving a space so that vessels might run in and out when they pleased.

22,106. You say you are decidedly of opinion that the thing to do is to have one large harbour of refuge placed at Hartlepool ?—If you are to have one monster harbour, I would.

22,107. What do you say as to the advantage of endeavouring to improve the Tyne and the Wear ?—I have not a doubt, so far as my opinion goes on that matter, that if there are a number it will always be better. I am ready to state that if there were two or three made or improved, we should save more lives by them. There is not a question we have many imprudent men who will run into risks at various times. If they run past a place of safety they get themselves into dilemmas, but if you had more than one place, they might save themselves by it.

22,108. Therefore, besides one large harbour, would you be disposed to endeavour to improve the existing ports ?—I should advocate three places if we could get them. Though it may be considered speaking for my own interest, I would advocate Runswick Bay, both as a herring station and a place of refuge. The Tees could be improved for a very trifling cost. I was down two or three times at the Tees, and was one of a deputation to the Duke of Northumberland when he was in the Ministry. He raised several objections to the Tees. I answered all his queries, and I suppose those answers will be in the Admiralty.

22,109. As respects Runswick Bay, you stated that you prefer Hartlepool ?—As a large scheme.

22,110. Tell me why you prefer Runswick Bay ?—I prefer Runswick Bay on account of its being able to be made at much less cost, and on account of the depth of water there.

22,111. I think, if you look at the chart and run your eye along a line taking 10 miles from the land to any distance, three to five leagues, you will always get Runswick Bay, no matter from what position, with

WHITBY.

Mr. R. Brown.

23 Oct. 1858.

Chairman.

the wind at east-north-east. But you know 1,000,000*l.* at Hartlepool and 500,000*l.* at Runswick Bay is rather a large demand on the public. Do not you think they are rather too close to each other?—I do not recommend Runswick and Tees Bay together. I say, if only one is to be made, let us have it in Tees Bay.

22,112. Which would you take first?—Tees Bay decidedly. If that cannot be done let us have Runswick. The only reason I would give is that I think Ranswick more preferable on account of the ports to the north of the Tees. When ships trade in the Tees and this locality they will always congregate about the trade places, and there would be more ships to save than we could save at Runswick.

22,113. (*Mr. Lindsay.*) It is your opinion that if only one harbour is to be made, the Tees Bay would be the best site for that harbour?—I believe it is sufficient on a large scale.

22,114. Whether do you think Redcar as a site, presuming you could get the same area of water at Redcar for the same cost as you could get it at Hartlepool, whether do you think Redcar or Hartlepool would be preferable?—There is a very nasty sea at Redcar.

22,115. If the public money was to be devoted to the construction of two harbours, where would you make them?—One at Runswick, and the other in the Tyne. I would improve the Tyne. I think that would answer all purposes.

22,116. Say that it rested between spending half a million of money at Filey Bay, and half a million of money at Hartlepool, do you think the money so distributed would do more good in that way, than if it were all spent in Hartlepool Bay, all things considered?—As regards Filey Bay there is one point we must remember, the vessels that are always dodging about off Flamborough Head. They consider it quite comfortable and safe; and if a space was made they might go in instead of dodging about.

22,117. Looking to the saving of life and property, and the facilities of commerce—looking to all points of view, but above all to the saving of life (which is the all important point), do you think that the money distributed between Filey Bay and Hartlepool Bay would do more good than if it were all spent at Hartlepool Bay?—I think it would be better all spent at Hartlepool Bay. The reason is this; because Filey Bay is no convenience, except to that very one point. Then there is another thing. You might say, if there were any ships dodging under the Head at the time, and they wanted to take shelter, that it was not worth while spending a great deal of public money upon Filey; for if they had West Hartlepool to run to as a place of refuge, of course they could run with safety and go to Hartlepool. The only thing to be said to that is, that it might so happen that some of the vessels should be lost in running there. I think it would not be well to spend money for that purpose there.

22,118. We have heard a great deal about the danger that ships encounter in running for Hartlepool Bay, on account, it is alleged, of the shallow water and the broken and troubled seas which extend considerably out from the land. Do you see objections to Hartlepool on that ground?—None, if you carry out the breakwater sufficiently.

22,119. You think that if a line of breakwater, such as you have mentioned, were carried out into a line of six fathoms water, or say seven fathoms water—do you think there would be any danger to a ship coming in in heavy south-east or easterly gales? Do you think there would be any danger to ships outside of the line of the breakwater? In a word, you think they would encounter greater danger between the breakwater and the 15 fathoms line of depth, than they would outside of the 15 fathom line, where there could be no broken water by any possibility?—As you shoaled your water you must have more danger, but I do not apprehend any danger in a vessel going before the sea. If she had to cross it there would be danger.

22,120. Knowing this part as you do so well, do you think there is any danger from broken water in Hartlepool Bay at a depth of seven fathoms?—I think on account of its gradually deepening, which it does, you get deep water as soon as you do from Redcar Rock. On account of its gradually deepening the water is more quiet going in, and it does not break so suddenly. There must be danger at all times where the sea does break, and the shallower the water the more dangerous the sea.

22,121. Do you think there is any extra danger in running between the 15 fathoms line and the seven fathoms line in approaching Tees Bay?—I should not consider so.

22,122. Do you think any advantage would be derived from the construction of a harbour of refuge at Filey, so as to warrant the expenditure of public money, say, to the extent of half a million?—I do not see it.

22,123. You think not?—I think not.

22,124. You think that, even if a fine harbour could be made there which would afford protection in the most dangerous gales of wind, it would not be of that value to warrant the expenditure of half a million of the public money upon it?—I do not.

22,125. As the last witness did not understand the nautical part of the Runswick Bay case as you do, tell me what kind of a beach there is there?—The beach where Runswick is, is sand.

22,126. On each side of it?—There is freestone right under the Scar.

22,127. Are there any rocks that intervene between this anchorage ground and the sand or beach in Runswick Village?—I believe there are a few that have come from the cliff, and been shoved into the water, and been there a considerable time, but these are all moveable stone.

22,128. Are there any rocks which would catch a ship if running upon a sandy beach?—Decidedly not; the *Amelia* was coming in when she was lost; two vessels were coming for Runswick beach, and if they had come, no doubt they would have saved their lives.

22,129. In the line of soundings between Kettleness Scar and Rust Hill, can you account for the 54 feet lying between the 40 and 41 feet?—I do not know the reason.

22,130. Do you know if the bay is free from rock?—Quite so.

22,131. All over the bay?—I believe so; the only rocks we have are on the side, which is an advantage to the breakwater, and they would be an assistance in carrying them out; they are on the low-water mark, running a little farther out.

22,132. Is there any trade in and out of Runswick Bay?—We are shipping ironstone; we have two harbours of our own in course of erection now, under my house, not in the bay.

22,133. For what sized vessels?—Vessels of 120 tons; we have had three or four of that size, or a little less.

28,134. Say the Government were to think of constructing a small harbour at Runswick Bay, are there any parties, proprietors of existing harbours or others, interested in the district, who would be disposed to subscribe?—There are no persons but the Marquis of Normanby who have a great interest; there are very few gentlemen about there; there would be no funds of that kind to assist.

22,135. No means at all to assist the expenditure?—Not any as I believe; they are wanting a railway to come there from the North Eastern.

22,136. There are no parties resident to find funds?—I think none, without it was the Marquis of Normanby, and very likely he might give the stones for nothing, which he could very easily afford to do; that would be a few thousand pounds.

22,137. (*Capt. Washington.*) When five of the Commissioners visited Runswick Bay yesterday, they saw some works going on at Kettleness?—That is the Marquis of Normanby's.

22,138. What are they ?—Alum works.

22,139. Are there alum works on the other side ?—Yes ; they are worked by a Company at Leeds ; that is my ground.

22,140. On the north side ?—Yes.

22,141. Do a large number of fishermen belong to the Bay ?—Yes, a great many belong to Staiths and Runswick.

22,142. How many fishing vessels were there ?—I think 21 out of Staiths, and I think two or three from Runswick, besides small cobles ; we have a lot of the fishermen here.

22,143. (*Mr. Coode.*) Do you know any instance of a vessel caught off Flamborough Head being driven to the north ?—No doubt many ; but I cannot name them.

22,144. Is that a matter which often happens ?—Unquestionably ; but vessels do not always run back, because they cannot keep their place ; but when one man goes, they are like a flock of sheep, all follow. When one goes they all follow, and go ashore together.

22,145. Did you ever hear of any vessels foundering in running back to the north ?—I think there are not many vessels that founder at sea.

22,146. Do you think they never do ?—No doubt, occasionally, but I think very rarely ; there are several mutual insurance societies at Whitby, and several at Scarborough, in which I have an interest, and several also at Hartlepool, and various other places ; and if their averages were examined you would find they paid very little money for vessels foundering.

22,147. You spoke of the *Amelia ;* do you know how far south she had got ?—The owner is here and he will give you the best information about it ; I know the particulars about her, but do not know how far south she went ; she was wrecked close to my works ; she got too far to leeward and the men belonging to Runswick knew she could save herself.

22,148. Were any lives lost ?—Yes, she got too far to leeward, and got upon the Scars ; those which are marked by dots upon the chart, the sea lifted her and knocked her to pieces. There was another vessel wrecked at the same time.

22,149. (*Mr. Lindsay.*) You say you resided two years at Hartlepool ?—Yes.

22,150. Was it Old Hartlepool ?—It was Old Hartlepool. It was before the docks were made. It would be 15 or 16 years since ; probably 14 years since I left.

22,151. During your residence there, or since, has it come to your knowledge that the bay was silting up ?—I have never examined it. It is a thing which ought to be taken care of ; and I believe that, by contriving passages in the breakwater, it may be taken care of, if the harbour could be constructed without stopping the progress of the tide. I wish to say about Filey that I don't see the utility of Filey, with the exception of one point. I never think we are on a lee shore, dead on land, if we have the wind east-north-east or east, having made Whitby Rock. We consider, if we can fetch Filey Bay, we can fetch Flamborough Head ; and if we can fetch Flamborough Head, and get round we can get into Bridlington Bay ; or, if we don't like that we can go into the Humber. There is no case in a thousand where we might not be in that position on this coast.

22,152. Do you mean, that in any wind that you can fetch round the Brigg at Filey point, you can weather away Flamborough Head ?—Unquestionably, I think so, unless you were close ashore, which would very rarely happen.

22,153. Unless you were right in the bight between Filey Brigg and Flamborough Head ?—Yes; and by extending the breakwater at Filey, and running it further south, there is another objection, that you would have to steer further out to get round.

22,154. By extending the breakwater you would increase the difficulty ?—Yes.

22,155. Then do I understand you to say that, vessels following the usual course bound south, would, in any winds that they could weather away Filey Brigg, weather away Flamborough Head ?—Unquestionably, any winds of any service to them.

22,156. And with the winds with which they can weather away Flamborough Head cannot they reach the Humber ?—Unquestionably, without they are very wrong ; that is, if they take the usual track. If they get round the Whitby Rock in that direction they have a south-south-east course.

22,157. Then your evidence goes to the extent, that the construction of a harbour of refuge at Filey Bay would only be of value to those ships which are caught close in to the northward of Flamborough Head in the bight of this small bay ?—Yes, that is it.

22,158. For this reason, that when they could weather away Filey Brigg they could weather away Flamborough Head, and when they could weather away Flamborough Head they could get to the Humber, where there is a place of safety ?—Yes.

22,159. Consequently, that the site of Filey Bay could only be of use to those ships which were caught out of the usual track, close to the northward of the Head, in the bight of this small bay ?—Yes.

22,160. Do I understand that is the substance of your evidence ?—That is the substance of my evidence.

Mr. JOHN DOBSON examined.

22,161. (*Chairman.*) How long have you been at sea ?—Twenty-five years.

Mr. J. Dobson.

22,162. Are you still at sea ?—I left 2½ years ago.

22,163. How many years were you in command of vessels ?—Sixteen years.

22,164. Do you appear here to advocate the formation of a harbour of refuge at Runswick Bay ?—Yes.

22,165. Will you state to the Commissioners your reasons for wishing to have one there, and the advantage and the necessity of having one there in preference to any other place on the coast ?—I was invited to inspect Runswick Bay, by the parties who were interested in the matter. I did so, and was very much astonished to see it such a very nice little place as I found it to be. I have anchored there when master of a collier, merely stopping the tide. I always had a favourable opinion of it ; and it happens that it is within six miles of being exactly midway between Flamborough Head and Tynemouth, where most of the wrecks on this coast occur. It is, in my opinion, very useful on account of vessels leaving Hartlepool. For instance, supposing a vessel left Hartlepool to clear the northern part of the Yorkshire coast, her course would be about east-south-east. If the wind blew strong at east-north-east the ship would be in a dangerous predicament. By laying south-east by north she would not weather the North Cheek of Robin Hood's Bay. If she were opposite Runswick she would run in. If she tacked could not regain Hartlepool on the starboard tack, and she would be wrecked about Huntcliff. I am decidedly of opinion that several small harbours of refuge on the east coast of England would be better for saving life and property than one grand scheme ; but still I cannot help thinking that the river Tyne and the Wear might be improved so as to save life from shipwreck. Only last Wednesday I was at Cullercoats ; there was a vessel from Hamburgh came close in shore, the fishermen drew my attention to it ; I said, "It is "going to blow very hard, this ship is shortening "canvas ; she will fetch round to Huntley Foot, and "ten to one she will go on shore ; what is the cause of "it ?" The fishermen said she got off the Tyne when it was not tide time, and the captain stood off for the north. If he did not get away she would have been lost. I think it might be made a harbour so that any vessel might take it at any time of the tide ; it would be useful then, if not it would be of no use at all. I certainly think from the soundings in Runswick

WHITBY.

Mr. J. Dobson.

23 Oct. 1858.

Chairman.

Bay, which I have examined, and from the nature of the beach, and taking everything into consideration, the quantity of ships which it will hold,—the immense number of ships that it would hold,—that it would be decidedly a very excellent place for a small harbour of refuge, an auxiliary harbour.

22,166. Have you anything further to say?—Nothing at present.

22,167. You were in the room yesterday and to-day?—No, I was not; I was obliged to leave.

22,168. Were you here to-day?—I have been here a portion of the day.

22,169. Do you agree generally with the other witnesses as to the character of the wind on this district of the coast?—There is no mistake about it.

22,170. In your experience of the coast have you ever been in danger of your life in running into any of these harbours?—Yes.

22,171. On what occasion?—Once, when Mr. Lindsay was at Hartlepool, when I was commanding a collier, I was in great risk of my life, and had to run the vessel on shore.

22,172. What were the circumstances in which you did that?—The vessel shifted her ballast; it came on to blow very hard and I was obliged to run in, she struck on the ground on going in and shifted her ballast. There was one other occasion on which I was obliged to run in and save life. I have fortunately not been placed in many very awkward positions on this coast, but on the south coast of England I have had to run to save my life.

22,173. (*Mr. Lindsay.*) I think you said you were in favour rather of improving the existing harbours than making one great one?—Yes.

22,174. Supposing the Government arrives at a different conclusion, and decides that only one great harbour is to be made, where should you prefer it?—At Hartlepool.

22,175. Did you hear the evidence Mr. Brown gave just now?—Yes.

22,176. Do you agree generally with him?—Yes.

22,177. You do not differ with him on any points, either with reference to Hartlepool or Filey?—I am quite of his opinion about Filey, and also about Hartlepool.

Mr. William Clarke examined.

Mr. W. Clarke.

22,178. (*Chairman.*) You were for four years master of a ship, and after that harbour-master at Whitby?—I was.

22,179. For how many years?—I got 13 years' pay, but was only 12 years and nine months harbour-master.

22,180. Do you now reside at Runswick?—Yes.

22,181. Have you been present during the course of this inquiry?—Yes.

22,182. Would you be good enough to give your opinion as to the advantage or necessity of one harbour of refuge on this district of the coast?—I think it is very necessary there should be one, but I would recommend two or three rather than one on a large scale, because the ships might get to one when they could not get to another. I will answer any other questions which you may put.

22,183. Would you be disposed to recommend the improvement of the Tyne, the Tees, and the Wear, if possible, to take vessels of 16 feet draught at low water, in preference to the establishment of one large harbour anywhere else?—Well, if there was only to be one harbour I should recommend Filey. When ships come out of the north country ports they generally have a fair wind, and always manage to get as far as Flamborough Head. At least it would be very bad weather if they did not. I think a harbour at the Tees would be good, only it is too near to the loading ports.

22,184. You say that ships which leave the ports are generally able to get up to the Head. But we have had it put strongly in evidence to day, that they seldom get past Whitby Rock?—It all depends upon circumstances. I cannot say, the ships will always get as far as Flamborough Head, but I suppose they would; I cannot say it for a fact.

22,185. (*Mr. Lindsay.*) Did you hear what Mr. Brown said with regard to Filey?—I did.

22,186. Do you differ with him in that respect?—Not at all.

22,187. Then why would you prefer Filey to Hartlepool?—It is a more central place. I have been riding in Filey Bay, both light and loaded, and I should prefer Filey to the Tees.

22,188. Is there any reason besides it being a more central point, and because you happened to ride there once as master of a ship, why you should prefer Filey to Hartlepool, more especially as you heard the evidence of Mr. Brown, and say you altogether agree with him? Are there any other reasons?—If you were caught with a heavy gale of wind off Flamborough, you could go to Filey and be in safety; and, perhaps, before you got to Tees Bay you might lose your ship and all hands.

Mr. Robert Pollett examined.

Mr. R. Pollett.

22,189. (*Chairman.*) You live at Hinderwell and are a shipowner?—Yes.

22,190. Did you follow the sea formerly?—Yes, for 27 or 28 years.

22,191. For what period were you master of a vessel?—For 20 years.

22,192. Have you been present to-day?—Yes.

22,193. And yesterday?—Yes.

22,194. Are you for one harbour of refuge, or for the improvement of the existing ports?—I should be for the three ports, Filey Bay, Runswick, and Hartlepool Bay, say at one side or other of the Tees.

22,195. Will you tell me why you select these places?—I think they are well divided on the coast. I do not know much about the coal trade myself, having always been in the foreign trades, the southern trade and the transport trade, and very little upon the coast. I prefer Runswick for a harbour of refuge, because it always has been a place of refuge since I knew it, and many hundreds of lives have been saved there.

(*The witness was evidently suffering from severe indisposition, and it was with difficulty he could make his voice audible.*)

(*Chairman.*) It is useless my professing to hear you. I have not heard a word you have said. If you cannot speak louder, and are labouring under indisposition, you had better be kind enough to put what you have to say upon paper, and send it to our secretary.

Mr. Richard Verrill examined.

Mr. R. Verrill.

22,196. (*Chairman.*) Were you formerly at sea?—Yes.

22,197. How long have you left it?—Five years.

22,198. How long were you in command of a ship?—Twenty-five years.

22,199. Where do you reside?—At Staiths.

22,200. In what trade were the vessels you commanded generally engaged?—The coasting, the Baltic, and the Archangel trades.

22,201. How many voyages have you made from the Baltic?—I was 16 years employed in that trade out of the 25.

22,202. How many voyages did you make on an average?—Never more than two in a year; one at

Archangel generally, and one to Petersburgh, or some other port in the Baltic.

22,203. So you may have made 16 voyages from the Baltic, and 16 to Archangel?—No, only about nine times, I think, to Archangel.

22,204. Have you ever come home from the Baltic late in the year?—Yes.

22,205. Where did you generally actually make the land in coming home?—I have generally made Flamborough Head, the Shetland Islands, and Buchan Ness. I have made the Orkneys and different parts of the coast.

22,206. As a general rule can you state one part of the coast, more than another, where you generally made your landfall?—I think, Buchan Ness for the most part; but frequently I had to call at Peterhead for orders.

22,207. Then there was a reason for making it?—Yes.

22,208. What is a fair period in winter for a voyage from the Scaw or the Naze for this part of the kingdom? What would be a long voyage from there?—Three weeks or a month.

22,209. Are passages of that description frequently made?—Often from a week to a fortnight.

22,210. But long passages?—Not very often.

22,211. Ships that make these long passages, have they been at sea all the time or have they taken shelter in the ports of Norway?—I have been a month myself and never took shelter.

22,212. Where were you?—Knocking about in different parts of the North Sea, trying to make my voyage.

22,213. What was the time of the year?—Different parts of the year; in the summer time, the backward, and the fall.

22,214. Have you ever been so long about it in the winter time?—I have been there in December.

22,215. Was the weather very coarse?—Both coarse and cold.

22,216. When you made the voyages from Archangel, did you call at Peterhead for orders?—Not always, but sometimes.

22,217. In making your passage home from Archangel, what landfall did you endeavour to make?—I generally endeavoured to make the Shetland Island, or Peterhead, or Buchan Ness, or some other headland. It just depended upon how the wind was. If the wind was from the eastward, south, and east, I tried to make the land on the Yorkshire coast.

22,218. With a fair wind where did you make your landfall?—With a fair wind, sometimes at the Farn Islands, and different other points—Flamborough Head, anywhere likely. It all depended where we were bound to. We generally think that when clear of the land there is more rest; and when we come in contact with the land a ship has many things to fear.

22,219. Bound to this port from Archangel, where would you make your landfall with a fair wind?—About the Farn Islands.

22,220. (*Mr. Lindsay.*) About this coast here, do you think one great harbour or the improvement of the existing harbours would do the most good?—I think the improvement of the existing harbours would be the better.

22,221. Say it was decided otherwise, and that you were only to have one great harbour, where should you have it?—I think in Hartlepool Bay.

22,222. Do you know the site of Redcar?—Very well.

22,223. Do you think one at Hartlepool or in Redcar Bay would be of most service?—I think it would be of most service in Runswick Bay. In Runswick Bay there are 100 fishermen from that shore every day who are exposed to very serious weather. If it were not for Runswick there would be serious loss of life, and therefore we consider it a place of refuge in a general position as it now is. It would be made a place of refuge with a very little amount of money. I think we ought to try to do something for the safety of fishermen as well as sailors.

22,224. (*Sir F. Smith.*) How many boats are there?—Twenty-one large boats.

22,225. How many losses have you had of late years?—I am sure I cannot say. I think in my time I could name nearly 40 or 50.

22,226. The men have perished?—The men have perished in sight of their own native home.

22,227. Within how many years?—In about 35 years.

22,228. That is upwards of a man a year?—Yes. Runswick is their only place, and when they go off shore in a morning, and the weather comes on bad, they have nothing but Runswick to flee to in its position as it now lies. The *Peter and Mary* and the *Mary Ann* have been spoken of. I had the management of those two vessels when they were lost.

22,229. I see in the neighbourhood of Runswick Bay you have the Runswick Sands?—Yes.

22,230. What is the length of the sandy beach?—It will be near upon a mile along to what are marked in the chart "the white stones." These are freestone stones.

22,231. What is the length of the beach marked the "white stone"?—It varies in some parts.

22,232. The length of it?—I think the farthest I can name is about half a mile or so. Then you come to sand, and then you come to freestone again. All the way along the cliff there are inlets of sand round Runswick Bay.

22,233. How much sand is there upon which the fishermen can beach their boats?—I should think three quarters of a mile going from the village of Runswick to a place called Cuthbert Hill. If you had this breakwater it would be all sand, because the stones would go to make the pier.

22,234. As the bay stands at present, what quantity of sand is there on which the fishermen can beach the boats?—I think three quarters of a mile.

22,235. That is the space marked the "white stones," which is unfit to beach the boats?—Yes.

22,236. If they attempted to beach boats on that beach would they lose their lives?—The would lose their cobles.

22,237. But not their lives?—Not their lives, I think.

Mr. JAMES WOOD examined.

22,238. (*Chairman.*) You reside at Runswick?—Yes.

22,239. You are a fisherman?—Yes.

22,240. For how long have you been employed in that occupation?—Forty-five years.

22,241. Will you make any statement you like to us, which will express your own sentiments, and those of the fishermen who have come from Runswick?—If ever we get inside the Kettleness Point we are safe. The Staiths men often cannot get home. It has saved hundreds of lives in my time; they would all have been lost if it had not been for Runswick; it is a refuge for fishermen all along, and I have kept the coast from Flamborough Head to Shields hundreds of times, and we cannot find another refuge. We can always save ourselves if we get into Runswick. If our boats are lost there never is any accident if we get within Kettleness Point. If there are many lost they are always lost at sea.

22,242. You have a bit of sandy beach, have you not?—Yes.

22,243. When you reach that, you save yourselves in the boats?—Yes.

22,244. What is it you would like done, that there should be a harbour made for you to run inside of, instead of beaching the boats?—Yes.

22,245. Are you aware that in very large districts of the southern coast and other parts of England, there are great lines of coast where the fishermen have nothing but open beach on which they are in the habit of coming in bad weather, and beaching their boats?

WHITBY.

Mr. J. Wood.

23 Oct. 1858.

Chairman.

—I do not know. They heave them up directly. We cannot.

22,246. I may inform you that it is the case; that there are large districts of the coast of England, and probably of Scotland and Ireland, in which the fishermen have open beaches upon which only they can beach their boats. I should imagine, if anything is to be done for the fishermen of this country, that it would form a very important element in the consideration of what is to be done; and those fishermen who are located on iron-bound coasts, and have no sandy beaches on which to beach their boats, would be the fishermen who would have to be first considered?—We should be much better off if we had something to shelter us.

22,247. (*Mr. Lindsay.*) Whenever you can get in with your boats to the sandy beach which is in Runswick, you can always save your boats and your lives?—Yes.

22,248. Then a pier run out there would not make it more safe than it is now?—Oh yes, it would.

22,249. How could it when you tell me you can always save your boats and your lives?—If we reach the sandy beach we can.

22,250. A pier would make it more easy?—Oh yes, and save a great deal more of ships coming in; ships run ashore and save their lives, but they could save the vessels also if there was a pier.

Mr. William Ward examined.

Mr. W. Ward.

22,251. (*Chairman.*) Are you a fisherman?—Yes.

22,252. And reside at Staiths?—Yes.

22,253. How long have you followed your present occupation?—About 35 years.

22,254. Can you confirm the statement of the previous witness that fishermen who belong to Runswick Bay can always save their lives?—Not always, but in general they are able to save their lives in bad weather by beaching their boats; they cannot beach the large boats without loosing them; the smaller boats they can; the large boats they dare not beach; there are 21 large boats at Runswick and Staiths.

22,255. What is the size of the largest boats?—From 33 to 36 tons.

22,256. Are they decked?—Yes; they carry nine hands in one of those boats of from 33 to 36 tons.

22,257. Are they good sea boats?—Yes.

22,258. First-rate sea boats?—Yes.

22,259. Then can they keep the sea in very bad weather?—Oh yes.

22,260. Then in point of fact they are much in the same case as coasters?—Yes.

22,261. What do they draw?—Some draw very nearly eight feet; seven to eight feet in ballast.

22,262. They draw less water than a light collier?—Some of them draw nearly eight feet water in ballast.

22,263. Therefore it is more especially for these that you would urge the necessity for a refuge?—Yes.

22,264. You consider the same refuge is required for them as for the smaller class of coasting vessels?—Yes.

22,265. What particular advantage does Runswick Bay present for a refuge for the smaller coasting vessels? Is it not much better than any other place?—It is a fine bay for small vessels to go into.

22,266. Are the fishing grounds in the neighbourhood? If the boats were caught in bad weather, would they be likely to be in the neighbourhood of Runswick?—Sometimes they go under there.

22,267. Where are their fishing grounds? in what direction, and at what distance from Runswick Bay?—They are fishing now about 40 miles from Scarborough, fishing for the herring.

22,268. Therefore a harbour of refuge in Runswick Bay would not be of any use to them? In that case they would get a refuge, a better refuge and a nearer one, in Scarborough, or somewhere else?—Yes.

22,269. Where do they fish during the greater part of the year?—They have been fishing north-north-east from Staiths about 50 miles.

22,270. If taken by a gale of wind on shore, they have rather a choice of harbours to run to, as they can get into most of the harbours on the coast?—It would be nearer to their own homes if they wanted to come there. They have to come and get bait once a week.

Lieut. Henry Bainbridge, R.N., examined.

Lieut. Henry Bainbridge. R.N.

22,271. (*Chairman.*) You command the coast-guard?—Yes, at this station.

22,272. How many years have you been in the coast-guard on this particular district of the coast?—It is 12 years since I first came, but I have been twice away during that time, leaving nine altogether here.

22,273. You have been present during the greater part of this inquiry?—Yes.

22,274. Be kind enough, at your convenience, to forward to the secretary any observations which you may like to make upon the evidence you have heard, keeping in view the object of our inquiry?—Certainly.

(*Chairman.*) Are there any other parties whatever interested in this inquiry, who have evidence to tender to us?

No answer.

Sittings at Whitby closed.

FILEY.

Monday, 25th October 1858.

PRESENT:

Admiral Hope (Chairman).

Sir Frederic Smith.
Mr. Lindsay.
Captain Washington.
Captain Sulivan.
Captain Vetch.
Mr. Coode.
Mr. Evans, Secretary.

FILEY.

Dr. Cortis.

25 Oct. 1858.

(*Dr. Cortis.*) I have a memorial, signed by upwards of 100 of the Filey fishermen, requesting to be allowed to give evidence as to the advantages which would accrue to them from a harbour of refuge being formed in the bay. (*The memorial was handed in.*)

(*Chairman.*) Will you now, Dr. Cortis, be kind enough to proceed with any statement which you wish to make relative to the advantage, or necessity of a harbour of refuge on this point of the coast, observing, that it will be convenient to us if you will abstain as

FILEY.

Dr. Cortis.

25 Oct. 1858.

far as possible from telling us anything which we have before us already in an official shape in the Reports of the Committees of the House of Commons upon this subject?

(*Dr. Cortis.*) Mr. Chairman and gentlemen of the Commission,—In making the following statement to Her Majesty's Commissioners, I beg to claim some little indulgence, inasmuch as, while other places which have put forward claims as suitable sites for the formation of a harbour of refuge are represented by Dock or Harbour Commissioners, whose duty and profession it may be said to be to see these claims properly put forward and supported by suitable evidence, with funds at their disposal on which to draw for the carrying out of their objects, here it is entirely different. A population mainly dependent on fishing for a hardly-earned livelihood, with neither wealth nor influence, nor any officials with professional knowledge and acquirements to manage their case, they have been compelled to trust to such advice as chanced to be within their reach. With the diffidence which becomes every landsman in approaching nautical subjects, I beg to make a few remarks in opening the case to the Commissioners. Before doing so, perhaps I may be allowed to say that the proposition for a harbour of refuge at Filey dates from a very early period. I hold in my hand a document containing an account of a survey of this bay in the year 1741, 117 years ago. I need not occupy the time of the Commissioners by reading it; but if you will allow me to make an extract from the commencement and termination, showing what the document is, I shall feel it as a favour. It is headed, "A True and Exact Plan of Filey Bay," and commences, "From the point "of Flamborough Head to the easternmost part of Filey "Bay is about eight miles, which bay was sounded and "surveyed on the 21st and 22d September 1741, both "at high and low water in a common tide." It goes on to give certain soundings of the bay at that period, and then it terminates thus:—"Every one will "be satisfied that this is not set forth for any view "of interest not further than as information public of "the commodiousness of this place for a harbour. "One would fancy that every gentleman and others "that are well-wishers to this large and brave and "active branch of Northern navigation will do their "best to endeavour to act for the safety and welfare "of it. For instance, the 1st of November 1740, "was totally lost, 9 sail of large ships under Flam-'borough Head, and much damage was caused—no "less than 12,000*l.*; nay, much dearer than that was "lost, two-thirds of the sailors belonging to them. "Provided there had been a harbour in Filey Bay, "both life and goods might have been saved. On "the contrary, many a widow and fatherless child "was made." In advocating the claims of Filey Bay, I contend, first, that the situation of Filey Bay is incomparably superior to all others, inasmuch as it is just exactly at that part where the greatest difficulty and danger arise, consequently, where more lives and vessels might be saved by the construction of a harbour of refuge than elsewhere along this coast. Secondly, because the character of the bay is such that it is provided by nature for the formation of a harbour of refuge. Thirdly, because a harbour of refuge can be made at Filey Bay at less cost, acre for acre, than at any other point along the coast. We believe that these advantages contain the whole of the matter. I beg to remind the Commissioners of the evidence which has been already given before the Parliamentary Committee upon these points by Admiral Ross, Captain Anderson, Mr. Clarke, and masters of long experience, whose opinions are entitled to considerable weight. Most of the witnesses have stated that vessels usually leave the coal ports on this coast with such a wind that they get up as far as Flamborough Head, when the wind very frequently bears away from south or south-east and they are baffled, and bring up under Speeton Cliffs, and dodge about for days. Supposing even that they can weather the head, and proceed a little further to the south, they often dare not do so, knowing that their meeting such a heavy sea increased by the outset from Bridlington Bay, that as soon as they have lost the shelter of the head they will be driven back again here; they hang on as long as possible at imminent danger, and often in difficulties—frequently many hundreds of them—until the wind getting more easterly and increasing, they are compelled either to stand out to sea or to run north in search of shelter. All the gentlemen I have mentioned were, I believe, unexceptionable witnesses and men of capacity, and they all agreed in this, which all residents of Filey can confirm, that constantly during the winter months we see large fleets hanging about the head and anchoring under the Speeton Cliffs. For instance, in proof of this, what occurred during the present year I may be allowed perhaps to allude to. On Sunday, the 7th of February last, we counted between 90 and 100 sail brought up under Speeton Cliffs, and several others dodging about the head. A gale came on from the south-south-east on the following day, and they were compelled to get under weigh and leave the place. In the *Shipping Gazettes* of the next few days I noticed the accounts of wrecks of not less than 50 of these vessels, and fortunately I extracted two or three of them, from which I will read the masters' accounts of their proceedings:—"Extracted from the "*Shipping Gazette* of 13th February 1858.—Captain "Thos. Hall, of North Shields, from Shields for London "—coals, left Shields on the 5th inst. Wind west. "Fine. 6 P.M., wind south-west, strong; double "reefed topsails. Midnight, south-south-west, in-"creasing; stowed main staysail and jib, Scarborough "bearing north, distant 10 miles; tacked ship off the "land; 4 A.M., tacked to windward; 9 P.M., brought "up in Filey Bay in 8 fathom water, and remained "during the whole of the 7th, wind being south "and very strong. 8th, at 8 A.M., wind south-south-"east, strong; got under weigh; stowed topsail "and double reefed foresail; sea on; sailed off and "on, pumps going every half hour, the sea being "heavy and the ship making water greatly. 9th, "still kept the ship to windward, water increasing. "10th, 6 A.M., Scarborough distant 10 miles—blowing "strong, three feet of water in the hold; called "all hands; bore away before the wind, steering "north-north-west; both pumps continually going; "found the water increasing very fast; ran for "Whitby, and got assistance. 1.30, off High Whitby, "7 feet of water in the hold—ship unmanageable; "rounded her to. 2 P.M., 7 feet 5 inches of water in "the hold. 2.30 P.M., a steamboat came and took "the crew off. 2.53 P.M., ship foundered in about 33 "fathoms of water." A few days later we find a report of Captain S. Fuller, master of the *Billow*, of and from Sunderland, with coal:—"Left Sunderland "on the 5th instant; wind south-south-east; double "reefed topsails; wind increasing; stowed foresail; "stood on and off; wind east-south-east." The course of this ship is very much the same as that of the other, and the end of it is that the ship goes on shore in Runswick Bay. On the 15th the cargo and stores were saved by a private enterprise, and three hours afterwards the sea increasing, getting heavy, she went broadside on to the beach, and was dashed to pieces. The report of the *Colony* brig, of Whitby, dated Berwick, bound from Shields to Whitstable, is, that the vessel had got a little to the southward of the head, but was off the head on the 8th; was driven back to Coldingham Bay, near Berwick, and there sustained considerable damage. Another is, the *Friends' Goodwill*, of South Shields. I had a letter from the Captain, in which he gave me an account of their voyage. I may say that on that voyage he was no less than three times to the southward of the head, and always obliged to run back. He abandoned the ship off Whitby, but she was afterwards recovered. In the *Shipping Gazette* is also the report of the brig *Annandale*, Captain Blakerstone, in the same gale. Hearing that she had been

FILEY.

Dr. Cortis.

25 Oct. 1858.

in the same gale, and had been driven to Leith, I wrote to him to get an account of his voyage, in answer to which I received the following letter :—

"17, Herring Street, Shields,
2d April, 1858.

"SIR,

"ON my arrival at South Shields the other day, a letter was put on board the ship *Annandale*, of which I was in command, from you, desiring my opinion of a projected harbour of refuge in Filey Bay, and desiring me to make a statement of our late voyage, which I will most willingly do. We sailed from Shields for London on the 5th of February [the same day that the other vessels had left their ports]. We got as far south as Robin Hood's Bay ; fell in with gales of wind from the south-east ; dodged for several days off the head, and put back for Leith Roads on the 11th of February. Leaving there again on the 14th we got again as far as about six or eight miles to the southward of Flamborough Head. Meeting gales again we drove as far to the northward as Shields, and the tide being at the worst had a second time to run for Leith Roads, which we reached on the 24th of February. Heavy gales of wind continued from the eastward, and on the last of February and 1st of March we drove some considerable distance ; and we were obliged in the end to take assistance, to slip from our chains, and proceed up the firth to Queensferry. Now, had there been a harbour of refuge at Filey or Redcar, instead of having to put back 200 miles for shelter, we could have put into that place, and saved all those disasters, besides saving to the owner the loss of the chains and anchors, and also the moneys paid for assistance. In your letter you ask me three questions ; first, whether Flamborough Head is the point where laden colliers are most frequently caught with gales of wind north of the Humber ? I beg to state, in answer to that question, that I have often found it so, and there we have no safe refuge, as I have already said, until we reach the Firth of Forth. Your next question is, whether under such circumstances a harbour of refuge at Filey would not be particularly useful ? I have for many years been of that opinion, and often had long conversations with several of our north country or collier captains about it. Your third and last question is, any general facts I may be able to state showing the desirableness of a harbour of refuge at Filey Bay. I have now been 30 years at sea, about 20 of which master and mate of vessels principally in the coal trade, during which time I have had very many opportunities of observing the great necessity there was of having a safe harbour of refuge between the Humber and the Forth. Only about three years ago I was obliged to ply about with the same ship I am now commanding for six days between Flamborough Head and Whitby, blowing very strong from the southward until we split several of our sails ; whereas, if there had been a harbour at Filey, we might have put in, and hauled the ship in safety all the time, and saved our canvass. While at Queensferry there was a gentleman who told me he was going to publish a book as to the desirableness of harbours of refuge on the north-east coast, and wished my opinion whether I considered Filey or Redcar the most eligible place on that part of the coast. I at once gave my opinion in favour of Filey.

"I beg to subscribe myself,
"Your obedient servant,
"JOHN BLAKERSTONE."

I never saw that man in my life, and I never had any other communication with him than that to which he refers. Filey not being a port, we have not all the facilities of procuring the evidence of masters engaged on the coast, especially at this season of the year, when they are so constantly at sea, but an immense volume of testimonies has already been given by sailors employed on the coast in favour of Filey Bay. Sailors on the north-east coast generally, to the number of nearly 2,900, signed a petition, which was presented to Parliament, and referred to the Select Committee of the House of Commons then sitting during the last session, of which I beg to hand you in a copy.

"The petitioners desire to call attention to the great and peculiar advantages possessed by Filey Bay for the construction of a harbour of refuge, first, because its situation on the coast is well adapted for a harbour of refuge from the circumstance of its being close to Flamborough Head, where so large a number of vessels are frequently caught by bad weather, and for want of shelter are compelled to run for the different tidal harbours along the coast, thereby causing the loss of many vessels and their crews. Secondly, because with contrary winds a great number of vessels now anchoring off Flamborough Head and in the south part of Filey Bay are frequently detained for considerable periods waiting for a shift of wind to get to the southward, and are exposed to great danger with a heavy sea, and in case of a gale coming on from the eastward. Thirdly, because Filey Bay already possesses considerable shelter from the natural formation of the coast. The anchorage ground is of good quality, and we believe that from its situation and the great natural advantages it is unequalled as a site for a harbour of refuge by any other along the north-eastern coast."

I have not the precise numbers of those who have signed this petition, but I am quite sure that I am within a very small number in the figures which I have stated. It was signed by nearly 2,900, between 2,800 and 2,900, of whom nearly 1,480 were either masters or mates. A similar petition was presented from the different ports upon the coast, one from the River Tyne with 900 signatures, of whom nearly 275 were masters and mates. One from Hartlepool and the River Tees, with nearly 470 signatures, of whom nearly 200 were either masters or mates. The total number of signatures to the petitions presented to Parliament during the last session in favour of Filey Bay amounted to about 5,450 within a trifle one way or another, more or less. The fishermen also employed on the coast petitioned Parliament to a similar effect, which petition had about 850 signatures, making a total of 6,300 individuals engaged on this coast who have petitioned Parliament in favour of a harbour of refuge in Filey Bay, including the sailors of Hull, who signed a petition to the number of nearly 700. These petitions I beg to put in. (*Several petitions were handed in.*) Since our case was laid before Parliament, I have occasionally taken opportunities of getting information from masters of colliers by letter as well as vivâ voce, and I have received many, about 20, very interesting ones. The writers are all at sea without exception, otherwise some of them would have attended before the Commissioners. Under these circumstances I trust I may be allowed to read one letter, dated from Seaham :—

"SIR,—I received your letter, and I hope you will succeed in getting a harbour of refuge at Filey Bay. I myself came out of Hartlepool in December 1852, and got to Filey Bay with many more ships in company, about 100 sail, and all were driven back for want of a harbour of refuge at Filey. I was in company with two ships which foundered with all hands.

"(Signed) HENRY SAYERS,
"Master Mariner."

(*Chairman.*) Do you give these letters in as evidence ?

(*Dr. Cortis.*) Yes, I do.

(*Chairman.*) Have you any more of these letters ?

(*Dr. Cortis.*) I have several.

(*Chairman.*) Just count them and see how many they are. If you will be kind enough to tie up the remainder of these letters, and hand them in as they are to the Secretary. They will not be received as evidence at present, but we will consider whether

they can be so admitted, and will inform you at a future period.

(*Dr. Cortis.*) They are mixed with other papers at present, but I will take care to forward them to the Secretary. It seems to us that the most easy way of providing safety for these vessels is to do so just where their dangers and difficulties occur, and not to compel them to run to a place 50 miles distant in imminent risk of founding or being driven on shore during every mile of their running that distance, which will be often increased to 70 or 80 miles. It is to be remembered that a vessel does not get into safety immediately on rounding the head. She has to sail 30 miles distant to the Humber, and many a vessel is caught just north of the Humber in a gale from the south and east, and being unable to reach that river, is compelled to run or drive north. The last wreck but one which occurred in this immediate neighbourhood presented an instance. The brig *Minerva*, of Whitby, was caught south of the head by a south-east gale, and beat off as far as off Dimlington. In order to fetch the river for shelter the master carried a press of canvass, and beat about for some time, until, in consequence of the straining, the ship became leaky, and was compelled to bear up. That was a ship coming round Flamborough Head. Early next morning, being evidently in great distress, she came towards our beach. The life-boat was manned, and everything in readiness to save the crew, when they changed their minds, and bore away to Scarborough, where they beached the vessel, with a considerable quantity of water in the hold, and the crew were taken out by the life-boats. We had gone along the cliffs with the rocket apparatus to save the crew, as the vessel seemed scarely able to reach the distance. I saw the master when he came ashore, and got the above particulars from him. I am aware that great stress is laid upon the fact that so many wrecks occur in the Tees Bay, and further north, but the entire testimony of practical seamen bears out our argument, that most of those wrecks are of vessels which have run all the way from Flamborough Head or its neighbourhood in search of shelter; and also the particulars of wrecks in our last great gale, that of the 4th of January 1857, support it very strongly. Upon that occasion a fleet of laden vessels, said to number about 200, having left the coal ports on the 2d of January, got up the greater part of them to Flamborough Head, were overtaken there on the morning of the 4th by a gale from the east; as was also a fleet of light ships, numbering about 80, which left Yarmouth Roads on the previous day. The disasters which then occurred are probably fresh in the memory of most of us. Two vessels, one laden and the other light, came ashore in our bay. Their crews were saved, after the light broke, by the life-boat, and almost the first remark of their masters was their dread of what would happen to the large fleet with which they had been in company at nightfall. There can hardly be a doubt that the 34 vessels contained in this list were part of that fleet, and that a very great proportion of the other vessels lost on that day were likewise caught at Flamborough Head. (*A return was handed in of vessels wrecked on the 4th of January* 1857, *known to have been caught by the gale near Flamborough Head.*)

(*Mr. Lindsay.*) You give this in as a return?

(*Dr. Cortis.*) Yes, I do. The masters of the vessels lost in Filey Bay are both at present away on foreign voyages, or I should have endeavoured to place them before the Commissioners as witnesses. I have letters here from Captain Baines, of Shields, who says that if there had been a harbour at Filey the greater part of the ships and lives lost in that gale would have been saved:

"In the abstract of the returns of Wrecks and Casualties in the year 1857, the principal part of those on the north-east coast occurred between Newbiggin and Flamborough Head. This space may be divided into three equal lengths, each rather less than 30 miles; the first extending from Flamborough Head to Whitby inclusive, between which points light vessels bound north, and loaded ones running in search of shelter in easterly gales, are frequently embayed; the second extends from north of Whitby to about Blackhalls, and is of consequence chiefly to vessels bound to and from Hartlepool and the Tees, and includes these important entrepôts; the third extends from Blackhalls to Newbiggin, and includes Seaham, Sunderland, Shields and the Tyne, Blyth, &c.

"In connection with these districts, the Wreck Chart, for 1857, shows,—

	Partial Loss.	Total Loss by Stranded or Foundered.	Sailing Vessels in Collision with each other.		Sailing Vessels in Collision with Steamers.	Total from all Causes.
			Total Loss.	Partial Loss.	Partial Loss.	
Reference Marks in Wreck Chart	⊙	X	○⊙	○○	○I	
From Flamborough Head, including Bridlington to Whitby	28	25	10	1	2	66
Whitby to Blackhalls	24	17	7	1	0	49
Blackhalls to Newbiggin	22	35	4	0	2	63

"Although the claims of Filey as the best site for a harbour of refuge do not rest on the number of wrecks in its neighbourhood, but on the fact that the dangers occur here, the wrecks taking place to the vessels running back, it nevertheless appears that in the first, which may be called the Filey district, there were of wrecks from all causes:—

Totally lost - - - 40
Partially lost - - - 26
Gross number - 66

"In No. 2, Hartlepool, or Tees district—
Totally lost - - - 31
Partially lost - - - 18
Gross number - 49

"In No. 3, Northern Ports, or Tyne district—
Totally lost - - - 26
Partially lost - - - 37
Gross number - 63

"No. 1 thus having a preponderance over No. 2 in vessels—
Totally lost - - - 7
Gross wrecks - - - 17

"Over No. 3—
Totally lost - - - 12
Gross wrecks - - - 3"

Some time ago, certain returns were sent by the Filey Committee to the Commissioners for their information, in connexion with the wrecks in the gale of the 4th of January, 1857. I see that the correctness of these returns, as to ships lost between Flamborough Head and Whitby, has been called in question, and I beg leave to say that I am responsible for those returns, and am prepared to defend their bonâ fide character, and general correctness.

(*Mr. Lindsay.*) Will you be good enough to give in that return to which you are referring, signed and vouched?

(*Dr. Cortis.*) I wish to give this explanation. The cause of this return having been compiled was this: I noticed in the evidence of Mr. Calver, given before the Select Committee of the House of Commons, that he stated that all the wrecks in the 4th of January gale on this coast would have been saved by a harbour of refuge in Tees Bay. It appeared to me that the ships lost in Filey Bay could

FILEY.

Dr. Cortis.

25 Oct. 1858.

not be so saved, and I therefore proceeded to search the *Shipping Gazette* of the following days for reports of ships wrecked between Flamborough Head and Whitby. I afterwards examined as to the ships wrecked north of Whitby, and I included all of which I could get any particulars. It is very probable that the return of those lost to the north of Whitby does not include all that occurred, for I had great difficulty in obtaining them. I included all that I could find any account of. But I believe that the principal matter which has been called in question with regard to Return No. 1 is this, that ships have been included at Whitby.

(*Chairman.*) I should like to have a copy of that return. (*Document handed in.*)

(*Dr. Cortis.*) I may state that I find an error has accidentally crept into No. 1 by my writing Robin Hood Bay for Runswick Bay, which affects apparently two vessels, the *Peter and Mary* and the *Amelia*. It does not, however, affect the question of what is proved by the return, for I have a letter from Captain Henry Binton, the master of the *Ratcliffe*, in which he states distinctly that the *Amelia* was in company with him off Flamborough Head the night before the gale. That letter is dated "Sunderland, February 9," before these statistics were printed, and I will put that in as evidence. (*The letter of Captain Binton was handed in.*) I have also, in the *Shipping Gazette* of January 9, a report of the captains of two of these ships lost in Whitby Bay, which are two of those called in question. —"Captain William Ellis, of the *Abeona*, brig, of "London, for Hartlepool. Left London January 2d. On "the 4th, about 2 A.M., ship 15 miles off Flamborough "Head, rounding north-north-east, wind south-south-"east, constantly increasing. 2.30, wind east, a gale; "close-reefed fore and main topsail, stowed mainsail. "At 5 P.M. stowed foresail. Heavy sea on. At 7 A.M., "on the 5th, sighted the south cheek of Robin Hood "Bay, distant half a mile. [There are other details "which I need not read.] Rounded Whitby Bay. "At 2.30 P.M. carried away lee bulwarks and stan-"chions; could no longer keep off the land [which, "I apprehend, is the essence of the matter]. Put the "helm hard a-starboard, and ran for the beach at Sand's "End." In the same paper there is another account: —"Captain John Quesnel, master of the *Lively*, of "Guernsey, for Shields, in ballast. Left London on "the 1st of January. About 11 A.M. passed through "Yarmouth Roads. 1.30, wind north-north-west, "the breeze increasing. Bore off for Yarmouth "Roads for shelter. On the 3d, wind south-west "[and here there is an account of a collision]. "On the 4th, wind east by south. At 2 A.M. wind "strong; Flamborough Head bearing west-south-"west, distant 10 miles. At 3 the gale increased. "At 4.30 hove ship to under double-reefed mainsail "and standing jib, all the others furled. At 11 "A.M. made the south cheek of Robin Hood's Bay, "bearing west three miles distant. At 1 P.M. the "north cheek bearing west by north, about a mile and "a half; kept the ship off in order to weather Whitby "Rocks. At three minutes past 2 P.M. wind east-north-"east, Whitby Bay bearing north-west, distant one mile. "Found it impossible to weather Sand's End Ness "Point. Lowered the mainsail; squared the yards; "put the helm hard a-starboard, and ran for the "beach." Captain George Robinson, master of the *Medora*, of Whitby, reports:—"Sailed from London, "1st January, for West Hartlepool, in ballast. Wind "on the 2d west-north-west. Anchored in Yarmouth "Roads. On the 3d, 7.20 A.M., wind south. Weighed "anchor, and proceeded northwards. At 10 P.M., about "15 miles south of Flamborough Head, rain and "wind from south-east suddenly increased. Double "reefed topsail. At 2 A.M., on the 4th, passed the "head distant six miles; gale increasing. 4 A.M., "wind east, a sea struck the ship on the starboard "quarter; hove her under the wind; split the fore "topsail. 8 A.M., made Whitby west-south-west, "distant 1½ mile. Found it impossible to keep the "ship off the land, and ran her for the beach."

(*Chairman.*) I may take the opportunity of observing, with reference to what you have been reading, they are, I understand, extracts from the *Shipping Gazettes?*

(*Dr. Cortis.*) Yes.

(*Chairman.*) What you have read, of course, is not from your own immediate knowledge. It is, therefore, merely a statement. If you wish it to be received as authentic evidence, your better plan will be to have the extracts made from the *Shipping Gazettes*, and to have the substance of the statements regularly deposed to before a magistrate, and sent up to our Secretary in London.

(*Dr. Cortis.*) I think that these reports prove that the statistics which were sent to the Commissioners from Filey were not without foundation. I further think that the wrecks on this part of the coast in that gale fully prove this position; namely, that a vessel just to the eastward of Flamborough Head, with the wind up east and by north, may not be able to weather Whitby, and therefore reach the Tees Bay. Neither can it be said, that, had there been any good harbour in Tees Bay, the case would have been altered by the laden ships bearing up sooner, or the light ones making sooner for a port; for all the captains' reports agree that the gale came on suddenly; in fact, the light ships were already making the best of their way down either to the the Tyne, Sunderland, or the Tees Bay when they were caught by the suddenness of the gale. Of course, I am aware that any one harbour on this line of coast cannot prevent the loss of every vessel; but these statistics tend to show that if only one harbour be constructed, and if that harbour be placed to the north of Whitby, a very great proportion of these wrecks will still take place. On the other hand, with a single harbour immediately at the end at Filey Bay, most of the wrecks would be prevented. It may undoubtedly occasionally occur that a vessel cannot reach Filey, being caught too far to the north by gales from the east-south-east; but this will be a much more rare case. As for the prospect of reaching a safe harbour as anchorage, they will persevere; and it will very seldom happen that a vessel will be caught so suddenly with a gale, and with so slight an offing, that she cannot reach this bay. I am not precisely aware of the exact way in which these statistics have been questioned, but I believe that the case of the *Duke*, of Lynn, was mentioned. I have a report from the captain of the *Duke*, of Lynn, here, and I beg to say that return was received by a highly respectable gentleman in Lynn. It was received in the presence of a witness, and it can be fully substantiated as being the report of the captain. The foregoing remarks refer to the case of colliers alone, as that of the vessels particularly requiring refuge; but there is another case entitled to consideration. I mean the Baltic traders. For these vessels bound for Hull, and the more southerly ports, the only place where you can provide a harbour of refuge is Filey Bay. I need hardly point out this to the Commissioners, as it is particularly notorious that with these traders bound from the Humber, Flamborough Head is usually the last land sighted, and it is the first made by vessels both bound for the Humber and more southern ports. The masters of these traders will tell you that a harbour down in the Tees Bay would really almost never be used by them. These ships are too large to be taken down into such a deep bight of shallow water, and they would still go to the Firth of Forth in preference when they were obliged to run north for shelter. Filey Bay would be similarly well situated for the trade from Archangel, and also from Hamburg for Hull. Again, for vessels coming through the Pentland Firth, and for Scotch traders, after passing the Farn Islands, the next land made is Flamborough Head, and for similar reasons Filey would be the best point where a refuge could be provided for them. But there is still another class of vessels which have hitherto been entirely left out of view in the consideration of this question. I allude to the fishing boats. Off this

FILEY.

Dr. Cortis.

25 Oct. 1858.

coast, to about 30 miles south and about 30 miles north of Flamborough Head, lies the fishing ground, upon which, for the greater part of the year, seldom less than 1,000 craft, each with a crew on the average of eight or nine men, are employed. When a gale springs up from the south and east all these boats which cannot reach the Humber, and consequently a very great number of them, have no harbour for which they can run, and are obliged to keep to sea until the gale is over. If they attempt to run during the gale for any of the ports on the coast, such as Whitby, Scarborough, or Bridlington, they are burnt off, as the signal that they cannot enter, and they must keep to sea until the gale is over. For these, again, Filey Bay is the most suitable site at which to provide a refuge; and upon this subject I may perhaps be allowed to take this opportunity of remarking, that not only do these losses actually take place, but the prosecution of the fishing is very much checked by the want of a harbour of refuge in this neighbourhood, for the fishermen are continually deterred from putting to sea in beautiful weather by the knowledge that if a storm does occur there is no port into which they can get. The produce of these fisheries probably reaches one million annually; and I feel satisfied that it would soon be doubled with the construction of a refuge harbour here. Flamborough Head is thus the joining point of the several different trades, and a source of danger to them all. Fortunately the means of remedying these dangers are alone at hand. At Filey you have a good bay, with sufficient depth of water and unrivalled holding ground. At present it is only open to six points of the compass, and with the materials on the spot for the construction of whatever artificial works are necessary to make this a complete harbour. In these local advantages we fearlessly challenge all rivals, so that in the important item of expense, whatever a harbour may cost here will be enormously increased—in some cases doubled—elsewhere. From the peculiar circumstances in which we are situated, we have not thought it advisable to offer you any engineering evidence. We have not the slightest alteration to propose in our plans or in our estimates, or, in fact, in anything connected with them. We are perfectly satisfied that they will stand any test which may be applied to them. I believe that at Hull you will hear some engineering evidence. The commercial people at Hull, and the people interested in the commerce of Hull, take considerable interest in this question, and the consulting engineer of the Dock Committee has been sent over to examine the spot; and I believe that his evidence, whatever it may be, will be laid before you when you get to Hull. There is no cause to fear for the maintenance of the harbour when made, as Filey Bay is not exposed to any action of silting. Now I am aware that this is a most important point; for I imagine that Her Majesty's Commissioners will hardly advise the expenditure of much money in the formation of a harbour here were that harbour likely to prove a mere sand-trap, and be filled up in a few years. I am also aware that it is a danger to which the harbours on this coast are very much exposed; but we think that in this place it will be impossible, for the following reasons, that any silting should take place:—Following out the line of the cliffs to the brigs, we find that this brig continues to run at the depth of 12 or 14 fathoms right across the bay to opposite Flamborough Head, presenting on its external face perpendicular scars, so that any sand in the bay might easily be shot out of the bay, and fall over those scars; and any silt travelling along the bay northwards and southwards by the tide would have great difficulty in getting above the face of the scar. When the soundings are examined carefully, the lead tells you that it dips sometimes 10 or 12 feet in a single fall. Again, looking at the places where the silting does take place, we can see some cause acting which is absent at Filey. For instance, Mr. Calver has proved, in his report to the Admiralty, dated the 31st of March 1855, that the whole of Hartlepool Bay, at a line from the Heugh to the Long Scar Rocks has silted up several feet, and gives as an explanation of the cause of the silting the existence of sand frontages north and south of the bay, and the quantity of alluvial matter brought down by the River Tees. Here we have rocks north and south, as well as in front of our bay, and no river to bring down alluvium. Again, it was given in evidence before the Parliamentary Committee that a considerable shoaling has taken place in Bridlington Bay, and from Bridlington along by Barmston Swards there is an enormous wasting of the coast annually to the extent of several acres. In a paper which was read at the meeting of the British Association in Hull it was stated that the whole of the coast line is thrown back two yards and a quarter annually —that is, the coast line south of Bridlington. It is possible that a considerable portion of this may have been deposited in Bridlington Bay. But here we have no such land waste. Further, were there any danger of silting we might expect to see indications of it against those Roman works, "the spitals," which run for some distance nearly parallel with the proposed breakwater; but here is nothing of the kind. It is important that here there is no such silting; because it has been given in evidence, and there is no doubt that it has been going on to a considerable extent in the bay of Hartlepool. In fact, during the last summer, one of the herring cobles, drawing less than two feet water, grounded on the bar at Old Hartlepool: and the men waded on the bar, and dragged their cobles over. I find that at high-water springs, in one instance at any rate, a vessel of 300 tons burden grounded in coming out of old Hartlepool, and was fairly dragged through the bar by the assistance of powerful steamers. Before concluding I wish to point out, what I cannot help thinking will not, under present circumstances especially, be considered irrelevant,—namely, that in drawing the plan of this harbour the point of national defence has not been neglected. It will be seen that this plan (*referring to the published plan in the Report of the Select Committee of the House of Commons*) will give 200 acres of completely sheltered area, with a depth of water sufficient for the largest ships in Her Majesty's Navy; and this space can be easily increased if considered necessary. It has already been given in evidence, by more than one naval officer, that a harbour between the Humber and the Firth, capable of accommodating Her Majesty's largest ships, is highly desirable. Now, gentlemen, where ought such a harbour to be placed? Surely not at the bottom of a deep bight in the rear of the coast to be defended. Whatever difference of opinion may exist as to whether the bottom of the bay, or one of its salient points, is the best position for a commercial refuge harbour, in a strategic point of view, I apprehend no such difference is possible. Here the mere question of 2*s.* or 3*s.* per ton less at which Her Majesty's ships can be supplied with coal cannot for an instant be allowed to stand against the advantages of such a position as ours — prominent for attacking the enemy and for defence, covering the whole coast seawards as far as the Wash, and westwards as far as the Firth of Forth. In the presence of such authorities as Her Majesty's Commissioners I touch upon this subject with deference, and shall merely point to the evidence of Admiral Ross in support of these views. I may yet remind you here, that the last attempt that was ever made by an enemy to intercept a Baltic fleet was made by his lying off Flamborough Head, proving that 80 years ago it was then notorious that Flamborough Head was the point at which the Baltic fleet made the land when homeward bound. I may also remark, that during the last war privateers were generally on this coast, for on two different occasions the inhabitants of Filey and the neighbourhood beat off the attacks of the enemey's privateers upon vessels which ran into this bay for shelter. In one instance, the volunteers turned out, and with the assistance of two field-pieces beat off the enemy. In another, some of

the inhabitants boarded one of the vessels which fortunately had a couple of small guns, and on that occasion also beat off the enemy.

(*Chairman.*) Will you hand in to the Secretary by and by a statement of the dates to which you refer, and also that of the occasion upon which an attempt was made to intercept a Baltic fleet—I suppose you mean a Baltic convoy ?

(*Dr. Cortis.*) Yes; I mean the action when Paul Jones fought his action off here, 80 years ago. In conclusion, I will merely point out that from the nature of the proposed works here, they would offer from the very commencement a very considerable protection to the vessels upon the coast, and therefore no time would be lost in accomplishing the desirable object which the Commissioners have in view. Before calling witnesses, may I put in a very important document, dated Bridlington Quay, 22d October 1858?

"We, the undersigned masters of vessels belonging to the ports of Ipswich, Sunderland, and the Forth, and elsewhere, do hereby declare that we are willing to make oath to such declaration, based upon the long experience some of us have had as masters and owners of vessels trading to and from the north-east coast of England, say, between the Firth of Forth and London, that, should a harbour of refuge be constructed, that harbour of refuge we most earnestly recommend should be constructed near Flamborough Head and in Filey Bay; the said bay not only being the most central place between the Firth and the Humber, but also the very best site which can be fixed upon for the saving most shipping in the winter season, and a very large amount of life and property. And, further, the undersigned, most of them, are at this time in Bridlington Harbour with damage and expense, which would not have occurred had there been a harbour of refuge in Filey Bay. We also declare that we can at no time trust to the holding of our anchors in Bridlington Bay, when the wind comes in from the eastward, or indeed when the wind is westerly.

(Signed by)

"John Cooke, master of the schooner *Enterprise*, of Ipswich, with 50 years' experience."

"Jas. White, *Favourite*, Ipswich, 18 years' experience."

"John Finch, schooner *Wave*, Maldon, 30 years' experience."

"Henry Turner, schooner *Britannia*, Colchester, 30 years' experience."

"Capt. Andrew Calder, brig *Pearl*."

"Capt. Joseph Collier, schooner *Spring*, Colchester, 10 years' experience."

"Capt. Alexander Johnson, master of the clipper *Maldon*, 30 years' experience."

"William Beaumont, 39 years' experience."

"James Beaumont, master of the *Samuel*, Ipswich, 20 years' experience."

"J. G. Cooper, master of the schooner *Salatia*, Yarmouth, 20 years' experience."

(*The document was put in.*)

These vessels were riding in the last gale; some of them were compelled to go into the harbour, and several of them received considerable damage. I have another letter from Capt. Randolph, of Her Majesty's ship *Cornwallis*, which is to the following effect:—

"Sir,—I regret much I was not in the way when you did me the honour of calling on board the *Cornwallis*, more especially as it happens that to see me was the principal object of your coming to Hull. I have to thank you for the pamphlet which you left explaining the views of the Committee which you represent. I cannot have any hesitation in saying that it, appears to me perfectly indisputable, in a nautical point of view, —and I take no other, either engineering or pecuniary —that a harbour of refuge at Filey would be more useful than one at any other point between the Humber and the Forth. I do not see why there should not be one especially for the benefit of the Tyne and Wear trade at Hartlepool. In adopting the arguments used in the address of your Committee, I believe, speaking from memory, it omits the most important circumstance, that ships might and would run for a spot upon the coast with bold and comparatively high land north and south of it, when they dare not do so for land of an opposite character, such as Hartlepool. Having stated my concurrence in your views, I regret that I shall be precluded from intruding my opinions on the Commissioners in any way, nor is it at all likely that they will ask for them.

"I am, your obedient servant,

"George Randolph."

22,275. (*Chairman.*) You reside at Filey, Dr. Cortis ?—I do.

22,276. How long have you been resident at Filey ? —Sixteen years.

22,277. You talked of the fishing boats belonging to Filey. Of what tonnage are they ?—Forty tons new measurement; about 60 old.

22,278. What number of that size are there belonging to the place ?—Twenty-five.

22,279. And therefore when you spoke of these fishing boats you referred to them in point of fact as being the same as vessels in the coasting trade; they are not boats, they are vessels ?—They are yawls.

22,280. What distance from Filey are the fishing grounds, and in what direction ?—The Doggerbank is the principal fishing ground, except the herring trade, which lies between the Doggerbank and the coast; sometimes close upon the coast, and sometimes further off at sea. It depends on circumstances; they seek the herrings all the way between the coast and the Doggerbank.

22,281. You cannot give the bearing and distance of the fishing ground. Shall we have fishermen who can do so, and do you prefer to refer me to them ?—Yes; the only thing which I wish to state is, that I believe this place is about opposite the centre of the Doggerbank.

22,282. (*Sir F. Smith.*) In the plan before us, I see that the east and west lines are stated to contain two and a half fathoms, and upwards of 685 acres ?—666 acres.

22,283. Can you tell me what extent of acreage there is in three fathoms ?—535 acres.

22,284. In five fathoms, five fathoms and upwards ? —204.

22,285. In four fathoms ?—It is not marked in four fathoms; but it would be something between the two.

22,286. You think about a mean between the two ? —I think so. I should think it would be perhaps nearer to 535 than to 204; but it would be somewhere between the two.

22,287. Is there any tendency to a movement of land along your bay ?—Not the slightest perceptible.

22,288. Filey Brigg is marked in the plan as terminating at the end of the line in a south-easterly direction. Does it terminate abruptly there ?—It gradually dips.

22,289. From that point it goes gradually into deeper water ?—Yes.

22,290. But does it turn out in the direction of the proposed breakwater ?—It tends a little more to the southward. The rocks and scars face north-east. Of course there is comparatively deep water at the back of those scars. The line of the breakwater is very much the same as that of the land. One fisherman tells me it goes to about half a mile or a mile outside Flamborough Head. If you take a point at that distance, and draw a line from there to the Brigg, you will then have got about the direction in which the rocks run under water.

22,291. You have reason to be sure that that is so ?—That is the information the fisherman gave me.

22,292. There has been nothing to determine that ? —Nothing but the Admiralty survey. The fishermen have been engaged sounding a little just to see the correctness, and to prepare themselves a little for examination before the Commissioners.

22,293. Have they had before them the Admiralty plan ? have they discovered any error in it, or any change in the soundings since that was made ?—

They have taken the soundings to the northward, and their soundings give rather more water than the Admiralty soundings.

22,294. Much more ?—Not very much more.

22,295. What is the greatest difference in any one case ?—Their soundings are taken at half flood ; they were taken upon the rock, and therefore any difference that has been found cannot be one of alteration in the bottom : it must be one arising from the difference between their soundings and the Admiralty soundings ; the bottom there being rock, it is impossible it can have altered. The soundings have been taken out in a line to the north, about east-north-east of the breakwater, and are more particularly taken for the purpose of ascertaining the facilities with which sailing directions might be laid down, by which vessels might feel their way from Filey Bay to the northward by means of the lead.

22,296. Did I understand you to say that Filey Brigg would intercept the movement of the sand along the coast ?—Yes.

22,297. You say there is none now moving in your own bay ?—None in our bay.

22,298. Is there any tendency to move beyond Filey Point ; is there any amount of sand coming from the north ?—There is a movement in Scarborough.

22,299. Is it moving towards Filey Brigg ?—The movement in Scarborough Bay is of a local character. The sand comes into Scarborough harbour. I believe at one period last winter there was less water than at any time before you have entered Scarborough harbour.

22,300. You think there is no movement of sand into your harbour ?—No.

22,301. There would be less chance when a breakwater was formed ?—I don't think it would make much difference. There would be this less tendency, that as the sand which exists in the bay seems to be formed by the striking of the wave upon the cliff, causing a little wearing away, and as that wave would then be kept off, I should apprehend there would be nothing else to cause a formation of sand.

22,302. Shall we have evidence before us to prove that the holding ground is good ?—I can give excellent evidence.

22,303. Also to show that it is free from rocky substances ?—Every witness that comes before you almost.

22,304. Also that there is no tendency to deposit : will there be evidence to that effect ?—The fishermen will give evidence to that effect.

22,305. Persons who have made it their study ?—Persons who have been sounding practically by means of lines all their lifetimes.

22,306. With regard to the materials of which the breakwater would be formed ; they will not be able to speak to that ?—No.

22,307. Can you speak to that ?—I can tell you that on the cliffs round to the north from Carnaze, there is stone which has been pronounced by different engineers to be of excellent quality. It is oolitic stone.

22,308. I believe that Filey Bay is midway between the Firth of Forth and the Thames, is it not ?—It will be about midway.

22,309. Is there any harbour of refuge properly so called between these two points ?—There is nothing but natural harbours, such as the Humber, Yarmouth Roads, and Harwich.

22,310. How is Filey situated for obtaining coals for the navy ; what is your nearest coalfield ?—They would be West Yorkshire and the north of England, which would be brought down by railway.

22,311. (*Mr. Lindsay.*) In your list of witnesses I suppose you have seafaring men who have been trading along the coast ; and I will therefore only ask you one or two questions. During the 16 years that you have been here, what is the greatest number of vessels that you have known to be anchored under Speeton Cliffs ?—I have sometimes endeavoured to count those dodging about the head, and sometimes got as far as 400, when I gave it up as useless, and could not count them at that distance. There was certainly more, but how many I can't say, under weigh and anchoring.

22,312. Were those vessels which were to the northward of the head ?—Yes ; under the head, and including vessels about to the westward; I include those anchored under Bempton and Speeton Cliffs, as well as those dodging just north of Flamborough Head.

22,313. How many vessels have you known on shore during the time you have been here between Flamborough Head and Filey Brigg ?—I can't speak to the number.

22,314. Twenty or 30 probably during 11 years ?—Yes.

22,315. Were there very many lives lost during that time ?—Two vessels were lost with all hands; but I am glad to say that our fishermen are always so ready to man the life-boat, and so dexterous in using her, that it is very seldom a loss of life occurs. One reason appears to be, that vessels here take the beach so easily. The beach is an excellent one for beaching upon.

22,316. Were those vessels which were lost with all hands driven on shore, or did they founder ?—They were driven on shore.

22,317. In what part were they wrecked ?—They were upon the Reighton Sands, near the Farm.

22,318. How long ago is that ?—It will be 10 or 12 years ago. They were two Scotch clippers.

22,319. Do you remember how the gale was ?—No, I don't.

22,320. (*Capt. Washington.*) How many lives did you say the life-boat had saved in Filey Bay ?—I can't tell the number. I have no idea of the number of lives she has saved, but a very great many ; the crews of almost all the ships that have come ashore. I may tell you, that before I came the life-boat took the crews out of 10 vessels. Thirteen came ashore in one day, and the life-boat took the crews out of 10. One had soldiers and soldiers' wives and their children on board, and there was not a single life lost. A man will be produced, John Ruddick, who was the master of the life-boat then, and was engaged on that day taking out the 10 crews without the loss of a single life.

22,321. Can you state the number of wrecks that have occurred in Filey Bay between Flamborough Head and Filey Brigg ?—During the time I have been here ?

22,322. Either that or during the last 10 years ?—I have not kept any record of them.

22,323. During the last five years is there a record ?—I have seen a list of wrecks here.

22,324. Does it give the total number in five years or from any period in which you have it drawn up ?—I can give you them from 1852 to 1857 inclusive. There were 14.

22,325. Between Flamborough Head and Filey Brigg ?—Yes. These are vessels that came ashore.

22,326. Do you know how many lives were lost out of those vessels ?—They were all saved. That does not include the vessels that foundered off Filey Bay ; it merely includes those that came on shore in the bay.

22,327. Have you a statement of those which foundered off Filey Bay, and could have come into refuge ?—Nothing but what the wreck chart shows.

22,328. In the printed return of wrecks are the columns headed rightly ?—The total and partial loss from collisions should be changed places. The printer has headed the columns wrong. He has transferred the figures.

22,329. Would it not be better to append that as a note to the bottom of the page ; otherwise your evidence and the return will be in contradiction ?—I have entered it in the report I was reading, and which I intended to have put in.

22,330. Taking the district of the coast between Flamborough Head and the Firth of Forth, only the

FILEY.

Dr. Cortis.

25 Oct. 1858.

Capt. Washington.

vessels caught in a south-easterly gale between Flamborough and Filey Brigg, that is, a distance of eight or ten miles, could have taken advantage of a refuge in Filey Bay ?—Do you mean with a wind at south-east ?

22,331. Thereabouts: from the south-east ?—They could not.

22,332. Did you not state that the south-east was the most dangerous wind that blew on this coast ?—No ; I was never asked such a question.

22,333. Is not the south-east wind the most dangerous on the coast ?—I don't think so.

22,334. Will you state what wind you think is the most dangerous ?—From about east and by south to east and by north. With a south-east wind a vessel can stand off the land on the starboard tack, and clear the land. It is not an embaying wind at all.

22,335. Do the vessels off Flamborough Head not bear up with a south-east wind ?—They sometimes attempt to ride with a south-east wind, if it is not very heavy. I have seen vessels riding this winter. There was one vessel rode this winter with the wind at south-east.

22,336. Where ?—Under Speeton Cliffs.

22,337. A single vessel ?—Only one. One vessel rode out the 7th of January gale under Speeton Cliffs from the south-east. They usually go away. Most of them will often go when the wind is about south-south-east. They will begin to go then.

22,338. What do you consider the most embaying wind on the coast ?—From east and by south to east and by north.

22,339. At that time it would only be vessels actually between Flamborough Head and Filey Brigg which could gain a refuge in Filey ?—That would depend upon the offing they have with the gale that we are speaking of. The 4th January 1857, one of the vessels that came ashore in Filey Bay, the *William IV.*, was caught off Flamborough Head. He stood to the north until he got off Whitby, when the wind came to east and by north, and he ran back, and came ashore in Filey Bay. I apprehend it will depend on what offing you have how far a ship can reach Filey Bay with the wind at east and by north.

22,340. What do you consider the most dangerous wind on this coast: east and by north ?—Yes ; or from east and by north to east and by south. A vessel will want but a very small offing if she can carry double-reefed topsails to reach Filey Bay even from Whitby.

22,341. I think you said, in answer to a question, that there is no accumulation of mud or silt in the bay ?—I did.

22,342. Is there any debris from the cliffs ?—Very little.

22,343. Do these cliffs wash down ?—Very little.

22,344. From the Reighton or Bempton Roads is there any drift ?—Very slight.

22,345. You do not know of any accumulations of sand under the Brigg ?—I know of none ; the fishermen do not report any. The fishermen do not report any : I have asked the question over and over again. I have asked it of the oldest fishermen in the place, and they all say, none. One or two of them say, "We believe there is more water in the bay than "there was when we were boys," but none have reported a diminution of it.

22,346. What number of vessels did you say you had seen under Filey Bay ?—I said I had sometimes counted until I had got to near 400, and then given over counting. They were not all at anchor.

22,347. I understand—dodging about ?—Yes ; dodging about and at anchor.

22,348. (*Capt. Sulivan.*) You have read many letters and put in many statements of men from different ports, commanding vessels, with reference to this place. Can you state whether all these men are perfectly independent of all local interest connected with Filey ?—The greater part of them were ; almost all of them, with one or two exceptions. I never had any communication with them, except seeing their reports in the papers of their vessels having been caught here. I wrote to ask them the circumstances under which they were caught, desiring them to express their opinions with respect to Filey Bay. I have the letters particularly from one man on the Tyne, whom I never saw in my life, and never had any communication with him except on this occasion. That man sends the names of five or six, six or eight other captains, who would be glad to come and depose that Filey Bay is the best place for a harbour of refuge ; but I never saw one of them in my life.

22,349. Are all these men, so far as you know, quite unconnected with the locality ?—Entirely unconnected with the locality ; and I may also state that I never received an answer from any sailor to whom I have written, unfavourable to the claims of Filey Bay.

22,350. Have these answers been given perfectly gratuitously, and independent of all local influence, only looking to the real merits of the case, so far as you know ?—Entirely so.

22,351. Can you tell me anything about that petition: how were all the signatures obtained to the petition ?—The petitions to Parliament ?

22,352. Yes ?—We obtained a good many in this way :—We had a petition drawn up, and sent a man down to the north with it. The men were so anxious to sign that many of them took printed copies, and sheets, saying, "If you will only give me copies, I know several captains who are on the river." They took them with them to Shields, and got them signed themselves.

22,353. You said that a harbour in Hartlepool Bay, in addition to one in Filey Bay, would also be desirable for vessels in the bay, or something to that effect?—One of the letters that I read said that there should be a harbour somewhere down in Hartlepool Bay.

22,354. I think in your statement I understood you to make some remark on Hartlepool Bay ?—I made the remark that one harbour would not save all ; but I did not say anything about Hartlepool.

22,355. I did not say Hartlepool, but in the bay ?—I said one harbour would not save all the vessels. I said that a second one would be required somewhere.

22,356. That is what I allude to. I fancied you said that that would be required more to leeward in the bay. Is that your opinion that that second harbour should be somewhere further in the bay ?—I have considered the question a good deal, and asked the opinions of sailors on that point. I have said, "It "is very evident that our own harbour will not save "every vessel upon the coast ; where do you think we "should have it for those cannot reach here?" The opinion has been either "Well-water Harbour at Red-"car," or else "Improve the entrances to the rivers "Tyne, Wear, and Tees." As I have said, the opinion of a landsman is worth nothing on this subject, and the opinions of sailors are very much divided.

22,357. I do not ask you any further on that point. Supposing the harbour at Redcar and one of the ports in the bay improved, is it your opinion that the harbour at Filey would more especially save life and property in laden vessels, and that the port in the bay or a harbour in the bay could more particularly save them in light vessels ?—That is just the case. But I wish to be particularly frank. Filey would not save vessels that are occasionally caught in this way. It occasionally happens that a vessel is caught short in such a position that she could not reach Filey Bay. A harbour down in the bight would save such a vessel, but the greatest majority of vessels would be able to reach Filey Bay.

22,358. Of laden vessels ?—Of laden vessels, and also a great number of light ones.

22,359. From your knowledge of this coast, do you know whether it is the case that the great loss of life occurs in laden vessels ?—I believe there cannot be a doubt of that.

22,360. You alluded to a number of vessels having

come into the bay. I think nine on one occasion, before you came here?—Thirteen.

22,361. Are those vessels generally got off again?—Almost always, unless they are very old things. One of these ships was dismasted when she came ashore; but I believe every one of these 13 vessels was got off.

22,362. Have you found laden vessels oftener become total wrecks than light ones?—Much more frequently.

22,363. Do you speak of that from your own knowledge?—Decidedly I can.

22,364. You say that 14 vessels have been lost in six years inclusive in Filey Bay. Under present circumstances would it be the case that a small number of those off Flamborough Head would be lost here in consequence of the endeavours to get back, and therefore many being lost to the northward of this port along the more rocky coast, would it therefore be the case, that, although a comparatively small number are lost in this immediate bay, that many more that were in the neighbourhood of the bay are lost in endeavouring to get back into some place of shelter, and are lost on the more rocky coast?—There is no doubt about that. We see them flying past here in gales of wind in great numbers constantly.

22,365. You spoke of 1,000 fishing vessels and boats within 30 miles north and south, but you gave me no idea about the places where they are principally stationed?—From the boats belonging to Staiths in the north, to Lowestoft, including Yarmouth.

22,366. I understood you within 30 miles?—I said "Engaged fishing within 30 miles north and south." The boats come from a distance to this fishing ground.

22,367. There are eastward of this coast about 1,000 boats gathered from different places?—Sometimes more. We have French and Dutch as well.

22,368. Do you include the small fishing cobles, or are they all sea-going fishing boats?—All sea-going fishing boats, yawls, and smacks.

22,369. (*Capt. Vetch.*) Supposing a south-easterly gale to come on when the vessels are sailing from the Firth of Forth, the Tyne, the Tees, and the Wear down to this part of the coast, how many vessels, that is, what proportion of the vessels, do you think this harbour at Filey, if it was constructed, would save?—I believe that as the greatest number of these vessels from the coal ports would, before the south-easterly gale came on, have got into the neighbourhood of Flamborough Head, that it would save the greatest part of them.

22,370. Supposing it is not so? supposing the gale came on when they had not reached there?—I do not think it is exactly a supposition, because we know it is a fact. We know that the vessels coming from the coal ports get to Flamborough Head, and cannot pass it. An accumulation of days, nay, of weeks, takes place there. I have seen them gradually accumulate for nearly six weeks, the vessels going out in the morning to try to get round Flamborough Head, and coming back at night, bringing up again to the north of the head. That has gone on for weeks, and in the meantime vessels keep coming up the coast as far as there, and do not get further south.

22,371. Do I understand you to say that vessels are never caught to the north of Flamborough head in a south-south-east gale?—I just now said "occasionally," but few would be so caught.

22,372. (*Chairman.*) You stated, Dr. Cortis, that to the best of your knowledge the opinions of these seafaring men were very much divided as to whether, supposing a harbour were made in Filey Bay, they would like to have one more, or whether they would like to improve the three ports. Have you any idea how the majority of opinions goes on that question?—I believe that if you could satisfy them in an engineering point of view that you could improve the ports so as to maintain a certain depth of water at their entrance, the majority would be in favour of improving the existing ports.

22,373. Then do I understand you that there is considerable doubt in the minds of these men as to the possibility of improving the three ports to the extent requisite?—They have great doubts about it.

22,374. Very great doubts?—Yes.

22,375. How is the opinion of the majority upon that point?—I should say that the opinion of the majority is, that you cannot do it.

22,376. (*Mr. Lindsay.*) You give in a return here of 32 vessels which were known to have been caught in the gale of the 4th January near Flamborough Head; but it does not show the position of any of these vessels. Are we to understand by this return that these vessels were all in such a position when they were caught by the gale that if there had been a harbour of refuge at Filey they could have found shelter in it?—Decidedly. That is my strong opinion.

22,377. Do you know the position that these vessels were in at the time they were caught by this gale, so as to be able to say that if a harbour had been constructed here they would all have been able to have fetched into it?—I do not know the position of each individual vessel, but I have the testimony of some of their captains that they were caught off Flamborough Head. The captains of the *Radcliffe* and of the *William IV.* described themselves as being in company with an immense fleet of vessels off Flamborough Head. Then you have these facts, that these vessels left the ports at the same time as the *Ratcliffe* and other ships. I know that the *William Alexander* had got considerably southward of the head. The *Amelia* was off the Head, and so were other vessels. I know by examining the returns that other vessels left the same ports at the same time and tide, and therefore it is probable they were in company with those named.

22,378. It is probable with some of them, but are you prepared to say that all those vessels when they were caught by the gale were in such a position that if a harbour of refuge had been made at Filey they would have been able to have taken it?—I apprehend there cannot be a doubt about it.

22,379. But you have no facts which are sufficient to warrant you in saying that the whole of them could have taken the harbour of refuge in Filey Bay if one had been there?—I should not like to state that every single vessel was so placed.

22,380. Then you do not know that?—I do not.

22,381. Then you cannot state it as a fact of your own knowledge that the whole of the 32 vessels which were caught in the gale were in a position that they could have taken refuge at Filey if a harbour had been constructed?—I should not like to pass my word that each identical vessel was in such a position that she could, because it is a serious thing to pass one's word for what you have no proof of; but I do feel perfectly convinced that every one of these vessels was in such a position that she could have got into Filey Bay.

22,382. You are aware of the fact that those you have named were in that position, but you are not aware of the others beyond merely supposing it?—Yes, with the grounds I have named for my opinions.

22,383. Referring to the statistics of wrecks, Table No. 1, which you have put in, are you aware of the fact that those 27 vessels named in it as having been lost between Flamborough Head and Whitby were lost during the gale at the places which you have specified in the return?—I have taken these facts from the *Shipping Gazette.*

22,384. You have made up your returns from the columns of the *Shipping Gazette*?—Principally from the columns of the *Shipping Gazette.* I have one or two vessels, about which I have private information, but the great majority of them I have taken from the columns of the *Shipping Gazette.*

22,385. The *Shipping Gazette* does not report the places where they were lost. Am I to understand from you that you have received from the masters of

FILEY.

Dr. Cortis.

25 Oct. 1858.

Mr. Lindsay.

these ships, or from other authentic authority, the places where these vessels were lost ?—Yes.

22,386. Then your return is made up from the lists which appeared in the *Shipping Gazette* and from authentic documents, either from the owners or masters of the ships ?—Not from the owners or masters.

22,387. What are the documents ?—I believe the *Shipping Gazette* contains every vessel, with one or two exceptions, I know of.

22,388. In any of the letters which you have read from the various masters of ships, or in any others which you state you have in your possession, and which we have to consider, did the masters of the ships make the statements voluntarily to you ?—I wrote to them by post to ask the questions which I have named to you, and by post I received their answers.

22,389. But they had no communication with you, or any party interested in the establishment of a harbour at Filey, until they were first communicated with ?—None whatever.

22,390. Have you kept a copy of the letter which you have sent to the masters ?—The substance of my letter is contained in the one which is put in evidence, for it contains the questions which I asked, and the captains' answers. My letter is very brief. It would be :—

" Dear Sir,—I see you lost your ship in such and such a gale, will you be good enough to tell me the circumstances under which she was lost, and how far a harbour of refuge at Filey would have prevented that loss."

22,391. That was the substance ?—Yes.

22,392. (*Capt. Washington.*) This printed return you have put in is not precise as to which part of Whitby Bay you mean. It would be better to define it exactly ?—I mean the whole of Whitby Sands, from Whitby Rock to the north of Whitby Sand inclusive. Kettleness Point bounds Whitby Bay to the north.

22,393. You say, in the return, between Flamborough Head and Whitby ; do you include the whole of Whitby Bay, as far as Sands' End Ness ?—Yes, the whole of Whitby Bay, as far as Sands' End Ness.

22,394. Other returns which we have seen have excluded the north of the entrance of the harbour apparently, and therefore that produces an appearance of discrepancy which might not exist. Then the wrecks north of Whitby, which we see here, are from Sands' End Ness north. The Return No. 2 should be, wrecks north of Sands' End Ness, Whitby. I wish to get it distinct, that there may be no question about whether other accounts do not concur with these.

22,395. (*Sir F. Smith.*) May I ask whether the letters written to every captain were identical ?—They were identical. I do not mean to say exactly word for word, but the substance was precisely the same.

22,396. The questions were all the same ?—All the same.

22,397. Will you put in a copy of the letter so far as you have got it ?—I doubt whether I have a copy, except what is contained in the letter of Captain Blakerstone.

22,398. Could not you obtain such a letter from one of the captains ?—I am afraid they will not have kept it for such a length of time. I had no idea of the letter being applied to such a purpose. I should think the captains do not generally keep letters; they will probably have destroyed it.

22,399. It would be very desirable that you should obtain it ?—I will endeavour to do so ; but I am afraid I cannot.

22,400. In any one case did the information you derived from the *Shipping Gazette* differ very much from that which you obtained from the captains or other sources ?—No, in no instance.

22,401. I see you call this return, " An Abstract of " Vessels wrecked on the 4th January 1857, known " to have been caught by the gales near Flamborough " Head." How are we to understand the word " near ?" What distance do you include in that word ?—Well, I should say Flamborough Head to, perhaps, Scarborough, or a little north of the Scar.

22,402. Within these limits—that is quite the extreme ?—If a vessel was caught south of Flamborough Head I should still include her if she was a few miles south, because in reality the case would be stronger.

22,403. I only want to know the limit, because the word " near " is very indefinite.

Mr. Alexander Curzon examined.

Mr. A. Curzon.

22,404. (*Chairman.*)—You reside at Lynn ?—Yes.

22,405. Were you ever at sea ?—I was bound apprentice in 1805.

22,406. During the period you were at sea for how many years did you command vessels ?—From between 1815 and 1816.

22,407. In what trade were the vessels generally employed that you commanded ?—Between London and Firth of Forth, Hamburg, Antwerp, and the north coast, twice to Lapland, generally out of the Channel, and one voyage to Gibraltar.

22,408. Generally foreign ?—Yes ; to those places that I have named just now.

22,409. Did you ever go north about through the Pentland Firth ?—Never.

22,410. To Archangel ?—No ; I have been to the north of the North Cape, but not to the White Sea.

22,411. To the Baltic ?—Never to the Baltic, but up to the Baltic.

22,412. How long have you been on shore ; how long have you left the sea ?—Well, three years ago on the 19th December I was riding in Yarmouth Roads with a very large fleet of ships in a gale of wind from the south-east, and——

22,413. How long have you given up the sea and come ashore ?—I am giving an answer to that question.

22,414. I only want the time and not the circumstances ?—Three years. I was then taken with an ague in my eye.

22,415. You are aware of the object of this inquiry ?—Yes.

22,416. Will you now give your opinion as to the advantage or necessity of one single harbour of refuge on this district of the coast, or whether you think that, with a view to the saving of life, it would be better to improve the Tyne, Tees, and Wear ?—My opinion is, that for the safety of life and property it is absolutely necessary that there should be a harbour of refuge about this locality ; but I am of opinion also that there should be a second harbour of refuge down somewhere in Tees bight.

22,417. Supposing that it is possible to improve the several harbours at the mouth of the Tyne, the Tees, and the Wear, so as to take in ships of from 16 ot 18 feet draught of water, would you still prefer one down in the bight to the improvements of these three ?—And not have a harbour of refuge at Filey at all ?

22,418. Supposing you have a harbour at Filey too ?—If there is a harbour at Filey, and the other harbours could be improved so as to admit vessels such as you have named, there might be no objection. But, for my own part, I rather fear that those harbours could not be improved. There are strong objections, I think, that may be brought against the harbours of the Tyne and Sunderland, in consequence of the heavy freshets coming down. They would, at all times of heavy rains and so forth, have a heavy sea on the bar with the wind at east ; and we should find it difficult for ships to steer. The consequence is, that innumerable accidents have in times past happened, and I rather fear that they would not be avoided in the future.

22,419. Supposing that could be avoided, the difficulties which you have named about the freshets and the want of water; should you prefer three to one in the bight of the bay?—I certainly should, if these difficulties could be entirely avoided, inasmuch as a larger extent of coast would be covered; but I do not think that any of these harbours, either the Tyne, Sunderland, or Hartlepool, would exactly meet the case of the emergency of vessels taken down in Tees Bay. I rather am inclined to think that a harbour somewhere about Redcar would save life and property better.

22,420. You talk of a harbour at Redcar, putting out of the question the difficulty of tides and freshets and circumstances of that kind. Redcar is not down in the bight; Teesmouth is down in the bight. Which would you prefer, Redcar or the Teesmouth?—Redcar is close down in Tees Bight, and the wind is always down there when the wind is from the east-north-east. It is down direct on there.

22,421. Looking at the chart, I have the Tees Bay bounded on the south by Redcar, and on the north by the Heugh of Hartlepool. Supposing a vessel to be embayed, disabled, and in distress between these two points, of what use would a harbour at Redcar be?—If the wind was from the north-east, it is down directly on the harbour of Redcar.

22,422. I am supposing the wind to be dead into the bay?—Dead into the bay, a ship could either take Hartlepool, if it was a harbour, or she would take Redcar.

22,423. Drawing a line from the Heugh of Hartlepool to Redcar Point, and supposing a vessel to be within that line, and to be disabled there with a wind dead in shore, how could she get into either Redcar or Hartlepool?—If the wind was from the north-east, she could.

22,424. I have not given you the wind from the north-east, but dead into the bay, whatever that may be. I do not care what quarter it is from?—If the wind is dead into the bay, if a vessel carries any canvas, she could either reach to the north for Hartlepool or direct for Redcar.

22,425. Supposing she could carry canvas with a heavy sea setting on shore, and under low canvas, and with a heavy gale, could she get into either Redcar or Hartlepool?—Yes.

22,426. How many points leeway would she make under close-reefed topsails and reefed canvas—a loaded ship under close-reefed topsails and reefed courses?—She would make perhaps $2\frac{1}{2}$ if heavy canvas was carried on her.

22,427. Not more than $2\frac{1}{2}$ with a heavy sea and a heavy gale blowing?—If there was a very heavy sea and wind. But she could make more than $2\frac{1}{2}$.

22,428. How many?—$3\frac{1}{2}$.

22,429. How many would a light ship make?—I should say she would go to leeward altogether; but the sea is so heavy down there at times that it is almost impossible to calculate exactly the leeway she would make, except one was on board the vessel.

22,430. (*Sir F. Smith.*) To what point in Tees Bay should you give the preference for a second harbour of refuge?—I should say take Redcar for the saving of life, but Hartlepool would be the best for an outlet for ships to come southwards afterwards. A harbour at Redcar would be a bad outlet to come south.

22,431. Taking all these circumstances into consideration, and supposing that the public funds could only be applied to make a harbour here, and in making a harbour to the northward, then what point would you select?—For the first harbour I should prefer Filey Bay. It is in my opinion the most advantageous point that could here be selected.

22,432. I assume that as a settled point. I want to know which of the points to the northward you would select, supposing you had but one now to make; where would you apply the public funds?—I would apply them down in the Tees bight.

22,433. Do you mean at Hartlepool?—Either at Hartlepool or Redcar; one or the other.

22,434. You consider Redcar as part of the bay?—Yes; as part of the bay.

22,435. Have you been much in the Tyne?—Yes.

22,436. Sufficient to enable you to give a strong opinion against its being made?—Yes; I have traded a great deal to the Tyne at all times. I have taken the Shields Bar under very varied circumstances.

22,437. Is Lynn much interested in this question: do you come at the desire of the shipowners of Lynn, or do you come from any other motives?—No; we were written to by the Chamber of Commerce at Hull to know whether we would come and give evidence upon the present question.

22,438. Then the Chamber of Commerce at Hull is interested?—I presume so.

22,439. Were you asked to come individually, or was any attempt made to get up evidence at Lynn?—No attempt whatever is made. A gentleman was written to upon the subject, and he applied to us individually. We who have come here have all come in the same manner. We know nothing of each other as witnesses, although undoubtedly we have a perfect knowledge of each other.

22,440. You have come here from pure motives of humanity?—Pure motives of disinterestedness; it does not matter to any one of us who have come here whether there is a harbour of refuge here or not as regards pecuniary matters, only as far as regards the safety of lives and property.

22,441. You feel no doubt that it is a great national question—the establishment of a harbour of refuge somewhere upon the exposed coast?—A very important one indeed, both to the naval and mercantile marine.

22,442. An imperative duty?—Yes.

22,443. And looking upon it as an imperative duty, you have no hesitation in saying that Filey Bay presents the greatest number of advantages?—Oh yes.

22,444. You have no doubt about it?—Not the least doubt on that subject whatever.

22,445. (*Mr. Lindsay.*) How many colliers have you at Lynn—that is, vessels trading from Lynn?—Our vessels have greatly diminished since the bringing of coal by railway. Our trade has fallen off considerably. The import was, I think, 240,000 tons annually; I think last year it was only 160,000.

22,446. From the northern ports, Newcastle, Shields, Blyth, Seaham, Sunderland, and Hartlepool?—Yes.

22,447. In coming along the coast, what is the usual track of colliers? What distance do they keep off the land, say between Whitby and Flamborough Head?—That will entirely depend upon circumstances when we leave the northern ports; how the wind is, what is the appearance of the sky, &c.

22,448. Say the wind is tending from the west off the land, what distance do you keep from the coast?—We should keep close in along the coast. If we were leaving Hartlepool, for example, we should keep close in to Whitby and come as close round as we could, so as to get the advantage of hugging up.

22,449. At what distance from the coast?—About three or four miles.

22,450. If the wind is tending from the east upon shore, what distance would you keep then?—Directly upon leaving Hartlepool we would steer out east and by south, or south-south-east, until we had got a little offing out of the bay.

22,451. At what distance would you aim to keep from the land then?—I should keep seven, eight, or ten miles, according to circumstances.

22,452. With the wind from the land, you would keep off from three to four miles?—Yes; but if the wind was off, and the weather fine, we should keep nearer in than then, say a couple of miles nearer, going in all the way along.

22,453. Then your answer is, that with the wind off you would keep from two to five miles off the land?—Yes.

22,454. Not less than two nor more than five?—Yes.

22,455. With the wind on the land, you would steer

FILEY.

Mr. A. Curzon.

25 Oct. 1858.

Mr. Lindsay.

a course of something from eight to ten miles from the shore ?—Quite so.

22,456. It was stated to us in evidence at Whitby, that considering the usual track of vessels, there was no wind which a vessel could weather away Filey Brigg with which she could not also weather away Flamborough Head. What do you say to that ?—Well, that depends entirely how the wind would be.

22,457. But the statement was that there was no wind. And it was stated to us by a sailor of experience, that there was no wind with which a vessel could weather Filey Brigg with which she could not also weather Flamborough Head ?—If a vessel was close in off Filey Brigg, and the wind was east and by north, blowing very fresh, we shall often make one and a half points leeway, and we should be on Speeton Cliffs.

22,458. That is hardly the question. Looking to the usual track which vessels take, and which you have given just now, are there any winds which would enable a ship to fetch into Filey Bay, but would not enable her to weather away Flamborough Head ?—Oh, certainly ; she might fetch perhaps rather within Filey Bay, and would not go further than Speeton Cliffs. If the wind was from the east she would only lie south-south-east from Filey Brigg, and she would go under the cliff, and would not go further.

22,459. With the wind east-south-east, that is, upon the land, the usual course, as you have told us, would be from eight to ten miles off the land ?—Yes.

22,460. Looking to a ship eight or ten miles off the land, tell me the winds with which she could weather away Filey Brigg and not weather away Flamborough Head. Ten miles from Scarborough we will take, for instance. Take your own time to answer it ?—Ten miles from Scarborough, with a wind south-south-east, she would lie somewhere in for Filey Bay, I think. I, perhaps, could not at the moment tell that, unless I had the position of the vessel placed exactly ; but I should say that 10 miles from Scarborough, with the wind east-south-east, she would come down into Filey Bay, but would not go round Flamborough Head.

22,461. Do you think vessels caught off Scarborough in the track of 10 miles from the land, caught with a gale at east-south-east could weather Filey Brigg when they could not weather Flamborough Head ? Is that your opinion ?—It is.

22,462. Did I understand you to say that if a second harbour was to be made you would give the preference to Redcar as a site over Hartlepool, or that you thought either site would be of equal value ?—Either site is of equal value. I think, perhaps, that Redcar would save more life than Hartlepool would ; but Hartlepool would be the best outlet for ships going to the south. The other would be down on a lee shore with the wind north-east.

22,463. The question is the saving of life and property. All things considered, and if the site for a second harbour rested between Redcar and Hartlepool Bay, which would you prefer ?—I think Redcar.

22,464. Have you often run for Hartlepool in an easterly gale ?—I have.

22,465. A great deal has been said about broken water along the head of the bay. Have you thought that you were in greater jeopardy in approaching Hartlepool Bay than you were outside ?—Yes; in going down into the bay, as soon as you get somewhere in the line with the Heugh, the sea becomes considerably broken, in a similar way to what it does in approaching Shields Bay. There the sea is low ; but as soon as you come on the bar it becomes broken. It is so to a certain extent at Hartlepool, though not to the full extent that it is at Shields.

22,466. Then off Shields have you found the broken water more dangerous than you have in Hartlepool Bay ?—Yes ; as the sea is heavier off Shields.

22,467. I am speaking, not of the usual sea, but of the broken water ?—Yes.

22,468. Then does that broken water off Hartlepool apply equally to other places ?—Yes, quite so. It does to Shields, and at Sunderland there is considerable broken water there too ; but the land being flat above, the broken water is really not so dangerous. You gradually go into the Bay ; but it is not so at Shields or Hartlepool.

22,469. Is there a greater sheet of broken water off Shields in an easterly gale—a sheet extending further off than what there is off Hartlepool ?—I think so ; the sea is heavier.

22,470. Have you in your experience known many ships capsized and foundered in this broken water ?—I never saw one do so myself. I had a brother-in-law that once took Shields during the war with a little vessel. They had gun ports ; stern chasers they used to have. The first sea struck her upon Shields Bar, took all the timbers abaft, and whipped the two guns upon the top of the tiller. The vessel hove across the sea unmanageable, of course, at once. The people took to the rigging. One of them, however, jumped down below, and got an axe. As soon as the man came up with the axe, another sea came, and shot him away, axe and all. He took to the rigging immediately. Presently the water coming off the axe a little, they saw the axe lying against the scuppers. One of the crew got down, seized it, and liberated the tiller just in time to get off the Herd Sand, and the ship got in safe.

22,471. Does the broken water extend a long way outside the bar ?—Only upon the bar. In extremely heavy gales I have seen it break into many fathoms, but only occasionally.

22,472. In what depth of water have you seen the sea break off Shields Bar ?—I cannot speak to that exactly.

22,473. (*Capt. Sulivan.*) You say you have seen the water break off Hartlepool in a line with the Heugh. I see there is about four fathoms just abreast of the Heugh going in. If a breakwater was made there at the five fathoms' line, with an entrance sufficient for ships to take in safety, either at either end or in the middle, should you have any fear of taking the breakwater in a gale of wind on account of the sea ?—No ; I have an opinion with reference to Hartlepool being made a harbour of refuge, that the bay would require to be enclosed entirely, say, that from the Heugh that long pier were run out to the Long Scars ; and then I think vessels might take it with comparative safety ; but still I have seen the sea breaking very heavily out beyond where you would possibly think of placing your breakwater.

22,474. With a harbour enclosed as you describe there could only be one entrance ?—Well, there might be two.

22,475. So you would prefer two ?—I think they would find it necessary perhaps to have one on the north-east side, and somewhere by the Long Scars.

22,476. If these entrances were at five fathoms dead low-water spring tides, do you think, generally speaking, there would be any fear of the largest loaded colliers taking them in safety ?—I think there would then be danger in their taking them from the heavy seas, but not from their striking.

22,477. You think there would be danger then with piers carried out to five fathoms' water ?—Yes ; the sea runs very cross in that bay. Whether it is the tide going out of the Tees going round the Heugh, or whatever cause, the seas run exceedingly cross in the Tees Bay down there.

22,478. You were asked about vessels not weathering Flamborough Head, and yet weathering Filey. You have heard the evidence that a large number of colliers collected about Flamborough Head—off the Head—in south-easterly winds ?—Yes.

22,479. Does your experience bear out the statement we heard from Dr. Cortis on that point, of the large numbers of colliers being caught by foul winds off or in the neighbourhood of Flamborough Head ?—I am only astonished, on having seen, and also heard from report, of the number of vessels which at times collect under Speeton Cliffs, or what they term get

into Filey Bay, how it is that, with such a number of vessels collected together there at different times, you have not a great deal more damage than you have.

22,480. Then you confirm the statement about the large numbers frequently collected there?—I have been bringing up myself when there have been from 100 to 150 sail of vessels. Only last spring—I have an interest in two vessels—one, the *Unanimity*, left the Tyne somewhere about February, and came out with a number of vessels, and just exactly reached Filey Bay or Speeton Cliffs; and another, the *Dove*, came up also out of Seaham, also with a large number of vessels, and reached up under here. Here they rode two or three days, I do not know exactly which, when the wind shifted from the south-south-west to south-south-east, and perhaps a little more easterly. The small vessel, the *Unanimity*, had to slip her anchor, and went away for Shields, and got in in safety. The *Dove* had to go off to sea, with several other vessels, before the storm came, running the risk of being run down at sea, and so forth. They drove back as far as Scarborough, when they up helm, and went away for the Firth of Forth. Both these vessels might have got into Filey Bay if there had been a harbour here. During the time the *Dove* was away the captain reports that he saw a vessel go down with all hands. He did not specify the particular place, but it was somewhere between here and the Tees.

22,481. Do you know of any other vessels under the same circumstances?—There were lots of other vessels here. Some went away to the Firth of Forth, and some of them took the harbours. The *Catherine Fraser* took the harbour at Hartlepool, and struck going in. The captain of the *Dove* would not go there, because he once had taken that harbour with a small vessel, and got on shore, and suffered damage which it cost 300*l.* to repair.

22,482. The large number of vessels which you have seen at anchor under the head are cases of vessels that have weathered Filey, but cannot weather Flamborough Head?—It happens very frequently that when the wind is from the south-south-east, blowing hard, we cannot beat up.

22,483. Are not all these cases of vessels that have weathered Filey but cannot weather Flamborough head?—Yes; or if they have weathered Flamborough Head they have thought proper to come back.

22,484. We were told by one witness that one advantage of Hartlepool over Filey was, that when the wind came to the north-east sufficient to start again, they could weather Flamborough Head from Hartlepool, when they could not from Filey; can you fancy any wind or any possible case in which that could occur?—Well, if I came out of Hartlepool I should like to steer east and by south, or east-south-east, to get a tolerable offing; and if I was in Filey Bay and wished to get out, I think coming out south-east and south-east and by east would soon take me round Flamborough Head.

22,485. Would it be a great advantage to loaded vessels that had to take refuge after being off Flamborough Head that they should have a port somewhere near the head, not only to save them from running back into the bay, but to give them such a much better start when the wind came fair for them to proceed on their voyage?—Oh yes; the most dangerous part of the passage would be over, and riding here they could at any time up anchor and go away.

22,486. Is it the case that when a vessel has got round Flamborough Head with a slant the worst part of the passage is over?—So far as the coast is concerned, because this is what we term an iron-bound coast, and has no place of refuge.

22,487. We were told by a witness of a northern port that he never slept comfortably until he had passed Flamborough Head, and got the harbour under his lee: is that in accordance with the general feeling of masters bound south?—I dare say that all participate in that feeling.

22,488. From your experience, is it the case that much the largest number of lives are lost in the laden colliers in proportion?—Yes.

22,489. Then you would look upon it as more particularly desirable that wherever a harbour of refuge was placed it should be for the advantage more particularly of the laden colliers?—I should say so, because now it, as it were, hangs like a dead weight on the mind of a man commanding a vessel drawing 14 or 15 feet of water, and about to leave any of the ports in the Tyne, the Wear, or Hartlepool, that he perfectly well knows that as soon as he is out at sea, come what weather there may, he has no place of refuge.

22,490. If a harbour were also constructed in the bight of the bay, would that be especially valuable for light colliers which, having come round Flamborough Head, have got into difficulties, not having tide enough to run for other ports?—It often happens that light colliers are put ashore in the spot I mentioned somewhere off Filey.

22,491. Would it not be the case that a harbour nearer Flamborough Head would be especially valuable for laden colliers, while one in the bight would be more valuable for light colliers?—For both Filey Bay would be equally valuable, for light and for loaded colliers.

22,492. Such light colliers as you described as being caught in the gale you mentioned south of Flamborough Head; but are not the large mass of colliers running to the last moment in the hope of reaching the ports, and therefore quite north of Filey? Would not a port in the bight of the bay be more valuable for all that class?—They are frequently not able to reach the bight of the bay.

22,493. In some cases we have evidence to that effect, but I am speaking of the large mass. I ask whether generally the vessels that would take the harbour at Hartlepool or Redcar would not be light colliers, with some laden ones which could not reach as far as Filey; while, on the other hand, Filey would take a larger number of laden, with some light ones that got into it before they got past? Would that generally be the result of harbours at those places?—Those that could not make the northern ports would readily take a harbour of refuge; the light colliers, if they could not get to landing ports, would take the harbour of refuge at Redcar, or wherever it was placed.

22,494. If you had your choice, looking only to the saving of life and property, and you had to choose between one very large harbour of seven or eight fathoms, at one point on the coast, or a more moderate harbour at two places, such as Hartlepool and Redcar or Filey, each large enough to take laden colliers at all times of the tide, by day and night, which would you prefer—two smaller harbours, in two places, or one large harbour at any place you might select?—The two smaller harbours would be the best, if they were equally accessible, because they would extend to a greater distance, and would have a better chance of saving life.

22,495. Have you ever taken the Tyne and Tees at high water?—I have taken the Tyne, but never the Tees, except with a pilot. I have taken other harbours without a pilot, under circumstances where no pilot could ever get off.

22,496. You are aware that they hope to get 15 feet at low water at the Tyne?—I am aware of that.

22,497. How far would that be safe for vessels to take in a gale of wind (from the experience you have had in taking it), say at half tide, which would be about the same water, or something near it, that vessels now have there?—If it is after heavy rains it would be attended with extreme danger, in consequence of freshets coming down so strong. Freshets out of the Tyne run immensely strong, the same as they do out of the Wear.

22,498. Is it not the case that in the case of easterly gales, which are those in which you most want refuge, the wind on the coast in a great measure dams up the current and reduces its strength?—It may to a cer-

FILEY.

Mr. A. Curzon.

25 Oct. 1858.

Capt. Sulivan.

tain extent; but I have known very heavy gales of wind from the east, with heavy freshets, that nothing would stand against—freshets that have been so strong that both ships and keels, and everything on the Wear, have driven out against the wind, and have quite jammed up the place.

22,499. We have it in evidence that one advantage of having a harbour of refuge at an established port is, that it would be much better for getting supplies, and that if a harbour was placed where there were no established docks, or port or trade, that vessels taking refuge would not obtain supplies; and that if a harbour were placed where there were no established docks, or port or trade, vessels taking refuge there would not obtain supplies of spars, anchors, and things of that kind, such as they require. From your knowledge of the trade generally, will you tell me whether you should fear that if a harbour was placed, say at Filey, and ships came in there damaged, and wanting anchors, sails, cables, rope, or other supplies that ships usually need, there would be any fear of the trade not supplying their demands in Filey when a demand occurs?—None whatever. The harbour of refuge would soon bring persons down that would keep all these articles.

22,500. You think a trade will always follow the demand, and supply all that is wanted?—Yes; and only be too ready to embrace such an opportunity.

22,501. (*Capt. Vetch.*) Do you consider that a harbour of refuge between Flamborough Head and Blyth harbour would be very necessary and useful in saving life and property?—I think one is absolutely necessary.

22,502. Where would you place that harbour?—At Filey.

22,503. And supposing that two harbours were to be constructed for the same object, where would you place the other one?—In the Tees bight.

22,504. Supposing these harbours to be made, which of the two would in your opinion secure the greatest number of vessels and save the greatest number of lives?—Filey.

22,505. (*Chairman.*) I think from the tenor of your evidence that you consider it hopeless, owing to the freshets and the difficulties of the tides, thoroughly to improve the Tyne, Tees, and Wear to any great extent as subsidiary harbours?—Yes, as places of perfect safety to take.

22,506. Therefore in your view a refuge harbour at Hartlepool which would not be at the entrance of the river, would be preferable, as not being exposed to the tides and freshets to the same extent?—Yes, as places of perfect safety to take.

22,507. You mention that you have been in the Tyne pretty often in bad weather, as I understood. Can you mention any instance in which you have been in danger of losing your life or your ship in doing so? I cannot perhaps recollect dates at this distance of time. I have taken these ports so many times that dates are of no consequence to me.

22,508. Without dates, could you refer to any incident, and tell us the circumstances of any case in which you nearly lost your life and your ship in running into any of these harbours?—I have been one of those fortunate men in one respect. I never met with any accident myself, but I have been very unfortunate in other respects, for I have had vessels that have been lost for me.

22,509. Could you give us the details of the circumstances under which any of your vessels have been lost in taking any of these bar harbours?—I have had a vessel ashore. The *Dove* got ashore in taking Hartlepool some time ago.

22,510. But Hartlepool is not a bar harbour. I am talking of bar harbours in the Tyne, the Tees, and the Wear?—I never had a ship which got ashore in going into these harbours of the Tyne or the Wear.

22,511. In your experience have you ever seen or heard of a man bearing up for the Tyne, and putting his crew into the rigging, except himself and the man at the helm, and running into that bay in a heavy gale of wind?—I can easily account for that.

22,512. Have you seen it done?—No; I have not been an eye-witness.

22,513. (*Mr. Lindsay.*) You put the position of a ship caught with an easterly gale, with a gale east-south-east off Scarborough at 10 miles distance, and you said that that ship could reach Filey when she might not be able to reach to weather away Flamborough Head, but could it be because that a ship in that position with a gale at east-south-east could reach Hartlepool?—She could go back to Hartlepool very well.

22,514. She could reach Hartlepool with as great facility as Filey?—In going to Filey with a wind in that way they would have to keep the vessel at the wind, and carry very small canvass in order to fetch Filey, whereas if they were going to Hartlepool they would only have to bear away before the wind.

22,515. Then she could fetch Hartlepool more easily than Filey?—Considerably so.

22,516. Supposing a vessel in that position caught with a gale at east and by north dead upon the land?—Then Filey would have the advantage precisely as Hartlepool would have when the wind was east-south-east.

22,517. Then in that position, right abreast of Scarborough, 10 miles distance, would she be able to weather away Flamborough Head?—She would go round the head if it was not too heavy, but if it was an extraordinary gale a prudent captain would in that case rather take Filey than proceed onward.

22,518. Do I understand you to say, that, as a general rule, caught with a gale in that position at east and by north which is dead upon the land, and, consequently, the most dangerous gale upon this coast—that, as a general rule, though a captain might prefer taking Filey, he would weather away Flamborough Head if he could reach Filey?—Yes; he could go round Flamborough Head if the wind was east and by north, if he could carry sail on the vessel.

22,519. (*Capt. Washington.*) Do shipowners like their captains to go into refuge harbours, and especially on the road, if they can help it?—If they can escape the gales thereby, and save the wear and tear, they are glad, but if some of their companions make their passage, the one that has taken the harbour would get frowned upon sadly.

22,520. We have been speaking a good deal of a fleet of ships under Flamborough Head. Supposing the wind southerned upon them, they must go off; when the wind gets to south-east they must go off shore?—Yes.

22,521. Would they at once bear up for a refuge harbour, or thrash against it for some time, trying to get round Flamborough Head?—There would be no object to accomplish with the wind in that direction, even to get round Flamborough Head, because they could not make the passage, and, therefore, they would take the harbour of refuge immediately.

22,522. But, once round Flamborough Head, have they not the whole of the sea that they can work in? Have they anything nearer the lee than the Humber, and have not they that in any danger they will be able to run for the Humber?—It will depend entirely upon the wind.

22,523. When the wind comes south-east does not it often get a little more to the eastward?—Yes.

22,524. They would still struggle against that?—If they had once made the attempt, and got off to sea; but if there was a harbour at Filey they would never make that attempt.

22,525. That is just what I am asking; you think masters would be able to excuse themselves for going into a port under those circumstances?—Oh yes; they would be justified even by the owners in taking a harbour of refuge under such circumstances. The risk is increased so immensely by the steam vessels upon this coast that we are very glad in dark nights to get out of the way of the usual track.

22,526. (*Capt. Sulivan.*) Is it not the case that in the north and north-east winds a large number of light vessels congregrate in Bridlington Bay ?—Yes.

22,527. Then if laden vessels on the north side are similarly situated with north-east winds, are they not equally likely to get into an anchorage that will shelter them from these winds, if they have one ?—Yes, certainly they are.

22,528. Then from the fact of thousands of vessels anchoring on the south coast of the head rather than thrash about, and proceeding northward is not equally likely that if shelter is provided the laden vessels which congregate on the north side will make use of it in south-easterly gales ?—Yes, that is certainly conclusive enough.

22,529. (*Chairman.*) Have you any information whereby you can confirm or confute the correctness of the statement concerning *Duke*, of Lynn, in the printed statistics ?—No, I have nothing.

Mr. GEORGE JENKINSON examined.

22,530. (*Chairman.*) You are a fisherman ?—Yes.

22,531. And reside at Filey ?—Yes.

22,532. How many years have you followed that occupation ?—Fifty.

22,533. What is the size of the boat you fish from ?—Nearly 36 tons, new measurement.

22,534. How many hands have you on board ?—Ten.

22,535. What is the bearing and distance of the fishing ground from Filey ? As it may vary at different times of the year, and according to the nature of the fishing, just go through them all ?—We sometimes steer away east-north-east, other times east and by north, other times east and east-south-east as far as south-east ; sometimes we go off 20 miles, sometimes 30, and sometimes 40, as far as 50 miles ; we have been going off lately as far as 80 miles.

22,536. Your boats, what you call fishing boats, are in fact small vessels ; decked vessels ?—Yes.

22,537. And good sized boats ?—Very good sized boats.

22,538. I suppose you can keep the sea in any weather in which a small coasting vessel can do it ?—Yes, perhaps better than the generality of them.

22,539. Certainly better than laden coasting vessels?—Yes; a great deal.

22,540. You make much better weather than a laden collier ?—Oh yes ; unless she be a very large one.

22,541. Even if the collier is very large and very deep, do not you make better weather than a deep collier ?—Oh yes.

22,542. When it comes on a breeze of wind on shore, and you are 30 or 40 miles off shore, do you run for a harbour or keep the sea ?—We run for the Humber if we can possibly get there.

22,543. What water does your vessel draw ?—seven feet.

22,544. Besides the Humber, what other place can you run for ?—If the wind is anywhere from the north, round for Bridlington Bay.

22,545. Is there anywhere else you can run for ?—If the sea is not very bad we can run for Scarborough harbour.

22,546. Can you get into Scarborough harbour at all times of the tide ?—No.

22,547. At what times ?—First quarter flood if the weather is not very heavy.

22,548. Do you ever run for Whitby ?—Never so far north. No, we dare not go to Whitby.

22,549. (*Sir F. Smith.*) Would a harbour at Filey be of great use to you ?—Oh yes, of very great service.

22,550. In what respect ?—The first thing, many a time we dare not put to sea, being frightened of a gale coming from east-north-east or east-south-east, right upon the shore, anywhere from that quarter ; frightened we cannot get back into the harbour again, but be obliged to keep to sea.

22,551. You lose many opportunities of fishing for want of a harbour here ?—Yes.

22,552. Is there any point in the offing from which you can weather Filey Brigg, but cannot weather Flamborough Head ?—No ; if we can weather Filey Brigg anywhere with the wind from the east we can always weather Flamborough Head.

22,553. Do you know whether this bay silts up at all ?—Oh no, it never silts up, never since I can tell ; I think there is rather deeper water.

22,554. What reason have you to think so ?—We always find more water now down against the Brigg than ever we did before.

22,555. There is no sand comes round the Brigg, is there ?—Oh no, it cannot get round the Brigg.

22,556. What is the total length of the Brigg ?—I am sure I cannot tell that ; I never measured it.

22,557. (*Mr. Lindsay.*) You said that you had fished about 20 miles from this place many times ?—Yes, twenty.

22,558. What is the greatest distance to the fishing ground ?—Forty miles off.

22,559. You fish between 20 and 40 miles off ?—Yes.

22,560. That is about the distance ?—Yes.

22,561. Say, you were caught with a gale from east-north-east, could you fetch the Humber ?—Oh yes.

22,562. If it was east-south-east could you fetch the Humber ?—Yes.

22,563. Then you can fetch the Humber from your fishing ground in all the dangerous gales on the coast, and it is good anchorage, is it not ?—Oh yes, the Humber is good anchorage.

22,564. Then would a harbour at Filey be of great value in those most dangerous gales ?—Oh yes.

22,565. How so ?—Because in about five hours we could be in harbour at Filey, and perhaps we have to run 10 to get tothe Humber.

22,566. That is on account of the distance ?—Yes.

22,567. (*Capt. Washington.*) How many yawls fish out of Filey ?—Twenty-four.

22,568. From the coast just to the north and south of Filey ?—I do not know exactly ; I should think there would be 60.

22,569. Does a very large fleet of yawls come to to the Doggerbank ?—Yes.

22,570. Where do they come from ?—From Yarmouth, Lowestoft, Staiths, Runswick, Scarborough, Filey, Flamborough, all the way along the coast. And, besides that, we have Frenchmen and Dutchmen without number.

22,571. Altogether 1,000 vessels perhaps ?—I should think 1,300 or 1,400 altogether.

22,572. In case of a gale obliging them to run, where do they all go to ?—The Frenchmen keep the sea and the Englishmen run for the Humber ; that is the principal place. We have no spot unless we can get into one of the places before the sea gets heavy, or else keep the sea.

22,573. Do you go right off to the Doggerbank ?—Right off to the north-east corner.

22,574. What distance is that from Filey ?—I am no scholar, I do not know.

22,575. Fifty or sixty miles ?—It will be sixty miles.

22,576. What is the least water you ever get on the Doggerbank ?—Eleven fathoms. I have heard of boats being in seven or eight, but I never experienced that.

22,577. (*Capt. Sulivan.*) You said that with east-north-east round to east-south-east gales the boats could take the Humber ?—Yes.

22,578. If you were on the Doggerbank, and it was blowing a gale from south-east to east-south-east,

FILEY.

Mr. G. Jenkinson.

25 Oct. 1858.

Capt. Sulivan.

could you fetch the Humber then ?—We can, with the wind to the south-east.

22,579. You would be very close in the wind to fetch it ?—Not so very close, but we can fetch it.

22,580. If you were on the south part of the Dogger, what would you do ?—If on the north-west part of the Dogger we could fetch the Humber. Anywhere from the Dogger with the wind to south-east.

22,581. With gales from south-south-east and southerly, where do you go to ?—Under the head under Speeton Cliffs.

22,582. You said French boats kept the sea; are they much larger than yours ?—Yes.

22,583. Decked vessels ?—Oh yes, very large boats. I have seen some of the French luggers carry upwards of 30 men.

22,584. Are all your boats decked ?—Yes.

22,585. From stem to stern ?—Yes.

22,586. (*Capt. Vetch.*) I wish to ask whether you ever run to Bridlington Bay for shelter on those occasions ?—Many do run for Bridlington Bay.

22,587. Do you find that a very convenient place ?—Yes, with the wind from the north.

22,588. How many fishing boats have you seen there at a time ?—I should say 30 or 40 at a time ; but I never counted them.

22,589. (*Chairman.*) What is the largest number of vessels you have ever seen brought up in Filey Bay ?—I have known upwards of 700.

22,590. On what occasion ?—With the wind from southward.

22,591. But when ?—I cannot tell the date of the year. I never expected I should have that to answer any more.

22,592. Was it a long time ago ?—Yes, it was a good bit ago ; 30 years ago or more.

22,593. Was it during the last French war ?—Oh, was since then.

22,594. After the peace ?—Yes.

22,595. Then those 750 vessels were not a convoy ?—No, not convoys ; brought up.

22,596. Just vessels that came in and brought up ?—Yes, gathered up by laying there so long.

22,597. Have you seen many vessels come on shore from under Speeton Cliffs ?—No ; but I saw one at that time which came ashore here. She was amongst that fleet, and could not find a place to anchor.

22,598. It was so crowded ?—Yes ; and she was driven down to Scotland, caught in a gale of wind from away north-east, and was driven ashore here, and lost.

22,599. How do you know she was driven to Scotland ?—Because the master told me.

22,600. Can you give the name ?—The *Old Friendship*, of Yarmouth.

22,601. And the name of the master ?—No ; but I can name the mate.

22,602. What was his name ?—Taylor.

22,603. Can you remember any other occasion of a fleet being caught there and vessels wrecked ?—I can remember one going down under Speeton Cliffs, in Filey Bay.

22,604. What was her name ?—The *Commerce*.

22,605. Were the people lost ?—No; all hands were saved.

22,606. Can you give me any other occasions on which vessels have come on shore ?—I saw a Scotch ship come on shore, and all hands perished ; if there had been a harbour it would have been saved.

22,607. Do you know her name ?—No.

22,608. How long ago was that ?—I suppose about five or six years ; I cannot exactly say.

22,609. (*Mr. Lindsay.*) When you say that you have seen 700 vessels anchored in Filey Bay, you mean in that bight under Speeton Cliff and all along ?—Oh yes ; all for shelter ; all right up.

22,610. You do not mean Filey Bay proper ; you mean between Filey Bay and Flamborough Head ?—Yes, between Filey Bay and Flamborough Head, riding and dodging about, gillying about backwards and forwards. I once saw 13 come ashore here.

22,611. When was that ?—I do not know the date of the year.

22,612. In one gale ?—They were all light ships that weathered Flamborough Head and came in here.

22,613. Do you remember how the gale was blowing ?—About east ; east and by north, and that way. I do not know to a point.

22,614. Where did they come on shore ?—Between Speeton Cliff and Filey.

22,615. Were there a great many of them within Filey Bay ?—Yes.

22,616. (*Capt. Sulivan.*) Were those all vessels down from the south ?—Yes.

22,617. That had weathered the head and were driven in here ?—That had weathered the head and were driven in here.

22,618. Did some run to the beach and save themselves ?—They all ran on the beach ; 13.

22,619. Was it impossible for them to weather the land to the westward ?—Oh, yes ; impossible.

22,620. Or to weather Flamborough Head and go away south ?—They were really embayed ; they could not get anywhere else but here, or run among the rocks, which they liked. They might have been on shore rather further to the southward, or rather further to the northward.

Mr. Thomas Cammish examined.

Mr. T. Cammish.

22,621. (*Chairman.*) You reside at Filey ?—Yes.

22,622. You follow fishing ?—Yes.

22,623. How long have you followed that occupation ?—About 28 years.

22,624. What is the size and rig of the vessel you command ?—A yawl.

22,625. The size ?—Thirty-six tons.

22,626. Did you hear the evidence of the previous witness ?—Yes.

22,627. Was his description of the fishing ground correct ?—Why, we have gone further than what he has said at times. Further than 80 miles I have myself.

22,628. Do you agree with him as to being generally able if a gale of wind comes in on shore to run either into Scarborough or to the Humber ?—Upon all but one thing.

22,629. Tell us what that one thing is ?—When the wind is to the south-east they cannot get to the harbour,—not to Filey.

22,630. If you could get a harbour at Filey with the wind at south-east, could you not get a harbour at Scarborough, which is to leeward ?—Yes ; but at neap tide there is not room for us all to enter.

22,631. You cannot get in ?—No.

22,632. At what period of the flood can you get in at neap tide ?—At the top, high water.

22,633. Can you not get in sooner ?—Not at neap tides.

22,634. How many days in the month would you be disposed to say that you do not find shelter in Scarborough on account of want of water ?—About two days in every fortnight.

22,635. But at other times you can always get in at quarter flood ?—Well, you can get in at quarter flood at neap tides, but at spring tides the water is too low.

22,636. At neap tides you can always get in at quarter flood ?—Yes ; so far we cannot get right in ; we just come to the entrance.

22,637. Can you get shelter from a breeze of wind ?—There are so many craft that you could not always get shelter.

22,638. The harbour is too small for the number of craft that run there ?—Yes.

22,639. Supposing Scarborough is shut, is there any place to leeward you can run to ?—There is no place we should choose to take.

22,640. But is there any place you could run for if you chose ?—We would rather keep to sea.

22,641. Your boats are fine sea boats ?—Yes.

22,642. Have you ever known any founder at sea in a gale ?—Yes ; I knew my father lost in 1854.

22,643. Do you know of any other instance ?—Yes; my three brothers were lost at Scarborough in the same gale.

22,644. Within your 28 years' experience, how many of the fishing boats have foundered at sea from stress of weather ?—I do not remember. My mind does not comprehend it.

22,645. Will you endeavour to recollect ; I wish to know ?—I cannot remember all those that foundered at sea. I can remember three in that gale.

22,646. Will you, when you go home, think the matter over, and give Dr. Cortis a statement on paper, with your name signed, in the course of the next three or four weeks, putting down the number of those fishing smacks that have foundered at sea within your knowledge ?—Yes.

22,647. (*Mr. Lindsay.*) You mentioned a case in which your father was unfortunately lost in a boat that foundered at sea ?—Yes.

22,648. Would a harbour of refuge have saved those two cases ?—A harbour of refuge would have saved my father, because he was in that bay, and had to put to sea. She was lost next day. He would not have gone off if there had been a harbour of refuge. It was blowing a gale of wind when he was obliged to go out.

22,649. Where was he laying ? — He was in the bay, somewhere about where the boats were yesterday, at the north end of the village.

22,650. He was obliged to put to sea on account of having no shelter ?—Yes, and consequently was lost the next day.

22,651. Have you seen many ships at anchor in the bight of the bay ?—I have seen 300.

22,652. Have you known cases in which they were obliged to slip, and run ?—Many. I have often got their anchors.

22,653. (*Capt. Sulivan.*) You said that with south-east gales the boats ran for Scarborough. Such a wind is right into the entrance of Scarborough harbour, is it not ?—We have been obliged to do so when we have had no other places.

22,654. Is not a south-east gale directly into the entrance of Scarborough harbour ?—Yes ; but there is a little shelter, because of the south cliffs.

22,655. The entrance of the pier where the boats would have to round the outside would be right in a heavy sea in a south-east gale, would it not ?—Those piers fetch near about north-north-east.

22,656. Is a boat running for those piers with a south-east wind exposed to a very heavy sea ?—Yes, right before it.

22,657. In such shallow water is not the sea breaking outside ?—Yes.

22,658. Is it not very dangerous for boats of that size to attempt in that sea to round too, and enter Scarborough harbour, even if there is room ?—If they see it is too dangerous, they generally kindle a fire on the top of the castle ; and when we see it we put our boats to sea again.

22,659. I am speaking of south-east gales, and I want to know whether it is not very dangerous for hundreds of boats running to the entrance of the harbour in such gales ?—Yes ; if those on shore see that it is too heavy they light a fire, and we are what we call burnt off, and put our boats to sea again.

22,660. Then even if it would hold all the boats, Scarborough is no harbour of refuge for fishing boats in a south-east gale ?—No.

22,661. How many boats have you known running for the Humber at a time ?—Hundreds. A couple of hundred, I should say: Yarmouth and north country boats and others.

22,662. How many men ?—We carry 10.

22,663. Would a couple of hundred boats have a couple of thousand men ?—They would average 10 a piece.

22,664. They would average 10 a piece ?—Yes.

22,665. Did you hear what the last witness said about the bay silting up, and there being deeper water now near the brigg. Have you found that ?—Yes, it is deeper.

22,666. Is it close to the brigg ?—At the back side.

22,667. Have you known any alteration within your experience as a fisherman ?—If there is any alteration, I think it is better now than ever I knew it.

22,668. Whereabouts ?—Close to the brigg, and round about the back of the Speeton cliffs.

22,669. (*Chairman.*) Can you state any instance in which you have been nearly lost yourself for want of a place to run to ?—I can state one.

22,670. Will you do it ?—It was in March. I was off here when I was borne off with the violence of the gale, and lost my mainsail and nearly all I had. My father was lost in November, and this was in the spring of the year, in the month of March, in the year 1855. We were borne off with a very violent sea breaking on us. We thought we would keep at sea. We were driven a good bit north, and lost some of our men. The first land we sighted was the Speeton Cliff, about a mile from it, thick with snow, with the wind about east and by north. With great difficulty we got round the head, and then kept to sea. We durst not attempt to take the Humber, night coming on, and it being thick with snow. If there had been a harbour of refuge at Filey, we could have got in with safety.

22,671. It was all you could do to weather the head ?—Just so.

22,672. If you had not weathered it, what would you have done ?—We should have tried to 'bout ship, and to go on the other tack ; but there would have been great danger. There were hundreds of seas breaking that would have smothered us ; but Providence ordered it differently.

22,673. Any other instance ?—No ; I have been in the life-boat several times assisting men.

22,674. How many men have you assisted to save out of vessels ?—I cannot tell ; a great many.

22,675. How many vessels should you say ?—I should say 20.

22,676. And five or six men out of each ?—About that perhaps.

22,677. On the average, taking one vessel with another ?—Yes ; I remember once having very hard toil to save a crew ; that was from the *Medusa*. There was a boy lost at sea. We were 13 or 14 hours at work with the life-boat.

Mr. Benjamin Simpson examined.

22,678. (*Chairman.*) You live at Filey ?—Yes.

22,679. You follow the fishing ?—Yes.

22,680. How many years have you been at it ?—About 28.

22,681. You have a vessel of your own ?—Yes.

22,682. What size is she ?—Thirty-nine tons.

22,683. A decked vessel ?—Yes.

22,684. A good sea boat ?—Yes.

22,685. Have you heard the evidence of the previous witnesses as to the bearing and distance of the fishing ground ?—Yes.

22,686. It is correct ?—Yes, I think it is.

22,687. You agree with them ?—Yes ; on one point I don't.

21,688. State any point on which you differ from them ?—They said that with the wind at south-east, or about that, they would fetch a vessel from Dogger Bank. A vessel won't fetch it.

22,689. What is the largest number of vessels you have seen anchored in Filey Bay and its neighbourhood at one time ?—200 or 300.

22,690. Has it ever happened to you to be in risk

FILEY.

Mr. B. Simpson.

25 Oct. 1858.

Chairman.

of your life from having no place to run to ?—Several times.

22,691. Will you give me an instance of that ?—In 1844 I was fishing off the Doggerbank, on the 23d of February, the wind about south and by east, blowing heavy. I wanted to get into the Humber, but could not yet, so I bore down into Filey about 11 o'clock at night. About five o'clock in the morning the wind dropped round to east by north, blowing heavy. With great difficulty we had to get the anchor ; and I put out of the bay, and bore away for Scarborough. I fell in company with other two boats, one belonging to Filey and the other to Scarborough. The Scarborough boat was a little a-head of us. The sea took her as she tried to make the pier, and capsized her just like a dish. I saw that if we persisted in the same track that she was going we should be worse, so I put the tiller a-weather, and ran her on shore. The other boat, close behind us, was capsized too.

22,692. Was your boat saved ?—It was.

22,693. Was she much damaged ?—Not a great deal.

22,694. If the other two boats had taken the beach as you did would they have been saved ?—The first would ; the last could not have got upon the sands ; it would have been rocks.

22,695. What became of the men ?—The vessels that were capsized drowned all hands.

22,696. The first could have taken the sands ?—Yes ; but in rounding the pier head the sea capsized her.

22,697. Do you confirm the statement of the witness just before you, that Scarborough is no place for fishing boats to run to in heavy southeast gales ?—No place at all ; it is not worth running for.

22,698. Blowing hard from east-south-east, will it do ?—No ; no good either.

22,699. East ?—No.

22,700. East-south-east ?—No.

22,701. What is it good for ?—It will do with a northerly wind.

22,702. Only with a northerly wind ? — And the wind away from south-south-west.

22,703. How far round to the eastward is there anything to be made at Scarborough ?—I once went in myself with the wind at east-north-east. It will be about four years since. The people on shore never thought she would bring us in at all.

22,704. How would north-east do ?—There would be shelter as soon as you rounded the castle.

22,705. Would it be difficult to get in ?—Not very, if it was a flood tide.

Mr. John Paul examined.

Mr. J. Paul.

22,706. (*Chairman.*) You reside at Lynn ?—Yes.

22,707. How many years did you follow the sea ?—I was bound apprentice in 1804.

22,708. How long is it since you have come on shore for good ?—Two years.

22,709. How many years were you in command of vessels ?—Forty-two.

22,710. In what trade were the vessels chiefly employed which you commanded ?—Chiefly on the east coast of England.

22,711. How far north ?—From the Firth of Forth to London.

22,712. What size and description of vessels were yours generally ?—Small vessels, from 113 to 114 tons.

22,713. Smacks or schooners ?—Brigs and schooners.

22,714. You have been present during the inquiry to-day ?—Yes.

22,715. Therefore you are aware of the objects of it ?—Yes.

22,716. Will you give me your opinion as to the necessity or advantage of a harbour of refuge in Filey Bay ; and also state what you think of the improvement of the three ports, the Tyne, the Tees, and the Wear ?—It is my impression that one at Filey Bay would serve a very great purpose, although it would not save all ; but there is many a time that I should have been very glad to have had a harbour under my lee here where I could have gone, instead of going to Scarborough. I have borne away and gone to Scarborough with a small vessel, but it was no place to go to when you got there. Bridlington Bay was no place to go to ; but if there had been a harbour of refuge at Filey I would many a time have taken it. If there was not, with loaded ships we were obliged to go to the Tyne. For the greater part of my time there was no other harbour. Hartlepool was not made.

22,717. Suppose a harbour was to be made at Filey, and something else was to be done farther north, would you rather endeavour to improve the three ports, the Tyne, the Tees, and the Wear ; or would you make one harbour (which would not be a bar harbour) at Hartlepool ?—I should say one harbour in the bight of the Tees.

22,718. Why do you say so ?—Because I consider that these bar harbours about the Tyne and the Wear are so constructed that when the freshets come down vessels are not safe when they get below the fresh and salt water. I have frequently seen vessels turn quite round in spite of you.

22,719. Have you ever run into the Tyne in a gale of wind against a strong freshet ?—I have run in there. There has not been that strong freshet at the time perhaps which there has been afterwards and before. Indeed, I once took the Wear when it was blowing very hard. We got between the piers, and were driven out by a freshet, and obliged to go to sea again.

22,720. Do you recollect how the wind was ?—Right in.

22,721. What was the time of tide on that occasion ?—About half flood, or a little better.

22,722. What description of vessel was she ?—A brig.

22,723. What sails had you set ?— We had all the sails we could set on account of the wind.

22,724. What were they ?— Double-reefed topsail.

22,725. And foresail ?—Yes.

22,726. Nothing else ?—Nothing else.

22,727. It was blowing a heavy gale of wind ?—Yes, blowing very strong. I have been in a great deal heavier gale, but it was blowing strong. But the freshet was so powerful we could not go in.

22,728. Had you a heavy sea ?—No ; the sea was not so very heavy.

22,729. Can you give me any other instance in which it has happened to you to be in danger in running into these bar harbours ?—I remember going over Shields Bar with the wind at south-east, when we shipped a sea, which did not wash everything off the deck, but the greater part of them. I remember standing at the fore braces myself very well. The sea caught me and took me as far as the braces and my arms would let me go.

22,730. Had you a pilot ?—No pilot.

22,731. The pilot could not get on board ?—No.

22,732. The wind dead in ?—The wind was from the south-east.

22,733. Is that dead in or not ?—No.

22,734. How was the wind then ?—Round in the south-east.

22,735. Was it on the port quarter, and how many points ?—It was on the larbourd quarter.

22,736. Do you recollect what sail you were under ?—We were, I think, under double-reefed topsails, foresails, and fore topmost staysail.

22,737. And blowing very hard ?—Yes.

22,738. That was as much sail as you could carry ?—Yes.

22,739. When the decks were swept what happened ?—We got in safe after all.

22,740. Were the men washed from the helm?—Yes, the mate was washed away.

22,741. Was the ship broached to?—No, she kept end on.

22,742. Any other instance?—No, I don't remember any.

22,743. Do you know anything about Hartlepool Bay?—Yes, I have been there several times.

22,744. Does the sea break, and how far?—Yes, all the way.

22,745. How far out?—I should say two or three miles.

22,746. In what water?—I should say in eight fathoms.

22,747. A heavy breaking sea is bad for a ship?—Yes.

22,748. What sort of land is it to make about Hartlepool?—It is not very good.

22,749. In thick hazy weather?—No, not in thick hazy weather. The land is in the background.

22,750. But is not Hartlepool Heugh easily made out; is there anything on the coast like it?—When at a distance you will find the land at the back is higher, so you cannot make it out perhaps until you get well in shore.

22,751. Hartlepool Heugh is so obscured under the higher land that you cannot make it out well until you get in shore?—No.

22,752. Supposing you cannot see the land behind, but can see the Heugh?—You could not see it if you could not see the land at the back.

22,753. Is there any other point on this coast which resembles the Heugh, so that you could mistake one for the other?—No.

22,754. So that if you see the Heugh, and make out its shape, you know it?—Yes.

22,755. What kind of soundings have you running into Hartlepool Bay?—We come out of deep water, and it shoals gradually.

22,756. So that, in thick weather, could you run in by your lead?—I could if I was to the southward of the harbour. Then you come to 12 fathoms, to 10, to 8, and so on.

22,757. In thick weather you could feel your way by the lead?—I would not like to attempt it in bad weather.

22,758. You could do it in fine weather, but you would not like to try it in bad weather? You would think it too much risk?—Yes.

22,759. From the northward, can you in thick weather feel your way in by the lead?—No, I think not.

22,760. Why not?—On account of the rocks at the Heugh.

22,761. In working your passage along this coast are you accustomed to hug the land?—Different people have different opinions about that.

22,762. What is yours; how do you generally endeavour to make your passages?—I generally keep two or three miles from the land; if the wind is so as to allow me to go within two miles, that is quite near enough.

22,763. Then are you in the habit in fine weather of coming in to get slants of wind and take advantage of the tides?—I should not like to do so amongst these rocks.

22,764. With the wind from the eastward at all, what kind of offing do you endeavour to keep?—Ten miles.

22,765. Are the shifts of wind on this coast very sudden?—Sometimes.

22,766. If you are well in with the land, and not much wind, does it ever happen that a gale of wind comes on in shore?—It has done so.

22,767. Is that a frequent occurrence?—Not very frequent; it has sometimes done so.

22,768. When it does happen, what kind of warning have you; three or four hours by the look of the sky?—Sometimes, and sometimes not that.

22,769. So that a man who knows the coast and the winds will have sometimes been taken by surprise by these gales in shore?—Yes.

22,770. (*Mr. Lindsay.*) If the Tyne was deepened so as to have 24 feet at low water, would you have any hesitation in running for it in an easterly gale?—If it entered as a tidal harbour, I should.

22,771. Speaking of it as it is; if the entrance was deepened to 24 feet at low water, would you hesitate?—Yes.

22,772. Is that on account of the freshets, setting out?—The deep water comes so sudden on to the bar that there is the greatest danger imaginable when you come on to the bar of the ship turning athwart.

22,773. Would there still be danger if the water on the bar was deepened to 24 feet at low water?—No, there would not be that danger.

22,774. That would lessen the danger?—Yes; but at present the sea coming out of deep water and striking the bar causes the sea to break.

22,775. Is it the sea coming out of deep water and breaking and rolling upon the bar which causes the troubled sea, the troubled wave, or is it the tide coming out and meeting the gale blowing in; which of the two causes the heavy sea?—Both of them.

22,776. Which has the greatest effect in making the troubled sea, do you think?—If it blows hard right in a freshet comes out at the same time; they assist each other.

22,777. Now, tell me why you would prefer Filey to any other site, supposing there was only one great harbour to be made?—On account of the tidal harbours.

22,778. Putting tidal harbours out of the question, and speaking entirely in regard to position, tell me why you would prefer Filey to any other place?—Because I think the greatest number of vessels are collected together about this point.

22,779. That is to say, your opinion is, that there are generally more vessels collected under Flamborough Head and about it, than at any other point?—I think so.

22,780. Is it the case that the wind often baffles them about the head, and they cannot get round?—That is the case sometimes.

22,781. And is it the case that before these dangerous gales, the gales blowing from east-south-east or east-north-east, come on, you often have baffling and variable winds, or how do they usually come on?—Sometimes we have them very sudden; other times they wear round either one way or the other. If the wind is to the westward away to the southward, sometimes it backs round to south-east; at other times it will come the other way.

22,782. Do they blow hardest when they back round from the westward to south-south-east?—That I cannot tell you.

22,783. Now you give Filey the preference to any other place, because you think more ships congregate about Flamborough Head. Say there was to be another harbour, where would you have it?—In the bight of the Tees.

22,784. Say that it rested between Redcar as a site and Hartlepool Bay as a site, which should you prefer, all things considered?—I scarcely know which to prefer. If you make the harbour at Hartlepool I think we should be in danger very often, with so many light ships coming in there; there would not be room sufficient for refuge, and still you would have a tide out of the harbour at the same time.

22,785. Then your objection to Hartlepool is, that on account of the number of light ships coming there to seek for cargoes there might at times not be sufficient space for refuge ships?—That is one reason.

22,786. Is another reason, because there is no tide coming out there?—There is a tide coming out there.

22,787. There is no river?—There is no backwater.

22,788. That is what I mean?—But there is a tide coming out of the bight, and setting round the Heugh.

22,789. Have you any other reason against it?—No, I don't know any other particular reason.

22,790. (*Capt. Sulivan.*) Do you think it is generally the opinion among the masters you are acquainted

FILEY.

Mr. J. Paul.

25 Oct. 1858.

Capt. Sulivan.

with at Lynn, that for laden ships the great difficulty is near Flamborough Head ?—Yes.

22,791. Do you think a harbour at Flamborough Head would save more laden ships than a harbour in the bight ?—I think it would.

22,792. Would not a majority of light ships get down in the bay, and therefore would not Hartlepool save more light ships than laden ?—Yes ; but there is not the same danger with a light ship that there is with a laden one.

22,793. Not the same danger to life ?—No.

22,794. Nor property ?—Nor property.

22,795. Light ships are oftener got off the beach again ?—Frequently, and if not they go higher up so as to save life.

22,796. In a laden ship you have the additional value of the coals or well of the vessel ?—That is true, but it is not a great deal.

22,797. Do you know whether it is the case that vessels which are caught at Flamborough Head and try to keep to sea, not only are frequently driven back great distances, and knock about for a long time, but often get into a leaky state, wear out the men at the pumps, and so get into danger ?—Yes.

22,798. Is that a common case ?—It is a common case.

22,799. Would a harbour here in a great measure prevent risk in such cases ?—In a great measure it would.

22,800. I believe colliers as a class are generally rather old vessels compared to others, are they not ? —They are not first class generally speaking, although there are some first-class vessels in the trade.

22,801. Generally speaking they are vessels which can't get general cargoes—which cannot get cargoes in another trade ?—That is so.

22,802. Do you know what becomes of the old colliers when they are worn out ? did you ever know of colliers being broken up ?—I have known some.

22,803. Is it a rare thing to have a collier broken up ?—The greater part of them, I think, founder at sea or else go on shore. I can give an instance of a vessel I was in. We got to the southward of the Head twice the same passage, and were driven back. Another vessel, in which I had an interest, on the 3d of December 1847, got to the southward of the head a considerable way, half way down to the Humber, but she was obliged to bear away, and went ashore at Hartlepool. She did not become a wreck, but we had to strip her, put her on a slip, and repair her, which cost several hundred pounds. Had there been a harbour of refuge here at the time it would have saved all that.

22,804. (*Chairman.*) In the case which you have just mentioned, did the crew of that vessel run any risk of their lives ?—Yes ; they were obliged to take to the rigging as soon as she got ashore.

22,805. When the vessel got ashore they were obliged to take to the rigging ?—Yes, and wait until the water fell, so that they could get off.

22,806. They were all saved ?—Yes.

22,807. Have you any information by which you can confirm or confute the statement respecting the *Duke*, of Lynn, in the printed statement ?—No ; I do not know the circumstances.

22,808. In answer to a question a little time ago you said that, in consequence of the hard work on board these colliers, knocking about in bad weather, in pumping, and so forth, a harbour here would be of great use to them ?—Yes.

22,809. I understood you to say that the crews of colliers run great risk in consequence of being out in bad weather with leaky ships, in which they have to be constantly pumping ?—Yes.

22,810. What is the risk they run ? is it the risk of foundering at sea or of going on shore ?—The risk of foundering at sea, and the risk of being run down.

22,811. And therefore are you able to say that you consider that risk so great that a harbour which could be made here would be most effectual, not merely for the purpose of saving property, but of saving life as well ?—It would save both.

22,812. And do you think that in these instances men really run the risk of their lives ?—Of course they do.

Mr. Samuel Cuthbert examined.

Mr. Cuthbert.

22,813. (*Chairman.*) You reside at Lynn ?—Yes.

22,814. How long have you followed the sea ?—Fifty years.

22,815. Of that period how long have you been master of a vessel ?—Thirty years master and owner.

22,816. In what trade have the vessels you commanded been chiefly employed ?—Most frequently on the coast between Lynn, London, and the Firth of Forth.

22,817. What description of vessels have they been ?—Brigs.

22,818. How long have you given up the sea ?—Three years.

22,819. You have been present during this inquiry? —Yes.

22,820. Will you now give us your opinion as to the advantage or necessity of a harbour in Filey Bay, and generally what you think on the subject ?—Yes. I have for many years been of opinion, and frequently talked it over with brother seamen, that no place along the coast between the Humber and the Firth of Forth would be a more convenient place, or a safer place, for a harbour of refuge than Filey Bay.

22,821. Why do you think so ? Give us your reasons ?—Because there is not another place that I can find which a laden vessel can take in safety when it has got to the southward of Filey, or to the southward of Flamborough Head, and cannot reach the Humber. In the large fleets which bear away for the northern ports many disasters occur by their waiting for the tide time, and all wanting to go together. We cannot enter while the ebb is running out, on account of there not being water sufficient. Moreover, it is very dangerous for vessels, when freshets come down and strong ebbs prevail, to enter with the ebb coming down. Therefore, we wait for a sufficient time of tide, and then we all want to go together, and that frequently causes damage. But I myself was never one to go to these harbours if I could see the sea. Perhaps, like Mr. Curzon, I have been one of the most fortunate men that ever sailed out of Lynn, so far as avoiding damage goes. I always went home with the same ship that I came out in, but I have known plenty of my neighbours who have borne down from Filey, Scarborough, or Whitby to these ports, and many of them have been wrecked when I have kept the sea, and have then made Holy Island or the Firth of Forth. I cannot say that ever I came from Scotland, and got a second time to the south of the head, and had to go back. I have got a long way to the southward, and then had to go back to Holy Island ; but I never would take Tynemouth or the Wear, on account of the freshets : I mean, in gales of wind.

22,822. You prefer to run to Holy Island instead of taking the ports of the Tyne, the Tees, and the Wear ?—Yes.

22,823. What kind of anchorage have you at Holy Island to run to ?—At Holy Island it is very good, but not a deal of room.

22,824. Good shelter ?—Good shelter from all seas.

22,825. Under the Farn Islands ?—Under the Farn Islands it is very well, but I never would stop there if I could get to Holy Island. It is well enough in the Farn Islands, with east winds, if you cannot get to Holy Island.

22,826. You have heard the evidence of the previous witnesses from Lynn, Captain Curzon and Captain Paul ?—Yes.

22,827. Do you generally concur with them ?—Yes.

22,828. Is there any point on which you differ from them ?—I differ a little from them about Hartlepool.

22,829. In what respect ?—I have borne down for Hartlepool in heavy gales of wind from the south-south-east, and that in the south-east, and further than that. The broken water has frightened me from going in, and I have held out to sea and gone away to Holy Island rather than go in among broken water. I think Captain Bailey's evidence that he gave, if he mentioned it, would throw some light upon that, for in that gale of last January he actually unshipped his rudder in broken water, without touching the ground.

22,830. Who was that ?—That was the master of the *Duke*, of Lynn. I have that from himself.

22,831. Can you tell me anything of the *Duke*, of Lynn, as to the correctness of the statement in the printed statistics ?—No.

22,832. I understand you to say you have never been in any danger of life or vessel in running into bar harbours yourself ? You have been fortunate ?—I have ; but I have suffered by them for all that. I have had two vessels, in which I had shares, lost in taking Tynemouth Harbour.

22,833. Tell us the circumstances ?—Three years ago the *Annie* left Lynn ; it was the very first Saturday in January, but I cannot tell the day of the month. Another vessel that belonged to me left with her. It was just as the frost broke up, and they left on the Saturday. The *Annie*, she ran down next, moving for Tynemouth Bar. There was a heavy freshet out. We had had a fall of snow, and as soon as ever she came to the fresh water the ship became unmanageable, and went ashore on the Herd Sand, and there became a total wreck. The other vessel that came away with her kept out to sea for, I think, two days longer. The master would not go down for the bar. She was a small vessel, and when the gale was over he went in. Another was lost was one of the finest little vessels that belonged to Lynn—the smack *Lively*. She was loaded, and bound for Sunderland, but the tides being small the captain durst not take Sunderland, and preferred Tynemouth Bar rather than keep the ship to sea, which he could have done if he had liked. As soon as that vessel came to the freshets she lost her steerage, went on the Tynemouth side of the rocks, and there became a wreck. In both cases it was on account of the freshets coming down.

22,834. (*Capt. Washington.*) Notwithstanding those accidents, if the entrance of the Tees could be improved, so as to have a depth of 12 or 15 feet at low water of spring tides, by means of piers running out, would you then see any objection to running for the Tyne ?—Not if you could turn the force of the current another way, I should not. But if the current had still to come out between the piers, with the strong freshets, and the ebb tide which runs so very strong, I should have the same objections which I have now.

22,835. I dare say you are not much of an engineer, are you ?—No.

22,836. Nor I either. But there are two sorts of piers. You know the piers of Sunderland, which run parallel for some distance. Suppose at the Tyne they were to build piers curved only to meet each other at the two ends, with a large expanse inside, so that directly the wave went in there would be an expanse upon which it might expend itself. Do you think there would be any fear of taking such pier heads ?—I think in taking any pier harbour there is very great danger indeed. I think you, with me, must have seen that.

22,837. You have said you have seen a great deal of broken water in Hartlepool Bay ?—Yes.

22,838. Have you been there often ?—Yes, often. I have passed it some hundreds of times, but never went down to it in gales of wind. I saw enough without.

22,839. How often have you actually had occasion to go there ?—Why, I never was much in Hartlepool. I do not think I ever was in Hartlepool half a dozen times in my life. I was 20 years in the Newcastle trade.

22,840. The Tyne was your chief place ?—Yes.

22,841. You have accidentally gone into Hartlepool half a dozen times ?—I have not gone there for refuge. I have gone there to load.

22,842. In fine or bad weather ?—In fine weather.

22,843. Then you never saw anything of the broken water ?—Only once, when I bore up with a loaded ship, intending to go to Hartlepool ; but the broken water was so bad that we thought it better to haul the ship out to sea.

22,844. You hauled her off. Where did you go to ?—To Holy Island.

22,845. How was the wind blowing ?—About south-south-east, quite far enough southerly to enable me to keep the ship off in safety.

22,846. How close did you run in on that occasion ?—When I hauled the ship, perhaps I would not be above two miles from the Heugh.

22,847. What depth of water, ten fathoms ?—I did not sound, I should think, all that. In fine weather I have been down by the lead to Tees Bay.

22,848. Have you been far down the coast of Scotland ?—Not except when a very young man in Her Majesty's service.

22,849. Have you ever been off a bold headland like Flamborough Head ?—Buchan Ness, I have ; but I knew but little about it.

22,850. What I wanted you to tell us was, whether you think the sea breaks heavier where you jump suddenly from deep to shoal water, or where the bay gradually shoals ; which is the heaviest sea ?—I think Flamborough Head will show us a little about that ; for I find that off Flamborough Head, and I think off St. Abb's Head, are two of the heaviest places as to sea of any on the coast,—Flamborough Head in particular.

22,851. Then you are of opinion that a large harbour of refuge should be made somewhere along this coast ?—Yes.

22,852. Would you have one, or more ?—I should say that two would be none the worse.

22,853. Where would you place those two ?—I cannot myself see any place more suitable than Redcar for the second.

22,854. Suppose you got comfortably into Redcar with a large fleet, and the wind came from the northward, would you have any difficulty in getting out ?—Yes, with the wind at the north.

22,855. Would you with the wind at north-east ?—If it was fine weather you could get out, and if it was bad weather you do not want to get out ; you do not want to be on the coast at all. We want to be in harbour then.

22,856. But somewhere in Tees Bay, on one side or the other, you think the second harbour should be ?—Yes ; I would certainly recommend one in Tees Bay,—in any part of it preferably to the Wear and the Tyne ; a place where there are no freshets, and which is accessible at all times of the tide.

22,857. But I think you admit that the trade of the Tyne is so important that it is worth trying if the harbour there cannot be improved ?—Yes ; the trade of the Tyne is very great. We will allow that. But there is good water in the Tyne now, and I cannot see how that when it is deepened three or four feet you will still have that same current of fresh and salt water out as you have now. If that continued I cannot say that it would be any safer for ships. Take Sunderland piers. They must be three times as long as they were when I first knew Sunderland, yet now there is quite as much danger in taking them as ever there was, and the sea is quite as heavy.

22,858. (*Capt. Sulivan.*) You say that the sea is very heavy off Flamborough and St. Abb's Head. Is that probably caused in a great measure by the strong tides around the headlands ?—Perhaps it may ; I am not able to say what is the cause of it; but the truth of it is, it is so off Flamborough Head.

FILEY.

Mr. S. Cuthbert.

25 Oct. 1858.

Capt. Sulivan.

22,859. Do you agree with the previous witness as to the great danger being in laden vessels ?—Yes.

22,860. Much more than in light vessels ?—Much more than in light vessels. Light vessels invariably come high up on the beach when they are obliged to run on shore or when they are driven upon the shore, as compared with what laden vessels do, and therefore there is not the same risk either to life or property.

22,861. You said there was great danger in running for any pier harbour. Would not that apply to a harbour of refuge built anywhere, with a tide or not, or did you mean with piers and with a tideway ?—Yes.

22,862. You said running for any pier harbour ?—Any pier harbour, whether with a tideway or not.

22,863. Would not that apply to all harbours of refuge made with piers ?—I think not to Filey, with a great space for making a breakwater. If it was carried as far as is proposed in the plan there would be plenty of room for a vessel to work out or into Filey Bay.

22,864. Would you not in any harbour try to have an entrance at both ends ; say that a ship could come in and go out with a leading wind instead of having to work out ?—We have talked about that, but I am afraid it would let the sea in very much when the vessels were at anchor; that it would let more swell in.

22,865. Have you taken many pier harbours ?—I have been in many pier harbours, but not in bad weather—Sunderland and Dover and Ramsgate.

22,866. What width of opening between the piers would you consider it safe to take with a laden collier? —200 or 300 feet, it ought not to be less.

22,867. 400 feet you think would be safe to take in any weather, with a gale even ?—I think it would if there was not broken water too far away out.

22,868. Did you ever take Whitby piers ?—I have been in, but it is a long time ago—not since the piers were extended. I have not been there for these twenty years.

22,869. With an entrance 400 feet wide, do you think any collier, provided she could go in with a fair wind, would be in danger in taking it ?—I really do not think she would with that breadth, provided the piers ran out into deep water.

22,870. In a place like Filey, what depth of water would you consider quite sufficient at dead low water spring tides, for the heaviest collier on the coast to take, allowing for the sea that would get up with an easterly gale ?—I think six fathoms.

22,871. You think it ought to be six fathoms ?—Or five fathoms ; I do not think any collier would come to the ground on that water.

22,872. If at Hartlepool there were piers with five fathoms of water at the entrance, do you think that any vessel with a fair wind need hesitate to take them ?—Five fathoms would be broken water there.

22,873. Say to six or seven. Would it be broken water then ?—At Hartlepool I think it would.

22,874. Then the same objection would apply ?—Do you think colliers would hesitate to run for it with five fathoms ?—Some would hesitate ; some would not go to harbours if there was ever so much water.

22,875. Why ?—They would prefer keeping the sea.

22,876. But suppose they were embayed ?—If they were embayed they would be very glad of such a place to run to.

22,877. Do you know Redcar ?—I know it, but I do not know anything definite about it, only as I have heard other people say. I never sounded or anything of the sort.

22,878. Would there be less sea in running for a harbour at Redcar than at Hartlepool ?—I think so, with the wind from the south and east.

22,879. No, but from east-north-east ?—Then we must not expect many light vessels will come there with the wind.

22,880. Why ?—I think with that wind they would get up to Flamborough Head.

22,881. Suppose the case of laden vessels caught by the gale before they had weathered the high land of Whitby ?—I should think that a harbour at Redcar would be the best. There is deep water close to it.

22,882. You would carry the deep water close to the piers, while in Hartlepool Bay you would have shoal water for a long way ?—That is my own opinion of it.

22,883. (*Chairman.*) I think I understood you to say that in bad weather you preferred keeping the sea to running for harbours of refuge ?—I always did.

22,884. Why ? — Because I have seen so much damage done by ships running for harbours as compared with the damage which has been done to those ships that have kept the sea. I have invariably found that where one of our ships has been lost by keeping the sea, three or four of them have been lost or wrecked by bearing up for harbours.

22,885. Therefore you encourage your captains to keep the sea ?—Yes.

22,886. Do you give them any positive instructions on the subject ?—I give them positive instructions not to run for a harbour in bad weather if they have a light ship and good canvass, with which I generally take care to get them provided, and if they can keep off the land with safety. If they can make a harbour in safety before the gale comes on so heavy, do so.

22,887. It was told us the other day at Whitby, I think, that sailor owners generally find their ships the best. How is that in your experience ?—Well, they understand the nature of the thing better than farmers, grocers, and bakers, and all those people do. I can only account for it in that way ; but to tell the truth I believe sometimes in a gale of wind I have slept better aboard my ship when I have got pretty well off the land, and under good canvas, than what I can do in a gale of wind at home.

22,888. Therefore you rather agree in the statement that, as a general rule, owners of ships who have been captains look sharper after the way in which they are found than those who have not been ?—I do.

22,889. (*Capt. Sulivan.*) With reference to your having ordered the masters of vessels to keep off the land, I understood you that that alludes particularly to the dangers of tidal harbours ?—Yes.

22,890. But suppose in future you had a harbour made safe at all times of tide, and without those dangers, would you then consider it so advisable to keep off the land ?—Oh no ; I should not then advise them to keep off the land, thrashing about. If they could get such a place as the Humber, Harwich, or the Firth of Forth, or anywhere there, I should advise them to take it.

22,891. Your objections apply to bar harbours ?—To bar and tidal harbours.

22,892. Not to harbours generally ?—No ; we call them roadsteads.

22,893. (*Chairman.*) Your objections would not apply to roadsteads ?—No.

22,894. And as an owner of ships, would you direct your masters to take a roadstead to save the wear and tear of the ship and damage to the cargo ?—Yes, if it was a roadstead where they were safe from all winds. Not such a place as Bridlington Bay ; I would not advise them to go there. It is very well with a northerly wind, but if the wind gets round to east or east-north-east, up anchor, and get off if you can ; get to the Humber.

Mr. JOHN ANDREWS examined.

Mr. J. Andrews.

22,895. (*Chairman.*) You reside at Lynn?—Yes.

22,896. How long have you followed the sea ?—Twenty-six years.

22,897. How long have you been ashore ?—Twelve years.

22,898. Do you own any ships?—No; I am not a shipowner.

22,899. Are you connected with the shipping interest in any way?—I am agent for Holloway, Hart, and Company, of Lynn.

22,900. Are they shipowners?—No; they are merchants.

22,901. Do they own any ships?—No; they do not.

22,902. For how many years were you in command of vessels?—Twelve, as master.

22,903. In what trade were the vessels which you commanded?—The coal and the Baltic trade.

22,904. How many voyages have you made home from the Baltic?—Two and three in a year.

22,905. How many should you say altogether?—I have made a vast number of voyages to the Baltic, because I was 15 years in that trade.

22,906. How many have you made home from the Baltic?—About 22 or 23 altogether.

22,907. Late in the year?—Yes; as late as Christmas time.

22,908. To what port were you homeward bound?—Always Lynn.

22,909. As a general rule, where did you make the land fall; I do not mean where you endeavoured to take it, but where, as a general rule, you did actually make it?—Flamborough Head. I always endeavoured to make it there, and generally did.

22,910. How far north did you ever make it?—As far as Blyth.

22,911. Never further north than Blyth?—No, never.

22,912. What was your longest passage home from the Baltic?—Three months from Petersburg.

22,913. Under what circumstances?—Gale of wind from the westward, in the later season of the year.

22,914. Did you take refuge in any Norwegian port?—No; we had a very short passage from the Sound. We laid a month in a bay in the Gulf of Finland.

22,915. How many days did you pass between the Scaw or the Naze and Lynn?—Only 12 days from Elsinore Roads to the Humber. The principal time was spent in the Baltic.

22,916. You have been present to-day?—Yes.

22,917. Give us your opinion about the inquiry. What do you say: is there to be a harbour here or not?—I think it is very necessary and essential that there should be a harbour here.

22,918. Tell us why?—Ships congregate so much here. They come from the north ports with the wind from the south-west. They work up a long way, and when they get to Flamborough Head the wind frequently gets south-south-west or south-south-east, and they cannot get any further. I have been laid here under the cliffs for four or five days together with 300 and 400 sail, some riding and some under canvas.

22,919. Therefore a harbour here would be a great boon?—There is not the least doubt of it.

22,920. Are you disposed to say that it would be more than a boon, and that loss of life and destruction to property would actually be prevented?—It would be the greatest boon which you could offer to the merchant service on the north-east coast.

22,921. Supposing we had a harbour here, what do you say about the ports to the northward? Would you have one more harbour to the northward in the bight of the bay, or endeavour to improve the Tyne, the Tees, and the Wear?—It would be more essential to have another one if we could pick a suitable place. That is the greatest difficulty I see—the getting a suitable place.

22,922. Which would you prefer—to improve the existing ports, or have one east entirely new harbour in the bight of the bay?—I do not like the bight of the bay.

22,923. Why do you not like it?—The water is so shallow, and the sea breaks so.

22,924. Where would you put it?—It is total destruction to go into broken water.

22,925. Where would you put it?—I could not put it there. Perhaps you might improve the existing ports to the northward, but to them I have strong objections on account of the freshets which set out of them.

22,926. Are these freshets very frequent in the winter, because freshets won't run from one year's end to another: are they of frequent occurrence in the winter?—In the winter, and during the rains and easterly gales.

22,927. How many freshets have you in the year out of the Tyne—really dangerous freshets?—Not many; they generally occur in the spring.

22,928. How many did you say—two or three?—More than that.

22,929. Would you say six or eight in a year?—Yes, perhaps.

22,930. You have no idea of the number?—No.

22,931. Has it ever occurred to you to be in danger of losing your life or your ship in running into these bar harbours?—In going into Shields I have.

22,932. On what occasion?—Running in, in ballast I have seen the sea break right over a vessel, and the men have had to take to the rigging.

22,933. Give an account of any instance of this kind which has happened to yourself?—It has never happened to myself but once, when going into Shields harbour, and then I was not the captain of the vessel; I was only a seaman.

22,934. Give the name of the vessel?—The *Margaret*, of Lynn, a brig. The wind was from the east-south-east, blowing a very heavy gale; but there was no freshet at that time—merely the sea breaking on the bar. We had to take to the rigging then; the sea completely overran us.

22,935. What was she—a collier?—A brig.

22,936. What sail were you running in under?—Single-reefed maintopsails. We were generally obliged to set more canvas in taking the bar, in order to force the vessel before the sea. Single-reefed main-foresail, double reefed foretopsail, and topsail.

22,937. Dead before the wind?—Yes.

22,938. What time of tide?—About half flood.

22,939. You were all in the rigging except the man steering?—Except the man steering.

22,940. You were in the rigging to save your lives in case of accident?—Yes; and to attend to the braces.

22,941. Where you pooped?—Yes; completely from the stern. The sea pooped her.

22,942. Did the vessel broach to?—No; she was kept before the wind. She was steered well, and being in ballast was easier managed.

22,943. You got in all right?—Yes, all safe; without the loss of anything, fortunately.

22,944. Still you felt it a considerable risk?—It was a great risk.

22,945. If the vessel had broached to what would have happened?—The sea would have swept her off, and she would have gone on shore upon the Black Middens or the Herd Sand.

22,946. Were there any other occasions in which you ran similar risks?—No.

22,947. (*Capt. Washington.*) How often have you been to Hartlepool?—A number of times; I could not tell you how many. For seven or eight years I traded to Hartlepool and the Tees.

22,948. In fine weather generally?—Yes; it is a good fine-weather harbour.

22,949. You never went there with the wind blowing hard?—Not from the eastward, but I have been there when it has been blowing very heavy from the westward, and the sea breaking very heavily over the land.

22,950. Have you been there within the last 12 years?—No.

22,951. Then you don't know anything about the

FILEY.

Mr. J. Andrews.

25 Oct. 1858.

Capt. Washington.

improvement of West Hartlepool ?—They were making the dock at the time I was there last.

22,952. Where do you say you would place the second harbour ?—I did not mention any place. You cannot find the place. I do not like these deep bays.

22,953. You think Filey the only place between Flamborough Head and the Staples ?—If you could get a place to the north it would be much better.

22,954. Where do you mean ?—To the north of the Filey.

22,955. In your opinion, there is no place ?—Not what you may call a safe place. The depth of winter is the time when the greatest danger occurs ; they are all good summer harbours, and smooth water places, and they are all improved since I first recollect them, and a very great deal, too.

22,956. (*Capt. Sulivan.*) If they got 15 feet water at the Tyne, will that make it a much safer harbour ? It won't prevent the sea from breaking ; the sea breaks in a much greater depth than that. At times the sea breaks in six or seven fathoms, or even 10 fathoms. Do you think the sea off Hartlepool would be too heavy for a vessel to run through it if she had got a safe harbour under her lee, having got into less than five fathoms water ?—I should never think of going to Hartlepool with a ship in a gale.

22,957. If you had a safe harbour into which you could get at five fathoms dead low-water spring tides, would you then hesitate to run through the breakers ? —I should hesitate. I would keep the sea if I possibly could. If my vessel was only seaworthy, and I had good canvas, I would rather keep the sea. More casualties occur in running down into these deep bays, where vessels get into broken water, spring a leek, and are frequently lost, than from keeping the sea.

22,958. Are not many vessels so situated that they cannot help themselves, and cannot keep out of the deep bay ?—Force is one thing, and choice another. What you are forced to do you must do.

22,959. Have you heard of the losses in the gale of January 1857 ?—Yes.

22,960. A large number of vessels were wrecked that could not possibly keep out of the bay ?—The principal number of them, I believe, bore away to Hartlepool, and foundered in shoal water.

22,961. Numbers ran on the beach, not being able to keep the sea ?—Yes, there were.

22,962. For vessels situated in that way would not a harbour at Hartlepool, or Redcar, or somewhere in the bight of the bay, be a great boon, particularly to light vessels ?—For light vessels there is not that danger ; they would find water enough.

22,963. But if they get disabled before they get to to a harbour ? Suppose a ship was disabled some time before one got near a harbour, and lost her rudder, or something of that sort ?—In the gale of the month of January one ship was disabled and a man was washed overboard at Hartlepool.

22,964. Have you any information whereby you can confirm or refute the statements respecting the *Duke* in the printed statistics ?—That statement was made to me with a little addition, that the master could have made Filey had there been a harbour of refuge, and that Scarborough bore south-south-west when he made for Hartlepool Bay.

22,965. Then you can confirm that statement ?—I can ; it was made to me.

22,966. Do you know anything of Redcar ? Would there be the same objection to it as there is to Hartlepool ?—I do not know much about it. I have understood there is a good deal of water within the Scars.

22,967. I am supposing there are equal means of making the harbour ?—I cannot speak for Redcar. I have been many times past, but don't know the depth of water, or anything about it.

22,968. I am supposing a harbour can be made with equal depth in both places. Would you have the same objection as to the danger of running to Redcar which you have in running to Hartlepool ?—Redcar is deeper over the bar than Hartlepool. I would rather take the Tees, if possible, than Redcar; I should get more water I think. I have been in the Tees many times ; there is no objection to the Tees if the weather is clear and you can see the Fairway buoy.

22,969. I am supposing a harbour made at Redcar ; would you have any objection to run for that ?—I cannot answer.

22,970. Do you think if the Tees were deepened five or six feet it would become a safe place ?—In the Tees, when I traded there, there was more water than there is now.

22,971. I think about 11 feet ?—There was more than that then ; I know a vessel, the *George*, of Whitby, sailed up a short time ago ; she drew 10½ feet.

22,972. I am speaking of 11 feet at dead low-water spring tides ?—I am taking part of the water. I have been towed into the place at low water many times.

22,973. If deepened so as to have 10 feet at dead low water, do you think that would be a safe place to run for ?—Not in a gale of wind. In that you always have more broken water to get through than at Hartlepool.

22,974. What do you think would be the best way of laying out money so as to ensure, as far as human means can go, the safety of vessels in the bight, supposing you have done all you want at Filey ?—If you would improve the northern ports, that would be the best mode of spending the money. That is the only opinion I can give. As to the bight in Hartlepool Bay, no money would be well spent there ; it would be liable to silt up.

22,975. Do you say that from your own knowledge or from report ?—From my own knowledge and from report. It has shoaled considerably since I recollect it.

22,976. Hartlepool has ?—The bay has.

22,977. But you have not been there for 12 years ? —No ; but before that.

22,978. Before that did you know it as silting up ? —Yes.

22,979. On what do you found that statement ?— —There is so much sand accumulates about there ; it grows up.

22,980. On what ground do you state that ? how did you ascertain that it grew up ?—By the shoaling —by the broken water.

22,981. Have you brought up in the bay ?—Yes ; we have frequently had to ride off Hartlepool. There is not so much water there as there was when I first went by some few feet. I have seen the water breaking tremendously in Hartlepool roads. At every sea the ship nearly came to the ground.

22,982. Did you hear what the previous witness stated respecting the dangers of laden vessels keeping the sea after they got up to the Head, by springing a leak, and by thus wearing out the crews at the pumps ?—I cannot confirm any statement as to the vessels being leaky ; but I know they often turn out so in stress of weather. I have no recollection of particular instances, but they do.

22,983. Do you know that colliers which have been caught off the Head have got into danger from the leaks increasing, and the men being kept to the pumps, and so being very much worn out ?—Oh yes, that frequently happens in gales of wind.

22,984. For vessels under those circumstances would a harbour here be of great value ?—No doubt this would be a harbour of refuge such as those vessels want.

22,985. Do you think they would use it, and that the owners would not object to the vessels coming into the harbour when it was made ?—No prudent owner would object to that, if they took the harbour in time before the gales came on.

22,986. (*Chairman.*) In making the passage up and down the coast with an off-shore wind, do you keep in shore generally ?—Yes.

22,987. With on-shore winds, what offing do you

keep ?—As far off as we can keep. We must avoid the land.

22,988. Are the changes of wind very sudden on the coast ?—Very sudden sometimes.

22,989. And do they give any warning ? Does not the state of the weather and so on give a man a warning ?—At times they do not ; they chop round very suddenly, and you are taken all about entirely with the wind in an opposite direction.

22,990. So it may happen to a man who knows this coast well and the weather well, and who keeps a sharp look-out, that he may be caught in a breeze of wind very close to the shore, and may get into a scrape ?—He might. A sharp look-out, though, is a great thing in coasting—everything.

22,991. I ask whether a man who knows the weather well and the coast well, is likely to be caught in that scrape for want of warning ? I want to know if a man who is well acquainted with the weather on this coast is likely to be caught on a lee shore, from a gale of wind coming on without any warning ?—No ; there is always some warning, or appearance of some sort to guide you ; either the clouds in the sky, the look of something brewing, or something of that kind.

22,992. Are these changes of wind preceded by light winds which would prevent a man from getting off shore, although he saw what was coming ?—I do not understand the question.

22,993. Are these gales of wind which come on in the way you describe, on shore ; are they ever preceded by light winds and calms which would prevent a ship close in shore from getting an offing before they should come on ?—Not always.

22,994. But does it ever happen ?—It seldom or ever happens that it falls from a gale to a calm instantly.

22,995. But from a calm to a gale, I suppose it does sometimes ?—Not so sudden as that. It comes on a little gradually.

22,996. So that a man who knew the coast and the weather, and who kept a sharp look-out, could generally get an offing before the breeze came on ?—I never was caught in such a difficulty as that.

22,997. I think you know Hartlepool well ?—Yes.

22,998. What kind of land is that about Hartlepool to make in thick weather ?—It is very well. In thick weather all lands are very bad to make.

22,999. Well, if all lands are bad to make, some are worse to make than others, and I want to know how Hartlepool stands in that respect ?—Hartlepool is low by the shore ; the land behind is very high, and in easterly gales the haze hangs very much on the land, and the land is very bad to make.

23,000. When you do see the land two or three miles off in bad weather, do you know it when you see it ?—I know it very well ; you can tell it immediately by the church.

23,001. As a rule, when you could do so, would you keep the sea in bad weather instead of running for a harbour ?—I never put back to a harbour.

23,002. Why did you not ?—Because I thought it was dangerous to go ; I did not like it.

23,003. You thought it was safer with a good ship to keep the sea ?—Yes ; and I always had a good ship, good canvas, and a good crew. There was no danger then.

23,004. You heard the question I asked, as to whether ships owned by men who have been to sea are better found than others ?—I think that ships are badly found ; they are often so badly found that you can hardly keep them together.

23,005. You think all are badly found ?—No ; there are some exceptions.

23,006. You heard the question, whether ships owned by men who have been at sea are, as a general rule, better found and more carefully looked to than other ships ?—Their owners are practical men ; I think they are better found.

23,007. You attribute that to the fact that the men who own them are more thoroughly acquainted than other people with what ships require ?—Exactly so.

23,008. (*Capt. Washington.*) I think you said you had not been at Hartlepool for a good many years ?—Twelve years.

23,009. Then I think you do not know the state of affairs there ?—I do.

23,010. Perhaps you will reconsider your opinion when I tell you, that for the last 20 years 22 lives have been lost annually in Hartlepool, and that in the gale of the 4th of January 1844 alone, 44 lives were lost in that bay. Such being the state of things, do you consider it desirable that a refuge harbour should be placed there to save life ?—They were lost I suppose principally through running down for shelter. The ships were lost by running into disasters, and not by any other cause.

23,011. In an easterly gale no one would affirm that they would find shelter there, and therefore it is fair to presume that they were embayed and could not get off ?—They got into broken water and foundered. If even there was a harbour of refuge they would frequently be destroyed in the same way in attempting to take it.

23,012. What depth do you think that broken water is ?—Nine or ten fathoms.

23,013. Do you believe a number of vessels foundered in 10 fathoms water ?—No, not a number.

23,014. Light vessels or laden ?—Laden ; light vessels do not founder.

23,015. Not in broken water ?—It is a very rare occurrence.

23,016. Is it a very common thing for a vessel to founder ?—It is for a laden one. They get into broken water, shallow broken water.

23,017. Do you think that vessels founder from the seas breaking on them, or from leaks chiefly ?—From seas breaking aboard ; very often that causes them to spring a leak and to founder.

23,018. I ask you as an old sailor. I think you and I have met before ?—We have.

23,019. Do you believe that vessels founder at sea from springing leaks, or from seas breaking on board and the weight of water swamping them ?—The seas breaking on board them and causing them to spring a leak.

23,020. That is your opinion ?—Yes ; the sea breaking on board would cause almost any disaster. It will clear the decks, stanchions, bulwarks, boats, and everything.

23,021. On these occasions do the vessels batten down the hatches ?—Yes.

23,022. Then suppose the bulwarks swept away, need she founder ?—If the stanchions were swept away there would be holes for the water to get down, and she would spring a leak and founder.

23,023. If the stanchions are swept away sufficiently below the decks to make a hole through the decks ?—They are sometimes.

23,024. It is your experience as a sailor that this is a common occurrence ?—I never saw it.

23,025. No, nor I either.

23,026. (*Capt. Sulivan.*) You mean that the stanchions break out the covering boards ?—Split the covering boards.

23,027. And then an opening is made for the water to get down ?—Yes ; I have known the covering boards to have been split, but it has been in a Baltic ship with timber.

Mr. Frederick Makinson examined.

23,028. (*Chairman.*) Where do you reside ?—At Leith.

23,029. Are you still in command of a vessel ?—No ; I am at present a North Sea pilot.

23,030. Before being a pilot were you at sea ?—Yes.

23,031. For how many years ?—From 1808.

23,032. Did you ever command a ship ?—I com-

FILEY.

Mr. F. Makinson.

25 Oct. 1858.

Chairman.

manded a ship from 1825 up to about four years ago.

23,032*a*. In what trade were the vessels which you commanded chiefly employed ?— Principally in the London and Scotch trade.

23,033. Between Leith and London ?—Yes.

23,034. What were they ?— Schooners, steamers, and smacks.

23,035. You have been here to-day ?—Yes.

23,036. Give us your opinion as to where a harbour of refuge should be, and whether you would have more than one ?—I should think it would be better to have two, but I think the principal one should be at Flamborough Head.

23,037. In the neighbourhood of Flamborough Head ?—Yes.

23,038. And why ?—Because it is easy to approach, and a quantity of vessels bound north and south generally meet there.

23,039. Supposing there was one here, what would you do then ? Improve the three ports of the Tyne, the Tees, and the Wear, or try to put one somewhere else ?—I cannot say much about that, for my brig has not been there. It has been going along the coast. I have only been twice in the Tyne in my life.

23,040. Do you agree in the account as to the weather which is found on this coast ?—Yes.

23,041. As to the shifts of wind, and the worst winds on the coast ?—Sometimes the wind shifts very suddenly, and at other times it comes round by degrees, and perhaps in 24 hours.

23,042. What is the worst wind on the coast ?—East and by north.

23,043. The wind which blows hardest ?—West, west-north-west, and west-south-west ; but the most dangerous wind is east and by north, east-north-east and east-south-east.

23,044. In making a passage along the coast with a wind off shore do you keep close in ?—Three or four miles off ; that is, with a sailing vessel.

Mr. John Loudon examined.

Mr. J. Loudon.

23,045. (*Chairman.*) You belong to Ipswich ?—I do.

23,046. How long were you at sea ?—I have been at sea for 50 years.

23,047. When did you go on shore ?—I go to sea occasionally now.

23,048. For how long have you been master of a vessel ?—I have been master since 1823, about 15 years.

23,049. In what trade have the vessels you commanded been chieffy employed ?—The chief part of my practice has been on this north-east coast ; a portion up the Baltic ; a portion to Holland, Sweden, and the parts about.

23,050. How many voyages have you made hence from the Baltic, should you say?—Somewhere about 20.

23,051. Some of them late in the year ?—Not extraordinarily late ; never beyond October.

23,052. For what port were you bound ?—Generally London.

23,053. I won't ask you where you endeavoured to make your landfall, but where did you actually make it in coming across ?—In the summer time, in the month of July, I would endeavour to make my passage to the westward, and come in about Lowestoft. In October, I would at that time endeavour to make Flamborough Head.

23,054. You have told me what point you would try to make. Where did you generally make the land ?—Generally where I had anticipated, at Flamborough Head or Lowestoft.

23,055. Have you ever made it to the north of the Tyne ?—Never.

23,056. What have you got to tell us about harbours of refuge ? What is your opinion ? — My opinion is, that a harbour of refuge is particularly required for the safety of life and property, and I believe I entertain that opinion in common with most people along the coast. I know my own opinion is, and has been for a long time, that a harbour of refuge is very particularly required, and that this spot, being so central between the Firth of Forth and the Humber, no better site can be desired than this. That is my opinion, and that is the opinion of most people belonging to my port.

23,057. Supposing we had a harbour of refuge here what would you say as to anything else ? Would you improve the existing ports of the Tyne, the Tees, and the Wear, or would you have another harbour of refuge down at the bottom of Tees Bay ?—That question I will endeavour to answer, but I must first declare to you that I would give the preference to a harbour here at Filey Bay. If you were to have a second harbour I first considered Redcar Bay might do. I thought Redcar, perhaps, might be better than any other ; but I do not believe so now, from what I have heard, though it is true I have never had the practice of going into Redcar. I have never had the practice I could wish for giving an answer. From what I have heard of Redcar I should now decidedly give the preference to Hartlepool. I believe Hartlepool is preferable for a harbour of refuge than either the Tyne or the Wear, for this reason : that both the Tyne and the Wear send out strong tides, more especially at spring tides. Again, when we have rain there is a great current coming out in addition to the ordinary tide of these rivers. At Hartlepool, now, there is not that extraordinary tide ; and, although there is broken water near Hartlepool, there is also broken water near Sunderland and the Wear, and on that account I give Hartlepool the preference.

23,058. You prefer Hartlepool because there is no strong tide running out there ?—Decidedly.

23,059. Do you know the Tyne well ?—Yes.

23,060. How many freshets should you say there are there in the course of a year ?—I could not tell you ; but I can tell you, that when I am at sea as commander of a vessel, and bound to the Tyne, if we had a heavy rain at any time previous to my arriving at my destination, I should be in great anxiety for fear that a strong freshet was coming out, but how many times that occurs in a year I am really not in a position to tell you.

23,061. Has it ever occurred to you to be in risk of losing life or ship in running into these bar harbours ? —I have been one of the most fortunate men who have been on the coast, and cannot declare that I have been in risk. I have sometimes run in with a heavy sea, but I do not recollect that ever I had occasion to run into one of these bar harbours when it was blowing a heavy gale.

Mr. William Dodds examined.

Mr. W. Dodds.

23,062. (*Chairman.*) Do you live at Scarborough ? —Yes.

23,063. How long have you been at sea ?—Twenty-six years.

23,064. How long master of a vessel ?—Eighteen years.

23,065. In what trade ?—In the coal trade.

23,066. You have heard the evidence of the previous witnesses ?—Yes.

23,067. Have you anything to add to that ? Do you generally concur in what they have told us, or are there any points on which you differ from them, and which you would like to state to us ?—I should like a harbour of refuge at Filey Bay.

FILEY.

Mr. W. Dodds.

25 Oct. 1858.

Capt. Washington.

23,068. You think it the best place?—Decidedly so.

23,069. And why?—I have plenty of reasons. I have been practising here a good bit. The ship I have now I got off the rocks at Carrnaze. I have had another ship on at the other side. I have gone all along the coast, and have been at work in the bay two winters running, and I think this the finest place for a harbour of refuge. I have run two or three times to the north, but never would do so again. If caught at the head, I would, instead of going to sea, shove the ship ashore in Filey Bay, in case she was making water.

23,070. Would you prefer running her ashore here to going to the Firth of Forth?—Yes; I know I could save my life here.

23,071. Supposing we had a harbour at Filey Bay, what would say as to the other part of the coast? Would you improve the three harbours of the Tyne, the Tees, and the Wear?—I would improve all three, or make them improve themselves. We pay a passing toll to Shields; and there, every voyage we go, it costs me about 15*s.* 11*d.* I have paid it for four years, and never got any benefit from it.

23,072. Putting that on one side for the present, supposing you had the choice of spending a considerable sum of money in the improvement of those ports, would you prefer that to having one harbour at the bottom of Tees Bay?—I should not approve of one immediately at the bottom of Tees Bay at all, because I had a vessel in Hartlepool slip once, which cost me about 450*l.* Another time I got "raffled" up like a bale of old spun yarn along with other ships, and lost my mast as well as everything else, in taking the harbour. We ran down in the bay, and got to the entrance of the harbour. It was blocked up with laden ships, and before they could get in the light ones ran in amongst them, and all were almost sunk together in the channel. We were there until the night tide made. A vast many of us closed down to the pier end. The light ships came in at night, and they came right in and sailed slap into us, taking bulwarks, stanchions, and everything out of us.

23,073. Do I gather from your answer that your reason for preferring the three ports is, that shipping running in, particularly light ships, would be divided amongst the three, and therefore there would not be so much crowding?—Decidedly; if I could have got further north, and saved the daylight, I would not have gone to Hartlepool. I should have gone to the Tyne. I should have been there almost all the time, except in the cases in which I have cut, and been forced to take Hartlepool as a refuge.

23,074. You have heard the evidence as to the preference of keeping the sea with a good ship, or making a harbour?—I should prefer it to the harbours which now exist; but if there was a good one to go to I would go directly.

23,075. Why would you do so?—In case the wind was foul, to save my own property; especially if I was there myself.

23,076. To save the wear and tear of ship and cargo?—Yes; I could do as I liked if I was there.

23,077. You are disposed to say that, instead of keeping the sea in bad weather, and attempting to make the passage, it would be better for the ship and the cargo and the owner to go and lay up and wait for a change of wind or moderate weather?—Yes.

23,078. With these harbours of refuge I presume it would be very essential to have them so constructed that ships could get out easily when the weather moderated?—Yes.

23,079. With a passage sufficiently wide that with a moderate wind any ship could work out easily, would that be necessary?—I think it would, so that you could work out, or a passage that the tide would come through, so that they could go out with the tide, if it could be made in that way.

23,080. After heavy gales on shore, does the swell on the coast last for a considerable time?—Sometimes it does a good bit.

23,081. How long should you say altogether? how many days?—Forty-eight hours I should say.

23,082. So that with the wind into these refuge harbours, there might be sea enough to prevent a ship getting out for 48 hours?—Not so long in a roadstead; I mean upon the beach.

23,083. I want to know, if light ships run into harbours, and there was a moderate and light wind blowing in, whether, for a day or two, there would be swell enough to prevent their getting out?—I don't think there ever would be any swell to prevent a ship getting out here. I have gone out with a gale from the north-east, and have gone in a light ship round the head. There is a tremendous sea in the offing; but you can always get vessels out.

23,084. (*Capt. Sulivan.*) Do you concur in the opinion that the great danger is for laden ships, and that it is for them especially that harbours should be made?—Decidedly; they cannot get into any port along the coasts, except at high tide.

23,085. You think that the danger is much greater in laden ships?—Decidedly; I would run for Scarborough or anywhere there, if I thought there was a fleet of ships likely to be caught at any one time. They flock in so, that I might get 100*l.* or 200*l.* damage.

23,086. (*Chairman.*) What are the most dangerous winds on the coast?—From about east-north-east to east-south-east.

23,087. What do you think of Bridlington Bay?—If I were riding in Bridlington Bay with a light ship, and there was a refuge here, as soon as the wind came enough from the north-east I should reach out, and reach down to where I should be in safety, because there is no safety there. If you go into Bridlington Harbour they make you pay for it.

23,088. Is Filey Bay well known by vessels along the coast?—It is known by almost everybody. Some strangers I have seen come and bring up, and call themselves in Filey Bay, where they have been right outside altogether, and not in Filey Bay at all. Many ships do bring up right out.

23,089. Have you had any experience of riding under Speeton Cliffs yourself?—I have been riding there four or five different times. I was riding there in this April. The wind came in from the north-east upon us when we were riding. We got our anchor, and sheered off with the ebb, and went away clear of the land altogether.

23,090. Was that because you felt you could not remain there any longer?—When the wind came in that way we had no business there any longer. It was time we were cutting out of the way.

23,091. Have you ever been driven from the Head to the Firth of Forth?—I never got up into the firth. I got above St. Abb's Head.

23,092. You preferred going up to trying the bar harbours?—I had tried one of these before, and always got damage. I thought I had better risk trying further north.

23,093. (*Capt. Washington.*) You said that if you go to Bridlington, they make you pay. You mean, if you go into the inner harbour, not for anchoring?—If we get caught in the bay, and cannot get out, what must we do? We must go for the harbour.

23,094. Have you ever laid there with a great many vessels?—With between 600 and 700 sail of light ships.

23,095. Have you been detained there for any time?—About a fortnight.

23,096. How do the vessels get supplies?—We had to go ashore and take the bread bag to the bakers, and leave it at the shops, sometimes three or four days before we could get it at all, and when we got it it burnt our backs. We took the beef off just cold; sometimes took it off warm.

23,097. What I meant is this,—is the inner harbour sufficient to supply such a fleet of ships, or could anything be done on the north beach by which you could more easily land and approach the town?—I don't think so. You see 500 ships is a serious affair.

FILEY.

Mr. W. Dodds.

25 Oct. 1858.

Capt. Washington.

There are a good many now, at least 5,000, perhaps. I don't see that anything at all can be done. We pay passing toll every voyage going south, both for that place and Whitby, which is of no use all. I would take and block them both up.

23,098. Could you point out how the bay could be made use of at Bridlington ?—I could not. The bay runs shallow from the piers. I think if we had a good refuge harbour here they would not come into Bridlington, but would always come down here instead. You could always get out of Bridlington Bay, and get down into this by taking the ebb tide, and fetch down into this bay.

23,099. You think that many of the ships that now take refuge in Bridlington would, if there was a refuge here, come to Filey Bay ?—They would proceed the first tide to get into a proper and safe position.

23,100. There would be light vessels coming northward ?—Yes ; for vessels going south you can almost always get worked up under Speeton Cliff ; but when you get to the Head the wind is more southerly. It is not often you see laden vessels in Bridlington Bay, only when the wind is north. I have been with a laden vessel when the wind was so strong from the north that we durst not run across the deeps, and waited till the weather moderated a little.

23,101. If these vessels came to a refuge in Filey, and if the wind came free out to go to the northward, could they get out and go away ?—A light ship could always work out of Filey, because there is plenty of room to turn out.

23,102. You think there would be no difficulty ?—Not at all ; not in the least.

23,103. Did you not say you were forced to run into Hartlepool Bay under some difficulties once ?—Twice.

23,104. Why did you go there ?—Because I was caught by the sea one time, and run down for the harbour with a laden ship in a gale, the same as everybody else.

23,105. Were you bound there ?—I was bound south.

23,106. Why did you run to Hartlepool Bay ?—Because the ship was making a little water, and I thought I should get in as well as the rest. I did, but I got all smashed to pieces.

23,107. The upper works ?—Yes ; all about the top and the keel, all amongst the stones aback of the pier ; we got the keel all knocked to pieces.

23,108. Were there a great many ships in the bay at the time ?—A great many ships in the entrance of the harbour, not in the bay, inside the piers of the channel.

23,109. What took them all there ; were they bound for that port ?—No ; bearing up from the Yorkshire coast, some from the southward of the head, some from one place, and some from another.

23,110. Could they have got farther north ?—They could if they had laid their ships off to sea.

23,111. But they thought the bay sufficiently safe to run for ?—I don't know why they run down there. I did not think it sufficiently safe, but thinking it might be a dirty night I thought it was better to try to be in there than go farther north.

23,112. Would it be a benefit to ships under these circumstances to have some refuge provided ?—Decidedly it would be, if there could be a refuge ; but I don't see any refuge in Tees Bay, the sea breaks off so far. The second day after we got on the ship ; having discharged our cargo, we got on the ship—a brig, they called the *Dublin*, of Whitby, came round, and she was knocked down by the sea before she could come to Hartlepool Bar. She was nearly under water before she came to the bar, and when she got to the bar of the old harbour she laid down. The life-boat was ready and got two or three of the crew out, but most of them were lost.

23,113. What time of tide was it ?—Two thirds flood or ebb.

23,114. Could she not take the bar ?—She was knocked down by the sea, and making water, I expect. She hardly even reached the shallow water outside the pier. She laid down as she came to the bank outside the pier—laid down with her yards in the water. The life-boat got away in time to take off two or three of crew.

23,115. She was leaking badly, I suppose ?—I expect so.

23,116. (*Capt. Sulivan.*) Surely if there had been a refuge harbour at Hartlepool the whole of them might have been saved ?—She was knocked down by the sea.

23,117. If the piers were in a line with the outer pier of the Heugh that would have saved her, would it not ?—They might be a good deal better than they are, and there is no doubt they are making them better.

23,118. You spoke of the light colliers in Bridlington Bay. Which winds prevail most on that coast for the longest time ; south and south-west or north and north-west ?—It used to be about north-west and south-east, but lately them come any way—sometimes one way and sometimes another.

23,119. Do the south and south-west winds blow longer during the year than the others ?—In the winter months I believe we have the wind more from the south-east than in any other direction.

23,120. If so many vessels congregate in Bridlington Bay, bound northward, would not that make it pretty certain that there would be an equal number of laden vessels, bound south, as frequently glad to take refuge in a harbour on this side of Flamborough Head ?—Decidedly. If there was a harbour on this side both light and laden vessels would take refuge.

23,121. But more especially laden ?—Yes, more especially laden, because there would be no chance of getting round the head with a south-east gale.

23,122. On the average, there must be as many laden vessels hanging on this side of Flamborough Head as light vessels on the other ?—On the average, throughout the year, there will be the same each way ; there will be the same number backward and forward.

23,123. Would not that show that a harbour on this side of the head would be equally valuable as the anchorage on the south side now is to light vessels ?—More valuable, because it would be of advantage to light vessels, which would never ride more than one tide in Bridlington Bay.

23,124. You were asked if your colliers could get out of Filey Bay to the north with southerly winds, and you said they could work out. If there was an opening in the north part of the breakwater, so as to give them a fair wind out with south and south-west winds, would not that obviate the difficulty ?—There is plenty of room to work without.

23,125. But it would be an advantage if a light collier could go to the north, or a laden one to the south, without having to work out ?—I think it would be an advantage.

23,126. Would that remove all the difficulty as to light colliers getting to sea with south winds if they come in now ?—They could get to sea without that. There is plenty of room for a ship to work out without that.

Mr. Richard Elders examined.

Mr. R. Elders.

23,127. (*Chairman.*) You reside at Scarborough ?—Yes.

23,128. How long have you followed the sea ?—About 40 years.

23,129. For how many years have you commanded vessels ?—For 12 years.

23,130. In what trade were the vessels which you commanded chiefly employed ?—The coasting trade.

23,131. What description of vessels have you generally commanded ?—Schooners.

23,132. Have you heard the evidence of the previous witness, from Scarborough, Mr. Dodd ?—Yes.

FILEY.

Mr. R. Elders.

25 Oct. 1858.

23,133. Do you generally concur with what he has stated ?—Yes.

23,134. Is there any point in which you differ from him, or what you think he has omitted which you would like to state ?—There is nothing that I know of.

23,135. Have you been at anchor under Speeton Cliffs ?—Yes, different times.

23,136. Have you ever been there in bad weather ?—Yes.

23,137. Have you ever been blown off?—I have been obliged to get my anchor and run away.

23,138. From the wind coming round ?—Yes, from the south-east.

23,139. Would you put a harbour of refuge at Filey ?—Decidedly so.

23,140. Why ?—Because I think it the most proper place. It would be preferable to any other part in the north.

23,141. Why would it be preferable here ?—I have been going to sea often from the northern ports. With the wind north-west we can always reach up here, and when we reach the head we are often met by the wind coming south-south-west and that way.

23,142. If there was to be a second harbour, where would you put it; or would you improve the three harbours of the Tyne, the Tees, and the Wear ?—I cannot say anything about them.

23,143. You have no experience on that point ?—Not in regard to that.

23,144. And you would rather not give an opinion?—I had rather not.

23,145. (*Mr. Lindsay.*) Have you anchored all over this bay ?—Yes.

23,146. What kind of holding ground is it ?—Very good, where I used to bring up.

23,147. Where was that ?—Where the boats generally ride, in the bight of the Spittles.

23,148. What is the nature of the ground, is it clay or sand ?—It is clay.

23,149. Blue clay ?—Yes.

23,150. If there is only one harbour to be made, you would prefer a harbour here in Filey Bay to one anywhere else along the coast ?—Yes.

23,151. Do you think a harbour here would do more to save life and property than one down in the bight of the bay, say down about Hartlepool Bay ?—So far as my experience tells me, it would be preferable here.

23,152. Do you speak from experience ?—I do speak from experience so far.

23,153. You think it would do more to save life here ?—I think so, both life and property.

23,154. After making a harbour here, if it were desirable to make another harbour where would you put it ?—I don't know, I am sure, where I should choose then.

23,155. Are you prepared to say anything about that ?—Not in regard to any other place.

23,156. Do you know Tees Bay ?—No ; I never was down there much. I have been off Old Hartlepool once or twice.

23,157. But you don't know it sufficiently to offer an opinion ?—No.

Mr. JAMES SKERRY examined.

Mr. J. Skerry.

23,158. (*Chairman.*) You belong to Scarborough ? Yes.

23,159. Do you follow the sea ?—Yes.

23,160. For how many years have you been at sea?—For forty-two years.

23,161. For how many years have you been in command of vessels ?—Twenty-nine years, nearly thirty.

23,162. In what trade were the vessels which you have commanded chiefly employed ?—In the coasting, the Baltic, the Mediterranean, and the American trades.

23,163. Have you given up the sea now ?—No.

23,164. How many voyages may you have made from the Baltic ?—25 or 26 altogether.

23,165. In making them home, for what port were you generally bound ?—Different ports; Scotch ports; in fact all the ports along the coast almost.

23,166. What is the northermost port you have ever been bound to ?—Leith.

23,167. Coming across from the Baltic in the fall of the year, have you ever made the landfall to the north of the firth ?—Yes ; I have been through the Pentland Firth; I have made the land there, and gone through there if bound to the other side of the land.

23,168. But I mean when homeward bound for London, did you ever make the landfall to the north of the firth ?—In general St. Abb's Head. I never was but once at Leith from the Baltic.

23,169. Generally speaking, to what ports were you bound from the Baltic ?—Hull, Newcastle, and London.

23,170. When bound to Newcastle, where did you generally make the land fall ?—Some part of the Yorkshire land.

23,171. You say you have been north-about ?—Yes.

23,172. Often ?—Two or three times.

23,173. There is a question as to a harbour of refuge either at Peterhead or Wick; which do you think would be most useful for ships bound north-about ?—I should give the preference to Wick.

23,174. Will you give your reasons ?—I think it is more in the bight where ships fall with the easterly gales. Another thing is, that I think it would be more acceptable to a vessel which is bound through the firth. Many times it is blowing a gale from the north and east, and a ship cannot get into it. If there were a harbour of refuge they would take it.

23,175. You think the use of this harbour would be for them to hold on until there was a fair wind ?—Yes.

23,176. In such a case, though very useful, it would be necessary to the saving of life ?—Of course it would save life.

23,177. Is there any case in which you are disposed to say, that the harbour at Wick would be useful for vessels bound through the firth, as a means of saving life ?—No doubt. In many instances where they durst not take the firth they might get into a harbour of refuge, and save life and the ship also.

23,178. In what way ?—Say, for instance, bound close down with the wind from the south-east, blowing a gale of wind. The tide is somehow running so rapidly that a ship dare not take the firth. Perhaps before they could get a favourable tide the ship might be on shore, or blown to the northward.

23,179. What is to prevent the ship being hove to, and waiting for the turn of tide ?—She would drive to leeward.

23,180. What is prevent her heaving to in time ?—She might heave to in time.

23,181. What would prevent her shortening sail in time, so as to hit the right time of tide ?—She might sometimes do that, but you cannot do so at all times.

23,182. Do you think it would frequently happen that a vessel would be forced into the firth, whether she liked or not, against a weather tide ?—Many times.

23,183. As respects a harbour of refuge on this coast, where would you put it ?—At Filey.

23,184. And why ?—For the same reason the other witnesses have given ; on account of Flamborough Head being a prominent part of the coast, and so many vessels always accumulating about there.

23,185. You have no doubt it would save a great deal of life and property ?—There is no doubt about it.

23,186. Supposing there was to be another harbour,

FILEY.

Mr. J. Skerry.

25 Oct. 1858.

Chairman.

where would you put it; or would you prefer trying to improve the three harbours of the Tyne, the Tees, and the Wear?—If that could be done it might do, but I should be rather afraid of that.

23,187. You have great doubts whether that could be done?—Not with safety for any vessel with a great draught of water.

23,188. If we could get 16 feet at low-water spring tides, would that serve your purpose?—If it could be done; but I should dispute that myself. Shields harbour is a very dangerous harbour to take, and would be so even if it had 16 feet of water in it; and it is most dangerous with the wind from south-east, east-south-east, and so on.

23,189. Have you ever taken it in bad weather?—Yes, many times.

23,190. Have you ever risked ship and life?—I have been in risk, but never fell in with any accident. I always got safe in, but often with a very heavy sea. It was with light ships.

23,191. Will you give an instance?—I don't know that I can now. I have gone in many and many a time; never with a loaded ship, always with a light ship.

23,192. Supposing there was a good harbour of refuge at Wick, and you were going to make your passage north about, and reached the entrance of the firth with a strong east-south-east gale, would you attempt to avail yourself of the fair wind to run through the firth, or would you go into the harbour?—Of course I should if it was prudent to do so. The wind at south by east is right through.

23,193. Why would you run?—To make my passage.

23,194. (*Mr. Lindsay.*) I think you said you would prefer Wick because it is down in a bight?—I did.

23,195. And you prefer Filey because it is close to a promontory?—Yes.

23,196. Why do you prefer the bight in one case and the headland in another?—There are many instances of a ship coming from the north from Archangel bound to the Firth of Forth that gets to leeward with the wind east-south-east and cannot get round Buchan Ness. They are jammed completely, and there is nothing but the firth they can run up. They could get a place of safety even there.

23,197. Is Long Hope a good anchorage?—Yes; it is a beautiful place when you get in, but it is very dangerous sometimes to get there.

23,198. Do you think any harbour could have a better anchorage than that one?—The only difficulty in getting in is the tide, which runs out so fearfully.

23,199. When you are down in the bight of the bay you have Long Hope to run for?—A loaded vessel would sometimes be foundered before she could get there if it were blowing a heavy gale.

23,200. Would you have any hesitation in going through the Pentland Firth with a south-east gale and an ebb tide?—Sometimes in a heavy gale I should; with the tide with me, of course not.

23,201. But with a flood tide and a gale of wind from the south-south-east?—With a strong spring flood, particularly in a laden ship, there is not one vessel in a hundred that would live.

23,202. When caught in the bight of Tees Bay, is there any harbour like Long Hope or any other place of refuge to go to?—No; but there would be a harbour of refuge, if we had one built, that would be as good as Long Hope.

23,203. I am speaking now of the bight of the bay. You preferred the bight of the bay in the case of Wick, where you have Long Hope to go to; but you do not prefer the bight of the bay on this coast, where you have no anchorage to go to where you can find shelter in easterly winds. Why prefer it in the one case, and not in the other?—I prefer Filey because it is central. Ships, both light and laden, are all caught about Flamborough Head. In general, more ships accumulate together at a time, and make it very dangerous, particularly for laden ships. I have been many times for days and days beating off Flamborough Head at the risk of being run down—many times when, if there had been a place of refuge, we should have taken it, and laid in comparative safety, particularly now, when there are so many steam-boats on the coast that it is dangerous for laden vessels to lie there.

23,204. Do you desire a harbour of refuge here on account of the danger of collision, or on account of the danger of being caught on a lee shore?—On both accounts.

23,205. Say that a harbour were made here, and that it was considered desirable to make a second harbour between this and the Farn Islands, where would you put that second harbour?—I should myself give the preference to Redcar. If it were possible to have a second harbour made, there, I think, would be the most suitable place.

23,206. You would prefer Redcar to Hartlepool Bay?—I should.

23,207. Why do you do so?—There is more water, and there would be no fear of the harbour silting up. I think there is not so much danger of the sea running so heavy in the deep water as when you get into Tees Bay.

23,208. Is the sea very heavy and dangerous in Hartlepool Bay in seven fathoms?—I have seen it break in 10 fathoms there.

23,209. Have you ever seen the sea break in 10 fathoms anywhere else, at any other part of the coast?—Yes, very many times along the coast. It breaks off Scarborough in 15 or 20 fathoms sometimes, with heavy gales from the east. That is a rare case, in very extraordinary gales; but in Tees Bay at any time in nine or ten fathoms. In a gale from the east-south-east or the east-north-east the sea breaks most tremendously.

23,210. Do you say that the sea breaks in 10 fathoms to the east of Hartlepool more heavily than at any other part of the coast?—I don't say Hartlepool, but Tees Bay.

23,211. You mean to tell me that you think the sea breaks more heavily in 10 fathoms as you approach Tees Bay than it would break in 10 fathoms water approaching Filey, approaching the Tyne, approaching Scarborough, or approaching any other part of the coast?—I think I should almost say so. The tide drawing from the Tees sets so strong out in the bay, meeting the easterly sea coming in, that it causes it to break further out. There is no disputing it.

23,212. (*Capt. Sulivan.*) You described the state of the weather and the tide that would make it advisable for a vessel to go into Wick; a south-east gale and a flood tide. Could a vessel, under these circumstances, possibly cross that tide and go into Long Hope?—It is very dangerous. They might do it. It is possible.

23,213. Could a vessel do it with safety?—Not with safety.

23,214. Then, under these circumstances, Long Hope would not be a harbour of refuge for vessels so situated?—They durst not attempt it.

23,215. In coming from the westward would vessels bound up to the southward, and meeting heavy gales from the south-east and east between Peterhead and the Pentland Firth, be placed much in the same position, and, having the firth under their lee, have no alternative but to go back either to the firth, or go into Wick, if there was a harbour there?—Of course they would go into Wick.

23,216. At present are vessels that come through the firth liable to be caught there in a dangerous position if they get south-east gales?—Not so; because if they get it in the tideway it is possible that the gale is so heavy that they may tack and go away to the northward, to the Orkney Islands, if the wind is at south-east.

23,217. You mean go back to the Orkneys?—Yes, rather than attempt the firth again.

23,218. But for vessels in that position would Wick be a very good place of refuge?—Of course it would, equally the same as it will with the wind anywhere

FILEY.

Mr. J. Sherry.

25 Oct. 1858.

from the east or east-north-east, and you right from the place.

23,219. If you know that vessels of 1,000 tons take refuge in Scarborough Roads at the west entrance of the Pentland Firth, would that be a reason, do you think, why a harbour at the east end also would be very much used by vessels if it should be made?—I have no doubt of it. Scarborough Roads is a beautiful place. It is almost a harbour of refuge with certain winds.

23,220. Does that show that a safe harbour of refuge at the other end of the firth, if there were one, would be very valuable, and that a large number of vessels would use it?—No doubt of it—vessels bound there away with gales from the south and east.

23,221. Do you know any place through which you have taken a vessel more dangerous than the Pentland Firth?—I have been pooped two or three times; the last time with a heavy-laden vessel.

23,222. (*Chairman.*) What sized vessels have you generally commanded?—The one I was then going through with was 286 tons.

23,223. And the other?—The last one was 236 tons.

23,224. How have they been laden?—With all sorts of cargoes.

23,225. What is the worst cargo you ever carried?—I mean to say that railway iron is the worst, and the deepest too.

23,226. Was your vessel very deep then?—Yes, very deep.

23,227. Was she a brig or a schooner?—A brig.

23,228. If you were out in the North Sea in bad weather with a cargo of that kind in a heavy gale, which would it be safest to do—to sail or to lie to?—As to that, I should be guided by circumstances. Of course, if the vessel would lie to, by all means I should lie her to.

23,229. I am talking of this vessel with railway iron on board?—I should lay her to, if I durst not run. I should forereach her under two close-reefed topsails.

23,230. If the wind was blowing so hard that you could not carry close-reefed topsails?—I generally make it a practice of carrying two close-reefed topsails, if possible, and never but once have been put off it.

23,231. On that occasion, when you were put off it, was it safer to heave to, or to run?—I deemed it safer to heave her to.

23,232. Leaving that particular vessel, what would you say as to the general run of vessels employed in the coasting trade if deeply laden? Is it safer in very heavy weather, when there is lots of sea-room, to heave them to or to run?—They generally run back for harbours of refuge.

23,233. I am not talking of what they generally do. Supposing they had no harbour to run for, and these vessels have lots of sea-room, but that it is blowing so hard that there is a question as to the safety of the vessel; which is the best thing for saving the vessel and life, to heave to or to run?—I should say heave the vessel to by all means,—not heave them to, but if they will forereach, let them forereach.

23,234. But if you cannot carry sail with which they can forereach, is it then safer to run vessels or to heave them to?—I should say, heave them to; because the sea is generally so heavy it would wash everything away.

Mr. JOHN RUDDOCK examined.

Mr. J. Ruddock.

23,235. (*Chairman.*) You reside at Filey?—Yes.

23,236. Have you followed the sea?—Yes; I went to sea when I was nine years of age, and I am 60 now.

23,237. For how many years did you command vessels?—Only seven, and they were small vessels.

23,238. In what trade were the vessels employed that you principally served in?—I have been 30 years in the coal trade.

23,239. For how long were you mate before you were captain?—Only a few months mate.

23,240. You have been here all to-day?—Yes.

23,241. Do you generally agree with the other witnesses as to Filey being the best place for a harbour of refuge?—Yes. There is not another such place on the eastern coast of England. It is formed by nature.

23,242. Do you agree with the reasons the other witnesses have given us, or have you anything to tell us which we have not already heard?—No; I cannot say I have. I know it is a fine bay. I have delivered 30 cargoes of coals here in six months, coming regularly to the beach.

23,243. (*Mr. Lindsay.*) How many points of the compass is the bay open to?—Only $4\frac{1}{2}$.

23,244. Not from the cliff tops?—Filey Brigg bears east from us. We tried it by the compass, and Filey Brigg bears east from where we are sitting; no, not from where I am sitting—from the watch-house.

23,245. How does Flamborough Head bear?—South-east $\frac{1}{2}$ south; that is $4\frac{1}{2}$ points. It is only open to the sea $4\frac{1}{2}$ points out of 32.

23,246. What is the heaviest gale that blows in here?—From east-south-east to east-north-east.

23,247. Does the heaviest sea come in with these winds?—There is a heavy sea if the gale is heavy.

23,248. With a heavy gale from east-south-east is there a very heavy sea tumbling in here?—There is a heavy sea all over with a heavy gale.

23,249. If only one harbour is to be made you think Filey the best place for it?—Yes; I am sure of it. There is not a place to equal it on the east coast of England.

23,250. Tell me why you think so?—Because it is here where most ships are detained after leaving the ports with a favourable opportunity; eight or ten hours bring them here. Then if the wind blows hard against them they cannot get round the head and lie under Speeton Cliffs. I have laid under the cliffs for many and many days, and then have driven as far north as St. Abb's Head.

23,251. The wind chopped round when you were lying there?—Yes.

23,252. And you were obliged to cut, and run for it?—Yes, we used hemp cables. They slip now. We cut them.

23,253. Is it often the case, in your experience, that vessels anchored under Speeton Cliffs when the wind comes suddenly round are obliged to slip their cables and run?—Yes, and run for the northern ports; sometimes for Leith Roads.

23,254. Is there any place to run for down in the bight of the bay? Do you think another harbour would be desirable?—Hartlepool was not much of a port then.

23,255. Is there any place for them to go to? Say Filey was made into a harbour of refuge, do you think, considering the trade going along the coast, it would be necessary to have another harbour of refuge as well?—It would be all the better if there was one.

23,256. Where would you have that?—I should recommend Redcar.

23,257. You prefer Redcar to Hartlepool?—Yes. Hartlepool is nothing but a breaking-up yard.

23,258. Why do you object to Hartlepool?—Because the water is so shallow, and there is such a strong current coming out of the Tees, setting down upon it. There would be none at Redcar.

23,259. You think it is the stream of the Tees setting out so that causes the unsually heavy sea in that part?—Yes. With an east sea going in, and a strong tide coming out, it makes the sea very heavy at Hartlepool. The water is very shallow, and just at the back of the Salt Scars it is very deep. Redcar will not silt up, and Hartlepool will.

FILEY.

Mr. J. Ruddock.

25 Oct. 1858.

23,260. How long is it since you gave up the sea —About 12 years.

23,261. Are you a resident of Filey ?—Yes.

23,262. Have you any occupation at Filey ? — No.

23,263. I ask the question because I see you have a medal. What is that for ?—It is for being in the arctic regions. I was with Sir J. Parry and Captain Ross, on board the *Fury*. I was captain of the main top.

Mr. Lindsay.

Mr. Thomas Richardson examined.

Mr. T. Richardson.

23,264. (*Chairman.*) Do you reside at Filey ?—Yes.

23,265. Have you followed the sea ?—Yes.

23,266. For how many years ?—Ever since the year 1820.

23,267. For how many years have you commanded vessels ?—For nearly 30 years.

23,268. In what trade were they chiefly employed ? —In my youthful time, in 1829, I went master of a fishing boat.

23,269. Since then ?—Since then I went master of a collier brig, and for the last 10 years I have been employed in the coal trade and the Baltic trade.

23,270. How many voyages have you made home from the Baltic ?—Ten from Petersburg.

23,271. Have you come home late in the year ?— I have come home very late.

23,272. Bound where to ?—Hull or London.

23,273. I don't ask you where you endeavoured to make your landfall, but where, as a general rule, you actually do make it ?—I always endeavoured to make it at Flamborough Head.

23,274. I want to know where you actually did make it ?—I always made it there.

23,275. You have heard the evidence of the previous witnesses as to Filey Bay being the best place for a harbour of refuge, do you concur with them ?— Yes.

23,276. Are your reasons the same as theirs ?—Oh yes.

23,277. Have you anything in addition to tell us that we have not heard from them ?—Oh, yes. I have been for the last 10 years commanding vessels which have drawn 15 feet water, and which have been driven for eight or ten days up and down this coast for want of a harbour to go into.

23,278. But why did you not go into the Tyne, for instance ?—Because there is not sufficient water.

23,279. Not at half flood ?—No.

23,280. Not at high water ?—Not at high water.

23,281. Could you not have gone into Hartlepool ? —No, that is worse still.

23,282. Supposing we had a harbour here, would you think it desirable to try to improve the three ports of the Tyne, the Tees, and the Wear, or would you like to have another harbour made in the bottom of Tees Bay ? — I should endeavour to improve the three ports.

23,283. For what reason ?—Because I think it would be preferable to having a harbour in Tees Bay ; because when I went to sea I always detested being near Tees Bay.

23,284. Why ?—Because it is an unsafe place.

23,285. Is there a great draught into it ?—Yes, there is.

23,286. (*Sir F. Smith.*) What draught of water were the vessels which you have commanded ?—For the last 10 years I have commanded a vessel drawing 15 feet, laden with coals.

23,287. What water is there over the bar at the Tyne at low water, spring tides ?—At what place ?

23,288. Over the bar at the Tyne. Shields Bar ?— About five or six feet.

23,289. What is the rise of the tide ?—Seventeen or 18 feet ; sometimes 20 feet.

23,290. Would not that be enough for your other brig ?—Not in a gale of wind.

23,291. How much would you want besides your draught ?—It would not be safe for a vessel of my draught to take any of the northern ports ; not any of them.

23,292. (*Mr. Lindsay.*) Had the vessel in which you were knocking about for 10 days, 15 feet draught ? —Yes.

23,293. And you thought she was drawing too much to take any of the harbours in the bight of the bay with safety ?—Decidedly so.

23,294. If they were deepened, so as to give 16 or 18 feet at low-water spring tides, would you have any hesitation in taking the Tyne with your vessel ?—If the three harbours could be improved so as to give access at all times of the tide, I should say, improve them.

23,295. Would you have any hesitation in running for any one of these harbours if there was plenty of depth of water ?—No ; if it was a suitable time to run.

23,296. But would you have any hesitation, under ordinary circumstances, in running for any of these harbours ? Take, for instance, the Tyne. Would you have any hesitation in running for the Tyne during a gale of wind, and during the ebb tide, under ordinary circumstances ?—With an ebb tide.

23,297. You still would ?—Yes.

23,298. You would not consider it safe, even, if the Tyne were deepened to 18 feet at low water, to run for Shields with an ebb tide and an easterly gale of wind ?—I should consider it unsafe.

23,299. Tell me why ?—In running with a laden ship into one of these harbours, with an ebb tide, there is a tide runs out, such as you can hardly force an ordinary vessel against, and that being the case you would be so long detained in the broken water.

23,300. Say the tideway running with the force of three knots an hour, and the wind blowing a strong gale in, and you were obliged to seek refuge ; would you consider it dangerous to take it under those circumstances ?—If I could keep to sea, I should prefer it.

23,301. Say there was to be a second harbour made, do I understand that you would prefer Redcar to Hartlepool Bay ?—Yes. I should prefer Redcar to Hartlepool Bay.

23,302. Why would you prefer Redcar ?—Because I think there is more water.

23,303. Is there any other reason ?—No, I don't know any other reason, further than there being more water.

23,304. Did you hear what the other witnesses stated about the great danger being to laden vessels ? —Yes.

23,305. Do you agree with them ?—I do.

23,306. You consider it of the first importance to provide for the safety of the laden vessels before the light ones ?—Yes, provide for the laden vessels, by all means. There is not so much danger in light vessels.

23,307. If the Tyne be deepened, as they purpose to deepen it, to 15 feet at low water, would that become a good harbour of refuge for light vessels ?—Oh yes.

23,308. How soon would you venture in with your vessel, which draws 15 feet, if the Tyne were deepened to 15 feet ?—I would venture about the last quarter flood.

23,309. Not before ?—No.

23,310. If the Tyne were deepened to 15 feet, and you were off there in a heavy gale, right on shore, wanting refuge, would you risk taking the Tyne against the ebb tide, or prefer bearing up for the Forth ?—I should prefer bearing up for the Forth if the wind were suitable, so that I could go away.

23,311. Rather than take the Tyne, even if it were deepened ?—Rather than take the Tyne with the ebb tide.

23,312. What is the greatest number of vessels you

have ever seen assembled under and round Flamborough Head ?—I have been in company with 400 or 500 sail, dodging about and buoying up together.

23,313. Have you known any cases within your own knowledge in which vessels that have been off Flamborough Head, after bearing up, have been wrecked ?—Yes.

23,314. Will you mention any cases ?—I cannot mention the names of any vessels that have borne up and been wrecked at the time I have been under the Head myself.

23,315. Have you known any instance of large numbers of vessels being scattered and driven back away to the northward ?—Oh yes, frequently; when the wind begins to easter they get under weigh, and reach to the northward and the eastward.

23,316. Have you ever been driven back yourself more than once on the same voyage ?—Yes, twice, but not on the same voyage. I have been twice off Flamborough Head, and bore away for Leith, but the weather moderated before I reached it, and so I kept to sea.

23,317. Do you know whether it is the case that deep-laden colliers caught in heavy weather off the head often get leaky and in great danger, and are in want of a harbour before they can run far back ?—Oh yes, a great many.

23,318. Do you know any cases of your own knowledge ?—I have heard tell of several instances of vessels getting leaky off Flamborough Head, and having to bear up for the northern ports, because they could not keep to sea.

23,319. Do you know any cases of vessels foundering or being run ashore in a leaky condition to save them from foundering ?—I have been coming into Shields harbour with vessels that have borne up to the southward, and have been wrecked as they went in. I have been going in light at the same time that they have been.

23,320. If a harbour were built at Hartlepool, would not that do away with your great objection to its being a breaking-up place by vessels getting foul of each other ?—I never did bear up for Hartlepool.

23,321. Would you have any hesitation in bearing up for Hartlepool if a harbour were made there ; that is, if you were so far to leeward that you could not fetch out of the bay ?—If I was so far to leeward I should be obliged to bear up for the place.

23,322. In such a case would it not be of great use ?—It is quite necessary if a ship gets embayed. It would be very acceptable to vessels in that position.

23,323. Filey would not be of any use to vessels in the bay ?—I should consider that a harbour of refuge in Tees Bay would be of not much use to one here.

23,324. You say that to vessels embayed, and that could not get out, Filey would be of no use ?—If they were embayed in Tees Bay, Filey would be of no use.

23,325. Or embayed in the bight around the high land at Whitby, somewhere between Whitby and Sunderland, in that large bay, they could not get out if there was an easterly gale ?—No, not very well.

23,326. For these vessels a harbour in the bight of the Tees would be very valuable ?—Yes ; but a vessel caught to the north of Whitby could not get round there.

23,327. Do you consider that Filey would take a much larger number of laden vessels than a harbour in the depth of the bay would do ?—Yes, I think ten to one, because there is not such another place all along the coast where so many vessels get together as off Flamborough Head.

Mr. GEORGE RICHARDSON examined.

23,328. (*Chairman.*) Where do you reside ?—At Filey.

23,329. Are you following the sea ?—Yes.

23,330. How long have you been at sea ?—About 28 years.

23,331. How long have you been in command of vessels ?—Thirteen years.

23,332. In what trade have the vessels which you commanded been chiefly employed ?—Chiefly from Shields to London, and other parts of the coast, France, and different places.

23,333. Have you been present during this inquiry? —Yes.

23,334. What, in your opinion, is the best place for a harbour of refuge ?—I think this, decidedly.

23,335. Will you give me your reasons ?—I have experienced many a gale off Flamborough Head, and had to put off below Dimlington to go to the northward of Flamborough for shelter, and then been obliged to put to sea with the wind easterly.

23,336. How far to the north have you been driven for want of a harbour of refuge ?—I have been driven to the north many a time ; once particularly, when I took Shields. Once I have put into Leith : but many a time I have never put into any of the ports, for the weather has been better before I got so far.

23,337. How far to the north have you ever been driven ?—With a laden ship I once got nearly to Leith Roads. I have been under Speeton Cliffs a long time.

23,338. Waiting for the wind ?—Yes ; upon about 10 days on the passage.

23,339. What is the danger of lying under Speeton Cliffs ?—The danger is the wind eastering on us, so that we are obliged to put to sea.

23,340. Supposing you had a harbour at Filey, what would you prefer next in addition to that, our improving the three harbours at the Tyne, the Tees, and the Wear, or making one large harbour down in Tees Bay ?—These last seven years I have been master of a vessel trading from Filey to Hartlepool and the different ports north for coals, and it is very desirable that there should be one in the Tees ; some part about Redcar.

23,341. Why do you prefer Redcar ?—Because I think that at the mouth of the Tees the sand grows up, and alters it very much.

23,342. Therefore it is on account of the silting up at the bottom of the bay that you would prefer Redcar ? —Oh yes.

23,343. For any other reason ?—No ; but it is clear of all shoals. The sands are down at the north end, the bottom of the bay.

Mr. RICHARD WHITE examined.

23,344. (*Chairman.*) You are in command of the coast guard party at Filey, are you not ?—Yes.

23,345. How long have you held that appointment ? —For 19 years at Filey.

23,346. Previous to that, where were you stationed? —I have been at Marske, Flamborough Head, and Scarborough.

23,347. You have been on this district of the coast how long ?—For 40 years.

23,348. You have been present during the greater part of the day ?—I have.

23,349. And you have heard the evidence which has been given to us ?—Yes.

23,350. Have you any remarks to make ?—No.

23,351. Do you generally agree in the opinion that Filey is the best place ?—I do.

23,352. For the same reasons that the other witnesses have argued in its favour ?—Exactly the same.

23,353. You have nothing to offer further in addition ?—No.

23,354. (*Mr. Lindsay.*) During your long experience on this coast, how many vessels have you seen off Flamborough Head and in the bight of the bay, dodging and at anchor ?—Frequently between 300 and 400.

FILEY.

Mr. R. White.

25 Oct. 1858.

Mr. Lindsay.

23,355. When you say frequently, how many times in the course of the year ?—That depends on the continuance of southerly winds.

23,356. Taking an average year ?—Perhaps three or four times in the year ; that is, in the winter time chiefly.

23,357. How many of that number would be at anchor ?—Perhaps half at anchor, and half dodging.

23,358. Have you known them often, when at anchor, been obliged to ship ?—Frequently ; a great number of anchors are recovered.

23,359. Does the wind come round so suddenly that they are obliged to leave their anchors ?—Sometimes, and sometimes it comes on gradually.

23,360. Do you know the anchorage in the bight ? —Very well.

23,361. What kind of ground is it ?—Excellent holding ground.

23,362. What description of soil ?—It is clay.

23,363. Any sand ?—A little, but not much.

23,364. Surface sand ?—Surface sand.

23,365. You say you were stationed at Marske for some time ?—Yes.

23,366. You will know that coast very well ?—I know Redcar very well.

23,367. If there is to be a second harbour of refuge ?—I should recommend Redcar.

23,368. Supposing the first they decided was to make a harbour at Filey, and that something more was wanted ; whether do you think the formation of a harbour at Redcar or the improvement of the existing harbours, so as to make them accessible at all times of the tide, would be of the most value ?—I think Redcar. There is depth of water there.

23,369. You think that would be better than improving the three harbours ?—I think so.

23,370. (*Capt. Washington.*) Are you acquainted with the river Tyne ?—Not a great deal. I have not been there these 40 years.

23,371. You are clearly of opinion that if one harbour of refuge is to be made on the coast it should be at Filey ?—Yes.

23,372. You think that would be the means of saving a great number of lives ?—I do, particularly in laden ships.

23,373. You have, I think, been 19 years at Filey? —Yes.

23,374. During that time have many wrecks occurred in the bay ?—Within the last 10 years there have been 14.

23,375. Any lives lost ?—In one vessel ; that is all, I think. The *Sphynx*, 14 years ago, broke up as soon as she struck the beach.

23,376. At that time was there a life-boat here ?— Oh, yes. We took the life-boat about the vessel, but she broke up before the life-boat got there. I believe the crew were all washed overboard before the vessel came to the beach.

23,377. What year was that ?—It is about 12 or 14 years ago ; I don't exactly remember the date. The vessel belonged to Dundee.

23,378. How many lives were lost on that occasion ?—I think there were seven persons on board the brig.

23,379. Has there been a life-boat here long ?— Since the year 1822.

23,380. Has that boat been the means of saving life ?—A great many.

23,381. Do you happen to know what number ?— Since I have been here she has saved 30 lives.

23,382. The boat is under your charge, I think ?— Yes.

23,383. Is she in good order, with everything complete in case of going off to a wreck ?—She is in excellent condition. I don't think there is another on the coast equal to her.

23,384. Can you always get assistance to launch her ?—Always : the fishermen are always very ready to assist in such cases.

23,385. (*Capt. Sulivan.*) I see she is one of the old boats. Have you ever had her swamped ?—No.

23,386. Does she run the water off when she fills ? —In a very few seconds.

23,386*a*. Have you ever turned her over ? Does she right of herself ?—We never did that.

(*Chairman.*) Are there any other parties present, who are interested in this inquiry, who wish to tender their evidence ?

No answer.

Sittings at Filey closed.

BRIDLINGTON.

Tuesday, 26th October 1858.

PRESENT :

Admiral Hope (Chairman).

Sir Frederic Smith.	Captain Sulivan.
Mr. Lindsay.	Captain Vetch.
Captain Washington.	Mr. Coode.

Mr. Evans, Secretary.

Mr. Thomas Prickett examined.

BRIDLINGTON.

Mr. T. Prickett.

26 Oct. 1858.

23,387. (*Chairman.*) You reside at Bridlington ?— I do.

23,388. Are you connected with the port in any official capacity ?—No.

23,389. On whose behalf do you appear now ?—On behalf of the committee appointed at a public meeting of the inhabitants of this place.

23,390. Will you now proceed with any statement you may wish to make on behalf of the committee ?—Perhaps, before the reading of the memorial which I have to present to you, you will allow me, in the first place, to express, on behalf of the inhabitants of the place, the great satisfaction they feel in receiving a visit from the Royal Harbour of Refuge Commission ; and, in the next place, I beg to express the very great pleasure which I feel in presenting to you the memorial which has been entrusted to me by the committee, appointed at a public meeting of the inhabitants, held in the Town Hall, on the 24th of October, 1858, for the purpose of bringing before you the capabilities of Bridlington bay as a harbour of refuge. Perhaps you will allow me to remark that the committee have no sordid views of self-interest in the matter ; they desire that the best possible shelter should be given to this shipping on the coast, wherever and in whatever locality that shelter can be best obtained, but they feel convinced that this fine bay of ours has claims, and claims of a superior nature, well deserving the particular notice and attention of the Royal Commissioners. They have felt it their duty respectfully to set forth these claims in the memorial which I hold in my hand, and which, if you will permit me, I will now read.

To the Royal Commission appointed to inquire into the best situation for a Harbour of Refuge.

The Memorial of the Committee appointed at a public Meeting of the Inhabitants of Bridlington, in the county of York, held in the Town Hall, Bridlington, on the 4th day of October, 1858, William Forth, Chief Lord of the Manor, presiding,

Humbly showeth,—

That your memorialists view with unfeigned satisfaction the labours of the Royal Commission to inquire into so desirable an object as the formation of a harbour of refuge on the east coast of England, and cannot but feel gratified that they have the honour of offering to your Royal Commission, within sight of so enviable a locality as the Bay of Bridlington, incontrovertible facts as evidence of its character, its importance, and its utility for the purpose of sheltering shipping property and of saving the lives of those whose heritage it is to plough the mighty deep.

Your memorialists respectfully submit, that the northern part of the Bay of Bridlington already naturally possesses, bounded as it is by the bold promontory of Flamborough Head, unprecedented shelter in stress of weather in many winds; that in its natural condition it has for many generations been, and annually now is, used as a place of refuge for thousands of both laden and light coasting and other vessels; that, from the prominence of the "Head," it is in the locality made for by vessels bound southward from the Baltic and other parts of the north of Europe; that it is accessible in every storm, and so materially sheltered by the Smithic Sand that vessels anchoring within the bay have that security which no other part of the north-eastern coast affords.

Viewing, then, its natural capabilities, it appears manifest to your memorialists that these, improved by the able engineering art of the present century, would render it capable of affording commodious and convenient shelter for nearly a thousand sail of ships in every storm. The formation of a breakwater on the Smithic Sand appears to them to be one means of accomplishing this desirable end, as it would enclose an area of water, with an entrance from the east and another from the south-south-west, more than sufficient for the present, and equal to the growing, mercantile necessities of our country. Nor must it be forgotten that, even with that shelter afforded, there is still on the west the Harbour of Bridlington, capable of affording additional shelter if required. It will be apparent that a harbour of refuge thus formed could be taken either by the eastern or southern entrance in every wind, and that vessels would also have the same facilities for egress, whenever it might be apparent that they could safely proceed for their respective ports of destination. The enlargement and improvement of the present harbour would be another means of giving the required protection.

BRIDLINGTON.

Mr. T. Prickett.

26 Oct. 1858.

Your memorialists have not prepared themselves with engineering plans and estimates of the cost of the breakwater, to the erection of which, as a means of saving life and property, they respectfully direct your attention, believing, as they do, that the interests at stake are not local nor particular, but general and national, and therefore claiming the paternal consideration of Government itself; and further, that such evidence is superfluous, your Honourable Commission being no doubt, by experience of similar works, well acquainted with the probable cost thereof. Neither will any evidence of a statistical character be laid before you, but that only of nautical men well acquainted with the coast, and the immediate locality under consideration in particular.

Your memorialists are highly sensible of the onerous position they occupy in counselling, by the evidence they are prepared to lay before your Royal Commission, your judgments on this important undertaking. Having no local interests to support, but approaching the subject for a national good, with a desire on behalf of humanity that the most suitable place on our shores should be selected, and being firmly impressed with the belief that Bridlington Bay possesses in its natural condition many advantages over other places claiming your consideration, your memorialists would be guilty of culpable remissness if they did not earnestly direct your attention thereto, and show in evidence that the erection of the proposed breakwater would have the effect of affording a safe rendezvous, not only for our mercantile marine, but for no inconsiderable portion of the British navy.

Your memorialists earnestly hope that your arduous labours in connection with this laudable and humane project will shortly come to a close by the selection of the most suitable locality; and they feel confident that the commencement of the erection of a harbour of refuge will be hailed with proud satisfaction by the many thousands of mariners who throng our eastern coast.

Your memorialists, therefore, humbly ask that the evidence they are prepared to tender may be heard, and that, though limited, yet capable of great extension, it may be duly entertained and considered by your Royal Commission.

And your memorialists will ever pray, as in duty bound, &c.

Mr. William Hopper examined.

Mr. W. Hopper.

23,391. (*Chairman.*) How long have you followed the sea?—Thirty-seven years.

23,392. How long is it since you came on shore?—Rather better than 12 months ago.

23,393. How many years did you command vessels?—Twenty-seven years.

23,394. In what trade were the vessels which you commanded chiefly employed?—Principally between the Tyne and the Thames; occasionally I have gone to the Baltic.

23,395. You are aware of the objects of the inquiry?—Yes.

23,396. Give any opinion which you may entertain as to the advantage or necessity of one harbour of refuge on this particular district of coast, that is between the Tyne and the Humber?—I think that Bridlington bay is the most eligible place on this coast for a harbour of refuge.

23,397. Will you state your reasons?—In the first place it is a promontory at Flamborough Head, which protects it from the north-east and north gales, which are the heaviest on this coast; another thing is, that it is accessible at all times, either night or day, and in thick weather it is accessible by heaving the lead; whereas, on the north side of Flamborough Head you cannot run into any port by the lead, because there are not soundings to the north of the Head.

23,398. The anchorage which you advocate under Flamborough Head would be of service to laden ships?—With a breakwater on the Smithic it would materially.

23,399. Have not laden ships, with the wind from the southward, very considerable difficulty in getting round the Head?—Not at all; I have known vessels drift round the Head with the flowing tide under close-reefed topsails, dodging round the Head; they do not like to bring up under Speeton cliff; we have nine hours flood, or more than that.

23,400. Running to the southward?—Yes.

23,401. Are you prepared to state that with the wind at south-south-east, or with the wind round at south, blowing hard, a vessel could get round the Head with a flood tide?—Yes.

23,402. And come round south and get into the bay?—Oh yes.

23,403. Have you ever done that?—Yes; I have many times come round the Head when all the ships were bringing up under Speeton cliff, because I was coming in to the harbour; if there were a harbour in the bay the vessels would come round into it; it is because they get shelter from the south that they stop there; it is not to say, they cannot get round Flamborough Head.

23,404. What depth have you at low water on the Smithic sand?—Two and a quarter fathoms.

23,405. With the wind blowing in from the south-east and south-south-east, is there much sea in Bridlington bay?—At high water there is; there is a strong sea, but at low water it is protected by the sand.

23,406. Can a ship lay there at high water in safety, if it is blowing hard?—If she have good ground tackle she could; I have ridden there when there was too much sea to take the harbour.

23,407. Ridden with safety?—Yes.

23,408. During the course of your experience, have you seen many ships riding out gales of wind from the south and the south-east, in Bridlington bay?

BRIDLINGTON.

Mr. W. Hopper.

26 Oct. 1858.

Chairman.

—Yes, about 20 sail rode out the gale about a week ago; those that did drive, their anchors were unstocked; the Filey people got up evidence showing that they drove with their anchors.

23,409. What wind makes the worst sea in the bay?—East-south-east.

23,410. That blows, in point of fact, right in?—Yes.

23,411. Between the sands and Flamborough Head?—It comes right over.

23,412. That makes the worst sea into the bay?—Yes, at high water; at low water it is sheltered by the sand.

23,413. During the gale the other day, was the wind in that quarter?—Not so much east.

23,414. And none of these vessels drove?—No, only one, a schooner; both her anchors were unstocked; one of the boatmen got them.

23,415. How many anchors had most of them down?—Two anchors.

23,416. What scope of cable?—Perhaps 70 or 80 fathoms on one anchor, and perhaps 40 on the other.

23,417. Is the tide strong in the bay, does it run round strong?—It does, stronger than it used to do; vessels lying at anchor now will tend to windward with a fresh wind, whereas I can recollect when they always rode head to wind.

23,418. What is the strength of the flood tide at the strongest?—Perhaps about 1½ knots.

23,419. Not more?—No.

23,420. These vessels rode out the flood as well as the ebb?—Yes, those which wished to ride; but those that wanted to slip and come for the harbour, came.

23,421. There were ships that rode out the flood as well as the ebb?—Yes, about 20 sail, or thereabouts.

23,422. Have you seen the same kind of thing before on any occasion?—Yes, several times, and never in my life knew of a vessel driving on shore with her anchors down.

23,423. You know the Downs?—Not well.

23,424. You have been there?—Yes.

23,425. You have been at anchor there in heavy weather?—Yes.

23,426. Comparing Bridlington bay with the Downs, which should you call the best shelter?—I would sooner take Bridlington bay than the Downs.

23,427. You would sooner ride out a gale in Bridlington bay, with the wind in, than you would in the Downs?—Yes.

23,428. (*Mr. Lindsay.*) Then Bridlington bay as it is, is an excellent anchorage in all winds?—It is at low water time.

23,429. You say you never knew a vessel to drive on shore in Bridlington bay, with a gale blowing right into it?—No.

23,430. Do not you call that a very excellent roadstead, as it is?—Yes, but still it wants protecting from the south-east winds; vessels ride with a deal of sea.

23,431. If you have never known ships to drive on shore with a gale blowing right in, what is the use of spending the public money for the purpose of affording better protection than what it has now got?—They want to ride a little smoother; they make plenty of water in riding out a gale.

23,432. You want the money, not for the safety of the ship, but the comfort of those on board?—The safety of those on board, because some men have not got nerve to ride it out in the bay; they slip and run for the shore.

23,433. Is the Smithic sand a shifting one?—No.

23,434. What is the depth of the sand?—I do not know.

23,435. What is the nature of the anchorage ground, is it clay?—Yes.

23,436. Blue clay?—Yes.

23,437. With regard to the harbour at Bridlington, what sized vessels can come in in a gale of wind?—Vessels of 200 tons and upwards.

23,438. Laden vessels?—Light vessels.

23,439. What depth of water have you in the harbour?—I do not know.

23,440. Say that one great harbour were to be made, and that it rested between Filey bay and Hartlepool bay, putting Bridlington altogether aside for the moment, whether should you prefer Filey bay or Hartlepool bay, all things considered?—I think a harbour at Hartlepool would be of greater service than one at Filey.

23,441. Tell me your reasons?—Because vessels in going out northward, if caught with an easterly wind, cannot weather south. In coming back they cannot weather Whitby, and they will have a harbour on their lee in Tees bay.

23,442. You think, all things considered, if there is only to be one harbour the Tees bay would be a better site for it than Filey bay?—Than Filey bay, I do.

23,443. What part of the bay do you prefer?—Hartlepool.

23,444. Have you often gone into Hartlepool with the wind blowing strong?—Yes.

23,445. Have you seen much broken water?—Yes. I was there on the 4th of January 1857, and saw a great deal of destruction.

23,446. How was that destruction caused?—It was caused by vessels running in for the harbour. They were struck by the sea, when, perhaps, I would say, they were in 8 or 10 fathoms. They were struck by the sea as I saw them going in; they became unmanageable, and four vessels foundered while I was standing on the pier.

23,447. If Hartlepool is so dangerous to take, on account of the broken water, why should you prefer it to Filey?—Because I think there would be as much damage done at Filey as at Hartlepool.

23,448. Does the water break there in the same way?—Yes, just the same.

23,449. Does it not break at Bridlington bay in the same manner?—No. It is low water when you get to the southward of the Head; you fall in with less sea.

23,450. Consequently with less broken water?—Yes, of course; the soundings get right down to the land.

23,451. If there were a harbour made at Filey and another at Hartlepool, would you have as much hesitation in running for the one at Filey, on account of the broken water, as you would have in running for the one at Hartlepool on the same account?—I should rather prefer taking Hartlepool.

23,452. In a gale of wind?—Yes.

23,453. (*Capt. Washington.*) What number of vessels have you ever known in Bridlington bay at one time?—700 sail.

23,454. Does it frequently occur that large numbers of vessels enter that bay?—Very frequently.

23,455. How often in the year, do you think, upon the average?—Perhaps 20 times, and more than that.

23,456. You do not mean to say that 20 times a year there are 700 vessels there?—Perhaps from 200 to 500.

23,457. You think you have seen as many as 700 at once?—I think I have.

23,458. In what wind would that be?—A north-east wind.

23,459. Do these winds last long?—Yes, a long while.

23,460. How long are vessels detained generally?—A fortnight or three weeks sometimes in the winter season.

23,461. Out of that number of vessels, do many wrecks occur in Bridlington bay?—Yes, several sometimes.

23,462. Do you know, within your own recollection, of any wrecks having occurred here?—No, I cannot speak from recollection.

23,463. How long have you resided here?—All my life.

23,464. If you don't know of any wrecks, does any one?—Yes, other people do; but I cannot bring it to

mind if there have been any. I believe you can get an account of the wrecks for years past.

23,465. Do you know of any lives having been lost in Bridlington bay ?—Yes.

23,466. How many ?—A vessel foundered at the pier head some years ago, with eight or nine hands on board.

23,467. How far off the pier head ?—In last February, I think it was, a vessel foundered here at her anchors.

23,468. Right in the bay ?—Out of the bay ; she was not protected from the Smithic sand ; she was more in the south line.

23,469. Would any breakwater on Smithic sand protect the number of vessels you speak of ?—Yes ; the breakwater on Smithic sand would protect a space of 3,920 acres.

23,470. How do you know that ?—By calculation.

23,471. Have you seen a plan showing a breakwater on Smithic sand ?—No.

23,472. Is there any plan ? Have you ever seen a design for a breakwater on Smithic sand ?—Yes, there is one in the room.

23,473. Besides those immediately on the table ?—Yes.

23,414. Do you know if there has been any boring in the Smithic sand ?—I do not know of any.

23,475. What depth of water is there upon it ?—$2\frac{1}{4}$ fathoms.

23,476. Nothing less than that ?—Nothing less than that.

23,477. There are buoys at each end of it ?—There are.

23,478. Are they ever moved ?—The north buoy has at times moved out of its place. That would be on account of the sea breaking on it.

23,479. It has broken away by the sea ?—Yes.

23,480. What I wish to know is this,—are the buoys ever moved in consequence of the sand extending ?—No, I do not know that they are.

23,481. The buoys lie in about the same place you have always known them ?—Yes.

23,482. And you have known the bay how long ?—37 years. I went to sea 37 years ago.

23,483. And you have no reason to suppose that the sand shifts in any way north or south, inwards or outwards ?—I have a chart in my hand about 100 years old, which shows that the Smithic sand has not altered at all since then. (*Witness handed in a chart prepared by Grenville Collins.*)

23,484. Do you know the year of the chart ?—There is a book of charts about that date, in 1759.

23,485. As late as that do you think ?—Yes, about that.

23,486. That chart shows that there is about the same depth as at present ?—There is rather less there according to the soundiugs on the chart.

23,487. Have you any reason to suppose that any part of the bay is silting up ?—None at all ; I have reason to think it is deepening.

23,488. Do not the cliffs wash down ?—Yes, to the southward.

23,489. What becomes of the stuff which is washed down ?—I suppose it deposits itself in the Humber.

23,490. How does it get there ?—It is swept away to the southward.

23,491. Is the set from the north-east ?—From the north to the south or south-east. With easterly wind it sets away to the southward very strongly.

23,492. Have you yourself recently taken any soundings in the bay ?—Yes.

23,493. How lately ?—About a fortnight ago.

23,494. What did you sound with, lead and line ?—Yes.

23,495. Have you been in the habit of taking soundings ?—I have been accustomed to heave the lead all the time I was at sea. When I first went to sea we used to find our way by the lead and not by guide ports. We were well practised in the lead then.

23,496. You say, of your own knowledge, that the bay is not silting up in any way ?—I say it is not so, according to my knowledge.

23,497. Where do all the vessels you have mentioned as anchoring here find supplies ?—From Bridlington.

23,498. Are there sufficient supplies and facilities for sending provisions and water to the ships ?—Oh yes. We have two markets, one at the quay and the other at Bridlington. We have always plenty of beef and bread for them, if they have to take it warm from the bakers' shops.

23,499. Can the boats always come for it ?—Not always ; not in easterly gales. With the wind from the north-east they can.

23,500. With the wind how much further out than north-east can vessels lie here ?—Until the winds are east and by north they have shelter under the Head.

23,501. I think you said it is your opinion that if a refuge harbour is to be made anywhere along the coast between the Humber and the Staples it should be at Bridlington ?—It is my firm opinion that this is the most suitable place for a harbour.

23,502. If two harbours are to be made, where should the other be ?—At Hartlepool.

23,503. (*Capt. Sulivan.*) Were the 700 vessels to which you alluded nearly all light vessels bound to Newcastle ?—The principal part of them.

23,504. The bay is very much used, I believe, by light vessels bound to Newcastle ?—Very much indeed.

23,505. If they find a harbour on the south side of the Head so valuable to them, would not laden vessels bound south find a harbour on the north side more valuable to them ?—I think they would have no difficulty in getting round the Head into the harbour to the south of it.

23,506. If hundreds of vessels anchor and dodge under the Head for protection from south-east winds, does not that show that laden vessels would prefer a shelter on the north side ?—No, it would not. I think that south of the Head there is a better line to go southward. If you are in Filey bay with the wind to the east you must stop there.

23,507. You say that Hartlepool would be the best place because vessels returning to the north get embayed ?—Yes.

23,508. Do you think that Hartlepool would principally save light vessels bound northward ?—Yes.

23,509. Is it the case that vessels bound southward and laden, more frequently get to Flamborough Head, and there their difficulty commences ?—They very frequently get nearly the length of the Humber.

23,510. A harbour near Flamborough Head would save most laden vessels ?—Yes.

23,511. If the wind is to the east enough to get laden vessels round the Head, do not they often fetch the Humber ?—Yes. If the wind is at the east with a good offing they will fetch the Humber. It just depends upon the offing.

23,512. If they cannot weather the Head with south-east and south gales where would be the best shelter then ?—They want a harbour to the north of it.

23,513. If this bay be so good that it affords protection to all light vessels bound north, if they choose to take it, and often would save life if laden vessels anchored in it, would you lay out more money upon the place, when further north there is no shelter at all equal to this, and vessels have no alternative but to go on shore for want of a harbour ?—I cannot understand that question rightly.

23,514. You say you would lay out money to make a harbour of refuge here ?—I am not talking of laying out money.

23,515. But you would advise the Government to do so ?—I say we want a harbour. I should not advise any one to lay money out.

BRIDLINGTON.

Mr. W. Hopper.

26 Oct. 1858.

Capt. Sulivan.

23,516. As the bay is evidently at present, from all the evidence before us, by far the best harbour of refuge between the Humber and the Firth of Forth, would you not think that the outlay to make another harbour should be somewhere where there is not such a refuge, and where vessels may be caught without a harbour to go into?—Of course they want protecting here with the south-east and east gales.

23,517. You told us that even with these gales you had never known a vessel drive?—No; that is a proof that the ground is good holding ground.

23,518. Between this place and the Tyne do you know any place where deep colliers can ride out easterly gales in safety?—No. Deep colliers cannot ride here in safety. I have been speaking of light vessels.

23,519. You say you have seen laden vessels?—Not laden vessels. I saw light vessels. There are now laden ones that take shelter here with north and north-east winds.

23,520. With south-east winds?—No, they never come in here for shelter with south-east winds.

23,521. How many vessels have you seen to the northward of the Head dodging under or about Speeton cliffs?—As many as 100.

23,522. If so many as 600 or 700 vessels are caught here by northerly winds would there not on the average be as many laden vessels caught by southerly winds to the north?—No. I think the light vessels accumulate more than the laden ones do.

23,523. The laden vessels come out of the ports in large fleets at the same time and tide?—Yes, they do, and sometimes we have 300 or 400 light vessels come out of Yarmouth Roads together. They get the length of the Head, and come into Bridlington bay.

23,524. The laden vessels come out of the different ports with a slant of wind, hundreds together, do not they?—Yes.

23,525. Do they generally get to the Head before their difficulty commences?—Generally off the Head.

23,526. Then a harbour in the bight of the bay would not be so valuable to these vessels as one near the Head?—A harbour here would be as valuable to them.

23,527. A harbour in the bight of Tees bay would not be as valuable to these laden vessels as a harbour somewhere near the Head?—Certainly not.

23,528. If you had to do all in your power to save life and property would you consider that a harbour near the Head for laden vessels would save more life and property than one anywhere in the depth of the bay?—Yes.

23,529. Is there much more danger in laden vessels than light ones?—Yes.

23,530. Is there very much more loss of life if a laden vessel goes on shore?—Yes, considerably so. She strikes a long way from the shore, and it is very often difficult to get to her safely, and she soon breaks up.

23,531. If there were two harbours, one near the Head and the other in the bight of the bay, would it be the case that the one near the head would be principally used by laden vessels, and the one in the bight of the bay by light vessels?—I think the one off the Head would be used by laden vessels, and the other also, but not by so many, because when the vessels come out of the port they always expect to get a run up to the Head.

23,532. If there was a harbour near the Head for laden vessels, would it save them the risk of being driven back to the northward?—Very great risk indeed. A great many vessels run back for Hartlepool, and sometimes founder before they can get there.

23,533. Leaky vessels?—Yes, leaky vessels.

23,534. Are there many of that kind in the coal trade?—Sadly too many.

23,535. Are there many of that class of vessels in which the men get worn out at the pumps after they get up to the Head?—Yes.

23,536. For all this class of vessels would a harbour at the Head do better than one in the bay?—Of course it would.

23,537. Have you been in the colliery trade?—I have been principally in the coal and corn trade to London.

23,538. Do you know how the old ships come to an end; are they ever so unseaworthy that they are condemned and broken up?—They run as long as they can, and then they are obliged to knock them up.

23,539. Have you ever known old colliers broken up, and sold as old timber?—Yes, several times.

23,540. Is it a rare thing?—I do not know. We often have them broken up here on the beach.

23,541. I do not mean wrecked, but have you known vessels fairly worn out, so that the owners would not send them to sea for fear of danger, but condemned them and broke them up in port?—No. As long as they will serve at all, they will send them to sea.

23,542. Is it the common ending of colliers either that they drive on the beach, and are broken up, or founder at sea?—The old colliers, a deal of them, founder at sea. I should think the greater part of the old colliers in a gale of wind founder at sea.

23,543. Does the fact of there being so many old colliers in the trade make it more important to have a harbour for deep-laden vessels at the Head?—Yes. They come to the Head in fine weather. If they knew a gale of wind was coming on they could pop into a harbour and be saved. Where there is no harbour they are driven to the north and cannot keep the sea, and in running back will founder; and sometimes will run for port, and be lost on the bar, and perhaps the crews with them.

23,544. (*Chairman.*) You stated that you recollected an occasion on which 20 vessels rode out an easterly gale under the Head in Bridlington bay?—Yes.

23,545. Were those laden or light vessels?—Light vessels.

23,546. As a general rule you do not recollect to have seen any laden vessels riding out gales of wind under the Head?—No; we never have laden vessels running into the bay.

23,547. When do the vessels come in?—They come in with the north-east wind.

23,548. And the wind backed round?—It backed round to the eastward.

23,549. Comparing these light colliers with other vessels do they generally ride easy at their anchors?—The light ones do so.

23,550. Very easy at their anchors compared with the general run of vessels?—Yes.

23,551. Do you recollect what masts and yards these vessels had up?—Some of them had the top-gallant yards left, some of them had them struck. I think there was one brig in the bay had her top-gallant masts struck. They sent no topsail yards or lower yards down.

23,552. You have stated that a great number of colliers are bad in their hulls?—A great many of them are old vessels.

23,553. How are they found with sails and rigging?—Some pretty middling; some very bad; I have known them come into the bay with all the sails blown from the yards.

23,554. Do they generally take spare sails and so on?—Some of them, but they are no better than those that are blown away.

23,555. Some of them do not even take spare sails?—I do not know.

23,556. We had it in evidence in one or two places, that ships that are owned by men who have been seafaring men before they were owners, are generally better than other ships; how is that in your experience,—is it so or is it not?—No doubt of it.

23,557. It is further given as a reason that probably the men who had been seafaring men, better understood what ships wanted?—To be sure.

32,558. Should you say that that is the reason?—Of course, decidedly so; there is a great deal of

people who own ships and who do not know the right end of them.

23,559. I have also been told, and not very long ago, that these men who own ships and do not know the right ends of them, that they are not chary about giving their money to find the ships, but that masters occasionally appropriate the money, does that ever happen ?—I do not know ; I think a master would be very much to blame; if he had the privilege to find his own ship, he would surely find her well in stores and in rigging. It is very natural to think so.

23,560. Then within your experience do you ever recollect masters who have been prosecuted for appropriating money which has been given them by their owners to find their ships, and putting it into their own pockets ?—No; he would not be fit to be a master if he did.

23,561. You know Hartlepool well ?—Yes.

23,562. And the land about it ?—Yes.

23,563. Is Hartlepool a place that in thick weather you can run into by the lead ?—No, not if you come from Flamborough Head. You might if you had seen Hartlepool before it came thick.

23,564. But running into Hartlepool after thick weather, could you make it with the lead ?—No.

23,565. Why ?—Because you may as easy get into the Tees as into Hartlepool.

23,566. Cannot you tell by the nature of the bottom when you are running into Hartlepool ?—If you are to the northward you can.

23,567. But not if you are to the southward ?—No.

23,568. On the Yorkshire side of Redcar, to the southward of Hartlepool you find the soundings similar ; therefore, if you are to the southward of Hartlepool you might run for Tees bay, when you fancied you were running for Hartlepool ?—Yes.

23,569. What kind of land is that about Hartlepool to make in thick and hazy weather. Is it land that is easily known when you see it through the haze ?—You can if you see Hartlepool Heugh.

23,570. It has been a question before us, whether, supposing we had a harbour up in the neighbourhood of the Head—whether it be at Filey or Bridlington bay—whether we should not have something else further to the north ; or whether it would not be better to endeavour to improve the three ports of the Tyne, the Tees, and the Wear, so as to enable them to take ships at low water drawing 16 feet ; would you do that, or would you put one large harbour somewhere at the bottom of Tees bay. Which would be the best thing for the purpose of saving life ?—I think one large harbour in Tees bay.

23,571. You prefer that to endeavouring to improve the other three ?—Yes.

23,572. And why ?—Because I think there would be less risk in taking Hartlepool harbour, than there would in taking the harbours to the north.

23,573. Why should there be less risk ?—Because it runs further into a shoaler water. Improve Hartlepool you would get into shoal water, while by improving the other harbours you get into deep water.

23,574. Is it not better to have deep water to run for in a gale than shoal water ?—Not if you want to find it by the lead.

23,575. I am asking which would be the safest place to run for in bad weather ?—I should take Hartlepool.

23,576. Why ?—Because I think it would be a better place to take in northerly gales.

23,577. Why ?—Because as you draw in you find shelter under the Heugh.

23,578. In southerly gales how would it be ?—It would have shelter from the Yorkshire land with the wind from the south.

23,579. Altogether you think that would be better than improving the other three ports, that it would do more to save life ?—I think it would.

23,580. Have you ever in the course of your experience been in risk of losing your life or your ship in running into these harbours ?—No.

23,581. Have you ever been caught in the Tees by a gale of wind on shore and had to work off to windward ?—No.

23,582. What chance would a ship fairly embayed there have of getting off to sea with the wind on shore ?—If it was blowing a gale there would be no chance.

23,583. Is there much indraught into the bay ?—Undoubtedly.

23,584. (*Mr. Lindsay.*) If the Tyne, Wear, and Tees were improved so as to admit vessels at all times of the tide, do you still think that one great harbour at Hartlepool would be of more advantage to the saving of life and property ?—I think it would.

23,585. Why do you think it would be better if the harbours could be so improved to the depth I have named ?—I think the sea would be so tremendously heavy between the two pier heads.

23,586. Why would the sea be so much heavier ?—On account of the deep water and the bold shore.

23,587. Is the sea worse to take in deep water than in shoal water ?—When it breaks it is.

23,588. But is the sea more liable to break in deep water than in shallow ?—It is liable to break at the pier head, and would break there heavily.

23,589. But if the pier head were carried out to the depth of 20 feet at low water, would there be danger still ?—There would be a very heavy sea breaking at 20 feet water—very heavy indeed.

23,590. You think it would be more dangerous to take in gales of wind ?—I think it would.

23,591. (*Capt. Sulivan.*) Do you consider that the tide coming out of these rivers would add greatly to the danger ?—Yes ; the freshets would add greatly to the danger.

23,592. Meeting the sea ?—The tide meeting the sea.

23,593. If the piers at these rivers are dangerous, although they are carried out to deep water, say, to 20 or 25 feet, must not the entrance of the harbour at Hartlepool be at least, in that depth, to be useful, or even deeper ?—Yes, it must.

23,594. Then would it not, being deeper, according to your argument, have a heavier sea ?—I think, at Hartlepool it does not open so suddenly as it does to the north.

23,595. You mean, does not come so suddenly from deep water into the channel ?—Yes ; at Hartlepool it gradually descends.

23,596. We understand that the sea breaks in seven or eight fathoms off Hartlepool ?—Yes.

23,597. Should you fear running through that ?—Not at all ; after getting through the first. That is where all the damage is done.

23,598. What depth have you seen it break ?—I have seen it break in eight fathoms.

23,599. You think it is the first sea by which the damage is done ?—That is where the damage was done in January 4th, 1857.

23,600. Supposing you had a harbour with an entrance in eight fathoms water, and a harbour with an entrance in five or six, do you think that the sea breaking in eight fathoms would make it worse further in ?—The first sea is always the worst when you are running against the sea. When you have got through the first break you are amongst light sea, as it were.

23,601. Supposing the entrance to the harbour was just where the outer wave comes, would that make it more dangerous than if it were two or three runs inside it, though in shallower water ?—Yes, I think it would.

23,602. (*Chairman.*) You say that the worst sea is that which breaks outside all, that is the first and heaviest sea ?—Yes.

23,603. What has induced you to form that opinion. Have you actually tried the thing pretty often ?—I have watched it on the north coast in many of the ports when vessels were taking the harbour. I have

BRIDLINGTON.

Mr. W. Hopper.

26 Oct. 1858.

noticed in taking the Tyne and Hartlepool, that ships get the most damage when the first sea has struck them, and that if a ship gets through that first sea, she would always steer, but when the first sea struck her perhaps it would turn her round on her broadside and knock her down.

23,604. When a ship was once through the first sea you would say she was pretty safe ?—Yes, of course.

Mr. JAMES HERITAGE examined.

Chairman.

Mr. J. Heritage.

23,605. (*Chairman.*) You reside at Bridlington ?—No ; my home at present is at Hull.

23,606. How long have you followed the sea ?—Somewhere about 38 years.

23,607. Have you always been in fishing vessels ?—Nothing else.

23,608. How long have you been in command of one ?—I am 50 years old now, and was 23 when I first took charge.

23,609. On what part of the coast have you principally followed your occupation ?—Within the last 20 or 22 years about here, round upon the Dogger Bank, and all about.

23,610. You know the object of our inquiry ?—Perfectly.

23,611. Give us your opinion about it, as to a harbour of refuge on this coast. Where is the best place for it ?—According to my experience, everything is in favour of this place. The height of our fishing is in the winter time in all kinds of gales of wind. We fish from Flamborough Head right upon the Pits upon the Holland coast, right round about. There are 200 sail of vessels from 40 to 60 tons, sailing out of the port of Hull. We actually fish in this desperate weather. If there is anything upon the sea we mostly pick it up ; that is wreckage and disabled vessels. It has been known in the course of a winter that we have saved many lives. I have known the vessels bring up three or four ships' companies, whose vessels had foundered underneath them. The most of the disasters are in deep ships, collier brigs, off the land mostly, above the Head. If they come out of the northern ports we pick them up. With an easterly wind coming up, they always keep a good berth off, and if the wind should happen to change when they get up, if they cannot get into the Humber, they generally lay their head to sea and we are sure to fall in with them ; we must come to market with our fish. Bridlington is our regular rendezvous. I have come in in gales of wind to land fish. The fact is, twice in my life I have come in here with the wind at east, and rode out the gale of wind with other light ships. I have seen many ships slip from their anchors and go to the port of Bridlington. Some of them have done themselves great damage, but at the same time they have left 20 or 30 sail riding. And when a collier brig has slipped from her anchor leaving a slip buoy on the chain, I have taken it up in the gale and ridden secure with a vessel of 40 tons, and in a gale of wind veering to east and by south. We seldom had much water on the decks. My opinion is, that if there is a harbour of refuge anywhere about here, we should not fall in with so much disaster as we at present do at sea.

23,612. As respects your vessel taking up the buoy, you rode by the buoy rope ?—No, we hauled in and shackled our chain on to the other.

23,613. Precisely ; your vessel was light, I suppose, and rode well, did she not ?—We are always in ballast trim.

23,614. Therefore you ride easy at anchor ?—Yes.

23,615. Is it your opinion, like that of a former witness, that light colliers ride easy at their anchors?—Yes, they ride easy to all intents and purposes, and I believe there are no vessels on the coast that have better ground tackle.

23,616. As respects your own vessels, they are very good boats, are they not ?—Yes, they are.

23,617. There is hardly any weather on this coast in which you could not keep the sea if you liked ?—No ; we actually go out in gales, and it must blow very hard when we cannot fish.

23,618. It must blow still harder when your vessels are in danger?—Yes; but I have seen them in danger sometimes.

23,619. Have you ever, during the course of your experience, been in great danger of being lost in a fishing vessel?—Yes, many times; when it has looked rather comical, when anybody would look straight down the nose at it, and see the water on the deck, not caring much about leaving it. That is in those hurricanes, not gales of wind.

23,620. It must be very bad when it comes to that?—Yes.

23,621. Does that happen once a year, or once in half a dozen ?—I have not experienced it more than seven or eight times in my life.

23,622. You say, it is very desirable to have a shelter for loaded vessels which are caught off the Head ; is it much matter whether it is on the north side of the Head? Does it make much difference ?—No ; there might be a harbour on either side, whichever in your judgment is the best, the cheapest, and the easiest.

23,623. According to your judgment, as long as it was in the neighbourhood you would not care much which side it was ; you would leave that to us ?—To the best of your ability.

23,624. What is the greatest number of these vessels that you ever saw knocking about off the Head at any time, deep laden colliers ?—They vary ; not very great numbers when it is blowing that way; they are driving off; our vessels go a long way, and go through them scattered by threes, and fours, and fives and sixes. The winter days are short, and we soon pass our day.

23,625. No doubt there are great numbers ?—Yes.

23,626. Do the light colliers come running down in great crowds ?—In great bodies.

23,627. They all sail pretty much at one time ; they get together and sail at one time?—Yes; in Yarmouth Roads or other places of shelter they accumulate very fast.

23,628. Within your knowledge, have any disasters arisen at sea from the light vessels running the loaded ones down, or that kind of thing ?—There have been several like that.

23,629. Should you say that happened often, or not ?—Not often.

23,630. Should you say they stand as bad a chance of being run down by steamers as by light colliers ?—I should say, 500 times more.

23,631. (*Capt. Washington.*) I think you told us that 200 boats fished from Hull ?—Yes.

23,632. Of 40 and 60 tons burthen ?—Yes.

23,633. Do you include Bridlington in that ?—No.

23,634. Do any of them belong to Bridlington ?—No.

23,635. Are there fishing boats from Bridlington besides ?—Oh, yes, from all the coast round.

23,636. How many ?—The number I cannot exactly say ; but, I should think, from Staiths to Lowestoffe we should not have less than 2,000.

23,637. Do many of these boats land their fish at Bridlington ? — Yes ; sometimes there is a great batch.

23,638–9. How many have you known land their fish at one time ?—I have seen a great number of smacks in the bay. We usually make for here ; there is no other place in the bay where we can land our fish.

23,640. Do you usually land your fish here ?—Yes; and in fact many of our smacks use Scarborough, because we like to go to the place where we can get the most money for the fish. Scarborough is a place on the other side of the Head, and as soon as the wind comes on the coast, anywhere touching from the eastward, there is a very heavy sea, even when we can carry a gaff topsail. I have been in Scarborough harbour when a beautiful breeze at sea has made the sea there very heavy indeed. You find three times a

heavier sea to the north of the Head than to the south with these southerly winds, because the wind blows right across from Holland. There is no sea comparatively here, it cannot rise. It may break, but it cannot break so heavily as to the north of the Head.

23,641. Do the yawls more frequently land their fish at Bridlington or Scarborough ?—They are often compelled to land at Bridlington or Hull when they cannot look at the other side of the Head.

23,642. They do go up to Hull ?—Yes.

23,643. What number generally land their fish at Bridlington ?—I could not state any number, because there are several months that all the fishermen land here.

23,644. Do you go as far as the Dogger bank ?—Yes, and all about.

23,645. Are they all decked vessels ?—Yes.

23,646. How many men have you in each ?—We carry three men and two lads. The London smacks with the same tonnage would carry nine hands ; but they go upon wages, and if we do not earn a penny we do not have it, and therefore we try to do as much fishing as we can.

23,647. Are the fish landed here, sent by railway ?—Yes.

23,648. Where to ?—To London, Manchester, and all round the country.

23,649. At what time of the tide can you get into the inner harbour of Bridlington in your yawls ?—Our smacks draw from 8 to 13 feet water.

23,650. What is their tonnage ?—From 40 to 60 tons ; 62 or 63 it might be, but we have them cutter built. That is the reason they draw so much water.

23,651. You are speaking of smacks, not yawls ?—Smacks, fishing smacks ; they are generally smacks.

23,652. (*Capt. Sulivan.*) If there was a well-sheltered harbour near the Head, either north or south, would the large fleet of fishing vessels, in the winter particularly, find it of great value to come in and get rid of their fish, without going so far as the Humber ?—It would save us many a wet jacket. The reason we are compelled to go to the Humber is, because this bay is not sheltered from all winds, though sometimes we have to ride it out with the wind on, and we can ride here better than on any other part of the coast. To the northward of the Head we find no shelter at all.

23,653. At present there is deeper water everywhere to the north than you have here. The shoal water in this bay makes it comparatively safe anchoring for you ?—Yes.

BRIDLINGTON.

Mr. J. Heritage.

26 Oct. 1858.

23,654. Suppose a large harbour was enclosed behind a pier at Filey, with perfectly smooth water inside, would not that answer the fishing boat purposes just as well north as south ?—Two or three miles would not make much difference, and if it would suit your approbation to place the money there, it is three parts formed.

23,655. By the Brigg ?—Yes. But again on the other side you must understand that there is a great heavy sea, and if we built harbours and such like, we cannot stop the great heavy sea taking them.

23,656. (*Chairman.*) On which side of the Head do most casualties happen to laden vessels ? North or south ?—By my experience and what I hear from brother fishermen—because we generally know everything that is going on amongst us—most to the south of the Head, above it. If we go off east-south-east from the Head, then we strike the Great Silverpit above it.

23,657. As a general rule, you have assisted more vessels to the south than to the north of the Head ?—In that direction right off, we have picked up a great deal of disasters at sea. I have seen in one gale one of our smacks to bring up the whole ships' companies of two vessels. As a body of men we save a great deal of property and lives.

23,658. Those are vessels that make water and go down at sea ?—Some of them. In these gales we have got enough to do to take them out of the ship, and the ship sinks very shortly afterwards.

23,659. In how many cases of that kind have you taken the men out ?—Only three I have been in myself, but I have been personally acquainted with what has happened.

23,660. How many do you know of ?—Sometimes in the course of a winter, and it is not a pleasant thing to see, I have known something like 20 or 30.

23,661. In a winter ?—Yes ; I have known something like 50 of our fishermen drowned in a winter in these gales.

23,662. Then would you say that within your knowledge, and from the information you have, as many as 20 vessels go down at sea in one winter ?—No ; I have known as many as four in one winter. All the rest were brought up, over three or four that had been completely sunk, and the remainder have been brought up disabled, and have been towed in.

23,663. Disabled but not foundered ?—Yes ; not foundered.

Mr. A. Moore examined.

Mr. A. Moore.

23,664. (*Chairman.*) Do you reside at Shields ?—Yes, South Shields.

23,665. You are a ship owner and a North Sea pilot ?—I am, a pilot and ship owner.

23,666. How many years have you been a pilot ?—Eighteen years, I think ; I was pilot to one of Mr. Lindsay's ships.

23,667. Previous to being a pilot, did you follow the sea ?—I have been 50 years at sea on this coast.

23,668. In what trade were the vessels chiefly employed ?—I was about 12 or 14 years master of a ship.

23,669. In what trade was she ?—From London to Shields.

23,670. The coal trade ?—Yes.

23,671. If you are to have a large harbour on this part of the coast, where would it be most useful for saving life ?—I will tell you my opinion, and it is this, where you are now ; I do not know another place besides it to make a refuge for ships, because it is a place for both light ships and laden ships ; I have in my time put in here in gales, at different times ; I say I have been all my life time down on the coast, and I was obligated to put into this harbour for refuge to save my life and ship.

23,672. On that occasion did you ride a gale at anchor here ?—Oh yes, north-north-east.

23,673. Not further round ?—No, not further round.

23,674. At north-north-east you have capital shelter under the Head ?—Yes.

23,675. And have you ever ridden a gale out with the wind right out from the east or east-north-east ?—No, never from there, only north-north-east.

23,676. You are decidedly of opinion that you ought to have this harbour up in the neighbourhood of the Head ?—That is my opinion ; I have been many a time to Hartlepool, but that is not a place to run to with a gale of wind ; it is all broken water there across.

23,677. How far out have you seen the sea break at Hartlepool ?—I think sometimes in 7 fathoms water ; I have seen it break at Shields at 10 fathoms sometimes, in a gale on the bar.

23,678. Have you ever taken Shields bar in very bad weather ?—I have, with a ship from Hartlepool, drawing 18 feet water.

23,679. Was that during a gale of wind ?—Yes, right in.

23,680. What sail did you run in under ?—The pilot got on board with a steam boat ; the first man that came on board would not take charge, and I said if he did not, I would myself.

23,681. What sail did you run into Shields har-

BRIDLINGTON.

Mr. A. Moore.

26 Oct. 1858.

Chairman.

bour under on that occasion ?—Single-reefed topsails and topgallant sail.

23,682. What time of the tide ?—Just about the top of the high tide.

23,683. Was it breaking very heavy ?—Heavy ! she drew 18 feet water and only touched once on the bar.

23,684. It cannot have been blowing so hard as it does sometimes ?—It was blowing a gale of wind.

23,685. At the time it was blowing hard ?—Very hard in the tack from Hartlepool, and we were knocking about for about 4 days ; it was blowing hard when we went to Shields, but I had a little experience of the place, and crowded the canvass to carry me over the sea ; as I have heard a gentleman name to you, the first sea is the worst ; if it does not injure me by the next sea I shall be better off.

23,686. You agree with the opinion that the first sea is the worst sea ?—Yes.

23,687. Is it not the case that at Shields when it blows very hard the pilots cannot get out in their steam boats ?—I think it will blow very hard and the sea must be very heavy if the men cannot get out in the boat.

23,688. When they do get out, does it not blow so hard that the pilots cannot board the ships ?—No, they have a life boat on board the steam boat, and so they can get into the ships.

23,689. So that if the steamer once gets out, the pilot is sure to get on board ?—Quite sure.

23,690. You know the Tyne very well ?—I was bred and born there.

23,691. If it were improved, to take ships drawing 16 feet at low water, should you approve of it in preference to having a harbour in Hartlepool bay ?—I would approve of it ; I do not want it in Hartlepool bay, because it is shallow water; but at Tynemouth bar; there is room for improvement in all these harbours here, but Hartlepool is the worst for shallow water ; I ran a risk of my life there once.

23,692. On what occasion was that ?—I could not do any other than run with a laden ship.

23,693. How did that happen ?—With a gale from the south-east, and a ship making water, I thought she would not reach Shields and so went into Hartlepool, and laid her on the sand there ; the ship is alive yet, the *Harrison*.

23,694. Was the ship much damaged ?—She was a good deal damaged ; I had to discharge her, but she was repaired.

23,695. Why could you not reach Shields, the wind being from the north and east ?—As I came on the wind northered upon me, and I was obliged to go there ; I could find no other place.

23,696. If you had a good harbour to run into at Hartlepool, would you then have been very glad to have had it ?—Yes, I should have been very glad, but I do not see (excuse me for saying so) the place where you can make a harbour at Hartlepool ; I cannot see it, without it ran out in about 11 fathoms.

23,697. (*Mr. Lindsay.*) Just imagine yourself in a laden ship from Shields, bound to London, and that you are caught in a hard gale of wind upon the coast, somewhere off Scarborough or Whitby, and that you were able to weather away Flamborough Head; if you were able to weather Flamborough Head, is it the case that you would be able to get into the Humber ? —Some might get as far as the Humber, but I should not say it.

23,698. You and I are old sailors,—do not talk so fast ?—I am very glad we have a sailor man here.

23,699. Say you could weather away Flamborough Head with the gale, could you reach the Humber ?—I cannot answer the question ; it depends upon how the wind is.

23,700. I am telling you the wind is blowing from the east. Say, you were coming along with close-reefed topsails, the mainsail furled, and a reef in the foresail, and that you were enabled to weather away Flamborough Head four miles distant, and that the gale does not change, but continues to blow in the same direction, would you or would you not be able to reach the Humber?—No, I deny it. With a ship four miles off, under close-reefed topsails and a reefed foresail, she could not reach the Humber.

23,701. You would not be able ?—No, I should not.

23,702. With a laden ship with Flamborough Head 10 miles distant could you reach it ?—Oh yes, 10 miles, you would.

23,703. Is it, or is it not the case, that when a ship can weather Flamborough Head she can usually reach the Humber ?—No ; it depends on the distance that she is off the Head.

23,704. I am speaking of vessels caught in the usual track ; is it or is it not in general the case, that when a ship can weather Flamborough Head with a gale from the east, she can reach the Humber?—If only one mile off she cannot do it; but if 10 miles off, she can do it under close reefed topsails or reefed foresail.

23,705. What is the course from three miles to the eastward of Whitby Rocks to three miles to the eastward of Flamborough Head ?—I think about south-south-east $\frac{1}{2}$ east.

23,706. What is the course from three miles off Flamborough Head to Spurn point ?—About $3\frac{1}{2}$ west.

23,707. How many points can you keep away after you get abreast of Flamborough Head three miles distant in steering for the Humber ?—I would keep two points if I could.

23,708. You have only two points to come and go upon with a heavy gale of wind to encounter ?—That is two points lee way.

23,709. But you have two points more to come and go upon after you weather away Flamborough Head than you have before ?—That is right.

23,710. At least two points?—Yes, about two points.

23,711. From your long experience on the coast, tell me your opinion upon this point, say, there were to be only one harbour made between the Humber and the Farn islands, looking at the laden vessels and the light vessels, and the saving of life and property ; looking at the convenience of commerce, from being able to rest and wait a tide or two ; but looking more especially to the saving of life, tell me, where you think that harbour should be placed ?—I have been 50 years employed on this coast, and never got ashore anywhere but was driven to Shields Roads.

23,712. You have not made up your mind about it ? —I can only say that Bridlington Bay is the only place that I see, because it is formed of itself for it. I am not speaking against Hartlepool in that respect, because you might make a harbour there, but they must all be improved.

23,713. I want you to tell me what would be the best position between these places I have named. Where do you think a harbour of refuge would do most to save life ?—Here at Bridlington, because it is both north and south.

23,714. Do you think a harbour at Bridlington would save more lives than one at Filey ?—I do candidly.

23,715. What do you make of those laden colliers coming along a rocky coast, and not able to weather round Flamborough Head ; what is to become of them ? Did you ever hear tell of any getting on shore ?—You may tell of one here or there getting on shore, but not light ships ; they will not get out of a place before there is a fair wind for them to go well up.

23,716. I am speaking now of the laden vessels that leave Shields, Hartlepool, Blyth, and Sunderland, which come along the coast and are caught by south-east winds, and are unable to weather Flamborough Head. What is to become of them ; what position will save most laden ships ?—I say here. With a gale of wind at the east there is not a place. I have come in here with a gale of wind at north-north-east to save my own life and my ship.

23,717. Say a harbour was made here, and a laden ship could not weather away Flamborough Head; would it be any good to her ?—The ship has nothing to do but to put up her helm and come in here. I would make a passage about south and north, but she could not come in here if she could not weather the Head.

23,718. But if a ship could not weather away the Head, what would become of her?—She would have to go ashore at Filey.

23,719. If the Tyne was improved so as to give 18 feet at low water, would you, as an experienced pilot, have any hesitation in running for it in a gale?—Not in a gale of wind I would not; it depends upon the time of the tide.

23,720. Do you mean that, with 18 feet at low water, you would have any hesitation in running for it?—No, but I must know whether it is improved or not before I take charge of property.

23,721. Would you have any hesitation in running for it in a gale of wind?—No.

23,722. Would you have any hesitation to run for it with an ebb tide and a gale of wind?—I think I might contradict my opinion in that respect.

23,723. What would be the extra danger with an ebb tide and a gale easterly?—I think with an ebb tide, if the ship has any draught of water, there is the fear of getting aground, but I do not see there is any difficulty in a ship of 16 to 18 feet going to Shields Harbour.

23,724. I am speaking of the Tyne if it was improved, so as to have 18 feet at low water, and consequently a great deal more at high water; would you have any hesitation in running for it then with a ship during a gale?—No.

23,725. With an ebb tide?—I should like the tide to flow two or three feet.

23,726. Would you have any hesitation in running for it on account of the sea, with an ebb tide?—Yes, I should have an objection to run against the tide. Sometimes you are mistaken; the tide might be falling two or three feet, and the ship might draw about two feet more than there was on the bar.

23,727. (*Capt. Sulivan.*) You said that laden vessels bound south, after passing the Head, could take refuge here if there was a harbour?—Yes, I did.

23,728. Suppose the vessels have got 15 or 20 miles south, with a south-east gale they can fetch the Humber?—No, it is 35 miles before they get there.

23,729. If they had got 15 or 20 miles they would be far enough to the south-east to reach the Humber?—I ask you if she is 10 or 15 miles, whether she could get into the Humber, blowing a gale of wind south-east and by south, I will ask you that.

23,730. Vessels south of Flamborough, and not far enough to fetch the Humber, could take refuge here with south-east gales?—I do not mean to say they could not.

23,731. But with a harbour here?—Yes.

23,732. But the vessels that could not weather Flamborough Head with a south-east gale could not come in here?—No.

23,733. Vessels that had passed the Head and could not fetch the Humber, if there was a harbour at Filey, could they go back to Filey?—I do not know, I think you cannot make a harbour at Filey; I say they could come in here.

23,734. I wish you would answer my question. Suppose there is no harbour here, but that there is one at Filey?—If there is, of course I should go into it.

23,735. Those vessels that could not fetch the Humber with a south-east gale could go back to Filey, and all vessels that have not weathered the Head could go into Filey?—Yes.

23,736. Vessels both north and south of the Head could go into Filey?—Yes.

23,737. But only vessels south of the Head could come into Bridlington?—Both parties could go into Filey, whether light or loaded, if they had a mind.

23,738. And suppose there was a harbour where only loaded vessels which had weathered the Head could get in?—I do say that there is not a place that I know upon this coast that is more convenient for a harbour of refuge than this; I can bring in a three-decked ship round the buoy, and it will cost less expense than Hartlepool, or wherever you have a mind to put it.

Mr. JEREMIAH HUDSON examined.

23,739. (*Chairman.*) You reside at Scarborough?—I do.

23,740. Are you a seafaring man?—Yes, from 13 years of age.

23,741. How long were you at sea?—From 13 years of age, and now I am on the wrong side of 60.

23,742. How many years have you given up the sea?—About a dozen years.

23,743. How many years were you in command of vessels?—Ever since I was 22.

23,744. In what trade were the vessels chiefly employed that you commanded?—The coasting trade, the north of Europe, the American and the Mediterranean trade.

23,745. You sailed to foreign parts a good deal?—Quite as much as upon the coast; and I have been all round Ireland, England, and Scotland.

23,746. You are aware that one object is to find which is the best place for a harbour of refuge on this coast; will you give us your opinion on the subject?—Well, personal interest should have nothing to do with this, and therefore if I say Scarborough is the best it ought to be taken with great caution, because we would all recommend our own place as the best. If you wish to come to the subject as it is, and want only one harbour, take the centre between Spurn Head and Shields, no matter about Filey, Bridlington, Scarborough, or any other place, if that is the most dangerous part. Keep this in view, wherever you make a harbour, that you have it in accordance with the line of the tide; for if you have a harbour which is not in accordance with the line of the tide there is no danger of taking it when the tide comes against the wind.

23,747. I gather from your answer, that you would be disposed to put the harbour of refuge somewhere in the Tees bay?—That is, if you only want one, but if you wish two, by all means the Tees bay for one, and Bridlington for the other.

23,748. And if there was only one, where would you put it?—As near the centre between Spurn Head and Shields as I could find.

23,749. Where is the particular spot you are thinking of?—I have no particular choice myself; somewhere about Cloughton Wick.

23,750. Made in Filey, would it answer the purpose; would that do as a site?—Filey is very good, if you construct so that the outset will leave a clean turn round the harbour, between the harbour and the bay. That is one thing must be considered, looking at the outset; it is the same with Scarborough, you would have to look at the outset. Without you could leave that it would not be safe water one way nor the other.

23,751. Putting on one side local difficulties of construction, would you say that that point of the coast is a good one for a single harbour of refuge?—I should take that which I said, the centre, in preference to all others.

23,752. That would be about Filey?—No, Cloughton Wick.

23,753. Where is Cloughton Wick?—About five miles north of Scarborough.

23,754. Between Robin Hood's Bay and Scarborough?—Yes, between the south of Robin Hood's Bay and Scarborough. There the tide runs along the land, and the sea is as clear inside as outside; a very desirable object to accomplish.

23,755. If there was a second harbour to be made, where would you prefer it?—I should prefer this place and the Tees bay.

23,756. Would you put it at the mouth of the Tees or at Hartlepool?—I should just put it round by the Heugh. I have a good deal of experience; I happen

BRIDLINGTON.

Mr. J. Hudson.

26 Oct. 1858.

Chairman.

to have a steam-boat and we generally go once a week for coals. It does not matter whether the weather is thick or not, when you go, you go by the lead. I was sorry to hear a man say that we could not fetch the Tees bay with the lead, there is no better place to fetch the Tees bay; it is the same as Filey, and Filey is a very good place to make with the lead.

23,757. I understand you to say that Hartlepool in your opinion is easy to make with the lead in thick weather ?—Nothing easier.

23,758. You have sailed in ships from the North of Europe; if you were running from the Baltic in thick weather, and had not had an observation for a day or two running for a harbour, would you have any hesitation in running for Hartelpool by the lead?—Not at all. Not by any means.

23,759. Is it by the depth of water or by the nature of the bottom that you could tell your position ?—The depth of water with the lead.

23,760. The depth of water only ?—Nothing else, because the charts generally give the information about the bottom.

23,761. What I mean is this; of course you know perfectly well that in ascertaining one's position by the lead, there are two things to look to, the first is the depth of water and the next is the character of the bottom, whether it is sand, mud, or whatever it is ?—The chart generally gives the character of the bottom.

23,762. Does the character of the bottom at the north and east of Hartlepool bay differ sufficiently to enable or assist you knowing where you are, in going in with the lead ?—It is a sand with this difference, that when you are south of Hartlepool it shallows gradually, but when north it does not shallow so gradually ; you carry deep water close up to the works.

23,763. But is there not mud in one place and sand in another, or fine sand in one place and coarse in another ?—There may be something of the sort, but nothing material, my reliance is on the lead or the depth of water.

23,764. Is the Hartlepool land easy to make in thick weather, and do you know it well when you see it ?—If you can make it at all, you see on the north side it is high and on the east low.

23,765. If you can see the land at all it is not likely to be mistaken ?—No, a goose could know it.

23,766. Have you ever taken these bar harbours in bad weather, and in gales of wind ?—Sometimes, but I would rather stop out at sea.

23,767. You think the danger of taking the bar harbours is so great that it is much better, if you have a good ship, to keep at sea ?—I always made it a rule if the ship's head would lie off the land anywhere to let her lie under easy sail tumbling easily, then she must be right.

23,768. You said you ran a vessel with coals ?—No, she goes once a week to get coals, the steamer *Fame*, a steamer as big as yours and as fine. She runs along the coast with passengers.

23,769. And she coals at Hartlepool ?—Yes, once a week.

23,770. We have heard a good deal about the sea in Hartlepool bay. Is there a heavy sea ?—Wherever there is an outset going against a strong wind there must necessarily be more sea than there is when you get past the outset. The same in the Tees bay and at Filey and Scarborough, it matters not what the outset is, it is the same in Portland roads wherever I go. Wherever there is an outset going against a wind there must be more sea than when you are clear of it. I see it is truth you want, and it is truth I will tell you to the best of my knowledge.

23,771. How far out do you say you have seen the sea breaking in Hartlepool bay in bad weather ?—Not more than half a mile outside the Heugh. Not more than 10 weeks ago I came out with a very strong gale when the other vessels dared not come out. I had a fair opportunity of seeing it, and we did not see the sea break a quarter of a mile outside the Heugh.

23,772. In what depth of water ?—Not more than 6 or 7 fathoms water.

23,773. Are you in command of the screw vessel at this moment ?—I have one laying at Scarborough, one I want to sell.

23,774. Are you the owner or are you sailing her ?—I am the owner.

23,775. Are you in command of the vessel yourself ?—I would not let her go without me, because I never insure.

23,776. I understood you to say it was 12 years since you came on shore. I understood by that since you resided on shore ?—I did four years, but I could not be idle, so I got a steam boat to amuse myself, although I am a ship sailor myself.

23,777. (*Mr. Lindsay.*) Say that there was only one harbour to be made, and looking especially to the safety of life, whether do you think a harbour at Filey—supposing there were no engineering difficulties in regard to Filey bay ; would a harbour there or at Hartlepool be most useful for saving life ?—There could not be a finer harbour anywhere than you could make at Filey, if you could remove the outset.

23,778. But leaving that out of sight for a moment, I want your opinion as to the position. Do you think a harbour at Filey would do more to save life than one at Hartlepool ?—That depends entirely upon the locality of vessels. Some ships are out here, and some off other places.

23,779. But all things considered, and looking to where ships are usually caught ?—I cannot give any opinion. Filey is a place I am very fond of, but there is that outset. It is proper you should be made to know the thing as it is really. Perhaps you have never been told about it. There were three yawls about to take Scarborough, which were upset by an outset, and nothing else. Now if that happened at Scarborough, what would it be at Filey ? They were upset, and all hands were drowned.

23,780. Is the outset so strong that in east gales of wind, raising up a heavy sea, it would be dangerous to run for it ?—More dangerous by half than to keep out at sea.

23,781. Would you think it more dangerous to take Filey, on account of the outset in a gale, more dangerous than a tidal harbour, supposing there was an equal depth of water ?—I should ; because the outset goes out more strongly than the tide out of the Tyne, unless there is a freshet, which is out of the usual way.

23,782. Is the outset stronger from Filey bay than what it is from Hartlepool ?—Considerably stronger. It is the outset at this place, Bridlington bay, that makes it so valuable. It runs here for an hour and a half before high water ; it runs to the north of the Head, and that enables light vessels, when the wind is coming out from the westward. As soon as the wind comes from the eastward we trip and turn to windward, and the outset carries us round the Head. When the wind is blowing east-north-east or east it forces the water under the land round by the Head. It blows off the bay, and the water runs round into Filey ; having gone in it will get out, and there is no mistake ; when water goes in it will come out. It finds no outlet until it comes along to Filey Brigg. It is precisely the same at Scarborough, as we have a proof before us, every time there is an easterly wind. When it comes along by the Brigg, the end of the Brigg, there is nothing to stop it, and it forces itself out, and that causes the outset, and the danger there is of the outset. I have come through it hundreds of times with the inset. Filey would be as good a place as any in the world when it goes in. It goes in for 12 hours, as well as comes out. This is a subject so serious that the truth should be told, and ought not to be concealed from anybody.

23,783. Do I understand you to say that the outset from Filey bay is so strong that you would rather run for the Tyne during an ebb tide and an easterly gale,

than you would run for Filey ?—Certainly, by all means I would, because I never knew the tide to come out of the Tyne more than 4 miles an hour at any time. Then when we get inside the bar we are in smoother water.

23,784. From your experience, then, what is the greatest rate at which you have found the outset come round the Brigg from Filey bay ?—That I never tried, but you may form some idea if you have ever been in the Race of Portland. The water comes from shallow to deep and then runs from deep to shallow.

23,785. (*Capt. Washington.*) But this outset, where does the water come from ?—It is simply that blown in by the south-east winds. It comes from the sea, round Flamborough Head, and into Filey.

23,786. Is there a similar outset in Bridlington bay ?—No ; but there is a very unsatisfactory sea outside the Head : I suppose you have often heard of vessels coming to the southwards going down off the Head.

23,787. I hope that is not a very common thing ?—It is nothing at all uncommon.

23,788. Have you known of many such instances ?—I have never seen any myself, but I have frequently heard of them.

23,789. Bridlington is a larger bay than Filey, is it not ?—It is one of the finest bays that I have ever seen upon the coasts of England, Ireland, or Scotland.

23,790. Does not as large an amount of water in a south-east gale beat up here as at Filey ?—No.

23,791. Why not ?—There is nothing to confine it here, nowhere. There is the Smithic outside, but there is a considerable distance between that and the land. There is an outlet for it there. If the Smithic was joined to the end of the Head there would be as much danger and perhaps more so.

23,792. If a breakwater was placed in Filey bay, you think an opening must be left to the north to allow this outset to escape ?—I should not like to offer an opinion about that. I have gone through it so many times in all sorts of weather. I tell you, when I heard of your coming here, I proposed to myself that, if you liked, I would offer my steam-boat to go from Whitby to Bridlington, and would explain to you the whole thing, and let you form your own ideas about it.

23,793. Are you acquainted with the Race of Portland ?—Yes, I know enough of it to keep out of it.

23,794. And we understand you to say that the race off Filey Brigg, the outset from Filey bay, is nearly equal to the race of Portland ?—It is in violent gales of wind to the eastward, and spring tides, there can be no doubt about it.

23,795. How far from the shore does it extend ?—West by north it generally runs something like 300 fathoms outside the Brigg, but the buoy is not stationary, it sometimes shifts a little in and out.

23,796. Then you consider this outset to be an objection to the construction of a harbour of refuge at Filey bay ?—I should consider so ; if you make it south of Filey you could do so very safely a little south, but I should not advise you to confine yourself to Filey Brigg.

23,797. Generally speaking, you think that the best place for a refuge harbour upon the coast is about the centre ?—I should recommend that, irrespective of Scarborough or any place ; truth is truth; one ought not to speak for one's own place alone ; if there is to be one single harbour I should recommend it, but if you are to have two, then have this and Hartlepool.

23,798. We have heard a good deal about the danger of taking Hartlepool, on account of the broken water that there is always there, do you think there is any danger on that account ?—I do not believe in it ; Hartlepool is as fine a place as can be, but it has disadvantages as it now is ; the west docks are so constructed that if a ship will only sail down she will sail into them.

23,799. Supposing the bay were sheltered by a breakwater in 8 fathoms ?—It would be as safe as this room is.

23,800. It may be easily approached by the lead, you say ?—Yes, by them that will but take notice ; I never got off Scarborough in a dense fog, but I always heave the lead myself, I dare not trust it to any one to do.

23,801. (*Capt. Sulivan.*) Have you seen the proposed plan for Filey bay ?—I had a book sent to me, and I saw it.

23,802. Now here (*referring to the plan*) is the Brigg ; is it when the ebb coming along the shore escapes over the Brigg that the outset is so bad ?—Yes.

23,803. The outset is over the Brigg ?—Not over the Brigg.

23,804. Round the end of the Brigg inside the buoy ?—Yes.

23,805. I suppose where we saw a very strongly marked ripple on the ebb tide outside the Brigg, that would be the outset ?—Yes.

23,806. Would that be an objection to having an opening in the breakwater there ; if it was made would it make a very strong tide through that opening ?—That is only an opinion, but my opinion is that it would considerably ease the outset, if there was an opening in the pier.

23,807. If there was an opening at the north end of the breakwater, would not the tide sweep out very strongly through that opening ?—Yes.

23,808. Would it not make that opening very bad for ships to take in a gale of wind ?—I believe no ship could take it when the tide was coming out in a gale of wind.

23,809. Supposing that it was closed and that there was no opening there would not that prevent a strong tide altogether in that corner, and make it comparatively still water ?—It is my opinion it would do the same here as at Scarborough. There it comes along the west pier and is conducted to the end and rushes out. I saw it only this day week. At that time with the wind only moderate there was a tide of two or three knots an hour in the inner harbour. We have made a pier at Scarborough, and it comes along the west pier, which conducts it to the other piers, and when it gets there it goes right out. I know last Tuesday it went past the pier end at the rate of two miles an hour. It is very variable and sometimes bothers one. If I attempt to take the pier and calculate in fine weather that it is still water, sometimes I find there is a current going at the rate of two knots an hour past the pier, and I cannot tell what is the cause of it. Another time perhaps I think I will take care and make allowance for it, and then I find it is perfectly still, and there I am three or four knots from the pier, and we have to wheel her alongside at last.

23,810. I do not quite understand the thing. Does the current run round the bay, and does it then pass the pier head ?—Yes.

23,811. Then it does not run into the inner harbour and sweep through the inner harbour ?—Yes, it comes right along. I call the harbour that which is inclosed by the two piers. It comes south of them.

23,812. Does it come past the pier, or does it sweep into the harbour and out again ?—It comes with a rush to the spa.

23,813. Does it come past your pier heads, or does it sweep into the harbour and out again ?—First into the harbour and then it comes past the pier heads.

23,814. I do not mean the bay. I mean the harbour inclosed by the two piers ?—It goes into the bay, into the side of the, bay and then strikes the west pier.

23,815. That is, it goes across the entrance of the harbour ?—It comes out from the bay as far as it can come until it hits the side of the west pier.

23,816. That is, outside the inner harbour. Your harbour is on the east side of the west pier ?—It is.

23,817. Then if it strikes the west pier on the west side it sweeps out opposite to the mouth of your harbour, and not into the harbour at all ?—Yes ; it cannot get into the harbour.

23,818. That is what I have been asking you all

BRIDLINGTON.

Mr. J. Hudson.

Oct. 1858.

Capt. Sulivan.

along. Then the tide coming down along the shore of Filey bay with no opening in the breakwater would run out round the pier heads, you think ?—Yes.

23,819. That being a large space of comparatively still water, do you think that in that place any tide would come that would make it dangerous for vessels coming into the bay from the southward ?—No, it has this advantage, coming in from the southward the most danger is when vessels come in from the north or north-east to go round the outside, and to come from the south-west a finer place cannot be found.

23,820. With an easterly gale ?—I understand with an easterly gale there cannot be a finer place than Filey.

23,821. With what winds would Filey be most valuable for loaded ships bound south ?—Any wind for loaded vessels. For laden vessels it cannot be wrong for them, if they want to come southward, but at anywhere north-east they can always get the Humber if they round the Head. With a wind from the east a ship will always lay south.

23,822. Do you think that a harbour constructed like that proposed in the plan in Filey bay would be at all dangerous for light vessels to take with east or south-east gales ?—Not at all ; because they would come from the south ; and in coming from the north, when the wind is north or north-east, when they cannot take a safe sweep to the south outside to pass the end of the pier, then they would fall into it. We never carry more hands than we require, and sometimes not so many.

23,823. With north and north-east gales, would any laden colliers want to come in ?—No, certainly not ; she could go on her voyage.

23,824. (*Chairman.*) I think you said, that, although there was this strong outset from the Brigg end, you did not exactly know how many knots it ran ?—No, I never tried that, because the boat I have is very quick, and we soon run through it.

23,825. You judged of the strength of the tide from the sea it creates, from the kind of race it creates ?—Yes.

23,826. For laden vessels and south or south-east winds, that can keep inside the outset, it would be quite safe ?—Yes.

23,827. Of the existence of the outset you have no doubt ?—No ; it is there, and all the earth cannot remove it.

Mr. William Weir examined.

Mr. W. Weir.

23,828. (*Chairman.*) Do you reside at Scarborough ?—Yes.

23,829. Are you a seafaring man ?—I have been so for 20 years. At sea I was master of my own vessel.

23,830. Are you still following the sea ?—No ; I am ashore now as agent for Lloyd's, and a shipowner.

23,831. How long have you been ashore ?—About 15 or 16 years.

23,832. Since you have given up the sea ?—Yes.

23,833. For how many years were you in command of vessels ?—About 20 years, of my own vessels.

23,834. In what trade ?—Between London, Scarborough, and any trade. I have been as far as Warkworth, and all ports ; Shields, Sunderland, Blyth, and Hartlepool.

23,835. You were employed in the coal trade, of course ?—The coal trade and different trades.

23,836. You know the object of our inquiry is to fix upon the best spot for shelter, principally for vessels in the coal trade ?—I will give you my best opinion.

23,837. Where do you think is the best place ?—A vessel ought not to go out of a coal port without a chance of favourable weather, and making a fair progress to the south. They come out of Warkworth, Hartlepool, Sunderland, and other ports generally in large numbers, and trying for an opportunity they probably get as far as the Head, when perhaps the wind souths upon them.

23,838. What you say is, that most ships get as far as the Head ?—Yes, with the wind at south or south-south-west they can but beat with it blowing hard ; I have seen them beat up the Yorkshire coast and get as far as the Head, where they bring up for shelter on the north side of the Head.

23,839. Where would you put the shelter ? Which do you say is the place where there ought to be a shelter ?—The most danger is on the leemost bay. It ought to be where it will save most life and property. I have in my pocket an account giving my remembrance in 1807, of seventeen sail of ships being caught on the lee shore off Scarborough sands ; I can give the number to the year 1857 by records ; I can give the numbers up to the year 1857, the number of ships that have been lost. I cannot give the numbers of lives, but I can remember a great many being lost between Filey Brigg and Whitby Rock.

23,840. Will you answer my question ; where do you think is the best spot to put a harbour ?—I will tell you; I say Scarborough Wick, with a breakwater or even rough stones to direct the sea ; light ships can go underneath and let go their anchors.

23,841. Supposing we had this harbour in the neighbourhood of Scarborough and there was to be a second one, where would you put it, or do you think it would be better, instead of making another, to try to improve the three ports of the Tyne, the Tees, and the Wear, so as to enable them to take in ships drawing sixteen feet at low water. In all outsets of all rivers you may carry out the piers as far as you like, but the sand when it comes down the river as soon as it gets as far as the head will settle down and there will always be a bar. As soon as it gets into the sea, it will meet the swell coming against the wall. When you form your channel, you get deep water, but you soon get a bar again.

23,842. You consider it then impossible to improve a bar harbour ?—Yes ; almost impossible.

23,843. That in fact you simply carry the bar out with you ?—When I was 12 years old I used to go as a boy with my father ; I knew Sunderland piers when they were not half so far out as they are at present ; then it was a bar harbour ; they have carried them out as far as they can and it is still a bar harbour, and if they carried them out a mile further it would be the same.

23,844. That to your mind is an insuperable objection to endeavouring to improve these bar harbours, and that it would be only money thrown away ?—Yes ; our forefathers made all the harbours and docks upon dry land, now we attempt to make them in the deep sea.

23,845. Then where shall we have the second harbour ; if we cannot have it in the three ports, where shall we have it ?—I think it is not of much use my saying where it shall be, because you will satisfy yourselves hereafter, but I mean to say why should we have two ; I do not see the necessity for two between Flamborough Head and Tynemouth castle.

23,846. You think that one is quite sufficient ?—I do ; I approve of Scarborough Wick, although I belong to it, I throw that over my left shoulder.

23,847. But of what use would a harbour at Scarborough be to vessels caught with a gale on shore between Whitby and the Tyne? —If a loaded ship be to the north of Whitby Rock and is caught with a foul wind ; if she cannot go to south she can always get a north or north-west course, when she cannot get a south-south-east course.

23,848. You have some returns of wrecks ; would you be good enough to leave them, and just describe them as you hand them in ?—I have a great many here.

23,849. What are they ?—The returns are prepared from the records of an old gentleman, from my own memory and that of my father before me.

23,850. Will you give the first of them to the secretary, if you do not mind parting with them ?—I will

let you have it, if you will return it to me before I go back to Scarborough.

23,851. Let me see it, if you please (*referring to returns which the witness produced*). This is headed, "A list of vessels stranded or wrecked, from Robin "Hood's bay to Flamborough Head, compiled from "authentic records." What are the authentic records from which this is compiled from 1806 to 1857?—Partly from the records of an old gentleman, partly from my own recollection, during three or four years, from the records of the late Mr. Francis Hill, the late Lloyd's agent, and for the last 14 years the records of myself and partner as agents for Lloyd's.

23,852. Will you be good enough, at your convenience, to send to the secretary in London authentic copies of these records deposed to before a magistrate?—Yes; I can swear to the first 17 as well as to the last 14 years.

23,853. Perhaps you will be good enough to let us have them, and any other information you can give?—I will.

Mr. HENRY WYRILL examined.

Mr. H. Wyrill.

23,854. (*Chairman.*) Do you reside at Scarborough?—Yes.

23,855. Are you a seafaring man?—Yes.

23,856. How long have you been at sea?—I have been on this coast for 30 years.

23,857. Are you still following the sea in command of vessels?—I have not been at sea since last November.

23,858. How many years were you in command of vessels?—27 years.

23,859. In what trade were the vessels which you commanded chiefly employed?—In the coal trade the Baltic trade, and for the last 27 years I have been exclusively engaged as a fisherman upon the north-east coast of England.

23,860. How many years' voyage have you made to the Baltic?—I believe I have been there four times.

23,861. That was a long time ago, I suppose?—It was in the early part of my life.

23,862. The vessel you command is employed in the fishing trade?—The vessels I have are all employed in the fishing trade.

23,863. What are the tonnages of your vessels?—I have four from 27 to 60 tons.

23,864. Fishing vessels are capital boats, are they not?—Yes.

23,865. They can keep to sea in worse weather than coasting vessels generally can—what do you say to that?—Decidedly so.

23,866. You are aware of the object of our inquiry, are you not, to fix upon the site for a sheltered harbour where vessels can be sheltered. Give us your opinion about that. Where do you think it should be?—I will do my best to do that as a practical man; and this subject having been inquired into by a committee meeting at Scarborough for the last few months, I found a great difficulty attending the case. There is for and against on all sides, but this great fact must be the foundation of all. This harbour of refuge that would be the most valuable would be the best placed upon the most leewardly place. Which of us has not stood upon deck, in the depth of the snows, and wished for daylight, when, if we had had an hour or two more to drive, we should have been stranded. Therefore, upon that great point I would wish to ground my opinion, that if a harbour of refuge is to be made, it should be in the most leewardly place. That is the best harbour you can have; and, coming to that point, I should say, speaking from experience, that in Scarborough Bight, a little to the north, that is the deepest water, nearest to the shore, of any place along this coast, save and except under Speeton cliffs.

23,867. Will you look at this chart of the line of coast, and supposing the wind to be dead on shore, just put your finger upon the most leewardly point upon the coast between Flamborough Head and the Farn Islands?—(*Pointing to the chart.*) This is the most leewardly point upon the coast.

23,868. The Tees you mean?—Of course.

23,869. That, in your opinion, would be the best place to put a harbour of refuge, as it is the most leewardly point upon the coast?—I say so, provided that all other circumstances correspond and harmonise with it.

23,870. Will you tell me of any other circumstance which, in your opinion, does not correspond or harmonise with it?—Do you mean to inquire the reasons why I object to it.

23,871. Why do you object to the Tees bay, which is the most leewardly point upon the coast?—I object to Tees bay, in the first place, because the Tees and Sunderland are, in general, starting points; ships leaving the ports with auspicious gales, and proceed south. If we read the account of the wrecks upon this coast, we shall find, from the chart of the wrecks that I have, that nine-tenths of the damage done has been upon this coast, or by ships being upon this coast that have had to go back again; therefore upon these grounds, that the Tees is a starting point, and it is a long way to go back, if a ship is compelled to do so. Another thing is this, the mouth of the Tees is not near a safe place, for it is shallow water; and another reason is, that it is at the mouth of a river.

23,872. Suppose, now, that we have these auspicious gales or breezes, which induce the vessels to come out, and they start from Sunderland and the Tees at the same time; when the vessels from the Tees are about off Whitby, where will the Sunderland vessels be, as they come from farther north?—That will depend upon their speed; the time of the tide at which they get out. Different men get out at different times of tide.

23,873. My question was, if you recollect, if the vessels started at the same time. The generality of the vessels from the Tees and Sunderland are, I should imagine, about pretty much of the same speed. Suppose that laden vessels of about the same speed start at the same time, whereabouts do you suppose the Tyne vessel will be when the Tees vessel is off Whitby?—Perhaps as far as Redcliff or Staiths. There will be 20 miles difference between the two ports.

23,874. Then when the Tees vessels are off Scarborough, so as to be able to take this harbour which you would like to make, will the Tyne vessels also be able to take it, or will they be clear of the bight?—It is a great fact that from Whitby Rock to the bottom of Scarborough bight is in a line with the coast northward, and if a vessel weather Whitby Rock making even south-south-west course, and comes from a distance of 10 miles out at sea she can reach the bottom of our bay. To go south of that again she must go south-east by east and weather Flamborough Head. Therefore the fact is, a ship is embayed. She cannot weather the land on either side, nor upon either tack, neither starboard nor larboard, trying with the wind from east-north-east.

23,875. Then the Tees vessel could run into the harbour at Scarborough, but the Tyne vessel off the Staiths she could not, could she?—That would greatly depend upon the offing of the vessel.

23,876. But if she had made a straight course across?—If the wind had been from the north-east, which it is the practice of mariners to keep in general an offing according to the wind. I do not hesitate to say but that a vessel with any offing at all which a nautical man takes, that is seven or eight or nine miles from the land, that is not a great deal with the wind east-north-east would, if the gale increased, reach up to weather Whitby Rock, and consequently to come into Scarborough bight.

23,877. When these vessels are making a passage from a coal port with the wind off shore, do they keep along the land?—Invariably.

23,878. With the wind on from the eastward. Then they make an offing?—Yes, they reckon according to circumstances.

BRIDLINGTON.

Mr. H. Wyrill

26 Oct. 1858.

Chairman.

23,879. With the wind from east they make an offing of 9 or 10 miles, if they can?—Yes.

23,880. That accords with all the evidence we have received at other places. Therefore, if a Tyne vessel sails with the wind off shore, she will make a straight passage across the Tees Bay, will she not?—Yes, she will.

23,881. Then if the wind shifts suddenly and comes from the east, will such vessels be able to get into your harbour at Scarborough, they being off Staiths?—Not under those circumstances. Those sudden changes of wind upon any land would embay a vessel.

23,882. What is your worst wind upon this coast, I mean the most dangerous?—East-north-east.

23,883. How do these easterly gales commence? What kind of weather have you before the easterly gales come on?—Very often we have strong rains, the westerly winds coming out to north-east, with showers of hail. That is the course the gale takes.

23,884. Do these gales give a man who knows the coast and the weather any warning, or do they come upon him suddenly?—Well, I have known them come on as sudden as the electric telegraph, and I have known them give 24 hours' warning to the knowledge of a practical man.

23,885. Would you say it was a common occurrence that they should come on suddenly, so as not to give any warning at all?—No, not the east-north-east part of it. I would say they very often chop round from the westward to north, giving no warning, but they invariably go round to east in heavy showers, and therefore they do give a little warning.

23,886. Therefore, if vessels have started with an off-shore wind, and are close in shore, as a general rule have they time to make an offing, if they take notice—if the master looks sharp, and knows the weather and obeys the warning given him?—I should say so, by the general rule of things.

23,887. (*Capt. Sulivan.*) From your experience do you consider that the great danger is to laden vessels bound south?—Yes, nine-tenths of them.

23,888. Would you have special reference to laden vessels in selecting a site for a harbour of refuge?—Decidedly so.

Mr. Edward Templer examined.

Mr. E. Templer.

23,889. (*Chairman.*) Do you reside at Bridlington?—No.

23,890. What is your occupation?—I am a North Sea pilot, and a coasting pilot.

23,891. How many years have you followed that occupation?—Five years.

23,892. Previous to that, did you follow the sea?—I have been at sea for 38 years altogether.

23.893. Have you commanded vessels for any time?—I have commanded them for about 27 years.

23,894. In what trade were the vessels you were employed in chiefly engaged?—Generally in the coal trade. I have been up the Baltic a few times, but generally I have been in the coal trade.

23,895. Was it lately that you have been in the Baltic?—I have not been lately, only when I was on board a French frigate there, I was the pilot of one of them.

23,896. The other day you mean, in the late Russian war?—Yes.

23,897. What is your opinion about a harbour of refuge, and where it ought to be put?—Well, it is of no benefit to me. I am resident at Sunderland, and get my living out there; but I am a North Sea pilot, and generally come with ships from 17 to 18 feet water. My opinion is that the best place would be in Bridlington Bay.

23,898. If the wind is south-south-east or in that direction, can a vessel get round the Head into Bridlington Bay with a flood tide?—Oh, yes.

23,899. It is the practice for vessels to anchor under Speeton Cliff in great numbers during southerly winds, is it not?—Very few. They have to be very small vessels if they anchor under Speeton Cliff, as they are within a stone's throw of the shore.

23,900. Do I understand you to say that vessels do not anchor under Speeton Cliff, except in small numbers?—Very small numbers, and very small vessels I may say, unless they be dodging about under canvas all ready to get out.

23,901. I wish you to be very particular about this matter, because the evidence is in direct contradiction with what we have received elsewhere. You tell me that the vessels which anchor under Speeton Cliff are only small ones; am I to understand you that a considerable number dodge about there trying to get round the Head?—Yes.

23,902. What do you call a considerable number; how many?—Sometimes as many as 30 or 40, or 50 sail. I cannot say that I ever saw many more, because there is not room for many more to do it.

23,903. What is the largest number that you have ever seen at anchor under Speeton Cliff?—I cannot say that I have ever seen more than 15 or 20 sail.

23,904. What was the tonnage of those vessels?—The largest could not be 200 tons register, because nothing but small vessels go there.

23,905. If a vessel gets up under the Head, could she with a flood tide, under close-reefed topsails, and her courses, get round into Bridlington bay, supposing it to blow so hard as to oblige her to carry that sail?—Yes, as the tide runs there.

23,906. You could do that kind of thing, being a pilot, and knowing the place well; but do you say that masters in general commanding these vessels could do it as well as yourself?—Anybody that knows the locality, and knows the coast we are on.

23,907. You mean that anyone who has been accustomed to command vessels upon this coast would do it?—Yes.

23,908. Are they in the habit of doing it. Have you seen them work round the Head in that weather, bound to the south with a south wind?—Oh, never, because after they get round there is no refuge—not with a south wind.

23,909. Is the tide on shore round the Head stronger than it is in the offing?—Yes.

23,910. Is it much stronger?—Three times as strong.

23,911. Then when the flood-tide is running to windward with a strong south wind, would it not be better for a man who has to make his passage, to work his vessel to windward in the neighbourhood of the Head, to avail himself of the tide instead of standing right out in the offing?—Yes, with the wind down as far as south-south-west we do avail ourselves of the tide, but I am speaking of winds from the south, the south-south-east, and the south-east; we gain nothing by getting close round it, because there is no refuge, but if it was from the south-south-west, or even from the south, I would get round there with the strength of the tide, get into the corner of the bay, and get jammed up there upon the other tack.

23,912. I am not talking of vessels wanting to get into the bay for shelter, but of those who are making a passage working to windward, and who would remain in the neighbourhood of the Head to avail themselves of the strong weather tide, which you tell me is three times as strong there as it is in the offing?—Yes.

23,913. Is that done. Do they do it?—We do do it.

23,914. Do you do that with the wind from the south?—Yes, with the wind from the south-south-east.

23,915. I am not saying about that. Suppose you had a harbour in Bridlington bay where would you have a second one placed; or would you endeavour to improve the three ports; or would you put a single harbour some where else?—I would endeavour to improve the Tyne, the Tees, and the Wear.

23,916. Why improve them with the single harbour

at Hartlepool?—Because there is no place off the Tyne for a single harbour, and no place off Sunderland for a single harbour, not with safety in Hendon bay. There is no particular place at the mouth of the Tees, There is none can be made without a very narrow entrance.

23,917. For which reason you would endeavour to improve them all?—These northern ports and places of refuge to the south of them.

23,918. As you say these harbours would not be easily improved, why would you not have a large one at Hartlepool?—I say that Hartlepool is no better than our own place—Hendon bay; I shall not approve of Hartlepool no more than Hendon bay.

23,919. Of course you have taken these bar harbours in bad weather?—I have.

23,920. Can you give me any instance of loss of life and property in doing so?—I have never had the misfortune myself, but I have seen a many that have been caught in taking them, but I never took many but Sunderland, which is the place I belong to, not in a gale of wind from the east.

23,921. In taking Sunderland with a gale of wind from the east, were you ever in danger of losing your ship; if so, give me all the circumstances connected with it?—When I am going to Sunderland with a gale from the east, we are in danger, in great danger, because when we go for it, as the saying is, we only go to get there, just to get in it, and if we do not get in, we are sure to go to the back of the pier, and strike it or something.

23,922. I want you to tell me whether you have ever been in danger of being thrown behind the pier and losing your ship in going in?—I never had such a thing occurred to me; I have been in danger, but never went to the back of the pier.

23,923. Have you seen the thing ever happen?—Oh yes, too many times.

23,924. (*Mr. Lindsay.*) As a pilot, would you hesitate to run for the Tyne, if you had plenty of water, with an easterly gale, during the ebb tide?—The ebb tide is a bad time to run for it, because it makes the sea heavier; the tide running against the sea causes a rush.

23,925. Which you think would cause a great danger in running for the Tyne upon an ebb tide?—There would be as much danger as running for our own place, and there would still be danger, even if there was more water, as the entrance is narrow. There is not a ship can go into a narrow entrance for a refuge, I do not care how big or how small a ship may be; big ships have no business there, but small ships: it is never known how they get in.

23,926. With a narrow entrance would you have any hesitation in running in a gale of wind and a flood tide?—Not exactly so much as the other; not so much with the flood tide as with the ebb, if the entrance is narrow.

23,927. It is on account of the narrow entrance you would hesitate to run for this harbour?—That is my main objection, it is too narrow an entrance for a refuge.

23,928. But with a harbour at Filey, or any other part on the coast where there is no tide and no river, with the same width of entrance, would you have the same hesitation in running for it as you would for the mouth of the Tyne, supposing the width of entrance to be the same?—You mean about Filey. If there was a narrow entrance at Filey it would be just as doubtful running for it as I should for the Tyne or Sunderland, because I do not think it possible to make a harbour at Filey with a very narrow entrance. That is my opinion, knowing the locality of this coast.

23,929. (*Capt. Washington*). I think you said you think Bridlington Bay to be a right place for a refuge?—Yes.

23,930. Will you give your reasons for it?—My reason is there is the Smithic sands right before it, if there was a breakwater built upon the top of it we have a complete refuge for any amount of shipping that has a mind to come in. There is plenty of water for line-of-battle ships or any vessels. There is plenty of room, and a road to the south and to the north too.

23,931. That would be very good for light vessels, but would it be good for laden colliers?—It is laden colliers that I am speaking of. It is a good refuge now for light vessels as far as until the wind comes to the north-east when it is time to run out. To my idea there is plenty of water. We should have a road in and a road out. It is of no benefit to me, for I do not belong to the place.

23,932. Is a fleet of light vessels often caught here with a north-east wind?—Yes.

23,933. Where do they go to; can they ride here then?—They must get their anchors and see if they cannot get off for the Humber. If they are caught short, they must ride in the bay.

23,934. That is your reason for wishing for a breakwater upon the Smithic sands?—Yes, because within it is a refuge for any ships, I do not care how big they are.

23,935. Have any wrecks taken place in Bridlington bay?—I have known ships to come on shore, but there is more of them comes ashore when they have slipped and are driving for this bit of a hole, which they call here a harbour. That is, where more of them come ashore from that than anything else.

23,936. They can generally get their anchors up and make for the Humber?—Not generally; I have been riding in a very heavy gale of wind out here with both anchors down; if we had not had a particular eye to it we should have been caught many a time.

23,937. It is good holding ground if you can ride out an east-south-east gale?—It is good holding ground.

23,938. Does the Smithic sand give any shelter at low water?—Yes, the soundings are two and a half, three, and three and a half on the north end. Supposing there was a harbour made here, if I had got to the southward between the Humber and here, I could always come by my lead to this place, if it was ever so thick.

23,939. Because it is a shallow bay?—It is not shallow; there is plenty of water for any ship. It is the best coast we have right down to Scotland; altogether what I call the most harmless coast that you can go into between this and the Humber.

23,940. Do you think that range enough between the Humber to the Staples?—Yes, I think it is quite sufficient.

23,941. You are pretty well acquainted with the Tees bay?—Not much acquainted with that; I have not been in Hartlepool more than three times in my life.

23,942. Do you hear of many wrecks in Hartlepool bay?—Yes, a great many.

23,943. Do you happen to know that 22 lives are lost there every year and have been for the last six years?—Yes, that is true.

23,944. Do you know that 44 lives were lost in Hartlepool bay in the gale of the 4th of January 1857?—I do not know how many, but a great number.

23,945. Do you think it would be worth while to try and put a breakwater to prevent that loss of life?—I will not say anything against that, but it would have to be a very narrow entrance. The reason why there are so many lives lost about the Tees, is on account of the light vessels running to the ports they are bound to. Say I belong to Sunderland, and am making for it with a wind at south-south-east, I can keep off the land and I must run for it, because if another man gets there and I do not get in, I am unshipped. That is what leads to the great mass of losses which take place. That is why ships run into danger.

23,946. The shipowners require you to make the passage as fast as you can?—Yes.

23,947. They will not admit of delay?—No. If

BRIDLINGTON.

Mr. E. Templer.

26 Oct. 1858.

Capt. Washington.

another man gets down they would ask me why I could not do the same.

23,948. You know the coast pretty well, I believe?—Yes.

23,949. Suppose you were in one of the laden ships, working up with south-west winds, and got as far as Flamborough Head, and then the wind came round to south-east, would you at once bear up for a refuge harbour?—No; I would contend as long as I could, if I thought by so doing I could make my passage; but of course if I am caught with a regular gale, and cannot contend against it any longer, I must go to some place of refuge.

23,950. How long would you contend, 24 hours?—I might contend through two or three days, according to the weather. Perhaps I could not contend more than two or three hours.

23,951. Would you be able to hold your own, do you think, or would you drive to the northward?—If there was a harbour of refuge I could get hold of, I would take care not to drive to the northward.

23,952. You would run at once for refuge?—That is, if the place was safe, and there was plenty of room to run in.

23,953. Do not you think it desirable that there should be such a refuge?—Yes, for laden vessels and heavy vessels.

23,954. You think that such a place might be provided in Bridlington bay?—I am certain of it.

23,955. You think that vessels would be able to contend with the gale, and get round the Head?—I am certain of it.

23,956. (*Capt. Sulivan.*) If there was a good harbour in Bridlington bay, and another in Filey bay, both made safe from every wind, and you had got up to the Head with a heavy south and south-south-east gale, which had brought you to under close-reefed topsails, and you had your choice of either bearing up for Filey or trying to get round the Head into Bridlington bay, which would you do?—If there was one in Filey bay I should take Filey. If there was one in both places I should take the first, provided I could not get round.

23,957. When a ship is off the Head in a southerly gale, particularly under close-reefed topsails, is it not very doubtful whether she would get round?—If she can get to Filey the next flood she can always get round.

23,958. How is it we have evidence of very many vessels that are caught north of the Head, under Speeton Cliffs, being driven back to the Forth afterwards?—Because they knew, when they got round the Head, that there was no place for them.

23,959. If they have been driven all the way back, is not that a proof that they cannot hold their own off the Head?—There was no place for them if they tried; it was very little use contending, when they knew that if they got round there was no place for them.

23,960. Do you believe that any man in his senses, under close-reefed topsails under Flamborough Head, with a gale from the southward, would try to thrash round into the harbour in Bridlington bay, if he could put the helm up, and run into a good harbour in Filey bay?—If there was one; but suppose I was caught to the southward?

23,961. Now if you were five or ten miles to the southward of the Head, you would then get into Bridlington bay easily, could you not?—Yes.

23,962. But could you not also easily run back that 10 miles to get into Filey bay?—No, not if it was foggy weather; if it was thick, I could come in here by the lead, but could not get into Filey.

23,963. Is it generally thick weather with southerly gales?—Mostly; more so than with any other wind on this coast.

23,964. If you could see a breakwater, to enable you to get under it at Bridlington bay, could you not make Flamborough Head as easily as running for the breakwater?—Yes, if it was made here.

23,965. Even in thick weather, could you not make Flamborough Head as easily as you could a breakwater on the Smithic sands?—If it was thick weather, I could not go down to Filey by my lead, and no man could who knows anything about the coast; but you can come down into this bay in any weather you like.

23,966. You have already one refuge south of Flamborough Head, at the Humber, have you not?—Yes.

23,967. You have have no refuge from Flamborough Head to the Tyne, have you?—No.

23,968. Would you think it desirable to put a second refuge south of Flamborough Head where already you have the Humber, and leave the whole coast north of Flamborough Head without any refuge at all?—A second refuge to the southward besides the bay.

23,969. Yes; if you built a harbour in Bridlington bay, you would have two south of the Head, the Humber and Bridlington; and if one were built to the north, it would be hardly any distance from here?—If there is a harbour in Bridlington bay, it is a refuge for the largest ships we have in the world.

Mr. Robert Scales examined.

Mr. R. Scales.

23,970. (*Chairman.*) Do you reside at Bridlington?—At present.

23,971. How many years have you followed the sea?—Ever since I was 18 years old,—for about 50 years.

23,972. For how many years have you been master of a vessel?—Somewhere about 20, off and on, at times.

23,973. In what trade have the vessels you commanded been chiefly employed?—Fishing vessels.

23,974. What size?—From 60 to 70 tons.

23,975. At what distance from here are the fishing grounds?—Off as far as the Doggerbank, about 42 or 43 miles.

23,976. Do you ever go further?—In summer time we go to the north end; that would be about 60 miles from Flamborough Head.

23,977. You have heard the evidence which has been given us, that Bridlington bay is the best place for a harbour of refuge; do you agree with that opinion?—I have been here 8 years, and I think it is the best place upon this coast for a harbour of refuge.

23,978. What are your reasons?—My reasons are, because I can run out of the deep sea for a breakwater here, and if my vessel would live at sea, as soon as I got round the pier I should be in safety; but if I had to go on a lee shore I have to go to all the danger.

23,979. You know Filey?—Yes.

23,980. You know the Brigg?—Yes.

23,981. Is there a great outset there?—Yes.

23,982. Do you know that from your own knowledge?—Yes, and it makes a very cross sea off the Brigg end; I have a great right to know it.

23,983. Why?—Because I have been upset in going through it, and my companions were drowned away from me.

23,984. Can you tell me how many knots it runs?—I should say from $2\frac{1}{2}$ to 3 knots in strong spring tides, where the buoy is. I have seen the buoy go nearly over head.

23,985. (*Capt. Washington.*) I think you belong to Bridlington?—I belong to Filey. I was bred and born in Filey, and have lived there for 50 years.

23,986. Do you fish out of Filey?—Out of Bridlington at present.

23,987. Have you fished here for many years?—Eight years.

23,988. You are frequently in Bridlington bay?—Frequently in Bridlington bay.

23,989. Tell us the largest number of vessels you

have seen riding in Bridlington bay at one time ?—400 or 500 light colliers.

23,990. Tell us how many laden colliers you have seen lying north of the Head dodging ?—Upwards of 150 or 200 with the wind at south-south-west, riding and under sail.

23,991. Many of them riding ?—I have seen a good many riding.

23,992. What number, 50 ?—I have seen 100 riding.

23,993. Did you hear the evidence the last witness gave that he had never seen above 20 riding ?—Well, I have seen 100.

23,994. You have seen how many in Bridlington bay ?—500 or 600.

23,995. Did any of those vessels ever go on shore ?—I have seen some vessels run ashore from missing the harbour, but not drive ashore from their anchors.

23,996. It is good holding ground ?—Yes, I never saw anything else.

23,997. Did you ever know any lives lost in Bridlington bay ?—Not since I came into it.

23,998. There is a life-boat, is there not ?—Yes ; there was a vessel here to the southward of the harbour. The master did not come up the harbour, but brought her up. She was a billy-boy, and this happened last March, I believe. In attempting to ride, she pulled the bits out, was knocked all to pieces, and all hands were drowned after she touched the shore in less than five minutes.

23,999. Does the life-boat often go off ?—She goes off when she is wanted.

24,000. Have you been off in her ?—No, I am too old for that job ; I am not allowed to go in her.

24,001. By whom is she manned ?—By volunteer sailors.

24,002. Are there always plenty of volunteers ?—Yes, plenty.

24,003. Except the vessel you speak of, have you known any lives lost in Bridlington bay ?—Not from ships.

24,004. Where did you say the refuge harbour ought to be placed ?—I think Bridlington bay is the likeliest place, but I do not pretend to say it is the best ; it is only my idea of the thing.

24,005. Do you ever run to Scarborough or the ports to the northward ?—I have run to Scarborough.

24,006. Is that a safe place to take ?—Yes, with the wind at south-east and east-south-east.

24,007. Is there a great outset ?—Yes.

24,008. Is there the same at Filey Bay ?—There is more.

24,009. Does that ever damage boats or ships ?—Yes. I have been upset in it, and my companions drowned away from me. My father was drowned there too with other eight men, all in one day ; so I have a right to know it.

24,010. Do you say that was owing to the outset from Filey Bay ?—Yes.

24,011. How was the wind at that time ?—About east-south-east.

24,012. Was it blowing strong ?—Yes, when my father and the others were drowned, but not when my partner was drowned.

24,013. Was your father running in under sail ?—No, he was going in without sail, as I have heard ; I was not born at the time.

24,014. You can speak from you own knowledge of that outset, however ?—I have had experience of it for between 40 and 50 years, and have been in it in all kinds of weather.

24,015. Do you know the coast farther north ?—No, not a great deal farther north. I have never been in any of the harbours much north. From Scarborough to Yarmouth, Lowestoft, and that way, herring fishing and cod fishing, that has been the chief work of my life.

24,016. For the fishing vessels what would be the best thing which could be done ? To make a good harbour at Filey, to afford shelter from winds from the north-east and east-north-east ?—You could not make a large harbour there, not one to take to in bad weather.

24,017. Why not ?—Because if you were to make a very large harbour there, my opinion is that ships could never get into it, because I have seen the sea break all the way from Filey Brigg to the mainland ; nothing but broken water with the wind east-north-eart, and an ebb tide; that is my opinion. If you make a harbour of that kind you must be in before the bad weather comes. I do not think it is to be got into after a heavy gale does come.

24,018. But why, if a breakwater was run out into 7 fathoms, leaving an opening to the southward, why should you not run into that ?—If you run a breakwater there, a mile or two long, it leads you all that to leeward into more broken water. Nearer the Brigg is the deeper water. When we used to come round with the tide, we used to run so far southward. Running away upon the land clear of Filey Brigg would bring us into deep water, but if you leave us a mile to leeward, we have our death before our eyes.

24,019. How far does this outset extend from the end of the Brigg ?—It stretches about two miles.

24,020. North-east ?—About east from the south end.

24,021. Does it stretch beyond the buoy ?—That is only part of it where the buoy is. The north part of it bears about north-east from Filey Brigg, and the south part about east. It is called the north-east set. It is the tide which comes away from the south shore, runs round, and comes out upon the Brigg, and falls out of the shallow water into the deep water. It takes a north-east set, and then from that a north-west set in.

24,022. Is there a slight outset from Bridlington bay ?—There is some outset from Bridlington bay, but there is chiefly a passage between the Head and the tide. The tide sets out from here about east, or east and by south, and meets another tide about north-east, which puts it farther away from the Head.

24,023. If a breakwater were placed in Filey bay, you think there must be a northern opening to let that outset escape ?—Yes, I do. There must be an entrance at the north as well as at the south side ; that is my opinion.

24,024. (*Capt. Sulivan.*) You say that there would be no space for a vessel to run in round the end of the breakwater ?—No, I did not say so.

24,025. That it would be too far to leeward ?—Yes.

24,026. If the breakwater ran in the direction of Flamborough Head from Filey Brigg, how far would it be from the shore opposite ?—If it ran in a direction from Filey Brigg to Flamborough Head it would be in the same direction.

24,027. What distance would it be from the main shore, would it be above a mile ?—Yes.

24,028. Would that not afford plenty of room for a vessel to run round ?—Yes, but you would be amongst broken water in the inside.

24,029. Would not the breakwater throw off the broken water and give smooth water inside ?—It would, but the tide must go round the breakwater ; if you got it at the north end it would come out at the south end.

24,030. At present does the outset set over the south end of the Brigg ?—Yes, you know that you can walk off the Brigg into seven fathoms.

24,031. Is it there the outset is so dangerous, over the Brigg ?—No, it is without that, you have to go to the east from that, two miles, before you can get round it.

24,032. That is the outset ?—Yes, you must come there before you can get into Filey bay.

24,033. This would extend north of the east of Filey Brigg ?—The north end, north-east ; the south end, east.

24,034. Vessels coming from the eastward of Flamborough Head would come round the south end ?—Yes.

24,035. If there was a passage left through the breakwater somewhere about where the buoy is, in five or six fathoms water, would that be safe for

BRIDLINGTON.

Mr. R. Scales.

26 Oct. 1858.

Capt. Sulivan.

vessels to take from the eastward or north-east?—It would be safe in some cases, but I have seen it when it would have knocked any ship nearly down, not a ship's length off. Filey Brigg stands in about four and a half fathoms, and if you go four ship's lengths from that it is 16 fathoms.

24,036. The buoy is off the extreme end of the Brigg?—It is at the inside of the Brigg,—what we call the Brigg. As soon as ever you get within that buoy with a flood tide you have lost the flood.

24,037. Because it runs southward?—It runs away to the south-south-west.

24,038. With an ebb tide would you have any hesitation in taking an opening in the breakwater, if it was made outside where the buoy is?—It depends how the wind is. Is it one thing or another?

24,039. Blowing hard from the east?—I would not take it.

24,040. Would you have any hesitation in running round the south end of the breakwater if there was one made, with a gale of wind from the eastward?—I would not run into it at all, for if I ran round the south end of it I should run into nothing but broken water that came away from the breakwater end, if it was ebb.

24,041. A flood tide?—You cannot get a flood into the Filey bay. There is no such thing.

24,042. It is all the better, is it not?—It won't warp up so much at the south end; but if you make a breakwater from Filey Brigg, the tide which goes down the north side must be dead when it comes there, and I think that will warp up. If it is stopped there, it must come round the south end of the breakwater.

[*Sir F. Smith, Capt. Vetch, and Mr. Coode, who in the early part of the day had visited Flamborough Head, now took their seats.*]

24,043. (*Capt. Vetch.*) Can you tell me how many fishing boats you have out at Bridlington?—Three yawls.

24,044. Belonging to the port?—Yes.

24,045. How many have you seen take shelter in this bay at a time?—I cannot say exactly; perhaps 25 or 26 in the harbour, and 40 or 50, perhaps, in the bay belonging to Filey, Scarborough, Bridlington, Yarmouth, Cromer, and other places upon the coast. There are off here 600 or 700 sail of fishing craft, and if it came a northerly wind the chief part would be in danger.

24,046. Have you any Brixham boats come here?—Yes, England, French and Dutch boats.

24,047. When the wind is northerly how many vessels have you known lying in Bridlington bay?—500 or 600 perhaps, while I have been here; perhaps more at other times.

24,048. Do they get good shelter?—There is good shelter with the wind away from north and east, as far as east-north-east.

24,049. Vessels which are waiting for a wind to go north do not get wrecked?—I have seen collisions when they have driven from their anchors and run foul of one another when the wind has shifted sometimes. One minute it is blowing a gale from the north-east, and in a few moments from the south-south-west.

24,050. They find this a very convenient waiting place for vessels bound north?—Yes; I never saw no other.

24,051. (*Mr. Coode.*) Have you known vessels to drag their anchors in Bridlington bay?—Never to drag them on shore. I have seen one get foul of another, but I never knew a ship to drive on shore with an anchor.

24,052. Have you known ships drive out?—No, I never did.

24,053. Have you known them drag their anchors from one part of the bay to another?—Perhaps a ship's length or two, but nothing more than that.

24,054. What is the rate of the strong tide you speak of at Filey?—From 2 to 3 knots.

24,055. That is at the top of springs?—Yes.

24,056. What rate is it at the neap tides, do you think?—Perhaps 1 or 1½ knots. I never measured it. It is only a rough calculation.

24,057. Was it a fishing boat or a vessel that you spoke of being upset at Filey?—It was a fishing boat.

24,058. What size was she?—One of our cobles coming from Filey Brigg.

24,059. (*Capt. Sulivan.*) Do you recollect the loss of a vessel called the *Coburg*?—No.

24,060. Have you ever heard of such a vessel being lost here?—Here in Bridlington?

24,061. Including the neighbourhood?—No.

Mr. Henry Knott examined.

Mr. Henry Knott.

24,062. (*Chairman.*) You are a lighthouse-keeper at Flamborough Head?—Yes.

24,063. (*Sir F. Smith.*) How long have you been lighthouse-keeper?—17 years.

24,064. In the course of that time, have you kept any register of the number of vessels that have passed in either direction?—No.

24,065. Have you made any memorandum or kept any journal of the number of vessels which have been detained off the Head?—No.

24,066. Have you any good and clear recollection of vessels being detained off Flamborough Head?—Yes.

24,067. In any large numbers?—In Bridlington bay I have known 700.

24,068. What were they detained by?—By north and north-east winds.

24,069. Light ships?—Light ships and laden ships too.

24,070. Coasters, or employed in the foreign trade?—Coasters generally.

24,071. Sometimes in the foreign trade?—Sometimes.

24,072. Vessels from Hull, or do you know where they came from?—No.

24,073. Have you often any vessels detained on the other side of the head?—Yes.

24,074. In any great numbers?—Well, 50 or 80.

24,075. Never above 50 or 80?—No.

24,076. Were they bound south?—Yes.

24,077. Laden or in ballast?—Generally laden.

24,078. They were detained in consequence of southerly winds?—Yes.

24,079. Whereabouts were they?—Under Speeton Cliffs and in Filey bay.

24,080. Were they anchored there?—Some, and some beating about.

24,081. They could not get any refuge in Filey bay, could they, in the bottom of the bay?—Well, I have seen them ride at anchor in the bottom of the bay.

24,082. Exposed to south winds?—Yes.

24,083. Still riding?—Riding.

24,084. Not able to get round the Head?—No.

24,085. Do you keep any register of the persons who visit the lighthouse?—Yes.

24,086. Have you had many visitors lately?—Yes, during the summer.

24,087. Have you had many persons lately making an inquiry of you at the lighthouse with reference to the passing of vessels?—No.

24,088. Not lately?—No.

24,089. Not in the course of the present week?—No.

24,090. (*Mr. Lindsay.*) Have you known many laden vessels off Flamborough Head which could not get to the southward? What is the greatest number you think you have seen congregated off there?—Off the Head?

24,091. Yes, off the Head, scattered about as far as you could see?—Perhaps a score.

24,092. Have you never seen more than a score of vessels off Flamborough Head?—Oh yes.

24,093 What is the most?—400 or 500 sail off the Head, knocking about.

24,094. During what winds do most vessels congregate about the Head?—With the wind from north-west there is often a great many, and so when it is from north-east.

24,095. Do you keep any record of the wind?—Yes.

24,096. How does the wind usually veer in this quarter? Does it go from south to north or north to south?—When it is an easterly wind it frequently goes south, south-south-west, and west; sometimes the other way.

24,097. Have you known the wind from west, south-south-west, and south-west, to blow hard and suddenly?—Not suddenly.

24,098. Is not the heaviest wind you have on this coast from north-east to south-east?—Very heavy at times.

24,099. Do the north-east winds usually veer to the south-east, or is it the other way?—The other way generally.

24,100. Generally from south-east, going south-south-east and east?—No, it backs to south.

24,101. When it is blowing hard from the south-east, does it not often veer to east and the northward of east?—Frequently.

24,102. When it veers round in that way does it usually blow much harder about east and east-north-east than what it does at south-east?—Yes; from east-north-east and east-south-east I have noticed it blow heavier.

24,103. Is it the case that in such gales the wind oftener veers from east-south-east to east-north-east, or the other way? Say the wind is blowing strong at east-south-east, does it often go to east and then to east-north-east, and blow hard?—Yes.

24,104. Or does it blow hard east-north-east and go east and to east-south-east?—Sometimes it goes one way and sometimes another, but it generally goes from east-south-east to east, and then to east-north-east.

24,105. (*Capt. Washington.*) I think you said you had seen as many as 700 vessels lying in Bridlington bay?—Yes.

24,106. Did you count them?—Yes, several times I have counted them.

24,107. And counted that number?—Yes.

24,108. How many times have you seen as many as that in the bay?—Perhaps only once in a year.

24,109. What is the average number you have seen here in southerly winds?—500 or 600 frequently.

24,110. Have you seen 200 as often as ten times a year?—Yes.

24,111. In answer to a question you said you had seen fully 500 vessels off Flamborough Head. Do you mean laden or light?—Both together.

24,112. Do you remember how the wind was?—No.

24,113. How long do you say you have been the keeper of the lighthouse?—17 years.

24,114. Where did you come from?—The South Foreland lighthouse.

24,115. Do you think there are more vessels passing Flamborough Head than the South Foreland?—A great many more, but they are not so large.

24,116. No list of vessels in sight has ever been kept at the lighthonse?—No.

24,117. Would there be much trouble in doing it?—I suppose not.

24,118. Those that pass by day?—Yes.

24,119. (*Capt. Sulivan.*) Is it the case that by day the men at the lighthouse are employed part of the time in cleaning the glass of the light, and that the other time they are employed about their gardens and other things; that they are in fact off duty as it were by day?—Yes.

24,120. Would it add greatly to the work of the lighthouses if there was anything like the duty of counting the vessels that passed cast upon the keepers?—Very much.

24,121. Without great additional work you think they would not be able to do it?—It would be an addition to the work but it might be done.

24,122. Is it at present considered that the light keepers when they have cleaned their lamps have the day to themselves?—Yes.

24,123. Have you in southerly gales ever seen a vessel trying to thrash to the southward, and after all having to bear up?—Yes.

24,124. Is that a common thing?—In heavy southerly gales I have often seen it.

24,125. Have you seen vessels collected between the Head and Speeton cliffs obliged to go to sea and be driven to the northward?—Not from Speeton cliffs, but I have from Bridlington bay with the wind from the east.

24,126. You said you had seen vessels dodging to the northward? Have you seen those vessels driven out of that bay by the wind going to the eastward and obliged to go to sea and driven back to the northward?—I have never observed that.

24,127. If you include vessels at anchor and those off the Head trying to get to the southward, what is the greatest number of laden vessels trying to get south that you have ever seen at one time?—I have never counted them but have seen sometimes a large fleet trying to get to the south.

24,128. How many?—Say, perhaps, 100 sail.

24,129. Would you call that a large fleet?—I have seen many more in a light wind, but I am alluding to a strong wind.

Mr. Samuel Brown examined.

24,130. (*Chairman.*) Do you reside at Hull?—I do.

24,131. How many years were you a pilot?—49.

24,132. How many years have you given up going to sea as a pilot?—Eight. I retired in the year 1850.

24,133. (*Mr. Lindsay.*) Were you a North Sea pilot?—No; a Humber pilot the whole of the time.

24,134. Have you anything to tell us with regard to harbours of refuge which we have not heard to-day?—My opinion is there is no harbour along this coast, of any, from the Humber to the Forth, that is equal to Bridlington bay. There is no other except the Tees which can possibly render real service to the shipping interest.

24,135. Your opinion is that if there is to be only one harbour of refuge it should be Bridlington bay, and that if there are to be two, the second should be in the Tees bay?—Those are the only places that I have any idea of.

24,136. Will you tell me why you think a harbour in Bridlington bay would do more to save life and property than one in Filey?—In the first place it is naturally one, and by artificial means it might be made a real harbour of refuge. For instance there are 500 sail of vessels coming to Bridlington bay from the north and south. I have seen 500 sail and more. If there was a breakwater there would still be a safeguard for them; they would have no occasion to move then. They would stay here in safety. That is the only reason I have for speaking upon the subject, and I think a very just one.

24,137. That is the only reason why you prefer Bridlington to Filey?—Filey bay? I would not acknowledge it at all. I was standing upon the cliffs this summer, spending the day with some friends there, and they were speaking of some gentlemen coming round inspecting a harbour of refuge. I told them that it was all nonsense to see anything of the kind in the bay, and by that means I suppose I have been summoned here to-day to give my opinion upon that subject. I wish to leave it to your better judgment as to where a harbour of refuge is to be. I was told before I came from Hull that the chairman of the

BRIDLINGTON.

Mr. S. Brown.

26 Oct. 1858.

Mr. Lindsay.

Commission knew more than I did, and I allowed it to be so. Another thing they told me was that the Government never intended to allow a harbour of refuge, except Her Majesty's ships could go in. I could not understand it. I should have supposed that a harbour of refuge was made for the ships which were located on the coast, those which were upon the coast every month, and day in fact.

24,138. (*Capt. Vetch.*) I think you place a high value on the merits of Bridlington bay?—Yes; there is none except the Tees bay and Bridlington Bay which would make a good harbour of refuge.

24,139. Is there anything which might be done to improve Bridlington bay, and make it still better?—The fact is, there is no improvement at all; it is merely a safeguard with one wind. The north winds are continually blowing, and when there is a sudden change of wind upon the vessels which are lying in this bay there is no shelter for them whatever if it comes from the eastward, east and east-south-east, east-north-east and south-east. It might be made a good harbour of refuge with south-east gales, as well for loaded as for light ships.

24,140. What do you think could be done to improve it—erect a breakwater on the Smithic?—Over the Smithic bank, and extending away to the south-south-west. But then you would be locked in, and you should have two entrances, one to the north and the other to the south.

24,141. Then it would be a complete harbour from all winds?—It would.

24,142. The next harbour you propose between this and the Firth of Forth, where would that be placed ?—In Tees bay. There might be a breakwater formed. There is no other harbour that I see. It is an iron bound coast right from the Head to the Forth.

24,143. You think the Tees mouth would be the best place for another harbour ?—That is the only place that has any expanse.

24,144. (*Sir F. Smith.*) Do you think a harbour of refuge on this coast is very desirable ?—It certainly is, for the safety of life as well as property.

24,145. You say you would recommend a harbour to be made in Tees bay ?—I recommend so far as to say that that is the only place for an extensive harbour, with a breakwater across from Hartlepool Haugh away to Redcar.

24,146. You think you could not make a harbour at Redcar big enough ?—No, there is no extent whatever.

24,147. What depth of water would you have in the harbour you proposed here ?—From five to six fathoms, and two and a half on the Smithic.

24,148. At low water spring tides ?—Yes.

Mr. Thomas Fishcroft examined.

Mr. T. Fishcroft.

24 149. (*Chairman.*) Do you reside at Bridlington? —Yes.

24,150. How many years have you followed the sea?—Since 1809; 49 years.

24,151. What vessels have you been employed in chiefly?—All sorts, down from 98 tons to a small smack.

24,152. What vessels have you commanded?—A little brig and two smacks.

24,153. For how many years?—Perhaps I had the brig three years, one smack for seven years, and the other one for two years.

24,154. How are you employed now?—I am a pensioner.

24,155. You have come on shore ?—Yes ; five years.

24,156. (*Sir F. Smith.*) What part of the coast are you most familiar with?—All the way nearly as far as Coquet Island.

24,157. Give me your limits?—Anywhere from Yarmouth or London.

24,158. You think a harbour of refuge is required? —By all means; this is the first place that I know of.

24,159. On the eastern part of the coast where would you form a harbour if you had the money at your disposal?—I would form it here.

24,160. In preference to any other place?—In preference to any other place.

24,161. In preference to Hartlepool say, or Redcar? —Yes.

24,162. In preference to Filey?—Yes ; I have taken nearly all the harbours along the coast in gales of wind.

24,163. What do you think of the plan proposed at Filey?—I do not think much about it.

24,164. What is your objection?—In the first place, there is no man, as a sailor, who would run for Filey in thick weather, because there are no soundings whatsoever—no regular soundings. I have been trailing along the ground myself, and I know that there you never have two casts alike. I would almost defy any Filey man that there is to find it himself in thick weather. But Bridlington, a child might find it, because any man who is a sailor, knows that all along Holderness Binks, running along the coast from the Humber, is regular soundings. As easily as possible you may run into what water you think proper.

24,165. By having a harbour of refuge here you would always find it. In thick weather cannot you run by the lead into Hartlepool bay?—I could find it.

24,166. Better than you could Filey?—Oh, ten to one. I should say ten to one.

24,167. What do you think of Redcar?—You may find Redcar. With piers upon the Salt Scar you would make a harbour of refuge there ten to one better than Filey.

24,168. Did you ever anchor in Filey bay?—Yes, I have with a smack, with a gale of wind from the west-north-west.

24,169. Do you know much about Filey bay?—I do not know so much as they do.

24,170. How often have you anchored there?—Once or twice. We were coal-laden, and could not save the tide, and so made into the bay, and bore up. As soon as the tide turned we came out.

M T. Woodhouse.

Mr. Thomas Woodhouse examined.

24,171. (*Chairman.*) Do you reside at Bridlington? —No.

24,172. Where then?—Flamborough.

24,173. Are you connected with this port as a ship owner?—I have a small vessel that is occasionally here.

24,174. Have you followed the sea?—I was brought up as a fisherman, and went to sea for twenty years.

24,175. Did you command any of the fishing smacks?—No; I was brought up in those fishing cobles, fishing about Flamborough Head. I was never further.

24,176. You know the purpose for which we have met: to find out where is the best situation for placing a shelter for colliers, chiefly laden colliers. Give us your opinion upon the subject?—When I followed the fishing business I have seen loaded colliers with the wind south-south-west and south off the Head, particularly up under Speeton Cliff. I have noticed the vessels for a week together. We have gone off into the sea and come in through the fleet. I have noticed the vessels for a week together being laid under Flamborough Head, while if there had been a breakwater on the Smithic Sand the vessels would have taken advantage of it, and reached under the breakwater, because there is no hindrance to get there perhaps; and the light vessels would be on the south side on the Holderness coast, and if the wind increased they would run back under Flamborough Head, and lay to.

24,177. What is the largest number of colliers you have seen lying under Speeton cliffs?—When you say Speeton cliffs to Flamborough Head, at Speeton cliffs I can not say exactly, but I should think from 100 to 150 sail. That would be the farthest.

24,178. What was the size of the vessels?—Four or five keels, up to 17 or 18 keels.

24,179. What would be the tonnage of a vessel carrying 18 keels?—There are 21 tons to a keel.

24,180. When these vessels were lying under Speeton cliff, were there a considerable number dodging about off the Head?—Yes, you might reach through them day by day, and notice the vessels laid there. I have seen for a week the same vessels, sometimes vessels from the Baltic that we noticed most, from seeing the timber on their decks.

24,181. What is the largest number of vessels you have seen knocking about off the Head in this way? Can you form any idea of the numbers?—Do you mean loaded or light ?

24,182. Light.—The loaded vessels generally got collected together with the wind from the southward, south-south-west, and south. Some of them get worked to windward on the south land; and if the wind continues from the south they will bear up and come under the Head again for shelter.

24,183. As to the number of these loaded vessels you have seen together: how many is it, should you say, at a rough guess, on the south side in going out to sea?—On both sides I should not have seen more than 200.

24,184. You do not include the vessels that were running down, the light vessels?—No.

24,185. Has it ever occurred to you to have to assist these loaded vessels out at sea in bad weather?—It never happened to me, but I have had occasion to assist them from the beach when they have run in.

24,186. (*Sir F. Smith.*) When the vessels were unable to beat round Flamborough Head, with the wind blowing strong from the south, would they be obliged to haul off if they could not weather it?—If they could not get round they hauled out under the Head.

24,187. If the wind got at all to the eastward what were they obliged to do? — If that happened they would reach to sea.

24,188. But, blowing a gale, would they keep at sea with heavy loaded vessels, or bear up?—The loaded vessels would keep at sea and would not run to a tidal harbour, at least I should not.

24,189. You fancy they would not get in. But if there had been a refuge under their lee, would they have run for that?—Upon the north side the sea has a great fetch and it is dangerous taking one of those harbours in a strong sea.

24,190. In any case would they run for Filey if a harbour of refuge were made there?—Of course they would run to any place when the ship is in want of shelter.

24,191. Even to Filey?—Yes, Filey or any place. When you have a stormy night you would run to the first place you could get to.

24,192. (*Capt. Washington.*) Have you ever known vessels drive from their anchors in Bridlington bay ?—Yes, I have occasionally. I have known very large fleets of light vessels brought up in Bridlington bay when sudden gales have come from the eastward. I recollect in 1819, when I was a boy, I was herring catching here. There was a very large fleet, but I cannot say the number, of light vessels riding here. The wind shifted from north to east, I do not remember the point of the compass, but they were obliged to get under weigh, and they ran for Bridlington harbour until they filled it. Some vessels got within others' quarters, were jammed out, and ran for the Humber. We wanted to go about the herring business, and we had to land our boats up to the top of the harbour, and drag them through the streets to launch them. If there had been a harbour of refuge they would have been all laid up comfortably.

24,193. How many vessels will the harbour hold?—I am sure I cannot say.

24,194. How many have you seen in it?—I do not know. I do not mind the quantity. It was smaller then than it is now.

24,195. As it is at present, have you ever seen 50 sail in it ?—Oh yes, 50 or 100; I am sure I cannot say. It is only seldom I come to Bridlington.

24,196. Where do you fish from?—I do not fish at present. I was brought up a fisherman at Flamborough. I live at Flamborough, but have been at sea for more than 20 years.

24,197. You know Bridlington harbour pretty well?—Yes.

24,198. Can anything be done to improve it for the vessels which ride out in the bay when they have occasion to take it?—There might be a very good harbour made in Bridlington bay, where vessels could take it in all weathers and at all times of tide.

Mr. JOHN CAMPLEMAN examined.

24,199. (*Chairman.*) You are the harbour-master at Bridlington?—Yes.

24,200. How long have you held that situation ?—About 13 years and a half.

24,201. Previous to going to that situation were you at sea?—Yes.

24,202. How long at sea ?—About 27 years.

24,203. For how many years did you command vessels?—Only about four.

24,204. In what trade were the vessels chiefly employed in which you served?—Between here and Sunderland.

24,205. In the coal trade?—Yes.

24,206. (*Mr. Lindsay.*) What water have you at the entrance of the harbour at low water?—At low water we have not much.

24,207. Have you any?—It is dry sometimes. Forty yards out of the Pier-head I have seen it a deal lower than it is to-day.

24,208. What is the rise and flow of the tide?—About 18 feet rise and flow. We have 16 feet of water at the entrance of the harbour at spring tides on the average.

24,209. What is the largest vessel you have seen enter Bridlington harbour?—We have a vessel now in of 268 tons, which has been ashore. I think the largest vessel may be 350 tons.

24,210. What is the greatest draught of water?—We have had them 15 feet.

24,211. What sized vessel can find refuge in gales of wind?—We have had vessels of 70, 80, and 200 tons.

24,212. Have vessels of 200 tons run for it in easterly gales ?—She must be light, not a loaded vessel.

24,213. What is the largest loaded vessel that ever found refuge in the harbour in a gale?—I think the largest drew 14½ feet. They do not get in safely at that water.

24,214. She came in in a gale?—Yes, in a gale of wind, and leaking.

24,215. It was neck or nothing for her ?—Yes. There are several more of that kind.

24,216. What number of vessels of 150 tons register would the harbour hold?—It would not hold above 80 of that tonnage. We have had 120 in it.

24,217. What sized vessels?—They would average about 70 or 80 tons.

24,218. They would be very closely packed, I suppose?—Yes, pretty closely packed.

24,219. Is there much sea comes into the harbour in an easterly gale?—It is very nearly as bad as it is on the beach : we are completely open to the south-south-east.

24,220. You have run up a wooden jetty or pier inside. Was that meant as a breakwater?—It rather protects the north side of the harbour, but very little.

BRIDLINGTON.

Mr. J. Campleman.

26 Oct. 1858.

Mr. Lindsay.

24,221. Ships in here with a gale blowing right in are not safe, are they?—They have to come round under the rocks and all sorts of things. Some parts of the harbour are better than others, but none of it can be called good.

24,222. Do you deepen the harbour?—We took 700 tons out from a great bank close to the entrance of the harbour.

24,223. Has anything more been done in that way since you have been harbour-master?—No.

24,224. Any building going on?—The south pier has been made.

24,225. Was the whole of the south pier constructed during that time?—I think it had been about a year or a year and a half commenced when I came.

24,226. Has the construction of the south pier done anything to protect the vessels in the harbour?—No; I believe they were better off before it was made. It brings more sea upon them.

24,227. Do you know how much money was spent in building that pier?—I cannot exactly say.

24,228. Is it your opinion that the harbour is worse now than before the pier was built?—Yes.

24,229. It is more uncovered, and consequently it is worse?—Yes, it is more spacious; but it is worse in regard to sea.

24,230. Has there been any deepening going on while you have been here, except the 700 tons?—Just before I become harbour-master there were 5,000 or 6,000 tons taken out.

24,231. But has anything been done during the last 13 years?—I believe the contractor for the pier had an agreement to do something of that kind, but I think it was done away with.

24,232. What dues do you charge on vessels?—Vessels that pay passing tolls we charged 6*d.* for the ship altogether. That is called an ancient toll.

24,233. Who gets it?—The commissioners, of course.

24,334. Is that all the charge you make for refuge vessels?—Yes, coal laden vessels; but vessels with any other cargo pay 3*d.* a ton on the registered tonnage: a vessel coming in loaded with grain, or timber, or anything but coal.

24,235. Stop a minute. Say that a vessel comes in here for refuge, and is not going to deliver her cargo, but is fairly driven for refuge into the harbour, what charge do you make?—Any vessel loaded with anything but coal, 3*d.* on the registered tonnage. If she comes in in ballast, if the last cargo she had in was not coal, 2*d.* on the registered tonnage.

24,236. A refuge vessel loaded with coal coming in here is only charged 6*d.* on the vessel?—Yes.

24,237. But if a vessel laden with any other cargo comes in here for refuge, she is charged 3*d.* a registered ton?—Yes.

24,238. But if she comes in in ballast it is 2*d.* a registered ton, unless on the former voyage she was laden with coal?—Yes.

24,239. Is that correct?—Yes.

24,240. What do you charge on vessels coming to deliver their cargoes?—6*d.* on their registered tonnage.

24,241. With all descriptions of cargo?—Yes.

24,242. Including coals?—Coals pay 1*s.* 6*d.*; but that is for the coal and the ship too, 6*d.* for the ship, and 1*s.* for the coal.

24,243. What is the amount of the revenue?—It is very bad now. The last quarter was up two or three days ago, and it was only 65*l.* for the whole quarter. It will average about 500*l.* a year.

24,244. Is that derived from the tolls which you charge on ships coming in with cargoes or for refuge?—Whatever is discharged, there is a toll upon it.

24,245. The whole of that is raised by a tax upon the shipping which comes into the harbour?—Yes.

24,246. You alluded to the passing toll. How much of that comes to you?—I believe that the passing toll is about 3,000*l.* a year.

24,247. Which comes to Bridlington?—Yes.

24,248. Who gets that?—The Commissioners. They borrowed money to build the south pier, and they take that money to pay it.

24,249. Then the 3,000*l.* a year which you get from the passing toll is all consumed in paying the interest on the money which was borrowed to build the south pier?—That is it.

24,250. In fact, from what you say, this 3,000*l.*, instead of being used to do any good to the passing trade, has done a great deal of harm?—It has got the place into debt, and the only security which the Commissioners have for the money is the Act of Parliament. The Act has not above another 10 years to run before it is expired, and it will take nearly all that time before they get the money in.

24,251. There is no portion of the 3,000*l.* goes for harbour purposes?—No.

24,252. It is all consumed in interest?—In interest and in liquidating the debt.

24,253. Do you know how much they have in hand towards liquidating the debt?—I expect that before the 10 years have expired the debt will be completely liquidated.

24,254. You think the accumulation of funds will, before the Act expires, be sufficient to pay off the debt that was contracted for the building of the south pier?—I think so.

24,255. Now, tell me about the bay; is it good holding ground?—It is good holding ground. A great number of ships have been lying there during the last 10 years, and I have an account of them in these two books [*holding up two books*].

24,256. Do you keep an account of all the ships that anchor in Bridlington bay?—Yes.

24,257. For what purpose do you keep it?—Merely for my own curiosity; so that I can refer to anything.

24,258. Is it no part of your duty to keep this account?—No. I have put down in it nearly all the casualties that have occurred within these 10 years.

24,259. Say, that there is only one great harbour of refuge to be made between the Humber and the Farn Islands, where would you have that harbour?—I should prefer Bridlington bay, because I consider that in all roadsteads to which light vessels go—and we often have from 500 to 600 in Bridlington bay—there ought to be some protection when the wind suddenly shifts round to the eastward.

24,260. Do you think a harbour of refuge for laden vessels would do more good in Filey bay or at Bridlington bay?—If it was made for laden vessels in Bridlington bay it would also protect light ones from easterly winds, and so answer two purposes.

24,261. Do you think Bridlington bay would be a better site than Filey for loaded ships?—Decidedly so, for this reason, that while it would protect loaded ships it likewise would protect light ones, when the wind chopped round to the east. If the wind chops round to the east, particularly at low water time, it is no use endeavouring to get under weigh. We must ride on, and do the best we can until high water. Then, if it is a gale, the ships must slip their anchors and make the best of it. If there was a protection it would protect loaded ships, too.

24,262. If a second harbour was made, where would you put it?—I should say Hartlepool.

24,263. Say, there was to be one harbour made at Bridlington bay, and that it rested between the making of a harbour at Filey, and one at Hartlepool, which should you prefer then?—I should prefer Hartlepool still.

24,264. Do you think a harbour at Hartlepool or the improvement of the Tyne, the Wear, and the Tees, so as to make them accessible at all times of tide, if that were possible, which of these do you think would do most to save life and property?—I should advocate the improvement of the existing harbours: for if they could be improved they would do more to save life and property. A few hundreds or thousands of pounds would do a great deal more as to this place. If we had anything like a harbour at all we should

have as many loaded ships with southerly winds as we now have light ones with northerly. Now, if a man comes in here with a laden ship he will almost go anywhere before he will come a second time. It needs some improvement, and that very badly.

24,265. Do you mean the bay ?—No, the harbour.

24,266. Tell me what you want in the harbour ?—I propose a breakwater outside the present harbour.

24,267. In what water would you have it ?—Three fathoms at low water.

24,268. And what length of breakwater ?—About a mile and a quarter.

24,269. (*Capt. Washington.*) I think you did not mean that any due was levied on vessels which took refuge in Bridlington bay ?—No.

24,270. Only those that enter the harbour ?—That is all.

24,271. You produce a book containing an account of the vessels. Do you confirm the statement made by Mr. Knott, that 700 vessels have been anchored in Bridlington Bay at the same time ?—Very probably. I have known two or three cases in which there were 600. I cannot count them so well as Mr. Knott can from the lighthouse.

24,272. As often as 10 times a-year have there been 200 vessels in the bay ?—Oh yes.

24,273. How do they get supplies ?—They have plenty of supplies of everything.

24,274. Is there any difficulty in getting them off from the harbour ?—No, they come ashore in their own boats.

24,275. Has it not often happened that the boats can land on the north side of the bay, under the cliffs, when they cannot come to the harbour ?—No. Some of them might land at Flamborough merely for the name of the thing.

24,276. Do they ever land under Sewerby ?—Some land at Flamborough for their own amusement, not to say they cannot get into the harbour.

24,277. Are the boats ever prevented from coming into the harbour for two or three days ?—Very rarely. I have known the boats come when the wind was blowing from the east, when the wind was heavy to the north-north-east. They have come for supplies, and have very likely brought a water cask in the boat. Anywhere else on the northern coast you could not have gone off in a life-boat.

24,278. Are there means and appliances for repairing vessels at Bridlington ?—No ; very indifferent. There are very few repaired to perfection. There is a vessel now that has been ashore. They get some temporary repair, and then are towed away to the north.

24,279. There is no patent slip, and no dock ?—No.

24,280. Amongst the vessels you have seen riding in the bay, have many of them come on shore ?—Sometimes three or four. I should say, perhaps half-a-dozen in a winter ; sometimes more and sometimes less. Last winter we had only one; but it was a fine moderate winter.

24,281. Are there any lives lost in Bridlington ?—Not often. Last winter there were three or four, the winter before, two.

24,282. In your opinion, what is the best thing that could be done for the benefit of the bay and harbour ?—It wants something to be done immediately. If we could get anything that would bring a little more water into it, and make it smoother, if we had the means, but we have not the means.

24,283. (*Capt. Sulivan.*) Did I understand you to say that in 10 years you will no longer have any passing tolls paid to this harbour. Yes ; the passing tolls expire after that time, I believe.

24,284. You said that vessels with cargo pay 6*d.* per ton for coming into your harbour to discharge ?—Yes.

24,285. But you afterwards said that colliers pay 1*s.* 6*d.* ?—That is for the coal as well.

24,286. They pay both on the coal and on the vessel ?—Yes.

24,287. On other cargoes does the 6*d.* cover all ?—No ; the article pays besides.

Mr. JOHN WALLIS examined.

24,288. (*Chairman.*) Do you reside at Bridlington?—Yes.

24,289. What is your occupation ?—I am a seaman.

24,290. Are you employed in the coasting trade?—The coasting trade, and for seven or eight years in fishing.

24,291. Do you command a vessel of your own ?—I do; but she is a small fishing vessel.

24,292. You are also coxswain of the lifeboat ?—Yes.

24,293. (*Sir F. Smith.*) Have you often a great number of vessels in the inner harbour ?—Frequently a great number.

24,294. What number have you now ?—At the present moment not more than five or six. That would be the remnant of what we had in our last gale.

24,295. Vessels of small tonnage ?—Generally of very small tonnage.

24,296. Is the holding ground good ?—Very good anchorage ground.

24,297. What is necessary to make this a safe and efficient harbour of refuge?—A breakwater on the Smithic Sands.

24,298. What length should it be ?—It may be extended to any length.

24,299. What is the least length that would do ?—I should not say less than two or three miles. That would be necessary for the increase of the trade.

24,300. In what depth would it be ?—On the Smithic, on the part of the Sand where I consider it should be, it would be from 2½ to 3 fathoms water.

24,301. Is it very much exposed there to the beat of the sea ?—Not much exposed. There is a great row of shallow ground on the outside.

24,302. Does not that form a tolerable breakwater now ?—Yes ; it is a famous breakwater at low water time.

24,303. There would be no difficulty in getting into the harbour if it was formed ?—It is a rare case that we find it difficult now, but it would be perfectly safe if we had a breakwater. At low water time we find very little difficulty in getting into the harbour even now. It is not once in a hundred times that we have such a gale but what we can get off in one of our boats —18 feet boats.

24,304. (*Capt. Washington.*) You have no difficulty in getting off in the boats?—It is comparatively easy at low water time; that is, because the bay is sheltered by the Smithic Sand and the shallow water outside of it.

24,305. We have heard a good deal of the outset out of Bridlington and round Flamborough Head. What direction does it take ?—It sets out about east and by north, curves round to the northward, following the formation of the Head. It sets down into the open gut, and takes a course along the land, and goes out about a mile and a half. About the lighthouse it extends to about a mile and a half from the land. The ebb tide sets out a very considerable distance, and causes a large set to come up, which is thought the first of the flood. That is what gives loaded vessels such an opportunity of holding their ground at the Head. It is the eddy causes the tide : it causes nine hours flood to the northward of the Head.

24,306. Then about a mile and a half from the shore is the principal ground on which loaded vessels can hold their own to the north of the Head, without being drifted away. Does any tide set into the bight of Filey bay ?—Very partially; very partially as a flood tide.

24,307. You heard one of the witnesses say there was a great outset out of Filey?—Yes, there is. I have worked in Filey both in fishing and in herring catching, and there is a very strong outset—a strong

BIBLIOTECA DEL C.O.A.M.

BRIDLINGTON.

John Wallis.

26 Oct. 1858.

Capt. Washington.

outset, owing to the ebb. It sets out to the northward, the same form as the ebb tide. It strikes out to the eastward, and then changes its course to the northward, as it clears the Brigg End. With an ebb tide the set is comparatively light, but it gains strength as it goes on.

24,308. The same at Filey as at Flamborough?—Nearly so.

24,309. Do you think it runs so much as three knots an hour?—Spring tides it does. I tried it this last spring of the year, and made it run about three knots, or rather better.

24,310. Is it not such a set as would cause it to be attended with danger for any ship taking the bay?—We find it very dangerous with open boats in what we call ordinary weather; but in gales of wind I think it would be dangerous even to decked vessels.

24,311. Are you acquainted with the coast from the north, as far as Hartlepool?—Even to the northward of that, but not generally. I have been there occasionally as a fisherman and as a mariner, by being the mate of large vessels.

24,312. Have you ever had occasion to run for Hartlepool?—No, never in extreme weather. I have in fine weather.

24,313. In your fishing vessels?—We run to Hartlepool, Seaham, Whitby, Filey, Scarborough, and every port along the coast. I have been in all these places this last summer.

24,314. Do many vessels land their fish at Bridlington?—Great numbers; a great number of trawling smacks. I have seen as many as 14 and 15 land here of a tide.

24,315. Where do they find a market for the fish?—They generally send it to London as a market, or to Hull. If they do not find a market the fish is sent direct to Hull, Birmingham, Manchester, and other places.

24,316. (*Capt. Sulivan.*) If a harbour of refuge was constructed at Filey, would it become a valuable harbour for fishing vessels that could not fetch the Humber with south-east gales, and wanted a quick market for their fish?—I have a great aversion to pier harbours. I have not seen any to the northward of the Head which have been effectual. Seaham, Hartlepool, Whitby, and Scarborough, are all difficult to take at their entrances in bad weather.

24,317. I was not speaking of harbours made on shore. I mean if the bay was enclosed by a breakwater, so as to make a safe anchorage from all winds, would it then be used as a place for fishing vessels?—I have no doubt it would be used for fishing vessels; and I think it would be a great boon to them.

24,318. Supposing a harbour to be made all that could be wished, would it be valuable for the large fishing boats coming in to find a market for their fish, if it blew hard from the south-east or southward and they could not get to the Humber?—I think it would, if there was no other. But there are more eligible places than Filey. Still, even there it would be better than Scarborough or Bridlington now are.

24,319. (*Capt. Vetch.*) Do you know it to be a fact that the fishing boats which frequent this coast frequently carry their fish to Grimsby?—I know a great many of them that use Grimsby.

24,320. What proportion do you suppose of the whole? At present there will be 60 or 70 will rendezvous at Grimsby.

24,321. These send the fish direct to London?—Yes.

24,322. (*Mr. Coode.*) Have your fishing vessels got "wells"?—No; dry bottom vessels, all of them.

24,323. You said that you measured the tide at Filey?—Yes, just in the rough. We all form some idea of the difference between springs and neaps. I find an unusually strong tide whenever I have occasion to bring up in a fog there.

24,324. How did you measure it?—I merely threw a bit of line and noticed at what speed it was going, simply to ascertain where we were in the foggy weather.

24,325. Did you time it with a watch?—Yes.

24,326. Had the watch a seconds' hand?—No. It was merely a rough guess. We have frequently done so, because fishermen often go to sea without a compass, and we have to let go the anchor in a fog and calm weather to see which way we go by the set of the tide.

Mr. JOHN LYON examined.

Mr. J. Lyon.

24,327. (*Chairman.*) Do you reside at Bridlington?—Yes.

24,328. How many years have you been at sea?—Eighteen years.

24,329. For how many years have you commanded vessels?—About three and a half years.

24,330. In what trade have the vessels been chiefly employed in which you served?—I have been nearly all over the world within the last three years. I have been in the trade between here and Hartlepool, Shields, and those places. Previously, I went to America and different parts of the world.

24,331. In the foreign trade?—Yes.

24,332. Since you have commanded a vessel have you ever had occasion to know the want of a shelter on this coast?—Yes, many a time.

24,333. Give me an instance.—We have run many a time for Hartlepool for shelter, being laden. When we could not reach there we ran from here to Hartlepool, and sometimes to Shields. It depends; when we cannot get the length of the Tyne we consider Hartlepool the best.

24,334. Do you know anything of the Tyne?—Yes.

24,335. Well?—Yes.

24,336. The Wear; do you know it?—Yes.

24,337. The Tees also, do you know it?—Yes.

24,338. Would you consider it better to have one harbour at Hartlepool, or to try and improve the existing ports, so as to take ships of 16 feet draught?—I should approve of the existing harbours being improved, because there is never a vessel on the east coast of England can take a harbour of refuge on the north coast, not to bring it out into deep water.

24,339. Why is it impossible?—Because the whole North Sea has a fair fetch upon it, and it has a solid break; and if you bring your piers out the sea just breaks out there. I have seen ships in the January gale knocked down like cobbles by it in 10, 15, or 20 fathoms. If there had been a harbour of refuge here the ships could have come in with safety.

24,340. Then we will put Bridlington out of the question. Suppose there is to be a harbour made here, where would you put the harbour for the rest of of the coast?—I should choose the improvement of the other harbours.

24,341. Have you ever run into one of those harbours against a strong freshet with an easterly gale?—Many a time. Not really heavy gales, but with a deal of sea several times during the last winter and the winter before.

24,342. What was the vessel you commanded?—A little schooner of about 50 tons.

24,343. You ran her into the Tyne against a freshet?—No, not the Tyne.

24,344. The Wear?—No, Hartlepool.

24,345. But there is no freshet at Hartlepool?—There is a little at Old Hartlepool.

24,346. That is the reason there is not so much sea?—The Heugh runs a long way out.

24,347. You think Hartlepool a good place to run to?—Yes.

24,348. Better than the bar harbours?—Yes. The same with Filey; the North Sea breaks completely upon it. It is impossible for a vessel to take them. There are the Scotch vessels; we have 50 sail, may be going northward and 800 southward. When it comes a gale of wind from the north-east what are

the Scotch vessels to do? They must come to the Head and Bridlington Bay.

24,349. (*Sir. F. Smith.*) Does the sea break foul in Hartlepool Bay with an easterly wind?—Not inside the Stone buoy. Where the damage is done is outside, in the deep water.

24,350. What would be the effect of having a curved breakwater, curved outwards to the sea, with an entrance at both ends? Would that prevent the inconvenience from the breaking of the sea?—I do not think you will ever get anything for a ship to go in in safety. All the way to the north the North Sea has a solid break upon it.

24,351. What do you think of Redcar?—It would be very well with some winds, but I do not think it would be better than Filey in others.

24,352. Is it as good as Hartlepool?—No.

24,353. Is it better than Filey?—I think it is.

24,354. You would prefer the improvement of the harbours of the Tyne, the Wear, and the Tees?—A long way better. But if there is to be a harbour of refuge it wants to be here.

Mr. JOSEPH CATLEY examined.

24,355. (*Chairman.*) How long have you followed the sea?—About 20 years.

24,356. Do you reside at Bridlington?—Bridlington quay has been my home all my life.

24,357. Have you commanded vessels any time?—Yes, for 11 years.

24,358. In what trade?—Some time in the coal trade, and some time from ports in the Baltic.

24,359. You have been present at the proceedings to-day? Do you generally concur in the evidence given to us that Bridlington bay is the place where the harbour of refuge should be placed?—I do.

24,360. Are your reasons the same as those given by previous witnesses?—I think they are nearly so.

24,361. Is there any point which you think they have not brought under our notice, or any point in which you differ from them?—My view is, that it is accessible at all times, however heavy the gale may be from the eastward. The oldest person in the place cannot remember the sea being too high for ships to come into Bridlington bay. But it has been the case north of the Head. I can give two instances connected with my own experience which would tend to prove that a harbour of refuge in Bridlington bay would be of great service. I will be as brief as possible. Many years ago I was in a vessel coming from Riga in the month of January, laden with linseed. We had a long and dangerous passage. We made Flamborough Head on a very cold winter morning, just as the day broke, the wind blowing a gale, chiefly from the east, perhaps east-south-east. The sea was very heavy indeed. We laid the ship with her head to the southward. We were bound to London, and thought we would, if possible, take the harbour for refuge, because the weather was so tremendous we did not like to continue at sea if we could get a place of safety. It did not continue sufficiently clear for us to see the Humber, and we were obliged to keep her head southward. It so happened that Providence ordered it so that the weather abated, the wind became more favourable, and we arrived safe in port. But if there had been a harbour of refuge in Bridlington bay at that time, we should not have laid the ship's head to the southward. We should have made for it as soon as we saw the Head, and taken refuge until the weather abated. That is one instance. Another was a few years afterwards in a collier coming down from Maldon, also in the month of January. Forty sail being in Yarmouth roads, the wind north-east, blowing heavy, thick, and snow showers. It cleared up in the morning, and we got away, with another one called the *Carlisle*. When we got on the deeps the wind increased. It was moderate when we left the roads, but when we got there the wind increased and rather eastered. We thought we would run for the Humber, and would not come for Bridlington bay, or anywhere northward. It came so deadly thick with snow. It had cleared up a short time. We could see nothing, and we thought it very unsafe to run for the Humber under such circumstances. We laid the ship out at night, and let her go with her head off. We had two close-reefed topsails and a reefed forestay sail. She was a light ship, in ballast. There was a very heavy sea. We let her go with her head off, and kept her going all night. After she had gone for a certain time we thought the shore far enough off for the depth of water. We wore her with her head on, and let her go in until we shoaled the water again, still keeping to windward as much as we could. We kept on all night. In the morning it was still thick, with snow, blowing heavily, and a heavy sea. We could not go to the northward of Flamborough Head, because we knew that we could not depend upon the soundings in thick weather like that: durst not attempt it, like she was, because if we had gone there we could have seen nothing until we were right on the land. We thought if we kept to the southward and dragged down the Holderness coast we could depend upon the soundings; and if we had to come on shore, we knew that we had a sandy beach in Bridlington bay. We kept her coming down, and as day came on we got a cast of the lead. We just wore her head in and got a cast of the lead 20 fathoms, and a little further, another of 18 fathoms, and a little further still one of 13 fathoms. We let her go until she came to 7 fathoms, and then the sea nearly broke on board, and we knew that we were in Bridlington Bight by the regular soundings and the sandy bottom. The day cleared a little, and we saw the top of a church. Some of the men said it was Bridlington church. I said it was not, because it was a square church. We found afterwards that it was Hornsea. We consulted and thought among ourselves, and determined to keep her to windward until the tide time. It was low water here at half-past ten o'clock, and it was then half-past six. We laid her to, taking in the fore-sail and keeping the two close-reefed top-sails, waiting for the flood-tide, in order that we might go into Bridlington harbour, knowing that if we anchored in the bay we might lose our anchors. We found that she drifted in and reached just within the Smithic, close within the sand and broken water. We got two rungs of cable, and when we came into what we thought the smoothest part of the water, we let go the small bower with a bite of 60 fathoms. The anchor weighed seven hundred weight and a quarter. She never looked at that, but drifted right away, and then we let go the best bower of 80 cwt., with 70 or 80 fathoms of rope chain, and she brought up. During this time the day had cleared up, and we could see the people on the cliffs, on the shore, and on the north pier. The sailors said they never saw such a thing.

24,362. How was the wind?—East-north-east, and it eastered as we came down.

24,363. How long did the gale last?—It abated in the night. We thought we might be on shore before the morning; and, being acquainted with the place, we thought we would cut the cables and risk the harbour. We did so, and got safe in with a little damage.

24,364. How long did you lie on the Smithic sand?—From low water in the morning till high water in the night. That was 17 hours.

24,365. Blowing very hard indeed?—Tremendous hard.

24,366. What yards had you aloft?—We had all up: we had no foretopgallant mast, or topgallant yard; but the main topgallant was up, and we had plenty of work for the hands without sending the yards down. I think if there had been a harbour of refuge in the bay, we should have ridden there secure, and not lost our anchors; and we could have found our way into it,

BRIDLINGTON.

Mr. J. Catley.

26 Oct. 1858.

thick as it was, but could not have done so at Filey, or those places northwards. We durst not attempt them under such circumstances.

24,367. (*Capt. Sulivan.*) In the case of the ship coming from the Baltic voyage which you have described, had there been a harbour of refuge at Filey, when off Flamborough Head could you have taken it?—I would not have attempted it, unless I saw that it was necessary to save my life, because of the tremendous sea to the north of the Head. When there was so heavy a sea in the regular offing, I knew there must be the same on the shore, when the sea falls into shoaler water.

24,368. Have you ever been to Plymouth?—I have passed it but have not been in.

24,369. You know the breakwater there is exposed to the whole Atlantic Ocean?—Yes.

24,370. Are you aware that ships of all classes run in with the west-south-west gales in perfect safety?—I have been told so.

24,371. If you could make a breakwater enclosing a good anchorage, why should not vessels run round and anchor as well as at Plymouth?—Do you mean in this bay?

24,372. I meant at Filey?—There would only be one entrance there.

24,373. You do not know that?—I go by Mr. Coode's plan.

24,374. Why should you not run in there as at Plymouth?—I do not know the sea at Plymouth; but there is a tremendous one at Filey, and would be at that breakwater.

24,375. Do you suppose there is a worse sea there than the sea in the English Channel, with south-westerly gales right up from the Atlantic?—I cannot say that. I have been 11 days off Falmouth with the thick weather, but never close in shore. I have been from Alderney and Guernsey to Swansea.

Mr. William Clark examined.

Mr. W. Clark.

24,376. (*Chairman.*) How long have you been at sea?—14 years.

24,377. Do you belong to a vessel now?—No; I have been fishing a little this summer.

24,378. What have you been before then?—I have been a seafaring man.

24,379. Have you been a mate?—I was mate of the *Oscar*, of Scarborough.

24,380. How many years?—Three.

24,381. Where have the vessels you have been in chiefly traded?—Principally between London, Shields, Hartlepool, and different places in the north.

24,382. Have you been present to-day?—Yes.

24,383. Have you heard the evidence in favour of Bridlington bay?—Yes.

24,384. Do you agree with the other witnesses?—Yes.

24,385. Have you any reasons to give for agreeing with them, in addition to those we have heard?—I think a vessel would be able to go into Bridlington bay when she would not be able to look at Filey at all from what I have seen of it.

24,386. Since you have been knocking about on this coast have you ever been in danger of losing your life or of your vessel being lost?—Oh yes.

24,387. Often?—Yes, often. I have been caught in a heavy gale of wind off here about eight years ago. The wind was away from the north-north-east, right off the pitch of the Head. 16 ships went down near us. We could not show a stitch of canvas.

24,388. Was the vessel light or laden?—Light.

24,389. Where were you going to?—We were bound to Hartlepool.

24,390. From where?—From London.

24,391. Where were you caught?—Right off the pitch of the Head.

24,392. Could you not get into Bridlington bay?—No, nor Filey neither at such a time. We could have gone in, if we could have got the ship's head, but the wind came so heavy we had to take all the canvas in.

24,393. What weather did the vessel make?—She was a very easy ship at sea. She did not make bad weather, but there was great danger. It was so dark you could not see from one end to the other; we had not anything set. She was a brig.

24,394. Did the sea break on board very much?—No, she laid very high, but we had a great deal of danger of other ships ruuning into us, because we had no command over the vessel.

24,395. Have you taken any of these bar harbours in bad weather?—Not in any bad weather, I have not.

24,396. (*Sir F. Smith.*) You have fished off the Dogger Bank?—Only this year.

24,397. What is the greatest number of boats you have ever seen there when the gale came on?—This last south-westerly gale there was about 200 sail off there.

24,398. The wind from the east?—No, from the south-west.

24,399. Did you run for shelter on any occasion?—No, we were obliged to hang on to our nets until the gale was over.

Mr. Benjamin Sawdon examined.

Mr. B. Sawdon.

24,400. (*Chairman*). Do you reside in Bridlington?—Yes, I have done so all my life. I have been a shipowner the last 40 years.

24,401. Have you ever been at sea?—No.

24,402. You have been present during this inquiry, you have heard the evidence of the previous witnesses, will you give us any additional statement you may wish to make on the subject of harbours of refuge?—I concur in the general remarks as to the excellency of this bay, which I think might be protected by a floating breakwater, a model of one of which I have brought with me if you wish to see it. I have also had considerable opportunities of viewing Filey Bay. I resided five years on the summit of Reighton Head, overlooking the whole bay. I was constantly on the shore, being out of all business. I came to the conclusion, from particular observation, that if the present plan for a harbour of refuge at Filey was carried out that bay must in consequence silt up.

24,403. Is there anything else you would like to offer? For the moment we will put the question of construction on one side?—I should like to state that I think the harbour would silt up. I have been in the habit of observing Reighton Bay between Speeton and Reighton. There is a deposit of 5000, 10,000, or 20,000 tons of gravel, which is evidently brought along by the sea (with the east and south-east gales), which runs almost at right angles with the shore, sweeping that vast mass before it, and there it lodges. I can find no reason why it lodges there, except the wave that runs down Filey Brigg, by its excessive recoil meeting the wave that flowed past Speeton, depositing the gravel there. As a proof of the wave recoiling from Filey Brigg I may mention that it is all swept clean of sand, and that it is rarely that there are even a few loads of gravel upon it. As you proceed down to the bottom of the bay the wave that has rolled down Filey Brigg recoils from it, sweeping the beach in Filey bay perfectly clean and leaving nothing but a thin coating of sand on the clay, and lodges the entire deposit at the foot of the Reighton and Speeton cliffs, but chiefly at the foot of the Speeton cliffs. I conceive that if the proposed plan is carried out that the recoil would no longer go down Filey Brigg

because Filey Brigg would be perfectly protected from the wave that now runs along it. The recoil wave being removed, the consequence of that, the regular and natural consequence must be that the superior wave running down Filey and Speeton cliffs would still go on, as there is sufficient inclination, and lodge all that there was before in the wave in the bay of Filey.

24,404. As respects the question of construction, what do you wish to say about the floating breakwater? —I think a floating breakwater of a construction that would induce the wave to run over it, and not to flow under it, would be sufficient to cause the roadstead to be very quiet indeed, and the expense would not be excessive.

24,405. Have you gone into any details of plans and estimates upon an extended scale?—I have a plan with me, and a wooden model.

24,406. Have you formed any estimate?—I have made an estimate, by which I believe the work might be constructed for, I think, 150,000*l.* a mile, and would make a very efficient breakwater.

24,407. Have you drawn up any statement in support of your views?—No, I have not done that; I only turned my attention to it in the last few days, after I heard the Commissioners were coming here.

24,408. Because you must be aware that it is a very difficult subject to undertake at a very few days' notice. It is a subject that has been considered very carefully by the best engineers in the country. Would it not be wise, if you wish to bring any such scheme under the consideration of the Commissioners, to give yourself a little more time to think it over?—I believe my plan is upon sound mechanical principles, and I should not alter it if I were to delay it longer.

24,409. I understand you to say you have only considered it for a few days?—About 10 days I have had it in hand. I think that is sufficient to determine in my mind the style of the construction and the calculation of the expense; when once the expense was decided upon was not difficult.

24,410. I think you can hardly expect the Commissioners to go into the details of a scheme of that kind, one which has been only under your own consideration for 10 days. But if you will give it a little further consideration, and at a later period send us up any well-considered plans and estimates on the subject, I can only assure you that they will receive our most attentive consideration?—I shall be happy to do so.

24,411. (*Sir F. Smith.*) I believe you are a shipbuilder, are you not?—A shipowner.

24,412. Not a shipbuilder?—No.

24,413. Have you turned your attention to timber constructions in any way?—I have built ships, and attended a good deal to building.

24,414. Have you attended practically to the construction of works of the kind you are now bringing forward?—Not to floating breakwaters, certainly, because they are not of common occurrence. I do not know where there is one.

24,415. That is a reason the more for taking a little time to bring forward a scheme of so much magnitude, because if your plan is a good one it would not apply to Bridlington only, but would extend over the whole country and to every description of breakwater. I would recommend you, as an old constructor myself, to think well over it, and even to take the chance of improving it. You will find it is not difficult to improve upon a first idea.

24,416. Will you tell me the length of the shore from Flamborough Head down to the bottom of Filey bay?—It will, I think, be about eight miles.

24,417. I understood you to say that there is a quantity of shingle, gravel, and sand?—Very heavy shingle indeed.

24,418. It comes round Flamborough Head?—The wave that strikes it does, and sweeps down the coast almost at right angles.

24,419. Where do you suppose the shingle comes from —I have no doubt that a very large portion of it is what falls from the rocks of Flamborough and Speeton. I am thoroughly sure that it is so because the largest shingle is flint.

24,420. Is not Flamborough Head greatly composed of chalk?—The foundation is entirely of flint; the lower courses are of flint; the principal part is chalk.

24,421. Where does the shingle come from, if the lower part is flint?—The shingle is flints that have come from Speeton or Flamborough cliffs.

24,422. Then they are reduced to shingle by the action of the wave?—Yes.

24,423. In that short distance of eight miles?—No, they are all shapes and sizes, some as large as half a cwt., others of various sizes.

24,424. Those must all have rolled with the sea, making from under the Head and under the Speeton cliffs?—Some may; some may not have come so far.

24,425. But how far are they moved?—They may come from Speeton, which is the adjoining cliff. There is a length of five miles of cliff, and I will not specify from which they come.

24,426. But the whole mass has rested at a particular spot?—Yes, it has, and I thought for the reason I have mentioned I come to the conclusion that it was arrested at that spot by the recoil from Filey Brigg, because we have an exactly similar deposit on the south side of Bridlington, arising from particular causes.

24,427. You imagine that if the wash over Filey Brigg was stopped there would be no means of resisting the accumulation, and it would spread over Filey bay?—I believe it would.

24,428. Do you know whether any soundings have been taken to see the extent of the accumulation?—No. There are many thousands of tons constantly being led away to all parts of the country for roads.

24,429. Sufficient to keep it down?—I have not seen it for five years; when I last saw it, it was a great thickness.

24,430. It must be very convenient to have that deposit. In point of fact, it does not amount to a great evil at present?—Not at all; it is a benefit.

24,431. It is a benefit resting where it does, for if it came along Filey bay it could not be carted away? —In all probability it would spread over the bay.

24,432. It would not come to the shore as it appears to do now?—I think it would not, but would in all probability spread itself more over the bay generally, but that is mere speculation.

24,433. You imagine that this silting up would be the result of the accumulation of this shingle working round into the bay by the stoppage of the resisting force which now arrests it?—Yes, not only the shingle but vast quantities of sand lodge in that quarter.

24,434. Has that accumulation never been examined to know its progress?—I am not aware it has been examined, though I have drawn the attention of several persons to it.

24,435. Then I conjecture that if an opening were left between the end of the breakwater proposed to be made, in order to form a harbour of refuge, so that the water could wash over Filey Brigg, you would have the same advantage that you have now? —When it was first mentioned that an opening might be made there, it did, for a moment, occur to me that such would be the case, but I cannot think that such would be the case. The wave that would run in at that opening would rush against the solid body of water, and would not go sweeping down at right angles with the whole Brigg. It would rush into the bight of the bay.

24,436. You think the action would be totally different?—It would take a different course, and would have a different action.

24,437. You give that opinion on full consideration? —Yes.

24,438. (*Capt. Sulivan.*) Do you know the north-west extreme of the chalk cliffs of Speeton?—I think it is about opposite the beacon.

24,439. How far from that is this accumulation of

BRIDLINGTON.

Mr. B. Sawdon.

26 Oct. 1858.

Capt. Sulivan.

shingle and sand ?—A little further to the west, perhaps three quarters of a mile further west.

24,440. You spoke of the wave running at right angles to the shore. If that is the case, how does it move the shingle ? You mean running parallel ?—No; not running parallel, it would naturally tend on shore, but as the wave rolls from the east the end must be directed to the Speeton cliffs. I will not say it is at right angles.

24,441. It must run along the shore to take the shingle ?—It does run along.

24,442. You mean the line of the wave ?—Yes; the line of the wave travels along in the same line in which it comes from the deep sea.

24,443. (*Mr. Coode.*) In which direction is the recoil you speak of from Filey Brigg ?—It recoils across the sand in front of Filey.

24,444. What do you mean by recoiling across the bay ; in what direction?—In the south direction.

24,445. With what particular winds ?—East, south-east, and north-east.

24,446. With north-east winds it recoils from the Brigg ?—Yes.

24,447. If it does so, would not the force of the wave be entirely lost if it recoils upon itself ?—It recoils across the Head.

24,448. Will you point out the direction the recoil of the wave would take ?—The wave that rolls in from the sea, if even it was a little inclined to the north, the end of it comes a little upon the end of the Brigg. It still comes sweeping along the Brigg and round to the top of the bay. So clean is it swept away that the Filey people have to come down the bay to fetch gravel for their roads.

24,449. Is not Filey bay more exposed to the south-east than to a north-east sea. Does not the heaviest sea come from the south-east ?—Yes.

24,450. Then would not the tendency of the shingle be to travel towards the north-west ?—It never does travel there.

Mr. John Wilson examined.

Mr. J. Wilson.

24,451. (*Chairman.*) Do you reside at Bridlington? —I do.

24,452. How long were you at sea ?—About four years.

24,453. Only four years ?—I am a shipwright by business. We had vessels belonging to us, and I went to sea to take charge.

24,454. Do you own ships at present, or have you given up that ?—I have given up that.

24,455. You have been present during the inquiry will you now give your opinion to the Commissioners as to the necessity or advantage of a harbour of refuge on this district of the coast, and where it should be placed?—My firm opinion is, in Bridlington bay.

24,456. Are the reasons upon which you found your opinion the same as those which have been given by the previous witnesses?—Quite so.

24,457. Is there any point which they have not brought under your notice which you would like to bring forward? anything which they have omitted?—I think there is nothing except about the vessels which have been to the southward; vessels which have been lying under the Head and dodging under Speeton cliffs; vessels come from the northern ports, some from Sunderland, some from the Tyne, some from Blyth, and some from Hartlepool. Those that come out of Hartlepool have the advantage of those from Shields and Blyth. They must have had a change of the weather and have got further to the southward. They all dodge under the Head, and I have noticed that many have got as far as Spurn Point, and then came back and dodged under Speeton cliffs.

24,458. It is for those vessels that have got so far south that you think a harbour in this bay would be advantageous?—Quite so.

24,459. Are you prepared to say that the number of vessels to the south of the Head is greater than that of the vessels to the north?—I consider that the greater part if they are not to the south of the Head have an opportunity of beating to the southward, if there is a harbour of refuge in Bridlington Bay.

24,460. Then you are of opinion with the pilots who gave evidence that, even in very heavy weather, ships can make round the Head and could get into Bridlington bay?—Yes, I have had a great deal of experience down north respecting the harbours. I made the channel at West Hartlepool. I was superintendent of the dredging department of the works, and I am well acquainted with both Hartlepool, Sunderland, and Shields.

24,461. You were too short a time at sea to be able to give nautical experience ?—True.

24,462. You do not consider your nautical experience much ?—Not more than as already given.

Mr. John Pockley examined.

Mr. *John Pockley.*

24,463. (*Chairman.*) Do you belong to Flamborough ?—Yes.

24,464. Have you been fishing all your life ?—Yes.

24,465. Have you been present here to-day ?—Yes.

24,466. You have heard the evidence of previous witnesses. Is there anything you have to offer to us in favour of a harbour at Bridlington bay, if that be your opinion, which we have not heard from them ?—No, I only have to state that I think a harbour in Bridlington bay would be a very great advantage.

24,467. It would be an advantage to Bridlington—that we can see very well ; do you think it would be of general advantage to the trade which is passing on the coast ?—I do not mean advantageous to Bridlington ; I mean it would be of service to the public.

24,468. Do you confirm the statements of previous witnesses in your own line of life, as to the number of vessels which you find off Flamborough Head in bad weather. Did you hear that evidence ?—Yes.

24,469. Has it ever occurred to you to take the crews out of vessels that were sinking ?—Never.

24,470. In what sized vessels have you generally followed your occupation of fishing ?—Generally in our small open boats ; but I have been in these large vessels and have commanded one.

24,471. You have fished from the shore chiefly ?—Yes ; a few years I spent in one of the larger boats. I commanded one.

24,472. What size is the boat you command ?—She is only a small one, perhaps ten tons, a small open-topped boat.

24,473. Do you know Speeton cliffs ?—Oh yes.

24,474. What is the largest number of vessels you have ever seen anchored there ?—I do not think I ever saw above fifty or sixty.

24,475. What is the largest number you have seen knocking about off Flamborough Head ?—I cannot speak positively ; perhaps 100 or 150.

24,476. You never acted as pilot to any vessel ?—No.

24,477. Has it ever occurred to you in your fishing to fall in with Baltic vessels making their passage home ?—Many times.

24,478. Do they often make Flamborough Head ?—Yes.

24,479. (*Sir F. Smith.*) Are you aware whether vessels coming from the Baltic call off Flamborough Head for orders ?—I am not aware of that.

24,480. Whether bound to London or Hull ?—I am not acquainted with it at all.

24,481. You do not know that it is the case ?—No.

Mr. GEORGE WILLIAMSON examined.

Mr. G. Williamson.

26 Oct. 1858.

24,482. (*Chairman.*) What is your occupation?—Fishing, at present.

24,483. Do you belong to Bridlington?—Yes.

24,484. Are you aware of the circumstances connected with the loss of the *Coburg*?—Yes, I was in the life-boat both times.

24,485. Detail them to the Commissioners?—The *Coburg* was going down from the southward, with the wind about east-south-east, I suppose, and the tide about half-flood, She had not sufficient water to come into the harbour, and consequently she came to the beach. A life-boat was manned, but by not having a rope ready we had to come on the shore and be hauled down by the south pier side. The second attempt we succeeded in saving the crew. A more disgraceful thing never was known, I should say, than the way in which we were behaved to by the master and some one in this place.

24,486. That is irrelevant to our present inquiry. We cannot enter upon that. Was it blowing hard from the east-south-east when the vessel ran in?—Very hard.

24,487. Was she a light vessel?—A laden vessel.

24,488. She was run upon the beach?—Yes.

24,489. When was that?—In March, 1858.

24,490. (*Capt. Sulivan.*) Where was the vessel bound to?—To some port in France; I believe with steam coal.

24,491. And put back in bad weather?—Put back in bad weather. She could not weather the Spurn Point.

24,492. Could she have weathered Flamborough Head?—No; one of her topsail sheets was gone.

Mr. ARTHUR STRICKLAND, examined.

Mr. A. Strickland.

24,493. (*Chairman.*) Are you a resident in Bridlington?—Yes.

24,494. Will you now state anything you wish to offer?—Merely you were asking the harbour-master some questions about the income and expenditure upon the harbour. I was for many years chairman of the harbour commission when they were building the harbour and different works, and I was also employed at the time of soliciting the last Act of Parliament, which we got for the harbour. The state of the case about the income is that it is now mortgaged to the government. We got an Act of Parliament for 30 years, on condition that we should finish our works by that time and pay off the mortgage. Some time ago he came to an arrangement with the loan office, and the income is now to be dedicated to that purpose. The works have been stopped for some years.

24,495. (*Mr. Lindsay.*) How much money was expended on the south pier?—I think 30,000*l.* was the contract price.

24,496. Was that all that was expended on the construction of that pier?—I think 32,000*l.* was the whole.

24,497. Did you borrow the whole of that upon the security of the passing toll?—Yes, upon condition that the passing toll ceased with our bill.

24,498. What interest are you paying?—I think four per cent.

24,499. You will still have a considerable balance out of 3,000*l.* per annum. It does not take the whole of 3,000*l.* to pay the interest of 30,000*l.*?—I think there is a good deal of loan to pay upon the other pier.

24,500. How much money have you borrowed upon the old pier?—I am sure I cannot speak as to that just now, but I think there is not much surplus left of the present income. We came to an arrangement some years ago, that instead of paying a large quantity of interest we should pay a certain sum every year so long as the 30 years lasted.

24,501. You pay a certain sum every year to liquidate the original debt?—Yes.

24,502. How much do you pay every year towards that?—It is somewhere near the income. Only a few hundred pounds is left of our income. 500*l.* or 600*l.*

24,503. The whole of the income, including the passing tolls that you receive from ships, is all expended in the payment of the interest, and in the liquidation of the original debt, save and except 700*l.* or 800*l.*, which is used in the maintenance of the harbour?—It is somewhere thereabouts.

24,504. (*Chairman.*) Do you think that the Commissioners have at all prejudiced the interest of trade here by charging heavy dues either on imports or on exports?—No, I think not.

24,505. Have they the power to alter the rates if they think proper?—Yes, to a certain extent. Vessels that pay the passing toll have the use of the harbour free except the 6*d.* that there is to pay. But that is a duty of Queen Elizabeth's time; except that by our present Act, any vessel that has paid the passing toll has the free use of the harbour. The passing toll ceases with our Act.

24,506. (*Mr. Lindsay.*) Following the question which has been sent up here, and has been asked by the Chairman, may I ask, do you think the Commissioners have at all prejudiced the trade of the harbour by not endeavouring to get more water, and by not taking more of the mud and sand away than they appear to have done?—It is not prejudice; it has been poverty that has been the cause. Our harbour ought to have been much deeper by the original contract with the people who took the building. The deepening of the harbour is part of the contract, but the contractor did not like that expense, and somehow or other, between the engineer and the contractor, they shuffled out of it.

24,507. During your long experience have any great efforts been made to get more water in the harbour than there is now?—You can only get more water by deepening the harbour.

24,508. Have any great efforts been made to deepen it in your experience?—When we built the south pier we nearly doubled the size of the harbour, and part of the intention was to lower it at the same time. I believe that the income fell short and the lowering never got done, at least in a very slight degree.

(*Chairman.*) Are there any other parties present who are interested in this inquiry who have any evidence to tender to us?

No answer.

Sitting at Bridlington closed.

HULL.

Friday, 27th October 1858.

PRESENT :

Admiral Hope (Chairman).

Sir Frederic Smith.	Captain Sulivan.
Mr. Lindsay.	Captain Vetch.
Captain Washington.	Mr. Coode.

Mr. Evans, Secretary.

Mr. Patrick Bruce examined.

HULL.
Mr. P. Bruce.
27 Oct. 1858.

24,509. (*Chairman.*) In what capacity do you appear here ?—I am secretary of the Chamber of Commerce.

24,510. Will you proceed with any statement which you have to make relative to the subject of our inquiry ?—It is a statement of my own, before presenting a memorial. The Hull Chamber of Commerce felt that the question of harbours of refuge was one of great importance, and consequently devoted considerable attention to it, and appointed a committee for the purpose of procuring evidence to lay before the Royal Commissioners when they should sit at Hull. Several merchants and shipowners have procured the opinions of their captains on the nautical view of this question, and have come to the conclusion, that for the trade in which the Humber is chiefly concerned—the Baltic and North of Europe trade—the position in which a harbour of refuge would be of the greatest use is in the neighbourhood of Flamborough Head, as there vessels, both out and home, are frequently driven to make that point. As our captains were daily arriving and sailing out of this port, it was impossible to know which of them would happen to be at home during the time the Commissioners were sitting ; and as I only received intimation of this sitting yesterday afternoon, I have been unable to procure the attendance of so many as would otherwise have appeared. It also happens that some of our most experienced captains are at sea, one especially, who, it is believed, can give the Commissioners important information concerning the whole coast—Captain Brown. He is now in the Baltic ; but as he is a person of great experience and high character, the Chamber of Commerce will be very glad if the honourable Commissioners will examine him in London upon his return. Other witnesses will most probably be shortly in attendance, as I have sent to inform several of the sitting of the Commissioners.

24,511. Does that conclude your statement ?—Yes. I have given a list of witnesses whom we have got so far, but in all probability there will be some half a dozen more. I may also venture to state, that it is important that some of the gentlemen who are named should be examined as soon as possible, as their vessels are sailing to-day or to-morrow morning.

Mr. John Gravel examined.

Mr. J. Gravel.

24,512. (*Chairman.*) Where do you reside ?—At Hull.

24,513. How long have you followed the sea ?—Since 1817.

24,514. How long have you been in command of vessels ?—Twenty-one years.

24,515. In what trade have the vessels which you have commanded been general y employed ?—Chiefly in the whaling trade, but also in the Baltic and the coasting trades.

24,516. Can you give me any idea of the time you have been employed in the whaling trade ; how many voyages you have made ?—I was 20 years at it before I commenced as master of a vessel, in the coasting trade. It will be 30 years and better in the whaling trade ; 35 years.

24,517. How many voyages have you made home from the Baltic ?—About 10.

24,518. How many years would you say you have been employed in the coasting trade ?—Six years.

24,519. Trading between what ports ?—Between Hull and London, between Hull and Rotterdam, between Rotterdam and Leith, with Hartlepool, Sunderland, Stockton, and others along the coast, and round the west side too.

24,520. Have you come home from the Baltic late in the year ?—Yes, at the back end.

24,521. How do you make your passage after you take your departure from the Scaw or Naze, as the case may be ?—It depends where you are bound to.

24,522. Bound to Hull ?—Bound to Hull, Flamborough Head.

24,523. Do you endeavour to make Flamborough Head ?—Yes.

24,524. Have you generally made the land so far to the south as Flamborough Head in your voyages ?—Yes.

24,525. Which is the northernmost point where you have made the land ?—We made the Bell Rock once.

24,526. Never to the north of the Bell Rock ?—No.

24,527. How many times so far north as between Berwick and the Bell Rock ?—Not more than once.

24,528. In coming home from the north from whaling voyages what landfall do you endeavour to make ?—We in general make the Shetland Islands.

24,529. From the Shetland Islands ?—Buchan Ness.

24,530. From Buchan Ness ?—Flamborough Head or the Farn Islands.

24,531. Are you aware of the object of this inquiry ?—Yes, I have a little information.

24,532. It is for the purpose of establishing a harbour of refuge, in the first place, on the north-east coast of Scotland, between the Firth of Forth and the Pentland Firth ; and, in the second place, on the east coast of England, between the Humber and the Tweed, or the Farn Islands. Will you, in the first place, give me your opinion as to the advantage or necessity of a harbour of refuge on the district of the coast which I last mentioned, namely, the north-east coast of England ?—I should say Filey.

24,533. That is the place where you would like to put it ?—Yes.

24,534. You have no doubt that something of the kind is necessary ?—Oh yes ; it is quite requisite. It ought to have been done years ago.

24,535. Will you give me your reasons for considering it necessary ?—We have no place to run to but the Firth of Forth. If we do not reach the Humber, we have no place of refuge but the Firth of Forth, all the other harbours being bar harbours.

24,536. Have you ever taken any of those bar harbours in bad weather ?—No.

24,537. Is your opinion of those harbours such, that, with a good ship, you would always keep the sea in preference to endeavouring to take them in bad weather ?—You cannot at all times keep the sea ; the weather is so boisterous in the winter time that it is almost impossible to keep the sea. With a smart vessel you run the risk of losing your masts.

24,538. Which would you rather do, run for the Tyne, or keep to sea if you can ?—I would by no

means run for the Tyne, unless I wanted to lose the ship.

24,539. Give me the reason why you would not run for the Tyne ?—Because the wind which causes a heavy sea is the one which causes so tremendous a sea on the bar, I am informed ; it would, perhaps, be almost impossible for you to hold out until high water to cross the bar. It is only just at the top of high water that you durst attempt it.

24,540. Your opinion of the Tyne is such that you would much rather keep to sea as long as you can than try the Tyne ?—If it were possible.

24,541. What do you think about Hartlepool ?—One is as bad as the other.

24,542. Give me your reasons for considering Filey the best place at which to put this harbour of refuge? —I am not certain how far it is sheltered, but I think it is nearly as far round as east-north-east, and then you have such a bold shore on the port hand. By running the breakwater out from the Brigg you have such a bold shore under Speeton Cliffs that you can make bold with it. There would be no danger in taking that harbour if it were formed properly. You have a light on Flamborough Head to guide you in, and undoubtedly there would be another light on the pier.

24,543. We will put the facility or otherwise of building a breakwater on one side altogether, and look merely to the position of the harbour on the coast. Have you any other reasons to give me why you prefer that point of the coast in preference to one further north or further south ?—It is more sheltered, and not only that, but there is a sandy beach, and in case a ship goes on shore you most likely land the crew in safety.

24,544. Why do you prefer a harbour to the north of Flamborough Head instead of to the south ? Suppose we put a breakwater on the Smithic Sands and made Bridlington Bay a good harbour of refuge, would you prefer the north side of the Head to the south ?—Yes.

24,545. Why ?—Because if I was on the south side of the Head and was obliged to go into Bridlington Bay for shelter, I could go into the Humber if I chose. If I was round the north side and wanted to go to the north, I should be ready to get under weigh, but I might have some difficulty in getting round out of Bridlington Bay.

24,546. If a ship can get into a harbour at Filey Bay, can she not get up under Speeton Cliffs, probably with the assistance of a flood tide ?—Yes, and a south-west wind.

24,547. We have had it in evidence that even with a very strong wind from the southward, when ships will be under close-reefed topsails and courses, that with the assistance of a flood tide they can always get round the Head, and so can get into a harbour in Bridlington Bay ; what do you say about that ?—Very few attempt it.

24,548. Is the reason because, after they have got round they have no shelter to go to ?—They have no shelter, and when the flood tide is done they are driven back again.

24,549. Suppose there was shelter if you could reach the other side of the Head, do you not think that with the assistance of the flood tide, which runs nine hours out of the twelve, a ship could run round and get into such a harbour in Bridlington Bay ?—She would not be able to work many miles beyond Bridlington Bay.

24,550. But she could get into Bridlington Bay with the assistance of the flood tide round the Head ? —She might; but the wind would be dead in the bay, and under Flamborough Head you are under the lee of the land.

24,551. Therefore, supposing you had a breakwater on the Smithic Sands, you still think it would be deficient in the shelter which the high land gives on the other side ?—Yes.

24,552. Tell me, if you were to have a harbour of refuge on the north-east coast of Scotland between the Firth of Forth and the Pentland Firth, where would you like to put it ?—At Peterhead.

24,553. Why would you prefer Peterhead ?—It is chiefly the landfall of all ships from the Baltic and Archangel.

24,554. Bearing in mind that the object of these harbours of refuge is to save life, is not Peterhead on such a point of the coast that a vessel can hardly go on a lee shore ; indeed, she can either weather off on one tack or the other ?—There is the Moray Firth if she can weather the Head, but I should prefer it before any other port on the coast.

24,555. Peterhead, you consider, would be the greatest convenience for the Baltic trade and the trade north ?—Yes.

24,556. Probably it would be considered by most people to be the point at which a harbour would be most convenient for those particular trades ; but taking into account the saving of life, is that the point of the coast where you think a harbour would be best placed for vessels to run to in stress of weather, and to save themselves from shipwreck ?—I do not know where there is another.

24,557. What would you say to Wick ?—I think you go worse.

24,558. Wick is worse ?—Much worse.

24,559. Why ?—Because Buchan Ness is so much further to the eastward, the eastwardest point of the coast, so that if you can get into the harbour you have a good drift north or south.

24,560. So that if a ship, in bad weather, run for a harbour of refuge, you would consider it an advantage that if she missed it she would not go on shore ?—She cannot, if acquainted with the coast, because there is the Moray Firth.

24,561. Have you been north, about through to Pentland Firth ?—Yes, some few times.

24,562. Have you run through it in a south wind and very bad weather, and what are the difficulties of the navigation of the Pentland Firth ?—Very few.

24,563. And what are those few ?—I do not see anything in the way, much. By referring to the chart, I do not see anything in the way but what the tide must take you clear of.

24,564. Do not the tides run very strong ?—They are very strong tides.

24,565. If you wanted to make a passage through the Pentland Firth, and were running down for the Firth, how would you deal with the difficulty of the tide, with a strong south gale ?—I should be guided altogether by the time of the year, by the time of flood, and by whatever way I wanted to go, west or east.

24,566. Would you time your entrance into the Firth according to the time of tide ?—Yes, if possible.

24,567. And so escape the difficulty of a weather tide in a gale of wind ?—Yes.

24,568. What would you say to being forced down to the Firth against the tide, whether you liked it or not ? Do you think it would ever blow hard enough to prevent you waiting for a tide ?—I do not see any difficulty in getting to a harbour in some part of the Orkneys, let the wind blow as hard as it liked. If you have a position and a good chart, one of the latest, there is no difficulty in taking most of the harbours in the Orkneys, especially if it is not thick weather.

24,569. Supposing you wanted to make your passage through the Pentland Firth, would you in heavy weather, really heavy weather, round your ship to, and heave her to, to wait for a tide, or would you time your entrance into the Firth by shortening sail in time, and so, availing yourself of the proper time to make a passage, get through the Firth without fear, or would you run into a harbour at Wick, supposing it were there ?—If I had a fair wind through the Firth, I should make use of it let the tide be as it might. There is no difficulty in going through the Firth, I am fully persuaded, if you can only see the lights.

24,570. I think you said that you had never been through in bad weather ?—Not in very bad weather, but there is a very heavy sea on at spring tides.

24,571. Would you run into the heavy sea which

HULL.

Mr. J. Gravel.

27 Oct. 1858.

Chairman.

the weather tide makes ?—I should have no fear, because we run no danger.

24,572. In what size vessel would you do it ?—A ship of 1,000 tons.

24,573. I mean how small, because it is more dangerous for a small than a large vessel. Would you go through in a schooner of 100 tons ?—That would depend on what she was laden with.

24,574. Would you go through the Pentland Firth laden with railway iron ? That is as bad a cargo as you can carry, is it not ?—Yes ; I have had it.

24,575. With a cargo of that kind would you venture into the Pentland Firth, blowing a gale of wind, and with a weather tide running ?—Yes, if I had a good vessel under my foot.

24,576. (*Mr. Lindsay.*) Would you have any hesitation in running for the Tyne if it were deepened to 20 feet at low water ?—To tell you the truth, I never was in the Tyne. I speak only from what I have seen and read in the coasting directions ; but I have been in Sunderland, Hartlepool, and Stockton, back to the Staples, into Holy Island, and all along there, but I never was in the Tyne. I have read some fearful accounts of it, and I have heard some.

24,577. But you do not know anything of your own knowledge ?—No ; no further than just passing it.

24,578. You expressed the same opinion about Hartlepool ; would you have any hesitation in running for Hartlepool in an easterly gale of wind, if there was a harbour of refuge made there ?—If there was a harbour of refuge in Hartlepool, I should wish to avail myself of it; but my opinion is, that no harbour of refuge has any business to be where there is a port.

24,579. Why do you hold that opinion ?—Because I think you are blocking up an outlet and inlet of ships.

24,580. Then it is your opinion, that if a harbour of refuge is made at the site of a port, in easterly gales of wind, when the ships are seeking refuge, it may be so blocked up with vessels trading to that port that the refuge ships would not be able to find anchorage ground and safe shelter ?—Not the whole of them.

24,581. You think that is one great reason against a harbour of refuge at a port ?—There would be such a number of them running for a harbour of refuge, that the ships which were intending to come out might be in that harbour, and the ships at sea running for it would fill up the harbour completely, unless it was very large indeed.

24,582. Is that one of the reasons why you prefer Filey, because there is no trade to it ?—Yes, one of the reasons.

24,583. But putting aside the question of the trade of any particular place altogether, whether do you think a harbour at Filey or a harbour at Hartlepool would do most to save life and property ?—I should say Filey.

24,584. You still think Filey ?—Yes, according to my judgment.

24,585. Will you tell me why you think so ?—I think that generally a greater number of ships are jammed off the head than anywhere else. That is where we, in general, find the blockage. There are more ships off the Head than anywhere else.

24,586. Do ships often get baffled off the Head, and find a difficulty in getting to the southward ?—Frequently. It is very frequent that they leave either Hartlepool or Sunderland, and get down to the Head, and then are taken short on a southerly wind. They would not like to run for Hartlepool or the Tyne, but if they had a harbour of refuge at Filey they would certainly take advantage of it.

24,587. Going back to the east coast of Scotland, from your experience do you think that a harbour of refuge is necessary on that coast ?—Well, I do not scarcely think that it is so requisite as on the coast of Yorkshire under Flamborough Head, because you have the Firth of Forth south, you have the Moray Firth north, you have the Pentland Firth further north still, and you have the Orkney and Shetland Islands, so that you have plenty of room to get shelter. You can always get shelter in the Moray Firth with a southerly wind.

24,588. Therefore, under the head of saving of life, you do not think that a harbour of refuge is anywhere nigh so necessary on the east coast of Scotland as it is on the north-east coast of England ? Under the head of saving or property you do not consider it is necessary there ; but under the head of giving facilities to commerce, such as a port of call and place for ships to run into, to get stores and various other things, do you think that a harbour of refuge under that head is necessary on the east coast of Scotland ?—I think it is very necessary they should have one.

24,589. Under the head of convenience to commerce ?—Yes, for ships short of provisions, and for a vast of things. There is no place for them to run for. They go to the Forth, but you cannot get up the Firth of Forth without running a good many miles up.

24,590. Is that one of the reasons why you give the preference to Peterhead ?—Yes ; you can get your supplies so much more readily, and it is the very land vessels generally make for.

24,591. (*Capt. Washington.*) I think you said that ships get jammed up under Flamborough Head. What number may you happen to have seen collected north of the Head at one time ?—A hundred sail, or close upon it. I have never counted them, but I have seen them running by scores to get in under Speeton Cliffs.

24,592. In case of a wind coming in from the south-east, would a refuge in Filey Bay be useful to these vessels ?—Yes.

24,593. Would they make for it at once, or would they try to contend against the wind ?—I don't see that they can contend with a south-east wind if bound south, very well. If they were to dodge off with the wind blowing strong, and could not fetch down with the wind south-east, they would have some difficulty in fetching the harbour, unless it was very moderate, or they had the flood tide to assist them.

24,594. You think that a shipowner would not complain of a master going to a harbour of refuge under these circumstances ?—No. If shipowners study their own interest, they will not.

24,595. Generally speaking, do you consider that it is for the shipowner's interest that a vessel in bad weather should take a refuge harbour, or should keep to sea ?—It depends on circumstances. I believe myself that many a ship is lost for want of taking a harbour in time. I had proofs only the other week —last Tuesday morning week—in running for the Humber.

24,596. What occurred then ?—Several vessels got ashore on the Holderness coast. If, when they had found the wind was coming in upon them, they had at once bore up for the Humber, as they ought to have done, they perhaps might have been saved. They sometimes hang it out too long. It is all right for a man to do his best endeavours, but we sometimes hang it out too long, until we cannot get into a harbour.

24,597. With the wind at south-east, would a master prefer running into a harbour of refuge at Filey rather than running back to his own port, knowing that at his own port he could not get in unless it was high water, but having a harbour at Filey, which he could run into at any time of the tide ?—I have not a doubt that any master of any ship would prefer it.

24,598. Would he be borne out by the owner ?—I consider I am both owner and master when at sea, to do what I think proper. If I have any judgment at all, I shall do the best for the owner if I do the best for myself.

24,599. Have you frequently seen many ships at the north side of Flamborough Head ?—Yes.

24,600. Have you ever known any of them wrecked

in Filey Bay ?—Very often ; but I have not been much upon the coast.

24,601. Have you ever known lives lost in Filey Bay ?—No.

24,602. On what part of the coast between the Humber and the Staples do the most of the wrecks take place ?—I think the Tyne.

24,603. At the entrance of the Tyne ?—I think that is where we have heard of a great many more than in the Tees Bay ; but Tees Bay is far from being a pleasant place to take.

24,604. I am speaking of the Tees Bay generally ?—It is not either a nice place to run for. Running between Hartlepool Heugh and Redcar, I think, in a very heavy sea you will find the sea very high there, with the wind easterly right across.

24,605. Do you know on what part of the coast most lives are lost ?—I think on that coast of the Tyne, and lower, about Hartlepool and there. We have had some instances of a few lives being lost at the Head, but not many, I think.

24,606. If many lives are lost at the entrance of the Tyne, do you think that some efforts should be made to improve that entrance ?—I do not know. I think the chief cause of lives being lost is their running for the bar when there is not water. Perhaps those very vessels have borne off from Flamborough Head, and were there a harbour there would not have run for Shields or Hartlepool, but would have embraced the first opportunity. I am speaking of what I should do myself.

24,607. Those are vessels which are actually caught at Flamborough Head ?—Yes.

24,608. But there is a long district of the coast between the Tyne and Filey ?—Yes, there is.

24,609. Where there might be a good many vessels which could not get to Filey in a southerly wind. Where would you give them refuge, if not at the Tyne ?—If they had not the Tyne, there is nothing left but the Forth for it. I would not attempt to go either into Hartlepool or Shields with a vessel of any draught of water with the wind easterly, if I could only claw round the Staples and get the Forth.

24,610. Not in their present state, you mean ?—The wind easterly causes a fearful sea on the bars.

24,611. I think you said you did not know where most lives are lost on the coast ?—Not exactly ; I have not taken particular notice, but I think in general it is about Shields.

24,612. Are you aware that 22 lives are lost every year at Hartlepool, and have been so for the last 20 years ?—No, I was not aware of that.

24,613. Do you remember the gale of the 4th of January 1857 ?—Yes.

24,614. Do you know that 44 lives were lost in Hartlepool Bay on that day ?—No, I do not recollect that.

24,615. Under these circumstances do you think it desirable that some efforts should be made to place a refuge harbour in Hartlepool Bay ?—I have no objection to a second one.

24,616. I mean a second one ?—I have no objection to a second one there, but I say Filey is the principal.

24,617. We will suppose Filey made. Then where would you place the second ?—In that bay, in preference to Shields.

24,618. You think two are desirable on this district of the coast ?—I do not think it would be any worse for two. It would be much better, if the owners do not find fault with their taking the harbours too frequently.

24,619. You do not think there will be much fear of that ?—No, I do not. I think that any man who understands his business will not take a harbour as long as he can keep the sea, if he thought there was any chance of making the voyage, particularly if he was an interested party.

24,620. As a general question, would you be of opinion that a refuge harbour should be placed where it can save most lives ?—Yes, at Filey.

24,621. (*Capt. Sulivan.*) Is it the case that the greatest loss of life occurs in laden ships more than in light ships ?—I think so.

24,622. Those lives which you have heard of being lost in Hartlepool Bay. Do you think that the laden ships which were wrecked there have in many cases been in such a position before they ran back that a harbour at Filey would have saved them ?—Yes.

24,623. Do you believe that with a south-east gale, if there were a harbour at Bridlington, that laden colliers—always keeping them in view, and not larger vessels, more powerful and better found—could thrash round the Head when they could only carry two close-reefed topsails, and get into Bridlington Bay ?—No, they could not.

24,624. Do you think it would induce men more prompt to take a harbour of refuge if, when off the Head, they knew they had one close under their lee at Filey, but that if they left it until they had been driven back to leeward of that, they had a long way to run back, and perhaps no place to go to at all ? Would that induce them more promptly to take the harbour which was at hand ?—No doubt it would.

24,625. You said that you had objections to a harbour being at a port of trade, on account of its being crowded ?—Yes.

24,626. You also told us that a second harbour in Tees Bay would be valuable ?—It would.

24,627. Would that be more especially valuable for light ships which have run past Flamborough Head, and have got into that bay ?—It would answer both for light and laden. If the laden had not got so far south as the Head it would turn their attention to it.

24,628. Do you believe that if a harbour were made at Hartlepool—a secure smooth-water harbour in all weathers—it would induce a much larger class of vessels to go to Hartlepool to trade—that these vessels would occupy the outer harbour very much in filling up the cargo beyond the depth with which they could come out of the docks, and so crowd in a great measure the deeper part of the harbour, and prevent its taking so many vessels for refuge ?—My opinion is that no harbour of refuge ought to have any connection with any port whatever, though it might be made as close in the neighbourhood as possible.

24,629. But I ask whether you think that a harbour made outside the docks at Hartlepool would cause a larger class of ships than can now leave the docks to trade there, trusting to using that harbour for filling up the cargoes, beyond what they could take in the docks, in the deep anchorage before they go to sea ? Would the effect of having a harbour at Hartlepool, under the ordinary circumstances of trade, be to take a larger class of shipping there than can now leave the docks, say after 17 feet, because they would have a sheltered anchorage outside to fill in their cargoes, and therefore so make the refuge harbour their loading-up harbour ?—I see now. I should say you would have a great many large ships in Hartlepool calling there.

24,630. Would that class of shipping tend very much to fill up the best depth of water inside the breakwater ?—No doubt. If I had a large ship I should prefer Hartlepool to Shields, if there was a harbour there for her.

24,631. Do you know Redcar ?—I have only very little knowledge of it, except just seeing it in passing.

24,632. If a harbour is to be made in the Tees Bay, and there are facilities for making it in Redcar equal to Hartlepool, would that answer the purpose of a harbour, without connection with trade ?—I have never looked at it very minutely, but, from what I understand, I think Redcar is preferable to anywhere else in that bay.

24,633. You say that the Pentland Firth is not a dangerous place to take, and that you would not hesitate to take it at any time of tide ?—No.

24,634. Are you aware that the tide runs there

HULL.

Mr. J. Gravel.

27 Oct. 1858.

Capt. Sulivan.

from 9 to 11 knots an hour ?—Not 11. I think you are wrongly informed.

24,635. We have it in evidence, on reliable evidence, that it runs from 9 to 11 knots. We have it also in evidence that a captain of a half-laden and good ship, with a light cargo, bound to the westward, with a rattling breeze and a press of sail, thought he could run over the tide, but failed to do it, and was drifted eastwards by the tide directly he got in. Do you think that with such a tide as that, and an easterly gale, it would be safe for the ordinary class of traders to attempt to run into it, or that they could stem such a tide if a half-laden and well-found ship could not ?—I should not hesitate a moment about taking it.

24,636. Do you believe you could stem a flood tide in that Firth ?—Yes, I am certain I could. If I had a strong breeze and could carry a maintop-gallant-sail, I should not be afraid of the strongest flood tide which you have.

24,637. If men who have traded there have told us they never could, and have utterly failed when they have attempted it, you would think they were giving wrong evidence ?—I should be rather doubtful on the subject. I should not wish to contradict them, but I think with a strong gale from the eastward the flood would have to run very strong if I could not run over it.

24,638. Even if it were a seven or eight knot tide, and you could run over it, would that tide against such a gale make a dangerous race for the ordinary class of vessels ?—Not half so much as in Sumburgh Roost.

24,639. What is the strength of tide in Sumburgh Roost ?—Six or seven knots.

24,640. Can you give any reason why, with the tide stronger in the Pentland Firth, it would not make the race so strong ?—Because it is more sheltered. There is the whole fetch of the North Sea and the Western Ocean into Sumburgh Roost.

24,641. Is there not a run into the Pentland Firth ?—It would be just at the first entrance.

24,642. Is not that the most dangerous place ?—It might, the first onset ; but I should not be at all afraid of it with a good breeze of wind.

24,643. (*Capt. Vetch.*) I think you said that you had been at the Shetland Islands ?—Yes.

24,644. Have you ever put in there ?—Frequently.

24,645. At Lerwick ?—Yes.

24,646. Have you ever taken a vessel through Sumburgh Roost ?—Frequently.

24,647. How far does it extend south of Sumburgh Head to the Fair Isle ?—Do you mean the Roost ?

24,648. Yes ?—Not quite. I think the strongest part is nearer the land.

24,649. How often have you been through the Roost ?—I cannot tell you. Above twenty times, perhaps thirty. There is always the alternative : you can get easier to the south of Fair Isle ; you can go the other side.

24,650. There is no necessity for going through the Roost ?—There is a necessity for us in the whaling trade. If I was in a corn ship bound from the Baltic, I should have no occasion to come between Shetland and the islands ; I could come down to the Orkneys and Fair Isle.

24,651. How many knots does the Roost run ?—I am not certain, but I think six or seven knots at spring tides.

24,652. You have always the option of going south of Fair Isle ?—Not if I am from Lerwick. If I am bound from the eastward, intending to land men at Lerwick, I must land them in Shetland, if possible, and consequently I come into the strength of the tide by going up on Fitfull Head or along there.

24,653. How often have you been through the Pentland Firth ?—Not above two or three times.

24,654. That would hardly afford a good criterion as to the difficulties of the passage ?—No ; but I am judging about the ship. If the tides run no more than eight knots, as I am informed by the coasting directions, I should not be afraid to run with a strong gale from the eastward, if I could carry the maintop-gallant sail.

24,655. But upon the experience of three voyages I should hardly consider you were qualified to speak ?—Sometimes one man will glean a good deal of information in a short time, which another will not get in a number of years.

24,656. Have you ever put into the Orkney Islands?—Yes, at Stromness.

24,657. Coming south of the Pentland Firth, do you know Wick very well ?—Not very well. I have been in once with a steamer from Lerwick.

24,658. What time of the year ?—The month of June.

24,659. Had the herring fishing commenced then ?—Yes. Then the sea was so heavy I could not bring up with the steamer. I saw one of the boats come on with the gale, and everything was swamped.

24,660. You have seen a number of fishing boats there ?—No; I did not take particular notice of them, but I know there are a great many.

24,661. Are you aware that there are 1,400 ?—No, I am not ; but there are a great number sometimes.

24,662. Considering that Wick is such a bad harbour as it is at present, and that there are 1,500 arrivals and sailings of vessels, at and from the port would you consider, that being such a bad place, and such an immense amount of fishing going on, that to save life and property some shelter should be afforded at Wick ?—Oh, certainly. It would be better for the fishermen to have a shelter, but you find no ships scarcely steer for Wick as a landfall.

24,663. I am asking the question as to the saving of life and property. Would you, as a man of feeling, consider that some shelter should be given ?—By all means, to such a number of fishermen.

24,664. Were you in the harbour ?—No. I was in the bay, just round the point.

24,665. How often have you been to Peterhead ?—No further than just passing it.

24,666. You have not been in ?—Not in the bay.

24,667. Merely passing off ?—Yes.

24,668. You cannot speak as to the competency of establishing a harbour there ?—No further than this—I know it is a principal landfall of almost all the eastern trade.

24,669. Coming to the south, you find the Forth a good harbour of refuge ?—Yes, but it is a long way up.

24,670. But suppose you were coming to the south, you would find that a good harbour ?—Yes.

24,671. Coming to the Tyne, I think you say you have not been in there ?—No, I never dared it.

24,672. There are two large piers now going out into deep water ?—I have read an account of it.

24,673. As to the number of wrecks at the mouth of the Tyne you are rather frightened, I think ?—The long list of the great number of wrecks which take place at the mouth of the Tyne, and the disasters there, make us fearful ; we in general give it a wide berth.

24,674. Do you not consider that the great number of wrecks and disasters which take place at the mouth of the Tyne must be owing in a great measure to the great number of vessels which go there ?—No doubt.

24,675. You have been into Sunderland, I think ?—Yes.

24,676. It is a rather difficult place to take, is it not ?—It is.

24,677. Coming down to Hartlepool you have a rather exposed anchorage on the north side, under the Heugh, open to considerable sea, is it not ?—Yes.

24,678. Have you ever been at anchor off Redcar, on the south side of the bay ?—No, never there.

24,679. You think that in Tees Bay, between Redcar and the Heugh, some refuge would be desirable. I suppose that is because it is in the bight of the bay, and if a vessel gets there she cannot get out

again ?—Rather than attempt Shields pier they would run for that harbour of refuge, if they were anywhere between the Head and Hartlepool. If they are caught in there they cannot get out, the wind being right on the land.

24,680. Some shelter, you think, would be necessary ?—Yes.

24,681. You do not know whether it ought to be at Redcar or Hartlepool Heugh ?—Either of the two. I do not know which.

24,682. Have you ever been at Whitby ?—I once passed it.

24,683. You do not know whether that would be a useful place for shelter ?—No.

24,684. You think coming down to Flamborough Head that some shelter is desirable on the north side of the point ?—Yes. That is the most likely place, because with a strong wind from the south-west ships hardly ever attempt to go round.

24,685. Would there not be a difficulty in getting out of Filey Bay and going south, if the wind did not exactly favour—a wind blowing into the bay ?—If the wind blows into the bay moderately, you might work out, and most likely you would have tugs to give the ships a tow out.

24,686. Between St. Abb's Head and the Humber, you think Filey Bay would be the most useful place for a harbour of refuge ?—Yes.

24,687. If two harbours are to be made, which would be the next best site for a harbour. between the Humber and St, Abb's Head, or between the Humber and Shields, if you please ?—I would say a place which holds out such inducements as Tees Bay, I see none but Tees Bay.

24,688. Tees Bay, then, is the next best to Filey, in your opinion ?—Yes.

24,689. (*Chairman.*) I think you said that you were acquainted with the Orkney Islands ?—Not so much as the Shetland.

24,690. Have you ever been in Long Hope ?—No, never.

24,691. You know it by the chart ?—Yes, very well.

24,692. And of course by the sailing directions ?—Yes.

24,693. And if you have a good chart and good sailing directions, I presume that, after your experience at sea, you consider you know a place pretty well if the chart and sailing directions are good ?—Yes ; I should be guided by them, and should not hesitate a moment if I wanted a harbour.

24,694. With the knowledge you have of Long Hope by the chart and the instructions, should you have any fear in running for it in dirty weather ?—Not at all, as long as I can see the marks.

24,695. As long as you can make out the land where you are, would you feel any difficulty in running for it ?—Not at all.

24,696. Speaking of the general run of coasting vessels when they are in ballast, if you were in very heavy weather, and really were alarmed about the safety of the ship, would you rather heave them to or run them, supposing you had plenty of sea room ?—I should run them.

24,697. Ships in ballast ?—In ballast.

24,698. I will put the same question with respect to laden vessels. With a laden collier, which would you rather do, heave to or run ?—Are you alluding to my having a fair wind for my port ?

24,699. I am putting you in this case : that you are in a very heavy gale of wind, when you are much alarmed for the safety of the vessels ; so heavy a gale as that, would you rather, in a laden collier, scud or heave to ?—In both instances I should rather lay to than run. I understood I was running for a harbour.

24,700. No ; I am now putting you in such a position that you see a risk of losing the ship from the violence of the gale ?—By all means heave them to in both cases.

24,701. With a light vessel, or a vessel in ballast, would you, for the safety of the vessel, rather heave to or scud ?—Lay to. I should say I was in double danger in running.

24,702. Would that apply to the general run of laden vessels on the coast ?—Yes ; I would lay to rather than scud, unless I had a harbour I was scudding for.

24,703. I put the harbour out of the question. You are now upon the sea, and a gale of wind so heavy that you must look to saving the lives and ship ; would you scud or heave to ?—Heave to in both instances.

Mr. Thomas Farr examined.

24,704. (*Chairman.*) Do you live at Hull ?—Yes.

24,705. How long have you followed the sea ?—Twenty-eight years.

24,706. And how long in command of vessels ?—Sixteen years.

24,707. In what trade have the vessels been chiefly employed which you have commanded ?—Coasting, Baltic, and South Australian trades.

24,708. How many voyages have you made home from the Baltic ?—About 20.

24,709. How many voyages have you made north about through the Pentland Firth ?—About eight times in favourable weather.

24,710. How many years have you sailed foreign ?—Four years in the coasting trade, the remainder of the time in the coasting, Baltic, American, and Australian trades.

24,711. In what trade were the coasting vessels employed ; in the coal trade ?—I was in the coal trade out of Hartlepool and Middlesborough about three years.

24,712. The object of this inquiry is to select the most suitable site for a place of shelter for the coasting trade, chiefly on the district of the coast between the Humber and the Farn Islands ; where would you put it ?—In Filey Bay.

24,713. Give me your reasons ?—There are many laden vessels accumulate off Flamborough Head. They come out of the ports with favourable winds from the south-west, and get out as far as the Head. When they get there, they find the wind away from the south-east, and have no harbour of refuge to go to, the bar harbours being so very bad that they cannot take them. They sometimes stand out to sea, when they are very liable to be run down by the light ships going to the north, of which there are many instances.

24,714. In southerly winds do the vessels accumulate off Flamborough Head very much ?—In great numbers.

24,715. Those vessels are chiefly laden ?—Laden, chiefly.

24,716. Is it for their use especially that you think this harbour should be made at Filey ?—Yes, principally for laden ships.

24,717. Have you ever worked round Flamborough Head in bad weather with a flood tide ?—No ; I have attempted it, but never could do it.

24,718. Have you attempted it more than once ?—Two or three times.

24,719. Do you recollect what sail you were under ?—Under close-reefed sails. I always drove back again.

24,720. In what description of vessel ?—In a brig, and schooner too.

24,721. Upon any occasion, carrying close-reefed topsails and courses in your brig, have you got round Flamborough Head with a flood tide ?—I could not get round it any distance, but was always driven back before I could get far enough up to come to anchor.

24,722. Have you ever been at anchor under Speeton Cliffs ?—Twice.

HULL.

Mr. T. Farr.

27 Oct. 1858.

Chairman.

24,723. Do vessels anchor there often for shelter? —Very often.

24,724. What is the largest number which you have seen there?—Upwards of 50 sail.

24,725. What is the largest number which you think you have seen dodging about under the Head? —From 300 to 400 sail.

24,726. How many voyages did you say you had made from the Baltic?—About 20, perhaps more. I was a good deal in the Hamburgh trade as well.

24,727. Did you come home late in the year?—Sometimes late in the year.

24,728. Tell me where you have made your landfall, not where you have endeavoured to make it, but where you have actually done so?—Generally Flamborough Head.

24,729. You have generally succeeded in making Flamborough Head?—Yes, or Tynemouth.

24,730. Never to the north of Tynemouth?—Nothing to the north of Tynemouth.

24,731. From your knowledge of the Baltic trade would you be disposed to say that, generally speaking, vessels can succeed in making Flamborough Head as their landfall, bound, say, to the south of the Head? —Yes, in general so. It depends entirely upon the wind.

24,732. But in the fall of the year there are certain winds—south-west winds—which are generally prevalent, are they not?—Yes.

24,733. If you took your departure from the Naze with a south-west wind, would you not be driven north of Flamborough Head?—A good bit.

24,734. You have generally been fortunate?—Yes; I have generally made Flamborough Head or Tynemouth.

24,735. What is the longest voyage you have made, or rather, what is the longest voyage you have made after you have taken your departure from the Scaw or the Naze?—Three weeks.

24,736. What time of the year?—It would be in the month of November.

24,737. Was the weather very coarse?—It was very bad.

24,738. Were the people pretty well done up when you got across?—Pretty well.

24,739. Therefore, in cases of that kind a harbour of refuge at Filey would be a great boon to vessels bound south?—Yes, a great boon.

24,740. You cannot absolutely call it necessary for the saving of life, I suppose, although it would be a great boon?—I think it would be a great boon, and save a great deal of life too.

24,741. I mean in those particular cases where they make long voyages home, and are pretty well beat by bad weather?—I can remember ships that have been driven away and foundered after they have made Flamborough Head. If there had been a harbour there they would have taken shelter.

24,742. In those instances there are direct cases in which there would have been a saving of life?—And property too.

24,743. Do you think that there are many instances of that kind? How many in the course of a year? —I cannot say exactly, but I should say a dozen.

24,744. There might be a dozen annually of that description?—Yes, of that description.

24,745. Where vessels have made the Head, or been driven to sea and foundered?—Yes, with south-south-east winds.

24,746. As respects the district of the coast between the Firth of Forth and the Pentland Firth, if anything were to be done on that coast for the preservation of life and property, where would you do it?—I should say Peterhead, but I have not had much experience, never having been caught in bad weather there.

24,747. Perhaps you prefer not to give an opinion? —I would rather not.

24,748. (*Sir F. Smith.*) Can you give the Commissioners the names of the vessels which foundered after they got as far as Flamborough Head?—I cannot exactly. There was one or two Scotch ships I was in company with when they foundered with all hands. I cannot give the names.

24,749. Can you discover them, and give them to the secretary?—I think it is possible I may.

24,750. We shall be obliged if you will, specifying in what year it occurred?—It would be about 10 years ago.

24,751. (*Mr. Lindsay.*) You say that if only one harbour were to be made on the coast, you would give the preference to Filey?—Yes.

24,752. Do you think that if Filey were made, one harbour would suffice for all the wants of the trade? —No, I do not.

24,753. Then, presuming a harbour to be made at Filey, and something more was to be done, whether do you think a harbour in the Tees Bay, say at Hartlepool, or the improvement of the Tyne, the Wear, and the Tees, so as to make them accessible at all times of the tide, if that were possible, would do most towards saving life and property?—I think in the Tees Bay.

24,754. Would do more to save life and property than the improvement of the existing harbours?—Yes, a great deal.

24,755. You would give the preference to Redcar over Hartlepool?—Yes, on account of there being more water and less sea.

24,756. Have you any other reasons?—Only that there is plenty of room to accommodate as many ships as are likely to use it.

24,757. (*Capt. Washington.*) How often have you been to Redcar?—I have been past it a great many times, not been in.

24,758. How near?—Within half a mile of the rocks.

24,759. How far do the rocks extend off the shore? —About three-quarters of a mile.

24,760. Have you ever been to Hartlepool?—Yes.

24,761. How often?—Perhaps a dozen times.

24,762. Is it a pretty good place to take?—Not very. A man lost his ship the last time I took it.

24,763. Under what circumstances?—Running from the Head, a deep laden ship, with a gale of wind from the south-east.

24,764. Why did you run to Hartlepool?—Because I could not keep the sea, and had no other place to run for.

24,765. Where did the gale catch you?—Off the Head.

24,766. How did the Head bear?—About south, I think.

24,767. At what distance?—About two or three miles when we were caught in "the vast" of it.

24,768. How long ago is that?—Twelve years ago.

24,769. That is about the same time you tell us you know of 12 vessels foundering?—Not 12 vessels —two. It would be about 12 years ago. I can give you the proper time.

24,770. You keep a log-book generally?—Yes.

24,771. When you bore out from Flamborough Head and ran for Hartlepool, having no other place to run for, was there any refuge at Hartlepool?—None at all.

24,772. Did you get it?—Yes, I succeeded; but with some difficulty.

24,773. Which harbour was it?—The old harbour. The new harbour was not open then.

24,774. Is that harbour a pretty good one to take at high water?—I don't find it very good.

24,775. Did you get damaged?—We did, a great deal. One boat went right over the windlasses, and ran ashore high and dry. The men went into the rigging, and we saved all their lives, and got the ship off again.

24,776. Is that the only time you ever had to bear up?—I bore up twice. Once before we got in very well; there was not so much sea. I bore up from Whitby.

24,777. Where did you go then?—To Hartlepool.

24,778. The wind at south-east, or how ?—About east-south-east.

24,779. Does it commonly draw eastward, backing round against the sun?—Yes, commonly. Coming out of the coal ports with the wind about south-south-west, and getting up to Filey or the Head, we find it coming from the south. Then it goes about south and south-east. You keep dodging under the Head expecting a slant of wind, but instead of that you stop, the gale increases, and you are obliged to stand to sea ; having no harbour to run to, ships are obliged to stand out and keep to sea. Many light ships run down, and perhaps they run over you often, or you founder at sea, with the ship in heavy weather breaking away the stanchions or covering boards, and going down.

24,780. With the wind at east-south-east cannot you fetch any place, cannot you make any bay at all? —No.

24,781. If the wind gets round as far as east-north-east, can you do so then ?—With favourable weather.

24,782. I mean blowing heavily, blowing a gale, with the wind getting round to east-north-east, can you make any bay, or can you round to ?—I should round to if it was blowing a very heavy gale.

24,783. The last witness said he would generally lie to, rather than scud. Do you agree with him ?—I would lie to if I had any harbour to run to. It would be no use scudding if you had no place to scud to.

24,784. There is the Firth of Forth ?—But it is a long way, and a ship might go down before you run as far as that.

24,785. You agree with Captain Gravel that the owner would bear you out in going to a refuge harbour ?—It would be his interest.

24,786. You think it would ?—Yes.

24,787. You are satisfied that a ship suffers more by thrashing about against a gale of wind than she does in losing time by going to a harbour of refuge ? —I am confident of that.

24,788. (*Capt. Sulivan.*) You say you would prefer Redcar to Hartlepool ?—Yes.

24,789. From what you have seen in heavy weather do you think a ship would get into Redcar with less danger from the sea outside, than into Hartlepool ?—I think she would.

24,790. Would it be equally safe to run for and make in bad weather, do you think ?—I think equally as safe.

24,791. With easterly gales, could ships running in feel their way along the Yorkshire land by the Redcar Rock ?—I don't see anything to prevent them.

24,792. To the entrance ?—To the entrance.

24,793. Would Hartlepool have the advantage, when the wind shifted, of being further to windward, to come to the southward again ?—Yes, of course it would.

24,794. If one harbour were made at Redcar, would it not be necessary very often to tow ships to windward, to give them a start ?—At times it might, but still it would be fair when the wind got from the east. They still would have the advantage then.

24,795. Do you agree with the last witness that it would be a great advantage to have a harbour of refuge free from the trade of a large port ?—I think it would. In that respect I agree with him, on account of so many light ships that would be running down for the port, and the harbour would be full of laden ships.

24,796. Ships bound to the port, as well as those taking it for refuge ?—Yes ; because they can only get in at a certain tide of the time. They must get in and come to anchor at a certain time of the tide.

24,797. We have heard of many large ships drawing 20 and 20 feet of water in the northern ports, laden with coal. If Hartlepool had a harbour outside, do you believe that a large class of ships that now use these docks would go into them and take part of their cargo there, and then go and fill up outside, and so keep the deepest water at the anchorage ?—I don't think they would find much deep water to keep ; not much of that depth of water in the bay at all.

24,798. But if a harbour were constructed, having a depth of five, six, or seven fathoms, or whatever it might be, do you believe that a large number of ships that cannot now frequent the harbour, in consequence of not being able to come out with more than seventeen feet water, would go in then, come out half loaded, and complete their loading outside ?—It might be the case.

24,799. Would that help very much to block up the refuge anchorage ?—I think it would.

24,800. Would that be a reason, if all other things were equal, for your preferring a harbour where there was no large trade ?—Yes.

24,801. For the general purposes of trade, if it is found by engineers that as large a harbour can be made at Redcar for the same money, and with at least the same depth of water, as can be made at Hartlepool, would you say that the outlay at Redcar would be preferable ?—I do ; perfectly so.

24,802. (*Capt. Vetch.*) In your voyage from the north southward, have you ever taken refuge under Speeton Cliffs ?—Twice.

24,803. Did you find it a safe place ?—With certain winds. I have ridden there with the wind as far as south and by east.

24,804. But you are always in danger of the wind coming round upon you, are you not ?—In the winter time.

24,805. You never took refuge in Filey Bay ?—Not in the bay ; at the cliffs.

24,806. You could not have got out of it again ?—In fine weather I should say there was no fear of getting out, carrying all sail.

24,807. Therefore it is necessary, in order to make Filey Bay advantageous to the trade, that a breakwater should be made there ?—Yes, it is.

24,808. If a breakwater were made, should you think it very useful ?—Very useful indeed for both life and property.

24,809. You have been saved by going to Hartlepool ?—Yes.

24,810. You find that rather exposed at present ?—Very exposed.

24,811. If a breakwater is made there, say into seven fathoms water, would you find that a great convenience when caught in gales of wind in the bight of that bay ?—If caught in the bight of the bay it might be of great advantage, of course. But still it is a nasty place. It is a nasty bay to go into on account of the outset from the Tees and the strong tide.

24,812. But if you were caught in the bight of the bay you could not help it. You must go in or go ashore ?—Yes ; but still one at Redcar would answer the same purpose.

24,813. You would prefer Redcar ?—Yes.

24,814. But still, on one side or the other, you would not be in safety without shelter ?—No.

24,815. Therefore the same necessity exists there as in Filey Bay ?—Just the same.

24,816. When ships get down to Whitby and cannot get south to the Head, have they any alternative but to run for Hartlepool ?—They must either go there or to the Forth.

24,817. Between Flamborough Head and Tynemouth, which site do you consider would be most useful for vessels to get in refuge ?—Filey.

24,818. Supposing there are to be two, which would be the next place you would select ?—Redcar.

24,819. (*Mr. Coode.*) You said you had seen from 300 to 400 vessels accumulated north of the Head ?—Yes, north of the Head.

24,820. Dodging about or at anchor ?—Some were dodging about and some were at anchor under Speeton Cliffs ; some were under canvas.

24,821. Have you known vessels detained there for any length of time ?—I have been detained myself five or six days.

HULL.

Mr. T. Farr.

27 Oct. 1858.

Mr. Coode.

24,822. Has this happened more than once ?—Several times.

24,823. That has happened to you ?—Yes.

24,824. (*Chairman.*) In a former part of your evidence I put the question to you, how many vessels you thought annually foundered at sea, having made Flamborough Head and having been driven off by stress of weather, and I understood you to say 12. Did I understand you right or not ?—I said about two.

24,825. It was a mistake of mine, then ?—That is, simply the vessels coming in from the Baltic and making the Head. I don't mean others going up to London or through. I should say more than 12 of them.

24,826. If colliers were included, you would be disposed to say more than 12 ?—Yes.

24,827. Speaking of the vessels generally that are employed in the coast trade, in a gale of wind which is so heavy as to put them in danger of their lives and vessels, in your opinion would it be safer for them to heave to or to scud ?—I would heave them to.

24,828. Vessels in ballast ?—In ballast I would scud to get down to a harbour.

24,829. Supposing you had plenty of sea room, and it was blowing so heavy that it was a question of saving your life, owing to the sea being so heavy, I ask you as a question of seamanship what would you do ?—I would heave to, by all means.

24,830. With a vessel in ballast ?—Yes.

24,831. With a laden collier what would you do ?—I would heave her to.

24,832. With respect to the general run of the coasting trade, besides colliers, what would you do ?—I would heave to under those circumstances.

24,833. You would always heave to, in preference to scudding ?—In preference to scudding with a heavy gale like that.

24,834. (*Sir F. Smith.*) Have you for any length of time been considering the subject of harbours of refuge ?—Very lately. I have not given much attention to it. When I was on the coast I often used to wish we had harbours of refuge down here.

24,835. But I suppose your attention has been directed to this subject in consequence of your knowledge that a Commission has been moving about the country to ascertain the best points ?—Yes.

24,836. And you have well considered it ? Have you consulted with other masters of vessels on the subject ?—I have ; many.

24,837. Do they generally concur in your opinion that Filey is the best place ?—The best site upon the coast.

24,838. Not only for the trade of the Humber, but for the general trade of the country ?—Yes.

24,839. Both coasting and foreign ?—Yes ; both coasting and foreign.

24,840. (*Mr. Lindsay.*) Do you know if there is a large trade from Sunderland and the Tyne to the northern ports ?—Yes.

24,841. About what proportion of the vessels eaving the Tyne and Sunderland do you think go north ? Will one-sixth of them go north ?—I should scarcely say that. Not so much as that, I should think.

24,842. Will one-eighth of the number loaded in the Tyne go northwards ?—I should say about one-eighth.

24,843. Would a harbour of refuge at Filey or Redcar be of any use to them ?—None.

24,844. (*Capt. Washington.*) Do you say you are well acquainted with the Tyne ?—I have been into the Tyne several times.

24,845. Lately ?—Not lately.

24,846. How lately ?—Perhaps seven or eight years ago.

24,847. Have you been at sea for the last eight or ten years ?—All the time since I was eleven years of age.

24,848. Because most of your answers refer to what took place 11 or 12 years ago ?—That was when I was on the coast. I have been in the South Australian trade since. What I referred to was when I was in the coasting trade.

24,849. Then most of your evidence is in reference to the state of the coast about 10 or 12 years ago ?—Yes.

24,850. To your recollection of it 10 or 12 years ago ?—Yes.

24,851. At that time did you often go to the Tyne ?—Perhaps I have been there five or six voyages ; not more.

24,852. You were frequently on the Tyne ?—I have been frequently in the Tyne, but more in the Tees and at Hartlepool than in the Tyne. I have likewise been at Sunderland.

24,853. And in the Tees ?—Yes, in the Tees too.

24,854. Is the Tees a pretty good place to take ?—Very bad indeed.

24,855. The river I speak of ?—It is a very difficult place indeed to take.

24,856. You went there because you were bound there ?—I was bound to Middlesborough and Stockton.

24,857. Do you think the masters of ships nearly always try to get the ports they are bound for, if they can ?—If they possibly can, they will do so.

24,858. Even if a better harbour were made, a little out of their course, they would not run for it if they could help it ?—Not if they could help it. They would not do so unless they were obliged.

24,859. If there was a chance to get to any of the ports, they would still go ?—If they knew there was plenty of water, of course they would attempt to get into the ports.

24,860. Seeing that that is the common and regular practice, do you think it would be desirable to improve the entrances of these harbours ?—I don't see how they could be improved in respect to laden ships.

24,861. Neither you nor I are engineers ; but supposing it possible to improve the entrance to the Tyne, so as to get 12 or 15 feet at low water, which would be something like 26 or 30 feet at high water, do you think it would be worth a great effort to accomplish that ?—I think a harbour of refuge would be preferable.

24,862. You do ?—Yes, I do.

24,863. Preferable to improving the bar harbours or river harbours ?—Yes.

24,864. You say you have lately been in the Australian trade ?—Yes, for four years. I was in a steamer out of Hull.

24,865. Where did the steamer go ?—To Rotterdam.

24,866. During the time you were in the foreign trade, what port did you go to chiefly ?—To London.

24,867. You came up the British Channel ?—Yes.

24,868. Did you ever get into the Bristol Channel by accident ?—I have been in it, but only once.

24,869. Were you ever caught there ?—No, never.

24,870. You never were in want of a harbour in the Bristol Channel ?—I always came right up, and went right down.

24,871. You don't know whether there is any want of a harbour at any part of the Bristol Channel, say near the Land's End ?—I do not. I could not give an opinion upon it.

24,872. You have said, in answer to a question, that you have been considering the subject for some time ?—I have, seeing it noticed in the newspapers.

24,873. When were you asked to give evidence here ?—Last night, at seven o'clock.

24,874. That's all ?—That's all.

24,875. By whom ?—By some more captains.

24,876. (*Capt. Sulivan.*) You say that vessels are fond of congregating at Flamborough Head. Is it not that some are so bad that they often become leaky there, that the men are constantly kept at the pumps in heavy weather, and are thus worn out, and that before they can reach any port they are in great danger of actually foundering ?—Yes, it is the case.

24,877. You can state with confidence that that is

of frequent occurrence?—Yes, I can state with confidence that it is of frequent occurrence. I have been caught that way myself.

24,878. (*Capt. Vetch.*) How often have you been caught by a south wind off Flamborough Head, so that you could not go south?—I should say perhaps a dozen times, and perhaps more.

24,879. How many years did that occur in?—That would occur in four or five years, perhaps.

24,880. In the winter season?—Principally in the winter season.

24,881. You would be detained twice or three times each year?—Yes; I bore up from Flamborough Head in one voyage.

24,882. On these occasions, which did you generally do—run for it, or get under the cliffs?—I got under Speeton Cliffs, but, with the wind from the east of south, I was obliged to go back.

24,883. From your general knowledge of the coast, tell me how often would a vessel in the coal trade be intercepted off Flamborough Head, so as to be unable to proceed further south; how many times in a year?—If following the trade during the whole of the year, do you mean?

24,884. No; upon the average?—Perhaps six times. She could make 12 or 13 voyages.

24,885. (*Chairman.*) In answer to a question put to you, you stated that you had once been caught under these circumstances, that your ship was nearly foundered from being in a bad condition?—Yes.

24,886. Will you detail the circumstances to the Commissioners?—It was blowing a gale from the southward. The ship was an old one, belonging to Shields. She was very leaky, and we were constantly at the pumps. We were obliged to run her back and take Tynemouth. We took Tynemouth that time in a gale of wind.

24,887. Was it blowing very hard?—It was blowing a complete gale of wind when we went in.

24,888. What time of the tide was it when you went in?—It was just at the top of high water.

24,889. Was there a very heavy sea?—Very heavy.

24,890. What sail were you under?—Under two close-reefed topsails.

24,891. Was the vessel in great risk running in?—Yes, she was in great risk running in.

24,892. Were the men in the rigging?—They were in the rigging tending the braces, for fear of the decks being swept.

24,893. Was the man lashed to the helm?—Yes; the sea moved the long boat right over the chocks, and right upon the windlasses.

24,894. Were you pooped running in?—Yes, we were pooped. The sea took the long boat right on the windlasses.

24,895. More than once?—Only once. The boat remained there till we got in.

24,896. On any other occasion have you run into these outer harbours in bad weather?—I run into Hartlepool once under similar circumstances.

24,897. Were the people on the rigging?—Yes.

24,898. Is it the practice in gales of wind, when running into these harbours, to send the people into the rigging, and lash the man to the helm?—If the sea is heavy, and it is a small ship, it is wisdom to do so.

24,899. In running into these harbours, where do you find the worst seas; because it was described to us the other day that when the sea breaks outside, the sea which breaks in the deepest water is the most dangerous. Is that your opinion?—I should say it is, or the second after that. There are in general three very heavy seas. In coming over these bars, I consider that the second is generally the worst.

24,900. Running into Hartlepool Bay in heavy weather, we were told that the sea breaks in seven or eight fathoms?—I have seen it break in 10.

24,901. In running into that bay, which is the most dangerous sea, the first sea or a subsequent one?—I should say the first sea is as bad as any.

24,902. It strikes the ship with a greater volume of water?—With a greater volume of water, and is liable to heave her out of the course.

24,903. When you are through that first sea, do you then consider the danger pretty well over?—Not in general. We are in danger until we have got through all the three seas.

24,904. Until you get out of the broken water?—Yes.

24,905. With reference to ships in the coal trade, are many of them very badly found aloft; I mean in sails and rigging?—There is no doubt that some of them are very badly found.

24,906. We were told the other day that the owners who have been at sea themselves generally find their ships better than other owners. What do you say to that; is it the case, or not?—I have not taken particular notice of them.

24,907. Have you taken notice who the ships belong to which are the worst found?—No, I have not.

24,908. But that there are many of them very badly found you have no doubt?—There is no doubt of that.

24,909. Do they generally go to sea sufficiently manned; I don't mean well manned as regards the character of the men, but sufficient in point of numbers?—I should say they do.

24,910. Now as respects the hulls, what would you say about them? Is the hull of a collier, generally speaking, as good as that of a vessel in the foreign trade of the same description?—Some of them; some are not.

24,911. Are some of them very bad?—There is no doubt of that; very bad.

24,912. They are generally well found with pumping gear, are they not?—Yes, generally so.

24,913. Does their leaking at sea arise in some degree from their necessarily being laid on the ground in the harbours they frequent, leaking as vessels generally do that are much on the ground?—Some of them, there is no doubt, may leak a good deal from coming over the bars, and perhaps striking the bars. There is, no doubt, a good deal of leakage caused by that.

24,914. When a collier is worn out, is she broken up for firewood?—I never knew one.

24,915. You never knew of one being broken up?—No.

24,916. Then where do they go to; do they founder, or go on to the beach; is that their end generally?—I cannot say what becomes of them.

24,917. Are the vessels in the coal trade kept in the trade by their being frequently thoroughly repaired?—I believe they are.

24,918. It is the practice to keep repairing them and keep them going on?—That is it.

24,919. Will that in some degree account for their never being broken up?—Perhaps it may.

24,920. To a certain extent?—Yes, to a certain extent.

24,921. (*Capt. Sulivan.*) Would you say that these old colliers get thorough repairs, or would you say they are patched up?—Partly repaired and partly patched up.

Mr. Joseph Maycock examined.

24,922. (*Chairman.*) Do you belong to Hull?—Yes.

24,923. How many years have you followed the sea?—Forty-one years.

24,924. Of that time how many years have you been in command of vessels?—Since 1840, — 18 years.

24,925. In what trade have the vessels which you commanded been chiefly employed?—The coasting trade; nearly all in the coasting trade.

HULL.

Mr. J. Maycock.

27 Oct. 1858.

Chairman.

24,926. In the coal trade?—Well, I have been a few voyages in the coal trade, from the Humber to London, and one or two voyages to the northward.

24,927. You have been present during the course of the inquiry this morning?—Yes.

24,928. Give us your opinion as to where a harbour of refuge should be placed,—on the district of coast between the Humber and the Farn Islands?—Well, I should say Filey; that is the best place.

24,929. Give us your reason?—If strong winds come round the Head. I have been detained myself with a laden collier under the Head, with even a wind at south-south-west, and durst not go round in a gale of wind with a small vessel of 100 tons register. I have been riding under Speeton Cliffs for several days with the wind south-south-west, and durst not go round with the flood tide, and with the ebb tide I could not.

24,930. Have you ever tried to get round the Head with a flood tide?—Yes.

24,931. You know the coast and the tides well, I suppose?—Yes; I have been riding under Speeton Cliffs, with a dozen others maybe, at nightfall on a winter's night. There have been perhaps 200 sail of us under the Head, and perhaps 100 sail brought up right along Filey Bay—brought up there with the wind at south-south-west often.

24,932. How many vessels have you seen dodging off the Head?—Oh, quantities; I cannot say. 200 sail of ships under the Head looks a good deal. I would say 200 sail, or 300 sail perhaps; the largest ships further out, and the small ships close in; the small schooners and smacks as close to the land as they can get.

24,933. What are the ports you have chiefly traded between on the English coast?—I am now in the Antwerp trade; I have been in the Rotterdam, and the London and the Leith trade a good deal. I run a steamboat for 10 months between here and Aberdeen.

24,934. Have your vessels been sailing vessels or steamers generally?—Sailing vessels for the last eight years.

24,935. Between Leith and Hull?—Yes.

24,936. What description of vessels?—A schooner, about 100 tons register.

24,937. When you get upon the Durham or Northumberland coast, with the wind off shore, how do you endeavour to make your passage?—With the wind from the south-west, crawl away along Tees Bay; with the wind south-east, get up under the Head; if it is blowing hard from the south-west, I durst not go round sometimes.

24,938. Do vessels making the passage with the wind off shore keep close in?—Always.

24,939. What is the reason; to take advantage of the tides and slants of wind?—Yes, sometimes when the wind is in the west; and in summer time a ship that is close in with the land will get along, when ships in the offing are driven back.

24,940. If a man wishes to make a passage he keeps close in?—Yes.

24,941. With the wind east on the shore, how do you make your passage coming from the Firth?—Steer for Flamborough Head, and keep pretty well out.

24,942. If the wind was scant would you still keep an offing with the wind on shore?—Oh yes.

24,943. What would your offing be from the Farns to Tynemouth?—I think something like 25 miles.

24,944. How far off shore would you keep with a scant wind from the eastward?—I should keep sight of the coast.

24,945. I mean with a scant wind—a wind you could not lay your course—and you would have to take the first occasion you could to get on; which offing from the coast would you keep in making your passage to the south?—10 or 15 miles while you get as far as Tynemouth. I would keep farther off after that, because I should want to get across Tees Bay, and not go round by the bight.

24,946. What are the worst winds on this coast and the most dangerous ones?—The wind from the east-south-east and east-north-east is as bad as it can be.

24,947. From what quarter does it blow hardest?—It blows heavy from the south-west sometimes on the Durham coast.

24,948. Are the changes of wind on the coast sudden?—Yes, very frequently; sometimes blowing a gale of wind from the east-south-east with rain, the weather will clear up, and the wind fly round to west-south-west or to south.

24,949. Does it generally go round from the southward to the northward with the sun?—Not always; it will back sometimes.

24,950. When you are pretty close in shore with lightish winds, does a breeze on shore ever come on very suddenly, and blow hard from the eastward?—Not very often; that is not a very usual occurrence. Perhaps the wind from the north will easter pretty sharply, and go to the north-east or further south, eastering round that way, but does not fly to the east all at once.

24,951. Does a change of wind of that kind generally come on so, that a man who knows the weather and the coast would easily have a few hours' warning?—Not in the winter time.

24,952. But time to get an offing?—Not with some ships. Not with a laden collier, that crawls about six knots an hour.

24,953. So that, if he is on shore, trying to make the passage, he may be caught on a lee shore by a sudden shift of the wind?—Yes.

24,954. And does that often happen?—It does sometimes, and very frequently too.

24,955. (*Mr. Lindsay.*) If there were to be a second harbour made after Filey, where would you prefer to have it?—To the southward of Tynemouth, do you mean?

24,956. Between the points named. You say you would prefer Filey, if there was to be only one harbour. If there was to be another between Filey and the Farn Islands, where do you think it is most required?—I will say Redcar, the same as Captain Farr.

24,957. You would prefer Redcar, as a site, to Hartlepool Bay?—Yes.

24,958. What is your reason for preferring Redcar?—There is more water at Redcar, and ships coming from Tynemouth come out at high water. I have seen them come out at high water with a gale blowing from the south-east, for instance. If you cannot get back, you must reach to the south. If there were a harbour of refuge at Redcar, you would bear up and get into Redcar, when you could not get back to Tynemouth.

24,959. Say, that the money that was to be expended could be distributed in improving the existing harbours, so as to make them accessible at all times of the tide, do you think it would be better expended on one harbour, or in the improvement of the Tyne, the Tees, and the Wear, looking to the saving of life and property?—I am sure I cannot tell. I think I should say, a harbour of refuge in preference to the improvement of the present harbours.

24,960. You think one harbour of refuge at Filey would be a greater advantage than the improvement of the existing harbours?—Yes.

24,961. Why do you think so?—Because I think, that in the time of freshets and heavy rain there are strong tides coming out over these piers. If you run the piers or jetties further out, you will still have the tide or freshets down the river with heavy rains.

24,962. Is there any other reason that strikes you?—I don't know that there is. It is mainly on account of the freshets which at times come out that I object. If you look at the harbours I have seen, you will see they make bars with heavy freshets. Over Aberdeen bar the sand will wash up a great deal with the freshets from the Dee.

24,963. Would your opinion be still the same if it

HULL.

Mr. J. Maycock.

27 Oct. 1858.

were possible to deepen these harbours to 16 or 20 feet at low water ?—I am not an engineer, but I think that is not possible.

24,964. Say it is possible, would your opinion still be the same with respect to one harbour of refuge ?—I should give the preference to one harbour where no business was done, rather than to one where there is a large coal trade, like Shields.

24,965. Do you know anything of the navigation along the east coast of Scotland, to the north of Aberdeen ?—No ; I never was below Buchan Ness in my life.

24,966. You are not able to offer any opinion as to the necessity of a harbour of refuge there ?—No ; I have seen Peterhead, that is all. I have never been in under it. I have been in a good many parts of the Firth of Forth.

24,967. Have you ever been in the British Channel ?—No.

24,968. (*Capt. Sulivan.*) Did you hear what the last witness stated as to the danger of laden colliers springing a leak in heavy gales from the south-east at Flamborough Head, so that the crews would be worn out at the pumps ? Can you confirm that statement ?—It is frequently the case. I should say that ships are lost by the men being worn out from heavy pumping. They cannot pump any longer, and the ship must go down. If there was a harbour, or even a beach to run on, no doubt they would run to the beach and try to save their lives.

24,969. Is the danger to the crews of laden vessels greater than to the crews of light vessels ?—I don't know. With easterly gales, a light ship cannot beat off, when a laden ship might.

24,970. I mean when they are wrecked. Is there more danger of loss of life in laden vessels driven on shore than in light vessels driven on shore ?—If I was going on shore, I should like a light vessel best.

24,971. Is there more danger to a laden ship than to a light one ?—Yes.

24,972. (*Chairman.*) You heard the question put to the two former witnesses as to which was the safest thing to do in heavy weather, to heave to or to scud. What is your opinion upon the subject, first with respect to a vessel under ballast ?—If there was a harbour before you ?

24,973. Putting a harbour out of the question, but giving you lots of sea room,—plenty of sea room for running, but no harbour to run to ?—Well then, heave to the ship, and make her as comfortable as you can. Let her lie as easily as possible.

24,974. Do these vessels always lie to easily ?—Not often. Sometimes a ship lightly ballasted will fall off very heavy, perhaps may cant her ballast, and have a deal of water in her hold. I have known vessels shift their ballast about, and then you must do what you can. They are rather unmanageable.

24,975. If they get a good deal of water in the hold, does not that act as shifting ballast, and make them very dangerous ?—There are many of them go to the bottom, and all hands are lost, through that.

24,976. Taking into account that if a vessel falls off into the trough of the sea, and may ship a very heavy sea, would you still say it is safer to heave her than to run ?—Yes ; you must do what you can ; perhaps get buckets down below, and do what you can with the pumps. It has been done that way.

24,977. As respects laden vessels ?—I should heave to, no doubt about that, with a laden ship.

Mr. Thomas Dawson examined.

Mr. T. Dawson.

24,978. (*Chairman.*) Do you belong to Hull ?—Yes.

24,979. How long have you followed the sea ?—Thirty-eight years.

24,980. For how many years have you been in the command of vessels ?—Twenty-two years.

24,981. In what trade have the vessels which you commanded been chiefly employed ?—For the first seven years I served my time in the London trade, from the Humber to London. After that I went to the Baltic and to Rotterdam.

24,982. Have you been employed on the coast at all since ?—Last year ; I have been from here to Newcastle.

24,983. Always in sailing vessels ?—No ; I was for a long time in a steam vessel.

24,984. How have your passages been made home from the Baltic, by steam or sail ?—Both.

24,985. Have you made many voyages home under sail ?—Yes.

24,986. How many ?—Perhaps 50 or 60.

24,987. A considerable of them late in the year, I suppose ?—Yes ; early and late.

24,988. Bound for the port ?—Yes, generally.

24,989. When you are bound for the port, I don't ask you what landfall you have endeavoured to make, but what landfall you have actually made ?—I have made as far north as St. Abb's Head and Flamborough Head.

24,990. But never to the north of St. Abb's Head ?—No, never.

24,991. Generally speaking, where have you made the landfall ?—Generally at Huntley Foot, and nearer the Head.

24,992. Have you been present this morning all the time ?—Yes, I have.

24,993. You have heard the evidence of the previous witnesses ?—Yes.

24,994. Now will you give us in your opinion where a harbour of refuge on this district of coast ought to be ?—Well, my opinion is at Filey, decidedly.

24,995. Will you give us your reason ?—I think it is a point where ships are generally collected. A great many ships are generally collected together under the Head, and now there is so much steam on the coast they are very much exposed to the danger of being run down, for one thing, and to get round the Head there with strong winds is impossible.

24,996. You think even with a flood tide it would be impossible ?—Quite so for sailing ships.

24,997. Have you ever tried it ?—I have ; and I have tried it with steam aid. I have had to run back even with steam.

24,998. With a flood tide ?—Yes, with a flood tide.

24,999. Then supposing a harbour of refuge were put into Bridlington Bay, you think that ships to the north of the Head would never be able to get to it in bad weather ?—They never would obtain it.

25,000. A harbour at Filey then would be of most use to laden vessels ?—Decidedly.

25,001. Is it a fact, as we have been told, that the light vessels generally endeavour to run for their own ports by preference ?—Yes, I believe they will.

25,002. They will run a great risk for that ?—They will run a great risk to get to their own ports in preference to running for a better port that is not their own.

25,003. You think so ?—Yes, I do.

25,004. Supposing they had a refuge harbour down in Tees Bay, do you think they would gradually come to use it, or would they still have a great preference for their own ports ?—I believe that Hartlepool would be a great inducement for them to run to as a loading port. They would say, if we cannot get a cargo for the north we shall always obtain a cargo of coals here.

25,005. So that one great inducement to run for their own ports is getting their vessels laden again without having to leave the port ?—Yes.

25,006. And in that way Hartlepool would work well, for there is plenty of coal there ?—Yes.

25,007. Have you ever run into any of the bar harbours in bad weather ?—Yes ; I was in Hartlepool two years since.

25,008. Was the weather such as to place you in any danger of losing your life or your ship ?—No. It was not so exceedingly bad as that, but neverthe-

HULL.

Mr. T. Dawson.

27 Oct. 1858.

Chairman.

less it was blowing hard. I had got off the Head and was becoming rather short of coal, so I bore up for Hartlepool, and went in.

25,009. You were in a steamer ?—Yes.

25,010. There would be comparatively no difficulty in that case ?—A steamer does not dip so on the bar as sailing vessels do, but still they are liable to ship a sea.

25,011. They are more in hand, I presume ?—Much more.

25,012. Have you ever made Hartlepool in dark weather ?—I have.

25,013. Is it easy to make out—that is, the Hartlepool land—when you once see it ?—No.

25,014. Is there any land on the coast which might be mistaken for it ?—Perhaps not, but the high land lies much further back than at any other place, so that you are actually down upon the land before you are aware of it.

25,015. The difficulty of making Hartlepool is the low land lying so much in front of the high land ?—Yes.

25,016. Hartlepool Heugh, there is no mistaking that, is there ?—No ; there are objects you may know.

25,017. Have you ever run for Hartlepool by the lead ?—No. I never was there but once.

25,018. Have you ever taken any other of the bar harbours in very bad weather, in a sailing vessel ?—No. I have been once or twice into the Tyne, but that was when it was moderate weather.

25,019. (*Sir F. Smith.*) Supposing Filey should be formed into a harbour of refuge, what other place do you recommend for an additional harbour ?—I should not give the preference to Hartlepool. I should give the preference to the south side of the Tees.

25,020. (*Mr. Lindsay.*) You said the south side of the Tees Bay. Had you any particular part in view? —There has been a place named.

25,021. Redcar ?—Yes.

25,022. You would prefer that to Hartlepool for a second harbour ?—Yes.

25,023. Do you think a harbour there would be of greater service than the improvement of the Tyne, the Tees, and the Wear, so as to make them accessible at all times of the tide ?—Yes. I don't think any of these bar harbours would keep open any time, that is to say, subject to the sea throwing up bars, particularly with freshets.

25,024. But if it should be discovered that there is little chance of their silting up, and that a sufficient depth of water could be maintained at all times of the tide, do you think one harbour at Redcar would be of more advantage than the improvement of the existing harbours ?—I do.

25,025. What is your reason for thinking so ?—The immense number of ships, for instance, that are trading there usually block up the harbours, and the present accommodation inside would not be sufficient to contain them.

25,026. You think that when vessels run for refuge the harbours would be so much occupied by the trading vessels that there might be danger of them not getting good shelter ?—I have no doubt that they would do a great deal of damage in running in. Perhaps they might get into the river, but perhaps they might not.

25,027. As you have made so many voyages to the north, have you formed any idea as to the necessity for a harbour of refuge between Aberdeen and the Pentland Firth ?—I am not acquainted with that case.

25,028. So that you are not prepared to offer an opinion upon that point ?—No, I am not.

25,029. (*Capt. Washington.*) I did not quite understand where you said there would be danger of ships running into each other ?—In a river such as the Tyne.

25,030. You know the Tyne well ?—No ; I have been in there twice.

25,031. How lately ?—Five or six years ago.

25,032. In a steamer or sailing vessel ?—A sailing ship.

25,033. You know there is a very large amount of trade there ?—There is.

25,034. You know that 45,000 vessels go in and out every year ?—Yes.

25,035. That being the case, do you think it desirable to make an effort to improve it far up the river ? —I should have a great desire to do it if it were practicable.

25,036. But you are not an engineer, and will not give an opinion as to the practicability ?—I have seen a vessel ashore on each side going in. There was a large ship—a foreign ship I think, a Spaniard or Italian, or something of the kind—just upon the Middens, and another upon the Sound upon the other side, in attempting the bar.

25,037. That being the case, if you have seen wrecks at the entrance, is it not still more desirable, if practicable, to endeavour to improve the entrance ? —Yes.

25,038. Yes ; but it is the narrowness of the entrance where the danger is on these bars ?—They have less steerage, and they must go to the back of the pier or on the rocks, a thing which frequently occurs in going over bars.

25,039. You know Tynemouth ?—Yes.

25,040. You know that the bar lies somewhere inside the Head ?—A very little distance.

25,041. Suppose there were covering piers, I don't mean parallel piers like Sunderland, but curved piers thrown out from Tynemouth Head and from the south side, so as to cover the present bar entirely ?—Yes, the bar would still follow it.

25,042. That is your opinion,—the bar would follow it ?—Yes.

25,043. Then you are a bit of an engineer, I see ?—I have seen it the case in all bar harbours ; when they have entered the pier the bar has followed.

25,044. To what bars do you allude ?—All the Baltic harbours almost, except St. Petersburgh.

25,045. Except Cronstadt, you mean ?—Yes, Cronstadt.

25,046. I don't think you ever went up to St. Petersburgh ?—Yes, I did.

25,047. With what draught of water ?—Eight feet and a half.

25,048. You said there would be difficulty in a number of vessels running into a bar harbour, in getting them out of the way, and they would run on one another ?—Yes.

25,049. I think I have heard there are some 200 steam tugs in the Tyne ?—There are a great number.

25,050. Could not one get hold of a vessel and tow her up the Tyne to a berth ?—Yes ; but that depends upon the tide, whether there was sufficient water to tow her up. There is a dock, I believe, made since I was there.

25,051. But at any time of the tide that they can get over the bars they can surely tow up the Tyne ; there is more water inside the bar than upon it ?—No ; only part of the way.

25,052. Up into good shelter, you might go above Shields ?—Well, there is good way there.

25,053. Is there not room for a good many ships ? —Yes, there might be in a large fleet of colliers, such as 1,500 sail come down from Yarmouth Roads all at once. You must judge a great number of vessels take the bar.

25,054. Did you ever see 1,500 come down at once ?—Yes ; bound for different ports.

25,055. Bound for the northern ports ?—All for the northern ports.

25,056. Should you say that if a harbour of refuge was placed on the coast there must be room made for 1,500 vessels ?—By no means.

25,057. How many do you think it would be necessary to provide for ?—There ought to be sufficient room for 1,000 sail.

25,058. There should ?—I think so. There is more

than that on the coast sometimes, but not often at the same place on the coast at one time.

25,059. If light vessels were running down from Yarmouth Roads, would they go into refuge at Filey?—Not if they could get into northern ports, certainly not if they found they could keep up; if not, they would not attempt to get into Filey.

25,060. With the northern ports in their present state, if they were not improved, what would vessels do in bad weather, blowing heavy from the south-east?—Run down, of course, to their ports.

25,061. Then it would not be necessary to provide for 1,000 vessels in Filey Bay?—No.

25,062. How many would do for all there?—Half that number.

25,063. Five hundred?—Say 500 of all sizes.

25,064. Have you any notion how many acres a vessel requires to swing at her anchor?—Not many acres.

25,065. Perhaps you have never thought on the subject?—No; I have not.

25,066. You are in command of a steamer at present, I think?—I am.

25,067. Is a steamer better to take a bar harbour with than a sailing vessel?—Yes.

25,068. It is more under command?—Oh yes, more under command, and the sea has not the power of throwing her round so quickly as a sailing vessel.

25,069. You say you could not on one occasion get round Flamborough Head in a steamer?—Yes.

25,070. What was her power?—100 horse; a screw boat.

25,071. What tonnage?—260 tons.

25,072. And 100 horse-power?—Yes.

25,073. Trading between what places?—I have been to the Baltic last, Rotterdam usually.

25,074. Where was she coming from when you could not round Flamborough Head?—From the Baltic.

25,075. With a south-west gale?—South and south by east.

25,076. You made the land to the north of Flamborough Head?—Yes.

25,077. And did I hear you say you had made to the Huntley Foot occasionally?—Yes.

25,078. Has that often happened?—Very often.

25,079. Is Huntley Foot about the highest land on the coast of Yorkshire?—Yes.

25,080. And a common landfall?—Yes; I think they could from there or the Head, generally.

25,081. From Huntley Foot to Flamborough Head is the general land fall to vessels bound for the Humber?—Bound to the Humber and even to the south; even to London a great many of them make the land there.

25,082. You are speaking of the fall of the year?—Yes.

25,083. In summer they must make for Orford Ness?—Yes.

25,084. (*Mr. Coode.*) You said you would give the preference to Redcar over Hartlepool, but I do not think you stated why. Will you give your reasons?—I think that Redcar would be more accessible than Hartlepool in bad weather.

25,085. Why do you think it would be more accessible than Hartlepool in bad weather?—If you run down to Redcar you will meet no broken sea; but in Hartlepool you will have broken water for a considerable distance, even at 10, 12, or 14 fathoms.

25,086. Do I understand you that the broken water is farther off Redcar than Hartlepool?—Yes.

25,087. Is that a matter you speak of from your own experience?—Yes; the tide coming out of the river, there meeting the sea, always creates a heavier sea than would otherwise be the case. There is no tide from Redcar.

25,088. When you say out of the river, I presume you mean out of the Tees?—Yes.

25,089. Has it ever happened to you to see a large number of vessels detained off Flamborough Head, attempting to get to the southward?—Yes, I have seen a great many at times.

25,090. What is the largest number?—From 200 to 300 sail.

25,091. Have you seen that more than once?—Oh yes, it is not an uncommon occurrence there at all.

25,092. (*Capt. Washington.*) Now about this wonderful tide out of the Tees which causes the broken water; I should like to know how far off it really does cause broken water?—It causes it from two to three miles probably,—often as far as that.

25,093. I am really asking for information. In what wind is this?—From east-north-east to east-south-east.

25,094. When the tide comes out, in what direction does it set?—It sets off, and then tends to the northward.

25,095. It first sets about east-north-east?—Yes, about that.

25,096. And then goes where?—North.

25,097. Have you had occasion to take the Tees lately?—I never was in it.

25,098. We were told at Redcar the other day, where I suppose they know something about the river Tees, that the course into the river at the best of the weather was south-south-east, that the entrance led out north-north-west?—That is very likely.

25,099. With a strong tide going out north-north-west, and the wind east-north-east, what could there be to make broken water extending a long way off the harbour?—The land which is thrown out from time to time accumulates, and lies in a long flat bar for a considerable distance off; so it keeps increasing, in my opinion, and will do it. There is a great deal of shifting sand about to the north of the Tees, and if you make a breakwater of Hartlepool it will soon fill up.

25,100. And by that offer an impediment to the tide?—I think it would.

25,101. I think you said you had not been into the Tees?—No, I have not.

Mr. William Talbot examined.

25,102. (*Chairman.*) How long have you followed the sea?—Thirty-one years.

25,103. Where do you belong to?—Aberdeen.

25,104. How many years have you been in command of vessels?—Eighteen years.

25,105. How long were you at sea altogether?—Thirty-one years.

25,106. Where have the vessels generally traded that you have commanded?—The first two years that I was master was in the coasting and Baltic trade. I was 11 years in the North American trade, and after being ashore a bit, I have been once in the Australian and five years in the trade between Aberdeen and here.

25,107. In sailing vessels always?—The last three years I have commanded a steamer.

25,108. Then you have been north through the Pentland Firth?—Yes, a good deal.

25,109. How many times during the 11 years you were in the North American trade?—We used to go perhaps three or four times every year.

25,110. If there was a place of shelter made for ships on the coast of Scotland between the Pentland Firth and the Firth of Forth, where would you put it?—There are two spots; Fraserburgh or Aberdeen Bay is the place for it, in my imagination.

25,111. Will you give your reasons for both?—My reason for Fraserburgh is, that it is the place that would be taken most advantage of by sailing vessels on the coast, and that, I suppose, is essentially all that need be said. Aberdeen lies at the bottom of a deep bay, and is a place of considerable trade, bothered with a bad bar harbour, where vessels of

HULL.

Mr. W. Talbot.

27 Oct. 1858.

Chairman.

any size cannot go in. A harbour of refuge there would be a very great advantage.

25,112. From what winds would Fraserburgh be a place of shelter ?—All round from south-east as far as west-north-west.

25,113. What would you say about Wick ; do you think Fraserburgh a better place ?—I have had a little experience of Wick Bay, having discharged timber there, and I have been obliged to get towed out. I have even laid a fortnight upon the coast through the weather.

25,114. Supposing there were two breakwaters put at Wick, so as to make it secure when you are in, what would you say then ?—I should say that Wick requires it very much for local trade and herring fishing.

25,115. But for the passing trade ?—For the passing trade, for the North American and Greenland and such trades, passing vessels would not take advantage of it.

25,116. It was stated in evidence the other day that Wick would be very advantageous for vessels that were homeward bound ; timber vessels which had come through the Firth with heavy deck loads, and had got down to Kinnaird's Head, and then met with heavy weather from the south-east and south, that they would be very glad to have Wick to run into ? —I would not think twice about it, but would make for Cromarty. I should have smooth water, and no danger in running there, while if you make the best harbour of refuge at Wick that you can, there would be great danger in running to it.

25,117. Does not that take you in a long way leeward ?—It would do so.

25,118. With a wind to get to the southward ?—Yes.

25,119. For a vessel bound to the southward you are clearly of opinion that Cromarty answers all purposes ?—Most decidedly.

25,120. You would have great hesitation in thick and blowing weather in running down upon Wick ? —Decidedly.

25,121. Why ?—In thick weather I could not be sure where I was. In running down upon a lee shore, there would be considerable danger from the number of vessels which would be enticed to run for a harbour of refuge, while in running for Cromarty I should be quite safe of getting to the Firth, or of having better weather.

25,122. If not Cromarty, do you think Long Hope would answer all purposes ?—Yes.

25,123. So that between Long Hope and Cromarty you are sufficiently provided for ?—Most decidedly.

25,124. If you were making the passage through the Pentland Firth, from this side, and were running down there with a heavy gale of wind, what would you do about the flood tide, because you would not run into it with a flood tide, would you ?—That would depend upon the state of the weather, and whether it was daylight ; if it was daylight, I would go through against the flood. I would go south of the island, and go inside St. John's Point.

25,125. You are sufficiently well acquainted with it to go south of the island ?—Yes.

25,126. But, generally speaking, men who are not so well acquainted with it as you,—do you think they would do it by knowing the place merely by charts and directions ?—I think not.

25,127. It would only do for a man who does know the place well ?—Who knows the place well.

25,128. Putting yourself in the position of a man running for the Pentland Firth, who had only been through it once or twice, and could not hug the land and get into the eddies like you ; would you, under these circumstances, lose a fair wind by running into a harbour of refuge at Wick, or would you endeavour to run into the Firth at a proper time of tide and make the passage ?—I should stop until the tide slackened, and take the Firth.

25,129. But supposing it was blowing a very heavy gale, how would you manage to stop ?—I should heave to.

25,130. (*Mr. Lindsay.*) Considering what you have said, that you have Cromarty on the one side, and Long Hope on the other, do you think that a harbour of refuge is necessary at Fraserburgh ?—I have been running all the summer to Fraserburgh, and often in height of summer I have found a number of ships detained under Kinnaird's Head. Some eight or nine years ago I was dodging through from North America with the *Hero*, of Dundee, and she went ashore at night. I went to Cromarty three years ago, coming round from Glasgow with the same little boat I have now ; we had been off the night before, the coals were getting short, and we wanted to go in and get coals ; going into the harbour we got 300*l.* or 400*l.* damages in both cases. If the harbour had been there, the accident would not have occurred.

25,131. But looking to the passing trade, and to the saving of life and property, and considering that you have Long Hope and Cromarty, do you still think that, considering the advantage to the passing trade, and the safety of life and property, a harbour is really wanted for the trade at Fraserburgh ?—I think it would be a very great advantage. For instance, vessels from the Baltic with the wind at south-west and south, that could not get to Peterhead, they would run up to Fraserburgh. They would decidedly go there on dark nights, when they are liable to get accident, to which the coasting trade is especially liable. Vessels are continually detained at Fraserburgh that can get neither up nor down ; and I think a harbour there would be of very great advantage.

25,132. Do you think a harbour at Fraserburgh would be of more advantage than one at Peterhead ? —I decidedly think so.

25,133. Why ?—They could mostly always get smooth water to get into, which is a great advantage.

25,134. Any other reason ?—The danger is past when they get round Buchan Ness. A vessel can get off two points, and rather than run any risk they would run up the firth and beach.

25,135. If it rested between Peterhead and Wick, which would you prefer ?—I should decidedly say, I don't see any advantage of a great harbour of refuge at Wick at all; but the local harbours are much in need of improvement.

25,136. Then if it rested between the two, I understand you would prefer Peterhead ?—I don't see any advantage of putting a harbour down at Peterhead at all.

25,137. Then you don't think a great harbour of refuge would be of any advantage at Peterhead or Wick ?—No ; I think if you are to have one on that coast, it should be put at Aberdeen in preference to Peterhead, decidedly.

25,138. For the north-east coast of England, if only one harbour was to be made between Flamborough Head and the Farn Islands, where would you place it ; what spot do you think best for it ?— I don't care about giving much of an opinion on that question. My experience is, however, that you require harbours. Filey is a site of very great advantage for a harbour, but it is not the site that I should say would be the best for this coast.

25,139. What site should you say should be the harbour for this coast ?—I think about Redcar would be of great advantage, if the ground was such that a harbour could be made.

25,140. Tell me why you think the position at Redcar would be better than Filey, all things considered ; bearing in mind both laden ships and light ships ?—Redcar is a dangerous part; it is of the greatest danger from the Head up to the Tyne. If it could be made, however, that would take away the danger. I have seen vessels go ashore there with the wind east-north-east and north-east. I have been in company with vessels that have gone away with the wind at east-north-east upon the coast, and have known

vessels go ashore, which they would not have gone ashore had there been a harbour on the spot.

25,141. Have you any other reasons ?—No ; that is all.

25,142. Is your sole reason for preferring Redcar as a position for a harbour of refuge on the east coast because there are dangers there called Redcar Rocks ?—I mean to say that the harbour proposed within the rocks would be far too small for this coast, but there is a clear beach to the southward of that that I allude to. I should say to the north of Whitby would be a very good place.

25,143. Then you give it as another reason, on account of the clear beach for a harbour there ?—Yes ; from the appearance of the beach in passing I should imagine the ground was pretty good.

25,144. Supposing that for the same expense they could construct a harbour at Filey, which would have the same area that could be obtained at Redcar, do you think that a harbour at Redcar would do more to save life and property than a harbour at Filey ?—Most distinctly I say so from experience.

25,145. You are most distinctly of that opinion ?—Decidedly.

25,146. Whether do you think a harbour at Redcar, which seems to be the spot you think would do the most to save life and property,—whether do you think a harbour at Redcar, or the deepening of the Tees, the Wear, and the Tyne, so as to admit vessels at all times of the tide, would do most to save life and property ?—It would be a great advantage to deepen these rivers, and would save a vast number of vessels, but at the same time I consider that a harbour of refuge is very much wanted on this coast.

25,147. Then your first consideration would be one great harbour at Redcar, and your next consideration the deepening of the rivers I have named ?—No ; I think a harbour at Filey is very much wanted.

25,148. Then your opinion is, first, you would prefer a harbour at Redcar ?—Yes.

25,149. Secondly, a harbour at Filey ?—Yes.

25,150. And, thirdly, the improvement of the other harbours ?—Yes.

25,151. (*Capt. Sulivan.*) I think you said that one reason for a harbour of refuge at Fraserburgh was that the Baltic ships came over with south and south-west winds and got under Kinnaird's Head, and that it would be very valuable to them ?—Yes.

25,152. Is the great want of a harbour of refuge the danger to vessels on a lee shore when they can't get off and must go on shore, if there is no harbour to take them to ; is that the great want of a harbour of refuge ?—That is one great want, along with the danger to which vessels are exposed in sailing to ports along the coast.

25,153. The vessels you describe off Fraserburgh would only be in danger from a wind on shore ?—South-west, right off.

25,154. Would you think a large outlay of Government money reasonable to afford a convenience to vessels in off-shore winds, when they could not by any possible means want it for purposes of refuge to save life and property ?—I see so much wreck upon that part of the coast, that if the Government expends sums of money to save wreck it would be a great advantage.

25,155. Do you know how the wrecks take place there ?—They are often from the wind sweeping into north-east and catching vessels. Since you were down here, three vessels were wrecked the other day at Fraserburgh.

25,156. Can you fancy any wind off Kinnaird's Head that a ship could not go safe on one tack or another, and have the open sea to leeward of her ?—The wind from the north-east comes in very heavy upon the coast.

25,157. With the wind from the north-east could a vessel help fetching Cromarty ?—I knew a vessel bound for Quebec last year that was here, with the wind at north-east ; she got to Cromarty, but they dragged up all the way and thought they would be on shore ; they were in very great danger indeed.

25,158. You said you would run for Long Hope ; would you venture, from your knowledge of the Firth, to run across the race of Pentland Firth for Long Hope with a south-east gale and the tide running to the east ?—Well, the south-east wind would require to be very strong ; I should prefer a still tide.

25,159. Would it be safe for the ordinary run of coasting vessels to attempt to cross the Pentland Firth with a tide running east to get to Long Hope ?—It would not, with small coasters.

25,160. One of the last witnesses has stated that with a good breeze he could always run through the Pentland Firth against a flood tide. Do you believe that the ordinary run of coasting vessels, even under press of canvas, could depend on running against the stream of the Pentland tide and getting through ?—No ; it would take a very smart vessel to make against that tide,—very smart indeed. Going to North America with a good smart vessel I have tried it, but we never could do it.

25,161. Was the vessel in good sailing trim ?—Yes, a vessel of between 400 and 500 tons ; a timber ship.

25,162. How laden, then ?—Ballast.

25,163. In ballast ?—Yes.

25,164. If you, with a good sailing timber ship in ballast trim, could not run over the tide, do you believe a laden vessel, from the Baltic to the west coast could possibly attempt it ?—Oh no, I don't think that, unless they are well acquainted with the navigation, and get into the eddies and cheat the tide.

25,165. (*Capt. Vetch.*) Supposing a number of trading vessels from the several coal ports were proceeding south, and the foremost had reached near Flamborough Head, and were there caught by a south-east gale and obliged to put back, how many of these do you think (supposing that there were 200) would get into Filey safely, if there was a harbour made there ?—I think it would be of little use making a harbour that would not hold 200 vessels.

25,166. Would all these vessels be in a position to take this bay coming from the northern ports towards the Head ? With a south-east gale coming on there, and being unable to weather the Head, they must put back, some to one port and some to another ; how many of these on an average do you think would be able to take Filey ?—Well, I should say not above 30.

25,167. Do you think the rest would be able to get refuge if there was a harbour at Redcar ?—The other portion would be likely to get there.

25,168. Supposing there was a shelter provided at Sands End Ness, would many get in there ?—Perhaps 100 sail.

25,169. What is the greatest number of vessels you have ever observed off Flamborough Head, unable to proceed south ?—Do you mean dodging ?

25,170. Yes. Suppose they are caught and cannot get to the south, how many have you ever observed at one time ?—About 150.

25,171. Does that frequently happen in the year ?—Generally in the spring of the year.

25,172. How often do you think, one year with another, it takes place ?—Well, very often indeed.

25,173. How often in a year ?—Vessels go to sea and keep dodging off. They will not all take shelter that might, if there were a harbour.

25,174. I mean in such a gale as would make them all desirous of getting into shelter as soon as they could manage it ?—At south-east, if the wind easters, vessels are far better to have an offing ; but some masters prefer going to the cliff and waiting. It is a matter of opinion.

Mr. JAMES PORTER examined.

25,175. (*Chairman.*) Do you reside at Hull ?—Yes.

25,176. You are a pilot ?—Yes ; a coasting pilot.

25,177. For what district of the coast ? How far ?—From Leith to the Downs.

Mr. J. Porter.

HULL.

Mr. J. Porter.

27 Oct. 1858.

Chairman.

25,178. A Trinity House pilot ?—No ; I am not a licensed pilot,—a coasting pilot.

25,179. How long have you followed that occupation ?—About seven years.

25,180. Previously how were you employed ?—Master, mate, and man 34 years.

25,181. For how many years master ?—About 11 years.

25,182. In what trade were the vessels employed ?—In the coal trade from Yarmouth, Sunderland, Shields, Hartlepool, and different ports.

25,183. You have been present during the whole of this inquiry ?—Yes.

25,184. Will you now give us your opinion as to where a harbour of refuge should be placed, and the reasons for your opinion ?—I should prefer Filey.

25,185. Now the reasons ?—The reason is that a ship coming from the north and bound south, will get up round the Head ; sometimes they will not get so far ; sometimes they will fall in with a gale of wind abreast of the Head ; and of course, if there was a harbour there, a great many of them would go in before they would run into Shields or Hartlepool, for when they got there it might not be tide time, and they might not be able to get in.

25,186. You have heard the account which has been given that vessels in blowing weather cannot work round Flamborough Head even with a flood tide. Does that accord with your experience ?—That depends upon what sort of a vessel it is. Colliers cannot get round ; but a smart ship can.

25,187. Can any others of the coasting trade ?—Very few.

25,188. Does the flood run nine hours ?—No.

25,189. How many ?—Not more than 6 or 6½.

25,190. Flood and ebb run very nearly the same ?—Yes.

25,191. Is there any advantage in point of strength with either tide to work round the Head ?—You might in a flood tide ; you could not with an ebb.

25,192. But what I mean is, does a ship working round from the north have more advantage from flood tide than a ship working from the south would have from the ebb ?—Very little ; it is much the same. The little advantage you have is working in under the land.

25,193. You have heard what has been said as to vessels making the passage with off-shore winds. Does that coincide with your experience ?—Yes ; because when you are close to the land the sea is smoother, and you get along quicker.

25,194. For slants of wind, do you count on getting them ?—Yes.

25,195. And more advantage by the tide ?—Yes.

25,196. Is there anything like tide and half tide on this coast, as in the Channel ?—You may get an hour or two's advantage by working into the offing.

25,197. Therefore a man who knows that takes advantage of it ?—Yes.

25,198. In sudden shifts of wind, how is it in your experience, in light winds, off-shore winds, in winter time does the wind come from the eastward and blow hard suddenly ?—It often changes in winter and blows very hard, but in winter you don't keep so close to the land.

25,199. When sudden shifts take place, do they come without warning, or if a man knows the weather pretty well can he generally get off shore in time ?—He will if he is pretty well acquainted with the weather.

25,200. Are these gales ever preceded by calms, so that a man could not get off shore, even though he knew the weather ?—Yes.

25,201. And is that common ?—I should say very common. Sometimes you are close in with calms. Very often I have been caught with calms.

25,202. Have you ever been caught with a gale coming on suddenly, preceded by a calm, which prevented you getting an offing in time ?—No.

25,203. (*Sir F. Smith.*) Supposing the Legislature felt an earnest desire to incur any amount of expense for the saving of life on this coast, how would you recommend that the money at the disposal of the Government should be employed ; what number of harbours would you recommend, and what points would you select ?—I should select Filey.

25,204. That would stand number one ?—Yes.

25,205. If there was to be another one ?—I should prefer Redcar.

25,206. Then how would you dispose of the rest of the money ?—I cannot tell you that.

25,207. You think that is enough, do you ?—I should say so.

25,208. You think there would be very little loss of life if a harbour of refuge were made at Filey, and another at Redcar ?—I think there would not be anything like so many lives lost. At present laden ships have to run back, and light vessels get down to Huntley Foot; but if there was a harbour at Filey they would go there rather than ride in Bridlington Bay.

25,209. You are of opinion that the establishment of two harbours of refuge would tend to diminish the number that now run to the Tyne, and therefore diminish the loss of life ?—Yes.

25,210. (*Mr. Lindsay.*) Would deepening the existing harbours or making a harbour at Redcar, in your opinion, do the most good ?—They never can deepen the harbours enough for a heavy ship to go in.

25,211. Say that the harbours could be deepened for loaded ships to run for them at all times of the tide, do you think that that, or a harbour of refuge, presuming one to be made at Filey, would do most to save life and property ?—I should say a harbour at Redcar before that.

25,212. Would Shields be before that, in your opinion ?—Yes, I have run into Shields, and have seen 17 vessels run on shore at the same time we were going in.

25,213. Was that because there was no water on the bar ?—No ; the sea was so heavy that the ships took the bar before there was water.

25,214. If there had been plenty of water on the bar, would these ships, in your opinion, have been driven on shore ?—Yes, about the same, the sea was so heavy.

25,215. Were they all driven on shore on account of the sea ?—Yes ; the sea hove all of them round. When they got into the trough of the sea they could not steer there.

25,216. Were none of them driven on shore because they touched the bar in going over ?—No; they were all light ships.

25,217. All on account of the heavy sea ?—Yes.

25,218. Have you been at anchor in Filey Bay ?—A good many times.

25,219. It was said to us yesterday that there is a very heavy outset round the Brigg, is that the case ?—Yes.

25,220. Would you, as a pilot, consider that you would be running a risk in taking the place in a heavy easterly gale with the outset ?—Oh, that will not prevent any ship from taking it. The outset will not hurt anything ; it would not be more than a knot and a half.

25,221. Therefore you don't see any objection to the construction of a harbour at Filey on account of the outset ?—No, it would be no hindrance at all.

25,222. No hindrance at all, in your opinion ?—Yes.

25,223. What kind of holding ground have you down at Filey Bay ?—It is very good holding ground. It is a kind of clay.

25,224. From your experience and knowledge of the bay, do you think it has been silting up, or has it been deepening, or has there been any change ?—I don't think there has been any change, not in my experience, and I have been in it backwards and forwards almost 30 years.

25,225. How many ships have you seen at anchor at one time under Speeton Cliffs ?—I may have seen 50 or 60. I have seen 200 or 300 knocking about the Head and at anchor.

25,226. Which could not get round with a southerly wind ?—That could not get round.

25,227. Have you ever seen vessels slip and run from their anchorage under Speeton Cliffs ?—Yes, several times. I have done it myself.

25,228. Under what circumstances ?—A gale of wind going to the southward and eastward. I have gone up the Leith roads to Flamborough Head.

25,229. Which way does the wind usually veer in these gales—does it usually go from about east-north-east to east-south-east, or from east-south-east to east-north-east ?—It will generally veer to east-north-east ; when the wind is south-south-east it generally veers round to north-east.

25,230. From south-east and east-south-east to north-east ?—Yes ; when it veers it will blow against the sun very heavily.

25,231. Does it veer when it is at east-south-east or east-north-east ?—I think east-north-east are the heaviest gales we have.

25,232. Does it generally end there, or does it draw round to the northward ?—Sometimes it will.

25,233. But is that generally the case ?—When it does go round, it does draw to the northward.

25,234. It goes to the northward and then lulls ?—Yes. I left Sunderland last Saturday night with a ship drawing 21 feet water.

25,235. Where was she bound ?—To Aberdeen.

25,236. What winds are the heaviest on this coast ?—North-east winds.

25,237. (*Capt. Sulivan.*) Have you piloted vessels of the Tees and Hartlepool along this coast ?—Yes.

25,238. If there was a harbour at Filey, and a vessel had got hold of the Head, even in thick weather, would she have any difficulty in feeling her way along the Cliffs with her lead into the harbour ?—No, not any at all, because you may go very close to the land.

25,239. Then even in thick weather, if she got hold of the Head, she could almost always keep close enough to the land to keep sight of it, and so lead her into the bay ?—Yes.

25,240. If there was a harbour at Redcar, would the land be a guide down along the Yorkshire coast to the entrance to the harbour ?—Yes ; because when you were running with the wind you would haul in close on Huntley Foot.

25,241. With a southerly wind you want no harbour of refuge ?—Oh yes.

25,242. Is not that a wind off the coast ?—Only a point or half a point.

25,243. Supposing a vessel embayed to the westward of Whitby, if caught so bearing up to a harbour of refuge in the Tees bight, could she by the lead, with the weather thick, go along the shore to the harbour at Redcar ?—Yes.

25,244. Would you have any hesitation in running for it, as a pilot ?—Not at all ; you are forced to run for these harbours in very thick weather at times, blowing heavy too.

25,245. You spoke of this outset in Filey Bay ; if there was an opening left near the buoy, near Filey Brigg in the breakwater, so as to have a passage that way as well as to the south for convenience of vessels, should you fear the outset making too strong a tide in the opening for vessels to weather it ?—I think it would be, the other part of the harbour being open.

25,246. The tide would come in to the southward ?—Come in to the windward.

25,247. To the southward along the coast, you mean ?—Yes.

25,248. And sets out through the channel ?—It would come out through there.

25,249. At present it runs strong over Filey Brigg, does it not ?—Yes, until the water gets clear of the rocks.

25,250. If there was a detached breakwater without on the Brigg, so as to leave free vent for the tide over the Brigg, and still a passage near the buoy to the northern end of the Brigg, in case of a vessel wanting to go out that way, do you think that the effect would be to strengthen the current and prevent vessels from running out by the buoy ?—Oh no, not at all.

25,251. Or with an easterly gale, if they got a little way north, would there be too heavy a sea for them to run in by the buoy ?—Oh no.

Mr. James Oldham examined.

25,252. (*Chairman.*) In what way are you connected with the port of Hull ?—I have resided in Hull nearly all my life. I am acting as a civil engineer in Hull.

25,253. Have you any statement which you wish to make with reference to the proposed breakwater and harbour in Filey Bay ?—Yes.

25,254. Will you proceed ?—Before I make a statement as to any calculations I may have gone into, I wish to state that when the question of harbours of refuge began very much to excite the public mind a few months ago, I turned my thoughts to what might be done upon our coast—upon the coast of Yorkshire in this neighbourhood—and finding that a plan had been proposed by Mr. Coode, one of the Commissioners, I gave to that plan considerable attention. Knowing Filey well, I went more particularly into it, and examined the nature of the plan and the various circumstances that would be necessary to carry out such works. I ought to state here that Mr. Coode is a perfect stranger to me. I don't know him personally. I know him only by name and reputation, and therefore I had no predilection for that gentleman's plan, beyond knowing what it referred to, and considering its merits in a public point of view. I never saw Mr. Coode before, when you yourself introduced me to him this morning, and therefore you will acquit me of any predilection for any pet scheme of any one's whatever. Having said thus much, I would now state that I have gone into some calculations as to the probable cost of carrying out such works as Mr. Coode has proposed for a breakwater in Filey Bay. I find that in consequence of the geological formation of the neighbourhood and the rock immediately adjoining Filey beach, that you have, perhaps, greater facility for carrying out such works there than any other place that I am acquainted with. A portion of the works, as you are aware, may be said to be nearly constructed—I think, to the extent of about one-fifth of the proposed breakwater, commencing at high water at the end of the projecting cliff. I have made a calculation as to the probable cost that you may be at, and I will state the result of those calculations. I saw two sections in reference to this work. I found these sections were first produced by Mr. Coode for a harbour at Wick. One of these sections, as you are aware, shows retaining walls, one on the sea much heavier and higher than the one within the proposed harbour inside of the pier. I have made a calculation as to the amount of stone that would be required for the foundation part of it, and that would be required to form the retaining walls, and the result of my calculation is, that, taking the total length of the breakwater to be 3,200 yards, it would cost at the rate of 253*l.* 18*s.* per yard lineal : that would produce a sum of 809,840*l.* ; but, taking into consideration that a large portion of the breakwater is already there as a nucleus to work upon, I make a deduction from the amount I have stated of 30,000*l.*, being, I think, a fair deduction to make; that would show the total cost of the work, according to my estimate, 779,840*l.* I have seen, in Mr. Coode's evidence, that the amount he calculated the whole cost at was 860,000*l.* ; that would, therefore, leave a sum for contingencies of 80,160*l.* I should say that the material, lias and coraline formation, which exists at that point, would be very easily obtained, and works might be constructed for carrying out the breakwater with the greatest facility imaginable. I can see no engineering difficulties in the way whatever. I shall be happy to

HULL.

Mr. J. Oldham.

27 Oct. 1858.

answer any questions in detail. I have understood that the section I have alluded to was proposed by Mr. Coode and approved by Captain Vetch, although that gentleman is not committed to work it himself. I understand Mr. Coode is in favour of the section having retaining walls, and it is on that I have more particularly grounded my calculation.

25,255. (*Sir F. Smith.*) You have given us a very clear statement and very full details. Looking at the circumstances, have you any doubt that the section to which you have referred is the best calculated to effect the object in view ?—I have no doubt it would effect the object most efficiently.

25,256. You think the same amount of protection could not be obtained by a different section without further expense ?—I certainly believe that it would cost more money to carry out any other plan which would be as efficient.

25,257. Are you of opinion that the material proposed to be used is sufficiently durable to suffice for the purpose, without sending for granite or any other hard stone ?—Judging from past experience, having known Filey for very many years, I have no doubt upon that point. I can refer you to stones that were quarried many years ago, perhaps well on to 30, with the intention of being conveyed to Bridlington, for a pier there, I think. Many of these stones are lying now upon a sort of spoil bank, with the marks of the tools upon them. They are there as entire as the day they were placed upon the bank. Many of them are of enormous size. I remember one many years ago, and it impressed itself so firmly upon my mind that I can remember exactly the weight. I found it to be 54 tons. You may obtain them of any size. I believe they will be exceedingly durable, and fit for all purposes that you can require stones for.

25,258. Have you seen these stones lately ?—I was down last week, expecting the Commissioners would sit in Filey last Wednesday. I went for the purpose of witnessing the proceedings there, but you did not meet ; and I took the opportunity of going on to the reef, where I saw some of these large stones. I did not make a minute examination ; they were so thoroughly grown over with sea-weed, that without some trouble they could not be examined.

25,259. They are in a very perfect state ?—Yes.

25,260. If you were informed that Mr. Coode, in drawing his estimates, had contemplated the probability of bringing granite from Cornwall, you would think that altogether unnecessary ?—I think it would be.

25,261. In fact, you have a very high opinion of the qualities of the stone on the spot ?—Yes ; my opinion is, that it is all you can require, judging from the state of the stones I have examined, lying there as they have been all these years.

25,262. Did you ever meet with any position in which the facilities for the formation of a breakwater were greater than they are at Filey ?—I don't think any can be greater ; few places will equal it. I know of no place better fitted for carrying out such works.

25,263. You imagine that the mass of material required is to be obtained without difficulty ?—Certainly there would be no difficulty. The stone would be comparatively easily quarried, and could be by slight machinery placed upon trucks, and run down by railways with the greatest ease possible.

25,264. In your estimate you have allowed for removing the superincumbent mass of deposit ?—Yes.

25,265. In point of fact, you think there will be no engineering difficulty ?—None whatever ; no possibility of retardation, except by gales of wind from the north-east. There will be certain interruptions occasionally, but nothing more than would be ordinary in the winter season.

25,266. (*Capt. Vetch.*) I merely wish to ask, with respect to the necessity of bringing granite or any other hard material from a distance, do you not conceive the stones now on the soil and ready at hand are quite sufficient for all the face works ?—That is my opinion. I should not have spoken with so much confidence, had it not been for the fact of my having known the place for so many years, and noticing these very stones that have been exposed to every kind of weather for all these years retaining their surface impression and form. I have consequently perfect confidence in the durability of the stone.

25,267. You are aware that there are beds of limestone in the vicinity ?—Yes.

25,268. Which would make building lime ?—Yes.

25,269. Also cement stone at no great distance ?—Yes, I am aware of the qualities of the stone.

25,270. Therefore there is every facility for such a work ?—Quite so.

25,271. (*Capt. Sulivan.*) Do you feel confident that contractors would take that work for the sum you have named ?—I dare say they would. I can say that I have already spoken to a contractor on the subject. I gave him a statement of the amount of work, and asked him generally whether he would undertake such a piece of work at such a price. "Oh," he said, "I would be delighted to have it. "I would undertake it to any extent."

25,272. (*Mr. Lindsay.*) I don't understand you exactly. What description of pier would it be,—altogether rubble stone ?—No ; the lower part—the foundation—would be of rough stone, forming a bank, on which would be constructed the upper part with retaining walls, one on each side. You have a section before you.

25,273. The section to which you refer is that in the Parliamentary Paper, No. 262, of the session of 1857, plate No. 3 ?—Yes.

25,274. (*Sir F. Smith.*) You are quite prepared to admit the expediency of adopting that section ?—I am.

25,275. In its entirety ?—Yes.

25,276. You think it would be necessary to have as much material above high-water mark as is shown there ?—Yes, I do.

25,277. You think without that you would not keep the bay in a still state ?—I think it would be a great assistance to ships approaching the harbour to have a good wall, a dark line to be visible, instead of having a low embankment of breakwater with the sea rolling over. You would have a much worse chance of seeing your approach than where you have a good dark line of wall.

25,278. You have known Filey Bay for a great many years ?—I have.

25,279. Have you any reason to apprehend that there would be any silt formed within the line of the breakwater of so serious a nature as to render the harbour less valuable ?—I think not ; and my reason for being of that opinion is, on account of the great extent of clean rock to the northward of it. Where we find a drift of sand or silt coming up, you will always have it in other parts of that neighbourhood.

25,280. We were told yesterday that there is a great set of the beach from Flamborough Head round along the shore, and that that beach was stopped from coming into the bay by the current coming over the Brigg. Do you imagine there is anything serious in that ?—I think nothing.

25,281. You think that the harbour, if formed, will remain free from silt or anything to interfere with it ?—I think so. I think whatever may come from points farther north is set off in consequence of the great extent of Flamborough Head. I think it is kept off in consequence ; in fact, since I have known Filey, I have perceived no alteration in the beach, no silting or excess of deposit taking place.

25,282. You think that the stopping the passage over the Brigg would not admit the shingle coming from Flamborough Head, into the anchorage ?—I certainly think not, because if it had had such a tendency you would have perceived it now to some extent, and under certain circumstances of wind or

weather; but I have never seen any accumulation there. I have seen a little sand upon the immediate beach, but nothing more.

25,283. (*Capt. Vetch.*) You prefer a breakwater with an upright wall which would rise from 12 feet below low-water mark?—Yes.

25,284. Beyond that you would prefer throwing down rubble and building upon it?—Yes.

25,285. So far as 12 feet below low-water mark you have a good foundation, have you not, for the works?—Yes.

25,286. (*Capt. Washington.*) I think you mistake the question about the drift spoken of. Yesterday it was stated in evidence at Filey that the material had been washed down from the Speeton and Bampton Cliffs, and that there was a collection of about 20,000 tons, if I understood right, of flints, and other débris of the cliffs, which had formed a large deposit upon the beach?—Yes, immediately at that point; but you don't find the same going on when you come to the lias formation, that we have at Filey Brigg and to the northward of it. At Speeton, Reighton, and other parts, it is soft chalk, which is constantly washing down, but you never find it coming northward. It always has a tendency to go south, if it can get.

25,287. In a south-east gale, why should it not be drifted to the northward?—Some portion may tend a little that way, but it is drifted back; it certainly does not accumulate in Filey Bay. I have never known it appear there. I have no doubt it does accumulate to a great extend under the rocks under the shelter of Flamborough Head, and near the Head, but I cannot imagine it forming in any quantity further northward.

25,288. If I understood the witness yesterday correctly, he said he it was stopped where it is by the sea coming from Filey Brigg—the sea from the north-east—and that if the sea was stopped passing over the Brigg, then a south-easterly direction would prevail, and would carry that collection up into the head of the bay. Are you of that opinion?—No, certainly not; because, admitting that there is a very heavy sea and fall of tide at present running over Filey Brigg, I think it is spent long before it could reach that point. I cannot think it is the fall of the water over Filey Brigg that can keep back the deposit.

25,289. Do you know that deposit?—Oh yes; I have seen it.

25,290. What is the nature of it?—Clay and flints, and chalk stone. It is a chalk formation, and very apt to fall down in frosty weather; in fact it goes very rapidly in frosty weather.

25,291. About what is the size of the stones on the beach?—Many of them are large masses thrown down as the cliff became undermined, but many are broken down to very small pieces, such as you would repair roads with. But the cliff is broken down chiefly in consequence of the frost in winter.

25,292. Does some of the deposit lie below high-water mark?—Some of it, I daresay, does.

25,293. What is to prevent that being drifted in a south-east gale to the northward along the beach?—I don't think you would get a force of current close in that would affect it.

25,294. I think it is not a question of current, for no tide that we know of would move such stones?—It is a question of the strike of the sea.

25,295. Would not the strike of the sea drive it to the northward?—I have never known it drive it northward.

25,296. It was stated to us that there is that collection, that it is kept in check at that point by the sea from the north-east, and that if the sea were prevented coming from the north-east, the strike of the sea from the southward would prevail, and drive it into the head of the bay?—I cannot see it in that light. I don't believe it would go northward.

25,297. (*Capt. Sulivan.*) You know the chalk end at Speeton Cliff?—I do.

25,298. Have you ever known an accumulation of flints and débris from these cliffs driven three quarters of a mile, I think we were told, northward, and on to the Filey sands, and there accumulating?—No.

25,299. I understood the witness who gave that evidence to say that it was the same south-east sea that swept round the shore swept round to the westward in front of Filey, inside of the Brigg, and then recoiled, and met the sea coming along from Flamborough Head, which caused the deposit to rest where it had accumulated. Do you understand that?—I quite understand it, but I think it is a very complicated idea.

25,300. The end of Speeton Cliff is something like two or three miles south of Filey, I think?—Yes.

25,301. And you have the action of the sea in a direct line from Flamborough Head?—Yes.

25,302. If there was such an action in the inside of Filey Brigg, meeting that direct action, could it by any possible means go back so far to the southward as to cause a deposit only three quarters of a mile from Speeton Cliff?—I don't believe it at all.

25,303. If there was any tendency of south-east and east winds to shift the shingle from the chalk along the Filey beach, must it not have taken it much farther than the point I allude to, before it could have met any influence from the sea at Filey Brigg?—Certainly it must. I don't believe any evidence given on that point.

25,304. Do you know, of your own knowledge, whether the flints and débris from the chalk have travelled northward of the end of the cliff?—I have not known it or seen it.

25,305. (*Mr. Coode.*) You have referred to two sections in the parliamentary blue book, one being on plate No. 3 of the Report of 1857, and the other on the sheet of Wick, in the same Report. Will you tell us on what section you have based your calculations?—Upon that in plate No. 3.

Mr. JOHN BELL examined.

25,306. (*Chairman.*) Are you the Mayor of Great Grimsby?—I am.

Mr. J Bell.

25,307. You wish to make some statement of your own relative to Grimsby, and the advantages which you conceive will arise from making a harbour of refuge in that locality?—I wish to do so.

25,308. Will you now make any statement you please?—In the first place I have to apologize to the Commissioners for the hasty manner in which the statement I have to submit has been drawn up. It was only this morning I got an intimation that a meeting of the Commissioners was to be held in Hull to-day, and of course I have had very little time for the arrangement of the facts that have been put together. I think these facts will show very pointedly and very satisfactorily the advantages which the port of Great Grimsby—connected as it is with the river Humber, of which indeed, it may almost be looked upon as a part—would offer as a harbour of refuge, and the capabilities which it possesses for fulfilling all the requirements of such a harbour. The report which I hold in my hand embodies the principal facts which will be brought before you, and which we are prepared to substantiate by the evidence of certain persons, nautical men, who are well conversant with the locality and the particular requirements of the coast. They are here to bear out the statements which are embodied in this report. Not being myself connected with the sea in any way, occupying a very different grade in society, I don't pretend to enter minutely into these matters myself; but I have hastily drawn together some few observations, which, with the permission of the Commissioners, I shall

HULL.

Mr. J. Bell.

27 Oct. 1858.

suggest that the town clerk who accompanies me, should be allowed to read.

(*Chairman.*) Before we go further, there is one part of the remarks which you have made, Mr. Bell, to which I should be inclined to take a little exception, and that is as respects the notice, because I find we have been in communication with you upon the subject since the 22d of October.

(*Mr. Bell.*) Although the letter was dated the 25th I only received it this morning.

(*Chairman.*) I had a letter from you, dated Great Grimsby, the 16th of October, to this effect :—"I am "desired by the Town Council of this borough to "draw your attention to the advantages possessed by "the harbour and port of Great Grimsby in reference "to the formation of a harbour of refuge, situated as it "is at the mouth of the Humber and the German "Ocean, and accessible at all times. The Town Council "beg respectfully to solicit you to appoint a meeting to "be held at Great Grimsby for the purpose of hearing "evidence on the subject, which I have no doubt you "will find to be of great importance in reference to "all the subject." That is signed by yourself. In reply to that letter I find our secretary wrote from Whitby on the 22d of October, saying, "I have to "acknowledge the receipt of your letter of the 16th "instant, addressed to the Commission, and in reply "thereto I am instructed to acquaint you that Grimsby "is not within the limits assigned to this inquiry, and "therefore the Commissioners cannot hold a meeting "there, but they will be happy to receive a deputation "from Grimsby to attend at Hull for the purpose of "expressing their sentiments, as they have already "been informed." Were there any previous letters in which notice was given from the Bristol Channel ?

(*Secretary.*) Yes.

(*Chairman.*) We wrote to you before from the Bristol Channel, stating that we were likely to come to Hull.

(*Mr. Bell.*) There might have been letters to the directors of the Dock Company, but that is different from the Corporation.

(*Chairman.*) I am afraid the letter has miscarried. I thought we were particular.

(*Mr. Ross*, the secretary of the Manchester, Sheffield, and Lincolnshire Railway Company.) A letter was written from Bristol to the railway company. It promised that three days' notice should be given of the meeting at Hull. We have not received such notice at all. We only heard by telegraph this morning from the Mayor of Grimsby that the Commissioners were to sit at Hull.

(*Chairman to Mr. Bell.*) It was with reference more particularly to your remark that the notice was not served, and therefore that you were not prepared, that I made these observations. Although it has not been in my power to give all the notice I could have wished to you, yet the matter has been in agitation, and you had ample time to consider it. From Bristol we wrote to the chief civil authorities of all the towns which we considered within our limits, and therefore the reason the Mayor of Grimsby was not written to was that we clearly considered Grimsby without the limits of our inquiry. What was running in my head was that very letter of which you spoke. I felt sure that some communication had passed between Grimsby and the Commissioners from Bristol. We shall now be happy to hear your statement read.

Mr. GEORGE BABB examined.

Mr. G. Babb.

25,309. (*Chairman.*) In what way are you connected with Grimsby ?—I am town clerk.

25,310. Will you now proceed to read the statement ?—We intend to produce evidence to substantiate it. The statement is as follows :—

"In the report of the Commissioners appointed to inquire into Tidal Harbours, made in the year 1846, the following paragraph in reference to Grimsby occurs :—'Grimsby, from its position near the entrance to the Humber, will, when the proposed extensive works are carried out and the proposed railway is completed, offer great facilities to the trade with the Baltic and the north of Europe. It will be a ready coaling place for the steamers, and will become the principal resort of the fishing vessels employed on the Dogger Bank, as well as on the more distant grounds of the north-east fisheries. This part of the Humber and the neighbouring anchorage of the Hawk roads offer the only harbour of refuge in easterly gales from Harwich to the Firth of Forth, and during these winds 300 ships have taken shelter there at one time. Every interference, therefore, with the set of the tides, or any removal of shingle which would injure Spurn Point at the entrance of the river Humber, should be most jealously watched and guarded against.' Since the date of the above report the commerce of this country had largely increased, and consequently a much larger number of vessels are now engaged in the mercantile service. It would, therefore, now be no exaggeration to say that during severe gales as many as 800 vessels find shelter and safe anchorage between Spurn Point and Grimsby. The projected works alluded to in the above report have since been successfully carried out, and at an expenditure of nearly 1,000,000*l.* the port of Grimsby possesses every advantage which can be desired. The new dock is entered from the Humber by a tidal basin of 15 acres in extent. It is capable of containing 50 vessels, while the dock will accommodate 500 more. The dock is entered by two locks, furnished with double sets of gates, opening with the greatest ease by means of hydraulic machinery. The large lock, which was constructed at the request of the Government, so as to be capable of admitting the largest class of war steamers, is 300 feet in length and 70 feet in width. The smaller lock is 200 feet long and 45 feet wide. The depth of water at high water of spring tides is 26½ feet. The docks are provided with spacious ways, traversed by means of a railway, enabling rapid communication with all parts of the kingdom. The ample shed and warehouse accommodation is provided with cranes worked by hydraulic machinery, ensuring the most rapid loading and unloading of vessels. Excellent coal drops, for enabling steamers to be coaled in the shortest possible time, have also been constructed at considerable expense, and the best class of steam coal in the kingdom is brought by railway direct to the drops from the South Yorkshire collieries, &c., and delivered free on board at a moderate price. A large graving dock, which can be entered at any time by vessels of any size, has been built, with workshops and every requisite for the economical and rapid repair of vessels. It would be easy to point out many other advantages which Grimsby possesses, were it necessary, but it cannot be believed that the fact of its great natural and artificial advantages will be denied. The operation of the river Humber between Spurn Point and Grimsby forms at present the best natural harbour of refuge on the east coast between the Thames and the Firth of Forth, having an excellent anchorage in blue clay, and being effectually protected from the storms of the German Ocean by the promontory of Spurn ; but little has hitherto been done to improve the natural advantages which it possesses, beyond buoyage and lighting, which is provided by the Trinity House of Hull, who collect dues for these services from all vessels sheltering within Spurn Point. With these material advantages, it cannot be doubted that it is capable by artificial means of being made the most perfect harbour of refuge in the kingdom. There are several points on which breakwaters might be constructed with advantage to the harbour without interfering prejudicially with the set of the tides, as, for instance, at Cle Ness and the Bull Sand. It is

HULL.

Mr. G. Babb.

27 Oct. 1858.

matter of surprise that, with such advantages as a shelter for vessels, this portion of the Humber should be allowed to remain quite unprotected in the event of a war, although the natural position of the coast, both the Yorkshire and the Lincolnshire side, renders its protection easy and comparatively inexpensive. It would not be difficult to combine the provision of breakwaters for the better sheltering of vessels with batteries for defence against hostile navies. In case of a war, the port of Great Grimsby, with its places for rapid entrance at all times, its facilities for coaling or repairing vessels, its capabilities of being extended to an almost unlimited extent, offers advantages for the formation of a government depôt which no other port on the east coast can give; and that this has received the attention of Her Majesty's advisers is evident from the fact of their having required the entrance gates of the new dock to be made sufficiently capacious to admit the largest class of war steamers, although no further steps in that direction, which would appear to have been thus indicated, have yet been taken. The Commissioners are therefore respectfully requested to hear the practical evidence which will be offered upon this subject. During easterly gales, from 500 to 800 vessels frequently anchor in the Grimsby and Hawk roads. The number of vessels which have run into the Grimsby docks for repair, arising from cases of collision out at sea, loss of anchors, &c., during the years 1855-6-7, was as follows:—In 1855, 189; in 1856, 141; in 1857, 118."

25,311. (*Sir F. Smith.*) Are you prepared with any drawings and projects, any engineering plans and completed estimates?—No, I believe not.

25,312. Then I am to understand that you are not prepared with any specific project, for which you have made an estimate, or of which there are drawings?—No.

Then I don't see how we can consider a proposition in so crude a state.

25,313. (*Mr. Lindsay.*) I think I understood you to say that between Spurn Point and Grimsby there is the finest anchorage on any part of the coast?—Yes, it is so stated in the report.

25,314. That ships can find safe shelter in every gale of wind?—I believe so.

25,315. Did you ever know of vessels driving from their anchors?—I am not sufficiently acquainted with nautical matters to know anything of the subject.

25,316. I will take it upon two points: first, on the point that as it exists it is the safest anchorage along the whole of this coast; and secondly, that vessels can in all winds find safe shelter here. If such be the case, what more can Government do towards saving life and property?—There might, as stated in this report, be certain walls constructed, which it is supposed would be of service.

25,317. Would they tend to make life and property more safe than they are now, when once ships have anchored in Grimsby roads?—I apprehend they would, to a certain extent. They would afford additional protection, additional safety.

25,318. If the anchorage at present, as a harbour of refuge, is one of the finest that exists along the whole line of this coast, do you think that Government would be warranted in spending public money for its improvement?—It may be capable of improvement, I think.

25,319. But if it is the finest already, that which is the finest cannot be improved for the purpose for which we are inquiring,—as a refuge for saving life and property?—It may be finer than others, and yet capable of being improved,—of being more protected.

(*Chairman.*) In referring to the report of the Select Committee of the House of Commons, and to those portions of it which define the limits within which our inquiry is confined, I find at page 6, in paragraph 7: "Secondly, the north-east coast of "England. It appears in the evidence taken, that "between St. Abb's Head and Flamborough Head, a "distance of about 150 miles, every harbour along the "coast, without any exception, has a bar at the "entrance," and so forth. Now, in point of fact, our limits are defined there to be St. Abb's Head and Flamborough Head. I should regret very much if the circumstance of the notice having been worded in this way, as to a harbour of refuge on the coast of England between the Tweed and the Humber, has at all misled you at Grimsby, and induced you to come over here with the idea that Grimsby was a locality in which by any means we could recommend that a harbour of refuge should be made. The real truth is, that all the evidence which we have had before us has gone to this effect, that the Humber is one of the finest harbours of refuge in the world; and it would be quite out of the question, in these circumstances, to recommend the construction of any large and expensive works in the Humber, when there is so much required round the coast of Yorkshire, and in the bight of Tees Bay, where a large proportion of wrecks and a great loss of life certainly takes place. Therefore we cannot receive any evidence as to the formation, or go into any evidence as to the desirability of the formation, of a harbour of refuge at Grimsby, while we shall be most happy to hear anything which the deputation may have to offer to us on the general question. It will be for you to acquaint us whether you would wish to call evidence upon the general question. If you like to retire and consult, we will take one of the Hull witnesses, and then if you will be kind enough to let our secretary know what decision you have arrived at, we shall be obliged to you. I have only again to express my hope that the wording of the notice, for which I, as Chairman, am personally responsible, has not misled you, and my great regret if that has been the case.

(*Mr. Bell.*) Is the Commission prepared to receive any project for additional defence of the Humber?

(*Chairman.*) No. The object of the Commission is limited purely, almost entirely, to harbours of refuge; first, for the purpose of saving the lives of men who are employed in the merchant ships of the country; secondly, for the saving of the property which is on board these ships; and, after all that, then may come to a certain extent the consideration whether such harbours would be of use for the military defence of the country. But that is so entirely a secondary question, that, in your own case, I cannot recommend you to urge it.

Mr. WILLIAM BROWN examined.

Mr. W. Brown.

25,320. (*Chairman.*) You are resident in Hull?—Yes.

25,321. What occupation do you follow?—I am a ship-broker and shipowner.

25,322. How long have you been connected with the port of Hull in these capacities?—For the last 15 years.

25,323. You have been present to-day?—I have been here part of the time.

25,324. At any rate you are aware of the object of our inquiry; that it is for the selection of the most eligible site for a harbour of refuge in this district of the coast. Will you be kind enough to give us your opinion on the subject?—My opinion is, that a harbour of refuge is greatly required between the Tyne and the Thames. In the early part of my life I was seven years upon the coast, and, in fact, never was off it, serving my apprenticeship in the coasting trade. I think myself that the best harbour of refuge that you could commence with would be the improvement of the Tyne in particular. If you could improve the Tyne so as to enable ships to go into it at all times of the tide, I think, from what I have seen of it, that there would be a greater saving of life and property

HULL.

Mr. W. Brown.

27 Oct. 1858.

Chairman.

than by any harbour of refuge that you could establish in that neighbourhood.

25,325. You would consider it the preferable course to endeavour to improve the three harbours, the Tyne, the Wear, and the Tees, to making one large harbour at any particular point?—I should not so much approve of the Wear and the Tees as I should of the Tyne, and for this reason: Tynemouth Castle, for instance, is a very prominent feature, and can be seen a long way at sea in cases of gales of wind. It enables the seaman to make sure of his point much better than when he has to run down upon a lee shore where the land is low, and where, consequently, he is not able to find his port, unless he knows his exact position, which it is very seldom that a man knows in a gale of wind. But if he knows the land in the neighbourhood—for instance Tynemouth Castle—he cannot mistake it, because it is so prominent an object that he must know in a moment that it is Tynemouth Castle. It is the same with Flamborough Head.

25,326. You advocate Tynemouth because it is a good landfall in bad weather?—That is the principal reason why I should advocate it.

25,327. You don't profess to have any great nautical knowledge?—I was 20 years at sea.

25,328. I beg your pardon; I did not catch that. How long at sea?—Twenty years.

25,329. In what capacity?—Seven years entirely between Newcastle and London in the coasting trade.

25,330. Have you ever taken these bar harbours in bad weather?—Yes, many times.

25,331. Is it not attended with very great risk?—Yes, at present.

25,332. Do you believe in the possibility of improving these bar harbours to any great extent, so as to diminish the risk?—It is my opinion that if a pier were run out from the south side of the Tyne it would deepen the harbour there, and I should say would be one of the best harbours of refuge. I am not sufficiently an engineer to know whether that could be done; but if the harbour could be deepened, if the present bar could be deepened, so as to enable ships to enter at all times of the tide, I am satisfied it would lead to a greater saving of life and property than any port upon the coast, because such a great number of vessels frequent it, and are in port always at Shields harbour.

25,333. What deepening of the water should you think sufficient over the bar at low-water spring tides? What would be the smallest depth at the entrance of the Tyne which you would say would make it a safe harbour for vessels to run into in a heavy gale on shore?—Not less than 20 feet.

25,334. With the lift of the sea would 20 feet be sufficient?—Perhaps not for all; but I think it would for several purposes.

25,335. For the general run of laden colliers?—Yes.

25,336. What does a laden collier draw?—I should think upon an average not more than from 14 to 15 feet, but there is a different class of vessels in the trade now to what there used to be.

25,337. Would you not say 16 feet?—We have heard a good deal about it. I have known them 16 feet, but I should take the average, because they are building them flatter on the flow, and they don't draw so much water.

25,338. Would you consider four feet allowance for the lift of the sea sufficient in a gale of wind?—I have seen the lift five feet there.

25,339. Have you ever taken one of these bar harbours in very heavy weather?—Many times.

25,340. Was there any particular time you can tell us of,—what was the worst time?—I cannot call it to mind; it is now many years ago.

25,341. Did you ever nearly lose your ship or your life in doing it?—I have struck Shields bar once or twice, but never to risk my life. I have seen 20 to 30 sail on shore together.

25,342. Has it ever occurred to you to put people in the rigging and lash the man at the helm in going in?—No, I have never been so bad as that, although I believe it has been done.

25,343. Supposing you had a good harbour in the Tyne, what else would you require to make the coast comparatively safe?—I should say one put in the middle of the coast, or near that, for ships detained north of Flamborough Head, anywhere near to Filey Bay.

25,344. You recommend first the Tyne and then Filey Bay?—Yes.

25,345. Why Filey Bay?—Because, generally speaking, it is a difficult matter to get vessels, particularly laden vessels, round Flamborough Head. I have been there many days with fleets of ships; with strong south winds it is a very difficult matter to get vessels round the Head.

25,346. Supposing you had these two harbours, how would that meet the case of vessels embayed in Tees Bay?—Tees Bay may be all very well for vessels which are close in shore, or anything of that sort, but I don't like the Tees at all with a gale of wind from the eastward. It looks to me to be nothing but a sheet of foam right down it, there is so much broken water when the wind blows hard from the eastward.

25,347. Have you ever been in Tees Bay in very blowing weather?—No; I have been riding in Hartlepool Bay.

25,348. How far out should you say the sea breaks?—I can scarcely say, but I think it is a long way. I should not be at all surprised if it broke in three fathoms water out from the bight of the bay in a very heavy gale of wind.

25,349. In what depth of water do you think it would break?—I should not be surprised if it would break in 14 or 15 feet, in round numbers, in three fathoms. With a heavy sea on, it looks like broken water all over.

25,350. (*Mr. Lindsay.*) As a shipbroker, have you had much conversation with the masters of ships upon the subject of a harbour of refuge?—Very little.

25,351. You have not conversed with them much about it?—I have conversed with them about it perhaps two or three times, but very lately.

25,352. Very lately you have conversed with them. Have you heard them express a decided opinion whether it would be better to have one harbour, if only one was to be constructed, close under Flamborough Head, off Filey, or somewhere in Tees Bay?—I have not heard a great deal about it, but the opinion which has been most generally expressed to me was always in or about Flamborough Head. They thought that if there was to be only one, we ought to have it in this neighbourhood, as we know the difficulties of getting round the Head with light vessels. Bridlington Bay is a very good place for light vessels, with the wind as far as north-east or east-north-east. In almost all winds they ride very well there.

25,353. You referred to the deepening of the Tyne; I think you said it was your opinion that if the Tyne was deepened to 20 feet at low water it would be the means of saving a considerable amount of property and also of life. Would you have any hesitation in running for the Tyne, if it was deepened to that extent, in a heavy gale of wind, and with an ebb tide?—Not at all.

25,354. Would you think you were running much greater danger in doing so than you would incur by running for a harbour where there was no tidal influence?—No, decidedly not, because you will get a true tide when once you are inside the pier. There would be no difficulty. You would have a true tide when you once get in within the breakwater, or whatever you may term it.

25,355. Would there or would there not be danger as you approached the entrance,—extra danger, I mean?—Not in clear weather, I think, as long as you know all the positions.

25,356. I mean is there any danger from the ebb

tide going out ?—I don't think there would be. The ebb tide does not run so strong, but what with a strong wind a vessel can always steer in it.

25,357. Then the danger in approaching the bar harbours—these tidal harbours and bar harbours—is in fact not so much from the ebb tide going out, in your opinion, but the real danger is of striking on the bar from too little water ?—That is, in fact, the only question.

25,358. Now is it not the case that the masters of ships, when they have left a port, and are caught by heavy gales of wind, and are obliged to seek refuge, will prefer running for their own port, even at a greater risk, rather than take a harbour of refuge?—Invariably a man who knows his business will always run for his own port, if it was a safe one.

25,359. Even if there was a somewhat greater risk in taking it, do you think they would ?—I have very little doubt about it.

25,360. Now let us suppose this case : A harbour of refuge is made at Redcar, easy of access, and a harbour made at Tynemouth, the entrance deepened to 20 feet at low water, and say that the Tyne ships are caught by a gale of wind, and that they could fetch either Redcar or the Tyne, is it your opinion that these ships would prefer, running for the Tyne, rather than take the harbour at Redcar ?—I think in that case, if they were south of Redcar, I think it is natural if they were pretty close to a good harbour. I don't know that they would give the preference to their own port if they had a southerly port in view.

25,361. You think that if they could fetch Redcar as easily as the Tyne they would prefer Redcar ?—If they were south of it they would take the first, I should think.

25,362. Does that arise from its being farther south, and therefore farther on their way ?—Yes, of course. They are so much farther on they way south, if they take that harbour. It is natural for all men at sea, particularly in a gale of wind, to take the first safe port they can get into.

25,363. Let us suppose the mouth of the Tyne at Redcar, and Redcar at Tynemouth, and let us suppose all the positions are changed, and that vessels were caught south of Redcar, and were obliged to seek refuge, do you think they would then run into Tynemouth ?—I think they would still take the first southerly port they could fall in with, and the fact of its being situate at the mouth of a tidal river would not lead them to fear any extra danger in taking it with a heavy gale of wind. There is no danger. There is only the tide running three or four knots an hour at the outside ; any vessels can easily get in.

25,364. Do you think there is any danger to ships in taking the harbour with the ebb tide running out at the rate of, say four knots an hour, and a heavy gale blowing in ?—No, I do not see any danger at all,—not any extra danger.

25,365. Putting aside the Tyne altogether, and any improvement of the existing rivers, if it rested between Redcar and Filey, and there was to be only one harbour, which would you prefer, all things considered, for saving of life and property upon this coast ?—I should prefer Filey myself, knowing more of it. I should certainly prefer it. It is a fine deep bight, and I think it might be made an excellent harbour. It has a nice sandy beach, and it is a place of great resort for vessels dodging about under the Head.

25,366. Do you know the east coast of Scotland ?—I have gone down it. I have been through the Pentland Firth a great number of times.

25,367. From what you know of that coast do you think a harbour of refuge is necessary somewhere between Aberdeen and the Pentland Firth ?—I can scarcely be a sufficient judge, not having been much upon that coast ; but I should think, from the natural state of the place altogether, from having so many firths, that there are plenty of harbours of refuge along the Scotch coast.

25,368. You think that, looking at the natural harbours which are there already, it is not necessary to provide other harbours of refuge upon that coast ?—There are so many firths and good places that I think it is hardly necessary to have any harbour of refuge.

25,369. But say that the Government should hold a different opinion, and had resolved to construct a harbour of refuge on that line of coast, upon what site do you think it could be most advantageously placed ?—Well, I think it should take the most prominent feature, some place like Buchan Ness, or something of that sort, as being the easiest point which all vessels make for. Thus, for instance, coming from the Baltic vessels bound to Scotland will make Buchan Ness ; coming through the Firth they make Buchan Ness. It is a prominent point for which most ships make, and for that reason I think a place of that description must be a place of greater resort than any other. Consequently, you have a right to suppose that there is the greatest danger there.

25,370. You say you have often gone through the Pentland Firth ?—Yes.

25,371. Do you consider the Pentland Firth to be a dangerous navigation ?—Not at all. I have gone through it on very dark nights, and blowing a gale of wind—turned through it, in fact—with a wind from north-east coming this way.

25,372. Would you be afraid to run for the Pentland Firth in a heavy south-east gale and a flood tide ?—No ; I have done it.

25,373. What description of vessels were you in ?—Ships of between 400 and 500 tons.

25,374. Were you able to stem the tide ?—No ; I have been stuck in one position for three hours.

25,375. Did you consider yourself to be in any great danger there,—in unusually great danger ?—Not at all, as long as it kept clear enough.

25,376. Does the tide set fair through the Pentland Firth ?—It does if you run through the two islands. There is no danger. I think there is more danger in running along the land in the narrow channel between one of the islands. I think there is greater danger there, considerably.

25,377. Suppose a vessel is carrying every press of canvas she can carry, and that she enters the Pentland Firth,—that the gale is very strong, and the current running contrary, which is still stronger, and she is in that position you were brought to—a complete standstill—would there be any danger of that vessel being driven out of her course and on shore by the tide ?—No, not at all, as long as it was clear. You may always keep a ship end on, and as soon as the tide eases you then get through.

25,378. From your experience you think that even if caught in that position, with the tide running so strong that you were unable to make head against it, you still do not think there would be any danger of the tide throwing you on the rocks on either side ?—No ; I have been in that position both ways. There is no danger so long as it is clear.

25,379. Do you know Wick ?—I have seen it in passing, but I should not like to give any opinion about it.

Mr. WILLIAM CAIRD examined.

25,380. (*Chairman.*) How long have you followed the sea ?—Thirty-two years.

25,381. How long have you been in command of vessels ?—For 20 years.

25,382. Do you belong to Hull ?—No ; I am not a native of Hull, but I have been living there for the last 16 years.

25,383. Do you reside at present at Hull ?—Yes.

25,384. In what trade have the vessels which you commanded been chiefly employed ?—In the first part of the time, for 20 years I was in the north country trade, winter and summer ; after that I was in the foreign trade, the Mediterranean and the French trade.

HULL.

Mr. W. Caird.

27 Oct. 1858.

Chairman.

25,385. What do you mean by the north country trade?—Carrying coals for the different ports in Sussex.

25,386. From the coal ports?—Yes, and to the different ports of France from the north. I think I have made 300 voyages nearly, altogether, in the 24 years.

25,387. Have you been here all day?—The best part of the day I have.

25,388. Then give us your opinion as to where the harbour of refuge should be?—I have been so many times in trouble, and generally off the Head, with the wind coming away from the south and south-west. I had one ship, the *Brunswick*, and nearly lost her and my brother; he lost her off the Head. It is, as you come off the pitch of the Head; there is generally a very heavy sea on when it is blowing south. Something generally happens to the old ships there. They split their covering boards. Many a ship is lost off the Head that is never heard tell off. My brother lost the *Brunswick*, and a Scarborough ship saved him; he was lost eventually in a brig called the *Hope*, I think she was lost off the Head. I have seen ships go down off the Head.

25,389. Therefore you consider off the Head to be the most central part of the passage in bad weather, and the one where vessels suffer the most?—Yes. I have been many a time running back from the Head to Shields bar, where many a misfortune has happened. I have seen ships run back for shelter to Sunderland and Hartlepool. I have been in company with 400 sail, and the greater part of us bore up. All the ships that were not fast sailers—clipper ships—would keep the sea; but the fast sailing vessels,—and there are some fast sailers among the colliers, have been forced to put into harbour to take the bars, which has been a great misfortune. When we have been going in, I have seen three or four go on shore at the same time.

25,390. Supposing with a harbour at Filey Bay, what would be the next best thing to do,—to get one in Tees Bay or to improve the three harbours of the Tyne, the Tees, and the Wear?—I never like the river. At the mouth of Tees Bay I nearly lost my ship there, and I think you don't like to go again to a place after that. If there is a heavy gale, there is broken water for a long distance from the shore.

25,391. Is not Tees Bay a place which it is very difficult to keep out of, sailing from the northern ports?—It is not. You often get in unless you are lying up along the shore. Sometimes they make a short cut and come close in.

25,392. That would not be prudent to do in doubtful weather?—I have done it, but not unless the weather was good. If I thought the wind was likely to get on the land I kept an offing.

25,393. Have you ever run a great risk of your life in running for these bar harbours?—I have several times seen ships close against me receive damage,—run on to the Black Middens and some to the Head. We perhaps were in the centre and we got through. The sea has been breaking over all of us; that has always happened on an ebb tide. There is much more sea then, and there the danger is. The danger is not so much with the flood tide as it is with the ebb. With the ebb tide the sea rolls up, and that causes all the mischief.

25,394. If you can recollect any particular instance in which your ship was nearly lost going out of the Tyne, tell us the circumstances?—I have kept clear of the ground every time. Once I was going out in a schooner. I thought it was not good weather to go out in, but one of the pilots came and said it was quite smooth outside. "Well," I said, "do you think "we can get over the bar?" He said, "I am sure "you will; there is no danger in going away with the "studdingsails set." I took his word for it, which I never made a principle of doing since. Before we came on to the bar the fellow was frightened. There was a strong wind and a heavy sea on. She struck the bar three times. I just saw the land opening as she went over. The fellow was frightened out of his wits. I said, "You are a pretty "fellow to take command, to be frightened when you "get into danger. I asked you particularly whether "there was any sea on the bar, and you said it was "smooth, and now I find this heavy sea." And so the vessel was nearly lost. We struck three times, and she looked very queer, but still I did the best I could to keep on.

25,395. Still, I think we have not got your answer, your opinion about Filey Bay; after that, what is the best thing to be done after Filey Bay? What can we do?—I consider that you want one harbour of refuge. No person runs back without he is forced; but if there was a harbour of refuge made at Filey Bay they would never hardly run back, for they would be so much farther on their road at Filey. I consider both for shipowners, for insurers, and everybody, it would be much better. I have thought that from my boyhood, and my father before me. We have been speaking of Filey, and wishing for it. I have put into Scarborough. Many a time I have gone in there when I was in the north country trade, but it is a bad place to run into.

25,396. (*Mr. Lindsay.*) Referring to these vessels that were unfortunately caught in the bay with an easterly gale, and did not get so far south as Filey, do you think a harbour of refuge at the Tees, or the deepening of the existing harbours so as to admit vessels at all times, would do the most good?—I would deepen the harbour rather than have another.

25,397. Say it was resolved to have another, and not to deepen the existing rivers, would a site down in the bight of the bay be most valuable for the second harbour?—I don't like bays; I have always made it a principle to keep out of bays whenever I possibly could do so.

25,398. But say that you were unfortunately caught in the bay, and could not help yourself, at what point of the bay do you think a harbour of refuge would be of most value?—I would sooner take Redcar than any of these places.

25,399. Rather than Hartlepool?—Yes; I should not have so much sea in going in.

25,400. Do you know anything of the coast of Scotland?—Not further than Peterhead. I have been in both harbours.

25,401. Do you think a harbour of refuge is needed down along that coast?—Not so much as it is between Flamborough Head and Tynemouth.

25,402. Do you think it is wanted at all?—My opinion is, it is not so much wanted. I don't see any occasion for it.

25,403. But if it was decided to make a harbour there, do you feel competent to say where upon that part of the coast you think it would do the most good between the Pentland Firth and Aberdeen?—I have found the harbours so very good. I have run for Montrose, and I have often wished we had as good harbours here as that to run to.

25,404. In fact, it is your opinion, looking at the vessels trading along the coast, that a harbour of refuge is not wanted there at all?—Not so much wanted as one in Filey Bay.

25,405. (*Chairman.*) What vessels have you generally commanded, brigs or schooners?—Both smacks, schooners, brigs, and ships.

25,406. Of course you have a good knowledge of the vessels upon this coast?—Yes, I have had too much of it in winter time. I was very much knocked about in many gales. Generally you find after it has been wet it draws the wind off the land. Now a little off the land to south-south-west or south-west, you keep holding up to the Head. There it souths by east and south-south-east, blowing strong, and you get a change directly. In all the voyages I have ever made in winter time—I will not say in summer time, for it is quite different in summer—I have always been stopped there. In summer you don't want a harbour of refuge so much as in winter. In summer you never look for it, but in winter nine

times out of ten I have been caught off Flamborough Head.

25,407. When the wind is hanging to the south and west, you crawl up under the Head, and when you get there the wind southerns?—Yes, directly we come off the pitch of the Head, where there is the nasty sea that troubles us.

25,408. Upon which side of the Head is the worst sea?—Upon the south side.

25,409. Are you sure of that?—Yes; as you come round you find yourself getting into this sea. I have been there several times. I have seen ships, I don't know their names, but I have seen them baffled both inside and outside, and us expecting ourselves to founder off the Head. I believe many a one has foundered there that has never been heard tell of.

25,410. Have you ever tried to work round the Head with a flood tide and a strong breeze?—Yes.

25,411. And how have you got on?—I have been in some ships that could not look at it, and I have been in others that could work round.

25,412. By taking advantage of the tide?—Yes.

25,413. As respects ships in ballast in a very heavy gale of wind, if you were really in alarm for your ship and life, owing to the heavy sea, and you have lots of sea room, would you rather heave the ship to or run her?—If I had a harbour.

25,414. But with no harbour at all to run for?—I should lay her to as comfortably as I possibly could. I have sometimes in heavy gales. I had a schooner that I expected to founder. I found the best plan not to lay her to, but to keep her with a little canvas just sailing,—just sailing, so as to keep her away, so that she should not lose her way.

25,415. But when it is blowing as hard as I am speaking of, it is difficult to do that; you can't have sail enough to keep the ship drawing through the water. You must either run her or heave her to with a trysail?—I should heave her to in the best manner I could; but I have seen some ships heave to that could fall off. Fore and aft vessels are all right, but brigs will fall athwart the sea, and it becomes dangerous: they shift their ballast. I had a brig that shifted her ballast, and we had to bear up and get her ballast righted again.

25,416. These vessels when you heave them to in that way, do they fall off into the trough of a sea, and so run a risk of the ship being swamped?—Yes

25,417. And take in a great deal of water below?—Yes.

25,418. Now as respects laden vessels how stands the matter? Would you heave a laden collier to or run her?—I would rather heave her to.

25,419. Coasting vessels generally? A common coaster, with an ordinary cargo, what would you do with her?—If I could not sail her I should heave her to. I have seen the time when I had one which was cutter built hove to for 21 days. In the Western Ocean I have seen some of the large ships, those American liners, that had been hauled to under close-reefed topsails, driven away from us, while we kept making way all the time.

25,420. You are well acquainted with the vessels employed in the coal trade?—Yes.

25,421. What sort are they, compared with vessels employed in the foreign trade, as respects their hulls?—They are not so well found.

25,422. I am not talking about their being found, but as regards the state of the hull in point of strength?—There are some in very good and some in very bad condition.

25,423. Now how they are found with respect to spare sails, running rigging, standing rigging, and so forth; are they well provided with all these?—It is just according to what owners they have. Some belonging to poor owners are poorly found, because such owners cannot afford to do more; others belonging to owners who can afford it are well found. I think in the coal trade generally there are more badly found than well found.

25,424. We have had it in evidence before that ships owned by men who have been at sea are, as a general rule, better found and looked after than those owned by other persons. How stands the matter in your experience?—I cannot say. I have seen some owners who have never been to sea, and have known them very particular about having their ships well found.

25,425. The reason assigned was, that men who had been to sea understood better what was wanted. What do you say to that?—I sailed under an owner who had been to sea, and he was very particular, but very close. I have seen some sometimes turn to and take care that we should not have all new. He would put the end of an old rope to a new one,—anything for saving. I have seen some of those do this who have been sailors.

25,426. Are there any large numbers of vessels owned by poor owners?—Yes. The lowness of freights makes it difficult for men under these circumstances to find the vessels so well as they could otherwise have done.

25,427. Are you acquainted with the Mutual Insurance Clubs in the different seaports on the coast?—Yes.

25,428. Does it ever happen that vessels are so bad that those clubs won't insure them?—They can generally insure better in the clubs than elsewhere.

25,429. Are the vessels so bad sometimes that the clubs won't take them?—Yes, if there are good surveyors who look over the ship, and will state whether one is well found or not.

25,430. As respects colliers being broken up, have you ever seen any broken up and sold for firewood?—Very seldom; I think the most part go down off the Head and different places.

25,431. Is it not the practice in the coal trade to repair the vessels from time to time, and so keep them running longer than is the case in other trades?—I have seen some where the men were obliged to keep pumping the whole time they were at sea.

25,432. Are you prepared to say that is a matter which requires looking into for the safety of life?—It does; both that and loading too deep.

25,433. (*Mr. Lindsay.*) Following up that question, do you think that colliers are sufficiently manned? Do you think there are enough hands on board?—Generally. I have seen some very weak manned, but generally they are sufficiently manned.

25,434. Do you, or do you not, think it is the case that when these vessels are caught with heavy gales of wind, and are knocking about for four or five days, or perhaps a week, the crew get so thoroughly done up in working the ship and in performing the other duties which devolve upon them, that they are really not able to take effectual means in order to save the ship when danger comes, especially if the ship is a leaky one, and that consequently many of them founder? Is that, or is it not, the case?—I will tell you a circumstance. I happened to be in a ship before I was master, and we were unfortunate. We got down as far as Robin Hood's Bay and were forced to go back again. We could not get off the land, and we found her driven in towards Hornsea. There was no alternative but to let go both anchors and cut away the masts. Had the men done as I wanted them to do, and had got canvas on the ship, she would have come into the Humber; but the fact was they were "done up," as you say, and of course we could not get them aloft. That being so, we were forced to let go both anchors and to cut away our masts, and the ship rode out the gale between Filey and Spurn Point. That would be about 30 years ago. Between Filey and Spurn Point there would be at that time 35 ships ashore.

25,435. Do you think there are a great number of ships founder or are driven on shore on account of the crews being so thoroughly done up that they neither can work the ship, get sail on if necessary, nor pump her if it be required?—I think there are.

25,436. And therefore you advocate a harbour at Filey a good deal on that account?—Yes; I consider Filey is a good place for them, and it would save a

HULL.

Mr. W. Caird.

27 Oct. 1858.

Mr. Lindsay.

great many sailors from being worn out, and from thrashing and knocking about, as they many a time have to do, off the Head. Sometimes I have been 10 days standing about to and fro, and could not get round the Head.

25,437. And you think that a harbour at Filey would be of great advantage to such vessels as these? —Yes.

25,438. Following this question out to another class of vessels, the voyage, I understand, from the Baltic in the fall of the year is often a very severe one. Is it the case that these Baltic ships, when they reach Flamborough Head, are sometimes caught and cannot get to the southward of it?—Yes.

25,439. Does that happen in the winter time?—It does more particularly in the winter time.

25,440. Would your remarks apply to the Baltic ships as well as to the coasting ships, about the crews being thoroughly done up and not able to work the pumps or put on sail, so that consequently the ship is sometimes driven ashore and sometimes founders? Do your remarks apply both to these Baltic ships and to coasters?—You will understand that there are more classes of ships than one. There are some classes of ships that would go off the land at any time. They are what we call clipper-built, but there is quite a different class of ships altogether to these.

25,441. Are many of these vessels to which you refer in the Baltic trade clipper-built?—There is not a great many of them there.

25,442. Is the tendency that way?—They generally build the fastest ships for the Mediterranean.

25,443. But is the tendency that way, to build faster ships for the Baltic trade?—I believe they have got much faster ships than they used to have, but not so fast as those which go to the Mediterranean. The fastest ships we have are engaged in the Mediterranean fruit trade.

25,444. Are there any of these fast ships in the coal trade?—I believe they go from here down north and get a cargo of coals for the Mediterranean.

25,445. Is it the case that when the Mediterranean trade is depressed, and perhaps is not paying, some of these ships are employed in the coal trade?—Yes.

25,446. And is it the case that when the Baltic trade is not paying, the ships engaged in that trade are then employed in the coal trade?—Yes.

25,447. Consequently we have in the coal trade at times a great many superior ships which are often employed both in the Mediterranean and the Baltic trade. Is that the case?—Yes.

25,448. (*Mr. Coode.*) Do you know any instances of vessels foundering when running back from Flamborough Head for the northern ports?—Yes.

25,449. How many do you think you know of?—I should think six or seven. I have seen them as we have been running back ourselves. We have seen them go down in heavy seas.

25,450. Do you allude to six or seven at one time, or are those all the cases that you know of?—During my whole time I have seen six or seven.

25,451. Have they been lost with all hands?—Yes.

25,452. Have you been detained long off Flamborough Head? You spoke of 300 or 400 ships being detained there. Have you been detained there any length of time on more than one occasion?—Yes, on several occasions.

25,453. What should you consider the ordinary detention off Flamborough Head, waiting to get to the southward?—I have been detained 10 days, and have then run back for Shields harbour, and have been another fortnight there.

25,454. Have you been detained for anything like 10 days on more than one occasion?—I should say 10 or 15 times.

25,455. Do I understand that 10 or 15 times you have been detained as much as 10 days?—Yes.

25,456. You spoke of the broken water in Tees Bay. Did you apply that to the whole of Tees Bay right across from Hartlepool to Redcar?—Yes.

25,457. Is the water as much broken on the northern side of the bay as it is on the southern side?—Not quite so much. I was there in a heavy gale. I did get; in but there were, I think, at that time seven ships all run back from the Head, which had sailed from different ports. I thought I would not go down as far as Tynemouth; I would take the Tees. We just got in, and about six went ashore at that time.

25,458. Do I understand there is less broken water off Hartlepool than off Redcar?—It seems to break always when there is a heavy sea and it is blowing heavily. It seems to break right across.

25,459. I understand you to say that there is less broken water on the north side of Tees Bay than at Redcar?—Yes, certainly less.

25,460. Do you mean to say, that the broken water extends further off the south side of the bay, or that there is more broken water there?—There is more broken water.

25,461. More on the south side of the bay?—Yes.

25,462. That is, more off Redcar than there is off Hartlepool?—Not quite so high up as Redcar; it does not break very much off Redcar. It breaks very much on those rocks.

25,463. I am speaking of the broken water in the offing, say, in three, four, or five fathoms water?—I have seen it break off in eight fathoms in the gale in which I ran into the Tees; I think it broke in eight fathoms.

25,464. Should you say the sea broke heaviest off Hartlepool or Redcar; or do you know enough of the coast to be able to give an answer?—At that time the broken water seemed more to the southward than the northward. I think I only ran about three times into the Tees, but they were all in gales.

25,465. (*Chairman.*) We have had it in evidence that in running in through broken water the outside sea is the most dangerous. Now what is your feeling about it?—It is generally the first sea you come to. I once was in a Sunderland ship, and we were arguing which was the best harbour, Sunderland or Tynemouth. I was not the master of that ship; I was the mate. We put back from Flamborough Head, when it was blowing a gale of wind, and when we got down and ran past Sunderland, says I, "Why do we run "past Sunderland? If you think Sunderland is the "best port, why don't we take it?" The master said, "There is more room in Tynemouth;" so we took it, rather than take his own port, though he thought there was not so much sea there. Sometimes over Shields bar you will have more sea a good deal, but as you go towards the Black Middens coming in you would not have so much sea as on the other side. Many are afraid of the Middens, but I have seen the greatest damage done in going into Tynemouth harbour by ships being afraid of the Black Middens and going too far the other way. They then strike on the sand and strike on the Black Middens, which, if they were not so much afraid of it, they would have got by, and gone safely in.

25,466. I think your answer is hardly a direct one to my question, which is one of much importance in the construction of breakwaters, because you will observe that it touches the question into what water breakwaters must be carried. I will therefore again put the question. Say you were running into a place like Hartlepool Bay, would you consider the first sea, which naturally is the heaviest, and has the greatest volume of water, to be the most dangerous one?—I have generally found that just as you get on the bar the first sea jumps up all at once, and it generally comes right over you. Say you have got over the first sea, the second is not so bad.

25,467. That is the result of your experience?—Sometimes I have seen a second sea heave a vessel right athwart. Sometimes I have seen the first sea break right over a ship and dash over everything, and I have seen another ship take that sea a good deal better, and then the next sea has taken her and driven her right athwart, and sent her right on to

HULL.

Mr. W. Caird.

27 Oct. 1858.

the sand, so that there is no regular rule as to the force of the first or second sea.

25,468. Still, how would you be disposed to view the question generally?—I think the first sea is generally the worst.

25,469. (*Mr. Coode.*) We have heard a good deal of a man's desire always to run for his own port. Do you think that applies most to light vessels bound to the northern coal ports, or to laden vessels bound to the south, and obliged to run back?—When they are obliged to run back, many of them like to run home. You see they want to be at home. I have known some sailors, as well as masters, if they could not contend with the gale, run for their own ports. That is how so many have been lost. We have lost more whilst bearing up and running for harbours than in any other way. It has been the deep-laden ships that have gone down. There have never been as many light ships lost as laden.

25,470. It is your opinion that a harbour should be provided more for laden ships than light ones?—Filey would suit the laden ships as well as the light ones. I have been in a light ship and have had to cut away her masts, when if there had been a harbour of refuge at Filey we should not have had to cut them away. That vessel was too light; we could not clear the land on either tack.

25,471. Is it then your experience that a harbour of refuge is required most for laden or for light ships?—I consider for both. There is many a time when you cannot get a light ship off the shore.

25,472. For which do you think it is required most, for light ships or for laden?—The laden ships are mostly lost.

Mr. John Atkinson examined.

Mr. J. Atkinson.

25,473. (*Chairman.*) To what place do you belong?—To Hull.

25,474. How long have you followed the sea?—Twenty-one years.

25,475. Of that period how many years have you been in command of vessels?—Sixteen years.

25,476. In what trade have the vessels chiefly been employed which you have commanded?—Principally in the coasting trade.

25,477. What description of vessels have you generally commanded?—Schooners.

25,478. Between what ports have you run?—The Baltic and down to Scotland principally.

25,579. Have you gone south out of the river Thames?—Oh yes, a good deal.

25,480. How many voyages have you made home from the Baltic?—I am sure I could not say; I have been going off and on there these last 16 years.

25,481. Should you say you had made 20?—I should say more, 30.

25,482. You have come home at all times of the year?—All times of the year.

25,483. What is the landfall,—not that you endeavoured to make, but that you have generally made in coming across from the Baltic?—I generally like to make Flamborough Head. I like to make that, but we cannot always make the point we wish.

25,484. Where have you generally made the land?—Generally the Yorkshire coast.

25,485. Have you ever made it as far north as St. Abb's Head?—Yes.

25,486. How often?—Twice.

25,487. To the northward of that ever?—No.

25,488. Have you ever been north about through the Pentland Firth?—Yes, I have been that way four voyages.

25,489. Have you ever run through the Pentland Firth in a gale of wind from the southward?—Yes; the last time we came through was with a gale of wind from the northward.

25,490. Do you know Scrabster roads?—No.

25,491. You know it by the chart and the sailing directions, I suppose?—Yes.

25,492. Would you have any hesitation in running in there by means of the chart and sailing directions?—No.

25,493. Was it blowing very hard when you ran through from the northward?—Very hard.

25,494. How was the tide?—The tide was through with her.

25,495. How did you manage that?—The tide was the same as the wind.

25,496. How did you manage to get into the Firth at the right time of the tide?—The tide was flowing, and we came through at the time of the tide.

25,497. Did you look out for the time?—We dodged some little time and shortened sail, and ran in with the tide.

25,498. Would you have run in with a weather tide?—No, I should not have liked to do that; I would rather have stopped outside.

25,499. You shortened sail, so as to suit your arrival to the time of tide?—Yes.

25,500. That being the case, would it ever have occurred to you to have run into Scrabster roads, and have lost a fair wind, for fear of the tide setting out?—No.

25,501. With a lee tide there is no danger?—Not the slightest.

25,502. What style of coast is it for a vessel to run for? Is it clean and bold?—It is very fair if you keep a look out. I do not see why you should get a ship ashore there.

25,503. Do you know Long Hope?—I have not been in there.

25,504. Do you know it by the chart?—Yes.

25,505. And by the sailing instructions?—Yes.

25,506. Should you have the slightest hesitation in running into Long Hope in bad weather, if you could make out the land?—Not the slightest.

25,507. Of course you would not attempt to do so across a weather tide?—On a southerly gale and a weather tide you would not attempt to run across the tide to it; but with favouring circumstances, by means of the chart and the sailing directions together, you would have no hesitation in running into it?—Not the slightest.

25,508. You have been present here to-day?—The greater part of the day.

25,509. Give us your opinion where we should place a harbour of refuge on this part of the coast?—I should say Filey.

25,510. Let us have your reasons?—On the first onset, it is just under the Point, Flamborough Head being the place where all ships meet. I have been detained there several times in the winter, dodging about there with a fleet of 300 or 400 ships.

25,511. The number of vessels that collect there is very great with southerly winds?—Yes, I have seen 400 sail there.

25,512. Perhaps you are not so thoroughly aware as we are that the object of these harbours of refuge is chiefly to save life, and therefore that we are not entitled to recommend harbours of refuge which are merely a convenience for the passing trade; that is a secondary consideration, the object being to save life. Are you prepared to say that a harbour of refuge placed near the Head or at Filey would save life?—I should say it would save as much life at Filey as at any other place on the coast.

25,513. Describe to me how it would save life specially?—On the first onset, ships get down there and lie knocking about,—ships which are generally not very well manned; the people get fagged out; they are done; and if there were a harbour of refuge there they would be able to go and get recruited and come out again; whereas now, if they are caught in a very heavy gale from the eastward, and are not able to make a harbour or anything of that sort, it would be a mere impossibility to keep the ship at sea, for the men would not be strong enough to make sail or take it in, as the case may be.

HULL.

Mr. J. Atkinson.

27 Oct. 1858.

Chairman.

25,514. So that in the winter, after pumping and working the ship, and knocking about in a heavy gale for three or four days, it is a question which essentially concerns the safety of the ship and of the men that they should have some place in which to take shelter ?—The ships are so lightly manned that in case one hand fails a vessel is disabled.

25,515. At present all they can do is to run back to their own ports ?—If they can get there.

25,516. If they do attempt to run a laden ship into those ports, the bar harbours are dangerous ?—Very dangerous.

25,517. Have you ever tried them ?—Yes, when it has been blowing very heavily.

25,518. Was there any accident to your ship?—None at all. She was very heavy, but a small vessel, and I had battened everything down.

25,519. You felt when you did it that you were running a great risk ?—Yes.

25,520. Did you put the people in the rigging ?—No, none in the rigging.

25,521. Did you lash a man to the helm ?—Yes, and the rest were on the alert.

25,522. Standing by ?—Yes, standing by.

25,523. You have heard the evidence given by the last witness as to the class of vessels which are in the coal trade, as to their not being very well found, either aloft or below ?—There are all classes in the coal trade, very good and very bad.

25,524. Which preponderate in number, the good or the bad ?—I should say there are more good ones than bad ones.

25,525. Many more ?—Not many more.

25,526. (*Chairman.*) I may remark that I put these questions with considerable hesitation; but still I think it is clearly our duty to do so. I can feel for a man who is working his way up in life; who starts with a small share in a vessel, and is not able to find her very well. I can sympathize with such a man; and in making our tour round the coast, we have had before us many gentlemen who have started as seafaring men, and have now placed themselves in most respectable situations in life in that way. I therefore feel considerable hesitation and considerable pain in putting these questions. Still, it is clearly our duty to elicit the truth on this subject, inasmuch as it is evident that it so nearly concerns the question of life. I have thought it right to make these remarks, because I should be very unwilling to have it supposed that we were bearing hard upon men in such a position : I mean shipowners of small means, who are struggling to make their way in life.

25,527. (*Capt. Vetch.*) You know the coast very well from Newbiggin to Flamborough Head ?—Yes; I have been along it many times.

25,528. You have seen many wrecks, or heard of many wrecks having taken place ?—I am aware of them, but have not seen them.

25,529. You do not know at what parts of this line of coast the greater number of wrecks take place ?—No.

25,530. If you were asked, where should you say that these wrecks take place in the greatest number ?—Principally, I think, from the Humber down to the Tees.

25,531. That is a long extent, but on what part of the coast between the Humber and the Tees do the wrecks take place in the greatest number ?—From the Head to the Tees.

25,532. That is a long distance. How many miles is that ?—Sixty.

25,533. On what part of that line of coast do the greatest number of wrecks take place ?—From Hartlepool to the Head, about 30 miles.

25,534. You would place a harbour of refuge where there is most danger, would you not ?—Yes.

25,535. Where most wrecks take place ?—Yes.

25,536. I want to know, if you can tell me, where that place is; is it at Whitby, or Redcar, or where ?—I should prefer Filey myself.

25,537. I am not asking you what place you would prefer, but I am asking you, if you know, to tell me where the greatest number of wrecks take place on that coast ?—Between Redcar and Flamborough Head.

25,538. That is no answer to the question at all. I wish to know from the witness where on that line of the coast, between Newbiggin and Flamborough Head, the greatest number of wrecks take place; at what particular locality ?—I could not give any particular distance.

25,539. Then you think every place along there is equally dangerous, and every place equally safe ?—I must think they are.

25,540. (*Mr. Coode.*) How long did you trade with coal from the northern ports to the south ?—I was in a small vessel about 10 years up and down the coast.

25,541. Constantly occupied in the coal trade ?—Principally from Leith up to London.

25,542. And in your voyages from Leith to London where did you consider you met with the greatest danger ?—Generally on the east coast we fell in with it.

25,543. Any particular part of the east coast ?—Generally from Shields to the Humber.

25,544. Any particular point within that range ?—Flamborough Head used to pick us up principally.

25,545. Did you consider you met with the greatest dangers off Flamborough Head ?—Yes.

25,546. Have you any doubt about it ?—No doubt.

25,547. And you think it is proper to place a harbour of refuge nearest to the point of greatest danger ?—Yes.

25,548. (*Chairman.*) When a vessel is in ballast, and in a very heavy gale of wind indeed, would you rather heave her to, or run her with plenty of sea room and no harbour, where it is a question of saving life ?—I should lay her to first.

25,549. A collier brig in ballast, would you lay her to ?—If she would lay to, and did not make too much water, I would.

25,550. How would she make water—by straining ?—Yes; by straining and shifting her ballast. Where a vessel is lurching heavily the ballast may shift on one side.

25,551. That would be very dangerous, would it not ?—Yes.

25,552. What sail do these collier brigs generally lay to under when they cannot carry a close-reefed maintopsail ?—We generally get a jib and lash it up to the mainmast.

25,553. And make a kind of storm trysail ?—Yes.

25,554. Do they bear the sea pretty well, or fall into the trough of the sea ?—Some will lay to pretty well; others very badly.

25,555. Still it is safer, one ship with another, than running ?—Yes; I should always like, if possible, to lay them to.

25,556. Why is it safer than running ? Why should not you put one of these vessels before the wind with a close-reefed maintopsail and foretopsail ?—I should have such a distance to come back again.

25,557. Then it is because of the distance, not of the safety. I am talking of when it is blowing very hard, and you are afraid for your lives and your ship ?—I should keep her laid to.

25,558. A laden collier, what should you do with her ?—Lay her to.

25,559. How do they lay to ?—They lay to much better than light ones.

25,560. They bow the sea better ?—Yes.

25,561. And ship less water ?—Yes.

25,562. As to the general run of vessels in the coasting trade, would you lay them to ?—Yes, if I could.

Mr. David Palmer Halliday examined.

25,563. (*Chairman.*) How long have you followed the sea?—Thirty-nine years.

25,564. Of that time how many years have you commanded vessels?—Twenty-three years.

25,565. In what trade have the vessels been chiefly employed which you have commanded?—General foreign and coasting trade to all parts of the Continent, from the Baltic Sea to the White Sea, and a good deal on the coast. In fact, the first thing I commanded. I was four years master of a vessel between here and the northern ports and the Forth.

25,566. You say you have sailed in the foreign and coasting trade about the same number of years?—Yes, generally in the winter season on the coast.

25,567. Have you made any voyages to the Baltic?—Many.

25,568. How many times have you come home from the Baltic?—I should say 20 times or more.

25,569. For what port bound?—Between the Humber and London.

25,570. Do you belong to Hull?—I have been a resident here for 33 years.

25,571. I do not ask you at what point you endeavoured to make the land, but where you did make it generally?—I have generally made it near the Humber or somewhere about Flamborough Head. One time I made it as far north as Sunderland. I think that is the farthest.

25,572. Have you ever made St. Abb's Head?—No.

25,573. Ever made the Farn Islands?—No.

25,574. What is your landfall coming home from Archangel?—It depends how we have the wind. If we are likely to have it westerly, we make for Aberdeen, Duncansby Head, and those places; if from the eastward we keep well up for Flamborough Head; we steer for Flamborough Head.

25,575. Supposing you had a fair wind, would you run for Duncansby Head?—It depends on your position, whether you are to the eastward or the westward. I should not run away down to the westward if I was in a position to the east, I should steer for Flamborough Head.

25,576. In a fair wind you would come straight across for Flamborough Head?—Certainly.

25,577. How many voyages have you made from Archangel?—Five.

25,578. Where did you make the land?—Once we made Berwick.

25,579. Did you ever make Kinnaird's Head or Buchan Ness?—Once Buchan Ness, the rest of the time about Flamborough Head.

25,580. Out of five voyages you only once made Buchan Ness?—That is all.

25,581. Have you ever sailed north about through the Pentland Firth?—No.

25,582. You have been present here to-day?—I have been here some time.

25,583. Give us your opinion where we should provide shelter for vessels on this coast, and which is the best place?—As far as I am acquainted with the coast, Filey Bay is the likeliest place, or somewhere between Filey Bay and the north part of Whitby; somewhere along the coast there, for various reasons. In the first place we have not only colliers, but also strangers, who come to that point bound for various ports—the East and West Indies, or those places—who load at Shields. When they come out of Shields, Hartlepool, and those harbours, in general they make for Flamborough Head, andif they can get any further they do; if not, they have to drive about there. Again, ships coming from the Baltic, a great number of them, come in the present day to Hull. In summer and winter they make for the Humber, if they can reach it; but if the wind is south and south-west, which winds prevail on this coast the greater part of the year, they perhaps cannot fetch that point, and they have to dodge about at sea, and to make a progress as well as they can. Again, in the winter time, when there is more occasion for a harbour of refuge, it is a general custom for large ships in particular to make Flamborough Head or somewhere on the north coast in preference to going in near Yarmouth sands. Consequently Filey Bay, lying in the vicinity of Flamborough Head, is, I think, a more eligible situation for a harbour of refuge than any other point, on account of the number of vessels that congregate about there.

25,584. Do vessels bound for the river in the fall of the year make Flamborough Head?—There are a great many masters who are not to say acquainted with the coast, or even with the North Sea, and the ships are driven about to all parts. In consequence, a great number of them prefer making the Yorkshire land in the winter, on the back end voyage from St. Petersburgh, for instance.

25,585. We had it in evidence the other day, from a man in command of a Baltic ship bound for the river, that he always endeavoured to make Lowestoft, and carried his soundings across the banks, and that he could always in thick weather be sure of knowing where he was. Should you say that is at all a common practice?—Well, it is with many, who are well acquainted, like himself, with the coast, and who have been accustomed to the soundings and that sort of thing, but there are a great numbers who are strangers and have not confidence in the soundings.

25,586. A man who is a stranger would not try that?—There are many who prefer making the land about Yorkshire. I have had many tell me they would endeavour to make it over there. In a great many instances they can make the land thereabouts very well.

25,587. If south and west winds prevail so much as they do, these ships get driven away?—It is not out of choice, but in consequence of being forced to the westward. They will then keep, and reach to the north-west and west, get in with a westerly wind, and go coasting along. Often they have to take a pilot.

25,588. What is the largest number of vessels you have ever seen dodging about Flamborough Head?—I should say from 200 to 300.

25,589. Is that a common occurrence?—Yes; many times it is when a fleet comes out of the northern ports, and the ships congregate and cannot make further progress. They dodge about there, and the light and small vessels, with a heavy wind from south and south-south-east, or south by west, or south-south-west, will go in and bring up in gales. They will dodge about during the day-time under canvas under the Head. By the water being smooth and the ships laden they can hold their own, and it is safest for them to stand off, in order to avoid coming into collision with each other. If it comes on to blow from the eastward, they have no harbour they can make, without they go further to the north.

25,590. So they would get up as high as the Head and dodge about it for a slant of wind?—If the weather is moderate, they can carry canvas and work away, and proceed as far as they can. No man will heave to unless he is forced.

25,591. Have you ever worked round Flamborough Head with a flood tide and a strong breeze?—I have done it, but the great evil is, when you get there you go back with the ebb tide.

25,592. Supposing there was a harbour in Bridlington bay, would a vessel get round into it by means of a flood tide?—Many a time they could not do so.

25,593. What is the largest number of vessels you have seen lying under Speeton Cliffs?—I should say 50 or 60.

25,594. Is that a common occurrence?—Yes; many times I have seen that. I have never counted them, but as far as I could tell there must have been from 20 to 70.

25,595. Bearing in mind that a harbour is designed especially to save life, would you be disposed to say

HULL.

Mr. D. P. Halliday.

27 Oct. 1858.

Chairman.

that the hardships which collier vessels undergo off Flamborough Head are such as to make it a question of life, and not alone of convenience?—It is both, because ships get up this far, and in consequence of having the wind southerly they keep persevering as much as they can. If there was a harbour at Filey, they would go in and be safe, but for want of it they persevere. The result is, they will get a moderate distance from there, and perhaps cannot go back, if it happens to become worse from the eastward, east-north-east, or that way, blowing a gale of wind on the coast. There is nothing for them in that case but to go on shore or run away for their own ports, and it is in attempting to take their own ports that so much loss of life and property takes place.

25,596. For your part, if you had a good ship, you would much rather keep the sea than try the bar harbours?—Yes; I once got to the Head in going to Plymouth. If there had been a harbour I might have been safe in it, but there was not one; and I drove to the Firth of Forth, and laid there nine days in a north-east gale.

25,597. Do you know Hartlepool?—Not much. I have been there twice.

25,598. (*Capt. Vetch.*) I think you said you had seen as many as 200 vessels at Flamborough Head waiting to go to the southward?—Yes.

25,599. And that you have seen 50 or 60 of these taking shelter under Speeton Cliffs—was that in moderate weather?—Yes. Suppose the wind gets a little stronger, and gets more to the eastward, they are obliged to cut and run; they must get their anchors up and cut away as soon as possible. It is only the small vessels which bring up there on this account, because they are handy, the men are ready, and they can get up the anchor in a short time. If there is a larger number of men, you cannot get them together to get the ship away.

25,600. Then the large vessels do not come under the cliff?—Not to bring up.

25,601. When they can no longer lie at Speeton Cliffs what becomes of them?—They must get under weigh, go to sea, and do the best they can; get into their own ports, if possible.

25,602. During the time you have been on this coast, have you formed any opinion as to where the greater number of wrecks take place?—I fancy that the greatest number take place in the vicinity of the coal ports. The ships put back, and the lighter ones go down to make these ports; and then, there not being sufficient water, and a strong sea running, they get lost.

25,603. When they are obliged to back from the Head in the southerly winds, do they get into the bight of Tees Bay?—Not often.

25,604. When they get there they cannot get out?—Just so. So 19 out of 20 endeavour to keep out of that bay.

25,605. Do they ever get into Whitby?—Small vessels do, but very few will go in that are not acquainted with it; they must be small ones. There is only 10 feet of water.

25,606. Some get into Hartlepool?—Some into Hartlepool, and some into the Tees.

25,607. Others get into the Tyne and Tees?—Yes.

25,608. Where do you think along the coast, in these prevailing winds, in which ships are obliged to put back, where do you think the greatest number of wrecks take place,—at the entrance of the Tyne, the Wear, and the Tees, where the greatest number are struggling to get in?—Yes.

25,609. You think the best place along this coast to save life and property would be Filey Bay?—Yes.

25,610. Have you seen the proposed plan of a harbour there?—I did see one, some months ago.

25,611. I wanted to ask you whether, with a gale in which ships are under Flamborough Head, they might all put in there with ease and safety?—I should say they might, if the place is made sufficiently capacious.

25,612. If they had a good deal of offing they would find it difficult?—Not at all. It is a very prominent headland is Flamborough Head, and there is a good deal of room.

25,613. Being in, would there be some difficulty in getting out?—When a man is in safety, he takes the chance of getting out.

25,614. Upon the whole, you think that Filey Bay would be the best place for refuge that you know of along your line of coast?—I do; I think it is the most eligible place.

25,615. Suppose that to be the best, which do you think to be the second best place for a harbour of refuge?—A harbour of refuge might very well be made at Redcar, but I think that, if it is practicable, the deepening of the present coal ports would be the most desirable.

25,616. You think that to improve the Tyne would do more good than to make a harbour of refuge at Redcar?—Yes; if it can be done.

25,617. Supposing that these river mouths of the Tyne, the Tees, and the Wear cannot be made into good and sufficient harbours, what then is the place that for your part you would recommend?—I should recommend, I think, Redcar in preference to Hartlepool.

25,618. Redcar would be next to Filey?—Yes.

25,619. (*Mr. Coode.*) Why should you prefer Redcar to Hartlepool?—I think it would be an easier port of access.

25,620. Easier of access?—Yes.

25,621. Why so?—On account of the Heugh, which is an unsatisfactory kind of a place frequently to get round. There is a heavy sea breaking along there. I think more on there than there is off Redcar. The greatest number of ships I should suppose would run from the south east if they were going there. Ships going down, light ships in general, will often be going along the Yorkshire coast, and they would have much less sea in taking that port than they would at Hartlepool.

25,622. Have you had sufficient experience of the Tees to be able to say that there is really less sea off Redcar than off Hartlepool?—I have been in it perhaps 15 times.

25,623. In gales of wind?—In bad weather, but not in excessive gales.

25,624. Is it within your experience that there is more sea on one side of the bay than on the other?—I think there is more on the Hartlepool side than on the other. With the wind at south-east the sea rolls down along, and it all settles into Hartlepool bight. With the wind from the north-east it comes round the Heugh and settles there.

25,625. Do you think with the wind at north-east there is more sea at Hartlepool than at Redcar?—Yes; I think so. A swell breaks round the Head, the distance is so short.

25,626. Is that a dangerous sea?—Yes; I should say it is.

25,627. You were asked questions as to the difficulty of getting out of a harbour, if it was made, at Filey. Do you think there would be more difficulty in getting out of Filey than in getting out of any place along the coast?—Not at all.

25,628. Would there be less?—Less. It lies upon a headland that looks out to the eastward, and consequently, if you had fine weather, or even an easterly wind, you would have a choice of going to the southward. Now if you come out of the Tees Bay you must lay out south-east with the wind east-north-east, and then you are close-hauled, whereas if you are in Filey Bay your course is east and by south to Cromer.

25,629. You consider you would have less difficulty in getting out of Filey?—Yes. Again, if you come out of Filey Bay down to the north your course is north, whereas if you are in Hartlepool or Tees Bay you must steer out at north-north-east.

25,630. Have you ever been through the Pentland Firth?—No.

25,631. You mentioned a case in which you were driven from Flamborough Head to the Firth of Forth?—I have been driven back several times, but that once in particular.

25,632. Driven back from where?—From the neighbourhood of Flamborough Head or Scarborough. Once it was three weeks after making Sunderland before we got into the Humber. That was with a ship of 700 tons.

25,633. Where were you bound from?—From St. Petersburgh to Hull. We got to the Yorkshire coast three times and were driven back as far as St. Abb's Head.

25,634. Did you keep the sea the whole of that time?—Yes.

25,635. What points were you driven back from?—Once we got from the north up to Flamborough Head, once up to between Scarborough and Whitby, and once nearly up to Huntcliff. We got up to the Yorkshire coast each time.

25,636. Do you know any instance of vessels foundering in running back?—I have heard of instances of ships foundering, but I have not known them particularly myself. One ship from Sunderland foundered on her first passage from London with coals.

25,637. Was she bound from Sunderland to London?—Yes.

25,638. Where did this vessel founder?—Somewhere off the Head. Somewhere between the Head and Yarmouth. Somewhere in the offing; but how far south she had got I do not know. It is a good while ago, and I do not remember.

Mr. Sidney Cooke examined.

25,639. (*Chairman.*) Are you resident at Hull?—I am.

25,640. How long have you been a pilot?—Eleven years—a coasting pilot.

25,641. Are you licensed by the Trinity House?—No.

25,642. For what district of the coast are you a pilot?—From Leith roads to the Downs.

25,643. Previous to being a pilot did you follow the sea?—Since 1825. Twenty years ago I was a master, in fact.

25,644. Since you were first a master, in what trade were the vessels chiefly employed that you commanded?—In the northern trade, from and to London, and in the foreign trade.

25,645. The foreign trade; in what direction?—Different parts. To the East and West Indies, and to the Baltic.

25,646. How many voyages have you made from the Baltic?—Six or seven.

25,647. When have you made the land coming across from the Baltic, not when have you endeavoured, but when did you actually make it?—If I was bound to London I generally made it at Lowestoft.

25,648. If you were bound to Hull?—Generally at Flamborough Head.

25,649. What is the northernmost point on the coast at which you have made the land coming across from the Baltic?—Huntley Foot.

25,650. You have been present during the greater part of to-day?—During the greater part of it.

25,651. Where, in your opinion, ought a shelter to be found for vessels on the coast?—I should say Filey is the most suitable place.

25,652. Do you generally agree with the reasons which have been given us as to Filey by other witnesses?—Yes, generally. I form my opinion from my own practical knowledge of the coast.

25,653. And does your own practical knowledge of the coast induce you to agree with those reasons which have been given us by previous witnesses for preferring Filey?—I only heard one or two witnesses. I have not heard many.

25,654. Will you state anything which you wish to add to what they have told us?—The value of a harbour at Filey would be for laden vessels leaving the northern ports, in consequence of vessels of great draught of water coming to sea to save the spring tides. They do not look at the wind, and sometimes soon after they get out a gale of wind catches them. These vessels, if the wind comes to the eastward, have to stand to the southward. They get down as far as the Head, and probably, before they can weather it, it comes on to blow very heavily, and there is always a sea from the north-east with a north-east wind. The result of that is, that the vessels cannot make any headway. They cannot fetch back to where they left, and if they cannot get round the Head there is nothing but the shore for them. Sometimes they go on shore at Whitby and sometimes further to the north, and sometimes they fetch as far as the Heugh and go on shore there.

25,655. Do many vessels go into Tees Bay?—I think more between Huntley and Filey than get as far as the Tees.

25,656. Between Huntley and Filey more get on shore on that part of the coast than in the bay?—Yes, generally the vessels approaching the north; as they go north with an easterly gale, they find they are able to wear off, and go on the other tack.

25,657. Do you know Hartlepool?—Yes, I have been frequently there with vessels of all nations.

25,658. Is there much broken water in Hartlepool Bay?—Yes, it breaks in from the north-east with an easterly wind.

25,659. North-east?—Yes.

25,660. In what water does it break?—Five or six fathoms.

25,661. How far out is that?—It is about two miles out.

25,662. Would you not like a harbour in Bridlington Bay that vessels could run into?—I should say it would be of great use for laden vessels near the Head at Filey.

25,663. If you had a harbour in Hartlepool Bay, would light vessels run into it, instead of going to other ports?—It would be nearer the port they were going to.

25,664. They would prefer going to their own ports?—Yes, I think they would.

25,665. What kind of land is that about Hartlepool to make in thick weather?—Well, I think it is good to make.

25,666. If you see the land at all about there, can you in fact mistake it at all for other land?—No, not if you see Huntley Foot.

25,667. Can the Heugh be mistaken for any other place?—No, it cannot easily.

25,668. Does not the land, being low down in the water, and at the same time being high at the back, make it difficult to make at night?—Yes; sometimes in the fogs on the coast you cannot distinguish the lights from the foundries from the lights of Hartlepool.

25,669. What are the soundings about Hartlepool? Can you run in by them?—At about nine fathoms it is time to bring up or to go off.

25,670. If running in from the sea, could you tell if you were running in to Hartlepool, or if you were running to the north or to the south of that place?—No, not very well.

25,671. Is there any change in the character of the bottom north or south of Hartlepool?—There is nothing to trust to, if you do not see something.

25,672. You mean the land by "something"?—Yes, I mean some mark.

25,673. Then as to the soundings about Flamborough Head, in thick weather do they tell you that you are near the Head?—There is rough ground about there.

25,674. If you are running across the North Sea, are there any soundings that would carry you across to Flamborough Head in thick weather?—No, I am not aware that there are.

25,675. Have you ever worked a vessel round Flamborough Head against a close-reefed-topsail

HULL.

Mr. S. Cooke.

27 Oct. 1858.

Chairman.

breeze with a flood tide ?—Yes, I have worked round when other vessels could not get round. I have been on board fast vessels, and worked round into the Humber with the wind east-south-east, when colliers and sailing vessels frequently could not get into the Humber.

25,676. But it is not a thing a laden collier could do ?—No, it is not.

25,677. Have you ever lain in Bridlington Bay ?—I have, when bound to the north with light vessels.

25,678. How was the wind ?—From the north, as far as north-east.

25,679. Have you ever lain in Bridlington Bay with the wind right in and blowing hard ?—Yes.

25,680. Did you ever lose an anchor ?—No, I never lost an anchor. I always managed to get out with double-reefed topsails. I used to beat out.

25,681. (*Capt. Vetch.*) I think you have given it as your opinion that more wrecks take place between Flamborough Head and Huntley Foot than between Huntley Foot and Blyth ?—Yes; vessels driven on shore by the wind, that cannot go further. Many vessels run for a pier and get lost with leading in, while vessels that cannot get further are driven on shore.

25,682. Looking at the wreck chart, you will see that considerably more vessels are lost between Huntley Foot and Blyth than between Flamborough Head and Huntley Foot ?—Vessels run there when they come down and it is low water, and they take the bar. Those vessels I mean that are wrecked, it is by carrying all the sail they can carry, and by doing all they can, and yet are driven on shore.

25,683. If those vessels that are wrecked north of the Heugh cannot get into harbours on account of their bars, would not that be a good reason why some provision should be made for saving them ?—Yes, undoubtedly.

25,684. And therefore, supposing that one harbour of refuge is made at Filey Bay, where do you think the best place would be to put the other and more northerly one, if there is to be a second one ?—I should say Sands' End Ness roads, at the north of Whitby. Vessels get embayed there and cannot get out—3½ miles from Whitby.

25,685. That is good holding ground, is it not ?—Yes, it is.

25,686. It is a good roadstead, with westerly winds at present, is it not ? It is well sheltered on three sides, I think ?—Yes, it is.

25,687. You think that would be the next best place to Filey ?—Yes, I do, for vessels that get embayed there and cannot get out.

25,688. (*Mr. Coode.*) I think I understand you to say that of all the vessels wrecked between Flamborough Head and the Farn Islands, you consider that the greatest portion of those that are actually driven on shore are driven on shore between Huntley Foot and Flamborough Head, and that the wrecks to the north of that arise, in the main, from vessels getting wrecked in attempting to make the harbours ?—Yes, that is what I mean.

25,689. Have you ever seen many vessels congregate about Flamborough Head ?—Yes, under Speeton Cliffs.

25,690. What is the greatest number that you have seen congregated there in your experience ?—I have seen from 400 to 500 laden vessels.

25,691. Have you seen such a number as that—400 to 500—on more than one occasion in the course of your experience on this coast ?—Yes; I have frequently seen that number in the course of the last 11 or 12 years.

25,692. Have you ever known many vessels driven back from Flamborough Head to the northward ?—Yes; I have known them driven back in great numbers.

25,693. Would you say that that is a matter of common occurrence ?—Yes, it is.

25,694. Did it ever happen to you yourself to be driven back in the way you have described ?—Yes, I have frequently been out, but I never went into port, but have fetched off into the offing when other vessels have gone in. The vessels that I have been in have been fast vessels—foreign vessels—vessels that sailed well.

25,695. And as to the colliers, what has become of them ? Have they gone to sea ?—They have gone on the beach, many of them.

25,696. Have you ever known of instances of vessels foundering in going back ?—Yes, that I have.

25,697. Can you tell us the names of any of those vessels that have foundered ?—No; I cannot recollect the names of any of them at present; but I have known numbers of vessels that have foundered and been capsized. There were two, I think, timber-laden ships, were capsized off Flamborough Head, a little to the northward of Scarborough.

25,698. When was it that that occurred ?—It was almost about four years ago, I think.

25,699. Were any lives lost upon that occasion ?—No; I think the people were all taken off.

25,700. Now, if it were left to you to select that site on the coast where a harbour of refuge would save the greatest amount of life and property, what position would you choose ?—I should say Filey Bay, because there is the greatest necessity for shelter there for saving life and property.

25,701. Have you been long of that opinion ?—Yes, I have.

25,702. How long have you entertained it ?—For 11 or 12 years. Since I have had charge of the vessels of all nations, from 12 to 14 every year of different nations within the last 11 years.

Mr. Robert Elder examined.

Mr. R. Elder.

25,703. (*Chairman.*) Do you belong to Hull ?—I am a resident in Hull.

25,704. Do you follow the sea ?—Yes, I do.

25,705. How long have you been at sea ?—For about 35 years.

25,706. Out of that period for how many years have you been in command of vessels ?—For about 28 years.

25,707. In what trade have the vessels which you have commanded been chiefly employed ?—I served my time in the coasting trade and to the Baltic—the coal and Baltic trade. After that I was in the American trade, the East Indian trade, the Chinese trade, and the African trade.

25,708. So you have been principally employed in the foreign trade ?—Yes, the principal part of my time I have been in the foreign trade. I have commanded steamers here for the last seven or eight years.

25,709. Where have the steamers run to ?—To Antwerp, Hamburgh and St. Petersburgh.

25,710. So that, in fact, you have not been much on the coast ?—I have not latterly.

25,711. How many voyages have you made from the Baltic in sailing vessels ?—Twenty or more.

25,712. At all times of the year ?—Yes.

25,713. Where has been your landfall ?—In the summer season I generally used to endeavour to make it between Lowestofft and Orford Ness; in the winter season Flamborough Head, and perhaps Dimlington, to the northward of the Humber, because we carry the soundings more regularly there. It is sometimes advisable to do that.

25,714. Were you then bound to the Thames ?—Yes, and sometimes to Hull.

25,715. Have you ever made the land to the north of the St. Abb's Head in coming from the Baltic ?—No, not from the Baltic. I have made it as far north as the Coquet Island and Tynemouth.

25,716. How many voyages have you made north about through the Pentland Firth ?—I should think a dozen.

25,717. Have you ever run in in a gale of wind blowing hard ?—I have gone through it both by day and by night. The last time I came through it I

came through it in a gale of wind. I was bound from Liverpool to St. Petersburgh.

25,718. Did you run into it with the lee tide ?—I did. I had the tide in my favour, a flood tide.

25,719. How did you manage that ?—I made the lights ; it was clear and I got through very well.

25,720. How did you time your arrival in the Firth ?—I was obliged to run in. The gale was very heavy. I made the lights when I got there.

25,721. The tide happened to favour you ?—Yes, it did. Had it been against the tide it would have been more dangerous, but then I could have hove to, and have waited for daylight, but as the tide was it was all right for us, and I got through very well.

25,722. If the tide had not been in your favour you would have had no hesitation in heaving to and waiting for the tide. You could have kept out of the Firth ?—No. I once tried twice to get through in the same voyage, and had to come round the islands. I could have gone round the Orkneys, but knowing the place so well there was no danger.

25,723. Have you ever been into Long Hope ?—Yes.

25,724. What kind of a place is it ?—It is a very fine harbour.

25,725. Is there any difficulty in running into it for a man who had only the chart and sailing directions and had never been there before ?—No, I should say not the least.

25,726. Would you now, or would you not, consider the navigation of the Pentland Firth to be dangerous for strangers ?—Oh yes, it is very dangerous for strangers.

25,727. By strangers do you mean men who have not been there before ?—Yes.

25,728. But if strangers have the sailing directions to tell them about the tides, and if they have also good charts, would it then be dangerous for them ?—I never found them of great service. I think there is nothing equal to practical experience.

25,729. In what does the danger of the Pentland Firth consist ?—It is very narrow, and the tide runs very rapidly ; I have seen it nine knots an hour.

25,730. If a man knows that there is such a tide, then why does he run into it ?—He cannot keep out of it if he once gets within its influence. I have been driven backwards two nights and not got clear.

25,731. But I mean if a man has run for the Pentland Firth, and knows he has to meet the tide there, why should he run into it ?—You may carry the breeze to the end, and when there all at once it may fall calm.

25,732. The danger then consists more in the calm there than its blowing ?—There is much danger in drifting ashore in a calm there, because the tide will set you off the rocks, if you get the ship's head the right way. The thing, in fact, to be afraid of is the Skerries, and there is danger to a ship of shipping seas.

25,733. It is so tremendous ?—Yes.

25,734. Have you ever shipped much water there in a calm ?—Yes, a good deal.

25,735. Did you ever have to batten down ?—No ; it was with a very light ship I was caught that time. I think that was when I was driving for two nights and days backwards and forwards in the calm, and could not get out.

25,736. Was there a heavy sea then running ?—No, not much sea, only when we come near the rocks we have been so near the broken water we did not know which side of the land we were going into. We got on a set of the tide and have gone round one side or the other, according to the tide.

25,737. Where do you think the harbour of refuge should be on this district of the coast ?—As far as I am a judge, it should be, I should say, in Filey Bay.

25,738. In the neighbourhood of the Head ?—Yes.

25,739. The north side of the Head in preference to the south ?—You are more sheltered with northerly winds than with south winds; taking both together, the most dangerous winds we have upon the coast. You are a good deal more sheltered there. I think it would be much easier to make a harbour at the north side than the south.

25,740. For what description of vessels would a harbour be most wanted ?—For colliers.

25,741. Laden or light ?—For laden. Large powerful ships would go off when colliers would not.

25,742. With a good ship under your foot would you rather keep the sea or run into a harbour ?—With a good ship, under my foot I would rather keep the sea than attempt to run into any of these harbours.

25,743. If it was a refuge harbour, a harbour without any tide and no freshets ?—If I made the Head I would not hesitate in going into a harbour then. But sooner than run into a deep bight I would run the risk of keeping out the sea with a good ship. If you get into the bight with a collier which will not go ahead there is little possibility of getting out.

25,744. (*Capt. Vetch.*) You know the navigation off Flamborough Head very well ?—Yes, very well.

25,745. Do vessels bound to the north when they meet adverse winds put into Bridlington Bay ?—Yes.

25,746. How many vessels have you ever known to be there at a time ?—Four hundred or five hundred sail of light colliers.

25,747. Do not the vessels that go north and are caught by the gale accumulate in greater numbers than those going south ?—Yes, they do.

25,748. They sail more under canvas from the south ?—Yes ; they take care in the winter time that they seldom leave one roadstead without a chance of getting another, but sometimes they are caught. You want as good a harbour on the north as you have on the south. I should say, indeed, a better for laden ships.

25,749. Vessels get up as far as the Head from the north—laden colliers—and are taken by south-east winds, and the large colliers cannot take shelter under Speeton Cliffs ?—No ; we get shelter under the Head sometimes, but that is no place.

25,750. What becomes of the other ships ?—If we can manage to get up to Dimlington with the flood tide then we have a little shelter.

25,751. What is to become of those that get as far as the Head and cannot proceed, the wind being from the south-east ?—Some of them manage to get the land of Dimlington by leading all along, and perhaps by taking advantage of the tide. Others lay under the Head and go out at night time. They are obliged to go out at night time for fear of getting into collision, and many of them founder and go down.

25,752. Suppose when vessels are caught by a south-east wind trying to get south from the Head, will it not happen that there is a good number of vessels much to the north of them that have not fetched up to the Head ?—Yes, that is the case.

25,753. What becomes of these ?—Many of them get back to the Firth of Forth, if the wind is so that they can get round the Farn Islands.

25,754. The small vessels may get into Shields ?—Some of them, but the heavy iron ships have no chance, and a great many of them get ashore on Coquet Islands, the rocks and other places. I have known many of them get shelter in the Skate Roads.

25,755. Those that get up to Flamborough Head, and are driven to the north : where do you think would be the best place to provide a shelter for them? —I should say Redcar, along by Huntley Foot. If they once get hold of that land, they can run along it if the weather is ever so thick. The most dangerous weather we have is in snow storms coming from the east, east-south-east, and east-north-east, and east and by north. If they once get hold of that land they can go there, it is so bold. If they once go from that, they are, perhaps, afraid to go into the bight.

25,756. What is the greatest strength of the tide round Flamborough Head ?—About four and half or five knots at the spring tide. Sometimes it may run six.

25,757. From your acquaintance with the Pentland

HULL.

Mr. R. Elder.

27 Oct. 1858.

Capt. Vetch.

Firth, you would say, that with the tide running 9 to 11 knots at Flamborough Head, it would make the matter much worse, and there would be many more wrecks?—Yes, more; all the old colliers would founder.

25,758. (*Mr. Coode.*) Have you ever found a difficulty in getting round the Head when bound to the southward?—Yes, frequently.

25,759. With a flood tide as well as with an ebb?—Not with a flood tide. I have generally endeavoured to get round with a flood tide when we have been under double-reefed topsails. As soon as the flood is made we have endeavoured to get round the Head and get away to Dimlington.

25,760. Have you always succeeded?—No; sometimes I have been driven off.

25,761. Even with a flood tide?—Yes.

25,762. Have you known many vessels driven back to the north?—A great number put back from time to time, and a great many are lost in the endeavour to do so, striking on the bars and knocking their bottoms out.

25,763. Have you known instances of vessels foundering whilst running back?—I have known several, but I cannot recollect the names, with the exception of one. That was the *Captain Cook*, a friend of mine, the owner's brother commanded her, and she foundered. She went off from the Head in a breeze, and she went off and foundered with him.

25,764. He was caught off the Head?—Yes.

25,765. Were the crew lost?—They saved their lives, but lost everything they had.

25,766. Has it ever occurred to you to be driven back to the Firth of Forth?—No, but I have been driven from in sight of Cromer, pretty near down as far as the Farn Islands. On one occasion I was; we just weathered the Head with the wind south-south-east, bound for the Humber; it came so thick; I was only mate; we saw the land once; I suppose the captain was afraid to run for it. If he had had more experience, he might have run by the lead; he kept out; a small brig passed us; we were hove to off the Humber; they were running away to the north-west, and a few hours after they went ashore in the bight, and drowned every soul.

25,767. What bight?—Just to the southward of Bridlington.

25,768. What is the longest time you have been detained off Flamborough Head, trying to get to the southward?—I have been detained for two or three days together. I mean either brought up or dodging about; dodging about for twelve or fifteen hours. Sometimes I have been brought up in Filey Bay for two or three days. I once brought up with a half water-logged ship; I got her pumps out, and got the Humber next day.

25,769. Did you hear the evidence of the last witness, as to the cause of the wrecks between Flamborough Head and Farn Islands; he stated, that he considered that the greatest number of vessels were driven ashore between Flamborough Head and Huntley Foot, and that between Huntley Foot and the north the greatest number were cases of vessels wrecked in attempting to get into harbour?—I think I have known more upon the coast to the south of Sunderland, I mean by that the coast between Sunderland and Hartlepool. I think I am not overstating the case, when I say that I have known 20 or 30 ashore on that part of the coast.

25,770. From what cause?—Driven on shore by the gale of wind.

25,771. Under what circumstances?—Perhaps after hauling upon the wind, and not being able to go out, in order to save their lives, and rather than go ashore on Souter Point, or those places, they ran upon the sands.

25,772. Were any lives lost on that occasion?—Not a great many, but not so many as might have been, except on account of their running in off the shore.

25,773. Were they mostly light vessels?—Mostly light, but some of them were laden.

25,774. You said you wanted a better harbour, rather north than south; did you mean that you wanted a more capacious harbour, or that it was more wanted?—More wanted for laden vessels, and those coming from the Baltic; we all steer for that part of the coast. It is land not difficult to make, unless there is a dense fog, and then there is no place to stop at, at any time, on this coast.

25,775. Do I understand you that there is less danger in making it in a fog than any other part of the coast?—I should say that, in snow storms, or in rain, or during heavy gales of wind, we have small rain, so that we cannot see more than a mile or a mile and a half. If you can only see half a mile you are safe off the Head.

25,776. You can approach that distance, then, without any hesitation?—Oh yes, within half a mile, or less than that.

Mr. T. Marshall examined.

Mr. T. Marshall.

25,777. (*Chairman.*) Do you reside at Hull?—Yes.

25,778. How long have you followed the sea?—About 28 years.

25,779. Of that period how many have you been in command of vessels?—About 15 or 16 years.

25,780. In what trade have the vessels been employed?—Principally in the Baltic. I have made a few voyages on the coast, but not many.

25,781. How many voyages have you made home from the Baltic altogether?—I must have made 33 or 34 since the war, and perhaps a similar number before that.

25,782. Have you made 100 altogether?—I should think 60 or 70.

25,783. Bound to Hull?—I have been generally bound to Hull.

25,784. Where have you generally made the land?—I have generally wanted to make Flamborough Head.

25,785. I do not want to know where you endeavoured to make the land, but where you actually did make it?—All the way from Flamborough Head, nearly as far as the Staples, I think.

25,786. Have you ever been to the north of the Staples?—Never.

25,787. Out of the whole 50 or 60 voyages you never made the land north of the Staples?—Never to the north.

25,788. Are you of opinion that Filey Bay is the place to put this harbour in?—I think so, on turning the matter over in my own mind.

25,789. You have heard the evidence of the previous witnesses?—I have heard some.

25,790. Is there anything which you have to say in addition to what you have heard from them?—Nothing. I think the principal danger is not with ships caught with a southerly wind under the Head; the principal danger is when you are keeping under the high land with the wind off shore for smooth water, &c.; it falls calm; you are close inshore; the wind comes from the eastward; you cannot get to the southward of the Head, and therefore must keep to the north, carrying canvas; with the head at east you may fetch a little north of the Tyne. One great danger is in that case, that if you once passed any harbour of refuge, that might be, for instance, at Filey, and have only one of the bar harbours which, in my case proved to be the Tyne, then the difficulty and danger is that when you arrive there it may be dark, or it may not be tide time.

25,791. But how would it be if the Tyne was made so that you could run into it at any time of the tide?—That would answer the purpose, if it could be

entered at half tide. The rivers are the great difficulty.

25,792. If the Tyne, the Tees, and the Wear were so improved as to have 16 feet water at low-water spring tides, could you then dispense with a harbour at Filey?—No, I do not think you could. A harbour at Filey is, I think, of great consequence, because ships around there, which would not risk one of those harbours you have mentioned, would take that at once, provided it was under the Head, so that they might get in before dark. It would be attended with nearly the same danger that any of the others would be, to take a lee shore in a gale of wind; there might be 30, or 40, or 50 ships run for the place at the same time. That is one of the great objections to the coal ports; the great number of ships running for them, and the consequent risk of damage and injury, and the same thing would apply to harbours of refuge.

25,793. Therefore there would be chances of difficulty and mischief?—The same thing must occur in all harbours of refuge with ships coming in in gales of wind, because you cannot tell what harm a ship will take. One man lets go his anchor, and others run in upon him.

25,794. For what number of ships should you think it would be necessary to provide accommodation in a harbour of refuge?—I should think that there should be a great space.

25,795. For what number?—I can hardly calculate because they would not be packed together. One would let go his anchor in one place, and one in another. In a dark stormy night, with an easterly gale, it is impossible for a man to see where to anchor, where he is, or how far he is from his neighbour. I should think it would require a space of 15 or 16 miles inside.

25,796. Will you tell me the number of ships that you will want it to take in?—I should think, on the average, perhaps 400 would be the utmost. It would not be likely that more, than 400 would accumulate. I should think that that would be the utmost.

25,797. What is the longest passage you have made home after taking your departure from the Naze or the Scaw?—I have been within 40 miles of Flamborough Head and then back to Norway. The longest passage that I have ever made was 20 days.

25,798. Were you knocking about in the North Sea all the time?—Yes, with gales from the south-west and south-south-west.

25,799. In heavy weather?—Of course there was heavy weather.

25,800. Had you hard work?—Very hard work.

25,801. And would a harbour at Filey have enabled you to run in there?—A harbour at Filey would have been of service.

25,802. If there had been a harbour at Filey could you have run into it?—It generally happens that a ship is well washed, and you would be glad to get any harbour of refuge if only to get put to rights for one night.

25,803. In that case in which you were 20 days at sea, as I understand, if there had been a harbour at Filey could you have run into it?—No, I could not.

25,804. It would not have saved you on that occasion running back to the coast of Norway?—No, I did not run back, I drove back.

25,805. You think this harbour would be of use for vessels after knocking about at sea, for some time, to go into to refit, if only for a time?—It would be of use in that way because ships could lay to, after they got under the land to the north of the head. At present if the wind should come from the east they cannot fetch round to the northward. They have no alternative but to stand to the north. They must take the chance. If the gale lasts more than 24 hours they have no alternative but to seek a coal port. They cannot fetch into the Firth of Forth, with a wind at east, nor can they get round the head.

25,806. That being the case, the refit touches the question of the safety of life?—Yes, because there are so many chances of danger on the coast. If a ship met any of these changes she would drown all hands.

25,807. Then were you pretty well knocked about that time you were 21 days at sea?—Yes, we were.

25,808. The crew were pretty well done up?—Yes; it generally happens that everything is wet on board.

25,809. There is a good deal of hardship?—A good deal of hardship to be endured in a ship that is, perhaps, a fortnight longer at sea than she is intended in such a short passage.

25,810. Would you say that the hardship is so great that it may touch the safety of the vessel, should she get on a lee shore, as to working off?—Well, it would almost be impossible, because a ship with a deck load of wood or what not, when she gets on the coast is not a coaster and not fitted for it. The anchors and sails are not so easily got up and down, and she cannot be managed like a regular collier, and, therefore, labours under great disadvantages.

25,811. (*Mr. Coode.*) Have you ever gone through the Pentland Firth?—Two or three times.

25,812. Have you gone through in gales of wind?—No.

25,813. Were you employed in the coasting trade at all?—I have been in the coasting trade.

25,814. For a length of time?—More or less for a year. Not at once, but at different times. But call it a year.

25,815. Did you ever see fleets of vessels congregate under Flamborough Head?—Yes; it is a matter of very frequent occurrence.

25,816. What is the greatest number that you have seen?—I have seen 200 or 300.

25,817. Vessels going north or south?—Bound south.

25,818. Do you consider that a harbour is wanted most for light or for laden ships?—I think the light ships are in most danger, but then they would not take it if they had any chance of getting to the north.

25,819. If they were north of Filey of course they could not fetch it. You think the light ships incur the most danger?—They are in the most danger on a lee shore, which all would be exposed to. A laden ship would always keep off 24 hours with the wind at east, and the chances are that in that time there may be better weather.

25,820. In which case would there be the greater danger to life, in laden or in light ships?—I think in laden ships.

25,821. Looking to the saving of life, you would provide a harbour rather for laden than for light ships?—It would be necessary to provide for both, but the laden ships are in most danger as to life.

25,822. As regards the saving of life, which class of vessels should you provide for most?—It would be necessary to provide for both. The thing is so near a balance, I cannot say which should be provided for in preference. I can only say this, that if a laden ship came on shore the chances are that she would drown her crew, when that of a light one might get clear ashore.

25,823. (*Chairman.*) In very bad weather, when it is a question of the safety of the vessel, in the open sea with plenty of room and no port to run for, would you heave a ship in ballast to, or run with her?—Heave to, no question about it.

25,824. Notwithstanding that accidents sometimes occur from vessels lurching or shifting their ballast?—Those are casualties that you must make the best of. If you shift the ballast and it shifts at the bottom end, you must go before the wind at any risk.

25,825. Does the ballast ever shift when you are running?—You can trim her and get it right again.

25,826. With a laden vessel, under the same circumstances, would you heave to or run?—I would lay to. It is not often that a sea hurts a good ship, if she is not overloaded.

HULL.

Mr. R. Bartlett.

27 Oct. 1858.

Mr. ROBERT BARTLETT examined.

25,827. (*Chairman.*) You are a resident in Hull?—Yes.

25,828. Are you a seafaring man?—Yes.

25,829. How many years have you been at sea?—Thirty-three.

25,830. How many years have you commanded vessels?—Eighteen.

25,831. In what trade were your vessels chiefly employed?—The North Sea, coast, and Baltic.

25,832. How many voyages have you made home from the Baltic?—Perhaps twenty.

25,833. At all times of the year, I suppose?—Yes.

25,834. What landfall did you make coming home from the Baltic—not what you did endeavour to make, but what you did eventually make?—Between Huntley Foot and the Head.

25,835. Did you ever make St. Abb's Head?—No.

25,836. Did you ever make the land to the north of St. Abb's Head?—No.

25,837. Did you ever make it as far north as the Staples?—No.

25,838. Never to the north of St. Abb's Head?—No, never.

25,839. What is the landfall you endeavoured to make?—We generally tried to make the Head.

25,840. Bound to the Humber, would you endeavour to make the Head?—That would depend on the time of the year. Generally in winter time I should prefer it. In fine weather we try to make the land at Orfordness or Lowestoft.

25,841. Where would you put a harbour of refuge on this coast?—Either at Redcar or Filey, or at both I should prefer.

25,842. Which should you prefer?—I do not know. I think Filey, because sometimes we may take the north country ports at high water. You might get the Tyne when you could not get Filey.

25,843. Have you ever run into bar harbours in very bad weather?—Not very bad.

25,844. Knowing that you risked ship or life?—No, not particularly. I generally endeavoured to keep off.

25,845. Have you been here to-day?—Part of it.

25,846. Is there anything more that it occurs to you to tell us which we have not heard from the other witnesses?—Frequently we might come with a little wind from Sunderland or the Tyne, being towed out by steamboats; after we got out the wind might come from the east, and then when we could not get Filey we might be able to get Redcar. The ebb tide comes on, and you cannot get clear of the land with an easterly wind. You get tide-way on the starboard bow, generally the ebb, with an easterly wind. You might fetch Redcar when you could not get round Robin Hood Bay and fetch Filey.

25,847. If you are to have a harbour at Filey would it not be better to put another in the bottom of Tees Bay, because if you could not fetch what would happen then?—We could generally get that far. It is only seven miles to get to the south-east and by south. The steamboats generally takes us that far—five or six miles, and Redcar is not over seven miles off Hartlepool to the south-east and by south.

25,848. Still a quarter of a mile to windward in a gale of wind is as bad as a dozen sometimes. Would it not be better to have the shelter in the bottom of the bay then at Redcar?—There is very little difference between Hartlepool and Redcar. I should not like to cross the mouth of the Tees.

25,849. With the wind from the south-south-east and south-east a ship could, could she not?—Not too well. I had rather keep under the land, in order to get into Redcar. You get a very nasty sea crossing the sands, and shoal water, and the offset of the tide.

25,850. A vessel off Redcar with a wind east-south-east, and even east, could aways get into Hartlepool, could not she?—She might; but there is a nasty sea to contend with crossing the mouth of the Tees.

25,851. Could she, with a wind east-north-east, fetch Redcar?—Carrying good canvas, she must.

25,852. Could she get off the coast on the other tack?—No; not on the port tack.

25,853. Do you know the land about Hartlepool?—Pretty well.

25,854. Is it difficult to make when you see it?—No.

25,855. If you can make out the land at all you can make out that? You cannot mistake it for the other side of the Tees?—No.

25,856. Is it difficult to see in thick weather?—It is not difficult to make by soundings.

25,857. But to see the land?—I could make it out if I could see the Hartlepool Heugh and the land to the south.

25,858. It is very easy to make?—Not if you have thick weather. The high land lying back and the low ground being in front, it is not easy to see, not until you get in about seven fathoms or less.

25,859. Before you make it out clearly in thick weather, can you run for Hartlepool by the lead?—No; not direct.

25,860. You could not tell how far you were off the land, and would not be positive as to your position?—No.

25,861. In a gale of wind you would not like to run down?—I would not attempt it if I could keep out. If I could not I must run in and try it.

25,862. Is there anything in the nature of the bottom which will tell you whether you are to the north or to the south of Hartlepool?—There is little black-specked sand to the northward, and there is more white sand going to the mouth of the Tees.

25,863. Therefore a man who is well acquainted with the coast and the nature of the bottom, might run in?—He may, but I would still prefer keeping out at sea.

25,864. Because there is too much risk?—Yes.

25,865. In what water does the sea break in Hartlepool Bay?—I should say in seven fathoms. It is not dangerous until about six, but it is very dangerous in seven fathoms.

25,866. How far off the shore is that?—It would be one mile and a half or one mile and a quarter. It is pretty well off.

25,867. Did you hear the evidence about running through the broken water? It was said that the first sea was the worst; what do you say about it?—I heard it.

25,868. Do you agree with it?—No, I do not at all.

25,869. What is your opinion?—My opinion is that the second or third is the worst and the most dangerous. My experience has told me that. I have frequently gone over the dangerous bar at Oporto, and experience has told me which is the worst sea. I have gone over Shields bar in heavy weather, but it is a great deal worse at Oporto. My experience tells me which is the worst.

25,870. Oporto is worse than Shields?—A great deal.

25,871. The result of your experience is that it is not the first sea, or the second, but the third, which is the worst?—Yes; I have gone through the first, but have been shot away by the second and third, the men lashed in the rigging, and the pilot also being lashed. The first sea never touched me.

25,872. Have you ever gone into bar harbours, say with the men in the rigging, and the man at the helm lashed to it?—No, only standing by and looking out to jump up, when going into Sunderland, and Shields too.

25,873. With a vessel in ballast with very heavy weather, blowing very hard, if you had lots of sea room, would you to save life and ship rather heave to or scud?—Heave to, decidedly. It is of no use running the ship. Do you mean if I have a harbour?

25,874. No, no harbour; in the open sea ?—Heave to, decidedly, under a trysail.

25,875. With a loaded vessel the same ?—The same rule.

25,876. With a loaded collier would you rather heave to than run ?—Most of them would go dry if she was a tight ship. If not, run her neck or nothing and take the beach.

25,877. I am speaking of the open sea; what would you do ?—I should heave her to. I think she would be easy; most ships are.

25,878. (*Capt. Vetch.*) Speaking of the difficulty of getting into Hartlepool, is not the light visible at some distance ?—Oh, yes; you can see it 15 miles off pretty well.

25,879. In thick weather ?—Nine or ten miles, perhaps.

25,880. So that you can generally see the light within four or five miles ?—Yes; it is not wisdom to run for the harbour, unless you can see it at that distance.

25,281. How far do you think you can see it in misty weather ? Do you see it two miles off ?—I should go by my lead, then it would be very near the seven fathom water.

25,882. In thick weather a lighthouse is of no use ?—No; but sometimes there will be a fog below and it will be clear up aloft, about the lighthouse top.

25,883. How far can you see the light in a misty night ?—About 11 miles; but it depends entirely on the mist.

25,884. What is there, a red light, and a harbour light below ?—Yes, a tide light.

25,885. How far can you see that ?—Ten miles off.

25,886. You would be able to see that three miles off in bad weather ?—Yes, we should.

25,887. Would not that be a guide to you to get in ?—Decidedly it would. The Seaton Carew light is a guide in; but I prefer having a harbour at Redcar, because Hartlepool is a harbour in itself. At tide time many light vessels could go in, even blowing a gale of wind. Laden ships from the north want to take a harbour of refuge. You have two places; the light ships bound there and if not, in seeking a cargo will go to Hartlepool; the loaded ships will go to Filey and Redcar. We should then have two ports in the room of one great large one.

25,888. I think so; but admitting that Redcar is the better place, still the objection that you cannot see the land at Hartlepool is a good deal lessened by the fact that there are two lights to be seen, the red light and the white light on the Heugh, and that there is also the lighthouse at Seaton Carew ?—By the same rule you would see the Seaton Carew to bring you round Huntley Foot; and get close round and hug by the land, and it must be very dark, indeed, if you could not find your way round the coast to Redcar.

25,889. (*Mr. Coode.*) Is the land as easy to make at Redcar as it is at Hartlepool ?—Much easier. Previous to going there, you must make the land to the eastward before you come to Redcar. You must go in close in shore at Huntley Foot; you go round along under the foot of the hill, and may go into five fathoms if you like to keep the land close aboard until you are clear of the Scars.

25,890. Have you had much experience in Tees Bay ?—No, I do not like to go there if I can help it.

25,891. Have you been there in gales of wind ?—Pretty close down, but I generally happen to keep off, as I endeavour to do.

25,892. Have you happened to notice whether there is most sea towards Hartlepool or Redcar ?—I should say it would depend entirely upon the wind, that if it was a south-east wind, blowing strong, the onset of the sea would be towards Hartlepool; on the contrary, if the wind is from the north-east or north, it would be towards Redcar.

25,893. Supposing the wind at east, setting right in ?—I should say it would be alike on both ends of the bay.

25,894. Have you been much in the coal trade ?—No, I have not; but I have been a good deal on the coast.

25,895. Between what ports have you principally traded ?—Between the Downs and Leith roads, and sometimes through the Firth.

25,896. The Pentland Firth do you mean ?—Yes.

25,897. Have you ever been through in a gale of wind ?—Yes, I have. The vessel was a large one, and carrying a press of canvas with a favourable tide. The first of the tide was against us, but it was only four knots an hour.

25,898. But would that be neaps or springs ?—I cannot positively say; the tide had not made its full force. It was about four knots when we got about half way through.

25,899. Have you ever seen many vessels collected off Flamborough Head ?—Yes, a great many in Bridlington Bay, or dodging about off the Head under Speeton Cliffs.

25,900. What is the greatest number you have seen together to the northward of the Head, either dodging about or anchoring under Speeton Cliffs ?—Not more than between 200 and 300 sail.

25,901. Have you seen that more than once ?—Yes, but I have not seen it very often; perhaps I have seen that quantity four or five times; 50, 60, or 100 I have seen more frequently.

25,902. That is a matter of common occurrence ?—Yes; when the south-south-west wind begins to blow they try at flood tide to get round, and if it blows too hard they do not attempt it, but dodge under the Head and the cliffs to and fro all night long.

25,903. What is the longest time you have ever been detained there ?—Ten or eleven days frequently between Leith and the Humber.

25,904. To the north of the Head ?—In order to get round I have been detained four or five days, I think, and sometimes I have been blown back as far as the Farn Islands.

25,905. Has that been on more than one occasion ?—Three times.

25,906. Have you known of any cases of vessels foundering in running back ?—No, I have never seen one; I would not run back; there is no place to run to only the Firth. You are not back until you get well to the northward and then keep away to the Firth.

25,907. You say you have been driven back three times from the Head; do you mean to the Firth ?—No; sometimes off Sunderland and sometimes to the Tees.

25,908. You were never driven as far as the Firth ?—Yes, twice to Queen's Ferry; I run for it twice when I got as far as Shields, with the wind blowing hard from the east, and there was no other refuge in a winter's day.

25,909. (*Chairman.*) Is there any place you could run into under Holy Island ?—Yes; a man who was acquainted with it might go inside the Farn Islands to the Skate roads.

25,910. What sort of a place is that to run into?—It is middling; a stranger could not take it. Under the lee of the land it is very good, but a stranger would not like to attempt it.

25,911. Why did you not take it instead of going to the Firth ?—I was a young hand on the coast, and I did not like. It was thick, rainy weather, and I did not know it, sir, then. In running down the coast in thick weather it is best to keep clear of the Ferns; it is dangerous about there. We have no soundings.

25,912. What about the Firth of Forth ? Could a ship run in at any time ?—I run right up to the Hope.

25,913. You know the Firth ?—Yes.

25,914. Could a vessel run up by night as well as by day ?—I should not fancy it without seeing the Inchkeith lights.

25,915. Do you know Long Hope in the Orkneys ?—I have not been in, but I have seen it.

HULL.

Mr. R. Bartlett.

27 Oct. 1858.

Chairman.

25,916. You know it by chart and sailing directions ?—Yes.

25,917. Would you have any hesitation in running for it under proper circumstances ?—No ; it is very easy of access.

25,918. From what you know of the general run of men who command coasting vessels, would you say that any of them would have any difficulty in running for Long Hope under proper circumstances, merely knowing it by chart, and having the sailing directions ?—A man who should be a master of a ship, and who can understand the charts at all, can take it if he can see the place.

25,919. If you were making the passage through the Pentland Firth, say from this side, and had a strong favourable gale of wind blowing, if there was a harbour at Wick would you use it or try to make the passage ?—Decidedly try to make the passage. There is no danger in running through.

25,920. But supposing the weather tide was making just as you were running into the entrance, what would you do ?—Heave her upon the wind until the tide eased, and as soon as the tide eased get through.

25,921. That being the case, from your knowledge of the coasting vessels generally, would you say that that is the course which they ought to pursue, and which they would pursue generally ?—I should think so.

25,922. What would you think of a man who did not do it, who, supposing that there was a harbour of refuge at Wick, ran into Wick with a fair wind there? —I should unship him.

25,923. You would unship him?—For not running through the Firth.

25,924. (*Capt Vetch.*) Have you ever been in Long Hope?—No, I have never been in the harbour. I have been close at the mouth.

25,926. We were told that claws of wind sometimes come down from the hills and sometimes cause vessels to drift from their anchors, and oblige them to leave and go to Widewall ?—I have never known a case of that sort, only in heavy gales. There are always gusts coming off high land, but not so serious as that, just before the gale is over.

25,926. If that be the case, it would not be safe to go to ?—If the holding ground is good, a strong puff of air does not matter.

25,927. If you were told by a person who knew the place well, that it was the case that ships drove from their anchors, what would you say ?—I have known them drive with both anchors down in heavy gales.

25,928. I am speaking of Long Hope ?—I have known them drive with both anchors down, with heavy gales of wind. They will, in most places, where it blows like a complete spendrift.

25,929. Have you been through the Pentland Firth in gales ?—I have been through five times in a calm, and have taken no harm going close to the islands. The tide has taken me through to Duncansby Head, and then changed, tracked backward, and turned me to Dunnet Head, and so I have turned and returned five times, going so close to the islands that you might jump on shore, and could almost smoke a pipe of tobacco before she passed them. Just when she got close to, off she would go.

25,930. (*Mr. Coode.*) Do you mean five times backwards and forwards in the same voyage ? — Yes, before I could get clear of it.

25,931. You have been often along the north-east coast of Scotland ?—No, not often.

25,932. Did it ever occur to you to want a harbour of refuge there ? Was your vessel ever endangered on that coast ?—No ; we generally had either one firth open or another.

25,933. If you are caught with any sort of offing, you can get into one of the firths. Do you think a harbour of refuge is necessary about Aberdeen ?—I think it would be very good.

25,934. Where would you place it ?—I really could not tell you the locality.

25,935. You think a harbour of refuge is necessary in that locality ?—I think so just about there.

25,936. Between what points should you say it is most required ?—I hardly know the locality just at this moment.

Mr. WILLIAM CLARKSON examined.

Mr. W. Clarkson.

25,937. (*Chairman*) Where do you belong to ?—To Hull.

25,938. Are you the witness whose evidence we were to have received at Bridlington ?—I am. I had a letter from them to come here.

25,939. How long have you followed the sea ?—Twenty-seven years.

25,940. How many years have you been a master?—Twenty-one years.

25,941. In what trade have the vessels you have commanded been chiefly employed ?—In the coasting trade.

25,942. In the coasting trade the whole of the time ?—In the general coasting trade. I have not any particular place ; we find employment where we can.

25,943. All round ?—All round, but more particularly on the east coast, chiefly between the Firth and the Humber.

25,944. Have you been present during the proceedings of the day ?—I have been here about half an hour or a little more.

25,945. You are aware that the object of the inquiry is to find which is the proper site for a harbour of refuge on this district of the coast, between the Humber and the Tweed ?—I am aware of that.

25,946. Where would you put it ?—I should prefer Bridlington Bay on the east coast.

25,947. Will you give your reasons ?—I think it would be of more service there to light ships, as well being nearly as good for laden vessels as further north.

25,948. For which class is a refuge most needed ?—For laden ships I think mostly. But light ships stand much in need of a harbour at times.

25,949. Have not light ships got a capital anchorage in Bridlington Bay as it is ?—Not while the wind keeps to the northward, but when the wind flies round easterly it is good.

25,950. Have you ever seen a vessel riding out a gale at Bridlington Bay with an easterly wind ?—Yes, frequently.

25,951. Was she a light or a laden ship ?—I have seen a laden ship ride out a heavy gale there.

25,952. But light ships ride more easily ?—The sea has less hold upon them.

25,953. A light ship rides more easily ?—She is not so deep for the sea to get hold of, but the wind has more effect on a light than on a laden ship.

25,954. Taking all that into consideration, which rides most easily, a light or a laden ship ?—A light ship.

25,955. Which is likely to part her cable soonest ? —A laden ship if the sea is heavy, but if it is only wind then the light ship will be likely to go.

25,956. What was this laden ship that rode out the gale in Bridlington Bay ?—She was a brig from the Baltic that rode out the heaviest of the gales. I was a master of a vessel nine years belonging to Bridlington, and was frequently in there, and have frequently seen vessels ride out gales.

25,957. What was the cargo of this brig ?—I do not know.

25,958. What masts had she up ?—She struck her topgallant masts and topgallant yards.

25,959. Were the yards pointed to the wind ? How many anchors were down ?—Two.

25,960. Do you know the scope of cable ?—I do not bear that in mind now, it is several years since. No one, except her, rode it out. It was a tremendous hurricane of wind from the east-south-east,

and nearly as bad as it could be. It could not have been worse. But the vessel rode the gale out.

25,961. Do you know any other instance in which a vessel has ridden out a gale with that wind ?—No, not exactly such an extreme gale as that. I have seen a good many ships go to the harbour to prevent driving on shore, and many drive on shore. I have been at Bridlington, when that has been the case, three or four times.

25,962. The holding ground is capital, is it not ?—Yes ; it is good ground to the northward of the harbour.

25,963. At low water the shelter from the Smithic Sand is pretty good ?—Yes ; it shelters a good deal.

25,964. That being the case, and Bridlington Bay being so good, would it not be almost better to put the harbour on the other side of the Head ?—It would be a shade better for laden ships, but it would be very useful to light vessels to have a harbour instead of an open bay in the winter months. It is only a few times that ships of the northward of the Head could not get round with a flood tide.

25,965. Have you ever worked round with a flood tide in a strong breeze ?—Yes.

25,966. In what description of vessel ?—A collier.

25,967. Blowing hard ?—Hard ; but not very hard. We never worked round unless we thought that there was a prospect of getting to the northward.

25,968. What sail were you under ?—Under single reefs. If we could not carry single-reefed sails it was useless to go round the Head with a southerly wind.

25,969. Could you have got round with a flood tide, say with two reefs down ?—I have ridden under Speeton Cliffs for four or five days with hard southerly winds, whereas if there had been a harbour at Bridlington Bay I could have got round with a flood tide, but I had not the prospect of getting south, and so did not try to do it.

25,970. Do you think a laden collier brig could work round the Head under close-reefed topsails ?—Unless it was an extreme gale, with a flood, she could make one tack off and then would be round.

25,971. Is not the sea heavy there ?—Yes.

25,972. Which side is the sea heaviest, the north or the south ?—At the south side with a southerly wind.

25,973. With a flood tide would it not be a weather tide ?—Yes, it would be.

25,974. At what rate does the tide run in spring tides ?—At 4½ knots.

25,975. Would not that make a bad sea in a gale of wind ?—It would, a very strong sea ; but there is only a very short tack, if the vessel is under Speeton Cliffs, to weather Flamborough Head, and then be in the harbour.

25,976. What leeway would a vessel make under close-reefed topsails ?—If she had a good flood tide she would not make much, but that depends on the character and build of the vessel.

25,977. Supposing that there is no tide, what leeway would you make ?—A good deal.

25,978. How many points ?—Perhaps three points. She would be nine points off the wind. They would never attempt to work without a flood tide.

25,979. A laden collier under close-reefed topsails and courses would make three points leeway ?—She would in a dead sea.

25,980. She would be sailing nine points off the wind ?—She would in that case ; without a tide to assist her she would never get round.

25,981. (*Capt. Vetch.*) You know Flamborough Head very well ?—Yes ; I have been at anchor in Filey Bay with northerly winds, and have shifted to Bridlington to get better shelter.

25,982. Can you tell me whether most vessels wait in Bridlington Bay for a wind to get northward, or in Filey Bay for a wind to go south ?—I think more wait at the south side for a wind to go north than at the north side for a wind to go south. I have several times seen upwards of 500 sail bound north anchored in Bridlington Bay, but I do not know that I ever saw more than 100 waiting to get south.

25,983. Where the greatest number of vessels are the greatest quantity of shelter is required, is it not ?—I think so.

25,984. Could Bridlington harbour be very much improved ?—The harbour ?

25,985. No, the roadstead ?—By making a breakwater on the Smithic Sand. I think it would.

25,986. Would that be of great value ?—Yes.

25,987. To what points is it most exposed ?—From east to south-east are the points to which Bridlington Bay is most exposed.

25,988. How many vessels did you say you had seen ashore on one occasion ?—Three.

25,989. Three in one gale ?—Yes. Two of them attempted to enter the present Bridlington harbour, but failed in the attempt ; and one drove right on the beach without trying for the harbour.

25,990. On the north side of the Head there is no place to resort to for safety ?—At present it is with north and north-east winds.

25,991. There is no shelter from a south-east wind, and the south-east wind is the worst that blows. In that case they must run back to their own ports ?—Perhaps they hold on under the Head, if the weather is at all moderate.

25,992. But I am supposing a gale ?—Under Speeton Cliffs is not a very pleasant place on a winter's night with a laden ship. If the wind comes round east, the chances are you would not be able to get out of Filey Bay.

25,993. If a breakwater were constructed in Filey Bay, would that be a great advantage to vessels that cannot get south ?—Yes, it would. It would be very good in Filey Bay ; but my idea is that it would be better in Bridlington Bay if only one harbour is to be made.

25,994. But you would prefer both ?—I should not prefer two so near to each other. If we are to have two, they ought to be placed further apart.

25,995. Suppose that Bridlington Bay is made a good shelter, what would you like to see done next ?—A shelter made north, in Tees Bay.

25,996. At which side of the bay ?—I think I should prefer the south side, the Redcar side.

25,997. Have you often been there ?—Yes, frequently.

25,998. Do not the lighthouses give you some assistance to find the land there in misty weather ?—If it is clear they do.

25,999. But even if it is hazy ?—No ; if there is much haze you cannot see the light very far.

26,000. Two or three miles off ?—Yes, if it is moderate, not very thick, you will see it two or three miles off.

26,001. Then you think the second harbour should be at Redcar ?—There or at Hartlepool.

26,002. (*Mr. Coode.*) Do vessels find good shelter under the Smithic ?—Not with easterly winds. If the wind is a little to the north of east they do, but if it gets out at east the shelter is gone to a great extent. The sea rolls in heavily with the wind at east.

26,003. Suppose that there were 100 vessels under the Smithic and 100 under Speeton Cliffs, which do you think would be in most danger if the wind shifted to the eastward ?—Those under Speeton Cliffs undoubtedly.

26,004. Did it ever happen to you to get to Flamborough Head, bound to the southward, and not to be able to get round ?—Yes, frequently.

26,005. What have you done under those circumstances ?—Sometimes I have tacked about under the Head, and I have been anchored for four or five days together under Speeton Cliffs when bound to the south, waiting for a change of wind.

26,006. Have you ever been driven back to the northward ?—Yes.

26,007. How far ?—When I have been south of

HULL.

Mr. W. Clarkson.

27 Oct. 1858.

Mr. Coode.

Shields I have never but once been driven as far north as the Farn Islands. I was once driven from Shields and took Holy Island.

26,008. You have been driven back from Flamborough Head ?—Yes.

26,009. More than once?—I have taken Scarborough for shelter, and Hartlepool once or twice. I have gone into Hartlepool with a very heavy gale from the south-east when neither steamboats nor pilots could get off.

26,010. On these occasions had you been to Flamborough Head, and not got to the southward ?—No ; I had only been the length of Whitby that time. I have never had charge of any very large vessel; the vessels which I had were generally of a smallish class, and even when the tide was ebbing we had water into most of the harbours.

26,011. I think I understood that it had happened to you to be detained for some days under Speeton Cliffs, unable to get southward ?—Yes.

26,012. When you were bound to the south with a laden vessel ?—Yes.

(*Chairman.*) Are there any other parties present who are interested in this inquiry, who wish to tender evidence to us ?

No answer.

Sitting at Hull closed.

LONDON.

Monday, 29th November 1858.

PRESENT :

Admiral HOPE (Chairman).

Captain WASHINGTON.
Captain SULIVAN.
Captain VETCH.
Mr. COODE.
Mr. EVANS, Secretary.

Mr. WILLIAM DALE examined.

LONDON.

Mr. W. Dale.

29 Nov. 1858.

26,013. (*Chairman.*) How long have you been at sea ?—Twenty-five years.

26,014. Of that period how long have you been a master of vessel?—Fifteen.

26,015. Where do you belong to ?—To Whitby.

26,016. In what trade have you been chiefly employed ?—In the Baltic, the coasting, and the American trade. Principally in the Baltic trade.

26,017. You have heard this question of a harbour of refuge discussed. Give us your opinion where is the best place for this harbour of refuge, for the purpose of saving life, on the east coast of England ?—Life and property ?

26,018. Life and property ?—To make another harbour of refuge ?

26,019. Which is the best place to make a harbour of refuge, whether it exists at present, or to construct one if necessary ?—My opinion is south of the Tees.

26,020. At what particular spot in Tees Bay ?—I must say I think in Tees Bay, if you make it on a gigantic scale. I do not see how you can make a harbour of refuge in the Tees without doing it on that scale.

26,021. You consider the bight of Tees Bay is the place ?—South of the Tees ?

26,022. South of the Tees ?—Yes.

26,023. Between the Tees and Redcar ?—Between Redcar and Flamborough Head, I should say.

26,024. Between Redcar and Flamborough Head ?—Yes.

26,025. Between Redcar and Flamborough Head is a wide term. Whereabouts would you place it between Redcar and Flamborough Head ?—I would not like to say about that. It is scarcely a point I could say.

26,026. Where would you put it ?—Well, to go south, of course I should say Filey is as good a place as anywhere I know of.

26,027. As good as any you know of ?—Yes ; but I should object to it upon one point, for its being too far south. Whitby is more central.

26,028. (*Capt. Sulivan.*) Did you say to go south or going south ?—To go south.

26,029. (*Chairman.*) In your opinion Whitby is the place ?—Whitby ; for, to take it altogether, I consider it as a central place for ships from the Baltic and different places, it is where ships make the land more usually than they do further north. I had experience of this a fortnight since on a Sunday. I made Whitby in a heavy gale on the Sunday night, and I was there from that time until Thursday.

26,030. If a ship was embayed in Tees Bay, of what use would a harbour of refuge at Whitby be to her ?—No ; but you must act with caution in going along the low land. The land is very low down there in Tees Bay.

26,031. (*Capt. Sulivan.*) Looking principally to laden colliers bound south from any of the ports, Hartlepool, Sunderland, or the Tyne, if you had to decide between Filey and Hartlepool, or anywhere in Tees Bay, as a harbour of refuge for laden colliers, which would you take ?—I should say Whitby.

26,032. I ask you if you had to decide between Filey and Hartlepool ?—To decide between Filey and Hartlepool ?

26,033. Yes, where a harbour of refuge should be placed at one of those places ?—I should say Filey.

26,034. For laden vessels ?—Yes; but it is too far south.

26,035. I am asking you between Tees Bay and Filey ; supposing it was to be at one of those two places and no other ?—In Tees Bay or Filey ?

26,036. Yes, for laden colliers ?—The thing is, that a laden collier will not come to sea unless the master can see a distance clear to get to Filey.

26,037. Then for laden vessels, do you consider Filey preferable to Tees Bay ?—I consider it is preferable, but too far south.

26,038. I do not ask you as compared with Whitby or any other place, I only ask you which of the two places I have mentioned ?—Between the two ?

26,039. Between Tees Bay and Filey. Which would be the most valuable for laden colliers if there was a harbour of refuge at each of those two places ?—Tees Bay, if it is thought you could make it the same as at Filey, but I consider in Tees Bay the water is too shallow.

26,040. Putting that out of the question, and looking merely to the situation for laden colliers leaving the coal ports. You said, I think, that vessels would not start without they could get some way to the south ?—Certainly not. None will go to sea with a bad prospect unless they see a little distance before them.

26,041. Considering that, and looking to laden

colliers, which do you think they would find most valuable for them, a harbour of refuge at Filey or one in Tees Bay ?—A harbour at Filey would be very valuable decidedly, but it is too far south.

26,042. Compared with Tees Bay, can't you say which of the two, if there is to be only one ?—I should say Tees Bay if there is to be only one. If there is to be only one upon a large scale, I should say Tees Bay would be the best.

26,043. Do you think one harbour at either place would meet the wants of that coast ?—That is a question I am not prepared to answer. I can't say one harbour would. I must say there is room for many improvements in different places.

26,044. If there was to be one harbour of refuge, do you think it would meet all the wants of the large trade on the coast ?—One very large harbour ?

26,045. A harbour sufficient to take in the number of vessels that would run for refuge at any one time ?—I should. One very large harbour would do.

26,046. Would you prefer one large harbour in one place, or two moderate harbours ; one in the bight of the bay, and one nearer Flamborough Head ?—I prefer the two.

26,047. From your knowledge, is it the case that in cases of shipwreck life is most exposed to danger in laden vessels ?—Yes ; I should think so.

26,048. Then would you make the laden vessels a first consideration in making a harbour for saving life ?—What do you say ?

26,049. Would you make laden vessels a first consideration in making a harbour to save life ?—Decidedly ; ships drawing the most water. They draw more water laden than light, and they want to enter at all times of tide. I mean as to danger to life.

26,050. Is there more danger of loss of life in laden vessels or in light vessels ?—In laden vessels decidedly.

26,051. Would you think that it would be most important to consider laden vessels in deciding upon a harbour of refuge ?—Most property I think is lost on the coast in laden ships ; I should think so.

26,052. Would that be a reason for having them especially in view in deciding upon a site for a harbour of refuge ?—Yes.

26,053. (*Capt. Vetch.*) Will you have the kindness to attend to the question which I shall put to you. I think you have said as regards Hartlepool that if a harbour there could be made upon a sufficiently large scale to meet all the requirements of the trade, you would think it the best place for saving the greatest number of ships and lives ?—I think so, most certainly ; that is my opinion.

26,054. A vessel caught down in the bight of the bay could not work out with the wind on shore ?—The water is so shallow that ships can't turn out there. The sea is so heavy in stormy weather. In heavy weather the sea runs so strong down in Tees Bay that it would be impossible for ships to get out of it.

26,055. That would be one reason ?—Yes.

26,056. I suppose you would stop until the gale was over until you came out ?—Out of Hartlepool ?

26,057. Yes ?—Yes, I dare say.

26,058. In your opinion, supposing that a large harbour was made there fully as capacious as you wish would more ships and lives be saved by a harbour of refuge, or breakwater, there than at any other place between Blyth and Flamborough Head ?—I can scarcely answer that question.

26,059. (*Chairman.*) You can't answer that question ?—No.

26,060. (*Capt. Vetch.*) I think you said the greatest number of vessels get embayed there—in danger there—which made you select that place, if you make a harbour big enough ?—I think so, as being more central.

26,061. (*Mr. Coode.*) In reply to Capt. Vetch's question you said that Hartlepool was more central ?—It is Tees Bay I mean when I say Hartlepool.

26,062. You mean Tees Bay ?—Yes.

26,063. (*Capt. Vetch.*) I meant Tees Bay too.

26,064. (*Mr. Coode.*) You say you would decidedly prefer two harbours ; assuming it to bedecided to construct two upon this coast, what sites would you prefer ?—I should name south of the Tees.

26,065. Supposing you were asked to name two sites for two harbours, which you say you would decidedly prefer, what sites would you select, provided it was left to you to do so ?—If two harbours were made ?

26,066. If it was decided to make two large harbours of refuge, what two sites would you prefer ? You have already said you would prefer two to one ?—To make two I should prefer Filey and Hartlepool.

26,067. (*Chairman.*) If you were in the gale of wind on a lee shore, where would you like the harbour to be ?—Under my lee.

26,068. Certainly under your lee ?—Yes.

26,069. (*Capt. Sulivan.*) Is it the case that laden colliers frequently get up to Flamborough Head, and are there caught by bad weather and there assemble in very large numbers ?—Yes, they do about Filey ; but I consider there is a great many lost that never get that far. Whitby Beach picks up a great many ships. I should think as much property is lost there as at any other place.

Mr. William Turner examined.

26,070 (*Chairman.*) To what part of the country do you belong ?—To Banff.

26,071. How long have you been at sea ?—Twenty-eight years.

26,072. How long have you been a master ?—Nine years.

26,073. In what style of vessels have you been chiefly employed ?—In schooners.

26,074. Along the coast ?—Along the coast, and to the Mediterranean and the Baltic.

26,075. Have you been much employed in the coal trade ?—Never in the coal trade. Only taking coal down home from here.

26,076. Do you know Hartlepool ?—Yes.

26,077. Do you know the Tyne ?—I know any place along the coast.

26,078. If there is to be a harbour of refuge made, where would you put it ?—Well, there is a good many places under cover of Flamborough Head ; but I think my proposal would be Hartlepool.

26,079. You would put it at Hartlepool ?—Yes.

26,080. Give us your reasons for putting it there ?—Both for ships coming north or south.

26,081. Both for ships coming north or south ?—Yes.

26,082. Then what is your reason ? Is it that it is the most central spot on the coast ? is that it ?—Well, it is there down in the bight, and if a ship is going north or south, she can always get Tees Bay, when she can get nowhere else.

26,083. Do I understand you to say that if a ship was taken by heavy weather with a gale on shore, just to the north of Flamborough Head, she could, as a general rule, get into a harbour of refuge existing in Tees Bay ?—Well, if she has any distance at all, if she gets round Whitby, she goes gradually on. There is always a bit of vacancy to go round the same, coming from the north. It is a bight place.

26,084. So that if a ship had a decent offing, she can always reach a harbour in Tees Bay ?—Yes.

26,085. Is that your reason for preferring Tees Bay ?—Yes. Of course if a ship is too far in shore at any stage of her voyage, she can fetch any harbour, you see.

26,086. (*Capt. Sulivan.*) Where have you traded from ; what ports principally ?—With the exception

LONDON.

Mr. W. Turner.

29 Nov. 1858.

Capt. Sulivan.

of the last six years, I have been on the east coast all the time I have been at sea.

26,087. Bound from what ports?—Bound to London.

26,088. From what ports?—From Scotland.

26,089. That is Banff?—North of Aberdeen to London; from London to Sunderland and Newcastle, to load coals there.

26,090. Do you make Flamborough Head bound south?—Always.

26,091. When you get off Flamborough Head, have you often found that the wind drawing to the south brings up a number of laden vessels off the Head?—Not from the south.

26,092. Do you find the wind drawing to the south off Flamborough Head brings up, that is, stops in that neighbourhood a large number of laden vessels? Do they collect off the Head?—If they are bound to the south and the wind comes from the south, then of course it stops them.

26,093. Have you ever seen a large number of vessels about Flamborough Head?—I never saw a great many laden vessels, but I have seen a good many light ones coming down. I never was in company with a great many laden ones,—very few.

26,094. For laden vessels off Flamborough Head would it be very desirable to have a harbour anywhere near the Head?—At times it might, but all times are not alike. It is owing to the winds. Of course in easterly winds they could not get out of harbour. Sometimes they are caught off Flamborough Head, but if the wind is from the south at all, they can always fetch the Tees Bay. They can run back there many times; they can run back to the ports they come from.

26,095. Have you ever, when off Flamborough Head to the north, found that the wind in heavy gales draws round to the north of east?—Yes.

26,096. Are you aware that in gales of that kind great numbers of laden vessels have been lost between Flamborough Head and Whitby, that could not get round into Hartlepool Bay?—There is a good deal to be considered. Sometimes ships get on shore for want of canvass, want of management, or one thing or another; there is no providing for everything. Of course there is Filey Bay, and a good many ports between the Tees and the Head.

26,097. Between where?—Betwixt the Tees and Flamborough Head.

26,098. At present there are no parts there?—Yes, there are Whitby and Scarborough.

26,099. When I say no ports, I mean ports in which a collier can take refuge at any time of tide in a gale of wind. There are none of these?—Not if she is long in getting to the place. There are none but tidal ports; none but tidal ports.

26,100. With your knowledge of tidal ports, in speaking of harbours of refuge for ships, would they do?—There are none except in Filey Bay: that might be a place, but it is not finished; it is not fit for them now.

26,101. Could we have a harbour of refuge off a tidal port?—Not such as they are now.

26,102. If there was a harbour near Flamborough Head, say at Filey, and another in the bight of the bay, would that be better for vessels than one large harbour in the bight of the bay?—Of course two chances are better than one.

26,103. Do you mean that even if the harbours were not so large, you would prefer two moderate-sized harbours, one in the depth of the bay, and another at Filey, to one single harbour of refuge at the bottom of the bay?—Yes, I should think so. That would be much better, of course.

26,104. Are laden colliers often in danger when running back, or in distress when caught in heavy weather?—Oh yes, they are in great danger going back.

26,105. For all laden colliers caught off Flamborough Head, would Filey be a better place than the depth of the bay?—Of course; they would get Filey Bay sooner than the Tees Bay. Before they get to the Tees they have nothing to take them there, neither canvass nor anything else.

26,106. You mean that their sails would be all blown away?—Yes.

26,107. Would that be a reason for having a harbour of refuge as near as possible to the Head?—Yes.

26,108. When you speak of Hartlepool do you mean that particular spot in Tees Bay or some place in that bay?—Some place in Tees Bay. I do not know all the rocks and places there.

26,109. Do you know Redcar?—I have been near in, but it is very seldom we are without way.

26,110. (*Chairman.*) Are you a shipowner as well as a master?—No.

26,111. You never owned any vessels?—No.

26,112. Are you acquainted with the general run of vessels employed in the coal trade, what style of vessels they are?—No, I could not say that.

26,113. You can't speak as to that?—No. There are good and bad ships among them.

26,114. There are good and bad among them?—Oh yes.

26,115. Which is the largest proportion, the good or the bad vessels?—I should say the most portion of them are good.

26,116. You would say the largest proportion was good?—Yes. I have seen a good many bad ones, but I should say the most part is good. No doubt there are some which I should not like to put my foot aboard of.

26,117. There are some you would not like to put your foot on board of?—No, that I would not, if it was likely I should be caught in a breeze of wind going along the coast.

26,118. Did you ever see one of the old colliers breaking up in any port?—Yes, I have seen them breaking up in all directions along the coast.

26,119. Along the coast?—From Yarmouth Roads to Hartlepool, lots of them; and at Sunderland too, and all places.

26,120. What I want to know is this: Have you ever seen any shipbuilder breaking them up?—No, I never saw any shipbuilder breaking them up.

26,121. Have you ever seen vessels broken up to be sold for firewood?—I have seen a few, not many.

26,122. Among those few have you ever seen a collier broken up in that way?—No, I never saw a collier broken up for firewood, but I have seen them cast on shore many a time. I never had so much time to spare to see whether they broke up after they went on shore.

26,123. Are the good colliers, generally, as good as your own vessel—the one you now command?—No doubt their tackle is as good, but they can't go with the vessel that I have got.

26,124. Are they sound in their hulls?—I can't tell you anything about that.

26,125. You can't tell, but you have your opinion; we all have our opinions, have we not?—I can't say anything about it, you know. I don't know how the ships are built, you see.

26,126. Are they as well found aloft as you are?—Well. I could not say.

26,127. You do not like to say, I suppose, so I will not press you upon that point.

Mr. CHARLES NOBLE examined.

Mr. C. Noble.

26,128. (*Chairman.*) Where do you belong to?—To Fraserburgh.

26,129. How long have you been at sea?—About 20 years.

26,130. And how long have you been in command of vessels?—Three years.

26,131. In what trade have you been employed

chiefly ?—The Baltic, the east coast of England, and Scotland.

26,132. If we were to have a harbour of refuge upon the east coast of England, where would you put it ?—I would have it about the month of the Tees somewhere.

26,133. At the mouth of the Tees ?—Yes.

26,134. Why would you put it at the mouth of the Tees ?—Because it is in the bight with easterly gales of wind, east and east-north-east gales of wind. It is the farthest point upon the lee shore.

26,135. It is the furthest in the bight and so you think that in a gale of wind on shore a ship would be sure to pick herself up there ?—Yes, from both sides.

26,136. Have you been upon this coast in heavy weather lately ?—Yes, I just was in the last south-east gales of wind.

26,137. Upon what part of the coast ?—I was just about three miles to leeward of Flamborough Head. I could not get round the Head ; I durst not look at it.

26,138. Upon which side of the Head is your worst sea ; on the north or on the south ?—Right abreast of the point is the worst ; I feel it the worst there.

26,139. Taking the sea to the north of the Head, and the sea to the south—I mean going along the coast 50 or 60, or 100 miles,—as a general rule, is there any difference between the sea on the one side or the other ?—It is far more broken to the south.

26,140. It is more broken to the southward than it is to the north ?—Yes.

26,141. Have you ever been into Tees Bay in bad weather ?—No, I always come out of it.

26,142. You always keep well out of it, then ?—Yes.

26,143. Did you ever run into Hartlepool in bad weather ?—I have made for it, but I have been frightened to tackle it, and I have hung her off at different times.

26,144. You have made for it, but have been frightened to take it ?—Yes.

26,145. Why were you frightened to take it ?—For fear of the tide.

26,146. That you would not hit the right time of tide over the bar ?—Yes ; the tide has always been out, and I have been too late always.

26,147. Too late always ?—Yes.

26,148. Is the land easy to make out about that part of the coast ?—Yes. It is a very particular part of the coast, that is.

26,149. There is no mistaking it when once you make it ?—No. At a distance at sea it is the best part of the coast, I should say. A man could distinguish Huntcliff on the one side, and the hills above Sunderland on the other, and then the vacancy of the Tees. A man can never go wrong, but run there.

26,150. Just in the immediate neighbourhood of Hartlepool is the land very easy to be made out ?—You can see no land at a distance at sea.

26,151. When you do see it is there any mistaking it ?—No.

26,152. It is not like any other part of the coast ?—Not like any other part of the coast, north or south.

26,153. About the soundings. In going into Tees Bay are they good ; can you make out in thick weather where you are by the soundings ?—In thick weather I hardly could without taking notice of the chart, and looking now and again. It is pretty shoal, from 7 to 11 fathoms.

26,154. You have never gone into Hartlepool or Tees Bay with the lead in thick weather ?—No ; I never try any place in thick weather, I always run off them.

26,155. (*Capt. Sulivan.*) Are vessels often stopped by east-south-east and south-east gales of wind off Flamborough Head, as you were the other day ?—Yes ; they must get south.

26,156. To laden coal ships bound south is that a frequent occurrence in their voyage ?—Yes, very frequent.

26,157. Would a harbour at Filey Bay be of great benefit to vessels caught in such a position as you were ?—It would, more especially for vessels coming from the Baltic and making the land at the Head.

26,158. Do you know that the loss of life is much greater in laden vessels than it is in light ones ?—It generally is, I think.

26,159. Is the danger to life greater when a laden vessel is wrecked than it is in a light one ?—Yes.

26,160. Then you would consider that it is of great importance in choosing a harbour of refuge that a site should be selected with especial reference to laden vessels ?—Well, for laden vessels or light vessels. You see, light vessels can bump themselves on the sand to save life, although the property is lost.

26,161. Supposing a harbour of refuge to be principally intended for the saving of life, do you think that, in considering a site for that purpose, you should have special reference to laden vessels ?—Yes, to laden vessels.

26,162. (*Mr. Coode.*) Were there many vessels in company with you in the last gale?—Three.

26,163. What became of them ?—One I spoke, and told him there was going to be a change of wind. He said he did not see any appearance of it. Says I, We are going to have a gale. He ran ashore the next day in Filey Bay.

26,164. When was that ?—It was on Friday night, the 12th.

26,165. Of this month ?—Yes.

26,166. Were any of the hands lost, do you know ?—No.

26,167. Have you frequently been in company with many vessels that were detained under Flamborough Head, being unable to get to the south ?—Very frequently.

26,168. What is the greatest number of vessels you have ever seen there ?—I have been in company there with about 300 sail.

26,169. Have you been long detained there at any time ?—I was detained once, and rode out a heavy gale of wind there in Filey Bay, with about 300 sail. I was the first ship that brought up in Filey Bay, and rode that heavy gale of wind out during five days, the wind being south and south and by west.

26,170. When was that ?—About six years ago this November. I came from the Baltic.

26,171. Do vessels incur much danger in running back, or when they are driven back, being unable to get to the south of Flamborough Head ? Vessels endeavouring to get south of Flamborough Head are very often driven back, are they not ?—Yes.

26,172. Do they incur great danger of foundering in running back ?—No ; without the ship springs a leak, and then they very often founder, you know.

26,173. Just so. If a vessel has to bear up, and to run back some distance, there is that danger attached to it ?—Yes ; there is that danger.

26,174. In such cases there is great risk of loss of life, is there not ?—There is in bad weather a chance of all hands being lost.

26,175. (*Chairman.*) Have you ever taken any bar harbour in bad weather ?—I have taken Shields.

26,176. In very bad weather ?—Yes.

26,177. How long ago was that ?—Three years ago, I took it with a gale of wind from the south-east. About five years previous to that, I was the mate of a vessel, and I then took it in a very heavy gale.

26,178. Were you obliged to lash the man to the wheel and send the people up into the rigging when you ran in ?—Yes ; all the persons were in the rigging.

26,179. I mean on the last occasion ?—Yes.

26,180. Did you get in without mischief ?—I did, because I had a ship that steered well.

26,181. But still there was great risk ?—Many ships went ashore. Oh yes, there was great risk.

26,182. There was great risk in doing it ?—If she had broached to the least, she would have gone over like a basin and capsized directly.

LONDON.

Mr. C. Noble.

29 Nov. 1858.

Mr. Coode.

26,183. On the occasion, five years before, were you in great danger?—We were in great danger.

26,184. From the same causes?—From the same causes.

26,185. What sort of vessels was it?—It was a schooner in ballast.

26,186. On both occasions?—In both cases.

26,187. If you were on a lee shore in a heavy gale of wind, where would you like the harbour to be?—Upon the north coast of England?

26,188. I mean anywhere? If you were on a lee shore in a heavy gale, where would you like to have a harbour to run for?—Right under my lee.

26,189. Is this a subject on which you have conversed with seafaring men on this harbour of refuge question? Has it been a matter of conversation amongst the seafaring men of your acquaintance?—Yes, very often.

26,190. Very often?—Yes.

26,191. Amongst men not locally connected with the ports?—Amongst our own Scotchmen.

26,192. Could you venture to say what is their opinion on the subject?—In general, it has been always the bight of the Tees; right in the bight.

26,193. Right in the bight?—Yes.

26,194. The question of a harbour at Filey has been discussed by them as opposed to a harbour in Tees Bay?—Yes.

26,195. It has been discussed amongst them, and you are disposed to say generally that they would like to have it in the bight?—They would like to have it in the bight.

26,196. For the same reasons you have stated to us?—For the same reasons.

26,197. Are you pretty well acquainted with the style of vessels they have in the coal trade?—Oh yes.

26,198. What style of vessels are they generally?—Old wrecks. They have enough to do to keep some of them afloat.

26,199. It is difficult to keep them afloat?—You see them always pumping in harbour, at all events.

26,200. You see them always pumping in harbour?—Yes.

26,201. How are they found aloft generally, so far as you had occasion to notice?—I have seen them generally very badly situated for canvass.

26,202. Generally very badly situated for canvass?—A great many of them.

26,203. Would you be disposed to attribute the loss of a considerable number of these vessels at sea to the circumstance of their being bad vessels, and badly found?—There are a great many lost on account of the bad canvass, because they cannot bring them off a lee shore.

26,204. As to the number of men who sail in them, do you consider they have generally on board a sufficient number of men to work them?—No, I think they have not.

26,205. They are insufficiently manned?—Colliers are in general insufficiently manned.

26,206. Have you any opinion as to whether the men are as good now as they were in former days, because they had then the credit of being the best seamen in the country,—for the north-countrymen of the coasting trade. What should you say now, are they as good as they used to be?—Well, I should say that they were.

26,207. There is no difference in the quality of the seamen?—I do not think it.

26,208. I suppose you are of opinion that there are no better men to be found?—No; I do not think that there are any better men to be found.

26,209. Who are the colliers owned by generally? Have you any notion?—No.

26,210. Do not they own them in shares?—Frequently some owners have lots of them.

26,211. You have no idea of the system by which they are owned?—No, I do not. I am not much acquainted about the coal ports.

26,212. (*Capt. Sulivan.*) You said a vessel was wrecked that was in company with you in that east-south-east gale?—Yes.

26,213. Do you know how she got ashore?—I stood on Scarborough Quay, and saw them run ashore.

26,214. Could she not have run back into Tees Bay?—My vessel is a small one, but I could have hung her off and gone off the lee shore; but she could not do so.

26,215. I suppose yours is one of the Scotch schooners?—Yes.

26,216. They will go to windward when the colliers cannot?—Colliers cannot go to windward, they are too deeply laden.

26,217. A vessel of the class you command is no criterion for the wants of colliers?—No.

26,218. Why did this vessel bear up, was she embayed?—Yes.

26,219. She could not get off, or could she have run to Tees Bay?—She could have run to Tees Bay with her yards checked if there had been a harbour there.

26,220. Was the ship leaking, or anything of that kind, that made her run upon the beach at Filey?—The report in the *Gazette* said that she was leaking.

26,221. For that reason she ran ashore on the first beach?—She ran ashore before dark.

26,222. For all vessels so situated would Filey save many more than Tees Bay?—Yes; Filey would save them if there was no harbour there, as it does now.

26,223. I mean with a harbour at Filey. With as harbour for vessels of that description caught as she was off Filey Head, would Filey save that class of vessels more even than a harbour in Tees Bay?—Oh yes, it would, because they are generally in bigger lumps about Flamborough Head.

26,224. Suppose you had to make a harbour of refuge for laden vessels bound south, leaving out of consideration all the light ones, in which of the two places would you put it, Filey or Tees Bay?—I would have it in Tees Bay.

26,225. For vessels bound south?—Yes.

26,226. (*Chairman.*) You say you would have it in Tees Bay?—Yes.

26,227. Is it for this reason, that generally speaking, in bad weather, a vessel to the northward of the Head could get back into a harbour in Tees Bay, and that, reversing the case, vessels in Tees Bay could not find a harbour near the Head of any use to them? Is that your reason?—My reason is, that it is for vessels upon both sides; for vessels making the land, foreigners and all; to give every man a chance who is driving down upon a lee shore. That is my reason, and not for colliers only.

26,228. Have you ever worked round the Head with a flood tide and a strong southerly wind?—Yes.

26,229. What sail were you carrying?—Double-reefed sails, to get the Humber.

26,230. Could a collier have done it?—No; there were colliers driven ashore at the same time.

Mr. Robert Philip Walker examined.

Mr. R. P. Walker.

26,231. (*Chairman.*) How many years have you been at sea?—Since 1839.

26,232. Of that period how many years were you master?—Eleven.

26,233. How long were you a pilot in the navy?—During the years 1854–5.

26,234. What part of the coast do you belong to?—To Whitby.

26,235. What have you to say about a harbour of refuge?—I think, according to my opinion, Redcar would be the best place.

26,236. Give us your reasons for thinking Redcar

the best place ?—Because I have been many times caught in a gale of wind from the eastward, with a collier bound from the north, and we could generally get back to Tees Bay when we could not get round Flamborough Head; but if you cannot get to the southward off Robin Hood's Bay, you have a little more allowance going to the north, and you can also get into the bay when you cannot get out of it.

26,237. Therefore you think Redcar would be the best place ?—For the class of vessels on that coast.

26,238. (*Capt. Washington.*) Do you know Redcar pretty well ?—I never was there. I have been trading to Hartlepool and the Tees, but I never was at Redcar.

26,239. You have been often at Hartlepool ?—Yes, and Middlesbrough.

26,240. Are you able to take the Tees easily ?—I have done so, but I have not been there lately. There have been alterations in the lights since I was there.

26,241. Would you venture to run for the Tees with the wind blowing hard ?—I should not like it; not with a ship of any draught, because before you get to the bar, the same as before you get to Hartlepool, you get into shoal water. There is much broken water, and a ship runs off her steerage.

26,242. In what depth do you meet with the water, five, six, or seven fathoms ?—It would be about eight fathoms when we began to fall in with the sea. There was not much in eight fathoms.

26,243. Do you know the Tyne well ?—Yes, I have been a great many times there. I was five years master of a vessel out of the Tyne.

26,244. Have you shoal water off the entrance to the Tyne ?—Yes.

26,245. Does it break in the same way ?—It breaks, but not so far from the Fairway buoy.

26,246. It does not break so far out ?—No.

26,247. Do you know Sunderland well ?—I have been there several times.

26,248. Where did you think the best place on that coast for a harbour of refuge ?—Redcar; because it would be principally used by colliers, and they are such a poor class they are not able to keep the sea.

26,249. Is your reason for mentioning Redcar because it is in the bight ?—Because it is in the bight. They have an opportunity, if they get to the southward, of getting down into the bight, while if they are caught in Tees Bay, and are running for Hartlepool, they are very likely to be wrecked, and cannot get out. If they were further to the southward and they would not be able to get out of Tees Bay, and as many are caught there and between there and Whitby and Scarborough as anywhere. I should say about 80 times out of 100 a ship can get back to the north, when she cannot get round the Head, and get into the Humber. When caught in a gale of wind, they can almost always get to the north. The wind so prevails, that it is better getting to the north than to the southward round into the Humber.

26,250. Has the subject of a harbour of refuge been a question discussed amongst seafaring men ?—It has for a length of time now.

26,251. During the last year upon the coast ?—Yes, amongst all the captains that I have been mixing with here, but I never felt any interest in it, not thinking to go to sea any more.

26,252. Have you happened to hear what they think of it ?—The Whitby people think Whitby would be the best place. The Hartlepool people Hartlepool, and so on; they are all of them for their own place. I am now keeping a public house, and mix with a great many north-country captains. Every one thinks his own place is the best.

26,253. Suppose that some of these tidal harbours could be improved, do you think it would be desirable to do so ?—I cannot see which of them would suit.

26,254. Do you think the Tyne could be made a harbour of refuge ?—No, I think not.

26,255. You would prefer a large harbour of refuge to any attempt to improve the tidal harbour ?—I should.

26,256. Do you think that that is the general opinion on the coast ?—It is the general opinion amongst seafaring people upon the coast.

26,257. (*Capt. Sulivan.*) Are laden colliers very frequently caught off Flamborough Head in bad weather ?—They are very often caught off Flamborough Head.

26,258. For laden colliers only, leaving out the light ones, supposing them to be bound south, would Filey Bay be a valuable harbour of refuge for laden colliers ?—It would; because it would be so much nearer hand. It would be a very nice place too.

26,259. Leaving out the light colliers, and speaking first only of laden ones bound south, which do you think would be the best site for a harbour of refuge ?—Redcar would be the best place to take between the Forth and the Humber, but there are a great many colliers very often dodging in the bay, and if they were caught there that harbour would be of great service.

26,260. Would a harbour there save all the loss of life which occurs in laden colliers running back leaking and unable to reach a port ?—Yes, but if they are between Whitby and Filey they cannot get into Filey.

26,261. I say for vessels near Flamborough ?—Filey would be the best place then.

26,262. If you had your choice between one very large harbour at Redcar, or a smaller one at Redcar and another one at Filey, both sufficient to take the deepest class of colliers, which should you prefer, one very large one or two moderate ones ?—I should prefer two moderate ones on the east coast of England.

26,263. If you had two, would Filey and Redcar be two as good places as you could find for them ?—According to my opinion they would be two of the best places between the Humber and the Forth.

26,264. Why should you prefer Redcar to Hartlepool, both being in the depth of the bay ?—Because it would be deeper water at the entrance.

26,265. Do you think there would be less danger from the sea to a vessel running for Redcar than for Hartlepool ?—A great deal less danger attends it.

26,266. Do you think there is any serious difference against Redcar for vessels bound south going to sea again ?—If they save their lives and the ship, let them stop until they can get safe out.

26,267. Would you think there was any great disadvantage at Redcar as compared with Hartlepool for vessels getting to sea when they had taken refuge and no longer needed it ?—Not the least. They would as easily get from one place as another; for when they go to sea from both the Hartlepools, they generally have steamers.

26,268. Supposing Hartlepool and Redcar to be equal in all these points you have named, but that one would have nothing but refuge vessels, and the other would have a large trade running to it besides, which would you prefer if you were in a vessel running for refuge; a harbour exclusively for refuge purposes, or one which would also have a large trade ?—A harbour exclusively for refuge.

26,269. Is the reason that it would give more room at all times and be less crowded ?—If they did not allow the two Hartlepools to make a convenience of it. They would have plenty of room in a harbour at Redcar for all the vessels that could be caught in a gale of wind on that part of the coast.

26,270. Is the advantage that you suppose a pure refuge harbour possesses over a trade harbour made into a refuge harbour, that it would have more room in consequence of trade vessels being kept out and going to another port ?—A harbour of refuge alone would be preferable a great deal.

26,271. If there was a harbour at Hartlepool ?—It would be full of steam-boats.

LONDON.

Mr. R. P. Walker.

29 Nov. 1858.

Capt. Sulivan.

26,272. Do you believe it would be used by larger vessels than can now load in the docks; that they would load inside up to a certain mark, and then make use of the trade harbour to load the rest of their cargoes?—They would do so, as sure as ever that was the case.

26,273. Would that crowd it for refuge purposes?—Do you mean, would they use the refuge harbour if it was at Redcar?

26,274. No, at Hartlepool. I say if Hartlepool was made a refuge harbour, would ships use it also for loading deeper than they could in the docks?—They could, because a great many more of those large vessels that go there and to the north would go there.

26,275. Would they load the last part of their cargoes in the outer harbour?—You might be sure that they would if they were allowed, and that would be a great disadvantage.

26,276. Would that crowd the safe anchorage for vessels?—It would: because if a vessel was running in, in a gale of wind, and the place was crowded, she would be liable to get a great deal of damage.

26,277. Would that class of vessels keep exactly the best part of the harbour, being of deeper water, which they would require?—I should say so.

26,278. For that reason should you prefer a pure harbour of refuge, such as Redcar or Filey?—That is the reason I should prefer it.

26,279. (*Capt. Vetch.*) Do laden vessels bound to the southward often get detained off Flamborough Head?—Very often.

26,280. Does it happen more often just off the Head than at any other part of the coast?—No.

26,281. Not more often?—No, not oftener off the Head than off Whitby or Scarborough.

26,282. Have you ever seen any large number of vessels off the Head trying to get southward?—Yes; as many as 200 at a time. What they call "dodging" off Flamborough Head.

26,283. Have you known them detained for any length of time?—Yes; several days.

26,284. Do many, when they are detained, go into Filey Bay and bring up?—It is very often the case, when they are not too far out.

26,285. Will a vessel so brought up in Filey Bay have occasion to go out again if the wind gets too far to the eastward?—Yes; ships anchor and go away if they can get round Filey Brigg. If not, they must ride it out.

26,286. To vessels so situated would not a harbour of refuge at Filey be advantageous?—Yes; it would indeed in that case.

26,287. How often do you think you have seen anything like 200 vessels off Filey Head trying to get to the southward?—Above a score of times I should think.

26,288. (*Chairman.*) Have you ever taken the Tyne in bad weather?—Never.

26,289. Never in bad weather?—No.

26,290. Have you ever run into Hartlepool in bad weather?—Never when it was past a steamboat getting off.

26,291. How far off Hartlepool did the sea break?—In about five fathoms water.

26,292. It breaks out in five fathoms?—Yes; I have seen it.

26,293. Do you know whether it ever breaks out further than in five fathoms?—I have never seen it.

26,294. You have seen it break in five fathoms?—Yes.

26,295. Are you acquainted with the vessels in the coasting trade?—I know that class of vessels exactly. I served my time in them.

26,296. What sort of vessels are they as to quality, good or bad?—A very poor class of vessels generally; vessels that are condemned out of all other trades.

26,297. How are they found aloft generally?—Just about as poorly as they are in hull; the generality of them.

26,298. Just as bad in the rigging as they are in the hull; is that it?—Yes.

26,299. You attribute the loss of these vessels at sea to their being indifferent vessels?—In a great many cases.

26,300. Do they overload them?—Yes.

26,301. Is overloading a common practice?—It is a very common practice now. They never carry enough for them. They hardly ever carry enough. They never consider them large enough.

26,302. I understand you to say that they do overload them very much?—Yes: rather too much so. There are exceptions. There are a great many good ones, and a great many more that are hardly fit to go to sea.

26,303. By whom are these vessels that are unfit to go to sea owned?—I cannot say. Every person. Almost every tradesman has got parts. Almost every young tradesman in these parts has part in a vessel.

26,304. You think the vessels that are owned in shares in that way are worse looked after than others?—At present, through times being so bad, they cannot afford to keep them well fitted.

26,305. The times being so bad, they cannot afford to keep them in good condition; is that it?—Yes.

26,306. Is it a common practice for servants and people of that description, who have saved a little money in the north, to put it into shares in a collier?—It is.

26,307. So that one of these vessels may be owned by 20 or 30 people?—In a great many cases.

26,308. (*Capt. Washington.*) You said you thought Redcar would be about the best place for a refuge harbour?—Yes.

26,309. Have you ever seen a drawn plan for a harbour at Redcar?—No, never. I am merely talking of the situation of the place between the Humber and the Forth. I have never seen a plan of any harbour, because I have never had any interest in it.

26,310. You take it as in the bight of the bay?—Yes.

26,311. You prefer it to either improving the Tees or Hartlepool. You very much prefer it as a site in Tees Bay?—Yes.

26,312. Or was it only that you said Redcar as part of Tees Bay?—To have a harbour of refuge at Redcar was my opinion.

26,313. I know you think that, but why do you say Redcar particularly?—On account of so many vessels being caught between Flamborough Head and there, further north.

26,314. You mean somewhere in the bight, do not you?—I mean in the bight. There are so many caught in Tees Bay, and they can generally get to the northward, when they cannot get out of Tees Bay and get to the southward. But if caught further south, they could always get back again, if they cannot get Flamborough Head.

26,315. I think you said, in answer to a question which Capt. Sulivan put, that if a large harbour of refuge was made at Hartlepool, vessels would come outside, and load up their cargoes in the refuge harbour?—I am almost sure of it.

26,316. It is very natural to suppose so, is it not?—They would be sure to take advantage of it directly.

26,317. But suppose a million of public money to be laid out upon a refuge narbour, say there or at any other place, would it be any hardship to make a regulation that ships should not do so, and enforce it under the direction of the harbour master by means of a heavy penalty; would that be any hardship?—Not at all, I should think.

26,318. The public money has a right to be laid out for the public good, has it not?—If it is to be a refuge harbour, I think it should be a refuge harbour independently of the colliers.

26,319. You would, as a sailor, think it no hardship to be placed under such a regulation if a refuge harbour was made at that part of the coast?—Not conscientiously; nor should I if I was an owner.

26,320. (*Capt. Sulivan.*) What depth of water at either of the places you have mentioned, that is, Redcar or Filey, would you consider necessary at the entrance of the harbour for a laden vessel to take it in safety in a gale of wind?—At low water?

26,321. Dead low water spring tides?—Six fathoms.

26,322. Do you think that would be sufficient for any class of vessels in any sea that you have seen on that coast at those two places you have named?—Not for any class of vessels.

26,323. I am speaking now of the class of laden colliers?—Yes, for any class of laden colliers it would.

26,324. At Redcar would the sea break inside six fathoms?—Not at six fathoms. I think it would not.

26,325. Have you ever seen a heavy sea in Filey Bay?—Never; because when I have been there it has been merely for shelter, dodging under the Head.

26,326. (*Capt. Vetch.*) Suppose there was a breakwater in Tees Bay on the line of seven fathoms, there would be no breakers inside of that, would there?—No.

26,327. (*Mr. Coode.*) Do you consider that there is less broken water off Redcar than off Hartlepool?—Yes, outside the rock.

26,328. Are you quite clear about that?—Yes; whenever I have been there, and I have been a great many times, I always saw less sea outside Redcar rocks than off Hartlepool.

26,329. That is to say, that in five or six fathoms water off Redcar you do not see so much sea as in five or six fathoms off Hartlepool; is that so?—The waves are more regular outside Redcar rocks than in Tees Bay.

26,330. You give it as the result of your experience that there is less broken water off Redcar than off Hartlepool?—Yes, I do.

26,331. Have you been there often in heavy weather?—Not such very heavy weather. I have never gone there in weather so strong that a steamboat could not get out. I have gone with a gale of wind, and then you could form an idea from the roll of the sea. That is the most that I have seen.

26,332. Then the result of your experience is, that there is less broken water off Redcar than off Hartlepool?—I think so.

26,333. Supposing that there was a small harbour at each place, and you had occasion to run for one or the other, which should you choose in a gale of wind?—Redcar.

26,334. You would rather run for Redcar than for Hartlepool?—Yes, I would.

26,335. For what reason?—Because I think there would be less sea in taking it. You are generally running from the southward, and the entrance to Redcar from the southward would be better than that to Hartlepool.

26,336. That is your reason. You think there would be less broken water?—Yes.

26,337. Would you have any question about prefering Redcar to Hartlepool?—I should prefer Redcar.

26,338. That is the only reason, is it?—That is the only reason. Taking it in a gale of wind, I think there would be less chance of a collier being pooped and running off her steerage.

26,339. (*Chairman.*) Are a considerable number of vessels that trade to the north for coals commanded by men from the river Thames or from this south part of the country?—Very few.

26,340. They are chiefly north countrymen?—Yes, if the ships are owned by London owners the captains are principally north countrymen.

26,341. So that the men on board are chiefly north countrymen?—Yes.

Tuesday, 30th November 1858.

PRESENT:

Admiral Hope (Chairman).

Captain Washington.
Captain Sulivan.
Captain Vetch.
Mr. Coode.
Mr. Evans, Secretary.

Mr. James Ware examined.

26,342. (*Chairman.*) You are the water-bailiff of the port of Bridgewater?—Yes.

26,343. And you appear here on the part of the Harbour Commissioners of Bridgewater?—The Bridgewater Corporation.

26,344. To state their views on the subject of a harbour of refuge in the Bristol Channel, is it not?—Yes.

26,345. Will you then proceed to make any statement you may wish on that subject?—All that I know, and I have an experience of thirty-six years up and down the Bristol Channel, is, that I have always thought it would be necessary to have a harbour of refuge there. I do not know any other place in the channel that is more convenient for that purpose than Lundy Island. I have many times seen 100 sail—so far back as when I went with convoy. We have been under convoy with 100 to 200 sail, and have been forced back to the Mumbles and further up in consequence of the weather blowing so strong from south-west and south-south-west we could not get shelter. If we had a harbour of refuge there we could always get under way,—on either side. We could go either to the northward or southward. Clovelly has been talked of, but I always thought it too far into the bay. I do not know a more convenient place in the channel than Lundy Island. It is mid-channel for shipping passing both up and down in gales of wind.

26,346. But were you a seafaring man yourself at any period of your life?—For thirty-six years.

26,347. And of that period how long were you in command of vessels?—For twenty-two years in one, for six in another, for one in another, and for four in another. I was mostly in the Government trade, carrying timber to Her Majesty's dockyards.

26,348. How long were you a master?—Thirty-two years.

26,349. Then in what trade were you chiefly employed—foreign or home?—I was always in the Portsmouth, Plymouth, Milford, and Chatham trade, carrying timber from Bridgewater, Chepstow, Barnstaple, and Bideford.

26,350. During the whole of that time?—Yes, during the whole of that time.

26,351. Then your opinion is decidedly in favour of Lundy Island?—Yes.

26,352. Have you ever made Lundy Island in very bad weather, running in from the sea?—Oh yes, many and many scores of times.

26,353. And it is an easy place to make?—Yes, very easy.

26,354. Is it easy and safe to make?—If we run off within a few miles, and we can always see where we are, or know by our reckoning. It is very seldom that we cannot see two or three miles off, unless it is very foggy weather; if it is any way clear, since the lights have been there, we can see them, and we have

LONDON.

Mr. J. Ware.

30 Nov. 1858.

Chairman.

a better opportunity of making it than we used to have.

26,355. Have you ever run for the land about the Mumbles in bad weather ?—Yes.

26,356. And what is your opinion of that as a land-fall to make in bad weather—Very bad indeed. I have nearly been ashore several times.

26,357. Why is it so bad ?—It is so very far to the leeward ; we are afraid to go, on account of the Skerweathers, and there is generally a great drift taking us on the starboard bow, and carrying us to leeward.

26,358. You have been inside the Mumbles ?—I have not been inside the Mumbles.

26,359. In thick weather, in the daytime, is there anything in the land to prevent you ; is it not high land ?—Yes.

26,360. Then is it not easily made ; is there anything that prevents it being less easily made than other high land ?—No ; sometimes I have been at the Mumbles when we could not see the land : we have seen the sea break in when we could not see the opening of the harbour or knew where we were.

26,361. But is it worse at the Mumbles than anywhere else on that part of the coast ?—No, not worse than it is from that to Ram Head, or for 15 miles along. We call it running so many miles to leeward when vessels are over by Lundy Island, and it is hard to run back again 35 miles on a lee shore.

26,362. In the upper part of the Bristol Channel what kind of anchorage is there ?—Whereabouts do you mean ?

26,363. About the Holmes ; what kind of anchorage is there ?—Oh, there is very good anchorage ; everywhere above the Holmes on to Pentreath there is anchorage.

26,364. But is not, in point of fact, the whole of the channel above the Holmes a harbour of refuge in itself ?—You can always stop a tide in the tideway, but you don't lie in an open roadstead like that, in consequence of the tide running so strong there.

26,365. But, supposing a ship running in from south-west, is there anything to endanger her safety besides the tide if she lies there ?—She would lie under the Flat Holmes, where there is a roadstead ; in general, large ships lie there ; I have seen Government ships there.

26,366. Did you ever know an accident happen to a ship lying there, in that part of the Bristol Channel ?—Not while lying at anchor.

26,367. Have you ever rode out a gale of wind there in the Bristol Channel ?—No, only at Penarth.

26,368. Do you know Milford ?—Yes.

26,369. Have you ever made Milford Harbour in bad weather ?—Yes, I have been in and out of the harbour.

26,370. And would not anchor ?—Yes.

26,371. Why ?—Because it blew so hard.

26,372. You could not fetch far enough in to anchor ?—No ; I was obliged to come out again.

26,373. What kind of a place is Milford to make ?—It is like all other places when the weather is fine, and you can see the light.

26,374. But in thick weather, what kind of a place is it to make ?—We cannot make it well in thick weather, the fog hangs about it.

26,375. Is it what is called a blind harbour ?—Yes ; we are obliged to go off to sea. I have sometimes been close in to the Head, and could not see the top, and have been obliged to go off again to sea, and wait a few hours.

26,376. You are well acquainted with the coast between Hartland Point and the Land's End ?—Yes.

26,377. Supposing you had a harbour of refuge at Lundy Island, where would be the best place of shelter for a vessel caught on that coast with the wind on shore between Hartland Point and the Land's End ?—There is Padstow. I have run into Padstow. St. Ives is a good place.

26,378. Which is the best, do you think, Padstow or St. Ives ?—Why, I can hardly say. I have been to Padstow when it has been blowing a gale of wind right in, but it is bad getting in. You can beat into St. Ives Bay better. But a harbour of refuge would be outside, and you would not want to get in.

26,379. But to repeat my question. Between Hartland Point and the Land's End where would be the best place to spend money upon in forming a harbour of refuge to give shelter to vessels caught there with the wind on shore ?—I should say St. Ives.

26,380. And would a vessel always be able to get to St. Ives ?—Oh no ; sometimes there are 200 or 300 vessels lying off the Land's End and obliged to beat about or run for the Scilly Islands.

26,381. How many vessels have you seen off the Land's End so circumstanced ?—I have seen as many as 200 sail there.

26,382. At anchor ?—At anchor and beating about, not all at anchor.

26,383. When you say at anchor at the Land's End, where do you mean ?—At Whitsand Bay.

26,384. Where is Whitsand Bay ?—Just to the eastward of Longships, between that and the Brizons.

26,385. How many vessels have you seen at anchor there at one time ?—I have seen 100 sail, and as many working off and on, when I have seen a fleet of vessels meet from each way, down the Bristol Channel and from Liverpool.

26,386. These Liverpool ships you speak of are coasting vessels ?—Yes.

26,387. I suppose the foreign traders from and to Liverpool never come near the Land's End ?—Oh yes, when they are bound to the English Channel.

26,388. You mean those which are for the western foreign trade ?—Oh no ; they go round by Cape Clear, they never touch the Land's End.

26,389. (*Capt. Washington.*) You belong to Bridgewater, do you not ?—Yes.

26,390. What is doing at Burnham now ?—They are repairing the causeway, and making up and new building the quay.

26,391. Is there any intention of making a large harbour there ?—I do not know ; they have been speaking about it ; they have been talking about going to Parliament for a bill, but I do not know anything about it.

26,392. You do not know anything about it yourself ; you have not been consulted ?—No ; all I know is from hearing the Burnham people speak of it.

26,393. The Burnham people and the Bridgewater people are separate, are they not ?—Oh no. I am opposed to the causeway, for I was driven ashore there.

26,394. The causeway projects too far out, I suppose ?—It is two feet high and eighteen feet long, and vessels bringing up drive on shore there. It was said there is no sea there, but there has been 500*l.* damage since.

26,395. Since the causeway was placed there ?—Yes.

26,396. You mean that the damage was done to the shore, not to the vessels ?—Yes, to the shore.

26,397. Has any vessel been driven on the causeway ?—No ; I think it will do good sometime. The Bridgewater people are not against it.

26,398. You speak of a good many vessels being anchored at Whitsand Bay, lying off the Brizons ?—Yes, a great number.

26,399. Have you ever been anchored there yourself ?—Yes.

26,400. That as a stopping place ?—Yes, as a stopping place.

26,401. Is it not very much exposed ?—Yes, and the anchorage brings home such a surf.

26,402. Would a stopping place there in that neighbourhood, or a harbour of refuge at any point of the Land's End, not be useful ?—I am afraid not ; I think the surf is too great.

26,403. I speak of the coast anywhere within ten miles of the Land's End ; at St. Ives, for instance ?—

At St. Ives it would. There is a fine bay there, and the stones run out. You are sheltered from the easterly winds.

26,404. If anything is to be done in that neighbourhood, then you think St. Ives Bay the best place?—Yes.

26,405. Have you been there since the light was placed there?—No, I have not been at sea for the last 14 or 15 years.

26,406. What was the tonnage of the vessel you commanded?—About 135 or 140 tons.

26,407. I think you said you had been in a convoy that was forced back to the Mumbles?—Yes.

26,408. How far had you got?—Below the Mumbles, with the wind north-north-west.

26,409. Where were you going from?—From the Mumbles.

26,410. But what port had you sailed from?—From Bridgewater.

26,411. How came you then on the north side?—When the wind is north-north-west we cannot get down the channel, and we run away to the Mumbles, where there is good shelter until the wind comes round to south and south-south-west.

26,412. Is that the usual practice with vessels sailing from Bridgewater?—Yes, and from Bristol.

26,413. And from Penarth?—Yes, because then you get the wind, and get down to Lundy Island.

26,414. I think we were told in the Bristol Channel that no vessel went near the Mumbles that could help it; is that your experience?—No, a great number go there.

26,415. What number have you seen there?—About 200 sail.

26,416. Is that a common occurrence?—No; sometimes with long southerly winds blowing I have seen 100 to 150. There is a great many go into Swansea.

26,417. Then the Mumbles road is still found a useful shelter for vessels navigating the Bristol Channel?—Yes.

26,418. But your opinion is, that if one harbour of refuge is formed in the channel, Lundy Island would be the right place?—Yes, because it is in the middle of the channel.

26,419. The middle of the whole channel?—Yes, of the whole channel.

26,420. You are speaking of the upper part of the channel, are you not?—Yes.

26,421. Do you think anything is wanted further seaward, further down,—at St. Ives, for instance?—It would be an excellent thing if it could be done.

26,422. Would it be the means of saving many lives?—I should think there are many lost there. I should think there are a great many vessels lost inside Hartland Point that cannot get off. I have been in company with two vessels that were lost there.

26,423. You have been in company with two vessels that were lost on that part of the coast of Cornwall?—Yes, they got embayed.

26,424. Where?—In Bude Bay.

26,425. Would a harbour of refuge at St. Ives have saved these vessels?—Yes, if they had gone there.

26,426. Would they have gone there if there had been a harbour of refuge there?—I don't know. I can't say.

26,427. Do you think if harbours of refuge were placed round about the coast, vessels would try to make their passage so as that they could run into them if bad weather came on?—Certainly.

26,428. And that a harbour of refuge placed at a good spot would be a more direct benefit than at first sight appears?—It would.

26,429. Have you ever been anchored under Lundy Island yourself?—Yes, many a time, lying out there and anchoring there; and I have been to the eastward, running under double-reefed canvas, not being able to get up. I did not like to go to Padstow.

26,430. (*Capt. Sulivan.*) What gales do you specially want refuge from in the Bristol Channel?—South, south-south-west, south-west, west, and west-north-west.

26,431. Does not Lundy Island afford a good anchorage with these winds?—Yes, from south-west, but people are afraid of the wind coming in.

26,432. You mean shifting to the eastward?—Yes. It is like Dublin Bay. See what an excellent place that is. When I went to sea how many vessels were lost there; but now it is an excellent harbour of refuge, on account of the breakwater.

26,433. In your experience, where have you known the greatest loss of life in the Bristol Channel,—above Lundy, or between Lundy and the Land's End?—Above Lundy.

26,434. What part?—In Tenby Bay.

26,435. That is below Lundy?—No.

26,436. I speak of the Bristol Channel proper; that is, the narrower part of the channel above Lundy Island, between the Nash and Bristol; where have you known the greatest loss of life,—there, or between Hartland Point and the Land's End?—I think we have more lost up above the Nash and Thorney Point, and up along there.

26,437. Where is that?—Up above the Nash lights.

26,438. Have you known any case, of your own knowledge, of vessels that have put back from Lundy that have been wrecked there with loss of life?—I cannot say; I may have forgotten.

26,439. Have you of your own knowledge known any vessels wrecked between the Land's End and Lundy?—I have heard of them.

26,440. I do not mean to ask you if you saw them, but do you know from information that many vessels have been wrecked in that locality, with loss of life?—Yes. We had one from Bridgewater lost there.

26,441. With loss of life?—Yes, with loss of life.

26,442. What gale was it that you were anchored in,—in the bay you described near the Land's End, Whitsand Bay?—I did not anchor during that gale.

26,443. No, but some vessels you told us were at anchor?—Yes, that was with an easterly wind.

26,444. Then you would not want a harbour of refuge at St. Ives or on the west coast of Cornwall with these winds. No vessel is in danger of being lost with these winds?—No, they are in danger of driving out; several were driven out during this gale, and driven over to Crookhaven or Baltimore.

26,445. The danger is being driven out to sea?—Yes.

26,446. But for a refuge to save life you want a harbour where the gales are on the land?—Yes.

26,447. Then the north-west gales are, I suppose, the most dangerous gales on the coast?—Yes, the north-west would be.

26,448. Then St. Ives Bay would be the best place?—Yes.

26,449. If an anchorage was made at St. Ives Bay, do you think that vessels bound down the coast would be far enough to windward to fetch into it?—Oftentimes I have been myself down there for Bridgewater, and been forced to go back to the Mumbles again.

26,450. But with a north-west gale a vessel might not be able to weather Hartland Point?—She might not be able to weather it out when you take a lee tide.

26,451. With north-west gales a vessel might find a difficulty in weathering Hartland Point?—Yes.

26,452. But vessels caught between Hartland and St. Ives with such a wind would be in danger?—Yes.

26,453. Would Padstow form a desirable harbour of refuge?—Yes.

26,454. Do you know the difficulty of entering Padstow?—Yes, with the wind north-west and north-north-west. There is a sand called the Doom-bar, and I have known many vessels get on it.

26,455. Have you ever experienced any difficulty in high gales from the north-north-west from the wind being suddenly eddied by the Point?—No, I

LONDON.

Mr. J. Ware.

30 Nov. 1858.

Capt. Sulivan.

have never attempted to run in there with such a wind.

26,456. If the entrance to Padstow could be made safe with north-west gales for vessels to enter, would it then be a very desirable harbour of refuge ?—It would be, if you could make it so. But you could not make it so while the Doombar is there, unless you made it outside by the island. The entrance is very narrow there.

26,457. (*Capt. Vetch.*) I think you mentioned that you had taken refuge under Lundy Island ?—Yes.

26,458. How often have you done so ?—Once or twice in a year.

26,459. Once a year, how long ?—Sometimes I have been there two days at a time, sometimes more, and sometimes only a tide.

26,460. What is the greatest number of vessels you ever saw there at any one time ?—Never more than a dozen.

26,461. How long do you say you have been kept there at anchor ?—Two days, and sometimes a day.

26,462. Waiting for a wind ?—Yes, and then we ran away to Milford or back to the Mumbles, for we were afraid to lie there, because the wind set in sometimes a whole week together.

26,463. Then you think Lundy Island would make a good harbour of refuge ?—I think it would.

26,464. Is it not so now ?—No ; when the wind comes round any way to the south, you must go off and run up channel, or away to Milford if you are bound for the Land's End.

26,465. What would be necessary to make it a good harbour of refuge ? What works do you think would be necessary ?—I was thinking it might be done like Kingstown in Ireland.

26,466. That is, to enclose it on all sides except one ?—Yes.

26,467. Except an opening in the middle ?—Yes.

26,468. That would be very expensive ?—That is what I say.

26,469. Is not the island two miles long ?—2¾ miles, and there is shoal water at two points. It is shoal water from Rat Island to the one point, a distance of 1¾ miles.

26,470. I believe the great difficulty there is, that the vesssels drag their anchors ?—I never knew them to drag their anchors. I have known them to part from their anchors.

26,471. Would not the fact of laying down moorings obviate that difficulty ?—It would do great good for the vessels to make fast to.

26,472. And at small expense ?—Yes, at small expense.

26,473. You spoke of Whitsand Bay ; did you ever lie there ?—I have lain there a day or so, and ran for the Scilly Islands. I have frequently run for the Scilly Islands when we could not get up channel.

26,474. That would be only in easterly winds ?—Just so, in easterly winds, when the wind is east-south-east.

26,475. And with regard to St. Ives,—did you ever take shelter there ?—Yes.

26,476. I believe that is very open at present to the north-west, is it not ?—Right open to the north-west. They did begin to make a breakwater there themselves, years ago.

26,477. If it was protected by a breakwater, would it then be a valuable place for vessels to shelter in ?—Yes, the breakwater would take away the north-west sea, and the bay shelters you from the east ; and it is a convenient place for getting round the land for ships and vessels.

26,478. You have also been asked about the Mumbles. You say that at certain times that proves a very useful place for vessels to reach when waiting for a wind ?—Yes.

26,479. But it is rather shoal at present, is it not ?—Yes, it is dry at half tide.

26,480. If it could be deepened and dredged, and a little more sheltered by works, it would be a much more useful place, would it not, than it is now ?—Oh yes, for large vessels strike now sometimes at low water, but the small craft lie aground there dry.

26,481. You have spoken of the Padstow Harbour, I suppose you have often been in there ?—Not more than seven or eight times in my life.

26,482. Did I understand you to mention that you had been on the Doombar Sand ?—Oh no, I was never on it ; if I were, I should be afraid of getting off again. I have been there ; in easterly winds everything tacks off Lundy Island.

26,483. But if the Doombar could be removed altogether it would be a useful place ?—Yes ; but I recollect many years ago they tried to do that and could not succeed.

26,484. (*Mr. Coode.*) You said you had been to Padstow several times ?—Yes.

26,485. When you went to Padstow did you run for shelter or did you go there in the ordinary course of trade ?—I have run there for shelter many times. I was once forced to run in, in the middle of the night, or we should have foundered.

26,486. When you say forced, could you have got to no other place for shelter ?—No ; I was in a brig which was leaky, and she made so much water that I was forced to run in, about 12 o'clock at night.

26,487. Do you mean to say that vessels in the bay cannot run for anywhere else ?—Oh yes, they can run down channel, but I was forced to run in or sink.

26,488. Now, speaking of the two positions quite irrespective of their natural facilities for making a harbour, which would you prefer, supposing it could be made at Padstow as readily as at St. Ives, and at St. Ives as easily as at Padstow, at which place would you have it, if you had your choice ?—I should still prefer St. Ives.

26,489. You prefer St. Ives ?—Yes.

26,490. Why so ?—We are often getting down to St. Ives, and if we had the harbour there we should have something to look to. In heavy gales we get further down.

26,491. Is it a fact that the heaviest gales in the channel come from the southward and the westward ?—I suppose they do.

26,492. And if you were off Padstow and caught by westerly gales, would you be able to fetch St. Ives ?—No, nor Padstow either.

26,493. Then it would often occur that you could not fetch either one or the other ?—It would.

26,494. What would you do under such circumstances ?—Go away for the Mumbles.

26,495. And suppose there was a harbour at Lundy Island, could you fetch it ?—Yes, I should then go for Lundy Island. If close to Hartland, I should then go for the Mumbles.

26,496. What were the circumstances attending the loss of the Bridgewater vessel you spoke of just now ?—She foundered.

26,497. She did not get ashore ?—No, she went down.

26,498. Had she been beating about long in heavy weather in the channel ?—No ; she was coming up channel, beating up when she went down, and all hands on board were drowned.

26,499. But that is not a case, then, in which the vessel would have been saved, had there been a harbour of refuge ?—No.

26,500. You said just now that many vessels were obliged to go to Padstow. Do you think those vessels would be able to fetch St. Ives as well as Padstow ?—No, or they would not go to Padstow.

26,501. They only go to Padstow, then, when they are forced there ?—Yes.

26,502. Is not that an argument for making a harbour of refuge in that locality ?—I think there are more vessels caught down by St. Ives than near Padstow.

26,503. Just so, and therefore you think a harbour at St. Ives preferable ?—Yes.

26,504. With regard to those vessels you referred to as being caught in Whitsand Bay, would they have gone there, do you think, if there had been a harbour

at St. Ives ?—Perhaps they would not have gone down. If the weather was blowing hard they would probably have gone into St. Ives.

26,505. But if they had passed St. Ives and had got as far as Whitsand Bay, could they have got back to St. Ives ?—They could not.

26,506. They could not get back with an easterly wind blowing ?—They could not.

26,507. But would have gone into St. Ives, you think, as they went down ?—I should say so.

26,508. Is it a common occurrence to see anything like 200 vessels off the Land's End at Whitsand Bay ?—Oh no ; but this wind prevailed for five or six weeks.

26,509. When you spoke of making a harbour at Lundy Island similar to that at Kingstown, you did not, I presume, propose to throw a pier out from the south, and another from the north point of the island ?—Oh no.

26,510. What is your idea of the position in which the harbour should be placed ?—I would run the south pier out from Rat Island and the north pier from Tibbet Point.

26,511. If a harbour of refuge were to be formed at Lundy Island, for how many vessels do you think it should be made to provide ?—About 100 sail.

26,512. You think that would suffice ?—Yes, I should think so.

26,513. You have seen large vessels brought up under Lundy Island, or dodging about there ?—Oh yes ; I was brought up there on one occasion with a large brig, or I should have been obliged to run away for Milford or forced to the Mumbles.

26,514. Have you not known any instances of vessels parting from their cables and losing their anchors at Lundy Island ?—No.

26,515. I think you said you knew of no instances where the vessel dragged her anchors ?—No.

26,516. From your experience of Lundy Island, then, do you say it is good holding ground ?—I should say so, speaking from my own experience.

26,517. For small vessels ?—Yes, small vessels we bring up well now.

26,518. You never found the holding ground bad or indifferent ?—No, not where I brought up ; but I cannot speak to it in deeper water.

26,519. You said that you had been down to St. Ives and driven back to the Mumbles ; has that happened more than once ?—I don't know exactly. I have got back to Milford again many times.

26,520. Were many vessels in company with you ?—Oh yes, a great many. We cannot beat back, you see.

26,521. How many vessels have you seen so circumstanced at any one time ?—We have gone out with about 100 sail perhaps, but have soon lost each other ; some would sail faster and some slower than others.

26,522. Where have you generally sailed from ?—Some from the Mumbles, and some from Milford.

26,523. Have you known any vessels lost or foundered through being driven back ?—No.

26,524. You say that you give a decided preference to St. Ives, from Lundy downwards, for a harbour of refuge ?—Yes.

26,525. Taking the British Channel as a whole, you prefer, first Lundy, and then St. Ives ?—Yes.

26,526. (*Capt. Sulivan.*) Do you think it desirable that any harbour of refuge should have its entrance placed in such a position that vessels taking the entrance should go in with a fair wind ?—Where ?

26,527. Anywhere. Would it be necessary that all vessels using the harbour should have a fair wind in ?—You cannot at all times do that.

26,528. If you have a harbour of refuge at Lundy, the entrance must be on the eastern side ?—Yes.

26,529. And if you had to put back with westerly gales you would have to work up into the harbour ?—Yes, but you are under the lee of the harbour.

26,530. Could any disabled ship work into the harbour if she was on the lee side ?—Not if she was disabled, but she would have a buoy or something put down to assist her.

Mr. Charles Hunt examined.

26,531. (*Chairman.*) You are a seafaring man ?—Yes.

26,532. How long have you been at sea ?—Twenty-five years.

26,533. Are you still following the sea ?—Not now.

26,534. Are you a shipowner, or connected with shipping in any way ?—I am a shipowner.

26,535. How long have you been in command of vessels ?—For 15 years.

26,536. In what trade were the vessels which you commanded chiefly employed ?—In the coasting trade, in the Bristol Channel.

26,537. What description of vessels were they ?—Coasters of about 100 tons, about 60 or 70 tons register.

26,538. Schooners ?—Schooners and brigs.

26,539. You have heard the evidence of the last witness ?—Yes.

26,540. Do you generally concur in the reasons which he has given for placing a harbour of refuge at Lundy Island ?—Yes.

26,541. Have you anything to state in addition to the reasons he has already given ?—No. There was one question which you put respecting loss of life ; I think the greatest loss of life occurs between Lundy Island and the Land's End.

26,542. Is not the whole of the channel about Lundy Island nearly a harbour of refuge in itself ?—It is very nearly so.

26,543. Supposing a vessel in a heavy south-west gale runs in and drops anchor anywhere near the Nash lights, she can hardly come to mischief with good scope of cable and ground tackle ?—She would not stop ; she would run up the channel for Penarth. It is clear up the channel at any time. There is high land in some parts, and you can go in shore so close that you can throw a biscuit on shore, and shape your course to Penarth, where you have not the difficulties you find at the Mumbles Head.

26,544. If you are running with a heavy breeze, would you run for the Mumbles or for Penarth ?—I would not run for the Mumbles with a good ship ; I should be afraid.

26,545. Where would you run for in preference to the Mumbles ?—Right up the channel to Penarth.

26,546. Supposing a ship to drop anchor in 14 fathoms water abreast the Nash lights with a heavy breeze right in, is there any sea that could do her a mischief ?—No.

26,547. With good ground tackle and scope of cable ?—No ; the only difficulty is the strength of the tide, and the ship getting athwart and rolling heavily.

26,548. But still there is not much sea there to hurt a vessel ?—Not much.

26,549. Not a good ship ?—No.

26,550. Have you seen any sea in the Mumbles hurt a ship ?—Yes.

26,551. From what direction ?—If it blows strong from the south-west there is a very nasty sea.

26,552. Have you seen ships part there ?—Yes, and drive ashore ; I have had my own ship ashore ; I have known 20 at one tide.

26,553. Therefore for the Swansea shipping some additional protection is necessary ?—Yes ; Swansea is a little harbour of refuge for small vessels. No stranger would ever run for the Mumbles in dark weather, for, if you happen not to sight the land, you have so much to encounter. The south-west weather is often so thick and dirty that you cannot see the length of the ship, and you are in amongst the breakers before you are aware of it ; you don't know

LONDON.

Mr. C. Hunt.

30 Nov. 1858.

Chairman.

whether you are too far to the east or to the west. There is the Helwick, a long dangerous sand, and I have known vessels coming to Swansea get ashore. At the Mumbles Head there is a sand, and not far from the Mumbles Head there is the Skerweather Sand; so that you have a narrow channel through which to find your way to the Mumbles, and sometimes vessels coming up channel will get on the Skerweathers.

26,554. Are these the grounds on which you think the Mumbles a bad place for a harbour of refuge?—Yes, on account of the danger of running for it in thick weather. At this time of the year, and with strong south-west gales, which are generally thick and dirty, you can scarcely ever see three times, the length of the ship, and the tide runs rather unruly.

26,555. From Hartland Point to the Land's End where is the best shelter for shipping going round the Land's End?—From Hartland Point to the Land's End?

26,556. Yes. Where would be the best place to find shelter for shipping in an on-shore wind?—Padstow would be a very good place, and if you could make a harbour there we should be very thankful. I should say the same with respect to St. Ives and Lundy Island. If you come to the point whether there should be one or three harbours, I shall be able to answer.

26,557. I put Lundy Island out of the question for the present, and ask, which is the best place on this district of coast between Hartland Point and the Land's End?—I should say St. Ives Bay.

26,558. In point of fact, a ship caught with an on-shore wind to the north of Padstow would always be able to get into St. Ives Bay?—It would be very hard if she could not get either to Padstow or St. Ives. If not, she must get ashore. Sometimes the weather is so bad that, even with a harbour of refuge under your lee, you cannot get into it; that is the case in thick and snowy weather. When a vessel is leaky it is sometimes a difficult matter to get into a harbour.

26,559. But you think St. Ives would be a most useful place?—I think if a harbour were made there it would be the means of saving a great deal of life and property. I have no interest in the matter, and wish to answer the questions in a straightforward manner.

26,560. (*Capt. Sulivan.*) Do you know Padstow yourself?—I never was in there. I have passed it several times. I have been close in, and know all about it.

26,561. I mean with respect to the difficulty of entering with a north-west wind?—I don't know how that can be altered.

26,562. Do you know anything of the difficulties of the entrance?—Yes; going in you are so close under the land, and the channel is so narrow, that the eddying wind drives the vessels over the Doombar.

26,563. The difficulties would be averted if vessels could get a cable's length inside the Doombar when she is met with the baffling wind?—Yes.

26,564. If the point could be cut down quite low, and to a sufficient distance to carry a steady wind a cable's length further in, would the harbour be safer to enter as a place of refuge?—I am afraid not, because vessels going in, go in under canvas, and it would be difficult to cut away such a quantity of the point as to get a true wind.

26,565. But supposing you could carry in a steady wind by cutting away the point, would that obviate the great difficulty?—I am not prepared to answer that question, and think it better to leave it alone.

26,566. (*Chairman.*) I think we have nothing further to ask you, Mr. Hunt. The last witness went so fully into the matter, and you so entirely agree with him, that we have no wish to detain you further. There is nothing further that occurs to you, as I understand?—With respect to Whitsand Bay, I have had vessels there in easterly gales. If there had been a harbour of refuge at St. Ives, the vessels would have gone there in preference to lying in Whitsand Bay. One of my captains says that several vessels drove away, the anchors and cables having parted. Some of the vessels went to the Scilly Islands, and others to different places. If there had been a harbour these vessels would have gone into it.

26,567. (*Mr. Coode.*) With respect to the saving of life and property, would you prefer St. Ives, or Padstow, as a harbour of refuge? I am not speaking of their relative engineering facilities, but, from your knowledge of the coast, I wish to know which place you would select?—St. Ives.

26,568. You think St. Ives better than Padstow?—Yes.

26,569. Do you agree with the last witness, that if a harbour were made there, many vessels would put in during doubtful weather, and not run on with the chance of being brought up in Whitsand Bay?—Yes.

26,570. There is great danger when 100 vessels bring up in that small space, of their running into each other and doing considerable damage?—My captain says there were three or four steamers there, which could not steam up channel, but were in Whitsand Bay.

26,571. When did your captain write to you?—About 10 days ago.

26,572. Was there any damage done on that occasion?—Yes; he lost an anchor and cable, and tells me that several other vessels parted from their cables and drove away.

26,573. Do you think that much of that damage might have been avoided if there had been a harbour of refuge at St. Ives?—Yes; the vessels would have run in. It blew so hard that they could not get to Mount's Bay, and sometimes they run for Scilly.

26,574. They would run into St. Ives?—Yes.

Mr. JOHN W. ARNOLD examined.

Mr. J. W. Arnold.

26,575. (*Chairman.*) What is your present occupation?—I am a Trinity House pilot.

26,576. How long have you occupied that position?—Four years.

26,577. Previous to that how were you employed?—In the coal trade.

26,578. How long were you engaged in the coal trade?—Five years.

26,579. As mate, or in what capacity?—I was for three years mate in the coal trade.

26,580. From what ports did your vessel sail?—From Shields to Woolwich Dockyard, and Chatham and Sheerness.

26,581. How long were you employed in the fishing business?—About 10 years.

26,582. Where were you so employed?—Along the coast, in luggers,—from the Farn Islands to the North Foreland, on the whole of the north-east coast.

26,583. Where would you put a harbour of refuge between Flamborough Head and the Farn Islands?—If I had to place a harbour of refuge I should decidedly say Filey Bay.

26,584. Why?—Because it would be more in the direct track of the shipping at Filey than at any other part of the coast.

26,585. Taking the coast from Flamborough Head to the Farn Islands, what is the wind that blows dead on shore?—The east-north-east.

26,586. The east-north-east blows dead on shore?—Yes; or the east by north, as near as can be.

26,587. Now supposing a vessel to be caught somewhere between Whitby and the Farn Islands, embayed there, of what use to her would be a harbour at Filey, with the wind dead on shore?—If a man knew there was a harbour he would persevere and get there.

26,588. But how could he do that if he could not weather Whitby Head?—A man coming there with

a good harbour would persevere and get there if possible.

26,589. But if he could not?—I should say he would then go back again.

26,590. Where to?—Hartlepool; but I should prefer going to Shields at once.

26,591. You say you would prefer a harbour in Filey Bay. What I want to know is this: with the wind on the shore on that line of coast how would a vessel be able to make Filey, if she was in danger of going on shore? What use would Filey Harbour be to her?—A heavy gale of wind always gives some hours' warning, except it is going to be a south gale. That perhaps will only last a few hours, and is of no consequence till it gets round to south-south-west, then it ends with lots of rain. If the wind goes the other way, we expect two or three days of it to the east and the east-north-east, and from that to the north-east.

26,592. I understand you to say that a vessel knowing there was a harbour at Filey Bay would get a sufficient offing to fetch it before the wind came on?—Yes.

26,593. Have you ever taken the Tyne in bad weather?—I have.

26,594. More than once?—Once or twice.

26,595. Give us some account of the worst time you ever took the Tyne?—I cannot give exactly the date when that was.

26,596. I do not want the date. Tell us how it happened?—We were caught down there. We had hove to in the night, waiting for water, and were forced to go in in the morning. We could not keep off the land any longer, and of course we had to go in through the broken water. There were a great many vessels there in the same predicament, all wanting to go out together, and the consequence was there was many foul of one another. I did not get any damage going in.

26,597. Was it blowing very hard?—Yes.

26,598. What time of the tide did you run in?—About a couple of hours before high water.

26,599. Were you light or loaded?—Light.

26,600. What sail did you run in under?—Under a foresail and a close-reefed maintopsail.

26,601. And what sail had you been heaving to under?—Under a close-reefed maintopsail and a fore-topmast staysail.

26,602. When you run in were you in danger of incurring any mischief?—The vessel was a very handy vessel, but some of the others—most of them—are very bad vessels to go in with in such a case as that. They almost all broach to.

26,603. Were your men placed in the rigging on that occasion?—No, I don't recollect that they were.

26,604. You did not put them up in the rigging?—No.

26,605. There was no necessity for that?—No.

26,606. Did you ever run into Hartlepool in bad weather?—No, I never did.

26,607. Have you ever been in the bay in bad weather?—Yes.

26,608. When?—I had a specimen of it a few days ago.

26,609. In the *Banshee*?—Yes.

26,610. Was there a heavy sea?—Yes.

26,611. What water were you lying in?—About four and a half fathoms at low water.

26,612. What distance were you from the shore?—I should think about half a mile from the Heugh, and I suppose about a third of a mile from the Longscar buoy.

26,613. Did the sea break outside of you?—Yes.

26,614. How far?—About a third of a mile outside, when we were lying there, and before we could get outside of it.

26,615. (*Capt. Sulivan.*) Do you know if the greatest loss of life happens in loaded colliers?—I think that is so.

26,616. Do the loaded colliers often get up to Flamborough Head before they meet bad weather, and collect there in great numbers?—Yes; they generally sail from the coal ports with a slant of wind. That brings them up to Flamborough Head, and three times out of five they catch the wind southerly, and get there in a lump together.

26,617. Are many vessels lost in putting back after getting up to Flamborough Head?—Yes.

26,618. For vessels under these circumstances would Filey be the best place for a harbour of refuge?—Yes; I think so.

26,619. For light vessels bound to the north, caught in east gales, would a harbour somewhere in the bight be better?—I think if the Tyne and Hartlepool were improved they would answer the purpose for light vessels, for light ships.

26,620. But if there were a harbour of refuge at Hartlepool and another at Filey, which do you think would save most loaded vessels?—One at Filey.

26,621. Do you think that the persons generally on the coast who are unconnected with the coal ports would prefer Filey?—I think so.

26,622. For loaded vessels?—I think so.

26,623. Have you ever heard such an opinion expressed?—I have.

26,624. Have you spoken to any persons on the subject?—I have spoken to captains of the Woolwich vessels trading constantly to Newcastle. They are in the habit of making about sixteen voyages a year, and are more along the coast than any other class of colliers.

26,625. Have you found them generally prefer Filey?—Yes.

26,626. Have you never heard them speak of any place in the bay as desirable?—I have heard them speak of it, but they generally give a preference to Filey.

26,627. Do you think any one harbour, either at Filey or in the bay, would save a large portion of the vessels that require shelter?—I think one at Filey would do so.

26,628. Do you think that a harbour at either of the places would be as good as a moderate though even smaller harbour both at Filey and in the bay?—The more harbours the better, of course.

26,629. But if you had your choice between one large harbour at Filey, say, and a smaller harbour, but one sufficient to take loaded colliers at all times, at Filey and somewhere in the bay, which would you prefer?—I should prefer a large harbour at Filey, with an improvement at Hartlepool and the Tyne.

26,630. But supposing these harbours could not be improved, and you had to make some shelter, would you prefer two smaller harbours, one in the Bay and the other at Filey, to a large harbour at Filey alone?—I should prefer a large harbour at Filey.

26,631. Would a harbour of refuge at Filey be of great advantage to the off-shore fishing vessels?—Yes, very great. They come from Penzance, and round the whole coast of England, and go to the Scarborough herring season. I believe 600 or 700 of these vessels go out every night in September and October. They are often caught, and have no place to go to except Scarborough, and nine out of ten get into the Humber.

26,632. For all that class of vessels would Filey be the best place?—Yes, decidedly the best place.

26,633. (*Capt. Vetch.*) Between the Farn Islands and Flamborough Head, with the wind directly on shore, you are of opinion that a shelter in Filey Bay would save more vessels than at any other site?—More loaded vessels.

26,634. Do you know the distance between the Farn Islands and Filey Bay?—I should say 90 miles.

26,635. Suppose it to be 90 miles, and suppose there are five ships in every mile, and the gale is dead on shore, how many vessels would Filey save out of that number?—I think, supposing these vessels to be between the Farn Islands and Filey, that a great number of them would get back again to their own ports, such as the Tyne and Hartlepool, before the

LONDON.

Mr. J. W. Arnold.

30 Nov. 1858.

Capt. Vetch.

weather came on very bad, because such gales generally give some hours' warning.

26,636. Do you think that vessels that had reached Whitby would be able to get on to Filey ?—If not, they would go Hartlepool or the Tyne.

26,637. Which place within these 90 miles would catch the most vessels ?—Provided the vessels had not got so far as Filey, Filey would be of no use ; but nine times out of ten they generally happen to be that far.

26,638. It would save all the vessels that had got so far as that ?—Yes ; and the others would persevere and get there if they could. If not, they must go back to their own ports. They could reach Shields or Hartlepool.

26,639. (*Mr. Coode.*) Is it the fact or not, that there are more vessels detained at Flamborough Head than on any other part of the coast ?—Yes.

26,640. And what proportion of vessels would Filey serve ?—For loaded vessels.

26,641. You were asked, if there were five vessels in each mile along the coast between the Fern Islands and Flamborough Head, what number Filey would save ; do you think vessels are ever caught equally distributed along the coast in that way ?—No.

26,642. Is it not a matter of common occurrence that vessels are caught in large numbers at Flamborough Head ?—Yes.

26,643. In large fleets ?—Yes.

26,644. How many have you seen there ?—From 400 to 500 sail.

26,645. Has that been a solitary occasion ?—Once. I have frequently seen from 200 to 300.

26,646. Have you been detained there yourself ?—I have.

26,647. Have you been detained for any time ?—For three or four days. I have been brought up in Filey Bay.

26,648. Have you had any great number brought up with you ?—About 200 sail.

26,649. Is it a fact that vessels seldom leave the coal ports till there is a reasonable chance of fetching the Head ?—Yes, they generally leave these ports with a slant of wind.

26,650. And if there is not a reasonable prospect of making the Head, they do not leave their ports ?—No.

26,651. (*Chairman.*) I think you said you had sailed from Gravesend in the coal trade ?—From Woolwich, rather.

26,652. Did the men who commanded the vessels in which you sailed belong to the south country or the north ?—The man I sailed with lives in the north certainly, and is a native of Shields. They generally belong to Woolwich, because the ships belong to Woolwich.

26,653. They are north countrymen generally ?—Yes.

26,654. That is the case generally with the London colliers ?—Yes.

26,655. That the masters and mates are north countrymen ?—Yes.

26,656. As respects the state of the vessels employed in the coal trade, what sort of vessels are they, generally speaking ?—Those I have been accustomed to were good sea boats, and made no water ; they made the whole passage without water.

26,657. There is no reason why a collier should be leaky if she be a well-constructed vessel ?—None.

26,658. There is no reason why she should be always pumping ?—No.

26,659. Are there many vessels in the trade like those you have described ?—I think a great part of the colliers are rattle-trap things ; most of them, I think. They are vessels worn out in another trade, and put into the coal trade afterwards.

26,660. Are a considerable number of them very bad ?—There are some I should not like to trust myself in.

26,661. A great number belonging to every port ?—A great number.

26,662. Does your answer respect the state of the hull, or as they are found aloft ?—Generally, as respects the hull.

26,663. Are they pretty well found aloft with sails ?—Generally.

26,664. How are they owned generally in the northern ports ?—The vessels belonging to the north are generally owned by small owners.

26,665. Are they frequently held in shares ?—I don't know any of them that are owned in shares.

26,666. What kind of cargo is coal in heavy weather,—is it a very dead cargo, like iron ?—It is a very lively cargo in bad weather.

26,667. So that if a ship is hove to in a heavy gale of wind, coal is not a bad cargo to have ?—No, it is a good cargo to have on board.

26,668. In one of these vessels coal-laden, would you rather run or heave to in a heavy gale of wind ?—I would rather heave to.

26,669. When in ballast would you rather run or heave to ?—I would rather lay to as long as possible, unless I was going to run for a harbour.

26,670. But putting that out of the question, you would rather heave to ?—Yes.

26,671. They are safe to heave to in ballast ?—Yes.

26,672. Supposing the ballast don't shift ?—Yes.

26,673. You have been hove to in very bad weather in colliers ?—Yes.

26,674. Under what sail ?—A close-reefed maintopsail, and a foretopmast staysail.

26,675. Under that sail they heave to very well ?—Yes.

26,676. Do you know Sunderland ?—Yes.

26,677. Have you ever been in Sunderland in bad weather ?—No, I never have.

26,678. What kind of land is the land about Hartlepool to make ?—It is very bad land to make.

26,679. Why is it bad land to make ?—Because it is low, with high land at the back of it.

26,680. But when you do make the land out, can it be mistaken for any other land along the coast ?—Not by anybody that is used to it. But a stranger would not make it out. He would be apt to get too far to the north or south.

26,681. But is not the land about the Heugh well defined ?—That is good land to make. You cannot mistake that.

26,682. Now with regard to soundings ; could you run into Hartlepool Bay in thick weather by your soundings ?—Yes.

26,683. Are the soundings such as to keep you in a fair course for Hartlepool ?—The soundings are very good, except you find deeper water to the north.

26,684. Is there any change at the bottom by which you would know where you are ?—Yes.

26,685. Is there anything in the character of the bottom, on the ground itself, that would tell you ?—North of Tees Bay you generally find mud. To the southward you find rock, small honeycomb rock.

26,686. By that you would know your place ?—Yes.

26,687. In running in for Flamborough Head in thick weather, can you tell where you are by the Head ?—The water is too deep.

26,688. There is nothing in the nature of the bottom which you can bring up, showing that you are running for the Head ?—There is chalk.

26,689. Therefore you could tell that you are running for the Head ?—Yes. There is no chalk on the other parts of the coast.

26,690. Is there any eddy off Filey Brigg ?—There is at Flamborough Head, but not at Filey Brigg.

26,691. There is no stream running out there ?—Nothing to speak of.

26,692. (*Capt. Washington.*) When you were at anchor in the *Banshee* at Hartlepool, how did the Heugh bear ?—About north-north-east.

26,693. By the compass ?—Yes.

26,694. Where did you say you chiefly traded to ?—Shields.

26,695. For four years ?—For five years.

26,696. Did you go to any other coal ports besides Shields ?—One year I went to Middlesborough. The other four years I went to Shields.

26,697. During the time you traded to Middlesborough had you any difficulty in getting into the Tees ?—No. We happened to be there every time in fine weather.

26,698. How many voyages a-year did you make ?—Nine or ten.

26,699. Winter and summer ?—Altogether, one or the other.

26,700. Did you go the winter through ?—We used to lay up sometimes in winter during the months of December and January.

26,701. Did you ever go to Sunderland ?—I never traded there.

26,702. Have you been to Hartlepool ?—I have been there several times.

26,703. On what occasion ?—Sometimes when I was trading to Middleborough we might go to Hartlepool. We used to call it trading to Middlesborough for the year because we only went to Hartlepool a chance voyage, and took a cargo in the wet dock.

26,704. Had you ever occasion to bear up in a heavy gale on the north-east coast ?—I have run down to Leith roads.

26,705. How often ?—Only once.

26,706. Have you ever run for any other place besides Leith roads ?—No, only the Humber. I have run there several times.

26,707. Where from ?—From Cromer.

27,708. What place are you a native of ?—Kingdown, a little fishing village close to Deal.

26,709. You are in the employ of Mr. Strother of Woolwich, I think ?—Yes.

26,710. I think you said that men would generally run for their own ports ?—Yes, they generally will in light vessels,—in light colliers. If there is any chance, they risk anything to get to their destination when on their homeward passage.

26,711. Would loaded colliers try to run for their own ports ?—No.

26,712. They dare not do it ?—No.

26,713. Seeing the great desire captains have to run for their own ports, is it desirable that they should be improved, if possible?—I think it is ; at least, Shields and Hartlepool. I think if they were improved it would be a great benefit.

26,714. What improvement would you suggest at Shields?—I think if they could get 14 or 15 feet at low water at Shields, that would be a sufficient protection for light ships.

26,715. Have you seen the piers now running out at the mouth of the Tyne ?—Yes.

26,716. Do you think it desirable to continue them into deep water ?—Yes ; the north pier, especially.

26,717. It is a shelter from the north that is wanted ?—Yes ; I think as the south pier goes out the sand will go away.

26,718. Does the sand come from the southward or the northward ?—I think it comes from the southward.

26,719. Do you think it worth while to make an effort to improve the entrance to the Tyne ?—Yes, I think so.

26,720. What would you do at Hartlepool ?—I would improve it by running out a pier on the Heugh, and another on the Longscar.

26,721. If piers such as you speak of could be carried out into six or seven fathoms water, would you have any hesitation in running for such a harbour ?—At Hartlepool ?

22,722. Yes ?—No, none whatever. If one pier extended as far as the Longscar Buoy, and the other to the Heugh Bay, I don't think there would be much difficulty in going to Hartlepool then.

26,723. Do many ships run there now ?—Not in bad weather.

26,724. Now there is no refuge ?—Not for loaded vessels.

26,725. But for light vessels ?—Oh yes ; light vessels go there, and very often get damage.

26,726. Do you know if many lives are lost at Hartlepool every year ?—I know that several are lost every year even in the light ships.

26,727. We were told at Hartlepool that for the last 12 years 22 lives have been lost every year in Hartlepool Bay ?—I should think so. We generally see something very serious about Hartlepool. If there are any gales on the coast, generally some vessel catches it at Hartlepool or Shields.

26,728. That being the case, do you think it desirable that shelter should be afforded for ships going there ?—Yes.

26,729. The fact that a great number of laden vessels and lives being lost there is a proof that a great number were there ?—Yes, light vessels.

26,730. (*Mr. Coode.*) Do you think that anything like the same number would run for Hartlepool as do now, if a harbour of refuge were made at Filey ?—The light vessels would go there, but not the loaded vessels. If there was a harbour of refuge at Filey the Hartlepool ships could almost get there in one tide.

26,731. Then you think Filey decidedly preferable for loaded vessels ?—Yes. Even if there was a harbour anywhere else, loaded vessels would go past it and proceed to Flamborough Head, and get jammed, as they do three times out of five ; that is, when a harbour of refuge at Filey would catch them.

26,732. Then the same reasons which induce the light vessels to press on to their ports would induce the loaded vessels to hold on and get to Flamborough Head ?—Yes.

26,733. And therefore a harbour near there would be more suitable for laden vessels than for light ones?—Yes ; not only colliers, but vessels from the Baltic, and fishing vessels.

26,734. For the Baltic trade alone, what position should you select as a site for a harbour of refuge ?—The Baltic trade, if they possibly can, like to make Flamborough Head the first land. If caught and they get to the southward, then Filey would be a good place and afford them shelter.

26,735. You say that Filey would be a good place for the fishing vessels ; would it be the best ?—Yes.

26,736. Why so ?—Because it is nearest to where the vessels are likely to be caught in heavy gales of wind. It is where the fishing ground is in the herring season.

26,737. How long does the fishing last there ?—August, September, October, and November.

26,738. Do you consider these treacherous months to be at sea ?—Yes, very.

26,739. About what is the average number of vessels employed in that fishery ?—It has increased very fast within the last three years. I dare say last year there were not less than 600 sail there.

26,740. How many men are there on the average in each vessel ?—There are eight or nine in each vessel.

26,741. In that case there are at least 5,000 men so employed ?—Yes.

26,742. Would Filey be as convenient as any other place for landing fish ?—More convenient.

26,743. (*Chairman.*) Supposing a harbour of refuge to be placed at Hartlepool,—as a general rule, with an on-shore wind blowing dead on the coast, could the vessels at the Head reach that harbour of refuge ?—I don't think they could.

26,744. Why could they not do so ?—If the wind was right on the land, I don't think they could get round Whitby rock.

26,745. What offing would a vessel require under such circumstances to get round Whitby rock ; how many miles say off shore ?—I should think five or six miles or so.

26,746. If a loaded vessel had an offing of six miles off shore, she could then, with a wind dead on shore, always reach a harbour in Hartlepool Bay ?—Yes, provided everything held on ; provided she had no

LONDON.

Mr. J. W. Arnold.

30 Nov. 1858.

Chairman.

misfortune, and was not struck with a heavy sea, and did not burst her decks through.

26,747. Taking the reverse case. Supposing a harbour of refuge to be constructed at Filey, could these vessels make use of that harbour ?—Oh yes.

26,748. But how could they reach it ?—Not if they were six miles off Flamborough Head ?

26,749. No ; but stretching across from the Tyne, making their course to the Head. Supposing they were between Whitby and the Tyne in a direct course stretching across the bay, could they get up to the harbour at Filey ?—Not if they were at Hartlepool.

26,750. Supposing a Shields vessel stretching across from the Tyne on a direct course, with a six miles offing at Whitby, and supposing her to be caught abreast of Hartlepool, in the same weather, could she reach Filey ?—It all depends on what sort of vessel she is. I think a good vessel would reach Filey or the Tyne.

26,751. But not colliers, as they generally are supposed to be ?—I think they could reach Filey, but I think they could reach the Tyne better. It would depend on the tide.

26,752. Have you ever seen the freshets come down the Tyne ?—Yes.

26,753. Are they heavy ?—Sometimes, but not often.

26,754. Do they occur frequently ?—Not very often.

26,755. How many are there in the course of the year ?—I don't think there are more than two or three.

26,756. What is the heaviest freshet you have seen running ? How many knots in addition to the usual stream or tide ?—I think not above three knots in addition to the usual tide. Certainly I have seen it break great tiers of vessels adrift.

26,757. And do considerable mischief ?—Yes, certainly.

26,758. Do these freshets increase the sea running into the harbour much ?—They make more sea upon the bar.

26,759. They make a worse sea upon the bar ?—Yes.

26,760. (*Mr. Coode.*) Which way do the south-east gales generally turn in the North Sea ?—Generally they go round with the sun from south-east to south-west, and finish at south-west with lots of rain. But if they come the other way they are generally very heavy.

26,761. Then the worst gales turn round from the east towards the north ?—From south-east to north-east. They generally terminate at north-east.

26,762. The worst gales ?—Yes.

26,763. Which way do the south-east gales mostly turn ?—To the south and south-west.

26,764. But the worst are towards the east and north ?—Yes.

26,765. If a vessel is caught off Hartlepool in the position put just now, in one of the heaviest gales, would the chance be that the wind would come more in her favour for fetching Filey, than in the opposite direction ?—Yes, if they could keep the vessel at sea so long.

26,766. And she would have a better chance of getting to Filey ?—Yes ; but about nine times out of ten, after sailing from the coal ports she would reach Filey before the gale came on.

26,767. If the weather is doubtful these vessels don't leave the ports ?—No.

Captain ROBERTSON, R.N., examined.

Captain Robertson, R.N.

26,768. (*Chairman.*) You are Surveyor-General of the Board of Trade, I believe ?—Of the Marine D-e partment of the Board of Trade.

26,769. Surveyor-General of the Marine Department of the Board of Trade ?—Yes.

26,770. And this return of wrecks which I have here is made out under your superintendence ?—Under my superintendence.

26,771. I see in the report made 27th January, 1858, that we have a description of the data on which this return is made ?—Yes.

26,772. That is, I presume, a perfectly accurate description of the causes of the wrecks, so far as it goes ?—Quite so.

26,773. These are the returns of wrecks made to the Board of Trade for three years?—For three years.

26,774. Do you consider this last return which I hold in my hand, the return for the year 1857, is more accurate than the two that preceded it ?—I think so.

26,775. You consider this last return more accurate than either of the other two ?—I think the last better than either of the other two.

26,776. To what do you attribute that circumstance? —I attribute it to the fact that we have got into better working order, and that our officers of the coast guard are more zealous, and their attention is called to every casualty that occurs along the coast. Then the collectors of customs are receivers of wrecks ; they hear of everything that takes place, take depositions from the masters, and make their report.

26,777. I perceive that the first return you have made is much less full than this one ?—Yes.

26,778. That arises, I presume, from the circumstance of your not having got your system into working order before ?—Yes, from its being quite new to me.

26,779. With regard to the return for the year 1856, ending December 1856, I presume that though it is not quite so full as that for the following year 1857, it is quite as accurate ?—Yes, it is, I think, quite as accurate. We obtained the information from the same source—the officers, inspecting commanders of Coast Guard and receivers of wreck, acting under the control of the department.

26,780. So that you are disposed to think that these returns for the two years afford a pretty safe basis for a decision respecting refuge harbours ?—So far as the wreck returns are useful for that purpose.

26,781. Will you turn now to page 18 of the report ?—Yes, I have it.

26,782. In table 19 there is the average given of the rate per cent. of casualties upon voyages for the last six years. and it is rather remarkable, is it not, that the average for the six years is decimal 44, which agrees exactly with the return under the head of "British ships," for the two years 1856 and 1857 ? —Yes.

26,783. The decimal 44 agrees with it exactly ?—Yes.

26,784. And there is very little difference between the returns under the several headings for 1856 and 1857 and the average for the six years. Do you notice that ?—I do.

26,785. As respects British ships, the average of casualties for the six years is precisely the same as the returns for the years 1856 and 1857 ?—Yes, I see it is as regards the number.

26,786. With regard to foreign ships there is a slight difference, but for the total the average for the six years is the same as the return for the year 1857, and not very greatly different from that of the year 1856?—I do not exactly understand what you mean.

26,787. I mean that the average for the six years is precisely the same as the returns for British ships for the years, 1856 and 1857 ?—Yes, I see it is for British ships.

26,788. And though in the same way the return under the head of "foreign" ships is slightly different, the average of the total for the six years is precisely the same as the return for the year 1857, and nearly the same as the return for the year 1856 ?—Yes.

26,789. Do you consider it, then, a fair conclusion that these returns for 1856 and 1857 may be taken as representing the fair average return for the whole six

years ? You see the rate per cent. of the casualties is the same ?—I can hardly say. I know nothing about the previous years. I cannot, therefore, say whether the return as to them is correct or not.

26,790. But as far as the returns go for 1856 and 1857, they will be a fair representation—supposing the returns for the previous years to be also accurate—of the average rate per cent. of casualties in the whole six years ?—Yes.

26,791. Would it, then, be a fair conclusion to draw that, so far as the averages go, the return for the six years are correct ?—I cannot tell at all. I know nothing of the first four years, and cannot, therefore, say whether the returns as to them are accurate or not.

26,792. But assuming the returns to be accurate, they would then form a very fair representation of the average ?—Assuming them to be accurate they would.

26,793. That is, that the returns for the years 1856 and 1857 would be a fair representation of the previous years ?—They would, assuming the returns for the first four years to be equally correct.

26,794. In one of your tables, at page 29—a short table which shows the total diminution,—there is a comparative statement of the number of lives lost during the previous six years, showing a diminution—a gradual diminution from the year 1852 down to 1857—the numbers for 1856 and 1857 being reduced to 521 and 532, the numbers in the previous years having been 1920, 689, and so forth. To what do you attribute that diminution? Is there any cause for it that you are aware of ?—I think that greater care is taken in navigating the ships off the coast, and that the ships are better.

26,795. To what do you attribute the greater care and the better ships ?—To the inquiries which are now going on by the officers of the coast guard, under the control of the Board of Trade. I think the men who command the merchant ships are more careful than they were formerly, now they know that every accident will be strictly inquired into. In every case of accident that occurs upon the coast it is the duty of the inspecting commander of Coast Guard to inquire into the circumstances attending it, and to report thereon to the department.

26,796. And you think that is telling upon them ?—I think very much so; and I think another cause is, the means adopted for saving life on the coast by life-boats, and rocket and mortar apparatus.

26,797. Now turn to the table which gives the losses, together with the state of the winds; have you got it ?—Yes, I have that table.

26,798. Then if you look at the following page—page 14—you will find there is a table, No. 10, in which the classes of wrecks are divided as having arisen from stress of weather, the state of the weather being indicated by numbers ?—Yes.

26,799. Now with regard to stress of weather, what force of wind do you call stress of weather ?—About 9, I think, would be stress of weather.

26,800. It would begin at 9 ?—With 9, I think,—"strong gales."

26,801. And are you aware if this table 10, class 1, was formed in that way, by taking the losses with the force of wind, as 9, 10, 11, and 12 ?—No, it was not; it was not taken by numbers at all, but by the opinions and facts given by the returns. We never take any numbers.

26,802. What is the precise meaning of the words "stress of weather" under class 1 ?—That the ships were in such a position that when the gale came on it was difficult to fetch off shore.

26,803. In forming this table, then, there was no reference made to the strength of the wind ?—None at all. These returns have been made by the inspecting commanders of the coast guard, by whom the circumstances have been inquired into, and who have stated what they found to be the case.

26,804. And if I were disposed to form an estimate of the losses arising from sheer stress of weather, then you would say that the numbers 9, 10, 11, and 12 would be the numbers to take ?—Yes, I think so: from 9 upwards.

26,805. You are acquainted with the east coast of England yourself, are you not ?—Pretty well.

26,806. Have you formed any opinion upon the subject of harbours of refuge ?—Yes, from reading the evidence taken before the Commissioners, and hearing what has been said on the coast.

26,807. What is your conclusion as to the best position for a harbour of refuge on the east coast ?—The opinion I have always had is that Hartlepool was the best place.

26,808. Why ?—Because there are two ports inside into which ships might go for repairs.

26,809. But considering the first requisite of a harbour of refuge to be facility to get to it in bad weather, should you still say that Hartlepool was, in your opinion, the best place ?—I know nothing of that part of the coast. I know nothing of the depth of water there, and therefore I cannot say.

26,810. You have formed no opinion, then, upon that subject ?—None.

26,811. (*Capt. Washington.*) You are aware that the returns of wrecks were given originally by the Admiralty ?—Yes.

26,812. Have you more perfect machinery at the Board of Trade for obtaining accurate returns than the Admiralty had ?—Much more so.

26,813. In consequence of what ?—In consequence of the officers of the coast guard and the receivers of wrecks having the duty of examining and reporting all cases that occur.

26,814. The Admiralty had not the means of obtaining information that you have ?—No; and to that I attribute the greater accuracy of our returns.

26,815. And you think that accounts for any discrepancy there may be between the earlier returns and the later ones ?—I think so. I think the earlier returns were not so perfect because you had not the machinery to make them so.

26,816. (*Mr. Coode.*) You have no reason to doubt that the returns of the Admiralty were correct as far as they went ?—I believe they were.

26,817. But that they were not complete ?—So far as they went I believe they were accurate, but they were not complete. They were principally made up from the returns in the *Shipping Gazette*, the reports of Lloyd's agents, and persons of that description.

26,818. But still you think that as far as they went they were correct ?—I have no reason to doubt; but they were not so accurate as the present returns, for the reason I have stated.

26,819. (*Chairman.*) When you used the word "control" just now you meant, I presume, legal control ?—I mean control by Act of Parliament. By the Mercantile Marine Act all the officers of the coast guard have certain duties to perform. They have to inquire into all wrecks and casualties. The Coast Guard act for receivers of wrecks, and it is their duty to make inquiry, and report.

26,820. What you mean by "control," then, is legal control,—control by law ?—Yes, not in any other way.

26,821. (*Capt. Washington.*) Are you aware that in the Admiralty returns there was a column for the authority ?—Yes.

26,822. And that in many cases the authority given was the *Shipping Gazette* ?—Yes.

26,823. Still you have no reason to doubt that these returns were as correct as any others ?—So far as they went they were no doubt correct.

26,824. (*Mr. Coode.*) From your recollection of the Admiralty returns, do they not quote Lloyd's agents and the Coast Guard as well as the *Shipping Gazette* ?—Yes, in some cases.

26,825. The accounts in some cases were quoted from Lloyd's agents, and in some from the *Shipping Gazette* ?—Yes.

26,826. And is it not a fact that the same wreck is sometimes quoted from three or four different authorities ?—Yes, it is.

LONDON.

G. Hampton.

30 Nov. 1858.

GEORGE HAMPTON examined.

26,827. (*Chairman.*) Where are you serving now; in what ship?—The *Cressy*.

26,828. What are you?—An able seaman.

26,829. How old are you?—I shall be 22 next May.

26,830. Where were you brought up?—I was born in Lymington, and was brought up at Southampton.

26,831. At what age did you go to sea?—At ten years old.

26,832. Who with?—My uncle.

26,833. In what class of vessel?—A smack.

26,834. Where did she trade from?—She traded from Southampton to Swansea.

26,835. Were you ever employed upon the east coast of England?—Yes.

26,836. In what class of vessel?—A collier.

26,837. How long were you so employed?—Seven years.

26,838. What age were you when you began to be so employed?—I was 11 years of age.

26,839. Then from the time you were 11 years old until you were 18 you were employed in a collier?—Yes.

26,840. After that how were you employed?—Part of the time in the merchant service,—in the Mediterranean trade.

26,841. When you were employed in the coal trade, what port did you sail out of?—Shields.

26,842. What sort of a vessel was it you were employed in?—A brig.

26,843. What was her size?—One was 300 tons, and one I was in afterwards was 400 tons.

26,844. What style of vessel was she; was she a good one?—Yes; a very good one.

26,845. Was she well found aloft?—Not very well.

26,846. Did you see a good deal of bad weather in her first and last?—Yes.

26,847. Were you in her the whole time?—Not the whole time; I was in three during the course of the seven years.

26,848. The second you served in, what was she?—A very bad one indeed; she was very leaky.

26,849. How long was you in her?—Seven months.

26,850. Where did she belong to?—Shields.

26,851. What time of the year were you in her; was it winter or summer?—It was winter.

26,852. Was there much pumping while you were in her?—Yes; we were obliged to keep the pumps always going.

26,853. All the time she was at sea?—Yes, all the time.

26,854. Is that a common occurrence among the colliers?—Very common, when they are loaded.

26,855. When they are loaded, for the pumps to be going all the time?—Yes.

26,856. And when they are light is there the same occasion for pumping?—No.

26,857. Were you ever in her in bad weather?—Yes.

26,858. I mean in weather endangering the safety of the ship?—Yes.

26,859. When?—The winter before last, in the south-east gales.

26,860. Where?—Off Flamborough Head.

26,861. And what were you in danger of being lost from; was it the leaky state of the vessel?—No; from bad weather.

26,862. This second vessel, how was she found aloft?—She was better found aloft than the first.

26,863. Were her sails good?—Yes, very good.

26,864. And her rigging, was that good too?—Yes, it was very good.

26,865. And the first one, in what state were her sails?—Her sails were all to pieces.

26,866. And her rigging, how was that?—It was almost all to pieces too.

26,867. Then if you had been caught in the first vessel on a lee shore, what would have happened, do you think?—She never would have got off.

26,868. On account of the bad state of her sails and rigging?—Yes.

26,869. The third vessel you were in, what sort of a vessel was she?—Oh, she was a very good vessel.

26,870. Was she well found aloft?—Yes; she was a new vessel altogether.

26,871. And was well found aloft?—Yes.

26,872. How was the first vessel owned; I do not want to know the names of the owners, but was she owned in shares or by a single owner?—Yes, by a single owner.

26,873. Not in shares?—No.

26,874. And the second, how was she owned?—The same as the first.

26,875. And the third?—She belonged to the same owner.

26,876. They were all in the same employ?—Yes.

26,877. Did that owner employ many ships?—Yes, a great many.

26,878. How many?—He had 34.

26,879. How many of them were good ships, and how many were bad?—There were a great number of bad.

26,880. What proportion do you think were bad of the whole number?—I should say fully two-thirds.

26,881. Are there any vessels in the coal trade that you know of worse than the worst of the three you have described?—Yes.

26,882. Some worse than that first ship you mentioned?—Yes.

26,883. Very old ships?—Very old.

26,884. Are they ever repaired?—Yes, they are repaired at times, but very little.

26,885. Did you ever see any of them under repair in the graving dock?—Yes, I have seen them; but very little was done to them.

26,886. Did you ever see one of these vessels opened out?—Yes.

26,887. In what state was her bottom?—It was rotten.

26,888. Her timbers were rotten?—Yes.

26,889. Were the timbers taken out and replaced?—Yes, I have seen the timbers taken out and put in again; but there was not sufficient timber put in—not what was wanted.

26,890. There was not sufficient timber put in?—No.

26,891. And the planking, was that bad likewise?—Yes, very bad.

26,892. Both inside and out?—Yes.

26,893. Was the planking made good?—Yes, that was made good.

26,894. (*Mr. Coode.*) Were you often caught off Flamborough Head in trying to get to Shields?—Yes, many times.

26,895. Do you know of many vessels being so detained in the same way?—Yes, a great many.

26,896. How many have you seen detained there at one time?—I have seen 50 or 60—close upon 100 at times.

26,897. Vessels detained there like yourselves?—Yes.

26,898. Have you been detained there long yourself at any time?—Yes.

26,899. How long?—Two days and two nights; that was in fine weather. I have been detained longer in bad weather.

26,900. (*Chairman.*) Did you ever know a vessel so bad that the men would not go on board of her?—Yes.

26,901. Where was that?—That was at Cardiff.

26,902. Did you ever know such a case at the coal ports, at Shields?—I knew of one at Whitby.

26,903. Where the vessel was so bad that the men would not ship on board of her?—Yes.

26,904. Is there any difference in the pay on board

bad ships and good ships ?—There is no difference ; the wages are the same.

26,905. And, as a general rule, are there sufficient men on board these coal vessels ?—Yes.

26,906. As a general rule there are sufficient men to do the work ?—Yes.

26,907. Did you talk amongst yourselves about the bad state of the vessels ?—Yes.

26,908. And it was considered by you that some of them were in such a bad state that men ought not to be sent to sea in them ?—It was.

26,909. Then why did they go ?—There were a great many complaints made.

26,910. But why did the men go to sea in these bad ships ?—They would not know how bad the vessel was till they got to sea, and the strain came upon her.

26,911. You only know of one ship that the men actually refused to go to sea in ?—Only one on the north coast, but I knew three at Southampton.

26,912. What became of those vessels afterwards ? —Two of those at Southampton were left for sale, and one was put through a thorough repair, and made a first-class ship again.

26,913. Do you know anything about the clubs that they insure vessels in, in the coal ports ?—No.

26,914. You know nothing about them ?—No.

26,915. (*Mr. Coode.*) The one vessel you have described as being so bad at Whitby that the men would not go to sea in her, what became of her ?—She was left there, and broken up.

26,916. How long was she left there before she was broken up ?—Two years. She was left there for sale, and then they found they could not move her, so they were obliged to break her up.

26,917. Did they try to move her ?—Yes, they tried to move her, and when they got her off into the middle of the harbour she sank.

26,918. That was where ?—In Whitby Harbour.

26,919. Inside the harbour ?—Yes.

26,920. They made the attempt to get her off ?—Yes, they tried to get her off to repair her, but they could not get her to the repairing yard.

Wednesday, 1st December 1858.

PRESENT :

Admiral Hope (Chairman).

Sir Frederic Smith.	Captain Sulivan.
Mr. Lindsay.	Captain Vetch.
Captain Washington.	Mr. Coode.

Mr. Evans, Secretary.

General Sir J. Burgoyne, G.C.B., examined.

26,921. (*Chairman.*) You are Inspector-General of Fortifications ?—Yes.

26,922. Have you ever had occasion to turn your attention to the establishment or improvement of harbours ?—I was chairman of public works for several years ; and during that time several harbours and harbour works came under my notice, and gave me occasion to consider the subject.

26,923. In Ireland ?—Yes.

26,924. Have you adopted any particular views regarding the construction of harbours ?—I should speak with great diffidence upon that question, because I have adopted views which I believe differ very much from those of many engineers, and therefore I have some doubts whether I am correct or not. One of my views is, that I think the principle of improving harbours by what is called a scour is erroneous. The greater the scour the more injurious effect will be produced. The best harbours are those where the sea has a clear, even, and smooth run in and out. A strong current out of a harbour always tends to create a bar and to do mischief; and therefore I think that rivers are particularly unfavourable and disadvantageous to form harbours upon ; for this reason, that every river that has a narrow entrance and narrow channel has a bar ; and the more backwater that comes out of it the worse that bar will be ; and therefore I think that this proves that the backwater is injurious. What first called my attention to that subject was as far back as 1814, when I was at Bayonne with the army. The river Adour, which runs past that town, and enters the sea a few miles below it by a narrow entrance, comes down with a great body of water, and has a very bad bar. Some 80 or 100 years ago they thought to remove that bar by carrying two parallel piers out into deep water, under the impression that the scour would carry away the bar. The result was, however, that the bar formed again at the mouth. They performed a similar operation a second time, but the bar still formed at the mouth. At last they gave it up, and there the bar is to this moment. I think that not only the backwater of rivers may be prejudicial, but that a similar result may be produced even in great estuaries if they have a narrow entrance,—narrow in proportion to the amount of water that comes in. In such a case a similar effect will be produced. We have a striking instance of that in the south of Ireland. There is there a great lake of Ballyteague in Wexford. It was of very shallow water, with mud banks, covered at high-water time, and it had a communication with the sea by a long narrow channel. The channel was so much in disproportion to the great expanse of water that there was inside, that the lake never had time to fill. The consequence was, that at high tide the water is fully three feet higher outside than it was at the upper end of the lake, and during the time that the real tide was falling it was still running into the lake. We made a proposition to drain the lake, and turn it into agricultural land. The proposition was to form a dam across the narrow channel where it began to expand. There was some opposition, as there always is, to measures of that kind. But when the opposition failed altogether in every other way, they appealed to the Admiralty, and said that we were going to ruin the harbour which was in the narrow channel. The subject was considered by the Admiralty, but they did not think it proper to prevent the works going on. The works proposed were completed, and the little harbour has been improved by them, as we anticipated; that is, the water goes in and out to the dam quite smoothly, and consequently it rises at the landing quay at that part a foot or 18 inches more than it did before, which is a clear gain. Whether the bar is improved I do not know; but if they thought it worth while to dredge out a passage through the bar I am sure it would have much less tendency to silt up again than it had before. I cannot help thinking that even Portsmouth Harbour might be improved by adopting a different system than that which is at present adopted there. At present there is a very strong current in and out of Portsmouth Harbour. It is very perceptible. I think that it arises from the great

LONDON.

Gen. Sir J. Burgoyne.

1 Dec. 1858.

Chairman.

quantity of water that goes in every tide, and the smallness of the channel that it has to go through. If the interior expanse were reduced by a judicious abstraction of the remote shallow mud banks by embanking, it would improve the navigation of the entrance, and perhaps the bar. Deepen it as much as you please: that will do no harm; but if the space inside is out of proportion to the channel by which the water enters, I do not think that any expenditure upon the mere removal of the bar will produce any certain and lasting effect. As long as there is a strong current it will always have a tendency to silt up; whereas if it goes in and out smoothly, whatever you dredge out you gain permanently.

26,925. (*Chairman.*) It may be convenient that my colleagues should ask any questions they may wish to put to you upon this subject before we go to the question of construction. Will you, therefore, proceed with any further statement which you may have to make in regard to that branch of the subject?—I have nothing more to say at present.

(*Sir F. Smith.*) Sir J. Burgoyne has put the subject so clearly that I really have no question to ask him.

(*Chairman.*) Surely this is a very interesting question, because in the case of the Tyne, where they are carrying out piers with a view to the removal of the bar, this would seem to be a very important point.

(*Witness.*) I will just add another point. Rivers sometimes have a very extensive navigation, and would make very fine harbours, but there is a difficulty in getting in, owing to the bar at the mouth. That is a difficulty I should be inclined to remove, by making, whenever it is practicable, a harbour outside the bar, and locking up into the river.

26,926. (*Chairman.*) A harbour on one or other side of the bar?—Yes; and then locking into the river. You will get a good smooth entrance, and ships will get up into deep water, and have all the advantages of an interior harbour. There has lately been a great question about opening the mouths of the Danube, and many projects have been suggested with that object. The Danube is an immense river, and has an immense body of water, and many engineers have offered projects for carrying piers straight out from either one mouth or the other. My impression is that these piers would do no good at all, because, whether the narrowness of the channel is natural or artificial, it comes to the same thing; there would be always that great mass of backwater going down and getting interrupted by the bank of the sea, and so laying its deposit, which I think is the cause of the whole evil. It drops whatever it is charged with in the sea, and whether the cause of the narrowness was natural or artificial, the same effect would be produced. In the case of the Danube, I recommended that they should try and find a place where they could make an artificial harbour near the mouth of the river, and from then lock up, having effected which they would get into the river, and then have 100 miles navigation in deep water; that has now been proposed.

26,927. (*Capt. Washington.*) An artificial canal?—Yes, an artificial canal; making a small harbour at the side of the St. George mouth of the river, and then locking up into the river itself, which will be a very simple operation, by means of a canal five or six miles in length.

26,928. You think there would be no fear of easterly winds throwing up a bar at the entrance of that artificial harbour?—I think much less chance, because there would be no backwater. The backwater is what occasions the difficulty, because the backwater coming down against the great bank of the sea, which you may call stationary, naturally drops all the matter with which it is charged to the bottom, and that makes a bar. If there is a side current along the shore, which carries sand or mud or any other material with it, of course that meets a check, in the same position and in the same sort of way, and tends to increase the bar. If you can have a harbour on one side, and lock up into the river, you will obviate all these difficulties, because that coast is a very peculiar one. There is a great current, and great quantities of sand and mud come down, and one cannot well answer for what might be the effect; but I think that, having no backwater, you would be very likely to preserve your harbour. I do not see any great tendency there would be to fill up.

26,929. (*Chairman.*) Do I gather that your opinion is that bars at the mouths of rivers are formed by the deposition of sediment in still water formed by the meeting of the current of the river and the current of the sea?—Yes; the bank of the sea, you may call it, which is comparatively stationary. The river water running out meets with a check, and naturally all the mud and other matter which it brings down from the interior falls to the bottom.

26,930. Have you a practical experience of bars formed in Ireland or elsewhere?—No; except that I see every river in the world that has got a narrow channel has a bar, and a bad bar too.

26,931. We have it in evidence before us that bars are frequently formed by deposition of sediment, not brought by the river, but of sand which is brought by the sea, and in corroboration of that the actual matter of a bar has been produced. Have you any personal experience as to that, whether bars are generally formed chiefly by the sediment from the sea, or by the sediment from the rivers themselves?—I could not say; but I should think that even if it is from the sediment brought from the coast the cause of its deposition will be the meeting of the backwater with the sea. That is what would cause the deposition of sediment brought from along the coast at the mouth of the river.

26,932. (*Showing a plan.*) Here is a plan of the port of Sunderland, showing the river Wear and the south dock which has been formed inside of it. Does that meet your views of what is requisite?—If the entrance is at the outside, clear of the bar.

26,933. (*Pointing to the "south outlet."*) Would that be sufficient?—That I should say would be much more likely to remain good than the entrance by means of the river; in fact this would be precisely what I recommend. It is an entrance into deep water, having a lock to prevent any violent tide in and out. I should suppose that if they dredge that out it would be likely to maintain itself for a long time. If it did collect it would be much more easily removed than the matter which comes down from the river.

26,934. Therefore, in your opinion, the mode of meeting the difficulties of having harbours at the mouth of navigable rivers that have bars, is to place a harbour on one or the other side of the entrance, if possible?—Certainly, if circumstances will permit it.

26,935. (*Sir F. Smith.*) Your view is to disconnect the harbour from the tidal river?—Yes; or else to draw the water of the river by means of a new channel away from the port on which a harbour is constructed, which would be equivalent. If you could make a new channel for the current, by putting a dam across, and keeping the backwater from the entrance, that would be virtually the same thing, and would have the same effect.

26,936. Your opinion is, that the bar is chiefly formed by the sort of dam which the flood tide forms, arresting the progress of the water running out of the river, and leading to the deposit of the matter which is held in solution?—The sudden check there is to a great current.

26,937. (*Referring to another plan.*) This plan which is before you represents a portion of the Tyne and Tynemouth. It shows the lower part of the river, and at the left extremity of the plan the Northumberland docks. With a view to the improvement of the Tyne, and to render it, as it were, partly a harbour of refuge, it is in contemplation to carry out two piers, one to the north and another

to the south of the entrance to the river, and in that way they hope to get the means of giving shelter to vessels of a certain draught of water at all times of tide. These piers are upon the plan represented as going out to 14 feet at low-water spring tides, and it is assumed that by getting in this large body of water, and improving by dredging in the Tyne, that the outfall will carry away the bar?—I think not; I should expect that the bar would form there again.

26,938. In point of fact if you extend it into deeper water?—I would rather have the harbour to the south or north, clear of the entrance, but I do not know whether circumstances would permit it.

26,939. In point of fact, you would rather have a harbour which is to be a harbour of refuge clear of the current?—Clear of the backwater.

26,940. Unless the current can be turned?—Then it is clear. We have a pretty good instance in the harbour at Kingstown in Dublin Bay which has answered beautifully, and never had the least tendency to silt up in any sort or way. There is a clear flow in and out, without any current, just as the tide rises; there is no tendency to silt up. If the Liffey was a great river like the Thames, and had a great navigation, there would be no great difficulty in making a canal from Kingstown harbour to the Liffey, and that would be better than attempting to improve the mouth of the river.

26,941. You think the Commissioners would hardly be justified in recommending a large expenditure of public money to carry out a scheme such as that proposed at the Tyne, which you are inclined to think would not succeed?—I should be very cautious in giving any opinion upon that subject, as the matter has been considered, and different conclusions arrived at, by many others who are more competent than I am to decide upon the subject.

26,942. In the case of the Adour, did the water shoal gradually, or was there a rapid descent? If you look at the mouth of the Tyne, the section shows a very great fall within a short distance; from 14 feet to 53 feet?—The Tyne is rather favourably circumstanced; from running into a kind of estuary, it does not continue its narrow course. I should think the best improvement would be to cut off a part, and give it a bell mouth; to cut off the Herd sound, and give it a bell mouth by means of excavating two points.

26,943. In fact, almost to reverse the order of the plan, which is a bell mouth in, instead of outwards?—Yes.

26,944. (*Mr. Lindsay.*) Is it your opinion, Sir John, that a bar is formed at the mouth of a river mainly by the sediment coming down from the river, or is it in part formed by the sand washing in from the sea as well?—Both. The sediment from the river must deposit itself first, and then if there is any action along the shore bringing sand or other matter, that will be checked at the same spot for the same reasons, and as the sediment that comes from the river is probably mud, and what comes along the shore is very likely sand or harder material, it is probable that the surface will remain of sand, and the mud will get sunk, and be apparently lost.

26,945. Do you think that the sediment which the ebb tide and freshets throw out of the river meets with the sand which the sea drives into the bight, and the two meeting together, the counter currents meeting together, form a bank which is usually called a bar, and that bar is usually at the point of the piers where the two currents must necessarily meet?—Yes; in proportion as the river is large the bar will be at a distance from the mouth. In the case of large rivers, the current so far overpowers the sea that it carries the bar off for two or three or even five or six miles, and it is formed outside of that, just where the current of the river comes to be checked by the sea. That is the case with the Danube; the bar is at a considerable distance from the mouth.

26,946. I know nothing about engineering, and ask purely for information. You see these piers which are laid down at the mouth of the Tyne. These are as present in the course of construction, and are at present finished to the extent which you see upon the plan. We had it in evidence, and the evidence was very distinct, that since these piers had been carried out only to this very limited extent, that the water has deepened upon the bar, and I think to the amount of two feet. Can you account for that, presuming it to be the fact that since the carrying out of these piers to the limited extent shown the water has deepened two feet?—I think that must arise from the cause you have mentioned; the checking of the side current.

26,947. Then if that be the fact, as stated, will the consequence not be that the further you carry out the piers the more you will check this tendency to accumulate, and consequently the more will you tend to deepen the water, and remove the bar?—I do not think that follows. This may have checked it in the first instance, but when the space behind the piers gets filled, the sand will run round the point to the end of the pier, and probably form a bar again. But it is possible and very likely that you may arrive at a point at which a pier may be usefully carried out, and beyond which it should not proceed, although you cannot lay down any principle as to where that point should be. A curious instance of this occurs to me. At the mouth of the Liffey, in Dublin harbour, there was a very bad bar, having only seven feet water on one side of it. They intended to improve the harbour, and formed a design to carry out piers in two different directions. After they had gone to a certain extent they produced a very beneficial effect upon the bar. They got 11 feet water in a straight line, instead of only a tortuous channel of seven feet. The engineer very wisely and prudently said, "I will go no further. I will not carry "out my whole plan. Here is a good effect. I will "finish what I have got." That was done. That is the story which I have heard, and that is kept up to this day. They have 11 feet at low tide.

26,948. (*Chairman.*) Where they had only seven feet?—Where they only had seven feet in a tortuous course, they have now 11 feet in a straight line.

26,949. (*Mr. Lindsay.*) Following this up, you say that in your opinion the cause of the greater depth of the water upon the bar at the mouth of the Tyne is to some extent that the carrying out of the south pier has checked the sand from falling upon the bar?—Yes.

26,950. Well then, the further you carry it out the greater will be the tendency to check that fall?—Yes.

26,951. Then the natural consequence of this south pier is to form a groin, and the object of a groin being to make land. Am I correct in that?—Yes; to fill up.

26,952. Suppose that we had no river here at all at this particular side of the Tyne; but suppose we had a sufficient space, and considered this a good site to make a good harbour of refuge, independently altogether of its being the mouth of a tidal river, from what you said the effect would be to surround these piers or groins with sand until the sand would gather right out at the pier head, and consequently would block it up altogether?—It would at last, I dare say.

26,953. Then, if your reasoning is good as to the effect produced at the mouth of a river, it goes to the extent that where you put piers which are groins the consequence is that you are putting that which will be collecting sand which will make land, and which will have a tendency in the course of time to make that dry land which is now deep water?—Exactly. That shows it is not a favourable place to put a harbour in. That is not the case at Kingstown, nor would it be the case under a rocky coast. It is only in the case of a sandy or shingly beach, under a rocky coast is the best place to make a harbour.

26,954. I will put before you a plan of Filey Bay. I understood you to say that a pier is to a certain extent a groin?—Certainly; if there is a tendency to

LONDON.

Gen. Sir J. Burgoyne.

1 Dec. 1858.

Mr. Lindsay.

collect shingle or sand or anything along the shore, every pier will be a groin.

26,955. And the object of a groin is to make land? —That is not the object, but the consequence.

26,956. When I say the object, I have a case in my mind. When they wished to construct docks at Sunderland they found the best site for them was upon the beach. To make land upon the beach they ran out a great number of groins. I suppose the object of running them out was to raise the land?—Yes.

26,957. If the object of groins is to make land, and if a pier run out to sea along the beach is nothing more nor less than another name for a great groin, what would be the effect of running out from Filey Bay a great groin to form that bay into a harbour of refuge? Would the tendency be the same; to collect the sand?—In which line does the sand run; because that makes a great difference? Does it run from the north or the south? It would be a material point as to whether it runs from the south into the bay, or from the north to the back of the pier.

26,958. Say that it flows from the south and within the pier, would it then form land along the pier to the eastward?—You might correct that by leaving openings for the sand to pass through.

26,959. That might be corrected if it had a tendency so to do?—I should think so. Leaving openings for the sand to pass through would prevent its collecting there.

26,960. Does the current run from the south or from the north?—There has been a very pretty operation carried out at Newhaven by means of a groin. Whenever the current along the coast is in one direction, and you put a groin, it will have a tendency to throw up the shingle or sand on the upper side, but to cut away the land on its lee side. At Newhaven they put a groin to the west of the line in which the shingle comes, and the result has been that it has made an excavation to the leeward of it, which has carried away the bar, or improved it very much, by the fact of that excavation.

26,961. Therefore, if the tide runs to the southward, the further you carry the pier the more tendency it would have to carry away the bar? Say that the sand flows from the north, will the tendency of that pier which they are now running out at the Tyne be to improve the bar?—I should think so.

26,962. Well then, that being the case, why do you think, because I understood you to say, in reply to Admiral Hope, that the expenditure of money in the construction of these piers which are laid down upon the plan, and which will cost about 1,400,000*l.*, will be of no value?—I said I should be very cautious in saying that, because there are better opinions upon the subject given by persons who have bestowed more consideration upon it than I can, and very likely those engineers are right; but as a matter of principle I should always object to backwater. I think backwater always tends to injury, and that the mouth of a river is, generally speaking, a disadvantageous place for the formation of a harbour. The Tyne is a place of very great importance, and it is very possible that there is no other mode of doing it, and this will create a certain advantage, I presume, as it has been so carefully considered; but still I should apprehend that there will be a bar formed there at the mouth of it, on account of the large quantity of water which I believe comes down it.

26,963. It seems to me to be a vexed question amongst very eminent engineers; this question of the carrying out of piers having the effect of carrying out the bar to whatever depth you carry out the piers. Now, looking at this river, the Tyne, and seeing that it would cost, presuming that it would cost, 800,000*l.* to make these great piers, and carry them out, not to 14 but to 30 feet at low-water spring tides, do you think that if the people locally interested were willing to raise 600,000*l.* by a tax upon themselves, on the faith of the eminent engineers whom they have consulted, do you think that for so great an experiment as that the Government would be justified in going to the extent of advancing 200,000*l.*?—I should say so, decidedly having nothing against their wishes but this poor opinion of mine.

26,964. I should like your opinion upon it. Such an offer is worth a great experiment?—They cannot have a better foundation than that the people there are inclined to advance largely towards it themselves.

26,965. Say that they were willing to tax themselves to the amount of 600,000*l.*, and come to the Government, and say that they want 200,000*l.* more, but that they are willing to raise 600,000*l.* themselves, having great faith that they will be able to maintain a depth of 30 feet at low-water spring tides, and consequently to form a harbour which will be the means of saving a large amount of property, but cannot raise more than 600,000*l.* by any means, would you think that under such circumstances the Government would be justified in advancing 200,000*l.* to make this experiment?—There is a great political question involved in that matter. If it were purely for local purposes the Government would not advance anything; but if it were made a harbour of refuge for ships passing along the coast, a general harbour of refuge of national advantage, then I presume the Government might advance money largely for such an object.

26,966. You think if it could be shown that the harbour would be made so as to have 30 feet at low-water spring tides, and that the people locally interested were willing to tax themselves to the extent of 600,000*l.*, and if it could be shown that that harbour would be the means of saving life and property in the passing trade, under such circumstances the Government might be justified in advancing this 200,000*l.* out of the 800,000*l.*, so that that great experiment might be tried?—Most undoubtedly. I cannot conceive any case where the Government money could be better expended than in the formation of harbours, directly or indirectly; they are all of such great advantage that the expenditure of a few hundreds of thousounds of pounds or even of a million of money is of trifling importance.

26,967. From the opinions you have expressed I draw this conclusion, that although you may have a strong conviction in regard to a bar being formed, even although the piers be carried out to 30 feet at low water, yet that that conviction is not so strong as to enable you to say that that bar would be formed there, that the bar which now exists would be carried out to that depth, and that, although you hold it strongly as an opinion, you are not prepared to say it would so happen as a certainty, and that there is still a conflict of opinion upon that point amongst many very eminent men?—The only thing which causes me to doubt is the opinion of others who I hold must be better judges than I am. There is one question as to the 600,000*l.*, as to whether the locality is prepared to spend that at once, or only to pledge dues for a Government advance; for I have observed in Ireland that that makes a great deal of difference. They promise dues to a large amount that are never realised. If the locality would spend the money at once it would be a bonâ fide outlay on their part.

26,968. I asked the question with this understanding, that the people locally interested would subscribe the money, or would give satisfactory guarantees to the Government that that money should be subscribed, and would be expended, and not merely expended but expended according to such a plan of a harbour as the Government might approve, and expended under their directions; it was assuming those conditions that I asked you the question?—That is a very favourable proposition, and very different from Government advancing money on the faith of prospective dues, because that has often led to undue outlay.

26,969. I asked the question, and you, I imagine, gave the answer, presuming that the Government would be perfectly satisfied as to the guarantee given? —I should think the Government would do very well

to advance the money in co-operation with any great body that would propose such an improvement.

26,970. In cross-examining the witnesses down in the north, we found out that the people at the Tyne are already expending 400,000*l.*, or that there is a great plan to expend that sum, part of which they are going on with, and that there is a disposition on the part of Newcastle to realise certain local dues, and thus obtain 200,000*l.*, which would make 600,000*l.*, provided the Government would come forward with the other 200,000*l.* That is the way I put it?—I should think it would be very well expended on the part of the Government for a great improvement like that as it promises to be.

26,971. (*Capt. Sulivan.*) If you knew that the result has been that as the pier has grown out so the sand has accumulated rapidly, so as in some cases even to flow over the pier, would that strengthen your opinion that as it goes out the sand will more rapidly tend to block up the entrance?—It is very possible that when it got to a certain extent it might not have a tendency to fill up any more.

26,972. With reference to the deepening of the channel of the Tyne two feet while the piers were going out, I can tell you that prior to that deepening there existed some large blocks of stone and fragments of rocks in the channel, just where it began to shoal, and that higher up there is what they call a nine-feet bar of conglomerate and very hard stuff. During the time that they were building the piers they were also cutting a deeper channel through that bar, by dredging and removing all the masses of rock and wreck which were inside the shoalest part of the bar. Might that not account for the subsequent deepening of two feet just over the bar, and therefore might not that be not altogether caused by the carrying out of the two piers?—I do not think that that would create a deepening outside the bar.

26,973. It is immediately inside the shoalest part of the bar at the inner edge?—I do not think that that would occasion its deepening outside the excavation. If it is a very hard substance it will never form again.

26,974. Would not that bar of nine feet tend rather, while shoal, to disperse the tide, and when the deeper channel was cut through would not it throw the volume of water more directly on the shallower bar?—It might move the bar a little further off, but I do not think it would prevent the collection of it.

26,975. Supposing the result of constructing these piers to be the deepening of the water over the present bar, must not all that material that is carried down by the river be deposited somewhere at or near the pier-head?—It would go to sea, I presume; but I doubt whether both piers have had the effect of deepening the channel. I suspect it has been only one or other of them.

26,976. But suppose the piers to be continued, and to produce a stronger current, so as to carry away some portions of the bar, must it not be deposited where the pierhead will be?—I think so.

26,977. Will it be only a question of time when that bar shall be formed at these piers?—My impression is that it will be formed there.

26,978. Would you be kind enough to say how far the Adour piers were carried out?—They were carried out three or four miles.

26,979. What depth of water were they in at the outer extremity? (*A plan of the Adour River, dated* 1828, *was produced, and shown to the witness.*) I refer to 1814, when the bar and the passage was in a different position to what it is shown upon the plan. We went in with boats.

26,980. Before these long piers were built?—The first piers were high up, and the bar collected outside them. Then they threw out other piers, and the bar collected again. I am told the present Emperor is about to renew efforts for its improvement.

26,981. Has the tendency then been to form land at the back of the piers, and as they were thrown out has the bar been thrown still further outside?—It has thrown the bar further outside, and sandbanks have accumulated at the back of the piers.

26,982. You were asked a question about Filey. I must first explain that at present a natural pier exists there for some distance above high-water mark, called Filey Brigg; that there is no tendency to any travelling of the sand from the southward to Filey towards the corner formed by that brigg and the shore. Would that be sufficient to show that building a pier still further out could not in any way alter the accumulation of sand?—I should think it would. That would give great reason to expect that there would be no accumulation.

26,983. Looking to the small plan of Filey Bay which I now place before you, you will see that Flamborough Head, which is a few miles south of Filey, cuts off entirely all travelling of sand from the south; that rocky chalk cliffs exist to very nearly within two miles of Filey, and the sandy beach only commences at the end of these chalk cliffs. We have it in evidence that flints falling from these chalk cliffs have not travelled at all along that sandy beach, but remain at or very near where they fell, and that there is no sand to accumulate from that end of the beach to Flamborough Head. Would that satisfy you that there would naturally be little fear of any accumulation being caused in that bay?—That looks very like it; but I should say that if a harbour were made under Speeton Cliffs it would remain perfectly clear, and having so much done by nature it seems worth while to carry the works further, so as to enclose the bay, and give more shelter.

26,984. Are you satisfied that with such a structure, or rather such a brigg, placed there by nature nearly in the direction in which a pier would be carried, that had there been any tendency to travel, the corner of the bay inside of that must have shown an accumulation of sand?—I should think it would; but there could be no harm in leaving a part of the pier open.

26,985. Filey Point at present projects nearly half a mile beyond the cliffs, and the brigg projects nearly another half mile even above high water, and there is another large portion dry at low water, yet there is no tendency to accumulation even in the corner inside Filey Point?—I should consider that promises to be a very good harbour. There is no backwater, of which I have the greatest dread, and there would be no fear of accumulation if there was. I think that leaving an opening in the pier would remove any such danger.

26,986. With reference to what you said as to the advisability of assisting the people at the Tyne by a grant of 200,000*l.*, if the responsibility rested with you to recommend to the Government the expenditure of a sum of money to do most good for the saving of live and property on the coast, could you recommend that outlay at a point that enclosed within the works a tidal river?—I should not prefer that. I should prefer a plan that did not; but there is a great inducement, having so much assistance from other sources.

26,987. If your views are right, that it is only a question of time before a bar will again form at the entrance, both the outlay of the local parties and that of the Government would be comparatively thrown away?—If my views are correct, it would.

26,988. You are aware that this question of the improvement of tidal rivers is one of very great importance to the country, in which nearly all our harbours are at the entrance of tidal rivers, and therefore you will excuse my asking one or two further questions. You instanced the Adour. Did I understand you to say that the want of gain that has occurred at the Adour would be a reason for not attempting any experiment at the Tyne?—Oh dear, no; not at all; because there are so many different circumstances in different rivers. When a river enters into a considerable estuary it is always very much better. Large estuaries, like the Thames and many others, remove the difficulty, because a great body of

LONDON.

Gen. Sir J. Burgoyne.

1 Dec. 1858.

Capt. Sulivan.

tidal water neutralizes the effect of backwater coming down, and therefore it has not so much effect as it would otherwise produce. Now the Tyne is under much more favourable circumstances than the Adour, because the latter river goes by a very narrow entrance abruptly upon the sea, whereas the Tyne does open into a kind of estuary. There is a great expanse for the flow of the water of the sea which would tend to relieve it.

26,989. The Adour is a small stream opening upon a sandy beach ?—It is a large stream; a large body of water comes down the Adour.

26,990. As large as the Tyne ?—I do not know exactly the dimensions of either one or the other, but it is a large body of water.

26,991. It opens, I think, upon a sandy beach, without any headland upon either side ?—Upon a sandy beach without any headland.

26,992. I think on the north-east angle of the Bay of Biscay ?—Yes.

26,993. Exposed to the whole force of the Atlantic wave ?—Yes.

26,994. And in a very sandy coast ?—On a very sandy coast, which is an unfavourable circumstance.

26,995. Therefore you would not compare that with the river Tyne ?—No. For instance there is the Nile, which is a great deal worse than the Adour. There is an immense river comes out, and not six feet water at the bar.

26,996. You would not adduce an argument from either the Nile or the Adour against trying an experiment at the Tyne ?—I would not speak against any specific project; I only hold it as a principle that a great mass of backwater is prejudicial to the forming of a harbour, but that if it expand into a great estuary it becomes in a degree neutralized. In fact that great rush of water coming at once against the bank of the sea is not arrested to the extent which takes place in other cases.

26,997. You are aware that the River Humber has no bar ?—The Humber has a very fine entrance.

26,998. And has no bar ?—And has no bar.

26,999. Can you account for that ?—I attribute it to the existence of the great estuary, which lies within the spit of land called Spurn Point; a great estuary which lets in a great mass of tidal water, so that the backwater has not the same effect; it is lost in that mass, and I have no doubt that the current at the Humber is not particularly strong, as it is out of many rivers. Whenever there is a very strong current I think there must be a prejudicial action produced.

27,000. Are you aware that in the river Tay there is, comparatively speaking, no bar; that is, there is a bar, but with 20 feet water at low-water spring tides? —My recollection is that the Tay runs out with a great bell mouth.

27,001. It does ?—That is what I consider a favourable circumstance.

27,002. A bell mouth with regard to the land, but carried almost to a small mouth by sands on one side. Are you aware that the Yare, the entrance to Yarmouth, has been deepened, and that a depth of nearly 10 feet over the bar has been gained within 20 years? —I do not recollect the Yare; I think it is a very winding passage.

27,003. Yet it meets the sea almost at a right angle ?—I do not know that that has been improved; has it ?

27,004. Yes; it has been greatly improved by dredging. Do you think that there is anything to be done in the way of improving a river by dredging the bottom to a very slight slope ? Do you consider that a slight slope is more or less likely to produce a bar than a rapid one ?—You may increase anything by dredging, but the question is whether it will not silt up.

27,005. But might we not reduce the sea reach of a river to a moderate slope; a better slope for meeting the sea water than allowing it to be rapid ?—Anything that reduces the rapidity of the current will produce a good effect.

27,006. Between the Tyne bar and Newcastle, a distance of 10 miles, there is, if I recollect right, a loss of 5 feet of tide. Do you think that any benefit would arise from dredging the Tyne up to Newcastle Bridge nearly to a level ?—I should think certainly so; the more you can dredge it, the more space you can get for the sea, the better.

27,007. You think that would have a beneficial effect upon the bar ?—I think it would. Anything that admits more sea into and neutralises the effect of the backwater I think would be of benefit.

27,008. Seeing the number of tidal rivers and harbours that we have around the country, do you think it desirable that every effort of engineering skill should be put forth to endeavour to improve them ?—Certainly.

27,009. Do we understand your evidence would be to discourage that or not ?—Oh no, not at all. The only thing I say is that I think backwater is prejudicial, cæteris paribus, to the formation of a harbour, and that I would rather have a harbour without any backwater.

27,010. For a general refuge harbour, would you construct it where there is no backwater ?—Yes.

27,011. I think all the engineers in the country would agree with you on that point, probably; but you would not carry that so far as to say that it would not be worth while to make an effort to improve the tidal harbours ?—Certainly not; many of the tidal harbours are of vast commercial importance. If you cannot gain the object in one way by a lateral port, as I have mentioned, your only choice is to improve the mouth of the harbour itself.

27,012. You are probably aware that in the River Clyde, at the Bromielaw Quay, within the memory of men living, a barge would not be afloat, and that at present West Indiamen drawing 20 feet of water discharge their cargoes at high water ?—I think Glasgow is not a favourable case to quote, as to the improvement of harbours, for if I am rightly informed I believe that the tide does not rise so high by two feet or two feet six inches as it did in former times.

27,013. Do you mean at Glasgow Quay ?—At Glasgow Quay. I do not know whether I am correct, but some years ago, in talking about Glasgow, it was explained to me that by restricting the flow of water by means of dams which they have made going up the river they have prevented the influx of the tide, so that it does not rise at Glasgow so high by two feet or two feet six inches as it did before. But they have gained by deepening. By dredging they have gained a passage up there, which has given an improved waterway.

27,014. I think you have been misinformed as to the facts ?—That may be.

27,015. No doubt some of the dykes in the lower part of the river have checked the tidal flow. It is, probably, one of the very points that led to the establishment of the Tidal Harbours Commission, that fault on the Clyde. At the same time they have dredged out the bottom so as to have a rise of 10 feet at Glasgow, where they had only 18 inches ?—Have they got that rise of tide ?

27,016. A rise and flow of tide from dredging out the bottom. They have lowered the level of the bottom, but not raised the level of high water above what it was formerly. You think it does not rise so high ?—I think the high-water level is not so high by two feet as it was before. That was the impression I formed, and that was occasioned by the dams they had carried out—longitudinal dams, I believe, carried all along, which have obstructed the entrance of the sea up the Clyde.

27,017. It is found that these dykes are now too narrow for navigation, and they are setting them back at a great expense ?—If they could carry them all away it would let in the tide, and would improve the passage to Glasgow.

27,018. I understand that you are in favour of encouraging the tidal flow everywhere ?—Yes, to the utmost extent, provided the entrance be proportionate.

27,019. You would remove all obstructive bridges, starlings, and piers that prevent the tide flowing ?—Everything which shows itself to be a real obstruction.

27,020. You are aware that at Newcastle Old Bridge the abutments, piers, and starlings occupy 200 feet, or two-fifths of the river ; do you consider it would be a great advantage to remove that structure, and allow the tide to flow upwards ?—I think anything that impedes the tidal entrance, with the proviso that I made before, is injurious. At Portsmouth, I think, if you lessened the amount of tidal water that went into the harbour that would improve the entrance.

27,021. (*Capt. Vetch.*) Admitting, the general principle, that in the case of a river meeting the sea, that the two opposite forces meeting must necessarily cause a bar by the stroke of the sea meeting the current and sand brought down by the river, that there must be a point where these two forces meet, and neutralise each other, deposit their sediments and cause a bar, I should like to know whether there are no other causes that help to form these bars ; for instance, whether when a river discharges itself, having shifting materials in its bed or on its shores, may that not be a great feature in the formation of a bar ?—Oh yes. It seems to be formed from that ; but I think it is occasioned by the deposit on a particular spot by the current meeting the break of the sea, and that even the side current drops its deposit from the same cause.

27,022. For instance, in the case of the Mississippi, with which I believe you are acquainted, there is 100 miles of very deep water from New Orleans to the mouth. At New Orleans the depth is 100 fathoms, but at the mouth you will recollect there is a bank or bar which large vessels cannot get over, a bank with 11 feet water, and there is little tide in the Mississippi ?—It is an enormous river, but the banks are of mud, and the bar is mud, and ships break right through it, and do not care whether they touch it or not if they have force to go through it. It is a very strong case of the effect of backwater. When we went there we had to anchor. It is of loose materials, and shifts about and deposits anywhere.

27,023. In the case of the Guadiana, one of the most powerful streams in Spain, a bar is formed all round the mouth, five or six miles in length, completely obstructing it. That I suppose you will attribute to the violence of a strong stream meeting the sea with a strong impulse ?—Yes.

27,024. That the two meet, and occasion a sediment ?—The current is checked by the break of the sea. The mouth of the Douro is another strong example. It is an enormous river, and brings down an immense quantity of water. There are parts in the interior where it rises 200 feet between the mountains. There is a terrible bar at the mouth of that river ; a very bad one indeed.

27,025. I think that in all the cases of bars mentioned we find that the material is loose both on the bottom and at the sides where the river discharges, whether it is sand or mud ?—At the mouth of the Douro I do not think there is much sand, or much cause for deposit, except what is brought down by the river, because it is a very rocky shore there.

27,026. Suppose the River Tyne, instead of falling through a great bank of sand, was bounded by two rocky promontories, one on each side, do you think that the same effect would arise as now occurs at its mouth ?—I think it would form a bar if it had a narrow entrance, from the mere deposit from the river alone.

27,027. I think you will find these bars generally exist where there is loose material ?—The mouth of the Tyne has a fine entrance, but there is a great estuary, which enables the tide to flow in and out smoothly ; still there is a bar there, but it is a very good one.

27,028. I only want to draw your attention to the combination of these two circumstances, first, the river running with rapidity and meeting the sea, and the shock of the two forming a deposit, and also to the fact that that tendency is very much increased by the nature of the material through which the river discharges itself ?—No doubt the Nile is very bad from that circumstance of sand.

27,029. (*Mr. Coode.*) Referring to the case of the Tyne, I should like to ask, if you will tell us, what in your opinion will be the effect of the works as indicated upon the Admiralty chart lying before you ?—It is very difficult for me, without knowing the movement of the sand, to judge precisely as to that. What I want to adhere to is, the main principle, that a great quantity of backwater meeting the sea has a great tendency to create a deposit.

27,030. I will tell you as a fact, that so far as the south pier has gone at present, the tendency has been to cause an accumulation of sand on the south side, and that the sand is growing towards the east end as the pier advances. Having made that explanation, I should like to know, if you feel in a position to give an opinion, what will be the effect of the works. If you cannot give an opinion, I will not press you for an answer ?—I should expect the sand would flow to the entrance, and ultimately form a bar.

27,031. You expect the ultimate effect will be that a bar will be formed ?—That is my opinion.

27,032. In short, that it would be simply a question of time ?—It may form so slowly that ordinary dredging might keep it clear ; something of that kind.

27,033. I gather, that the result of your observation and experience has been to confirm your opinion that the more nearly the entrance of a tidal river partakes of an estuary character the less will be the liability to the formation of a bar ?—That is my idea.

27,034. Holding these opinions, do you consider that the forming of piers at the Tyne is judicious, because it seems to me that it is the reverse of the estuary form ?—If it is narrow at the entrance that would be injurious.

27,035. You prefer the bell mouth ?—Yes.

27,036. I think your reason is that that more nearly partook of the form of an estuary ?—Precisely.

27,037. In fact it was keeping to those natural forms which we see are the most successful ?—It enables the sea-water to go in and out smoothly and evenly.

27,038. As you are aware, the matter we are dealing with is one of refuge rather than commerce ; should you think that if the Government made a grant towards the improvement of the Tyne, with a view to improve it for refuge purposes, some substantial guarantee should be taken that a proper amount of space should be always available for refuge, as an equivalent for granting the public money ; that the Tyne people should not be left free to occupy the whole for commercial purposes in any way they may think proper ?—That would be going into too great refinement of legislation. It would be better to take it for granted that the larger basin would be always available for refuge.

27,039. We have known these circumstances to have arisen, that notice has been given to prevent vessels from leaving the docks and going into the river, because there was no room for them ?—If these works are carried out they will form a very large basin, because it is natural to suppose that it will be artificially deepened, will it not ?

27,040. The deepening of that forming no part of the plan, I would ask you whether, in that case, do you think that the construction of that south pier would not have a tendency to cause an accumulation on the north side ?—No ; I expect a bar would be formed.

27,041. What do you apprehend would be the direction of the channel when the piers were made ? You do not apprehend that the simple construction of piers would cause the space between them to deepen, but that it would require to be deepened by artificial

LONDON.

Gen. Sir J. Burgoyne.

1 Dec. 1858.

Mr. Coode.

means ?—Yes ; it would be simple sand, and might easily be deepened.

27,042. Your reference to the case of the Adour might possibly mislead a little, if it were to be understood that the piers were carried out into the sea. I understood your explanation to be, that they had been extended two or three miles beyond the entrance of the river, whereas by the chart they appear to be entirely within the river's mouth ?—They were in the first instance carried out into the sea ; the first ones, according to my impression, were carried out into the sea, and the sand has accumulated about them since. My impression was that at first they were carried out into the sea, and all the sand round them has accumulated since.

27,043. (*Chairman.*) (*Looking at a plan that had been produced.*) It can hardly be that, I think ?—I will not be positive about it.

27,044. Upon what authority do you say that ; because from looking at the chart these piers do not seem to have been projected into the sea ?—That was the impression that I formed when I was there.

27,045. (*Mr. Coode.*) The impression made upon my mind by your evidence was, that these piers had been projected into the sea to the extent of two or three miles. Upon referring to the chart I find, that at present, the outer extremity of the piers just touches the line of the shore. If you could tell us what was the line of the shore at the time the piers were projected, it would be an important fact ?—I could not tell you that ; but there is an anecdote in connexion with this subject which may throw some light upon it. In the year 1782 the Emperor Joseph of Austria was travelling about the world incognito, and came to Bayonne. They were then carrying out the piers there ; and he said to them, "You may "carry out your piers as far as you like, even to the "opposite shore, but however far you carry them "the sand will fill them up, and you will not get a "harbour."

27,046. (*Capt. Sulivan.*) You have stated that the sand has formed at the back of the piers ?—Yes, that is my opinion.

27,047. (*Mr. Coode.*) Perhaps you have some authority or document which would assist us in coming to a conclusion ?—No, not at all.

27,048. (*Sir F. Smith.*) It is a question of recollection ?—Yes ; as the thing struck me when I happened to be there.

27,049. (*Mr. Coode.*) You said in reference to the Tyne you would encourage the tidal flow by all possible means. Do you not think that might be carried too far, and that at a certain point it is desirable rather to regulate than to increase the tidal flow ?—It may be carried too far where the entrance of a river is narrow, but not where the entrance is wide. The nearer you approach to a bell mouth the better for the influx of the tide. I believe it is something of that kind which creates the enormously high tides in different parts of the world ; at Fundy, at Liverpool, in the Bristol Channel, and in the Severn.

27,050. Taking the Tyne as an instance, would you apply the principle which you have laid down for the whole of the Tyne, from Shields to Newcastle ?—Yes. If I could make a great wide entrance for the tide to go in, it would improve it very much ; but it is out of the question ; it is almost impossible.

27,051. Taking the Tyne as it now exists, do you not think a greater depth of water could be obtained by training the stream of the tide than by encouraging the amount of tide beyond a certain extent ?—I do not quite understand that.

27,052. I wish to ask whether it would not be more judicious to train and regulate the channel which the tidal water would make above Shields, rather than to permit the influx of a greater quantity of tidal water ?—I think the tidal water does good, and the backwater does harm ; but I do not like to give an opinion upon this subject, which has been under the consideration of engineers who are very able to judge. I would rather confine myself to general principles.

27,053. The degree in which the piers that project from any shore will act as groins, must, I presume, from your former answer, in your opinion depend much upon the kind of material flowing the coast ?—Yes.

27,054. There are instances where projections or piers would not create accumulations ?—That is the case in Kingstown within Dublin Bay. There is an immense expanse of sand along the shore, but a mile from Kingstown there is no sand, and therefore the harbour of Kingstown is perfectly clear.

27,055. (*Chairman.*) You have used the expression "backwater" repeatedly. What must I understand you to mean by that ?—I mean backwater and the river course.

27,056. Backwater, as you have used the expression, is water of the river as distinguished from the water of the sea ?—Yes.

27,057. Therefore you would not call the ebb-tide, the water which flows off the banks in Portsmouth harbour, backwater ?—Except that it produces the same effect, if the expanse inside is out of proportion to the width of the entrance, and produces within a very sharp current, which I hold to be prejudicial.

27,058. But in the sense in which you used the expression "backwater" it is simply water which belongs to the river, and flows from the back country ?—Yes.

27,059. Referring to your evidence as to the piers of Bayonne, do you say, merely as a matter of opinion, or as a matter which you know from any certain authority, that the mouth of the river was where the piers commence, and that the sand at the back has been formed since they were run out ?—I cannot say positively as to that.

(*Capt. Washington.*) I believe that the whole account of the works at the mouth of the Adour may be found in the report contained in the French engineering papers. I believe it to be in the Admiralty library, but if not I can procure it from Paris in a very few days.

27,060. (*Sir F. Smith.*) You are aware that upon some parts of the coast of Sussex where groins have been placed for the purpose of accumulating sand for the protection of the towers they have not succeeded ; there has been no accumulation ; none have taken place, and in consequence some of the towers have been washed away ?—Not where there were groins, I imagine. The groins always succeed.

27,061. Oh no ; in some cases they do not. There seems to be no sufficient reason for it, but there are no accumulations. The line of the south entrance to the Tyne upon the chart shows the line of the south pier. It has been stated to you that in some pents to the right of the pier the sand has grown up to a level with it, and even in some instances has tipped over it. Now as there is a set of sand from the south to that pier, is it not a matter of necessity that it must eventually either spread at the end of the pier or must go over it, and form in a mass of sand on the other side, because it must find a level somewhere, either by going along the end of the pier or over it, and if it goes over the pier it helps to fill up the expanse intended for the accommodation of vessels, and if it does not do that must it not of necessity go to the end of the pier, and in the course of time, in the natural course of things, go into the harbour, and form a bar ?—I should expect it must do so.

27,062. Should you not have imagined, if this had not been a matter upon which engineers had expressed opinions, but if it had been only a scheme proposed by some one,—should you not think it would be a better plan to give the south pier just the reverse form to that which it takes, and make it go beyond the sand called the Herd Sand, so as to give it a bell-mouthed shape ?—The same effect would be produced ; that would have filled, up with sand, but the bar would not be formed, because there would be a larger expanse. It is difficult to give a confident opinion against the

construction which is recommended by celebrated engineers.

27,063. I am assuming that it is not the Tyne, but a scheme for some other place. With regard to Filey, we hear that there is no set of sand there whatever, and you are of opinion that that is an advantageous position for a harbour. If you had to define the form of coast most likely to give the advantages which you want, it would be something of that kind ?—I think it would.

27,064. With a rock to the south and the brigg to the north, without any movement of sand ?—Yes.

27,065. (*Mr. Lindsay.*) In reference to the answer which you gave to Sir F. Smith as to the tendency of sand to accumulate at the south pier at the mouth of the Tyne, would there be exactly the same effect if there was no such thing as the River Tyne at the site shown upon this plan ?—Certainly.

27,066. You said that in your opinion, and you merely gave it as an opinion, you thought that even if the piers were carried out a bar would still remain. Do I understand you to mean this, that if the bar now is at 6 feet, that being the shallowest part, and so called the bar, if the piers were carried out to 30 feet at low water, in the course of time the 6 feet within would deepen, and that where there is now 30 feet there would only be 6 feet ?—Yes, that is my opinion.

27,067. Say that the pier was carried out to 30 feet ; it would meet the ocean tide flowing along the coast. Would the effect of the ocean tide be to catch the sediment as it comes out of the river and scour it, and thus reduce the tendency to form a bar ?—Anything that would augment the force of the collision between the current running out, and the bank of the sea, which is nearly stationary, would be disadvantageous. So long as there is that collision, I think a sediment must be created.

27,068. It would tend to reduce it, but not to remove it ?—No, it would not.

27,069. (*Capt. Washington.*) I should like to return for one moment to the rivers which have been instanced. The Adour, which rises on the north side of the Pyrennees, is a rapid torrent, and falls into the Atlantic ?—Yes.

27,070. The Douro, another river that has been mentioned, also rises in the mountains, has a short and rapid course, and falls also into the Atlantic ?—Yes.

27,071. The Guadiana rises from a very high source, has a rapid descent, and falls, I believe, into the Atlantic ?—Yes. The Douro does not exactly rise in the mountains ; it rises in the great high plains of Castile and Leon, but it is not in the mountains. There are streams which come from the mountains ; but it cannot exactly be said that the river itself rises in the mountains. I do not know whether you mean by a rapid course a precipitous one, but you can navigate the Douro to the frontier of Spain ; I have been as far as that in boats. It is a rapid river, but quite navigable all the way up. It is not precipitous.

27,072. I wish to obtain your opinion whether you think any argument can be derived from the piers at the mouths of these rivers, against any attempt to improve rivers in England ?—I think the circumstances are the same, if a great current of backwater coming into the sea.

27,073. Do you not think a very rapid descent of a river an unfavourable symptom towards doing away with the bar ?—The more rapidly it comes into the sea the worse it is.

27,074. (*Capt. Sulivan.*) You said that you considered the Tyne rather a favourable specimen of a river, and that it might be worth while trying to improve it, because it forms something like an estuary ?—Yes.

27,075. If the piers are carried out as you see them drawn on the Admiralty chart, will not the whole of those advantages be destroyed, and will it not then become more like a river running through a narrow entrance upon a straight coast ?—Yes, I think it would.

27,076. Carrying out your view, and supposing it to be right, and taking it for granted that there is no travelling of sand from the north, will not that north pier as it closes the estuary, without keeping out any silt from the coast, do more harm than good ?—Except for the shelter it gives.

27,077. I am excluding all idea of shelter, because we never had from the parties who designed these piers any idea of their forming a shelter. The anchorage supposed to be gained is higher up. I never heard the idea suggested that the space inside the piers is to form a refuge, but only to deepen the river ?—Then the greater the opening the better.

27,078. The south pier, without the north pier, would according to your views, have more tendency to improve the river ?—Yes ; if there was a pier to the south, and none to the north, it would be better, I think.

27,079. Then, supposing it to be decided that the Government money should be laid out at that place, would you consider it desirable to lay it out upon a plan which shuts it up, and makes it a narrow mouth ? —It is a great question, what is the plan upon which the harbour should be constructed, and I should be very sorry to give my opinion against that of engineers who have considered it upon the spot, and who are really more competent than I am to judge of it.

27,080. (*Mr. Coode.*) Notwithstanding the strong opinion which you entertain of the difficulties which would attend any attempt to improve the entrance of a tidal river, looking also to the importance of this question to the country, you do not go so far as to say you would discourage any attempt to improve the entrance of these rivers, and to make them more valuable for purposes of refuge ?—Certainly not. I should not wish to stop any great improvement of this kind, particularly of such vast commercial importance as all these rivers are ; but in choosing a site for a harbour I would prefer a smooth rocky coast to any other.

27,081. You would give the preference to a site where there was no backwater.

27,082—92. (*Chairman.*) Can you offer any remark upon the means of reducing the cost to the country of the construction of harbours of refuge ?—In the first place,—it is not exactly any answer to that question,—but with regard to economy of harbours, I do not think the public are quite aware of the great benefit of these commercial harbours. They have considered it more as a question of the saving of life, and occasionally of ships getting in in tempestuous weather to find refuge for the moment ; but indirectly there are immense advantages gained by these harbours. Judging from Kingstown Harbour, whenever it blows pretty strong, particularly in winter, Kingstown Harbour is full of shipping. They may have come from Glasgow and other distant places, and having got a little beyond Kingstown meet with a foul wind ; if the wind is pretty strong they drop their anchor, and wait there for a fair wind, instead of running back to Glasgow or elsewhere. By that there is a great saving of property, of wear and tear to ships, and of time ; that causes the formation of such harbours as these to be a very judicious expenditure of money ; I think more so than people generally imagine ; besides the immense saving there is if you save even a single ship from being wrecked. Kingstown Harbour cost about 800,000*l.* Three or four ships saved would pay the whole amount of it ; so that I think it is of great national importance, and that these harbours are of much more national value than people generally are aware of. As to economy of construction, it strikes me that there is occasionally more expenditure in cut stone works and in heads than is absolutely required or actually necessary. The principal object of one of these harbours is to give anchorage, to shelter ships, and to save lives from the effects of the ocean storms ; and to get that in the cheapest way you can, whether by running well cut stone works up from the bottom to the top, or by throwing in rubble, and then afterwards adding your cut stone works just to the extent that

LONDON.

Gen. Sir J. Burgoyne.

1 Dec. 1858.

Chairman.

may be required for piers and wharves or things of that sort; but it is not desirable to carry the cut stone work all the way through, merely to make it a handsome thing; such things cost a great deal more money than is necessary. Some saving may be effected in that way. Another economy, that ought also to be considered, and one of much importance, would also be, before you construct a harbour you should secure the foreshore for the docks, the wharves, and other things of that sort. I think you have right to take that into your possession. I have known a case where a harbour had been made at a very considerable public expense, and where there was a little bit of foreshore within the limits of the pier which was required for a quay. There was a great necessity for taking it, and the value was enormously increased, and the proprietor of that little bit of foreshore asked an enormous price for what was only a piece of bare rock, and had only had any value conferred upon it by the formation of the harbour. That appeared to me to be very unjust; and not only that, but whenever you make a harbour you lead to the creation of a town, with stores and hotels, &c., and from the land being only of agricultural value of so much per acre it becomes of great value, so much per foot. I do not see why you should present that difference to private individuals, or make the fortunes of proprietors, at the public expense. You ought to take the ground round the harbour, and apply the increased value of it towards defraying the expenses of the works. Pay the full value, and a liberal value, for the land, in the first instance, and then turn it to account for the benefit of the harbour.

27,093. In respect to the actual construction of the piers, and so on, you do not wish to offer any evidence?—No. There are many different ways of doing such things. Engineers of course have different views upon these matters.

27,094. You do not wish to offer any opinion upon this subject?—No, none. I think that the upper works are often carried to greater refinement than is actually necessary. I think that the matter of taking the ground is of great importance. At Kingstown quite a city has grown up there, which would have paid the whole expense of the works if the ground had been purchased at the time the harbour was made.

27,095. If it had been bought in the first instance?—Yes, at its agricultural value; a full and liberal price being paid for it.

27,096. (*Mr. Lindsay.*) You have thrown out a very important hint, and I want to see from you how it could well be carried into practical operation, presuming the case of Filey Bay before us?—If you make a harbour there a town will spring up; and I think the Act of Parliament that enables you to make the harbour should empower you take a quantity of land, and turn it to any account you please.

27,097. We are talking of Filey Bay simply because Filey is before us. We might take any other place. Now say that negotiations were opened for the purchase of a certain quantity of land in the immediate neighbourhood of Filey, and the proprietors of that land would say, "the Government intend to do "something here, or they would not seek to buy the "land;" consequently they would not sell. Would you propose that the Government should introduce a bill so as to vest in them the power to buy the land at a valuation?—There is a general Act of Parliament for each specific work of this kind. There would be an Act of Parliament probably for this, to give them power to make these works. You also take quarries, and power over land for them. The Government, before it undertakes a work, is allowed to take land for quarries, and whatever may be necessary for them, at a valuation fixed by a jury; at its then value; not at its prospective value. At its then value, which is an agricultural value, worth perhaps 100*l.* an acre, power is given to take a certain extent of ground for quarries; and I say you ought to go further, and have power to take a considerable space of ground beyond that in case of harbours.

27,098. What you recommend then is that the powers which the Government already possess should be greatly extended?—Yes; they have no power at all except by each specific Act of Parliament.

27,099. Or rather that the power which by the Act of Parliament for any specific purpose, say this for Filey Harbour, they would be vested with for a specific purpose, should be acted upon to a much greater extent than has hitherto been the case?—I should not leave it in the discretion of the Government to take what they please, but should define the amount, within certain limits, and the Government should have the power of taking that at a valuation.

27,100. You would recommend that whenever an Act of Parliament was asked for for the construction of a harbour of refuge at any particular place that there should be a clause defining the amount of land the Government should include?—Yes.

27,101. And that that extent of land should be a good deal more than it has hitherto been?—Yes; quite, certainly all the foreshore and a great deal at the back. It would injure no one, and would be an encouragement to the commencement of such undertakings.

27,102. (*Sir F. Smith.*) Wherever stores would be required?—Yes; in many instances a town would rise up, and there would be an enormous increase in the value of land.

27,103. (*Capt. Washington.*) Have you ever considered the question of applying an island at the entrance of a river, say the Liffey, for the improvement of it?—No; I do not know of any particular instance of that kind.

27,104. Are you aware that about the year 1830 Sir T. Page proposed that an island should be put upon that bar, with a view to getting a deep channel on the other side of it?—No; I am not aware of it. I do not quite see how it would be an improvement.

27,105. Did you ever see any plan proposed by Mr. Glover for such a purpose?—No; I do not recollect ever to have seen it. I think you have a project before you which would be very useful for joining some islands at the Skerries, and making a very fine anchorage at a very moderate expense.

27,106. (*Capt. Sulivan.*) You mean that, supposing it is shown there is a want of a harbour of refuge in that neighbourhood, that that would enable you to make it comparatively easily at the Skerries? Yes. Whenever you decide that a harbour of refuge is necessary, and you determine to undertake it, I would take the land.

27,107. With reference to the Skerries, you said they could easily be made into a harbour of refuge. Do you mean that there is any necessity for a harbour of refuge there, or only that if one was necessary it could easily be made?—I have always understood that it would be a very desirable place; more a roadstead than a harbour. If we enclose a shelter for ships to anchor, I do not think they would go into a harbour at all.

27,108. (*Capt. Vetch.*) I think Sir John has brought a very important consideration before the Commissioners; viz., the fact of the necessity and advantage, whenever the Government means to construct a harbour, which would be highly useful to proprietors of adjoining lands as well as the public, that before doing so they should, under an Act of Parliament, have the same power as promoters of railways and other erections now possess. No one dreams of going to Parliament for such purposes unless he can obtain the power of acquiring land at a reasonable rate and valuation. If a harbour is constructed at Filey, it would be of immense importance to secure the shore, which at present is of very little use, but which would then become enormously valuable, and might be made to pay all the expense and cost of the works?—It

would pay a great deal towards it. A railway is different. They are not allowed to turn land to profit, but only to take what they absolutely want. We want to take more than we want, to turn it to profit, the improvements which make it valuable being effected at the public expense.

27,110. (*Mr. Coode.*) With reference to the suggestion which you have thrown out as to the purchase of land, I would ask whether you are aware that in the case of the harbour at Portland, a special Act was obtained, and a plan was lodged, with limits of deviation within which Government proposed to purchase; the whole frontage was secured, and something like 600 or 700 acres of land inclosed within the limits of deviation shown. There is now in the possession of the public at Portland, something like 500 or 600 acres, obtained in the manner you have mentioned?—I imagine that has been only taken with reference to quarries, to give space for quarrying, and for some works of fortification. The best ground for a town still remains in the hands of private individuals.

27,110*a*. The whole of the frontage is secured, and for the greater portion of the harbour, the land within half a mile of the shore?—I am very glad of it.

27,111. I wish to call attention to the fact, that the admirable proposition you have made was adopted in the case of Portland Harbour, in the Act passed in 1847, and that the whole of the land was secured, and a very large average beyond that necessary for quarrying and fortifications?—As regards the town of Portland, it will be of less consequence than at many other places, because they have Weymouth within reach.

I merely wish to mention that the proposition which you have made has been adopted, and that great benefit has been felt from it. I, as conducting the works at Portland, have been applied to by individuals to know whether there was any hope of the Admiralty selling any part of the frontage for commercial purposes.

27,112. (*Chairman.*) Admitting the very great advantage of taking the course you propose for the purpose of securing to the public the advantage of the increased value of land in the neighbourhood of harbours of refuge, do you not think that they would be better dealt with by a separate Act of Parliament, which would meet all the special circumstances of each case?—I should think each individual case. It would be giving Government too great a power to make it a general matter. The country would not allow that.

27,113. Take the instance of a town already being at the site of your harbour of refuge, then it would be impossible to take land?—Exactly; it would; but you might take the parts that were unoccupied, and that would be improved afterwards.

27,114. In many instances there are no such parts which are not already occupied. The foreshore may be supposed to be occupied by a seaport; in that case you cannot avail yourself of any land?—Just so. For instance, in this case of the Tyne you cannot take anything; it is impossible.

27,115. Do you not think that it would be right that if harbours of refuge are made at the entrance of ports already existing the Government should reserve power to secure a certain area for refuge purposes?—I should think that every harbour that is made at the public expense will be subject to the regulation of the public.

27,116. Wherever the public money is expended for refuge purposes, in your opinion a corresponding refuge area should be secured to the public?—Certainly.

27,117. (*Mr. Lindsay.*) I think in part of your evidence you have recommended that the Government in any Act of Parliament which they may introduce for the construction of a harbour of refuge should take an extended area of land in the immediate neighbourhood of that harbour?—Yes.

27,118. Then do I understand you to mean that the Government ought to take considerably more than would be required for the actual purposes of construction?—Yes; that is what I mean.

27,119. Then, as you are aware a great principle has been laid down and has long been acted upon, that the interests of individuals must be made subservient to the public good, that is, that wherever land is required for the construction of a great public work, the Government should have power to take it at a valuation, and that the owners should be bound to give it, do you think it would be just to apply that principle to the purchase of land not required for the public work?—I think that where a great public work is to be undertaken at the public expense the community in general ought to give certain facilities for carrying it out. There was one instance of that in the case of the Shannon improvement. The Government agreed to contribute one half of the expense of the improvement of the Shannon, the proprietors paying the other half, but upon the condition that all the land required for the work should be paid for under the judgment of the commissioners, and not according to the valuation of a jury That was a condition that was demanded, and was agreed to, and the result was very satisfactory.

27,120. The estimated value of the land taken amounted to 700,000*l*.; the cost was, under this special jurisdiction, reduced to 70,000*l*, and everybody was ultimately satisfied with the explanations which they received. In fact it was a better system of adjudicating, because the commissioners felt that a great responsibility was imposed upon them. They did not decide, as a jury would do, off hand at once, but in cases in which a doubt arose they took time. They employed valuators, surveyors, and engineers of character, who were perfectly impartial. They had these gentlemen before them in open court. The proprietors were allowed to question them, and the result was that they reduced the valuations very considerably, and in a manner that could not be disputed by the proprietors or by any one else. This arrangement proved so satisfactory that since that time proprietors have voluntarily allowed lands to be taken for railways upon the same principle.

27,121. We have mentioned the case of Filey. In that case there might be less difficulty in dealing with the proprietors in the manner you propose. But say that instead of Filey the Government decided upon having a harbour of refuge in Hartlepool Bay. In that bay there is the old town of Hartlepool and the new town of Hartlepool, and nearly the whole foreshore is covered with the two towns. There are an immense number of proprietors there, all of whom would, no doubt, be considerably benefited by the construction of a harbour of refuge there. How would you deal with such a case as that of Hartlepool?—It is a very difficult question on which to give an opinion; but I cannot see that there would be anything unreasonable, if you were making a great public improvement, in taking the unoccupied ground for the public benefit.

27,122. If you took the unoccupied ground at a valuation, why should you not, upon the same principle, take the houses, because they would increase in value as well as the land?—It is a very difficult question. I do not think you could do so, under those circumstances. I doubt whether in such a case you could ever make an equitable arrangement; but where you begin upon a desert, like the shores of Filey Bay or the rocks of Kingstown Harbour, there I think you may reasonably take the land.

(*Sir F. Smith.*) The other would be monstrous.

27,123. (*Mr. Lindsay.*) I was desirous to have it out completely, that although the principle may apply to open places you see a difficulty in regard to others?—It would be difficult.

(*Sir F. Smith.*) It would be a monstrous usurpation.

27,124. (*Capt. Sulivan.*) A portion of the shore of Filey Bay is built upon, and occupied by a town. The east corner is waste land, the very land that will become most valuable should a harbour be built there;

LONDON.

Gen. Sir J. Burgoyne.

1 Dec. 1858.

Capt. Sulivan.

and in the case of Hartlepool also, although the north side of the bay is built upon, yet there is some unoccupied land upon its shores, and therefore, if the principle is for the benefit of the public, why should it not be applied to the unoccupied land at Hartlepool as well as to that at Filey ?—I do not know. It is a very difficult question ; it would be beyond my power to unravel it.

27,125. I wish to know why the unoccupied land on the beach at Hartlepool might not be taken as well as that at Filey ?—You do not know where to terminate. It is a very nice question.

27,126. I understood that in a case such as that of Hartlepool, you would not apply it even to unoccupied land ?—I am afraid it would be very difficult.

27,127. Do you conceive that where the Government and the public are laying out money for a great public advantage, and if they could get a portion of the money by the plan you propose, they could make a much finer harbour, and give accommodation at a much less expense ? Do you think that that is a legitimate means of obtaining that public advantage ?—I think it is.

27,128 (*Capt. Vetch.*) There is one fact which I think you omitted, and that is that the foreshore between high and low water mark belongs to the Crown ?—It does, and therefore you have to deal with the Crown. Where there is no special grant, the land between high and low water mark belongs to the Crown.

27,129. (*Mr. Coode.*) I presume your opinion is that every place should be dealt with according to its peculiar circumstances ?—Yes.

27,130. You do not wish to lay down one general rule which shall be applicable everywhere ?—No.

27,131. You simply intend to propose that every case should be dealt with according to its merits and the circumstances attending it ?—Yes ; and I think that wherever you make a harbour upon a desert you may apply the principle which I have recommended.

Captain ADDERLEY SLEIGH examined.

Capt. A. Sleigh.

27,132. (*Chairman.*) Where do you reside ?—At 73, Harley Street, Cavendish Square.

27,133. State to the Commissioners what is your proposition with respect to harbours of refuge ?—My proposition is, to have an artificial or floating beach, intended to resist the force of the waves by yielding, and by the very modified angle which it presents to the action of the sea ; and, from experiments which I have tried upon a very considerable scale, I am led to believe it will answer all the purposes for which it would be intended, inasmuch as it would render the water perfectly smooth under its lee. There may be undulations, but they will be of the most modified character, because, from the nature of the construction, the artificial beach passing beneath the trough of the sea prevents any undulation passing under that point, while the other part, viz., the caisson on which the artificial beach is constructed, rests on the smooth water line, therefore I have never been able to find that any undulation, passed underneath to disturb it or make it oscillate. At the same time, reasoning from the fact that the wind, which is the cause of all waves, except some current waves, which are unimportant in this matter, is deflected over at the same angle at which it impinges on the inclined plane presented to it at an angle of about 15 degrees, there will be another effect produced, which is a still calm under the lee ; that is to say, if the inclined plane be 10 feet above the level of the sea, the wind being horizontal, the current, being deflected over at the same angle at which it would strike, would not fall on the face of the sea under the lee of this work for several thousand yards, and when it did it would do so in a very modified degree. This is exemplified in the coped walls of Scotland. The celebrated agriculturist, Sir Geo. Sinclair, conceived the idea of coping the walls, in order to deflect the wind over, and shelter the produce under their lee. That confirmed me in my ideas, and led me to try this plan. My breakwater, or artificial beach, was used with the most signal success at Lowestoft by Sir M. Peto, and the gentleman who superintended the works there declared that they could not have constructed the sea walls at all without the assistance of the floating sea barrier of my invention. The question of mooring is one which of course immediately suggests itself to the minds of scientific men and sailors. I believe there will be very little difficulty with regard to that. It is a mere question of force and resistance, and the results of the application of science to analogous cases show that we need be under no apprehension that we could not moor even the Isle of Wight if it were afloat. As a sailor, I should be happy to undertake the task. There can be no difficulty with regard to preconcerted moorings, if they are properly constructed, because it is a mere mechanical matter, and a calculation of force and resistance. The power of the sea and the effect of the wind upon any surface are perfectly well known. We can therefore ascertain with what force we have to deal, and may test our moorings beforehand, just as we test a gun. Contracts are about to be entered into for erecting this barrier at Galway, and also at Lyme Regis. The object which I had in obtruding the matter upon the Admiralty, in the hope that it might be laid before the Commissioners, was, that if by wiser and more scientific men than myself this invention was deemed worth a trial, the Government might make the experiment on such a scale and at such an expenditure as they might think they were warranted by the circumstances. I again assert that its perfect success at Lowestoft can be proved if witnesses are sent for.

27,134. (*Sir F. Smith.*) Have you formed any estimate of the cost of this barrier ?—I have. Its cost would be about 30*l.* per lineal yard ; but that would vary a good deal, according to the position in which it was intended to be placed.

27,135. We will suppose that it was to be placed in a very exposed situation, what would the cost be then ?—30*l.* per lineal yard.

27,136. That is the extreme cost ?—Yes.

27,137. That does not include the moorings ?—No. The moorings would be a matter of very little expense, from the fact of there being long links of iron stays inserted, by means of one-fluked anchors, into granite submarine foundations.

27,138. When you say that the cost would be 30*l.* per lineal yard, of what material do you propose to construct this barrier ?—I propose to build it either wholly of iron, wholly of wood, or of the two materials combined ; for instance, the caissons of iron, and the artificial beach of timber.

27,139. For which mode of construction does the estimate provide ?—It would make very little difference in the expense of what material it was constructed. I have ascertained that from practical builders.

27,140. Did I understand you to say that you had tried some small experiments ?—With very small models ; but at Lowestoft it was on a large scale. I think the section was 150 feet, with about 40 feet range of beach.

27,141. You have tried that ?—That was built by the direction of Sir M. Peto.

27,142. Do you consider that a very exposed situation ?—I should say, except Cornwall, the most exposed situation on the coast of England.

27,143. At what depth of water does the sea break off Lowestoft ?—I should say that on the average at from 12 to 14 feet from the trough of the sea to the crest of the wave.

27,144. In what soundings does the sea generally break ?—I should imagine not in more than two or three fathoms ; not in deeper water than that.

27,145. If you were to hear that in some situa-

tions the sea breaks in 12 fathoms, do you think that your breakwater would act in such a position as that? —Most unequivocally. If constructed proportionately large, I have not a doubt of it.

27,146. As a sailor you have no doubt that you can moor this breakwater so that it is utterly impossible that it should break away?—I am convinced of it, and I think that that is proved by what I have stated with regard to Lowestoft. It was there in the depth of winter. The sea washed the sea walls down, until they established this barrier, and under its lee, at a distance of from 100 to 200 yards, they constructed their sea walls.

27,147. Perhaps it is hardly necessary to ask the question, but what would be the effect upon vessels which had taken refuge under your breakwater if by chance the moorings should give way?—Very fatal; there is not the slightest doubt of that. That is one of the most striking objections to the plan, till the mode of securing it is explained. As we find that we can make iron stronger than any force which can be brought to bear upon it, I think we can get over that difficulty.

If we can do that.

27,148. (*Capt. Washington.*) I think you said that you are a sailor?—Yes, I am.

27,149. How long have you been at sea?—25 years.

27,150. In what service?—In the British navy, as midshipman, acting master, and second master. I have been in the Spanish and Portuguese navies as captain during the wars of Liberation and Succession, in the English army as captain, and commanded a corps of engineers in Spain.

27,151. Are you acquainted with the North Sea? —I am; but not so well as with the Channel station and other parts. I was on the Channel station.

27,152. I think that you have said that there would be no difficulty in mooring the caissons which you propose to construct?—I have stated so. I think that there could not be any difficulty.

27,153. Are you aware that light vessels lie at moorings in the North Sea?—I am.

27,154. Are you aware that in a single gale of wind three of them have been known to break adrift? —Yes.

27,155. Do you not believe that the Trinity Board, with the enormous funds at their command, would do their utmost to obtain for these ships the best chains that could possibly be provided?—Yes.

27,156. That being the case, and also that in one gale of wind within the last 20 years three of these vessels broke adrift, why are we to suppose that your caissons would ride better?—Because, in the first place, the construction of these caissons and of the light vessels are perfectly dissimilar. I beg leave to say that there has not been any structure formed analagous to or resembling that which I propose to adopt.

27,157. Do you mean to say that the caissons will present to the sea a less section than will a vessel that swings to the wind?—In that instance I think not; but I believe that there will be a vis inertiæ in this breakwater, or rather in the mass of inert water under its lee, which is not to be found in light or any other vessels.

27,158. To form a breakwater must not the caisson be moored with its broadside to the heaviest sea?— No; an angular side, offering less opposition than that presented by light or any other vessels. It is an acute angle which is presented to the sea.

27,159. What is exposed to the stroke of the sea? Is it not the broadside?—Yes, but with a slope of 15 degrees; it is not perpendicular. Besides there is no leverage. A light vessel exercises the power of a lever of the first order.

27,160. Are the caissons to float?—Yes; but on the smooth water line which never admits of undulation.

27,161. What is the smooth-water line?—A line between the trough of the sea and the crest which is thrown up.

27,162. Of what draught of water are the caissons to be?—Four feet, and 7 to 10 feet the lower point of the artificial beach to seaward.

27,163. What will be the dranght of water of your caissons on the seaward face?—The caissons are of even flotation of 4 feet, but the artificial beach descends obliquely to the depth of 7 to 10 feet.

27,164. Did I understand you to say that they will rest upon a stratum of smooth water?—Yes, the caissons upon the smooth-water line, which is that which is not disturbed before the wind occurs. When the wind takes place, an excavation is produced by it, and the water is rolled up on the sea or beneath the lee of the preceding wave. The line of the water before it was disturbed is the smooth-water line; on that the same undulation does not occur, and on that will rest the body of the caisson.

27,165. I think you mentioned that a section of this had been moored at Lowestoft?—Yes.

27,166. Of what length?—I understand about 110 feet.

27,167. When was it placed there?—I was told, between the years 1846 and 1848.

27,168. How long did it remain?—Until the whole of the sea wall was built.

27,169. How long may that have been?—About a year and a half.

27,170. What became of it afterwards?—It was taken away.

27,171. In what state was it?—Perfect.

27,172. Was it made of wood or of iron?—Of wood.

27,173. What became of it?—It was broken up by the direction of Captain Andrews or Sir M. Peto.

27,174. Why was it broken up?—Because it had accomplished that for which it was intended.

27,175. Do you know of any other proposals for floating breakwaters?—Plans or proposals?

27,176. Plans of which specimens have been laid down?—No, I do not.

27,177. Are you aware that one was laid down by Admiral Taylor off Brighton?—Yes. A frame of timber; a ship without planks. It came out contemporaneously with my own.

27,178. What became of it?—It was broken to pieces.

27,179. Did Mr. Grove lay one down off Dover? —Yes; a perfect cylinder; that was broken to pieces. I wrote previous to their being tried, and I demonstrated their inefficacy and their destruction.

27,180. Although all the floating breakwaters hitherto constructed have been broken to pieces by the sea, you think that yours would last?—Yes, because it is thoroughly dissimilar from any of those which you have mentioned. In those cases there was no reaction at all. In my plan the reaction arises from the dead water underneath, which does not occur in the case of a ship, or in the breakwaters before alluded to. You must be aware that the run of a ship is exceedingly fine, that there is no support under the lee of a ship riding head to wind, and that in conjunction with the action of the sea its masts exercise a most powerful leverage.

27,181. Vessels carrying light, do you mean?— Yes; a light vessel, or a vessel *not* laden, exercises the force of a lever of the first order.

27,182. (*Capt. Sulivan.*) Could the person who witnessed the operation of the breakwater at Lowestoft, and who ordered it to be broken up, give evidence as to the way in which it rode there?—I have not the slightest doubt of it. I heard the other day his brother,—the brother of Captain Andrews,—declared before a witness that Captain Andrews stated that the sea wall could not have been built without it. He did not ask me to establish it, though.

27,183. (*Mr. Coode.*) Do I understand that Captain Andrews would be prepared to come forward and give evidence upon this subject?—I suppose he would have no objection whatever to do so.

LONDON.

Capt. A. Sleigh.

1 Dec. 1858.

27,184. (*Chairman.*) If the Commissioners are desirous of having evidence as to the working of this breakwater at Lowestoft, perhaps you will undertake to produce it ?—By all means.

27,185. You will undertake to communicate with the witnesses ?—With a great deal of pleasure. I am very much obliged to you for allowing this subject to be brought forward. I will write to Sir M. Peto. Lucas, Brothers, had the contract for building the walls.

27,186. (*Mr. Coode.*) Did Lucas, Brothers, adopt your breakwater ?—I cannot ascertain by whom it was adopted, but there it was.

27,187. Was it exposed to many gales of wind ?—The whole of the winter, and withstood storms which had repeatedly knocked down their walls.

27,188. And never was removed at any time ?—Never ; except from one part to another, as protection was required for the work.

27,189. What sort of moorings were used ?—I do not know.

27,190. Do you think you could give us the names of persons who can furnish that information ?—I shall make it my business to get the fullest possible information on all points.

27,191. Do I understand you to say that the trustees of the harbour of Lyme Regis have resolved to adopt this breakwater ?—Colonel Pinney has laid the matter before the town council.

27,192. Then they have not decided to adopt it ?—They have not definitively decided. The Galway Steam Navigation Company, too, are only waiting to see if the Admiralty will do anything for them, and if not they will adopt it at once. Sir Hesketh Fleetwood told me the other day that they are going to do so, if the Admiralty do not consider it proper to do anything at Galway.

27,193. I understand that your estimate of 30*l.* per lineal yard is simply for the breakwater, exclusive of all moorings ?—Exclusive of all moorings. That is for the most exposed situations.

27,194. That is for the floating structure alone ?—For the structure alone.

27,195. Have you fixed upon any number of moorings for a given length of breakwater ?—I propose to have them every 50 feet ; that will be ample.

27,196. What kind of moorings do you propose to use ?—I should propose a one-fluked anchor, backed by granite, contained in a cradle of iron or oak, or elm, and a submarine foundation made of granite ; into that the anchors would be imbedded, that, with an endless chain or "messenger," forming the lower part of the mooring stays, so that at all times the moorings may be rove round and examined. This chain will be sufficiently long to come perpendicularly to low-water mark, and be wound round, in order that every link may be examined, and changed when necessary.

27,197. Can you furnish the Commissioners with a drawing of the mooring you propose to use, and an estimate of its cost ?—I shall be very happy to do so, and also of every other part if you wish it.

27,198. It is desirable that the Commissioners should have before them a drawing and estimate of the precise description of mooring that you propose to adopt, and also a statement of the length and size of the chains, the number of moorings in a given length of breakwater, and your ideas as to the durability which may be anticipated ?—If I may have a list of what particulars you require, I will furnish them all.

27,199. A list of queries shall be furnished to you. Is there any one besides Mr. Andrews who can give information as to the working of this breakwater at Lowestoft ?—A Mr. Coventry went to see it, and communicated to me before others the facts I have stated, he having seen my breakwater which I built of *two hundred and forty* feet long, and he was well acquainted with my plan, but I have tried in vain to find him at present. I am now gathering information as to its working from eye-witnesses who saw it at Lowestoft.

27,200. We should very much prefer the evidence of experienced men who were actually witnesses of the working of this breakwater during the time it was laid down. The evidence of individuals who merely went to make an inspection would be of little value ?—I will endeavour to get Captain Andrews, who I think was the harbour master.

27,201. We should prefer the evidence of those who were actually connected with the construction of the work ?—I think Captain Andrews would be the very man.

27,202. Will you endeavour to furnish us with the names of the superintending engineer, or the contractors or their agents, who were actually witnesses of the working of this breakwater during the time that it was laid down at Lowesstoft ?—I will.

27,203. What length of section do you propose to adopt ?—I propose 200 feet ; but I would have it as long as possible, say 500 feet because there will be greater and more uninterrupted dead water, forming a vis inertiæ under the lee to support it. As waves are known to travel about 10 miles an hour, and this recedes about five, there would be only half that pressure on the artificial beach.

27,204. Do you imagine that the structure would never be exposed to a more rapid wave than one moving at the rate of ten miles an hour ?—I draw my conclusion only from practical experience. While a ship is running ten miles an hour she never gets pooped, but the moment her speed drops to about seven, and she falls into the trough of the sea, carrying lower canvass, she is often pooped. From that I draw my inference as to the speed of the waves. I have no scientific data to go upon.

27,205. Are you aware that Captain Walker, the harbour master at Plymouth, has reported observations which he has made on the progress of waves, in the course of which he found waves travelling at the rate of 30 and 35 miles an hour ?—No, I am not. That would overrun any ship. If a vessel was going at the rate of 12 miles an hour, and the sea 30 miles, she could never escape it.

27,206. (*Capt. Washington.*) That must be after the sea has struck the beach ; not in the open sea.

27,207. (*Mr. Coode.*) The observations to which I refer were taken just outside Plymouth breakwater ?—It may be so, I am not prepared to say, nor do I give my opinion as a scientific one. I have only the practical idea of a seaman.

27,208. I wish to know if you have any extensive data on which you found your opinion that the waves only move at the rate of 10 miles an hour ?—I never ascertained it by means of any scientific instrument ; only as I have already mentioned. With regard to its force also, I have had practical experience by having the bulwarks of my ship and boats carried away, and things of that sort. There are, however, scientific deductions from experiments fixing the force with which the sea strikes at three tons per square foot. That three tons I have by the angle presented ; the back-set and the receding and reactionary tendency of my breakwater reduced that force to one cwt. on every square foot on the face of my breakwater.

27,209. Have you made any experiments to prove what would be the strain on the mooring chains ?—I had some small models, and they forged to windward. I think it would strike a scientific mind that the very action of the wind on the face of the inclined plane and the dead water under the lee, and the occasional resistance of the cables, and the back-set of the waves, would give a forward or windward tendency, on the same principle that a ship goes within six or seven points of the wind obliquely to windward. The wind strikes the inclined plane at an angle of 15 degrees, the same angle at which it strikes the sails of a ship ; and the dead water under the lee forms a positive resistance, and produces in the case of my breakwater the same effect which is produced in that of a ship. I never could get a strain on the cables.

27,210. Would not that forging to windward probably be the result of the recoil after the wave had struck the breakwater?—I have no doubt it is so in some degree. That is what I have consequently dwelt upon, that there is a re-actionary power in this breakwater which never occurs in a ship lying at anchor. Besides, the anchors of a ship are let go almost promiscuously; even in the case of light vessels the moorings are not preconcerted as they ought to be. A light vessel will readily go down at her moorings if the foundations are good, if they are not in quicksands. If there are no foundations the same difficulty would present itself to me as to the ordinary engineer in building a bridge or a pier, or a stone breakwater; he must select a foundation. I only ask for the same and will very readily moor any sized structure.

27,211. Should you have no apprehension that, in the case of a soft muddy or silty bottom, the moorings would drag?—Never for a moment. I have laid in St. Peter's Bay, Newfoundland, and the moment I cut away my masts the ship, being deeply laden and more of her hull being beneath the smooth-water line than above, forged to windward, because she was released from the pressure of the wind.

27,212. (*Chairman.*) Will you furnish us with a statement of the expense of your breakwater over a series of years, as compared with that of a stone breakwater, because as your breakwater is to be constructed of perishable materials that is a very important element in the consideration of the question?—I shall be very happy to do so. I have already made a calculation which shows that the interest of the money required to construct a stone breakwater would furnish one of these of the same size every year, if it was required. That is a mere arithmetical calculation.

27,213. Have you any models?—I have not. I shall be happy to get any made that may be required, but I think this rather a matter of scientific calculation than the mechanical illustration by models.

Thursday, 2d December 1858

PRESENT:

Admiral Hope (Chairman).

Sir Frederic Smith.
Captain Washington.
Captain Sulivan.
Captain Vetch.
Mr. Coode.
Mr. Evans, Secretary.

Mr. James Abernethy, Civil Engineer, examined.

27,214. (*Chairman.*) Mr. Abernethy, the object of your attendance here to-day is to give us some account of a new mode of construction which you propose for breakwaters?—It is so; and I would beg leave to call to your recollection that certain plans were required from me by the Commissioners when they visited Scotland. Those plans I have prepared, and brought with me, and I beg now to hand them in, in the order in which the examinations took place there. This first is a plan of Fraserburgh Harbour, with the piers as described by me in my evidence given before the Commissioners at Fraserburgh, made to the scale required by them. I also beg to hand in a plan of Aberdeen Harbour, with the proposed alterations; namely, the construction of a new breakwater, as described by me in my evidence at Aberdeen, also drawn to the scale required by the Commissioners. In reference to this plan you will observe that I have marked the acreage of the tidal harbour, showing the portion that would be available for refuge purposes, provided the breakwater were carried out as recommended. The acreage is marked at the corner of the plan, having reference to certain letters, as suggested by you.

27,215. Precisely the acreage as within certain letters which I placed?—Yes. It will also be in your recollection that a deputation attended at Peterhead from the harbour of Lossiemouth, and requested that I should be examined in London on the subject of their statement made there. They have since transmitted an additional statement with regard to that harbour, which I now beg likewise to hand in. With that statement I also wish to hand in a plan of Lossiemouth Harbour, made upon the scale directed by the Commissioners, and showing an extension of the present north pier, as proposed by me, with a view of obviating the range that exists within the harbour during north-east gales. I further propose to hand in a plan of Blyth Harbour, as coming next in order, made upon the Parliamentary scale, as required by the Commissioners. You will remember that when the Commission was at the port of Blyth I was requested to furnish details with regard to the mode of constructing the pier there. That I have done in this plan. There is also here a design for Lossiemouth Harbour, and for a round head at the termination of that pier. (*The several plans, as described, were handed in accordingly.*) With regard to the detailed plan of the proposed construction of the round head at the termination of Lossiemouth Pier, you will observe that there is something peculiar in the arrangement of the timber work. It is a design made by Mr. Michael Scott, civil engineer, and I believe it will be found exceedingly effective; very strong, cheap, and easily constructed. Mr. Scott will himself describe more at length this design for the proposed pier head.

27,216. Have you any other plans you wish to put in?—I have prepared from a recent survey a plan of the proposed breakwater at Swansea Bay. I had previously prepared plans in accordance with the directions of the Commissioners, but they were unfortunately destroyed by fire. Since then, by the kindness of Captain Washington, I have procured tracings of the chart made by Commander Aldridge, which I find differs in many respects from the survey made by Captain Denham. In this plan I have laid down a breakwater, as suggested in my examination at Swansea by the Commissioners. I have to add, that I have carefully revised the estimates which I gave in at that time of the cost of that work, that I believe them to be correct. (*This plan was also handed in.*)

27,217. Is the position of the shoal altered at all?—The position of the shoal is somewhat altered.

27,218. I mean the position of the shoal relative to the breakwater?—It is slightly altered, in consequence of the altered position of the shoal. But since my examination at the Mumbles by the Commissioners, I have taken means to ascertain the exact nature of the shoal by dredging. The dredging machine has been at work, and a large quantity of the materials of which the bottom is composed has been removed, by way of experiments. It consists generally of a crust of shells and small boulder stones, and beneath this crust there is a bed of stiff blue clay. It is obvious, therefore, that there would be no difficulty in removing the shoal by dredging. Of that I am quite satisfied. Commander Aldridge was, I understand, on board the dredging machine for a whole day, for the purpose of satisfying himself that the ground was of the nature I have described.

27,219. Are these the documents, then, Mr. Aber-

LONDON.

Mr. J. Abernethy.

2 Dec. 1858.

Chairman.

nethy, that you propose to hand in to the Commissioners? Are these all the plans, or have you anything more?—Yes; I have in addition to these one other. I have been requested by Mr. Ralph Ward Jackson, since my previous examination, to visit Hartlepool, and to prepare a report as to the formation of a harbour of refuge in that bay. At his request I hand in also a copy of my report on that subject, accompanied by a plan, drawn upon a large scale, showing the nature and character of the works.

27,220. You have given us a number of plans relating to works on different parts of the coast, and I think it would accord most with the convenience of the Commissioners if you would make consecutively any statement you may wish to give in reference to them, beginning at Fraserburgh, and taking all the places in the order in which we took them in the course of our visits. And when we have had your statement, if the question as to your peculiar mode of construction should not have been sufficiently entered into, we will take whatever explanation you may desire to give in reference to that point afterwards. Or, if you prefer it, we will take your statement as to the general object and design of the plans, and what you have to offer upon the question of construction first. Which do you prefer?—As my estimates for the breakwaters at Swansea Bay and Hartlepool are necessarily based upon the system I propose for the construction of the works, it would probably be as well to take that part of the subject first, if you have no objection.

27,221. Very well, then, you will enter upon the question of construction as a separate question first, without reference to any particular locality. Having done that, you can take the different works in reference to the respective localities where it is proposed that they should be constructed. If, then, you begin with Fraserburgh, and make what observations you may wish as to the application of your particular mode of construction to the works there, and so on with each of the other places, taking them in their order; when you have done that, the Commissioners will decide whether they will proceed with any further examination, or whether they ought not to give a little more time for the consideration of your proposals, and with that view defer the further examination to another day. Probably, looking at the mass of plans you have given in, this latter course would be the more convenient?—Of course I shall be desirous of consulting the convenience of the Commissioners, and shall be perfectly ready to attend whenever they may require me to do so.

27,222. Proceed then now with any statement you may wish to make explanatory of your peculiar mode of construction?—I must apologise for any defects there may be in the plans, on account of the pressure arising from the great number of plans we have at this period of the year to prepare for Parliament. I show here a section and part of the elevation of the work, with respect, first, to the breakwater proposed to be constructed in the bay of Swansea. I produce a sectional elevation and a transverse section of that work, which, with your permission, I will now proceed to describe. I propose, in the first place, at Swansea, to drive piles, two piles, as shown here on the plan, connected together by wale pieces; the piles to be driven down 10 feet into the clay bottom; these piles longitudinally to be 10 feet apart, and to be connected longitudinally also by wale pieces. That is the first process. Next, between these piles and outside of these piles to deposit a mound of rubble and copper slag to a height of 15 feet below the low-water level of spring tides. Next, to construct a framework, as shown in the drawing, of creosoted timber. This framework to be so let down between the ends of the wale pieces, and bolted to them, the frames being, like them, longitudinally 10 feet apart. The frames are then connected longitudinally by wale pieces in the same way. Thereafter I propose to bolt on within the piles planks 12 inches by 6 inches, as shown in the transverse sections; and that being accomplished, to fill in the space within the timber framework with rubble. We have then, what may be regarded as a temporary breakwater, composed and framed of timber in such a way as to have continuity of structure, which can only be attained in a minor degree by masonry simply. So that at the commencement a certain amount of protection would be afforded to ships taking refuge under the lee of the breakwater. I then propose to use this as the stage or means of constructing outside the temporary breakwater a permanent structure. That I propose to accomplish by using powerful hydraulic cranes, as shown upon the plan, each crane being perfect in itself, with its steam-engine, and the necessary accumulator for producing the requisite power to lift, first, large masses of concrete blocks from 20 to 25 tons weight each, which will be lowered down to the top of the rubble mound, the bottom course, or footing course, being let into it half its depth; these concrete blocks to be placed against and abutting upon the outside of the timber framework, which would thus serve transversely as a guide for placing them in position. From the low-water level to a height of 10 feet (in this case) I propose to construct a face wall of solid ashlar, and rubble also in large masses, and above that a rubble wall in mortar, faced also with ashlar blocks. In carrying up the wall I should remove as much of the timber of the upper part of the framework as could be spared from time to time, and by sacrificing a portion of the planks form a bond with the dry rubble packing behind the wall, and the hearting of the timber breakwater. The dry rubble packing would abut upon or come up to the back of the rubble wall.

27,223. (*Sir F. Smith.*) You used the word "bond," did you not?—I did; but you can scarcely call it bond in the dry rubble packing, it is a bond in such a very minor degree, although it would act in that way. Lastly, I propose to pitch the top of the breakwater, after removing the timber bearers, with sufficient pitching. The advantage which I think this mode of constructing a breakwater possesses over the method ordinarily adopted is, that I can afford in a very short space of time a considerable amount of shelter to shipping; that, instead of constructing a permanent structure merely from the end progressively, I can construct the sea and landward faces in lengths as shown upon the plan; by having several of these powerful cranes working at the same time a certain length of face can be brought up and completed at different parts simultaneously, instead of working forward simply from the end; and the staging is so far protected from the action of the sea that the loss of time and damage that accrues to staging in heavy storms by the common method will be altogether obviated. This, generally, is a description of the design. You will observe that the sections differ somewhat; that at Hartlepool being stronger than the section for the Swansea Bay, the sea on the north-east coast being much heavier that at Swansea.

27,224. If I understand you rightly, the main object you have in this style of construction is to afford very rapidly shelter to ships, and to be able to construct the whole work in much less time than it could be done by the ordinary method?—These are two of the objects I propose to accomplish.

27,225. Then I understand you think, further, that some economy would result from the adoption of your system?—I certainly think it would be found more economical than the mode now pursued, as regards the original cost of construction; and I think that the cost of future repairs would be considerably less.

27,226. We will get the work done first before we talk of repairs. What is the total length you propose for the breakwater in this case?—The total length of the breakwater proper at Swansea would be 2,200 yards.

27,227. I understand that 2,200 yards will complete the whole work at Swansea?—That will complete the work.

27,228. Can you tell me what the total cost will be?—I gave some rough estimates for these works in my evidence before the Commissioners at Swansea, and if I recollect rightly, one estimate was 850,000*l.* for the completion of the permanent stone structure, and I think 650,000*l.* for the timber breakwater within the stone facings. I have since gone more closely into the question of cost, and I see no reason to depart from those figures generally. I put it as the result of a more detailed calculation, that the cost of the permanent stone structure would be 847,000*l.*, and for the timber structure 629,200*l.*

27,229. That will give a total cost of how much?—The total cost of the complete work would be, as I have said, 847,000*l.*

27,230. That is of the whole of the works you contemplate, from beginning to end?—Yes.

27,231. Where do you propose to get the stone rubble from?—From the adjoining cliffs, which are composed of mountain limestone, and the copper slag I should get on the banks of the river Tawe, where it is lying in abundance.

27,232. In what space of time do you hope to complete the work from its first commencement?—That is a question I should like to consider a little more before I gave a decided answer.

27,233. There is no part of the work, then, as regards Swansea, for which, in point of fact, you are prepared to fix any time as that in which it might be completed?—I think, on my further examination, that I shall be able to state definitely the time in which I could undertake to complete the work.

27,234. I should be glad to know whether, in the first instance, you propose to complete the whole of the piling and the timber work, or simultaneously as you put in the piles to charge the space within the timber work with the other materials?—My present view is this:—The Swansea breakwaters are now two in number. I should propose, probably, to construct the greater portion of the first breakwater, the timber breakwater, at once, and then to use the material after the completion of the stone structure, for the formation of the second breakwater.

27,235. Then it would be necessary that we should know accurately about the time of the completion of the first to enable us to form anything like an accurate idea of the total time that would be required to complete the whole of the works?—Just so.

27,236. The only use, as I understand it, of the timber work, is to afford facilities for the construction of the more solid and permanent works?—And also to afford shelter to shipping in the meanwhile.

27,237. But the timber work will not afford much shelter?—The timber breakwater, as a breakwater, will be, as regards its efficiency, as complete as the stone structure, though not of the same permanent character.

27,238. You mean that it will be sufficiently strong in its construction to keep it efficient as a breakwater?—Yes.

27,239. In point of fact, then, the moment this timber structure is complete vessels might ride in complete safety behind it?—They might.

27,240. (*Capt. Vetch.*) I think the construction is pretty similar to what we saw at Blyth?—It is the same principle that is carried out at Blyth, but on a larger scale, and in deep water.

28,241. Could you, on this principle, add here an outer wall, as you now propose; that is, a wall outside the timber work?—I could; and I may mention, that when objections were made to the temporary character of timber work, I pointed out to the directors at Blyth how I could face the present piers with stone, if the necessary means were afforded for that purpose, hereafter.

27,242. Taking this plan as you now propose for Swansea as a whole, if you were to execute the timber work alone in the first instance, how long do you think that timber structure might remain and suffice for a harbour to afford the necessary protection to shipping?—I stated, in my examination at Swansea, that it might last for half a century; and if you can protect the timber from the action of the worm, and I am confident you can from my own experience of the effects of creosoting timber, I believe it might remain perfect and efficient as a breakwater, requiring comparatively but little repairs, for half a century.

27,243. Under these circumstances, if means were not forthcoming to complete the stone work, still, by carrying out this timber structure, we should obtain sufficient shelter for the shipping for half a century. Is that your opinion?—That is my opinion.

27,244. Can you tell us what rate of progress you could make with the timber portion of the structure, the timber staging, in a week, or a month, or any given time?—At Blyth, I think, the progress was at the rate of 100 feet a week; but I should like to consider the question more carefully before committing myself by an answer. I do not at present see any difficulty in the way of carrying out the staging and the framework simply at the same rate.

27,245. Could you do 10 feet per diem?—Yes; that would only be setting up one frame a day.

27,246. Then, if money was not forthcoming to complete the permanent structure, you would in this way provide an efficient shelter for ships such as could not otherwise be obtained?—Yes.

27,247. Do you contemplate that these works should go on, the one succeeding the other, or that the permanent or stone structure should be delayed for a while until you had tested the efficiency of the timber work alone?—I think it would be advisable that it should remain some time, to test the efficiency of the timber frame work, and also to allow of the consolidation of the mound below the low-water level.

27,248. And also, I suppose, to give shelter as soon as possible to ships?—Yes. I think it would afford immediate shelter to ships, and enable the Government to complete the permanent works, prosecuting them from time to time as might be found convenient.

27,249. With regard to these concrete blocks, which are to form the first course, are you clearly of opinion that the concrete can be made of such material and so cemented together as to become perfectly durable, and to be depended upon?—I am.

27,250. Have you made trial of the material?—I have made trial of it at Swansea, and we find there that rubble blocks made of sandstone and hydraulic mortar carefully and properly prepared, will in six months become so hard that we cannot separate the particles of the masonry. You must break it up in the mass.

27,251. At Swansea, I suppose, you have the benefit of the Aberthaw limestone?—We have.

27,252. What weight do you say are these blocks?—From 20 to 25 tons each; and, practically, there is no difficulty in making them still heavier, for the cranes will carry 50 tons; but I consider that sufficient weight.

27,253. No power of the waves will disturb blocks of that weight, you think?—No wave will disturb a block of that weight, the more especially as it will abut upon the timber framing, which will sustain and assist it in resisting the shock of the sea.

27,254. (*Mr. Coode.*) Could you give us the cost per yard of the timber structure and the rough rubble in a given depth of water and at a given rise of the tide; say seven fathoms of water, and 33 feet rise of the tide, which I believe are about the circumstances of Swansea?—I have not the particulars with me for that particular section which answers to those conditions; but I will furnish them. Meanwhile I will give you, if you will allow me, the particulars of another section; that at six fathoms water and 27 feet rise of tide. At such a depth and rise of tide I could construct a pier on the system I propose for 260*l.* the lineal yard.

27,255. That is to say, the whole of the pier complete, including the masonry?—Yes, of course,

LONDON.

Mr. J. Abernethy.

2 Dec. 1858.

Mr. Coode.

including the masonry, the timber work, and the rubble, complete, exclusively of the face work.

27,256. Will you give us the cost of the face work in the same depth of water and the same rise of tide?—With face work I would execute the whole complete for 350*l.* per yard, so that the difference between the 350*l.* and the 260*l.* will give you the cost of the face work.

27,257. That is 90*l.* per lineal yard for the two walls?—Yes, for the two walls.

27,258. Are these piles driven in?—I propose, in the case of Swansea, to drive these piles in 10 feet, as a general rule, into the clay below the bed of the sea.

27,259. And from what level do you propose to drive them?—The first piles would be driven from six or eight feet above low-water mark. That would be the top of the pile.

27,260. Then the top of the pile would be six feet above the level of low-water mark when driven?—Just so.

27,261. Then how do you propose to unite the upper part of one pile with the lower part of the other?—The plan shows the frame work brought down considerably over the pile first driven, so as to have a bearing of 15 feet on the piles first driven. The continuation of the inner pile is carried up, and secured with the transverse bracing.

27,262. But how would the upper portion of the piling be united and tied to the lower portion?—The upper part would rest on the top of the lower pile, and be kept in its place by the transverse bracings, and longitudinally by the planking inside.

27,263. Then the transverse and oblique framing would be let down over the piles first driven?—Yes, over the piles first driven, and embraced by the two wale pieces bolted into the piles first driven.

27,264. Would it not necessitate very accurate dimensions being taken of the breadth between the piles to the level of 15 feet below low-water mark, in order that they might fit accurately?—Precisely; and these piles first being driven in, and connected with the wale pieces, the exact width and form might be easily ascertained.

27,265. After the first piles are driven, you propose to bolt them to the lower wale pieces before the upper piles are let down?—Yes.

27,266. That will have to be done below low water, will it not?—It will.

27,267. The dimensions, then, will have to be taken and the holes to be bored below low water?—Yes.

27,268. And how do you propose to hold these timbers down? How will you prevent their being floated?—Which?

27,269. I speak of the cross wales?—I should load them so as to enable the diver to hold them. In point of fact I have been putting in some wales in a coffer-dam at a depth of 15 feet under water lately.

27,270. (*Sir F. Smith.*) Where?—At Newport. We excavated a new dock there, the water being retained, by means of a coffer-dam, in the old dock, with which the new one communicated, so as not to interrupt the traffic; consequently the lower wale pieces on that side were put on 15 feet below the water level.

27,271. (*Mr. Coode.*) But that was in still water within the dam?—It was in still water within the dock. It was rather muddy water; not clear, like sea water.

27,272. But that was not analogous to an open seaway. You could not work there below water, except in very fine weather?—No; it requires but moderately fine weather to work 15 feet below the surface in a seaway; the disturbing force of the sea is not much at that depth, except in very bad weather.

27,273. Then the piles would be first driven, and the lower wales fitted and fixed below low water?—They would.

27,274. And the wales below the level of low water would have to be let down over and bolted to the piles?—They would be put on, at first, on the top of the pile; I think probably that would be the course adopted.

27,275. Then I understand the whole of the diagonal frame would have to be bolted together, and let down under water over the piles?—As a general rule, I should complete a certain portion of the framework, and connect it together by the cross pieces on shore, and then lower it down. The diagonals and strutts might be let in at any time.

27,276. Do you propose to let down these diagonals, or to fix them after you have let down the vertical framework?—I could do either, but I should prefer to connect the sides of the framework together in the first place, and then put on the diagonals afterwards.

27,277. Then as to the planks within the piles below the level of low water, they would have to be fixed by divers also?—There are two ways of putting on these planks; first, I do not think it would be difficult to fix the planks by divers, but they might be put on in another way; as they are of given lengths, they might be connected together by vertical pieces, and let down bodily behind the piles, the planks of one panel or bay interlacing and binding, as it were, between the openings of the planks of the other, so as to form a bond, as shown in the sketch.

27,278. Do you propose to creosote the whole of the timber used in the entire structure?—I should certainly recommend that the whole be creosoted.

27,279. Then, if it is creosoted, would it not be necessary that the lengths of those several diagonal pieces should be taken after the piles are in place, so as to ensure that the ends may not be cut, and parts of the timber not creosoted left exposed to the action of the worm?—That difficulty was provided for at Blyth very carefully. The size of the timbers were carefully gauged and cut up in the yard; they were then numbered to fit, and all the ends were creosoted; and I see no difficulty in carrying out the same system in this case.

27,280. At Blyth was any portion of the work framed below the level of low water at spring tides?—No.

27,281. Therefore the whole work at Blyth is at some time of the tide uncovered?—It is.

27,282. Do you propose to complete this timber framing before the tipping in of the rubble?—I do. The first process is to drive the lower piles, and then to deposit the rubble round them.

27,283. Before you put in the wale pieces?—No; the wale pieces being put on, and the piles, and the bays also longitudinally connected by wale pieces, before the rubble stone is tipped within and around the piles.

27,284. In that case would not everything during the winter season be exposed necessarily to the action of storms, before the rubble could be tipped in?—It would, to a certain extent; but as the piles are 10 feet apart, a very small surface only would be exposed, being connected by transverse pieces and longitudinal wale pieces, unless you had a very heavy storm, I do not think that the sea would have any effect upon them.

27,285. Then, assuming that the piles were put in, and the transverse wale pieces fixed, and the upper part of the structure not completed, would not that part of the framework so erected, but not completed, be liable to accidents from gales of wind?—It would, but only to a small extent.

27,286. And must not the time of exposure during the winter season be greatly increased by your having to wait for a favourable period to fix the sheet planking?—I think not, for the depositing of the rubble round the piles, and the fixing of the planking, might be carried on simultaneously.

27,287. Do you think the planking, as shown here, could be fixed in anything like heavy weather in an open seaway?—Not in heavy weather in the open sea. But I should not attempt to proceed with that

part of the works which could not be carried on without risk in heavy weather.

27,288. Then there would be occasionally great risk of interruption, and also considerable danger to the stage, from the necessity of having to wait for a period of fine weather before you could proceed beyond a certain stage of the work?—No, I think not; because the deposit of the rubble mound might proceed pari passu with the driving of the first piles and the connecting of them together; and even the continuation of the timber framing above it, and also the planking, might in like manner, by proper arrangements, be proceeded with almost pari passu. I think by properly arranging the various parts of the work, all risk, except to a trifling degree, might be avoided.

27,289. Would not the risk with such a stage as you propose be much greater than in the system adopted at present at Holyhead?—I think not.

27,290. Would not the exposure of so much horizontal surface to the action of the sea necessarily greatly increase the risk of disturbance?—I do not think so. The manner in which the timber framework is braced together, and connected transversely and longitudinally, would secure it. Supposing you were not prepared to carry it up beyond a certain extent, you leave the planks out of the upper part until you are prepared to fill in the packing, so that the sea would pass freely between the piles, you would thus be in the position of having an open pile pier, but braced and secured in a way in which you cannot secure your piles at Holyhead.

27,291. Are you aware that a very similar system of construction was adopted by the late Mr. Rendel at Mill Bay near Plymouth, wherein vertical piles and horizontal and diagonal pieces were used, in a manner very similar to that suggested in your section, and that it was found after heavy gales of wind, that the stage was so much damaged that the system had to be abandoned, whereas when vertical piles alone were exposed it was found to be successful; in short, that the introduction of horizontal and diagonal timbers was found to be most destructive to the stage, and that it was in consequence of his experience at Mill Bay that Mr. Rendel was induced to abandon entirely the use of horizontal and diagonal timbers, and to expose vertical timbers only to the action of the sea?—As I have stated, I do not propose to expose longitudinal masses of timber to the action of the sea until the rubble packing is carried up to the level of those timbers. I am not acquainted with the instance you refer to, and in fact I never heard of it till now. But I know that we have carried out a pier at Blyth, which, though in shallow water, is exposed to the action of progression and percussive waves; that was carried out between low and high water throughout the whole winter without the least danger, 100 feet in length of the timber frame work connected together horizontally and diagonally being exposed to the action of the sea.

27,292. Where was this?—At Blyth.

27,293. In reply to a former question I think you stated that a portion of the works at Blyth was uncovered throughout some part of every day?—Except at low spring tides we cannot get to the base of the pier. There is generally about two feet or three feet of water there at other times, so that we were obliged to select the low spring tides to put down the great mass of the framework.

27,294. Has it not happened in the winter season, or might it not happen, in consequence of bad weather, at any time, that it might be days or weeks before the lower wales and the lower sheet planking could be fixed?—It might so happen in some cases that certain portions of the works could not be carried on in consequence of bad weather, but other parts of the works would be in so progressive a state that they might then be proceeded with. There would be, no doubt, some portions of the works which in heavy gales of wind we should not attempt.

27,295. The piles are driven from a floating stage, I understand?—Yes; but not necessarily so. This is entirely a matter of detail. In fine weather they might be driven from a stage erected on the piles already driven, or they might be driven from floating stages, barges, or punts.

27,296. But if they were driven from barges, that would, in bad weather, occasion delay?—It would; but you will observe that the driving and connecting the piles is a work of trifling extent, and does not of itself occupy any long space of time. The piles might be driven and securely connected in a day.

27,297. Are these piles formed of single timbers?—Of single balks of 14 inches scantling.

27,298. A great portion of the depth of water at the Swansea breakwater is, I believe, seven or eight fathoms?—Seven fathoms, I believe, is the extreme depth; a good deal of it is six fathoms.

27,299. In the case of the piles in the 8-fathom water, there would be 48 feet below low water to the surface ground, 10 feet in the ground, making 58 feet, and 15 feet above low water level, making altogether 73 feet?—I do not think I said 15 feet above low water. I spoke of the top of the piles being six feet above low water, and I said the framework overlapping above would be 15 feet. It is only about six feet from the top that the piles would be exposed to the action of the sea.

27,300. Then you have six feet above the level of low water, 48 feet to the surface ground, and 10 feet into the ground, making in all 64 feet?—Yes.

27,301. Do you apprehend that you will be able to obtain the balks for these piles, and in sufficient numbers, of that length, and bring them within a reasonable cost?—I think I should. Of course these long balks will be more expensive of themselves than the short timbers; but taking the whole of the timber required together I do not think I should find any difficulty in obtaining them at a reasonable price. In the Solway Frith I have put in piles between 60 feet and 70 feet in length, and experienced no difficulty in obtaining them.

27,302. Are they American timber?—Pitch pine.

27,303. What number have you used there?—I should think for about 300 feet we have used these piles, the bays being eight feet apart, and five piles in each bay.

27,304. And are the whole of these piles the length you have stated?—They are. Of course, with regard to the cost, the long piles are exceptional; but when you order a large quantity of timber, taking long and short together, as you do, the proportion of long timbers we should require would not materially increase the aggregate price of the whole.

27,305. Do I understand you, that, looking at the proportions that the long piles bear to the other timbers that would be required for the construction, there would be no additional expense on that account?—If you purchased the long piles by themselves unquestionably a higher price would have to be paid than for the general run of timbers, but not when taken together with the whole of the timber required, long and short.

27,306. You do not anticipate any difficulty in procuring a sufficient number of these long timbers?—No, I think not.

27,307. The diagonals, as I understand, are firmly bolted to the piles at the bottom and at the top?—Yes.

27,308. Assuming, when themound rises to above the level of half tide or thereabouts, that any considerable amount of settlement were to take place in one pile, and not in the others, what would be the effect upon this diagonal framing, with such a vast weight upon it above?—I believe if any material settlement took place it might disturb the diagonal framing to a little extent; but the whole mass of rubble there is allowed to subside between the framework and the outside of the timber skin resting upon the bays, and as the frames are 10 feet apart, the whole mass of rubble

LONDON.

Mr. J. Abernethy.

2 Dec. 1858.

Mr. Coode.

being confined only within the timber skin, it has free scope for settlement, and the only subsidence that would take place would be in the mass of rubble resting, so far as it rests, on the diagonals, the great mass of rubble subsiding clear of the diagonals.

27,309. Would not the rubble rest upon the lower wales in every case ?—It would.

27,310. Then whatever settlement took place in the rubble there would necessarily be a considerable weight thrown upon the wales by the superincumbent mass ?—Yes, a weight equal to the superincumbent mass upon those wales, multiplied by the breadth ; but as I have said, the great mass of the rubble is allowed to subside clear of the wales, consequently no great strain could at any time arise from the subsidence of the packing behind the transverse pieces. I cannot conceive, therefore, that any great strain can possibly result.

27,311. What is the size of the largest of the stones you propose to use ?—I should propose to use large and small together, keeping the larger masses externally.

27,312. But what size do you suppose that the largest would be ?—It is is difficult to define a size. We might have them up to a ton weight in some instances, but as a general rule they would not, I apprehend, be above four or five cwt. each, the heaviest.

27,313. What would be the greatest dimensions of the stones you would propose to use ?—I should not care to have stones of any great size for the internal part of the structure.

27,314. Would you have no stones three feet in length ?—You might certainly have some as large as that, but they would be exceptions, because limestone rock at the Mumbles does not come away in large masses, generally, but breaks up into rubble, which I should use with the copper slag.

27,315. But if you had a stone two or three feet in length falling upon the wales, would not its unequal weight, as compared with the looser material around, tend to separate the mass ?—That would be a good reason for not putting any large stones in that position.

27,316. But would not heavy stones in ordinary rubble be so interlaid as to bring about such a state of things as would tend to throw a considerable, and an unequal, strain upon these lower wales ?—From what I know of the foundation of Swansea I do not anticipate any subsidence in the packing within the piles that can have any material effect upon the transverse timbers. If you had a very soft bottom to deal with it might be advisable to carry out the packing to a certain height, and allow it time to subside ; but from what I know of the nature of the bottom at Swansea I anticipate very little subsidence.

27,317. What is the nature of the bottom there ?—Hard clay ; exceedingly hard clay.

27,318. Then you imagine that there is so much uniformity in the bottom at Swansea that there would be no fear of any settlement ?—I do not think there would ; but, supposing even a subsidence did take place, it would not materially affect the general structure.

27,319. But, assuming that one pile, or three or four adjoining piles, were to settle on the one side of the structure, and those on the other side, 50 feet or 60 feet apart, did not settle, what then would be the effect upon the general structure ?—I cannot conceive a pile driven down 10 feet into stiff clay settling, and I see nothing in this case to cause a pile so driven 10 feet into stiff clay to settle.

27,320. Then if you were told that in a particular case, piles screwed seven feet into very stiff blue clay, there had been a settlement of 15 feet, occurring sometimes to the extent of three feet or four feet in a single night, would not that circumstance give rise to some apprehension in your mind as to the stability of the structure ?—No, it would not raise any apprehension in my mind, because, as I have said, I know well the character of the clay of Swansea, that it is so compact that I cannot conceive any subsidence or any settlement in piles driven into it to the depth of 10 feet, those piles being, moreover, surrounded and embedded in a mass of compact rubble to a height of 15 feet below the low-water level. You have these piles, in fact, driven ten feet into the clay, and, moreover, surrounded and embedded above the clay bottom with rubble 21 feet in height.

27,321. In the section before us the rubble on the outside of the piles appears 20 feet in depth ?—No ; 21 feet.

27,322. And the rubble on the inside, appears to be about 75 feet in depth ?—It is just 15 feet above the low-water level, then 27 feet below the low-water level to the surface of the bottom, and then 10 feet into the clay ; that is the total depth from the top of the rubble mound to the bottom of the piles, making 52 feet.

27,323. I think you scarcely understood my question. It was this :—Is not the height of the rubble mound on one side of the pile about 20 or 21 feet, and on the other from 70 to 75 ?—No, not so much ; 52 feet.

27,324. My question is this:—We have a pile of 14 inches square, with a rubble bank on the one side of 20 or 21 feet in height, and the rubble bank immediately at the back of that pile 70 to 75 feet in height from the bed of the sea. You still think that you would have no reason to apprehend that there would be any inequality of settlement ?—I do not, for this reason, that the mass of rubble within the piles does not rest upon the top of the piles, but between the piles. The only way the pile could be affected by the rubble would be by the friction along its internal surface by the subsidence of the rubble.

27,325. Would not the bank of 75 feet in height be very much more liable to settlement than a bank of 21 feet in height ?—Undoubtedly so ; but the higher bank subsides within the piles, and not upon the top of the piles. This is a case of a pile driven outside the toe of a quay wall. If the wall subsides it does not follow that a pile driven outside the wall is to subside also.

27,326. Would not the rubble be so intermixed with the horizontal diagonal timbers that it would be impossible for one to settle, for the ground to compress, without inevitably carrying the timber structure with it ?— No, I think not, just for the reason I explained, that the great mass of rubble between the bays has a clear space for settlement from the platform to the base, and that the only pressure which could be exerted by the rubble packing upon the transverse braces would be the weight of the rubble packing above the transverse braces multiplied by the surface or width of the braces themselves. That portion of the rubble bears upon the brace, and to that extent might affect it. But then the great mass of rubble between the bays has a clear space for subsidence from the bed of the sea to the platform of the breakwater.

27,327. Then we have here above the lower wale a mass of rubble 54 feet in height ?—About that, I think.

27,328. 52 feet in height. The weight of a superficial foot of that would probably be somewhere about three tons, would it not ?—I should say 15 feet to a tor, or $3\frac{1}{2}$ tons to the superficial foot.

27,329. And that is resting upon three wales ?—Divided among those in different proportions, and to a certain extent upon the transverse bearers.

27,330. That assumes that there is perfect equality of bearing over every part of the whole structure ?—As all the packing above low-water mark is to be, as at Blyth, carefully done by hand, and put in layers, I do not conceive that any subsidence would take place in the case of Swansea to affect the transverse braces any more than it has done at Blyth.

27,331. It is true hand packing may affect the compression of the material itself, but could that in any way diminish the liability of the bottom to com-

press ?—No ; but I think that even supposing the bottom does compress you cannot suppose that the whole height of the rubble from the base to the summit rests upon those transverse braces. It is merely the mass of rubble between these braces pressing upon the surface or width of these braces ; and even supposing you take it at 3½ tons. for the whole height, that will be divided between all the braces, and I say that two timbers of 12 by 6 inches will bear the whole weight.

27,332. Would it not be a ton per superficial foot ?—Yes.

27,333. Then the lower braces being about 50 feet long, would not the total pressure be something like 50 tons ?—No, it would not, because I cannot conceive that the whole superincumbent mass of rubble above that base would rest upon them.

27,334. Can you by any possibility ensure such perfect uniformity of arrangement in the whole mass that such will not occasionally happen ?—If I had very bad ground to deal with, very soft ground, I might propose to adopt a somewhat different arrangement ; but as applied to the locality of Swansea, knowing, as I do, the nature of the bottom, I do not apprehend that there will be any subsidence. I feel confident that there will not be any subsidence in that mass of rubble that will affect the bracing of the timber work.

27,335. Then it is your opinion that the ground is not only so strong, but so perfectly uniform, that you can calculate upon the pressure upon these wales and on the several parts of the structure being simply the pressure which would be due to the theoretical weight ?—It is so. There is another thing I have not yet pointed out. The rubble mound is first constructed, and that rubble mound will have time to subside before the superstructure is proceeded with, and as the rubble mound has a very great base, as compared with the superstructure and packing above, I cannot conceive that the packing above the level of low-water mark or above the rubble mound can subside to any extent that would affect the bracing. If the whole thing had to be filled in rapidly between the timber work from the top to the bottom, perhaps such a result might take place ; but the rubble mound being formed before the packing above is put in, I cannot conceive that subsidence will take place ; and if comparatively large material was used in forming the base of the rubble mound, a tendency to subside would be still less likely to take place.

27,336. Must not the lower wale of necessity be fixed before the rubble can be carried to a greater height than 20 to 25 feet from the bottom ?—It must.

27,337. Would there not subsequently to the fixing of that wale be an additional height of upwards of 50 feet added to the mound ?—When complete ?

27,338. Yes ?—When complete.

27,339. You propose, I think, to reconvert some portion of the stage after you have tipped the rubble ?—Yes.

27,340. What portions do you think would be convertible ?—In the first place, the crane bearers, the transverse bearers, the transverse wale pieces on the top, the struts, and a certain portion also of the framework itself. The outer framework might be taken and used, when the concrete blocks, which are deposited by means of it, are put in, because it is not necessary to use the powerful travellers shown upon the plan for any purpose except the deposit of the heaviest material. A lighter class of crane will deposit the rest of the work.

27,341. Could you take away the topmost transverse bearers ?—That would be after I had completed the masonry up to that level, and was prepared to put in the pitching of the top of the pier, and then I have to remove both the longitudinal and transverse bearers, and might use them in another portion of the work.

27,342. If the transverse bearers could not be removed until the masonry was brought to that height, how could you get access to the struts ?—As I have already stated, these transverse bearers are only required for the heavy travelling crane, which is used to deposit the concrete blocks, and I can dispense with the use of them for a lighter class of crane required for fixing the superstruction.

27,343. By what means do you propose to deposit the rubble in the manner shown in the section ?—There could be no difficulty in fine weather,—in moderate weather,—in bringing off the rubble in barges, bringing them alongside, and depositing it as shown in the drawing. I cannot see any difficulty.

27,344. You would deposit a portion from staging and a portion from barges ?—That would be a question hereafter to be considered. It is a question of detail. It might be deposited from a roadway or from barges. My present impression is, that, as I intend, as a rule, to use a large mass of copper slag in the mounds below, I should bring it in large hopper barges, carrying each 100 tons, from the copper works, and deposit it upon the site, these piles being driven in to form a guide for the site of deposit.

27,345. Do I understand that you propose to tip the rubble and slag within the timber structure from the roadways above ?—It could be done from the roadways above, or it might, as at Blyth, be tipped from small waggons, passed along the transverse bearers. I think it might, in this case, be done from the roadway alone.

27,346. Assuming it were done from the roadways above, would there not occasionally be a danger of stones striking the piles, and cutting away the outer or creosoted skin ?—No ; because the bays are 10 feet apart. It would be very great carelessness if they tipped a waggon anywhere but between the bays.

27,347. Would not the bays being so close as 10 feet, add materially to the difficulty of so depositing the stones as to prevent the piles being injured ?—I think not. You might tip the stones clear of the piles without any injury in that case.

27,348. You think the stones might be dropped from a height of about 40 feet without separating five feet either in one direction or the other ?—I think they might. For instance, if you used hopper waggons, and brought them over the 10-feet space, and then dropped the stone out, it need not touch the piles, at any rate so as to injure them.

27,349. Have you suspended any of those experimental blocks to which you have referred in crane slings ?—I have not yet, but we are making preparations for lifting a block of 25 tons. I have no doubt about the practicability of doing it, because they are so hard that when we endeavoured to break one up we were obliged to break it in piecemeal, mortar and stone together ; you could not separate one from the other.

27,350. As yet you have not suspended any ?—I have not. I might mention that the idea of rubble blocks has, I find, been entertained by other engineers. In reading Mr. Rendel's report on the formation of the proposed breakwater at Hartlepool, the other day, I find that he proposed the same method of the formation of rubble blocks and masonry on shore.

27,351. I am aware it is not a new idea. I was not speaking with reference to the advisability of using blocks of concrete, but simply with reference to the mode in which you propose to suspend them ; would you do that by lewises, slings, or in what manner ?—It might be done by slings or by lewises. You might put in a small square piece of stone having the tail broader than the face, and put the lewis hole in that, or it might be done by means of slings.

27,352. Do you think you could sling a block of 25 tons from a single lewis ?—I think not. I would rather sling it from four than from one.

27,353. You think the sling method is preferable ?—I think so.

27,354. If you would adopt the system of slinging, I should like to know how, when the stone is lowered into the bed, the diver is to get the sling chain away ?—I misunderstood your previous question. I did not

LONDON.

Mr. J. Abernethy.

2 Dec. 1858.

Mr. Coode.

intend to say I would adopt the mode of slinging, but I think I should prefer lowering these blocks from a number of lewises, say four lewises instead of one, or a sufficient number to be equal to the weight of the block, and that might be done by imbedding in the rubble mass, say four small square stones, or stones approaching the form of a square, a little broader at the tail than the face, and cutting the lewis holes in these stones.

27,355. A plan similar to that has been adopted at Alderney, but not with blocks of so considerable a weight as you propose to use; but seeing a sling indicated in the drawing, I imagined you preferred it?—The draughtsman put that in.

27,356. It is quite a minor matter. Have you any experience of creosoted timber to induce you to believe that it could last for a period like 40 or 50 years?—I have this experience, that a large portion of the pier at Blyth has been executed for about two years, and that we there have uncreosoted timber placed in immediate juxta-position with creosoted timber; that the uncreosoted wood is almost destroyed by the action of the worm while the creosoted is not touched; I can see no traces upon the skin of that timber of its being in the least degree affected. I have always been of opinion, that as the worm will not eat green-heart timber, it cannot innocuously take every sort of material. I think creosote prevents the action of the worm. I think the worm will not touch timber so prepared. If it is done under pressure, and thoroughly well done, I anticipate no decay of the timber from that cause.

27,357. While quite of your opinion as to creosoted timber keeping off the ravages of the worm for a short period of time, I should wish to know whether you have any experience which would justify a recommendation of any structure which would require that the creosoted timber should be exposed to the worm for a period of anything like 40 or 50 years?—I have not, nor could you get such experience as that; but if the worm will not touch it in a period of two years, while it entirely destroys uncreosoted timber, I see no reason why it should destroy creosoted timber in a longer period of time, seeing that the timber is saturated considerably below the surface.

27,358. That must altogether depend upon the quality of the creosote, and the action of the sea water?—It would.

27,359. Over a period of time upon the creosote itself?—Yes.

27,360. To a certain extent it is questionable what will be the effect?—Yes.

27,361. (*Sir F. Smith.*) I think you have said, that although piles have been disturbed at another place, you think that the nature of the bottom at Swansea is such that that effect would not be produced there?—I think so.

27,362. May I ask you whether you have made borings, and ascertained the depth of the clay?—We have dredged for about eight feet down through the clay, and the resident engineer has driven an iron rod below that depth.

27,363. Was that in the line of the intended breakwater?—At several points in the bay on the line of the timber breakwater. We have only had one or two trials. We have not had time to make a continuous series of experiments.

27,364. These trials have satisfied you that it is a bottom of clay of such a consistency that there would be no liability to disturbance in the position of the piles?—They have.

27,365. To what depth have you dredged?—I think eight feet. There is a stratum of two or three feet of boulder stones, and oyster shells. The oysters are fond of the clay, and accumulate on these shoals.

27,366. Am I to understand that the upper portion of the pile is unconnected by scarfing or otherwise with the lower portions, and that the two portions merely abut upon each other, end to end?—They abut end to end, but the upper pile is retained within the ends of the transverse and of the cross braces, and the two piles are, moreover, connected by the longitudinal planking, which connects one bay with another.

27,367. Then you have no security for the stability of the upper portion of the pile, except that which is afforded by the waling and the cross-pieces?—In this case I cannot see how it can possibly shift, because it is confined externally by the transverse and cross-bracing, and internally by the planking, and also by the pressure of the rubble within, so it is impossible that that pile can shift from its position upon the head of the lower one.

27,368. If that principle is good, will not it apply so as to enable you to diminish the length of the first driven pile?—I could diminish that. I should have no fear of diminishing the length of the first driven pile.

27,369. Because you believe that your connexion is quite perfect, upon your system?—Well, as shown upon this plan it is; but I believe that in this instance I have been over cautious rather than otherwise.

27,370. In the future examination, which most likely the subject will undergo, I should be desirous to have precisely, clearly, and definitely marked out the way in which you intend to begin the work, and carry it through, taking the whole length of the breakwater, and showing where you propose to begin, and how you intend to carry it out, because you say that the filling in and the formation of a framework will go on pari passu. In some parts you do not say that, nor do I believe you could do it, because I apprehend that with bays of 10 feet you would not be able to put in the mass of rubble at the same rate at which you can construct the framework?—I think I said that certain portions might be done pari passu; that is, the formation of the rubble mound, and the driving in of the lower piles; but I do not think I used that expression as regards the superstructure.

27,371. I understood you in that sense. You said that to obviate a difficulty with which you certainly will have to contend in placing this planking by means of divers, that you will let it down in portions connected by means of vertical bars. If you do that, I presume you take the whole space between cross piece and cross piece, do not you?—I do.

27,372. You also said that you were not afraid of the action of the sea, because the only part exposed would be the upright pile. Before you can put in the hearting, you must have your planking. If the planking is put down in a bay of 15 feet, that must be exposed to the action of the sea?—It would all be below the surface of low water, and so would be preserved from the action of the wave. In heavy weather it would be a difficult thing to put 15 feet of planking in in that way.

27,373. In point of fact would not it be impossible?—Under ordinary circumstances there is no possibility of doing it. But I cannot see any practical difficulty in the diver putting on the planks one by one.

27,374. You stated that the only pressure that would come upon the cross pieces would be three tons divided into three intervals?—That is, admitting that there is a subsidence in the whole superincumbent mass of packing.

27,375. As a matter of course there will be. You say at one place that you would deposit the rubble by handpacking, and in another by tipping; which do you propose to accept?—The bays being 10 feet apart, the space between the bays for the whole height from the bottom of the sea to the platform of the timber breakwater is perfectly clear and uninterrupted for the subsidence of the rubble work, and if any subsidence takes place in the rubble work between the bays, this rubble work will be apt to follow it, fall off, and go down with the mass. I cannot conceive a vertical pressure equal to three tons a foot taking place without that the whole mass of rubble

between the different braces should simultaneously subside.

27,376. The three tons is upon one spot, and upon the whole length ?—If you take a superficial foot, it is so.

27,377. You must take the whole length to conceive of the pressure ?—I cannot conceive such a direct vertical pressure as that from subsidence.

27,378. Naturally, if there be any subsidence, it will occur to a much greater degree in the central portion than in the external parts ?—It would.

27,379. In that case, if there be any partial subsidence a rupture must take place ?—There is an advantage you possess. Swansea is perhaps as unfavourable a case as you can suggest, on account of the height of packing required above the mound, which would be much less at Hartlepool, and therefore the latter is a much more favourable instance.

27,380. You spoke before of bays, in describing your work. It is an imaginary bay, is it not, and not a natural bay, because it is an interval not enclosed at either end ?—You may call it an imaginary bay.

27,381. In point of fact the material runs over the whole extent, does it not. The action is continuous through the whole extent of the breakwater, and is not confined to the separate bays ?—All the frames are connected together.

27,382. The frames are connected together. If these bays, as you call them, were planked up, the subsidence would be divided, but in this case it is not ?—You may say tha they are divided into spaces by the transverse bearers.

27,383. But they are spaces which do not prevent the subsidence being general ?—They do not. The whole of the mass might subside from end to end of the breakwater between the frames, and then I think the tendency, if such a thing took place, would be that the rubble work, packed in between the transverse braces, would follow the mass, and subside with it.

27,384. Stones may overlap your bay in both directions ?—If you use very large stones, but as a general rule I should not allow them to put large stones on the top of the framework of the packing.

27,385. Would that avoidance have any influence ?—It might have a slight influence.

27,386. Your object would be to prevent any pressure coming on the transverse timbers ?—Yes ; it is in fact a dry rubble wall.

27,387. (*Capt. Vetch.*) With respect to those cross braces, Mr. Abernethy, have you any braces longitudinal and diagonal ?—No, I have not, in this case, without protection.

27,388. I put that question, because, referring to the work at Mill Bay, my impression is, that the braces that affected the stability of that work were longitudinal and diagonal braces, not cross braces, as you have on your section, and that therefore the two cases are not similar ?—That would make a material difference.

27,389. Have you used any of these braces at Blyth ?—Very similar ones.

27,390. Has the wave had any effect upon the sectional braces ?—None whatever, because the surface exposed to the action of the wave is small compared with horizontal braces.

27,391. What is the breadth of their surface ; their edge ?—Six inches.

27,392. What is the amount of interval between them ?—There is the thickness of the pile, about 12 inches, between them.

27,393. I am speaking of the waling pieces. What interval would there be between one pair and another ?—They are ten feet apart.

27,394. There being an interval of ten feet between the pairs of the braces, and the braces being only six inches in width themselves, is there any possibility that stones would hang upon the braces of six inches in width, when there is a width of ten feet on each side to fall into ?—I think that if there is any tendency in the ten feet mass to subside the stones over the braces would follow it.

27,395. If you keep the braces always sufficiently above the surface of the stones you would avoid the difficulty of stones being caught athwart the braces ?—Yes ; there are various ways to avoid it.

27,396. Suppose there is a difficulty with very large stones, could you not diminish the size of the stones of the internal hearting to such an extent that it would be utterly impracticable for any to be caught on the top of the brace ?—That is so.

27,397. You could reduce the stones to the size of road metal ?—As a rule, I should avoid putting in large stones.

27,398. Would not road metal be as good a size as any ?—I believe it would. I believe that heavy road metal might be used.

27,399. Talking of internal pressure, you could not take a single column of that pressure, say a six-feet column, but must consider the whole amount of the base with the whole amount of the altitude ?—Of course.

27,400. So that what would be applicable to a mere column would not be a legitimate measure of the power of a mass of materials of that great height and width, and having a base of a very great extent as compared with its other dimensions ?—It would not.

27,401. That is the view which I have taken ?—That is decidedly the view which I wish to express.

27,402. With respect to Blyth, have you not had practical experience there of divers putting in the frames under water ?—Not at Blyth.

27,403. Have you seen it anywhere else ?—I have done a great deal of work under water with divers, and feel no difficulty about it.

27,404. Frame and timber work ?—I have repaired lock gates, taken out gate rollers, and put down new segments entirely by divers. If you can execute a mechanical work of that kind in 25-feet water, the mere bolting on of a plank behind a pile is a trifle.

27,405. (*Sir F. Smith.*) Was that work performed in sea water exposed to the beat of the sea ?—It was in thick muddy water.

27,406. (*Capt. Vetch.*) It is an enterprise of rather a novel character, but you do not see that there would be any vast difficulty in providing expedients for any unforeseen difficulties which may not be very obvious at starting. The general principle is such that you could always find expedients to overcome any difficulties by which you may be met in the course of your operation ?—I think so. I can foresee no difficulty of any moment.

27,407. Those difficulties will only arise when you come to test the matter, but as the difficuties arise you expect that you will be able to find means of meeting them ?—Yes, that is so.

27,408. (*Chairman.*) Sir F. Smith asked you to forward a detailed statement of the mode in which the breakwater will be constructed from the commencement to the completion ?—I will do so. I think it would be done better by a series of drawings.

27,409. (*Sir F. Smith.*) They need not be coloured drawings; a statement will be sufficient; a statement with reference to the general line of the work.

27,410. (*Chairman.*) I asked the question because otherwise I should have been under the necessity of eliciting your intended mode of proceeding by questions at the present moment. I should have asked, amongst other things, as to the quantity of piling, the lengths of pile, you would drive before commencing tipping, and various questions of that kind. The statement which you will furnish will give a complete view of the mode in which you intend to proceed, will it not ?—It will.

27,411. The object of this mode of construction, or one of its great objects, is economy, is it not ?—It is.

27,412. Will you give us a comparative statement of the economy by this mode of construction compared with that according to which breakwaters have been constructed, say at Portland and Holyhead ?—I have no means of obtaining information as to the cost of those works.

LONDON.

Mr. J. Abernethy.

2 Dec. 1858.

Chairman.

27,413. Are there not published official statements which have come to your cognizance ?—The published statements give the amount of money expended, but not the quantity of work executed for the expenditure.

27,414. You have no means within your reach of furnishing a comparative statement of the expense ?—I have not.

27,415. Then how are we to judge whether your mode of proceeding is more economical than any other ?—One way would be to take a section of an existing work, and apply the same prices in both cases to the same description of material; then there would be the element of time ; a comparison as to the time occupied in the construction of each work. That is the only way in which I could draw a comparison.

27,416. That is the only way at your disposal ?—Yes.

27,417. How have you arrived at the conclusion that your mode of construction will be more economical than that which has been adopted elsewhere ?—Generally from a statement of the cost per running yard of certain breakwaters. That is the only way I could get at it. Holyhead is an unfinished work. It is merely a rubble mound, with a timber staging. A great part of the expense, that of the superstructure, is not yet incurred.

27,418. Of course in any comparative statement with which you supply us it will be perfectly competent for you to point out all that ?—That I will do.

27,419. I shall expect the best comparative statement which the means at your disposal enable you to furnish, because the cost is and must be a most important element in the decision, and we must have it from you or from other sources before we can arrive at a decision ?—I shall use the same data in both cases.

27,420. (*Capt. Sulivan.*) I want to understand one thing with regard to the section. Do you mean that the inner sleepers and inner ribbands, or whatever you call them, can be put on and left before the packing inside is put down to support them ?—I should put in a certain portion of it, one half, and then go on with the packing, then put in the other half, and then go on with the packing again.

27,421. That would all be done before the upper portion of the structure was proceeded with ?—It need not, because the outer frame could be put over and secured in its place before the portion of the packing is complete.

27,422. If it was not packed, would not there be a risk of a sudden gale taking away the whole of the framework ?—I should always, as at Blyth, carry on the packing simultaneously with putting on the frame.

27,423. Then I presume the lower part must necessarily be filled in from barges, because the upper staging would not be ready ?—I have stated that as soon as the lower piles are driven in a rubble mound will be formed.

27,424. That rubble mound is what I am speaking of ; that will be done by barges ?—Yes ; that is the first thing to be done. I would not attempt to carry on the superstructure until that was formed.

27,425. That must be formed by barges ?—I propose in this case to do it so. Probably at other sites I might do it by staging.

27,426. In this case you fill that in before you proceed with the framing ? This must be filled in by barges, and that would be going on as you drive your piles ?—It would.

27,427. You say, I think, that the uncreosoted timber to which you referred was destroyed by the worm in two years ?—Yes.

27,428. Supposing that you were going on with the work, masonry and all, do you consider it would be necessary to creosote the timber, or would ordinary materials last until the masonry was ready ?—If it is determined to carry out a complete stone structure at once, and without delay, probably in that case I should not propose to creosote the timber ; but in this case I have shown an instance in which a timber breakwater can be used "per se," exclusive of stone work, or where stone work can be delayed for a considerable length of time, and its construction spread over a considerable period. In this case I have thought it as a precautionary measure advisable to creosote the timber.

27,429. I do not quite understand how the frame, when it is slipped down, bears so as to take the enormous weight imposed upon it. On what does it bear ?—The frame does not carry any weight. The weight of the traveller comes upon the inner pile.

27,430. The outer part of the frame has a large scarfing piece on the outside ; outside the junction of the piles ?—It is for stiffening and scarfing.

27,431. Am I to understand that bears on the main piles ?—The strut abuts on the main piles.

27,432. The whole weight comes direct on the pile, and it is not on the frame ?—Not in any way upon the frame. The outside frame is to connect the transverse and longitudinal pieces together, and act as a stiffening.

27,433. With reference to the weight of the material bearing down the waling pieces, you were asked whether a narrow piece of six inches width would be likely to stop the stone. Have you not two pieces within a foot, and therefore you have two feet of bearing, unless the stones slip down ?—Yes ; I shall use such measures for packing that it would not occupy a space of that width.

27,434. Even supposing you had nothing equal to one foot in size, and nothing of what could go through, when you have such an immense mass of rubble above, do you believe that in case of subsidence these small stones would run round the obstruction, would not the whole of it come down bodily, and carry the wood with it ?—I think not, because the whole of the space, which would be something like 40 feet by 10 feet, would be perfectly clear and uninterrupted from the top to the bottom ; and admitting a subsidence, I cannot but imagine that the rubble between these various braces would all go with the large square pillar or mass of rubble between the frames.

27,435. Do you believe, supposing the mass of rubble to subside, that, however small it was, it would run round two sleepers of six inches, when only 10 feet separates them, without bearing them down with it ?—I think the fact would be this, that supposing the square mass of rubble between the frames to subside, an immediate displacement would take place in the rubble work between the frames. That would not be a vertical or downward pressure, but to some extent a diagonal or lateral one, and it would follow the mass.

27,436. Allowing that it were possible, without saying whether it is or not, that if that subsides the result must be to force out the bolt of one of these braces, supposing it did give way, can you expect to get up your structure so fast or in such a way that you will guard against any injury arising from that cause ?—I think I could. I think there would not be that risk. I have said, that, presuming that during the progress of the work a few of the braces were injured, I do not think that would affect the stability of the work.

27,437. Can you get up your structure fast enough to make the subsidence carrying away these struts and wales of comparative unimportance ?—I think so.

27,438. Or would any serious difficulty arise if one of these wales here and there gives way ?—I think not. I think it can be avoided altogether, as a general rule ; but suppose one or two did gives way, I do not think that would affect the stability of the work.

27,439. (*Capt. Vetch.*) I think each pair of these horizontal cross-waling pieces are a foot apart, are they not ?—Yes.

27,440. And the uprights are 10 feet apart ?—Yes.

27,441. Then on each side of each pair of wales there would be an interval of 10 feet for the stones to tumble down into ?—Yes.

27,442. Supposing any permanent difficulty is likely to occur from stones resting upon the wales, would

there be any vast difficulty or expense in putting a triangular piece between each pair of wales, so as to make every stone tumble down ?—It might be done.

27,443. You could resort to that expedient, so that that would avoid the difficulty. You could put a triangular piece upon each pair of cross walings, so that any piece of stone falling upon the point must deflect into the 10-feet space on one side or the other ?—Yes. I do not see how you could suppose the whole 52 feet of it to subside, because, supposing the stones to sink from both the wale pieces, then the weight above that wale piece would be the mass from it to the one above. I cannot conceive all the spaces moving with a simultaneous vertical motion.

27,444–5. (*Sir F. Smith.*) The difficulty of explaining this by a drawing is very great, because you assume that whatever comes upon one cross timber cannot by possibility bear upon another, but there is something that misses both, and comes down obliquely upon the lower one. If I understand rightly, the interval between these pairs of wales is a foot ?—A foot between the pair.

27,446. How broad are they ?—Six inches.

27,447. That is two-foot space ?—Yes.

27,448. Do you mean that you leave that space unoccupied by rubble altogether ?—No ; but I say that the spaces between the frames being open spaces, and spaces of considerable extent, perfectly open from the level of the roadway down to the very bottom of the rubble mound, and uninterrupted spaces, if any subsidence takes place it will take place in these large spaces, and not in the smaller between the wales or braces.

27,449. But some of the stones which are in these spaces will always project over these frameworks, and then there would be a leverage ?—I should avoid putting large stones in the hearting. I think, as Captain Vetch suggested, that stones not much larger than road metal would answer the purpose.

27,450. If that is part of your plan, let it be stated ?—Quite so.

27,451. (*Mr. Coode.*) If I read the drawing aright, the lower wales are about 42 or 43 feet in length between the piles ?—They are.

27,452. They are but half timbers, about 14 inches by 7 ?—They are mere ties.

27,453. I think I understood you in a previous part of your examination to say that some of the stones would be from two or three feet in dimension. At least they are so shown in the drawing ?—The lowest waling piece to which you refer would rest upon the top of the rubble mound. It is immediately upon the op of the rubble mound.

27,454. Then, if, when the upper portion of the rubble comes to be added, there is any subsidence in the first portion of your rubble mound, will not an undue amount of weight necessarily be thrown upon the lower wales ?—Supposing a great extent of subsidence to take place ; but I have already stated that I am dealing with a certain locality, that I cannot conceive that a rubble mound of that base will subtide to any extent which would affect the superstructure or the superincumbent mass of packing.

27,455. What amount of deflection do you think you might safely allow for one of the lower wales ?—I should not like to speak of deflection, because if it deflects much it must be broken.

27,456. If there be a small amount of subsidence in the lower portion, the weight must necesarily come upon the upper edge of the lower wale ?—I should point out that one of the main objects of that lower transverse brace is to connect the two lower piles together, before putting on the superstructure, because it is obvious that so far as the piles are concerned if may be dispensed with, they are embedded in the whole depth of the rubble work, and therefore cannot separate. The main object of those wales is to secure the outer frame.

27,457. Still, as a matter of safety, these wales must necessarily remain good until the upper portion of the frame is placed ?—The upper frame is placed on before the superincumbent mass of the packing is put in.

27,458. Then, assuming the lower wale to be broken, as you admit may happen, and that the lower rubble is put in as you propose before the construction of the masonry, if the lower wales be broken, would there not be a considerable strain put upon a single timber, which would be about 36 feet in height ; would there not be that pressure upon the pile ?—The pile is embedded and buried for 21 feet in the rubble mound, and I cannot conceive any lateral pressure being exerted upon it sufficient to thrust it out of its place.

27,459. The middle wales or diagonal braces being broken, the piling of that part of the structure would derive no support from the rubble on the outside ?—For 15 feet between low water and the top of the mound it would not; but those piles are 14 inches square, which is a very great scantling in proportion to the length.

27,460. With reference to the wales, the pressure upon them would not be merely that which would be due to the section of six inches in breadth, but it would also have to support the weight due to an inverted cone of this material (would it not) the angles of which cone would vary according to the natural slope of the material ?—The thick end of the cone is downwards. This [*pointing to the section upon the table*] I understand to be the cone, with the apex up and the base below.

27,461. I assume that you have to provide for an amount of pressure upon any portion of any one of these wales, and I ask you, would not that wale have to support, not merely the weight due to the pressure on a superficial foot of it, but the weight of an inverted cone of the material, the angles of which cone would vary with the natural slope of the material which you employ ?—No. If you are dealing with a very loose material, that would have a tendency to fall towards the centre, that would be the cone ; but with a dry rubble wall, hand packed, I cannot conceive it would have that effect.

27,462. Have you not just stated that you propose to deal with a material like road metal ?—Some like road metal ; but the larger masses of rubble would be carefully hand packed behind the planking, so as to form behind the planking two dry stone rubble walls. The interior part would be formed of a similar class of materials.

27,463. As there seems to be some difficulty in understanding the nature of the material, perhaps you will, in the statement you are to forward to us, state the exact character of the material which you would use, and say how far you would use hand-packed rubble, and how far materials of the character of road metal ?—I will do that.

27,464. You have stated that you believe the character of the materials at the bottom of Swansea Bay to be so uniform that there would be no fear of any undue settlement in the case of a mass of material 21 feet high in front of the piling, and I think about 75 feet high at the back of the pile ?—I think not.

27,465. Will you look at the Admiralty chart, and tell me the character of the ground, as generally described here, on the line of your works ? Is there not in one place the mark of broken and rocky ground ?—I have seen that often in Capt. Denham's chart, and have found it to consist of oyster-shells and small boulder stones on the surface of a clay bank.

27,466. Is there not just upon the line of your works the letter G, which describes gravel ?—It may be so ; but the soundings upon a chart of that class do not indicate the true nature of the ground, but merely what is the surface of the ground or the bottom with which they come into contact, that which they find on the surface. It is not to be supposed that they make borings to ascertain the true nature of the strata.

27,467. Seeing that that indicates the character of the ground on the surface, are you prepared to say to what extent the gravel may extend ?—I am not, at

LONDON.

Mr. J. Abernethy.

2 Dec. 1858.

Mr. Coode.

that particular site. The whole of the bay is covered with a certain stratum of sand, more or less thick.

27,468. Is there just within the line of the proposed work the indication of oozy ground marked by the letters O Y?—I should say that that would mean oysters.

27,469. (*Capt. Washington.*) It does mean oysters, and in any case it is only the surface which is marked there.

27,470. (*Mr. Coode.*) At any rate, seeing the description of broken rocky ground in one place, and G, indicating gravel, close by, and the letters O Y, indicating oysters, also just within the line of your works, does not that seem to indicate that there is a variation in the character of the ground?—The variance amounts to this; there is a variance in the depth of the clay banks which appear above the sand, and which, by the action of the tidal current, are left bare of sand, and attract the oysters, and oyster beds are formed on the top of those clay banks projecting above the general level of the sand in the bay; that is the true character of the variance in the ground throughout that bay.

27,471. Still, these letters indicate four different characters of ground?—That is of surface, merely.

27,472. You have no means of knowing how deep the same character would or would not exist. Would not the description given on that chart seem to indicate that some further examination is necessary before you can with safety adopt this mode of structure?—Probably it would. This might be considered as a general suggestion. If that work was carried out at Swansea it might be necessary for me to modify the design to meet any contingency; but at present I have not supposed all these contingencies to arise; I have taken the general character of the ground I have to deal with. At Blyth the section of the breakwater varied at different points according to the ground. We had to erect the foundations upon soft clay and rock, and we varied the form of the timber structure to meet these requirements.

27,473. What is the greatest height of the stone work deposited at Blyth?—I forget the height of the deep-water section. The greatest height would probably be some 17 feet.

27,474. What is the depth of the water at high water outside the pier at Blyth?—At the termination at high water spring tides it is about 13 or 14 feet outside. That extends on an average for a length of from 50 to 100 feet, and then the water deepens pretty rapidly. There is a ledge of rocks upon which the breakwater is built, and after that the water deepens.

27,475. Has not that ledge the effect of breaking the force of the sea?—Just the contrary. It has the effect of converting the oscillatory and undulatory motion of the deep sea into a wave of progression and percussion. I think so far the pier at Blyth is a favourable specimen of how that description of work meets the action of the sea, because it is a percussive sea from one end of the breakwater to the other. I say that a percussive sea, with a depth of water of 13 to 14 feet at high water, and a continued action, is a much more forcible agent in destroying a work of that description than the undulation of deep water, which is not a wave of progression but of undulation.

27,476. Is not the sudden deepening of the water of which you speak, somewhere about a cable's length in advance of the work at Blyth?—The ledge, I dare say, is that breadth at one place, but in others it comes in. At the Coble Hole we find the sea sets in with great force. It also comes in at another place, which is connected with the outer works by a little narrow neck. I think that if the breakwater at Blyth were placed out in the deep water, having only an oscillatory or undulatory wave to resist, the effect upon the work would not be so great as it is under existing circumstances.

27,477. You were asked some questions as to the diagonals of the pier at Mill Bay being placed longitudinally instead of transversely Would that affect the lifting power of the wave?—No; but if in this case, for instance, I put the plank or framework without carrying up the hearting, I should expect the sea to sweep the whole of the framework away, because I should then expose a surface to the action of the sea sufficient to destroy the framework.

27,478. Would not the hydrostatic pressure of the wave lift any horizontal surface exposed to its influence?—It would have that tendency.

27,479. Whether this diagonal or horizontal surface were placed horizontally or transversely to the structure would not affect the lifting power of the sea?—It would, of course, as far as the difference of specific gravity is concerned; it would so far affect the lifting power of the sea. If the timbers are placed longitudinally you expose to the sea a considerable surface which is not exposed in my plan.

27,480. Is there not also a considerable amount of horizontal surface exposed to the action of the sea in this half-timber sheeting?—Yes; but there is solid work within that sheeting.

27,481. Must not that sheeting be put in before the stone work is placed within, and would it not be for a certain period of time exposed to the action of the sea?—It need not be so. At Blyth we put on the timber planking "pari passu" with carrying up the rubble hearting. If a heavy sea comes on with the work half up, all it does is to tumble about the stone on the surface.

27,482. Has it not been necessary in some instances at Blyth to remove the planking, and to put fresh material to compensate for the consolidation?—We have had to do so to a very slight extent after the pier had been built, and had been exposed to the battery of that percussive sea which has tended to shake the rubble mass down, but that was only very slightly. We only had to take off one or two of the top planks, and put on a little rubble. The pier at Blyth is really a cone with a very narrow top and a broad base, and the difficulty there is to pack the hearting sufficiently, because you had the sides sloping from the apex, and the difficulty was to get the packing properly in. That difficulty would not occur at Swansea.

27,483. If that happens at Blyth with a height of 16 feet, would there not be a greater liability to the same kind of thing at a place like Swansea, where the height would be 72 feet?—The platform of the frame within which you tip the rubble is different in these two cases.

27,484. Still this vast height of material would be more liable to consolidation than the height of 16 feet there is at Blyth, and also to unequal consolidation?—It was impossible to pack the hearting from the sloping sides into the cone. It was impossible to pack the hearting at the base of the cone sufficiently close up against the face of the timbers, so as not to leave interstices or spaces between, and consequently, after standing the battery or thumping of the sea, the rubble work was gradually shaken into those vacant spaces thus inevitably left. That would not be the case at Swansea, because there you would have a considerable mass of rubble with which every vacant space within the framework is certain to be filled. That is not the case at Blyth.

27,485. As yet we have no information how far you would adopt the system of packing, and how far you would simply deposit the material. Perhaps you will show that in the statement you have promised to furnish.

27,486. (*Capt. Sulivan.*) I suppose that the section which you have produced is much the same as the section of any other pier, although built in another way?—It is very much like it.

27,487. Then the amount of material used there in stonework and masonry would be much the same?—Yes.

27,488. Then if there is a saving of material it must be in the woodwork?—There is some saving in the woodwork; but I conceive the principle saving is in the amount of labour required in putting it together.

27,489. In your statement will you make a comparison of the actual number of feet of woodwork required for that, compared with the amount required for staging, according to the plan usually adopted ?—I will do so.

27,490. (*Sir F. Smith.*) You said you do not apprehend any subsidence at Swansea, owing to the nature of the stratum on which the material will be deposited ?—No ; I do not say no subsidence. I mean there would be no subsidence of any extent which would affect the timber-work. In all works there must be some.

27,491. None of moment ?—None of moment. That would be the term.

27,492. Would you not think it advisable, before the public money was applied to a work of this kind, that it should be ascertained beyond a doubt that the soil is suited for that object, and that that should be done by a proper system of boring ?—That would be necessary and desirable before the work is undertaken.

27,493. I believe the project we now have submitted to us is applicable both to Swansea and Hartlepool ?—It is.

27,494. Are the circumstances much alike at Hartlepool and Swansea ?—Yes ; they have a very hard bottom at Hartlepool. They have already constructed piers upon this principle there, and they are now engaged in facing them almost precisely as I propose in this case.

27,495. In what depth of water would the Hartlepool Breakwater be formed ?—The extreme would be seven fathoms, six fathoms, and about five.

27,496. What the is rise of the tide ?—Sixteen feet at springs.

27,497. You think that a more favourable position than Swansea ?—Yes. The rise of the tide being considerably less, it is so far favourable that the work is not so much exposed between the period of low and high water.

27,498. I think you stated that the action of a violent gale would tumble the material about, and disturb it ?—Within the framework ?

27,499. Yes ?—It might.

27,500. That might happen, however well it might be hand-packed, and the arrangement of hand-packing would be disturbed ?—It would ; but I have no doubt the percussive action of the sea so far does good that it actually assists the packing below.

27,501. It might throw some material over the transverse wales ?—We do not find that much the case at Blyth, where there was a lateral sea, which was just the sort of thing to test it.

27,502. Would the sea have a different action at Swansea and Hartlepool ?—At Swansea it would partake more of the character of a deep-water undulating wave. There will not be the same percussive wave we have at Blyth.

27,503. How will that be at Hartlepool ?—At Hartlepool it will be the same, being in five fathoms water.

27,504. But we have had evidence given to us that the sea breaks there in 12 fathoms water. Whether this is true I cannot say, but suppose that was the case, would that have any effect ?—I cannot conceive in the north sea a wave becoming a breaker at so great a depth.

27,505. We have had such evidence ?—Not a breaker, properly. It may arise from this:—Often in violent gales the crest of an undulating deep-water wave has a forward motion from the action of the wind, and has the appearance of breakers. I have seen the sea at Aberdeen for two miles out perfectly white, but these were not breakers, properly so called. It only arose from the action of the wind upon the crest of the waves.

27,506. But supposing the ocean wave did break at that depth of water ?—I cannot conceive the possibility of that.

27,507. Would it interfere with your principle of action ?—I cannot conceive the possibility of a wave breaking at that depth.

27,508. I presume you could counteract the possible injury of pressure upon these works by increasing the dimensions ?—That would be a calculation of strength.

27,509. And of increased cost ?—A little increase of cost.

27,510. (*Capt. Vetch.*) Would you be astonished if I tell you that I have been for three days in the Atlantic in 90 fathoms of water, with the waves breaking so much that we could not see the surface of the sea ?—That might be a breaking wave of the character I speak of, the crest of an ocean wave blowing over by the wind, which has all the appearance of a breaker.

27,511. It looked like drifted snow. With respect to the comparison between the Mill Bay diagonal braces and those you propose to put up, the difference between the two would, I presume, be this, that at Mill Bay the face of the brace was opposed to the sea, and in your case the edge is opposed to it ?—That is the case.

27,512. That would make a considerable difference ?—Just the difference that there would be between the sea breaking upon the end of a pier and breaking at right angles with the side of the pier.

27,513. (*Mr. Coode.*) To follow up the last question, seeing that the damage at Mill Bay was from the lifting power of the wave, and not from the stroke of the wave, would it matter whether these braces were put in edgeways on or on the flat, so far as the lifting power was concerned ?—No ; but I never saw the drawings of Mill Bay Pier. If I saw them I might speak better.

27,514. The work which you speak of having done by divers below the water was entirely within docks or coffer dams ?—Yes ; I have had divers down in Swansea Bay too.

27,515. Still the work of which you have spoken of, putting on wales and so on, was within a dock ?—Yes.

27,516. In the comparison which you were asked to make as between the present system of constructing breakwaters and that which you propose to adopt, I would ask if you would be good enough to institute a comparison in similar depths of water, and with a similar rise of the tide ; and as the examination today has chiefly borne upon the design for Swansea, perhaps you will let the comparison be made with a depth of water and rise of tide similar to that shown on the Swansea drawing ?—Yes ; I will use the same data in both cases.

In applying the same principles to the same character of work you will bear in mind that the circumstances should be the same, or where they are not, you will make proper allowance for the differences.

27,517. (*Chairman.*) We have now gone through the first head of the examination to which we proposed to subject you, which is construction. I will now ask you what you have to offer upon the individual cases, commencing with Fraserburgh, and taking Aberdeen, and so on, in succession ?—I might add a little to my former evidence in each case.

27,518. (*Sir F. Smith.*) May I not venture to assume that the great merit of your plan is, in the first place, the great economy of material ; and, secondly, the great economy of labour and time as regards the labour necessary for putting that material in its place, and especially in the lower part. I look upon that as a great item of expense. If you had not the framework, the spread of the rubble would be considerably more ?—Yes.

27,519. Therefore the framework economizes material in that way ?—Yes.

27,519*a*. (*Capt. Vetch.*) Does not the plan also produce economy of time ?—Yes; that is one main object.

Friday, 3d December 1858.

PRESENT :

Admiral Hope (Chairman).

Sir Frederic Smith.
Mr. Lindsay.
Captain Washington.
Captain Sulivan.
Captain Vetch.
Mr. Coode.
Mr. Evans, Secretary.

LONDON. Dec. 1858.

The Secretary read the following report by Mr. Walker :—

To Joseph Cowen, Esq., Chairman of the Tyne Improvement Commissioners.

23, Great George Street,
Sir, 26th November, 1858.

Mr. Guthrie's letter of the 8th September requests me "to proceed with the preparation of a plan and estimate to show the capabilities of the river Tyne as a harbour of refuge."

The accompanying drawing is made in compliance with the above request. It will be seen to be little more than an enlargement of the design of 1853, and therefore the general reasoning in the report which accompanied that design is applicable to this, though to a greater extent, and will be my apology for some repetition, as it is desired that this report should contain a distinct expression of my opinion of the effect of the works I may suggest, without reference to a former report.

It may be proper, however, for the better understanding of the present works, and of my connection with them, to state that my first survey of the entrance to the Tyne was as Admiralty Inspector, in consequence of a difference of opinion between the professional advisers of the Admiralty and the engineer to the Tyne Commissioners as to the plan of piers for the entrance of the river, and their lordships having afterwards complied with the request of the Tyne Commissioners that I should be allowed to submit a plan, upon the understanding that the commissioners would agree that such plan should be final, and accepted by them, and not to be altered without the concurrence of the Admiralty.

After the above, with the evidence I had taken, and the various plans that had been proposed by others before me, for my assistance, I prepared a plan which, I believe, had the unanimous approval of the commissioners and also the approval of the Lords of the Admiralty, and of the then hydrographer to the Admiralty (Sir Francis Beaufort), to whom all the plans which had been received were submitted by me for his opinion. When, however, the commissioners applied for the official sanction of the Admiralty to proceed in the execution of the work according to my plan, that sanction (partly, as I have understood, from a wish to test the efficiency of the plan) was limited to a length of 1,400 feet of the north pier, and 2,800 feet of the core of the south pier.

I have now to inform you that a contract has since been entered into for these portions of the work, and that some progress has been made with both the piers.

The following contains my opinions expressed in my former report, which I have not seen reason to change, always bearing in mind that the extent of shelter, the depth of water, and the freedom from injurious shoaling or bar, will be more certainly obtained by the enlarged than by the former design :—

"The present great evil, to the removal of which all the designs have been directed, is the bar; this has been generally proposed to be effected by confining the ebbing water of the river and the harbour, and directing it upon the bar at the entrance, instead of allowing it to escape over the Sparrow Hawk and other sands; but the difficult question to solve is, can this increase of velocity and depth through the narrowed space between the piers be continued so as not to have the effect of causing a similar deposit outside the piers, and thus forming a bar there?

"It is, in my opinion, clear, that if the outgoing current and the passing (south to north) ebbing tide were in the same direction and of the same velocity as at present, and if the same quantity of sand were still to be admitted by the flood tide into the harbour and river by the 'Wheel,' and afterwards to be passed out during the ebb tide, the same causes would produce the same effect as they do at present, viz., a bar, but outside the present one, for the position of the bar is by no means fixed; it is at the point where the opposing forces, west to east, and south to north, meet or balance, and it would be moved out beyond the piers if this balancing point were moved out by increasing the current between them.

"My expectation, however, is, that all these conspiring causes of a bar would be modified, and the effect of them, to say the least, very much diminished, by the adoption of the design hereafter described, for the following reasons, viz. :—

"That all the outgoing water being confined by piers, instead of spreading over so wide a space as at present, would, at the ends of the piers, join the coast tide passing from south to north, with increased velocity or energy.

"That the sand would be brought out to where there is deeper water, and therefore the same quantity deposited would not produce a bar of the same height as at present.

"That the south to north ebbing tide, to which the piers would be extended, may be expected to be stronger when confined or collected, in passing the ends of the projecting piers, and thus to check the formation of a bar.

"That the operation of a south pier, even if but a short one, which Captain Washington and other naval gentlemen think likely to be sufficient, would stop a large portion of the sand that is now carried into the harbour during the flood tide by the 'Wheel,' so that there would be less sand to go out again on the ebb.

"The general observation of a sympathy between the bar and Sparrow Hawk has been considered as a proof of the effect which confining the water between the piers would have. It is remarked that at present, when the bar is low (good) the Sparrow Hawk is high, from which it would appear that the two facts are connected; but the Sparrow Hawk being high is, I think, rather the effect of the good bar than the cause of it. The sand that forms the bar is deepened by the scour of the river, chiefly during land freshes, with westerly winds; and when so deepened, there is, after the freshes have gone off, a greater channel for the ebbing water to escape in the straight line, and therefore a comparatively less quantity and velocity upon the site of the Sparrow Hawk, thus allowing a deposit upon it, and a rising of its surface. There is also, in times of these freshes which lower the bar, less room in the river for the tidal water to enter, and then all the sands, both the Sparrow Hawk and the Herd, over which the flowing and ebbing tide passes, have a tendency to rise. When there is no fresh, or when the action of a fresh is checked by easterly winds, these causes cease to operate, the sand or bar in the straight channel begins to rise, and a larger portion of the ebbing water is diverted over the Sparrow Hawk, so as to deepen it.

"On one point there was a unanimity of opinion among all parties whose evidence I received, that to confine the outgoing current over what is now the bar, must, by increasing the velocity, deepen the channel.

"In the position and direction of the piers which I have designed, I have been influenced by various considerations besides that of the removal of the bar. The following are the principal, viz. :—

"1st. To give heavy seas space to spread, and spend themselves immediately after passing the piers; so that vessels having got inside the piers, may be in quieter water, in a kind of outer harbour.

"2d. Not to lessen materially the extent or area of sloping sand, which is useful, not only for the above purpose, but also for vessels beaching upon it, in case of their being obliged to do so.

"3d. To enable vessels entering with scant northerly or southerly winds, to haul up close under either the north or south piers, and so to escape getting upon a lee shore, and (owing to the proposed height of the piers) to be sheltered from the violence of the winds; this they would be as soon as they should get inside, or round the heads, and would thus escape the dangers of the Herd Sand and the Black Midden Rocks. From the action of the north to south current of flood tide being upon their broadsides, vessels are at present liable to be driven upon the Herd Sand, particularly when, from the want of depth of water upon the bar, they are but little under command of the helm; but with the piers as proposed, even if vessels were to get ashore, it would be in smoother water, and the danger to ships and crews would be much less than at the present time, when they are quite exposed.

"4th. To give to laden outward-bound ships shelter

from the worst winds, while they clear the pier heads and get into deeper water; and,

"5th. To enable tug boats to get further out to assist ships in entering or leaving the harbour."

As to any interruption that the piers may offer to the full flow of tide into the harbour, I would only observe, that the flood current just outside the bar is at present little more than one mile per hour, and that the width between the piers is proposed to be 1,100 feet, while the total width of Shields Harbour opposite to the New Quay is only 920 feet, and at the Narrows still less.

Taking these considerations together, I do not think the tendency which any contraction would naturally have to throw off the flood tide would amount to a practical obstruction, but rather, that the width of entrance which I have proposed may be found to admit the heavy seas too freely, and that experience may show a further contraction to be desirable. The objects to be attained on the one hand are the removal of the bar, and shelter from heavy seas, and to make the width between the piers such as to accomplish these ends, without on the other hand excluding the flood tide, or increasing materially the velocity of the ebb during freshes, and so as not to interfere injuriously with the entrance of ships. If these objects are opposed to each other, absolute perfection in all of them is not to be expected, but such an arrangement should be attempted as may effect the more important purposes, without producing a conflicting evil to an extent that may prove equally injurious.

The design now submitted consists of an extension into deeper water, and such an enlargement of the plan (coloured yellow) that was proposed by me in 1853 as that all the work yet executed, and the greater part of that at present authorized by the Admiralty, would be brought in. If the work had not advanced so far as it has done, I should not have adopted for an extension into deep water exactly the same lines that I now propose, but I do not consider the difference to be such as to be of much importance practically.

The entrance, according to the accompanying plan, will be in six fathoms at low water, decreasing inwards. *The area* (according to the Admiralty chart) with not less than three fathoms at low water of spring tides is 76 acres, with not less then two and a half fathoms 90 acres, and with not less than two fathoms 104 acres. At all times, excepting at the low water of spring tides, the areas or depths will be considerably greater.

The above areas are comprehended within less than half a mile from the piers inwards, which is under one third of the length of the wide basin, if measured up to the Narrows.

It may be said, that for a general harbour of refuge, the above areas, considered by themselves, are small; but if, as I anticipate, the effect of the proposed piers shall be still further to lower the bar, and to deepen the water inside up to the present deep water above the Narrows, the extent of shelter will be large for vessels of considerable draught, even at low water of spring tides, and as the lift of tides is fifteen feet, ships of still larger draught may, when the channel shall be once dredged, be able to enter and go into Shields Harbour at all times of tide.

They being thus able to pass up to an inner harbour, so as to be out of the way of other vessels seeking shelter, is one of the advantages of a harbour of refuge being at the mouth of a capacious river like the Tyne.

Mr. Wake, the harbour-master, states in a letter now before me, "that the harbour of the Tyne above the Narrows, with the additional space afforded by the Northumberland Docks and the Jarrow Docks, is capable of containing 2,000 sail of vessels, and that before the opening of any dock in the Tyne he has known 1,250 sail of vessels lying at one time in the river, many of them being vessels that have sought shelter in the Tyne from a storm."

The scouring effect of a large backwater for clearing the entrance and passage is another advantage, while the pier heads being carried into deep water, with a tidal current outside, will tend to prevent the entrance of water charged with sand.

The greatest improvement as respects the depth from the proposed entrance, where there is now 30 feet at low water, up to the harbour where there is 20 feet, would be the entire removal of the present obstructions, so as to have practically an uninterrupted inclined plane between the two extreme points. This is more than should be reckoned upon, but I consider that with the aid of some dredging, for the removal of any hard material, there is a fair probability of 18 feet in the whole length of the channel; and I need scarcely say, that the good that would result from this in the saving of lives and property and in giving facility to trade would be great.

Undoubtedly all vessels bound for the Tyne, or having left the Tyne and being driven back by stress of weather, would prefer taking refuge in the Tyne to any other harbour near them; but the advantages to which I have referred apply to the shipping generally that may be caught by storms upon your coast, and seek the refuge of a harbour.

This suggested addition to the area would necessarily increase the cost of construction; my estimate for the present plan being 400,000*l*., while that of the extended harbour as now submitted is 800,000*l*.

The amount may appear large, but I would observe that the addition of 400,000*l*., if it would tend not only to prevent wrecks and loss of life, but to facilitate the trade and shorten the time of 45,000 ships (the annual traffic of the Tyne) making their voyages, or to enable a less number of ships to do the work, would even, as a matter of economy in money, be a prudent expenditure, of which the consumer would have the ultimate advantage.

The returns from the Board of Trade show some important facts named by Mr. T. J. Taylor, viz., that the traffic of the Tyne is nearly as great as that of Blyth, Sunderland, Seaham, Hartlepool, and the Tees collected. Mr. Taylor also remarks, that exceedingly few vessels not belonging or trading to the Tyne are wrecked at or near the mouth of the river, and that the great majority of wrecks upon the coast takes place at or near the entrance of the ports to which they are trading.

To complete the piers according to this enlarged plan would be the work of ten or twelve years, but I expect that the benefits I have referred to would be felt in very much less time.

I have the honour to be, Sir,
Your most obedient Servant,
J. WALKER.

Mr. J. WALKER, C.E., examined.

27,520. (*Chairman.*) Mr. Walker, your report, which has been forwarded to us by the Commissioners of the Tyne Improvement, has been read to the Commissioners; and before we proceed with any examination, I wish to ask you whether there is anything further you desire to state in reference to it?—I think not. The report in the shape you have it is of very modern date, as you will see, and I intended to embrace in it all that this Commission might think it necessary to interrogate me upon on the subject of the Tyne.

27,521. We shall be very glad to have your opinion on a subject which is one of some difficulty,—I mean the accumulation of sand which we witnessed on different parts of the coast. Can you inform us how that occurs? Is it from deposits of sand held in suspension in the water of the North Sea, and brought down by the tide flowing from the southward, or does it arise from local deposits washed in from the sea?—I think the sand you refer to is sand which belongs to the sea, not to the river.

27,522. Yes; but I am not now speaking with reference to the Tyne only, but to the deposits of sand all along the eastern coast of England. Wherever we have been upon that coast we have observed that in every place where there is a projecting point the sand seemed to collect, as if it came in from the south side of that point. Now we should be glad to know your opinion as to how those accumulations of sand arise, and from whence they come?—That is a very general question, and one that can only be answered satisfactorily after an examination of the stratification of the cliffs on each side where the sea washes. If those cliffs consist of stone, and the sea washes the shores at their base, portions will be washed off, and being pulverized into sand might form the matter you refer to.

27,523. Have you ever analyzed the water of the North Sea for the purpose of ascertaining the quantity of sand it holds in suspension?—No.

27,524. Has it never occurred to you to do so?—No; and I should think it would be almost a useless task, for the result would depend very much on the part of the sea you took the water from. If you

LONDON.

Mr. J. Walker.

3 Dec. 1858.

Chairman.

took it from near the shore, where the water is shallow, there would be a considerable quantity of sand, and if you went out to a distance, where the water is deep, there would be little or no sand at all.

27,525. But, as I understand, you do not speak from the results of any actual experiment that you have made ?—No.

27,526. Do you think that the large quantities of sand we found upon the north-east coast, or in certain parts of it, is sand brought down there from the sandy coasts about Yarmouth, and all that sandy district on the east coast, washed down by the action of the water ?—I think it is very likely to be the case.

27,527. You think it is very likely ?—Yes ; but when you say all that sandy district about Yarmouth and the east coast, you give me a very large field, for there is a very large district on that coast which is sand, and there are the Yarmouth sands.

27,528. But it has been stated that in the North Sea the ebb tide flowing to the north brings the sand down in suspension, and that whenever there is still water that sand is deposited ?—Yes.

27,529. You have had great experience in these matters, and may or may not have turned your attention to this particular point; if you have, we should be glad to have the opinion which you have formed as the result of that experience ?—It does not appear to me to be a matter depending upon any general rule so much as upon the circumstances of each particular locality, and for me to give an answer to such a question, applying generally, would be only to mislead you.

27,530. Can you suggest any mode, any experiment or series of experiments, by which the accuracy of the theory I have alluded to might be tested, or the reverse ?—The best experiment would be experience, and that would be best obtained by carefully watching the ground on each side of the rivers and streams, and carefully noting what takes place in the shape of washing down the sand from the cliffs, to ascertain how far that cause may operate to produce these effects.

27,531. You mean, in fact, that a careful examination of the coasts and banks of the rivers, and a careful examination of what is found at the foot of the cliffs comparing it with the geological stratification, would be the most obvious method of arriving at a satisfactory solution of the question ?—Yes ; for there are great lengths of the coast cliffs which have been washed away very rapidly.

27,532. Do you think any good would result from an actual analysis of the water of the North Sea at different distances along the coast, and in different distances from the coast ? Do you think we should be enabled to get at any practical result in that way ? —You mean by a chemical analysis ?

27,533. Yes ?—No, I think none at all. A survey such as I understand this Commission has been making along the coast would be worth 1,000 analyses.

27,534. For the purpose of testing whether the water of the North Sea does hold any considerable quantity of sand in suspension or not ?—Yes.

27,535. (*Sir F. Smith.*) Mr. Walker, I think you projected a scheme for the improvement of the Tyne some years ago ?—I can hardly call myself, as I am named in the report, the projector. I was sent down by the Admiralty to make certain surveys and inquiries upon the subject, and a variety of plans were set before me. I selected the good parts of each, and from them made the plan upon which we are now acting ; adding my own judgment, so far as I could apply it to them.

27,536. Have you a copy of that plan before you ?—Yes. Perhaps I may say, as the gallant General has referred to this point, that very nearly the same answer which I have now given is contained in my printed report. I state there, that I adhered nearly to the plan that was previously deposited to accompany an application to Parliament, and that Mr. Brooks was the engineer at that time to the Tyne Commissioners.

27,537. I am quite aware that what you are now saying is to be found in the printed report, but at the same time it is very desirable that we should have in the minutes of your evidence these important facts, inasmuch as a report given in the Appendix is not always referred to in the same way that the evidence taken before the Commissioners is ?—Will you excuse me ? Perhaps it is the intention of the Board to make the report a part of their proceedings ?

(*Chairman.*) It is minuted.

27,538. (*Sir F. Smith.*) I presume, Mr. Walker, that the plan you have before you is the coloured plan of the proposed breakwater ?—The plan I have before me ; that part coloured yellow is the present plan.

27,539. Looking at the southern breakwater, you will observe that there is a portion of it which extends over the narrower part of the Herd Sand ?—Yes.

27,540. And it goes out to the extent of the slope marked 1857. I perceive there is a considerable widening of the breakwater towards the root ?—Yes.

27,541. What does that represent, the yellowish-brown portion which is so widened ?—That represents the extreme line of railway for bringing the materials from the quarries to the south pier.

27,542. Then that dark yellowish-brown mass has reference to the railway, and not to the accumulation of sand ?—No, nothing of the kind ; it is all artificial.

27,543. Then this part that runs out to the extent of the base, marked September 1858, in various colours—brown and yellowish brown, may I ask why the change of colour takes place at that particular spot ?—Merely to show more distinctly the position of the works in September 1858.

27,544. It was carried up to that point at that date, then ?—Yes.

27,545. Will you be good enough to go a little further out to where the yellow and red form a junction. The yellowish brown runs up to the Head and the blackish brown to the pier head ?—And beyond it.

27,546. What project is that ?—The yellow ?

27,547. Yes ?—The yellow is the plan which I have referred to, and which I submitted to the Admiralty, —the plan which I believe the Commissioners of Newcastle unanimously approved, and which I believe also the Admiralty approved,—the plan which I presume will be carried out, and which I have as yet acted upon, only that, which I have also stated in my report, the Admiralty, for reasons best known to themselves, objected to go beyond a certain point marked in the plan.

27,548. And it is that point to which your project was then directed ?—The yellow was the project then.

27,549. Then, having arrived only at that point marked September 1858, am I to understand that from that point you give a change of direction and take the red course ?—Yes.

27,550. And that goes out so as to give between 30 feet and 40 feet depth of water ?—Yes, that is the plan proposed, should the Commissioners be assisted with the means of carrying it into effect ; in other words, by a grant of public money.

27,551. This, then, is the first time that that project comes before the public, is it not ?—Yes.

27,552. The project before the Admiralty was the shorter project ?—Yes, the yellow plan.

27,553. Will you be good enough to tell us what difference there would be in the expense if the change of projects you contemplate were effected ?—I shall answer that question by a repetition of what is stated in my report,—the difference would be 400,000*l.*

27,554. That is the total cost would be 800,000*l.* instead of of 400,000*l.* ?—Yes.

27,555. And the mode of construction you prefer to adopt is the same ?—Yes.

27,556. The same mode of construction as in the earlier part ?—I answer yes, not, however committing myself to it in all respects. If the gallant General has

seen the works, he will have observed that the south pier is made with a long slope.

27,557. Yes, I have seen it.—That I may call the core of the work ; but the intention was, and is, to raise on that.

27,558. To raise on that ?—So as to make it, as regards the upper part, the same as the north pier.

27,559. Now, I perceive that you carry both piers out to nearly the same distance, the one being in 37 feet water, the other nearer to 40 feet water ; are you of opinion that if you were to construct the south pier up to that point, between 30 feet and 40 feet depth of water, leaving the north pier as it was contemplated to be in the first estimate, it would not answer all purposes ?—I think not.

27,560. Has not an opinion been given by a very competent officer that the north pier might be dispensed with ?—Really, so many opinions have been given that I do not remember. Will the gallant General state to whom he refers as having given that opinion ? I suppose it is no secret.

(*Mr. Lindsay.*) It was given publicly.

(*Capt. Sulivan.*) It is Captain Washington. He is alluded to in Mr. Walker's report by name.

(*Capt. Washington.*) What am I supposed to have said ?

(*Mr. Coode.*) That a shorter pier would be sufficient.

(*Chairman.*) You had better read it.

(*Capt. Sulivan.*) I find in the report of Mr. Walker the following paragraph :—" That the operation of a " south pier, even if but a short one, which Captain " Washington and other naval gentlemen think likely " to be sufficient, would stop a large portion of the " sand that is now carried into the harbour during " the flood tide by the ' wheel,' so that there would " be less sand to go out again on the ebb."

(*Capt. Washington.*) That opinion only refers to the length of the south pier.

(*Chairman.*) The Commissioners, at the commencement of their proceedings, made it a rule that no member of the Commission, while examining a witness, should be interrupted, but that any explanation which any other member might desire to give in reference to such examination should be given subsequently.

(*Capt. Washington.*) But I cannot allow any Commissioner to state that I said what I never did say, whether he be examining a witness or not.

The Chairman directed the room to be cleared.

After a short delay the doors were re-opened, and Mr. Walker's examination was resumed.

27,561. (*Sir F. Smith.*) It happens to be a fact, that an opinion given to us by a man of high position is to the effect in which I understand this paragraph of yours. But I understand from my brother Commissioner, Captain Washington, that it was not intended by him in that sense in which I read the paragraph. Therefore we must suppose that I read it erroneously. I did not, however, read it carelessly ; and, remembering what had been said by another witness, I fancied that Captain Washington had agreed with that witness as to the mode in which the Tyne should be dealt with. An opinion has been given to us that the south pier, as projected, is most valuable and will be most valuable, but that, looking to the effect of the projection at the point, the north pier may be dispensed with ; and I read that paragraph of yours as meaning that a short south pier would suffice, according to the opinion so supposed to have been given by Captain Washington, that the north pier might be dispensed with. Am I to understand then, now, that it was never your intention to dispense with the north pier ?—I never intended that, certainly.

27,562. And you never understood that to be Captain Washington's view ?—I cannot answer that question so distinctly. If Captain Washington says that I am wrong and that he never intended it, I shall be satisfied.

27,563. Did you imagine that Captain Washington intended to say that he would dispense with the north pier ?—I think the substance of the paragraph, and the impression upon my mind at the time, was, that Captain Washington meant to say that the south pier would be sufficient. That appears to have been my impression when I wrote the paragraph ; whether I was mistaken or not is another thing.

27,564. It appears to have been a mistake. Now do you, on further considering the matter, think that the north pier is required to be carried out beyond its present length ?—That is my decided opinion.

27,565. Beyond its length according to the present plan ?—Beyond the length projected for the expenditure of 400,000*l.*

27,566. Do you think it would be necessary to make the additional portion which is coloured red on this plan ?—That would depend upon the objects that are sought to be attained. If I were to look upon it for its greatest capability for forming a harbour of refuge, it is required ; but if I am to look upon it only for the purpose of improving the bar, and allowing ships to enter with greater facility and greater safety than they do now, I should say not.

27,567. I believe you propose to complete the construction in the way in which you have commenced it, as a general principle ?—Yes.

27,568. The mode of construction will be the same ?—I saw no reason for altering that mode, or for altering the plan, until I was asked to accommodate the Tyne for a harbour of refuge. This, which I hand in, is a section of the mode in which the south pier could be finished if the same mode of constructing the base of it were continued which we are following at present, that is, the slope.

27,569. This section will not apply to both piers ?—Only to the south pier.

27,570. Have you any section of the north pier ?—No ; there is one in my report.

27,571. Only as to the south pier. In the south pier the hearting or core is entirely of rubble, is it not ?—It is.

27,572. And to be pitched, with what material ?—To be pitched with large limestone, which is found in the rocks adjoining.

27,573. And this, I suppose, will be used in large blocks ?—It will.

27,574. Will the whole of this pitching be above the low-water line ?—No.

27,575. Up to what distance will it be above the low-water line ; how far out from the shore ?—As the gallant General will see by the plan,—out to the point where the low-water line is shown upon the chart. We are beyond that now considerably.

27,576. Then by what process is the pitching put on ; is it by the diving bell ?—No ; we put the rough rubble stone in to form its natural slope until we get to the level of low water, and then the work of constructing commences. I was trying to think of a parallel case, and the pier at Jersey occurred to my mind ; but that is not the same. The Duke of Buccleuch's harbour at Granton, near Edinburgh, is nearer, but on a smaller scale.

27,577. The pitching is all set by hand?—Yes, with the aid of cranes. May I take the liberty of asking if any of the Commissioners have seen the work at the south pier ?

(*Capt. Vetch.*) I have seen it.

(*Witness.*) I think it is substantial.

27,578. (*Sir F. Smith.*) It is very substantial. Is it set without the diving bell ?—Yes.

27,579. How do you ensure the accuracy of the joints below the low-water mark ?—We do not try to ensure accuracy in the joints below low-water mark. The rubble is thrown with a long slope to find its own shape, then at low water we level the surface of the mass, and upon that begin to build.

27,580. Here, in this drawing, is observed a carefully laid pitching on the top of the rubble mass. I want to know as to that carefully laid pitching, how is it applied ? The pitching you refer to is all above low-water mark, I think, is it not ?—Yes, it is.

LONDON.

Mr. J. Walker.

3 Dec. 1858.

Sir F. Smith.

27,581. In point of fact, then, if you were to go out to deeper water you would still not have the pitching below the low-water line?—No, we should not; that is the intention. The mass of the Admiralty pier at Jersey is constructed in the same way. We began building there at the level of low water, and the plan has answered completely.

27,582. Then I may take it, judging from the report, that it is your opinion the bar will be removed out into very much deeper water by the plan you propose?—Whether it be by the one plan or the other, my opinion is that the bar will be removed out.

27,583. Will it be altogether removed by going to the utmost extremity you propose with the works?—I do not pledge myself to that. I will not pledge myself that there may not be some bar, but if there is it will be much lower than it is at present, and so low that it will form no impediment or inconvenience at the entrance.

27,584. Do you think it would be any advantage to change the form which you have given to the external parts in red, and just reverse them, so as to make it bell-mouthed externally?—If it were made bell-mouthed externally, you would have, instead of a contracting mouth to shut out the seas, an open mouth to admit them.

27,585. But might you not give it that form, and still keep it more contracted, so as to exclude the seas inside, and at the same time give it a wider mouth externally?—It might be done, but I should doubt the policy of doing it.

27,586. You doubt the policy?—Yes.

27,587. But do you not imagine if you did it that the quantity of silt and other matter ejected by the ebb tide would go over a large spread of surface, and therefore not rise so high?—If the gallant General supposes that there will be such matter ejected by the ebb tide he is right in his conclusion; but he will also see that the opening or discharge would be the cause of forming a bar at the mouth of the harbour; and he must also imagine, to support his theory, that there is such matter as he refers to ejected. But my hope is, and my opinion is, that if these works are completed, we shall be in water in which there is no such matter to eject; that we shall exclude the sand on both sides, and by going out into deep water exclude the drift also.

27,588. I think you say in your report that the bar is formed where the waters, west to east and south to north, meet and balance, and it would be moved out beyond the piers if this balancing point were moved by increasing the current between them?—It is quite evident wherever the forces cease to act in opposition to each other there must be a deposit.

27,589. You admit that to be the fact?—That is to say, supposing there is matter to deposit.

27,590. Then you are of opinion that there would be no matter to deposit coming down from the river?—There would be some, but not in such quantities as to be injurious here, or to cause a deposit.

27,591. There would be no quantity?—The gallant General must refer to the quantity of matter brought down the river?

27,592. Yes?—The quantity of that is very small comparatively, very light, and would be carried out, I think, to the sea.

27,593. If that is the case, does it not follow that the bar now formed must have been formed, not by various deposits coming down the river, but by the sand thrown in from the sea?—I think so; I think it is more from that cause.

27,594. There cannot be less to come down if you project the pier further out?—Certainly not.

27,595. Whatever there is now, there must be then?—You have just hit on that which is the very point; the great evil at Newcastle at present is the bar, and the great object is to get it removed.

27,596. You state in the report how that bar is to be avoided, how it is to be got rid of?—If any improvement can be made in the lines of these piers, I should be glad to have the advantage of any suggestions for that purpose. As when I first undertook the duty I consulted all opinions upon the subject, I shall now be glad to profit by the opinions of the members of this Commission.

27,597. The question of estimate in detail you are not prepared with, I suppose?—I can give you a detailed estimate, if you desire it.

27,598. I think it is desirable we should have it?—If that is done, I would suggest that it would be most desirable the estimate should be given as a private document, and that it should not be made public, seeing how the publication of such documents would affect contracts and other things hereafter.

27,599. (*Sir F. Smith.*) There can be no objection to that. It is for the use of the Commissioners only?—I shall be happy to give any information you may wish on these points for the use of the Commissioners.

27,600. You will then so understand it?—Then I will submit detailed estimates, which I understand shall be considered confidential and private.

The Commissioners held a short consultation.

(*Chairman.*) You will be informed later, Mr. Walker, whether we shall find it consistent with our usual mode of procedure to accept an estimate as a private document or not. Hitherto all such documents have been received publicly as part of the evidence.

(*Sir F. Smith.*) In the meanwhile Mr. Walker need not prepare it.

(*Chairman.*) You will understand, Mr. Walker, that all the estimates that hitherto have been given in to us have been given as public documents and incorporated with the proceedings, and therefore, before complying with your request, that yours should be considered private, I should like to have the opportunity of considering the question with my brother Commissioners. We will acquaint you with our decision afterwards; and, in the meanwhile, we will not ask you to prepare it.

(*Witness.*) I need not tell you that it is already prepared, for it is the basis of these projects.

27,601. (*Sir F. Smith.*) Have you ever had a project for the construction of a breakwater such as exists at Blyth?—I think there is no project for a breakwater that has not at some time or other been brought before me, but I do not remember what the Blyth breakwater is; how it is constructed.

27,602. By means of piling, and sheeting within the piling, and filling in with rubble. Some years ago Mr. Rastrick, you may remember, proposed to go across Morecombe Bay in that manner.—Perhaps no piers are more common than piers of that construction. The old piers of Dover Harbour were constructed in that way centuries back.

27,603. And so, I believe, are those at Boulogne and Calais. They are constructed much in the same way, are they not?—Yes, I believe so.

27,604. You do not think we should effect any great saving by adopting that system here?—Certainly not; quite the reverse.

27,605. You do not think there would be any difficulty in dealing with piles 40 or 50 feet long exposed to the beat of the sea?—No, we are driving longer piles than that at the Admiralty pier at Dover; but that would be a much more expensive plan than the one we propose to adopt, and would be much less permanent, a timber structure being much less durable than stone.

27,606. Did you drive these piles at Dover before you put in the hearting or afterwards; is it a mere stage for the work?—A stage for the work.

27,607. Then is not that a parallel case?—You will hardly find two parallel cases, as every structure must depend, as to the system of construction, upon the locality and circumstances of the place for which it is required.

27,608. Do you know the eastern coast where the Tyne runs into the ocean?—Yes, I do pretty well. I have had a good deal to do with many of the harbours there.

27,609. You are aware that there is a movement of the sand towards the north ?—Yes.

27,610. And none toward the Tees mouth from the north ?—I do not know if there is none; perhaps there is not so much as there is the other way.

27,611. Is there any ?—Well, I cannot say there is none.

27,612. Well, if there is, it is very slight in comparison with the other way, is it not ?—Very slight, if you please.

27,613. And do you think that a great period of time must elapse before the silting of the sand from the south to the south pier would tend to get round the head of that pier ?—I think it would tend to do so from the commencement, but I think, also, it would be a very long time before it touched the point, and after that I expect that the current and the force of the water passing through, and the obstruction caused by the piers themselves, would increase the tide and carry out the sand beyond the opening.

27,614. Might not the sand be prevented from entering the harbour mouth by shortening the north pier a little, so that the set of the tide would carry what was at the south pier beyond the north ?—Either I do not understand your question, or it would have quite a contrary effect.

27,615. You say that in the course of time the sand might come round the end of the south pier ?—Yes.

27,616. If it did, and the wash of the flood tide set in, of course the sand would come into the harbour's mouth, the north pier being at its extended length; but if, on the contrary, the north pier were shortened, the set of the south tide might send the whole beyond the entrance altogether ?—I fear, under those circumstances, with a flood tide the tendency would be to form an eddy inside and bring the sand in.

27,617. What amount of acreage do you get in your extreme harbour ? I mean, what is the increased capacity by your larger scheme ?—The quantity is given in acres in the report, at all the different depths.

27,618. Have you got the figures before you ?—I think the report does not give the increase of the new plan over the old ?—I think it does nearly so; it gives it in round numbers.

27,619. It does not separate them. I want to know precisely the increase of the area resulting from the increase of cost ?—I believe the increase of area is stated generally in the report.

27,620. But that is only the increase ?—Yes.

27,621. And not the total ?—No, not the total.

27,622. What is the increase to be got by your present plan ? I want to know what is the increase of area that you obtain by your extended plan ?—In the first case, I have data to go from; I have the present plan. You ask me the difference between the old plan and the new one.

27,623. I want to know what increase you get by the existing plan ?—Which I have answered in the report.

27,624. And how much by the enlarged plan ? How much do you get for this additional outlay of 400,000*l.* ?—That is a difficult question to answer. I do not know how far to measure to give you the acreage, and I have no data to go back to. I can give you the increase between the first plan and the second; but if I am to give you the increase upon the first plan I must have some data to start from.

27,625. That would be the state of things with which you commenced ?—Exactly so; the state of things with which I commenced. I can give you the area of the whole bay up to low water.

27,626. Well, what did the first plan contemplate that was to cost 400,000*l.*; did you contemplate any refuge by that first plan ?—Yes.

27,627. What is that acreage of refuge ? I think I had better take it up to low water; because, if I apprehend your scheme correctly, it is that by an increased size you get an increased area of refuge, and that you get rid of the bar ?—Yes, those are the two points.

27,628. Yes; but I want to know what are the advantages we are to obtain for this outlay of 400,000*l.* The riddance of the bar is one thing, the area is another ?—You ask me what you are to get for the 400,000*l.* To save time, I should answer you that I have given everything that I have stated in the report. I cannot make it fuller. You get the removal of the bar, and a large space that is enclosed within the piers. At low water there is not a very large space, but it is of considerable depth by the first plan.

27,629. Yes, I wanted to know what that space was; I wanted to know the area each plan gave; but if it is difficult to give it, I will not ask you any further ?—I cannot give it you so distinctly as it is given in the report.

27,630. (*Mr. Lindsay.*) The main points, after all, are the bar, the depth of water, and the maintenance of that depth, and as to these I will trouble you with one or two questions. It was stated to us at Shields, in the evidence of the harbour-master, who had sounded it since the piers had been commenced, that there had been a depth of water—an increase of depth—on the bar of two feet; do you think that the effect of the piers being carried out, as they are now, in a very limited degree, would be to increase the depth of the water to that extent ?—I had not calculated upon an increase of depth to that extent in so short a length as the piers are now carried out, but understanding that that effect was produced, I began to look if the piers were the cause of it. And it is an odd fact that the set of the Sparrow Hawk—do you know it ?

27,631. Yes.—It is an odd fact that there is a harmony and consistency between the sand of the Sparrow Hawk and the bar, so that when the sand is high at the Sparrow Hawk the bar is low, and when the Sparrow Hawk is low the sand at the bar is high. That is a fact that has engaged my attention, for it is well known that these two sands influence each other. I consider that what we have done here in forming the base of the pier is to form in some degree a permanent Sparrow Hawk. I do not know if you understand me ?

27,632. I understand you perfectly well.—And that the action of the tide is prevented by that from interfering with the water of the harbour to the same extent that it did, and therefore the effect is, I think, accounted for; although I confess that I did not expect that we should begin to improve the bar so soon; but I believe that to be the cause.

27,633. Then have you not in the course of your examination been able to find other causes which have tended to the deepening of the bar ?—I do not remember; examination of what ?

27,634. The examination of which you have spoken. You stated that when you heard that the bar was deeper by two feet, you were led to make an examination; did you in the course of that examination find any other cause for the deepening of the water at the bar, besides the carrying out of this pier ?—I meant a mental examination.

27,635. Just so, an inquiry in your own mind ?—We have also, as you have seen, carried out the south pier to a considerable length; that has, perhaps, had some effect in shutting off the sand, but not to the same extent that the north pier has done. The Herd Sand is lowering very considerably already.

27,636. I think you stated in evidence, in answer to Sir Frederic Smith, that in your opinion the formation of the bar was caused more by the sand flowing in from along the coast than by any sediment coming down the river ?—Yes, I said so.

27,637. Consequently the carrying out of your south pier will entirely shut out a very large portion of the sand which now tends to create the formation of the bar ?—Yes, presuming that it does so.

27,638. And from what you stated, it appears also that whenever the sand plays between the bar and

LONDON.

Mr. J. Walker.

3 Dec. 1858.

Mr. Lindsay.

the Sparrow Hawk, another sand—[Yes.]—by carrying out the north pier you prevent that constant playing that has hitherto been going on, and by means of this north pier you have actually obtained, either by carrying on the piers to the limited extent they now are, a greater depth of water on the bar ?—Yes.

27,639. In addition to which the co-operation of the tide at the bar is prevented, and the action of the tide over the set of the bar is less interrupted than it was before you began these works ?—Yes.

27,640. Now it has been stated—it is in evidence—that to whatever extent piers are carried out the bar will follow the piers. I notice in the chart before me a bar called the 9-feet bar, in which there is one patch marked 5½ feet. But take the 9-feet, is it the case that the 9-feet bar would be carried out and form a 9-feet bar at that point where we have now got the piers,—those piers where 37 feet of water is marked ; what is your opinion of that ?—That must be a mistake.

27,641. It has been stated so in evidence ; what is your opinion upon the point ?—I think there must be some mistake in the evidence.

27,642. I heard it so stated ; but it appeared to me so extraordinary a statement that I want to have your opinion upon it ?—Well, I think it would not.

27,643. You think it would not form a new 9-feet bar there ?—Certainly not.

27,644. Decidedly not ?—Yes, decidedly not.

27,645. Do you think that the carrying out of these piers would have a tendency upon the whole to give less water within a certain limit, or more water in the course of time ?—More water at the entrance, certainly.

27,646. But within the area altogether ?—It would give more area altogether. It would give a greater depth of water, and by giving more depth it would afford a greater area. And I think in the course of time the Herd Sand would go away altogether.

27,647. Then instead of these piers causing a silting up within the area, as has been suggested, you think the tendency would be quite the reverse ?—Yes, I dare say it would.

27,648. That is your opinion, that the tendency would be quite the reverse ?—Yes.

27,649. Decidedly so ?—Decidedly so. It would have been very wrong in me to have adopted these piers if I had had any reason to doubt it. In the first steps I took in the matter—in the first consultation I had with the Tyne Commissioners on the subject—or at any other time—such an idea was never broached, and it is altogether out of the question.

27,650. Then taking it in a more reasonable way than it appears to have been put by certain gentlemen to us, do you think you will be able to maintain the depth of water at the end of these piers, as stated, 37 feet, 36 feet, and 39 feet ?—No, I will not promise that. I will not promise always to keep that depth. I have already said in answer to the gallant General that I think there may at the entrance, near where the piers are, be something of a bar, but that it will be always so low as not to produce any inconvenience. I have had a good deal to do with these harbour questions, and I have known numbers of cases where the bar has been completely removed. We have no bar now at Dover ; we have no bar at Great Yarmouth.

27,651. In the plans laid down in the report there is marked at the entrance, a very little outside of the pier, a depth of 39 feet ; do you think that in the course of 20 years that 39 feet may be reduced to 30 ?—I think it may, or to less.

27,652. Is there any chance of its being reduced to 25 feet in that time ?—I cannot say there is no chance.

27,653. No, nor probably in 50 years ?—50 years is a long while.

27,654. It is ; but these are questions of importance which I want to get answered. What is your opinion about 50 years ?—You must take off a few feet for 50 years, if you please. It is not a pleasant thing to be confined to figures in this way. The honourable member will see that when the piers are carried out the current of tide in front will be stronger, and the probability is that the depth, except just outside the piers, will not be decreased at all. Upon the whole I think it will be increased. There is no reason why it should not. But I expect that a small bar will be formed exactly outside the piers.

27,655. Do I understand you to say that in 20 years at this place, now marked 39 feet, the depth will probably be reduced to 30 feet ?—Yes, probably so. But will you allow me to add, after a moment's consideration, that at the end of 20 or 25 years it will have acquired a regimen, and have arrived at that state at which it will not decrease beyond.

27,656. Then you think that, although in the course of 20 or 25 years the depth may decrease to 30 feet, the tendency after that will be not to decrease further ?—Yes, that is my opinion ; at the same time not wishing to confine myself to the 30 feet.

27,657. Do you know any instance—I ask the question for information, being ignorant of engineering points myself—do you know any instance in which a bar has been formed under such circumstances, or is the tendency of carrying out piers, as a general rule, to carry the bar out with them ?—The general tendency is to carry the bar out with them, and to lower the bar at the end of the piers. But if you will allow me the general tendency of contracting the water within the piers, and letting it at the end of the piers go into an enlarged space is to increase the velocity within the piers, and when that velocity meets the force of the water outside, and is checked to form a deposit, if there be matter to deposit ; in other words, carrying out the piers is carrying out the bar.

27,658. Carrying out the piers is carrying out the bar, you say ; carrying out the bar ?—Yes, but not carrying out the bar to the same level as it was inside of the piers.

27,659. That is just the explanation I want, because many persons who will read the report are ignorant, as I am myself, of engineering matters ; what I was anxious to know was, what in your opinion the effect of time in decreasing the depth would be ?—I think I have answered that question in what I have said as to the depth at the end of 20 years. I look upon the Tyne generally, as regards life, as one of the most, perhaps the most, important rivers in this kingdom. I feel highly honoured by having charge of these works, which I do expect will be successful, and more successful if we are allowed to carry them out to the greater extent.

27,660. Now in this bar on the plan nine feet is marked, and there is one patch here marked 5½ feet ; what depth do you expect to have there after you have completed these piers upon the extended plan ; have you formed any idea ?—I have formed an opinion, I hope, and I have said, I think in the last report, that I expect to have 18 feet of water then.

27,661. Eighteen feet at low water ?—Yes, at low water.

27,662. And you expect to carry 18 feet of water all the way down from Peggy's Hole, down at low water ?—We expect to maintain that depth of 18 feet at spring tides all the way out, and increasing downward, the minimum being 18 feet.

27,663. So that the carrying out of these piers will give a depth at the entrance at no time less than 30 feet at the outer pier ?—Yes.

27,664. Will give you a channel of not less than 18 feet at low water spring tides where it is now bar at 5½ feet ; that is your opinion ?—That is my opinion. But I have said, and repeat, that it must be assisted at places by dredging. In that very place to which the honourable member has referred it must be dredged. I take it that the bar at the 5½-feet point is rocky, and must be assisted. And it is but fair to the hydrographer now in the room to say, that he

pressed very much to have that done, and I know that the Commissioners were very desirous to have it done; and a great deal has been done, but not so completely as it might have been.

27,665. If that be so, you will have by the extension of the piers a harbour which will be an efficient harbour of refuge at all times of the tide, sufficient for the large majority of vessels frequenting the north coast of England?—Yes, at all times of the tide.

27,666. And a harbour whereby those vessels at low water spring tides will be able not merely to enter within the limits of the piers, but will be able to run up right opposite to Shields, and above it, and find good shelter?—Yes.

27,667. And abundance of room to move?—Yes; but the abundance of room to move must depend upon the number of ships there.

27,668. I say abundance of room nevertheless, when you consider the large space there is. There is a large space there?—Yes; but will you allow me upon this point to refer to a paragraph in my report? "Mr. Wake, the harbour-master, states." But I suppose this need not be taken down?

27,669. Oh yes. I want it in evidence, and therefore I am asking your opinion as to the abundance of room?—I suppose it is the intention of the Commissioners to print my report?

27,670. But what I want is, to get down your answer upon the point in reply to my question on the minutes of evidence?—Then I will read the passage. Mr. Wake, the harbour-master, states in a letter now before me, "that the harbour of the Tyne above the "Narrows, with the additional space afforded by the "Northumberland Docks and the Jarrow Docks, is "capable of containing 2,000 sail of vessels, and that "before the opening of any dock in the Tyne he has "known 1,250 sail of vessels lying at one time in the "river, many of them being vessels that have sought "shelter in the Tyne from a storm."

27,671. Then you are aware, Mr. Walker, that there is increased dock accommodation going on in the Tyne?—Yes, I am aware of it.

27,672. And you will recollect that many of the ships which are now moored in the river will, when that accommodation is completed, be removed to these docks?—No doubt.

27,673. Consequently a great deal more space will be available for those vessels seeking shelter?—Unless the trade increases to a greater extent than the docks can accommodate.

27,674. Now, as you are aware, there is another bar called the Bar, which is marked 6½ feet and 7 feet. Do I understand your answer as to the depth to apply to that bar also; that you will have 18 feet of water there?—Yes, it applies to that also.

27,675. Then would you obtain the 18 feet at this point by dredging, or by the river going out?—I think the scour would do it, with but little assistance by dredging.

27,676. And you think it would not be necessary to use the dredge in any portion of the lower part of the harbour?—I think not much.

(*Chairman.*) The report only reached the Commissioners yesterday afternoon, and therefore they have not been able to master it.

(*Mr. Clayton.*) We have had it two or three days in the north.

(*Witness.*) It is brought up from Newcastle to-day.

(*Chairman.*) I mention the circumstance that you may understand that if the Commissioners are occasionally going over the ground traversed in the report, it arises from that report only having come to hand late yesterday afternoon. Although the manuscript report was read to the Commissioners just before you came in, for the express purpose of endeavouring to avoid going over the same ground, you will observe that under the circumstances it is not altogether possible to avoid doing so in some degree.

(*Witness.*) Generally, matters are more correctly stated in a report than in a *vivâ voce* examination.

27,677. (*Capt. Washington.*) Reference has been made to a plan that I gave to you in the year 1853 for the improvement of the Tyne?—Yes, reference was made to the evidence you gave.

27,678. You have that plan before you at this moment?—I have.

27,679. It appears from that that the length of the pier proposed to be constructed on the north side seaward has 930 feet, and that at the end of that a further length of 100 feet is proposed in the shape of a T head?—Yes, I dare say you are correct in the dimensions.

27,680. And on the south side that I proposed a groin or pier 1,900 feet in length?—Yes, coming out to near low water.

27,681. Going out to near low water?—Yes, over the Herd Sand.

27,682. At the time the evidence was given before you, had you the whole subject of a harbour of refuge in the Tyne under consideration, or merely that of the improvement of the entrance?—I cannot say that the question of a harbour of refuge was entirely before me, but rather the improvement of the entrance and the general accommodation to the shipping in the Tyne, but not certainly as a general harbour of refuge.

27,683. Mostly, like the large scheme now under consideration?—Certainly not.

27,684. Do you happen to remember what depth you contemplated obtaining at that time by the then proposed improvement?—No; I dare say I did not commit myself to any depth. If I did, it is in the report; but I do not like to commit myself to dimensions, unless I am called upon to do so.

27,685. You are aware that the plan that I laid before you had no reference to a harbour of refuge, but simply to a mode of deepening the harbour three or four feet?—Yes, that is evident from the plan.

27,686. To return to your large scheme, may I ask if a part of your plan is to dredge the river upwards as high as Newcastle Bridge?—It is not part of the estimate, nor any part that I have at all referred to, but I think it would be a very desirable thing to do it, and I believe the Commissioners are at work at it. I think in numbers of harbours that I could name, quite as much good has been done by regulating and deepening the river as by works erected at its mouth.

27,687. I observe you say in your report, "the "scouring effect of a large backwater for clearing an "entrance passage is another advantage." Do you consider that it would be desirable to carry the tide up, and to free the river Tyne from any obstruction which would prevent its upward flow?—I do.

27,688. And to allow it to reach its utmost limit?—Yes.

27,689. Do you consider it would be desirable to remove the obstruction of the old Town Bridge, if it could be done without great inconvenience to the population dwelling on the banks of the Tyne?—Yes, I think it would; and undoubtedly it could be done without any inconvenience to the inhabitants on the banks of the Tyne, by substituting a modern bridge with less obstruction in the piers than the present one.

27,690. Do you think that would be a great benefit to the navigation of the river?—It would be a benefit.

27,691. Are you aware that the present piers and starlings occupy 200 feet of the breadth of the Tyne opposite Newcastle, or about two-fifths of the whole space?—I dare say that is the case, but I do not know it of my own knowledge.

27,692. You think it desirable that these obstructions should be removed, and a more open approach substituted?—I think it would be very desirable every way. I ought to say that I am not engineer for the Tyne, but only to the piers, and I do not remember that I have ever been consulted with regard to the general improvement of the Tyne.

BIBLIOTECA DEL C.S.A.M.

LONDON.

Mr. J. Walker.

3 Dec. 1858.

Capt. Washington.

27,693. I would go on to ask, do you consider that the Tyne as a tidal river has ever had as full engineering skill bestowed upon it as might have been in case abundance of funds had been available?—I am not aware of the fact, one way or the other.

27,694. You will understand that the object of my question is not to throw blame on any individual connected with the Tyne; it is only to ascertain whether you consider that any tidal river in this country has ever been treated with full engineering skill; any river with which you are acquainted?—I think that would be too sweeping a denunciation. I believe that rivers generally have been treated properly, so far as the funds would go, and I have no reason to suppose there has been anything otherwise. I have no reason to suppose that in the case of the Tyne the funds of the Commissioners have not been expended properly. I consider Mr. Brooks their engineer to be a very clever man.

27,695. What I wish is to get your opinion, whether you think that improving the upper part of the river would not be very beneficial towards removing the bar?—Yes, I think so. But, you see, that never having been consulted, and never having looked really at the question professionally, my opinion is not half so good as your own. But with regard to harbours, there is one which the honourable Member for Tynemouth knows, and to which I have been consulting engineer for a great many years, namely, the Clyde. I cannot say the Commissioners of that river have not improved it, as far as the means at their command have enabled them to do so.

27,696. I am glad you have mentioned that. A great deal of dredging has been done there, has it not?—Yes, and a great deal is being done now.

27,697. It was stated in evidence, a day or two ago, that at Glasgow, owing to the establishment of contracting dykes in the river Clyde, there had been a loss of $2\frac{1}{2}$ feet in the rise of the tide. Is that a fact within your own knowledge?—I think I may say it is a fact within my own knowledge that that is not so; there is no loss of rise of tide at Glasgow, but the reverse. It is possible that at one time, when, in order to get a depth of water, the trustees, 60 or 70 years ago, under the direction of Mr. Gouldburn, contracted the width of the Clyde, they may have prevented the water getting up to the full height by the kind of wire drawing that took place at that time, owing to the narrowness; but what we have been doing for the last ten years has been to widen the river and make a nearly parallel channel of water from Glasgow downwards, for some miles, so that any restriction of the passage of water that took place formerly is in the way of being entirely removed, and the water now rises higher at Glasgow than it does at port Glasgow, and will do so more and more as we remove obstructions. At high water the river is one foot higher at Glasgow than it is at Port Glasgow. There is still a fall at low water.

27,698. The whole rise of the tide at Glasgow is as great as at Greenock at the mouth of the river?—Nearly so.

27,699. You consider that a desirable state of things to exist in a river?—Yes.

27,700. Do you think that would assist in keeping down a bar at the mouth of the Clyde?—I do not know that they have a bar.

27,701. Towards keeping the river deep?— No doubt.

27,702. Can you tell me the difference between the rise of the tide at Shields bar and its rise at Newcastle Quay?—I cannot at this moment, but it is recorded.

27,703. You are probably aware that the rise is 15 feet at Shields bar, and 10 feet at Newcastle Quay, so that there is a loss of five feet in the length of the river, which is about 10 miles. Is that occasioned by the water that goes down the river being kept up, or by the flood tide being kept down?—I am not prepared to say which. I only know the fact that it is so. Mr. Messent, the resident engineer, says that it is from the water being kept up. That could be very materially improved by dredging.

27,704. Would it not, as a consequence of that state of things, be most desirable to carry the dredging to Newcastle Bridge?—No doubt it would, and perhaps it would be necessary to renew the bridge for the purpose, because many of those bridges are not founded sufficiently low to enable you to deepen the river.

27,705. You are aware that the tide flows 10 miles above Newcastle Bridge?—From 8 to 10 miles.

27,706. You consider it desirable to encourage the tide upwards as much as possible?—Yes.

27,707. You mentioned that in some harbours which you have treated—Dover and Yarmouth, for instance—there is no longer any bar. Can you say to what chiefly you attribute that improvement?—I think I have stated that the chief cause of the improvement at Yarmouth is the regulation, improvement, and deepening of the river. At Dover the removal of the bar was caused, I think, entirely by the Admiralty piers, which acts as a groin, and keeps the shingle from coming from the westward in front of the harbour. The late Lord Warden, the Duke of Wellington, took a great interest in that matter, and was anxious that the pier should be made; but he was afraid that the valuable buildings to the eastward which front the harbour would suffer by preventing shingle going to them. We have not only got entirely rid of the bar, but we have plenty of shingle, in front of the harbour to protect them.

27,708. Considering that in this country the greater part of our harbours are at the entrance to tidal rivers, do you think it desirable that every effort should be made, both by the expenditure of money and by the exercise of engineering skill, to try to improve these rivers to the utmost?—Yes; that is my decided opinion. I consider that a harbour of refuge at the mouth of a commercial port, such as the Tyne is, of very much more value than if there was no communication internally with a harbour of commerce, because it is almost unnecessary to say, that when a ship comes into a harbour of the former class, she is in the charge of people who take care that she is attended to, and goes out as soon as possible. I have heard very offensive terms applied by a very large shipowner to harbours of refuge which were not in connection with a port of commerce; that is to say, that captains got into them, and you could not get them out again.

27,709. Do you know any river in which that experiment could be tried on a better scale or with a fairer opportunity of beneficial results than in the river Tyne?—I do not remember anywhere the advantage would be so great; because, as I have said already, it is a river of the very first importance in the country. The Thames and the Mersey, both of which I know very well, have obstructions at the mouth. The Thames has shoals at the entrance and the Mersey has a bar; but the loss of life and property is, I believe, much greater at the entrance of the Tyne than it is at the entrance of either the Mersey or the Thames.

27,710. It has repeatedly been given in evidence to us along the coast that the sailors will run for the ports at which the ships are owned; do you believe that to be the case?—Yes. I suppose that is a matter of fact that must be known to every gentleman. It is quite evident that owners must desire that.

27,711. And that, even if harbours of refuge were placed along the coast, and the masters of vessels thought there was a chance of getting into their own ports, they would run the risk of being enabled to enter them rather than run at once for a harbour of refuge?—Yes.

27,712. You believe that would be the case?—I do.

27,713. Do you consider that an additional reason for attempting to improve the Tyne to the very utmost?—Yes. I think those owners would receive

them back to their own ports with welcome, whereas if they heard that they were in any other harbour, they would find fault with them.

27,714. And it is your belief that the Tyne may be so improved as to make it, in a limited sense, a harbour of refuge ?—Yes. As Mr. Lindsay says, the sea area is so great, both within the piers and above them, that it becomes a very large harbour of refuge, if I am correct in the opinion I have formed as to the effect of those piers.

27,715. (*Capt. Sulivan.*) With reference to your last answer, I will put a question that was put to the engineer of the Tyne. Do you know any instance in which two piers thrown out on each side of the entrance of a tidal river have permanently increased the depth of water at the bar ?—Yes.

27,716. Will you mention an instance ?—I may mention Yarmouth and Newhaven.

27,717. I understood you to say that you considered that Yarmouth Harbour had been deepened by the arrangement inside ?—I said the channel.

27,718. Then that would not be a case in point to prove that piers alone thrown out will deepen a river ?—That alone would not do it.

27,719. Do you know any case in which piers alone outside of a tidal river on each side have had the effect of permanently improving the depth over the bar ?—I have mentioned Newhaven.

27,720. At Dover, I think you say the bar was removed by the travelling shingle being stopped by the pier on one side ?—Yes.

27,721. Suppose there was a south pier only at the Tyne, and that there was no deposit coming from the north, and that the south pier cut off the deposit from the south, would then the effect probably be something similar to what has occurred at Dover ?—No; the Dover pier, or rather the Dover breakwater, is at a distance from the entrance. There are two piers, and the Admiralty pier is a considerable distance away to the westward of both.

27,722. I quite understand what you mean, but I understood you that the effect of the pier to the westward of the harbour has been to stop the travelling matter along the coast, and therefore that it has allowed the current of the harbour to remove the bar, and has prevented any accumulation or silting up ?—In that case it is because all the movement of shingle is from the westward.

27,723. Suppose the movement off the Tyne to be from the southward and not from the northward, might not a single pier to the south have the same effect ?—It would not have the same effect, supposing there was one only, if any sand came the other way. It is evident it would if no sand did so, because there would be none to be shut off from the other side. If none came from the northward there would be none to be shut off by the pier on that side of the harbour, but the harbour would, in the absence of a pier there, be left entirely open to the north-east seas, as it is now, and there would be no extent of quiet water inside the pier.

27,724. I see that; but I was asking you especially with reference to the effect on the removal of the bar, and not with any bearing on the shelter of the entrance. The bar I see is immediately inside your first-designed piers, and the piers are near enough to the bar rather to increase the strength of the tide over it, and narrow the channel, and so cause an extraordinary strength of the tide over the bar ?—Yes.

27,725. Will you tell me how, if the piers are removed further out, you will have any stronger stream over that bar than would be caused by the inner piers ?—You would not as regards the bar, but you must take the depth of water that is on each side of the bar. If the bar were removed, the water could not be lower than you see upon the chart on each side of it.

27,726. I see 18 feet immediately outside the entrance in your first plan, and I presume that the effect immediately between the pier heads would be rather to deepen the water ?—It would rather shallow it outside.

27,727. Then if you had that depth inside by the stream of the tide, and the tide will not be any stronger over the bar by carrying the piers further out, how do you expect to get any deeper water on the bar with the enlarged plan than by the former plan, if there is no deepening by dredging ?—Because I consider that the whole of the space between the present bar and the proposed piers would become an inclined plane. There is nothing in the first plan that should cause the water to be lower than it is marked upon the chart; but if the piers were extended to the action of the tide or into deep water, I think there is no doubt that the depth of 18 feet between the present piers would be increased.

27,728. If you take the part of the bar where, on the chart, the word "bar" is marked, I see there seven or eight feet. You propose by your plan that the current of the river shall sweep away that bar to a greater depth ?—I expect that would be the case with the assistance of dredging.

27,729. Would there be any stronger current to sweep away the bar at that spot with the enlarged plan than would be given by the smaller one ?—Not any greater extent of current, but it would be carried into a greater depth.

27,730. The material carried away would be carried into a greater depth ?—Yes.

27,731. Therefore it would be a longer time before the accumulation at the entrance could become serious ?—I have said that in the course of twenty years I think a regimen would be obtained to meet that, and there would be no increase.

27,732. But though it is carried into a greater depth, how would it deepen the bar to a greater extent at the point where those words are marked upon the chart ?—By the action of the current upon it.

27,733. But if the current is no stronger in that part of the bar, according to the enlarged plan, than it would be with the first plan, how will the larger plan deepen the bar any more than a smaller plan would ?—Simply as I say, because the depth of water at the extended piers is greater than the depth at the inner piers.

27,734. Will you explain how the depth of water at the entrance will cause the stream further in to sweep away a deeper channel ?—I think the tendency would be to form an inclined plane from Shields—from the Narrows—to the outer piers. If the lower end of that distance is 39 feet in depth, and the upper end 18 feet, the tendency will be to form an inclined plane from the one point to the other; but if the outer end be only 18 feet in depth, the tendency would be to form an inclination from only 18 feet at the upper end to very little more at the point between the inner piers to which you refer.

27,735. If at any future time the accumulation of sand at the back of the piers should grow out to the pier heads, will not the effect be to reproduce the state of things that existed before the piers were built, and, as it were, to start afresh with a bar off a straight shore ?—I think not. There is a considerable depth of water inside at present. There is more at the very further end of the piers, and therefore if this present depth remains I do not expect that at that part there would be much increase of sand, if any. I think it possible it might be the reverse.

27,736. If the sand grew out to the pier heads, would not the action of the sand along the shore be as likely to bring the sand into the mouth as it was before there were any piers ?—I think it would not. Are you supposing the sand is brought out to the end of the piers ?

27,737. Yes; that the corners are filled up ?—Then I think it would not, for the reason that there would be a strong tide passing, and a strong current coming out of the river, which would prevent the sand being brought into the harbour. If the piers were constructed so that one should be shorter than the other, or no north pier at all, that might be the

LONDON.

Mr. J. Walker.

3 Dec. 1858.

Capt. Sulivan.

effect; but I think by carrying the piers out as shown upon the plan, the effect would not be so.

27,738. You said that you wished to see the 9-feet bar dredged away. Would the effect of that bar being deepened be, that a straighter and more powerful body of water would be carried down to the bar?—Yes.

27,739. The tendency would be to sweep away any sediment from the bar?—Yes.

27,740. If any obstructions have been removed inside the outer bar,—blocks of stones, wood, and things that cause something like another 9-feet bar further out, besides the deepening of the 9-feet bar,—may that not account for there being a little deeper water on the bar?—I do not mean to say that the tendency would not be what you say. I was not aware that any such operations had been performed, but perhaps you know that they have.

27,741. We had it in evidence that large boulder stones—I think, some large stones and fragments of wreck sunk solidly in the ground—had been got up to some extent immediately inside the outer bar, at the same time that the nine-feet bar had been deepened. I think they were got up somewhere outside the Black Middens, or abreast of it?—I do not know the fact of their being got up, but Mr. Messent has pointed out to me where the wreck was taken up, and it was abreast of the Black Middens, but out of the navigable channel, as shown here, and I do not think the removal of wreck at that place could have the practical effect you attribute to it, and which it would have if it were in the navigable channel.

27,742. Would not the removal of that at the same time as the deepening of the nine-feet bar took place have some effect in deepening the outer bar?—Yes, that would be its tendency.

27,743. I understand that both these things have been going on recently?

(*Witness.*) When was that done, Mr. Clayton?

(*Mr. Clayton.*) Within the last two years. The increase of depth has been taking place during the same period.

(*Witness.*) How long has the two feet increase of water on the bar been noticed?

(*Mr. Messent.*) Within the last year.

(*Witness.*) Both the operations you mention must have the tendency you describe. With regard to the movement of wreck, I do not think it would have a practical effect; and with regard to the other, it would depend upon the extent to which it was carried. It appears that the deepening of the nine-feet bar has been the work of two years, while I understand that the increased depth on the bar has not been noticed until within the last year.

(*Mr. Clayton.*) The harbour-master's evidence says that the improvement has not been completed until within the last year.

27,744. (*Capt. Sulivan.*) You say that ships naturally run for their own ports, and will persevere in doing so at some risk. I presume you allude merely to vessels bound to ports light, and do not mean that vessels bound south in cargo would run back to their own ports if in danger, in preference to taking refuge in a harbour that was on their road?—That would depend very much on the distance. Unless it is a considerable distance, I think they would rather endeavour to find their own harbour, particularly if it was, as I hope the Tyne may some day be, a harbour of easy entrance. But that is a matter which can hardly be called an engineering question.

27,745. But as you gave an answer to that question before, I wish to know clearly whether you suppose that laden colliers, with a harbour of refuge on their road, would ever run past that and run back to the Tyne rather than go into it?—It must depend on the distance, and whether the harbour of refuge was a free harbour; but I think, that generally speaking, the case would be as I have said. I do not mean to give more than a general answer,—not to give it in miles; but I think that that would be the case.

27,746. We were told in evidence that one of the reasons why they endeavoured to run back to their own ports, when bound north, was, that the men were engaged by the voyage, and that the quicker the voyage was the better it would be for them; would not the same reasons induce them, when bound south, to put into any port that would enable them to hold their own, if it was a safe port, rather than lose time by running back?—I do. To return for a moment the bar, Captain Sulivan read an observation I made with regard to the Sparrow Hawk, and the analogy between it and the work we have done on the north pier.

(*Capt. Sulivan.*) I did.

(*Witness.*) If he has no question to put on that subject, I shall suppose he agrees with me.

27,747. (*Capt. Sulivan.*) I will put a question on that subject. Am I right in supposing that from the Sparrow Hawk not having grown up or enlarged since the northern pier has been built, that the sand or other matter travels from the north, which was formerly cut off by the Sparrow Hawk, and is now shut out by the northern pier?—Yes; I meant to say that the northern pier forms a substitute for the sand upon the Sparrow Hawk.

27,748. Then it does collect the sand?—Yes.

27,749. That would rather imply that sandy matter travels from the north as well as the south?—Yes, there is some sandy matter.

27,750. Did you ever give any opinion upon what would be the probable depth of water to be obtained by your original plan?—I do not think I have.

27,751. Could you give us any idea what would be the additional depth of water obtained upon the bar by your enlarged plan, because it would be necessary to know the increased refuge facilities, independent of the outer area, that would be afforded to vessels by the extra outlay?—I have said, that the nearer point being 18 feet in depth, any part between that and the piers would not be less than 18 feet, but rather increasing outwards, and if so it would be more than 18 feet on the site of the present bar. I said I thought it might be done without dredging, and I believe so; but I do not mean to say that dredging may not be wanted to a certain extent in different parts; but if it is all sand, clean sand, it will not be so.

27,752. I quite understand you, but I should like to know what depth of water additional you would get by your large plan that you would not obtain by your small one; that is, what additional depth you would obtain by the increased outlay of 400,000*l.*, because we had it in evidence at Shields that the depth of water expected to be got by the smaller plan was 15 feet, and therefore, if that be the case, you see you would only get three feet more depth for your extra 400,000*l.*?—The three feet on the site of the present bar.

27,753. I am quite aware of that. But how much greater depth of water could be got into the Tyne, because that is the real test? If 15 feet of water was the proposed depth in the one plan, and 18 feet in the other, the extra 400,000*l.* would be really required to obtain the three feet additional. Am I right in that view?—You are right in saying you would only have three feet more, supposing the premises to be what you say. You have, then, only three feet additional upon what I call the site of the bar, but you have beside all the area outside of it of greater depth.

27,754. I distinctly said in my first question to you, leaving out of consideration for a time the area to be gained, and looking only to the main question, which is, the real depth of water that can be carried into the Tyne?—I dare say that is not far from the mark.

27,755. (*Capt. Vetch.*) Have you formed any opinion in what direction the sand travels along that coast?—No. I think that would be very much better got from the observations which the harbour-master and others on the spot have taken.

27,756. Do you think that there is much travelling sand?—Yes. There is a good deal of travelling sand from the south, but I believe comparatively little from the north.

27,757. I suppose you found that along the shore the sand generally accumulates in sheltered places? —Yes.

27,758. And that consequently the Herd Sand is merely a shelter for it, a quiet nook in which the sand can obtain comparative repose?—Well, the shape itself shows a good deal the cause of it. It travels from the south until it meets the water issuing from the river, and there it forms, as the plan shows, not in nooks, but rather on projections.

27,759. The contest between the water of the sea and the river water makes it accumulate in that form?—Yes. We have found already that the Herd Sand is lower.

27,760. In consequence of its being stopped?—Yes, with respect to the channel of navigation from the Narrows down to the Head in the last-proposed plan. The first obstruction seems to be that of the 9-feet bar, with which you are well acquainted. I am not so well acquainted with it. I know it existed, and that it is partly removed.

27,761. Do you know whether it is rock or boulders, or what materials?—Chiefly boulders, I believe.

27,762. Is there no stratum of rock there?—I think not. I do not believe there is any. I think it is boulder.

27,763. Presuming, as you say, that you are correct in expecting there will be a natural inclined plane in the new channel from the Narrows to the pier heads? —Yes, that is the most we can expect. I do not expect so much.

27,764. But still that would be the direction?—Yes, the tendency of it.

27,765. Then, under the circumstances, do you not think it would be a proper thing to see how far you can propitiate nature in forming that inclined plane, if immediate steps were taken to remove the 9-feet bar entirely, and if there are rocks, which I presume there may be, that they should be blasted out of the way at once, because as long as the bar remains to collect material or large stones it will always prove an obstruction?—I think it ought to be done, and that that has been stated.

27,766. Then between the 9-feet bar and the 12-feet line, are you aware of what the sand in that distance is composed, or do you know whether it has been bored?—I believe thatit has been bored by Mr. Brooks. I think it would be better upon this point to have his evidence. I believe he has carefully sounded and bored it.

27,767. Supposing that it happened to be hard blue clay, it could not easily be removed by the scour of the river in the incoming tide?—Certainly not.

27,768. If it is composed of blue clay, of which there is a very considerable probability, it would be necessary to dredge it in order to produce the inclined plane which you expect?—Yes.

27,769. Because so long as the hard clay remains there will be no improvement in the channel?—No.

I mention these things because I really think the Tyne Commissioners ought to apply themselves to it.

(*Mr. Clayton.*) They are doing so.

(*Witness.*) I believe they have done so. I think Mr. Brooks has soundings. Mr. Messent tells me that in the report I said that Mr. Brooks had bored upon the bar to 18 feet below low water, and found that it was all sand.

(*Capt. Vetch.*) Then he did not happen to put his borer upon two wrecks which were got out of the narrow channel.

(*Witness.*) Before leaving the question of boring, Mr. Messent reminds me that Mr. Brooks informed me that during the last summer he bored in four places in a straight line inside, outside, and upon the bar to the depth of 18 feet below low water, and found it to be all sand.

27,770. How many borings did he make?—Four. It had better have been 40.

27,771. What additional means do you expect for maintaining the entrance when the pier heads get out into deep water? I presume the extended area in which the tide flows and re-flows would be an element towards scouring out the entrance?—Yes, an element, but not a very important one.

27,772. Then as to the question of carrying out the pier heads into 40 feet water, when the original proposition was to carry them into 14 feet only, would not that circumstance be more favourable to the maintenance of a deep entrance, since to silt up one in 40 feet water would require so much more deposit, and so much longer time to silt up, than one of only 14 feet water?—Where the quantities depend upon the square? I do not understand you.

27,773. That is, that the amount of accumulation of sand and silt in the deep water to impede the entrance of ships to the Tyne, must be greater in quantity and much slower to grow up, than in shoal water?—I do not understand that as to the square, but we will suppose it to be so.

27,774. The quantity of matter required to dam up a deep entrance would be much greater than the quantity of matter required to dam up a shallow one? —Yes.

27,775. In consequence of which it requires a longer time to accumulate?—Yes; in addition to that, sand is formed at the entrance, or is deposited at the entrance, because it is travelling along only at a certain distance from the shore; but if the piers were carried out to a great extent, as proposed in the large plan, I do not see where the sand is to come from. I think we should have this great area free—clear of sand.

27,776. Supposing that there was some accumulation, I want to know, from the piers being thrown more into the tideway, the flow of the tide outside would not help to clear away the sand?—Yes. The force of the tide would be very much increased by carrying out the piers. We found at Dover, although the pier is not carried out a great way, the current of the tide is very strong at the end of the pier—more than double what it was before the pier was erected.

27,777. Does that not happen at every headland nearly?—Yes.

27,778. At Flamborough Head, for instance?—Yes; but there is perhaps a difference, because in the case of these piers the expansion is very sudden, and the tide comes up with considerable force until it sets near to the pier, and then it is carried off with considerable velocity.

27,779. An assumption has been entertained by some gentlemen, that carry out the piers to whatever extent you may—even to the middle of the North Sea, if you like—you will still have a bar, or at least some deposit there. Do you concur in those views? —No; I think the evidence I have given shows that I do not agree with them.

27,780. (*Mr. Coode.*) In answer to some questions which have just been put to you by Captain Vetch, you said that if the piers were carried out to the middle of the North Sea there would be no bar. In a paragraph of your report, at the top of page 2, it is stated "that the sand would be brought out to where "there is deeper water, and therefore the same quantity "of deposit would not produce a bar at the same height "as at present." By your present plan you do anticipate some bar, but that bar not so high?—I think I have said so more than once.

27,781. Still the answer which you have just given might lead to some misunderstanding. If you carry the piers out to the middle of the North Sea there would be no bar, you say. What I wish to know is, whether, according to your present proposition, you anticipate that there would be some bar?—I do.

27,782. And you also said that in a period, which we may assume to be 25 years, a regimen would be acquired. Have you formed any idea what depth you would then expect to have permanently at the entrance?—No. Do you mean what the height of the bar would be?

27,783. Yes?—I would rather not answer that question. I have said it would not rise to such a height as to be inconvenient to the shipping.

LONDON.

Mr. J. Walker.

3 Dec. 1858.

Mr. Coode.

27,784. Is the matter composing the present bar sea sand, or is it material brought down from the adjoining cliffs?—I consider it to be all sea sand; but the sea sand, for anything I know, came originally from the cliffs.

27,785. In your opinion does it come from the sea?—I think it does come from the sea, washed down, I believe, originally from the cliffs.

27,786. Do you think that any very considerable portion of it is composed of shell sand?—There are some shells.

27,787. Do you think that any part of it consists of gravel or *detritus* brought down by the Tyne?—No, I should think not.

27,788. You would think not?—No, I do not think so.

27,789. Have you examined it so as to enable you to speak of it?—No; Mr. Messent, the resident engineer, will give you all the information upon that point which you may want.

27,790. I did not know whether you had acquainted yourself with that fact?—I have acquainted myself with a good many things, and I have afterwards forgotten them.

27,791. It was given in evidence before us, a day or two since, that the more the mouth of a tidal river partakes of the character of an estuary, the less chance there is of the formation of a bar. Do you concur in that opinion?—I am not prepared to give an opinion upon the point, for I do not quite understand what it means.

27,792. That the more the mouth of a tidal river partakes of an estuary character, the less would be the chance of the formation of a bar. Such was the evidence that was given to us only two or three days ago, and I would wish to have your opinion upon it. The Severn and the Thames were quoted as instances of the mouths of rivers partaking of the estuary character?—The Severn was named as one?

27,793. Yes?—Then I should say yes, now that I think I understand the question.

27,794. In such cases there would be less probability of the formation of a bar?—Yes.

27,795. In that case, as the shores at the mouth of the river would expand, and as your piers the shores would close together, I would ask you whether the form you have laid down for the improvement of the Tyne would not be opposed to the character of an estuary?—I do not regard it in that light at all.

27,796. The estuary character being considered to be that wherein the shores extend as they advance seaward, or, in other words, in a bell-mouth shape, your piers are the reverse of that. As you have already said that the bell-mouth shape is less liable to cause the formation of a bar, I wish to ask you whether you have not adopted in these piers the reverse of the principle which you seem to agree with other witnesses in thinking would be less likely to form a bar?—There is no parallel between this case and the instance of the Severn. It is a pity the Commissioners should be misled by any answer I could give to the question—and any answer which I might give might mislead them—for in referring to the Severn you refer to a river which is many, many miles in length, and which widens by degrees. That is quite a different thing, surely, from piers erected at the mouth of a river enclosing a portion of the sea, as is the case at the Tyne.

27,797. Am I to understand you to say that it would be an improvement in these plans if the entrance was made of an estuary shape? I am not saying whether it would or would not be an improvement, but I am merely calling your attention to the fact that the evidence of a gentleman has been given before us approving of that principle in which you appear to concur. I then see that your piers are in opposition to that principle, and I ask if you can give us any information which may tend to reconcile the two?—I do not think that the two want reconciling. I do not want in anything that I may say to refer to such a case as the Tyne, but I refer to the Severn, which is a river of a great many miles in length.

27,798. Still the principle is the same, whether it be large or small. It involves the question of a bell-mouth or of a mouth which gradually contracts as you go seaward; which is the best of those forms?—My opinion is that in the case of the Tyne to have made the piers bell-mouthed would have been a mistake. I think I said so in answer to a question from Sir F. Smith at the very commencement of my examination. Perhaps you will upon the plan mark the bell-mouth to which you refer.

27,799. I was asking as to the general principle. I mean, as to the application of that general principle to the case of the Tyne, if you will show me what you would consider to be a bell-mouth.

27,800. (*Mr. Coode having sketched in pencil some forms upon the plan, exhibited them to the witness.*) I do not refer to these precise lines here, but to the question of general principle. From your large experience I now ask you kindly to give us your opinion upon this point?—My opinion upon the lines you have drawn is, that that form would render the entrance much more open to the sea than it now is, and that a shallow bar would be apt to be formed where I have marked it inside the bell-mouth which you have marked upon the plan.

27,801. You still think that form of mouth would be liable to the formation of a bar?—I do, and that it would be more exposed to the sea.

27,802. My question referred rather to the formation of a bar than to the exposure to the sea?—I think all the space near the end of the expanded wall would be shallow water.

27,803. And there would be a greater liability to the formation of a bar than there would be with the piers which you have laid down here?—Yes; but as you are a professional man, it would be very satisfactory to me to know whether you agree with me.

27,804. I am not giving any opinion at this moment, but am simply asking for the sake of information?—The general inference that I should draw would be that you differed from my opinion upon the subject.

27,805. I am asking for information, in order that we might compare your evidence with that of a gentleman which was given before us two or three days ago, wherein he said, that the nearer the mouth of a river partakes of the character of an estuary, the less probability there would be of the formation of a bar at the entrance?—That is in the case of the mouth of a river. Now, this is not the mouth of a river. The gentleman's evidence would apply probably to the river from Shields upwards, and not to a space like this, which is entirely outside the river.

The evidence had reference to the mouth of a river, strictly so called, and it was laid down as a general principle, and it was assumed that the same principle would hold good in the case of the Tyne as he conceived it would apply elsewhere. It is a question of principle, and as such it is very important, and I should wish very much to obtain your opinion upon it.

27,806. Is there any tendency towards the formation of a bar at Dover during the long continuance of easterly winds?—No, there is not.

27,807. Is not the Admiralty pier at Dover on the west side of the harbour?—Yes.

27,808. Are you able to say that during the long continuance of easterly winds there is no tendency to the formation of a bar?—I meant to say that there has been none.

27,809. You said that you thought the effect of the construction of the piers at the Tyne would be that the Herd Sand would go away altogether?—It looked as if it would. I would not say I should be surprised if it did not, but I think the tendency would be to diminish and to go away altogether. After we have constructed the piers according to this plan, I can't see that there is any sea sand to come in, and the question is, therefore, whether some of it will not go away. There will be

none to come in, and if any movement takes place, some sand must be carried out.

27,810. You think that after the completion of these piers there will be no tendency of the sand to come into the Tyne ?—Well, I do not see where it is to come from.

27,811. Is it or is it not a fact that sand has been growing up on the south side of the south pier ?—It is.

27,812. And advancing as the piers advance ?—Yes, to the extent which I have stated I think it will. I have said also that a time may come when it will go round the end of the pier, but I think the ebb tide and the effect of the cross current on it will prevent any of it going into the harbour.

27,813. You said, I think, that the material would not travel at more than a certain distance from the shore ; in what depth of water do you apprehend the sand will move, and at what depth will it cease to move ?—I gave a general opinion, but I should not like to give it in feet or inches.

27,814. You would not like to define any limit ?—No.

27,815. The velocity at the ends of these piers will, I presume, be affected by the depth of the water which may permanently be found to exist there ; the rate of tide will be affected by the depth ; I wish to ask you a question, in consequence of a query which Captain Vetch put to you, wherein the ends of the piers were compared with Flamborough Head ; do you not think that the rate of the tide will materially depend upon the depth of the water existing there ?—Yes, it will depend upon what is the depth of the water, but I do not think a great deal. I do not think so for this reason, it has all the North Sea to supply it, and probably the greater the depth of the water the greater the current of the tide.

27,816. Presuming that material does accumulate at the south pier, when the water shallows the rate of the tide will not be so great ?—I do not think that will practically affect it one way or the other, the quantity of the sand is so very small.

27,817. Would a line drawn from the end of the north pier to the end of the south pier, as designed on the plan, be nearly in the general current of the coast tide ?—Nearly so.

27,818. At any rate, practically ?—Yes.

27,819. Are you aware of a proposition that has been made to improve the mouths of tidal harbours by the construction of what may be called island breakwaters in front of them ?—Yes, I have heard of a proposition by Mr. Glover of that kind.

27,820. Have you formed any opinion upon that plan ?—Well, in respect to Mr. Glover's proposition, I do not think, from what I could learn of it, that the time of the Commissioners would be taken up to much advantage in discussing that plan.

27,821. Still, the improvement of the mouths of tidal rivers is a very great and important question ?—I come here to speak of the Tyne, you will remember.

27,822. But if the Commissioners desire to obtain your opinion upon this point, would you have any objection to give it to us ?—I could have no possible objection to do so, but I would rather not commit myself either for or against Mr. Glover's scheme. It was intended at one time to have an island pier in front of Kingstown Harbour ; I have such plans brought before me daily. There is one, I think, just now for an island pier in front of Alderney.

27,823. Mr. Glover's proposition has reference only to the entrances to tidal rivers, and not to the enclosure of bays ?—Plymouth breakwater and that at Cherbourg are island piers, are they not ?

Plymouth breakwater can scarcely be said to be at the mouth of a tidal river ; it is at the mouth of a large bay, into which two tidal rivers empty themselves.

27,824. (*Sir F. Smith.*) I think you said the beach accumulated at the back of the western space of Dover New Harbour ?—Yes, it does, but not so rapidly as I could wish it to do.

27,825. Can I have been misinformed, if I have been told at Dover, a short time back, that there was not sufficient shingle there to make up the concrete with ?—No; the fact is so.

27,826. Do you imagine that that pier has had any effect in removing the shingle from round Sandown Castle, the base of which is exposed to the beat of the sea ?—The Admiralty pier ?

27,827. Yes.—No, not at all. The quantity is so small that is accumulated. The shingle is all caught which used to travel along the coast past Dover,—is all caught away to the eastward by Folkestone and other erections to the westward of Folkestone, so that we get none at Dover scarcely.

27,828. That corresponds with my view of the beach being taken away, even from Sandown Castle to the eastward of Deal. The Marine Parade at Dover is almost denuded of its shingle in front, and the shingle that was there has been removed by there being no fresh supply from the westward ?—It is in a very good state ; I have no reason to complain of a want of shingle in front of the Marine Parade.

27,829. (*Chairman.*) As I understand it, the normal state of the entrance of this harbour some 20 years hence will be a depth of about 30 feet water ?—I guessed it at that.

27,830. More or less, you mean ?—Yes.

27,831. In heavy gales of wind on shore would you expect the sea to break outside the mouth of the harbour in that depth of water ?—I should not.

27,832. From the observations you have made on the Tyne, which has been under your notice for many years, would you expect any sea to break in the harbour's mouth ?—I do not expect that it would in that depth of water.

27,833. From the form of these piers, which I may say have some resemblance to the bow of a ship, would you expect any reflex sea,—any back sea from the piers,—which would occasion a bad sea at the harbour's mouth, or would you anticipate that it would be a fair sea there ?—I think the sea opposite to the entrance would be a fair sea, but on the other side, on the oblique face, there would be a rebound.

27,834. But that rebound, from the peculiar form of the piers, would not affect the sea which runs into the harbour ?—Practically, I think not.

27,835. And this form is favourable to the sea continuing a fair sea ?—That is my opinion.

27,836. Do you consider this form for the piers is more favourable than if they were flatter ?—I think, if there was any return at all, the sea would be still fairer, but its force would not be so likely to be shut off from the inside, and therefore I think that, practically, that would be a fair sea. I do not think a contraction would assist the fairness of the sea, if I may use that expression.

27,837. I think you misunderstood my question. Supposing that the pier heads, instead of being curved, as shown in the plan, were brought squ: re across, as I have pencilled it on the chart, what would be the effect upon the sea running in at the entrance of the harbour ? Would it be more or less favourable ?—I don't think it would be more favourable. I should expect, rather, that the sea, coming obliquely upon the square face you have drawn in the sketch, would pass off and rebound so as to interfere with the entrance more than the line I have drawn would do.

27,838. Therefore, you think the sea would not be so fair as in the entrance which you propose ?—It would be more interrupted, more interfered with, I think ; more what we call a cross sea.

Saturday, 4th December 1858.

PRESENT :

Admiral Hope (Chairman).

Sir Frederic Smith.	Captain Sulivan.
Mr. Lindsay.	Captain Vetch.
Captain Washington.	Mr. Coode.

Mr. Evans, Secretary.

Mr. James Abernethy re-examined.

LONDON.

Mr. J. Abernethy.

4 Dec. 1858.

27,839. (*Chairman.*) Mr. Abernethy, it was arranged that when you came here again this morning you should take consecutively each plan that you have handed in, commencing with Fraserburgh, and make such statements respecting each as you might think necessary ?—I so understood the arrangement, and will commence with a few brief remarks respecting the port of Lossiemouth.

27,840. Have we more than one plan ?—I handed in one plan, showing the nature of the intended construction, which you have now before you, I have reduced the scale recommended by the Commissioners, and though it is small it is quite sufficient. The port of Lossiemouth at present consists of an outer basin, of 1 acre and 3 roods, and of an inner basin and new basin together of 2 acres. The entrance to the harbour of Lossiemouth is exposed to the action of the north-east seas ; and, in order to remedy the great range arising from those seas within the harbour, it is proposed to extend a breakwater beyond the northern pier for a length of 420 feet, as shown on the plan, sheltering the pier on the south side, connected with a railway which leads from the Great North of Scotland railway to Lossiemouth, with the view of making the harbour at Lossiemouth a station for a steam ferry across to the opposite coast. That has been a great desideratum with the directors of the railway for a considerable time, but from the unsheltered state of the harbour they found it impossible to carry out their views. The breakwater shown upon the plan is to be constructed of timber and rubble work, and the estimated cost of that and the pier which it shelters is 13,920*l.* I am of opinion that, if this pier be erected, sufficient shelter will be afforded for a steam-vessel capable of making the passage to the ferry on the opposite coast. Lossiemouth harbour is also a place of considerable trade in connexion with the herring fishery, and I have no doubt that the breakwater would afford great additional shelter for the herring boats in stormy weather. The present area is not sufficient to accommodate these boats, but by the extension of the breakwater considerable additional shelter will be afforded. Numerous wrecks occur in the neighbourhood of Lossiemouth, arising from the projecting rocks called the Scars, which extend a considerable way into the Firth of Forth, and vessels caught in north-east gales along the shore from Lossiemouth to the mouth of the Firth, in endeavouring to run up to Inverness for shelter, have been wrecked on the Scar rocks immediately to the westward of Lossiemouth. If the breakwater in the plan is constructed, the probability is that a portion of the vessels would be able to take the harbour during these gales ; and the directors of the railway, who are also the commissioners of the harbour, propose to excavate a new basin, and thus materially increase the area of the harbour within the shelter of the breakwater.

27,841. (*Sir F. Smith.*) You state that the wrecks at Lossiemouth take place on the rocks to the westward ?—Yes.

27,842. Do you imagine that they arise from the difficulties of the navigation at some particular spot, or from the efforts that are made to obtain shelter ?—I believe they arise from the difficulties of the navigation, and from the fact that in north-east gales the harbour is a difficult one to make. The danger arises from the projection of the Scar rocks to a considerable distance, two miles altogether, immediately to the westward of Lossiemouth, and if vessels have not a good offing at that point for a run up the Firth in north-east gales, they are wrecked upon these rocks.

27,843. There is a shelter now afforded by the headland, is there not ?—A partial shelter.

27,844. What depth of water would you get into the harbour by your proposed arrangements ?—There would be a pier beyond the projected breakwater, and there would be a depth of 13 feet at low-water spring tides.

27,845. At the entrance ?—Yes.

27,846. Would that extend to the full length of the docks ?—It would extend about 300 feet, the present depth is only 4 feet at spring tides.

27,847. How do you deal with that ?—There is a pier proposed to the south under shelter of the breakwater, and it is intended that a steam-vessel, in connection with the ferry traffic, shall lie there.

27,848. You do not propose to give much shelter ?—Except at high water, when the ordinary class of vessels are always entering.

27,849. How many could you accommodate then?—Assuming eight vessels to the acre, which I think a moderate calculation, for vessels lying in harbour, there would be room for thirty-two vessels in the new basin.

27,850. Vessels of what tonnage ?—The general class of coasters, about 100 tons.

27,851. At the present moment they can get in, I believe ?—Yes. There is a considerable trade in connexion with the railway, and vessels of 200 tons can enter the harbour. We are about to enlarge the harbour. A contract has been entered into, and arrangements have been made for extending it.

27,852. Unconnected with the breakwater ?—Yes, unconnected with the breakwater.

27,853. Then the breakwater merely gives a certain facility of entrance in north-east gales ?—Yes.

27,854. Will it not be exposed to the east winds ?—It will ; but the sea with an east wind is not so heavy as with a north-east wind.

27,855. Do you know the number of fishing boats at Lossiemouth ?—I do not ; but I believe a statement will be put in.

27,856. (*Capt. Sulivan.*) Is it the case that the new works in the old harbour have quite failed to answer the purpose for which they were erected, and that the depth of water at the entrance and inside has decreased, and is in fact less than was anticipated ?—No, it is not. I have examined into that matter very carefully, and I find that there is no decrease in the depth of the harbour. In fact the bottom of the harbour is rock, and I find that rock quite bare and free from any sandy deposit.

27,857. I believe the outer harbour is comparatively new work, added to the former harbour ?—Comparatively new. That is to say, the end of the north pier is comparatively a recent work.

27,858. Is it the case that this harbour has failed to realize the anticipations that were entertained, and that boats in the outer harbour are not so safe as it was supposed they would be ?—At present, in north-east gales the boats are not safe, and one of the great objects of the extension of the breakwater is to remedy that evil.

27,859. Could you, as an engineer, put forward this plan as in the slightest degree providing a harbour of refuge for passing ships ?—No ; I do not treat it as a harbour of refuge for ships. I should say that a few vessels might attempt to enter the harbour in

north-east gales, if compelled to do so, with much greater safety than at present. But I do not put Lossiemouth harbour forth as a harbour of refuge in a general sense. The plan is intended more to provide local accommodation than anything else.

27,860. (*Capt. Vetch.*) Are you well acquainted with the south coast of the Moray Firth?—From Burghhead to Troup Head?

27,861. From Banff to Burghhead?—I am; I have been there repeatedly.

27,862. Are you aware that it is a very shoal shore, generally speaking?—Generally speaking it is, and the shoal extends considerably beyond low-water mark.

27,863. It is a shoal coast, and very rocky, generally speaking, along that coast?—It is.

27,864. Are you aware that in north-east gales the sea breaks very heavily there?—It does.

27,865. Amongst these rocks?—Yes; I think it the most dangerous part of the coast in north-east gales.

27,866. And there is a great loss of life?—Yes, I am quite aware of it.

27,867. Will you tell me the particular object of the work now proposed?—It is chiefly local. The principal object of the extension of the pier is to afford accommodation to passage steamers in connexion with the railway. At the same time, no doubt, it will materially lessen the range within the outer harbour, which renders it dangerous for the herring boats to be there in stormy weather.

27,868. Are you aware that at Banff, and in the little harbours along the coast, Mr. Bremner used immense blocks of stone, coupled with iron clamps, and that the quantity of stonework was very large?—Yes.

27,869. And that notwithstanding all this the break of the sea, in comparatively shoal water, was so violent that the stones were disrupted, bars and all?—That is the case at Banff. I reported upon the state of that harbour, and am aware of the fact. The stones are large blocks, bound together with iron bars, and are constantly torn out in heavy gales.

27,870. I think you said, that it is proposed to constitute a ferry between Lossiemouth and Little Ferry on the opposite coast?—Yes.

27,871. Would that make the communication considerably shorter and more commodious?—No doubt. Through a considerable portion of the year it would be a great boon to the inhabitants of the north part of Scotland.

27,872. Are you aware that it has long been desired in the district?—Yes, and a company was formed at Elgin to carry it out. They were about to contract for a steamer of a superior class, but I advised them to wait, and extend the pier so as to enable vessels to enter.

27,873. What is the distance from Lossiemouth to Little Ferry?—I am not aware of the exact distance.

27,874. It seems, looking at the chart, to be about twenty-six miles?—I believe it is between twenty and thirty miles.

27,875. If the ferry did not exist, what distance would it be to go round by land?—You must proceed to Inverness and round the whole north coast of the Moray Firth. I should think it would be upwards of 70 miles.

27,876. The people in that part of the country consider it a great boon to have that accommodation?—They do. There is a very fine agricultural district to the north of the Moray Firth, and a great quantity of cattle could be sent across that would otherwise have to go round by Inverness.

27,877. You think an additional breakwater would be sufficient for the steamboat?—I do.

27,878. Would it in any way tend to preserve the boats and the fishermen?—It would. At present the harbour of Lossiemouth in the fishing season is extremely crowded, and in north-east gales the boats have great difficulty in getting under shelter.

27,879. Is it not the fact, that a little to the westward it was proposed to make an entrance for that purpose?—It was proposed to make an entrance there.

27,880. Can you tell me why the intention was abandoned?—The entrance was originally designed by myself and Mr. David Stephenson. After the Bill had passed through Parliament, I received a representation from the Commissioners that the ground at the entrance was extremely foul; that it was rocky ground. I made an examination of the ground, and found that we had made a mistake, and that the ground was very foul.

27,881. Was rocky?—Yes, and that it was impossible to form an entrance at the site which had been selected.

27,882. The position of the present harbour you conceive to be more appropriate?—It is the only clear ground. There are no rocks lying to the north-east or east of the entrance.

27,883. It will afford accommodation to the steamer?—It will.

(*Mr. Coode.*) As this appears to be matter of local convenience, more than a question of refuge, I do not think it necessary to ask any question.

27,884. (*Capt. Sulivan.*) Are you aware, Mr. Abernethy, that the Board of Scotch Fisheries are just about to make a harbour of refuge on that coast to meet the very wants you have described?—I have heard it so stated.

27,885. (*Chairman.*) Where is it to be? You mentioned this the other day, do you know the place?—I know the whole coast. It is about there (*pointing to a place on the chart*).

(*Capt. Sulivan.*) Mr. Stephenson has made a report, with drawings and a plan.

27,886. (*Chairman.*) The harbour at Lossiemouth would not be at all available, even as a small harbour for the smaller class of coasting vessels?—No. The outer part of the harbour we propose to devote to ferry purposes, and could not appropriate it to coasters.

27,887. It would not be available for them?—It would not; but it would, no doubt, shelter materially the inner harbour, and the boats lying there.

27,888. But the small coasting vessels could not come in at all?—Not as into a general harbour of refuge.

27,889. Will you now proceed with your statement relative to Fraserburgh?—I produce a plan of Fraserburgh, reduced to the scale required by the Commissioners, showing the extension of the present pier. Originally my design was simply to extend the pier, so as to afford shelter to the existing harbour for local purposes. It was then further proposed to extend the length 1,500 feet, so as to enable vessels in limited number to take shelter there at low water; and subsequently it was proposed to extend the distance to about 1,500 yards seaward, with a view of forming, not a local harbour of refuge, but a general harbour. On the plan I have shown the extension of the breakwater 1,500 yards. There you have a sheltered anchorage within the eastern line, as shown in the margin. I presume I need not recapitulate my evidence in favour of Fraserburgh?

(*Chairman.*) No. We have gone into the matter very fully.

27,890. (*Capt. Vetch.*) The ground inside the breakwater is clean ground?—Yes.

27,891. And good holding ground?—Yes. I think that was distinctly proved before the Commissioners. I perhaps may be allowed to allude to the estimate. The estimated cost of the first section, the 1,500 feet, I stated would be 80,000*l.*, and that the extension to the full length of 1,500 yards would cost about 400,000*l.* I have, since I made that statement, gone more closely into the matter respecting the quantities of the work, and I now put down the estimate at 375,000*l.*

27,892. (*Sir F. Smith.*) Is that on your new principle of construction or on the old one?—It is with the view of forming a stone breakwater, using

LONDON.

Mr. J. Abernethy.

4 Dec. 1858.

the medium which I have brought before the Commissioners to some extent, modified considerably from the circumstances of the case. The rise of tide and the depth of water being less than at Swansea, the difficulty would be still less.

27,893. (*Mr Coode.*) Have you a transverse section showing the mode of construction?—I have not. I have taken a section of the present pier, assuming that it would be carried out on the same line.

27,894. Will you describe as shortly as possible the sort of section you propose to adopt at Fraserburgh, unless you prefer sending it in?—If the Commissioners desire it I will send in the section. Perhaps the better course would be to do so.

27,895. Have you examined the bottom very carefully? Of what does it consist?—Clay, with sand above.

27,896. Have you probed the bottom to any depth, or do you merely judge from superficial results?—I have not made any borings, but I have probed and examined sufficiently to satisfy myself that there are no rocks, and all the nautical evidence shows that there are none.

27,897. What length of time do you think would be required for the completion of the length of 1,500 feet?—The period I originally proposed was three years.

27,898. And what period for the 1,500 yards?—I cannot say exactly. I may be prepared to state that, and send it in with my report on the Swansea case.

27,899. In sending in the transverse section you will perhaps state the length of time required for the construction of the 1,500 yards?—I will do so.

27,900. (*Chairman.*) What is the next harbour to which you wish to refer?—The next is the harbour of Aberdeen. I have upon the plan laid down a breakwater, with the view of making the harbour of Aberdeen accessible under any circumstances of wind or tide. The harbour at present is exposed directly to the action of south-east gales, and the existing breakwater being in a line with the present north pier head, affords no shelter whatever immediately at the entrance, but, on the contrary, tends to create a very heavy cross sea at that point. I have long been of opinion that by constructing a breakwater from Shortness point, about 1,300 feet further seaward, the entrance at the pier head would be rendered safe under any circumstances, and as Aberdeen harbour is a capacious harbour, and capable of affording a great amount of shelter when vessels are once within it, I conceive such a work would be of great public benefit. The port of Aberdeen is situated in the bight of a great bay, Buchan Ness Point bearing about north-east by north from the port of Aberdeen, and there is a long straight shore to the south; so that if vessels are caught in east gales in the bay of Aberdeen, unless they have a very considerable offing they cannot weather Buchanness point, and must run all the way back to the Firth of Forth for shelter. Vessels generally prefer running to the Firth of Forth to running for the Tay. The Tay is dangerous.

27,901. Will you state why?—It looks good on the chart. There is at the mouth of the Tay a bar and a considerable swell arising from the action of the outgoing current and tide, so as to create an exceedingly heavy cross sea there. Although I have not personally surveyed the mouth of the Tay yet I know from common report, and having lived so long in the neighbourhood, that it has always been considered a dangerous harbour to take. As I have before stated, unless they have a considerable offing in an east gale, they cannot weather Buchan Ness Point to the north, and it is doubtful whether they can succeed in reaching the Firth of Forth to the south, for they have a long straight shore between these points.

27,902. Does that conclude your observations?—I have estimated the cost of the breakwater at 75,000*l.* Its length is 400 yards.

27,903. On what system would the breakwater be constructed?—I might, to a limited extent, use the system I propose for Swansea, but of course varied with the circumstances of the case, and the different class of material with which I have to deal. We have an abundant supply of granite at Aberdeen.

27,904. What depth of water will you have at the pier head at low water?—There will be 5 fathoms at low water and spring tide at the point of the pier, covering about 13 acres.

27,905. And that 13 acres would be refuge?—Until there was sufficient depth of water between the pier head to enable vessels to go into the harbour. I have seen vessels riding at the point immediately within the site of the proposed breakwater. I recollect one London schooner arriving with passengers, and riding there 24 hours until she sank, the holding ground is so good.

27,906. Would you propose to retain or remove the old south breakwater?—I should propose to remove the breakwater and allow any sea that came in to expend itself on the beach. The object of the old breakwater was to protect the works at the north pier during their progress, and was never designed for a breakwater in the proper sense of the word.

27,907. (*Sir F. Smith.*) How long will it take to complete this breakwater?—I think it might be completed within a period of two years.

27,908. What am I to understand is the present depth at the entrance at low water spring tides?—The depth is 9 feet 6 inches at low water spring tides.

27,909. Will the breakwater make any difference in the depth of the water?—It will not affect the existing depth of the water, but a great additional depth has been obtained in Aberdeen harbour by dredging, and that process may be followed up to a considerable extent.

27,910. To what extent?—I think an additional 5 feet in the centre of the channel might be obtained, without at all risking the stability of the pier.

27,911. That would give you 14 feet?—Yes; 14 feet at spring tide.

27,912. That is all you expect to get?—Without risking the north pier, or rendering it necessary to spend money to secure the foundation of that pier.

27,913. If you were to do that could you get 19 feet?—I am of opinion we could.

27,914. Are there any obstructions of any kind before you come to the pier head?—No; the bed is composed of gravel and large stones. These we are constantly removing and thus deepening the harbour.

27,915. There is no bar?—There is no bar, no ridge in the proper sense of the word. It is a continued inclined plane down the channel seaward.

27,916. Is there any shifting of the sand along that part of the coast?—No, it is exceedingly permanent. In the condition of things at Aberdeen I have not observed any great variation.

27,917. Then this is an instance of a tidal harbour where there is no bar at the mouth?—Yes; this is an instance of a tidal harbour without a bar at the mouth. A bar formerly existed, and I attribute its removal to the prolongation of the north pier sufficiently far seaward to bring the matter which comes down the river in floods within the influence of the tidal current of the ocean, which sweeps round the point to the south.

27,918. Does the tide run to the north or south?—The flood tide, of course, from the north. The south tide is deflected considerably off by the point. There is a great extent of sandy beach from Aberdeen nearly to Buchan Ness Point, and north-east gales tend to bring that down to the harbour at Aberdeen. But we do not find that low water immediately to the north of the north pier has extended seaward. We have found no difference as regards the low-water line.

27,919. Then you imagine that any material coming from Buchan Ness Point passes with the tide beyond the mouth of the harbour?—It does; we find no deposit within the harbour.

27,920. But still it does pass along from north to south ?—Yes.

27,921. That you have no doubt about ?—None.

27,922. If it be so ; if it passes from north to south would not the breakwater arrest it in the angle ?—I should propose to have a slight opening, which is not sufficiently shown on the plan, between the end of the breakwater and the foreshore. The breakwater extends beyond Shortness Point.

27,923. Do you think an opening there would carry off the whole of the material ?—I think there would be a strong tide running past which would tend to remove the material.

27,924. Do you not think that all these little irregularities along the coast are filling up ?—We do not find that to be so.

27,925. Because the materiel passes with the tide ?—Yes ; it is all bare rock without any sand.

27,926. (*Capt. Vetch.*) What depth of water will the proposed breakwater give for vessels to enter at low water ?—Immediately within the breakwater there will be a depth of 5 fathoms.

27,927. Will that accommodate vessels of any magnitude ?—Large vessels arriving at low water which could not enter the harbour proper might take refuge under the breakwater, and pass into the harbour at high water.

27,928. In the present state of affairs how many feet have you at low water ?—9 feet 6 inches at low water spring tides.

27,929. Then a large vessel cannot get in at low water ?—She cannot.

27,930. Are there any other impediments to vessels entering ?—In south-east gales it is an exceedingly dangerous harbour to take. The sea is so heavy between the existing breakwater and the north pier that in south-east gales vessels lose steerage way, and are driven to leeward. No less than three large steamers have been wrecked on the north pier. Even steam-power does not avail them to pass the cross sea.

27,931. Does it often happen that vessels bound to Aberdeen are unable to get inside ?—Yes.

27,932. To get under shelter ?—Yes.

27,933. In that case, where do they run to ?—The general rule is to beach to the north. When they cannot do any better they are obliged to go on to the beach.

27,934. Can vessels get out at low water ?—Large vessels cannot get out ; smaller vessels can.

27,935. Do you think the proposed breakwater would completely qualify or rather supersede the present inconvenience ?—I have no doubt it would. I have no doubt that at high water vessels might pass in under any circumstances, and that at low water they might take shelter and pass into the inner harbour when there was sufficient depth ; and, as we have a floating dock of 30 acres, we can accommodate a great number of a large class of vessels.

27,936. What do you say the cost would be ?—75,000*l.*

27,937. (*Mr. Coode.*) I think you say you could obtain a depth of 14 feet at low water spring tides without endangering the safety of the existing pier ?—Yes, I think so.

27,938. What do you imagine would be the cost of dredging the channel from the entrance between the piers up to the point marked North Capstan on the plan ?—About 9,000*l.*

27,939. Looking at the risk of deposit on the north side of the proposed breakwater, do you not conceive that that would be a more judicious outlay than constructing the extensive breakwater laid down on the plan ?—No, I do not think it would. If you observe, that between the existing breakwater and the old south pier there is a bay. We do not find any deposit in that bay. It is in the same state it was fifteen years ago to my own knowledge, and by leaving a sufficient opening between the foreshore and the proposed breakwater the action of the tidal current will be preserved, and there will be no deposit on the rocks.

27,940. What width of opening would suffice for that purpose ?—I should think an opening about 200 feet in width would be sufficient ; and, as the shore within or lying to the west of the breakwater trends a good deal to the north, you might have an opening of that extent without affecting the question of shelter.

27,941. You think with an opening of that width there would be no risk of deposit on the west side of the proposed breakwater ?—I do not think there would be any. I may mention that the deposit we have most to fear is brought down by the floods of the Dee ; that is the only deposit with which we have to deal, because the beach to the northward has not altered for a long time, nor has the high-water mark advanced at that point. This shows that the tendency to accumulate sand to the north has reached its limit.

27,942. Of what material was the old bar composed ?—Of sand and the alluvial matter brought down by the river, which, being bound together, becomes exceedingly compact and hard.

27,943. Did that sand come along the coast from the north ?—When the bar existed the pier was not one-third of its present length, and therefore the sand brought down by the north gales was deposited on the bar ; but by the prolongation of the north pier into deep water that has been remedied, and for the last ten years there has been no trace of a bar.

27,944. That is because the materiel has been carried away by the current ?—Yes ; and because the sand brought down by the north-east winds is caught by the north pier, which forms a groyne and is prevented from going round the point.

27,945. Does the sand at the back of the north pier grow to the east at all ?—No, it does not. The high-water level there is permanent ; we have found no alteration for a long time.

27,946. Will you furnish us with a section of the construction you propose to adopt in this case, as in the case of Fraserburgh ?—I will.

27,947. The section should be in 4 fathoms depth ?—Yes ; you will find the average marked on the plan, and that is very considerable.

27,948. (*Chairman.*) I see there are no soundings marked in the spillwater channel, which is included in the acreage ?—The spillwater channel was originally intended to take off the flood water of the river Dee, but, in consequence of the increased capacity of the channel of the river and the raising of the banks, it is carried off sufficiently. The spillwater might be made an exceedingly useful adjunct for a tidal harbour.

27,949. What is the average depth ?—For a considerable distance up at spring tides the depth is about 9 feet at high water.

27,950. The minimum depth I think you say is about 7 feet 3 inches ?—Yes ; 7 feet 3 inches at one point.

27,951. Would there be any possibility of increasing the depth from the lock to the harbour's mouth 10 feet throughout ?—There would not. There is nothing impracticable in that. It is a mere question of dredging. When I became the engineer at Aberdeen in 1841, the entrance, at the present site, of the lock which is now 7 feet 3 inches was only 4 feet 6 inches.

27,952. And by dredging could you gain a depth of 15 feet throughout, do you think that possible ?—I think it is possible. It is a mere question of dredging.

27,953. What draught of water could get in in a gale of wind on shore with the present depth of 7 feet 3 inches, or rather with 10 feet 3 inches between the pier-heads ?—10 feet 3 inches at the pier-head would give a depth of 22 feet 3 inches at high-water spring tides.

27,954. You misunderstand my question. With a gale of wind on shore, what draught of water could get in with 10 feet 3 inches between the pier-heads ?—About 16 feet draught of water might get in between the present pier-heads.

27,955. That would be at high water ?—Yes.

LONDON.

Mr. J. Abernethy.

4 Dec. 1858.

Chairman.

27,956. But at low water ?—At low water no vessel would attempt it, in consequence of the lift of the sea being so great, and the channel so confined.

27,957. Supposing it possible to deepen the channel to 18 feet between the pier-heads, and then to 15 feet, gradually decreasing to 10 feet as you get up to the lock, what draught of water could then get in at low water ; a vessel drawing what water ?—A vessel drawing from 10 to 12 feet might enter at low water —the general class of coasting vessels.

27,958. In your opinion would it be possible by dredging to make the harbour at Aberdeen a harbour of refuge for the smaller class of coasting vessels ?—It would.

27,959. At all times of the tide ?—Yes. I have long entertained that opinion. I may state that there is no other harbour on the east coast of Scotland that has the same capacity.

27,960. Will you point out to me on the chart of the Tay where you suppose the difficulty to which you have referred, because we should be glad to have a harbour of refuge of this kind on the north-east coast of England. Is the bar marked from 16 to 18 feet your point of difficulty ?—That is not the main point of difficulty, but the Gay sands in north-easterly gales ; because, from the position of the entrance, a vessel is apt in north-east gales to get to leeward, and go ashore there. I have always heard the entrance of the Tay spoken of as dangerous.

27,961. The difficulty is, that when the wind is scant the vessel falls to leeward upon the Spit and the shoals adjoining ?—Yes ; and there is another difficulty. The Tay is subject to floods, and there is an outgoing current which would render it extremely difficult for a vessel to stand into the entrance. In easterly gales there is a very great conflict between the outgoing current and the heavy sea.

27,962. (*Mr. Coode.*) Supposing the breakwater to be constructed, the entrance to the harbour at Aberdeen would be equally exposed to east-north-east gales as at present, would it not ?—Yes ; but we do not find heavy gales with the wind in that direction. The heavy gales, as a general rule, begin from the south-east, vary to the east, and die away to the north-east ; and we generally find that a gale from the direction you mention does not materially affect vessels entering Aberdeen harbour during such gales.

27,963. The rule is, that by the time the gale arrives a teast-north-east its force is moderated ?—Yes ; and from the trending of the land to Buchan Ness Point, we are considerably sheltered. The fetch of the sea is exceedingly short in that direction.

27,964. (*Chairman.*) What is the next case ?—Here is a plan of the works at Blyth, but I have no remark to make with regard to the works, which will be completed within a month. I have here a drawing of Swansea bay, including the whole of the bay, and the town and port of Swansea.

27,965. There is nothing further to be said about this, I think, we have gone into the matter very fully. Have you anything further to say on this point ?—Nothing beyond this, that we have ascertained the nature of the shoals in the Green Ground, and we find they can all be removed by dredging, and also, that the position shown in the plan is more favourable than that shown on the chart by Capt. Denham.

27,966. There are one or two hummocks to the north of the pier, marked 1, 5, and 6⅛. Did we ask you the expense of their removal ?—I am not aware.

27,967. They are small in extent, and their removal would not be very expensive ?—It would not. If they are removed, the whole of the ground will give the very best anchorage, being clay.

27,968. I think the areas are not filled in ?—I have filled in the areas.

27,969. Perhaps you will read them over ?—The area of the sheltered anchorage is included within the south-south-east line from the pier head. The sea from that direction is not a heavy sea ; but I have thought it desirable to lay that line down upon the drawing, and to consider that the whole space between that line and the line of breakwater is an effectual shelter under all circumstances of wind and weather. From 1 to 2½ fathoms there are 265 acres.

27,970. Does that include the patches with the figures 1, 5, 6, upon them ?—They have been deducted from the area, but on the supposition of dredging the area will be slightly increased. The area from 1 to 2½ fathoms is 265 acres, from 2½ to 3 fathoms 67 acres, from 3 to 4 fathoms 161 acres, from 4 to 5 fathoms 40 acres, from 5 fathoms and upwards 235 acres, making a total of 768 acres from 1 fathom to 5 fathoms and upwards.

27,971. (*Mr Coode.*) Have you any observations to make, or any information to give, as to the strength of the tide at springs, either on the ebb or flood ?—I think you had that in evidence at Swansea. There is a very strong current upon the ebb tide round the Mumbles head.

27,972. What is the strength of the current ?—I think it is upwards of 3 knots an hour. I am desirous of leaving the present opening through the Mumbles headland and the other headland to allow a current to pass through, and to prevent the accumulation of sand, because I am of opinion, that if we made a continuous extension of the headland, the tendency would be in south-west gales to drive the sand against the breakwater and cause accumulation.

27,973. How far off the Mumbles head, in a south-east direction, does that current extend ?—A distance of about 1,000 feet, and then gradually diminishes to the usual tidal current. It makes a complete sweep out of the bay. All these shoals appear to be of a permanent character.

27,974. (*Chairman.*) I fear, from the very acute angle which the limiting line of the area forms with the line of the breakwater, that to obtain any area of refuge the larger part of the breakwater would have to be completed, would it not ?—The larger portion would have to be completed in order to afford shelter.

27,975. So that if one-half the larger and middle breakwater were completed, a very inadequate idea would be afforded of the advantages which the breakwater is calculated to afford ?—I think so. I should certainly recommend the construction of the greater portion of the breakwater shown on the plan. You will observe that the area of deep water is great as compared with the shallow. It is 335 acres.

27,976. Having given the subject, as you naturally must have done, a great deal of consideration, do you think there is no means by which a breakwater could be constructed by which a proportionate advantage could be gained as the breakwater was extended?—I think not.

27,977. I ask the question, because in these very extensive works it would be most desirable if we could adopt, to a certain extent, a tentative process, so that the country might become satisfied, as the work proceeded, that the advantages contemplated are likely to be ensured. Now this, I fear, is not a case in which that object could be accomplished?—I think not. I put the breakwater further to seawards. I should not require a greater length to shelter an increased area, but the depth is increased to 9 or 10 fathoms ; and I find as the expense increases so greatly with the depth, it would be scarcely advisable.

27,978. (*Capt. Vetch.*) How many vessels might safely take anchorage at a time ?—In my calculations respecting Swansea I spoke of 2 vessels per acre, and I think that a moderate allowance in a harbour of refuge.

27,979. Taking large and small vessels, from a draught of 8 feet upwards to 16 feet, what number of vessels would the harbour accommodate ?—It would afford accommodation for 1,500 sail, large and small ; and of the very largest class of shipping, 550 sail.

27,980. What is the direction of the pier ?—It is almost in the direction of the headland where the lighthouses are constructed. The name of the headland has escaped my memory.

27,981. (*Chairman.*) There is one point on

which I should be glad to avail myself of your experience, which is this:—What would you consider a fair average per acre for vessels in a harbour of refuge, taking one with another; I do not mean with reference to this particular case, but speaking generally?—Taking large and small vessels together, I should say 3 vessels to the acre. In a dock you may have 8 or 10 per acre.

27,982. (*Capt. Vetch.*) Supposing moorings to be provided in the harbour, how many could you then accommodate?—If you treat it as a tidal harbour, you might put down fixed moorings, and have 5 vessels per acre; but in gales of wind it is difficult for vessels to bring up.

27,983. You could put double the number with moorings that you could without moorings?—Yes.

27,984. (*Mr. Coode.*) Then you do not agree with the nautical evidence which has been given, that it would be necessary to provide something like 2 or 3 acres for each vessel?—I think not. I consider it an extravagant allowance.

27,985. Always bearing in mind that we are speaking of harbours of refuge, as distinct from commercial harbours?—Yes. I went minutely into the question with Capt. Herbert, a most experienced man, the harbour-master at Swansea, and we came to the conclusion that 2 vessels per acre could be accommodated with safety.

27,986. (*Chairman.*) Was that number adopted without reference to the additional accommodation that could be obtained by some regulation for placing vessels on their arrival, removing them on the following day to a better anchorage, so as to make more room?—Yes. It was thought desirable that a better system should be adopted, and that the vessels first coming in shore should go to the further portion of the moorings.

27,987. Of the harbour?—Yes, to the farther part of the harbour.

27,988. Will you now proceed with the Hartlepool case. With reference to Hartlepool, what is the nature of the statement which you wish to make? Because, although you were not present this is a case which we have fully gone into, and we only want any new matter with regard to yourself, or anything you may have to propose. You need not go into the question of general eligibility or any thing of that kind?—I have shown on the plan two harbours of refuge, one of them, coloured green, enclosing an area of 1,000 acres, and another, showing by the breakwater, coloured red, 2,745 acres. I may mention that I have described them fully in the report which I have handed in to the Commissioners. But perhaps I may be permitted now to give a few short explanations.

27,989. We do not want to go into anything which is contained in your report. We shall examine it.—I think I may show the nature of the designs.

27,990. We shall find full details as to the expense, the area, and such matters in your report?—Yes.

27,991. I ask the question, because we have been so fully engaged that it has been impossible for us as yet to examine all the reports that have been sent in.

27,992. (*Capt. Sulivan.*) Do you think that the sand travels to the north?—I think it does. In the year 1850 I visited Hartlepool as surveying officer to the Admiralty. That was before these works were progressing—the west harbour works. I found the beach between the north pier and the entrance to the harbour free of sand. I found there was no accumulation. I think the sand is driven on shore in heavy easterly gales.

27,993. I presume sand passes over the rocks?—I think not.

27,994. Then why do you put a pier there, where there is no chance of the sand travelling, where the rocks and the distant land protect the place? If the sand did travel, would it not be necessary to close the point altogether?—No. I think it desirable to preserve the existing action of the tidal current both on the flow and ebb round the margin of Hartlepool bay; because, although the sand does not travel from the south up into the bay, still, in stormy gales, even at the depth of fifteen fathoms, there is such an action of the wave as to disturb the bottom and take up sand in solution. I think it desirable to preserve that current and not to have the water still.

27,995. Would not that be equally done if the south breakwater did not reach the rocks, but was a detached breakwater?—I have considered the question of shelter in this case, and propose to leave a considerable opening between the foreshore and the end of the breakwater, and in the case of the large one to remove the Longscar rocks altogether.

27,996. But why do you consider it necessary to enclose the south side entirely by a breakwater if you have no fear of the sand travelling?—Because of the action of the south-east seas upon the entrance of the old harbour. Supposing no shelter is afforded by the green breakwater, the tendency would be to drive the sand into the west harbour, because any sand that has accumulated there is from the action of the east seas direct upon the beach.

27,997. If the outer arm of the south breakwater were continued a little to the south, and all the inner part were dispensed with, would not that be sufficient for refuge purposes if there was no fear of the sand travelling?—For refuge purposes it would to a considerable extent, but it would not sufficiently cover the entrance to the west harbour in south-east gales.

27,998. (*Capt. Vetch.*) How do you propose to carry the breakwater from the shore?—I propose to carry it from the west point by staging and from the shore by a tramway.

27,999. What is the width of the proposed opening?—About 850 feet. The larger harbour is provided with two openings, one to the north-east, and the other to the south-east. I think the action of any wave passing the entrance and expanding over an area of 1,000 acres within would be very trifling.

28,000. You think the wave would subside according to the extent of space over which it passed?—Yes.

28,001. (*Mr. Coode.*) We have not yet had an opportunity of reading your report, and I will simply ask you whether it contains the length of the breakwater in either case, the estimated cost, the site from whence the material is to be derived, and the depth of water in which the works are to be carried on?—It contains the length of the breakwaters, and the cost of the breakwaters; but it does not contain the exact site from whence the stone is to be procured. As I have to furnish more detailed designs to the Commissioners on other matters, I can embrace the details now asked for in my report. But I may mention that there is a very considerable supply of magnesian limestone of very hard quality to be procured within a mile and a half of Hartlepool.

28,002. Are you aware whether that is the quarry discovered just before the visit of the Commissioners to Hartlepool?—I am so informed.

28,003. (*Chairman.*) I see that at the entrance of the proposed harbour there is a depth of 33 feet at low water. Should you expect that the sea would break outside the harbour?—I think not.

28,004. You think the harbour will be thrown out, so that it will not be affected by the break of the sea?—My impression is that the sea wave does not become a breaker at the depth of 5 fathoms.

28,005. Did you make any special inquiry as to the breaking of the sea in this particular locality?—I did, and I find that the white water is out a considerable distance beyond the line of the piers, but I believe that is the action of the wind and not a breaker proper.

28,006. By a breaker proper you mean where the body of the wave rolls over, that is what you call a breaker proper?—Yes. A vessel can steam hard to windward over the sort of wave which I mean. It is a wave affected by the wind simply. But if it be a percussive wave or breaker proper that would be impossible.

28,007. (*Capt. Sulivan.*) Can you tell us what the difference of the cost would be if the 3,000 feet of the

LONDON.

Mr. J. Abernethy.

4 Dec. 1858.

Capt. Sulivan.

inner edge of the breakwater were done away with, and the remaining portion had to be done by sea work instead of from the land ?—I think the expense of the main portion of the work would be so increased that I should only save about 60,000*l.*

28,008. You think you would save about that ?—Yes. That is my impression.

28,009. (*Mr. Coode.*) I think I understood you to say, that in the event of the larger design being adopted, you would take away the Longscar rocks ?—I would.

28,010. With what object would you remove them ?—I think they tend in some slight degree to impede the action of the flowing tide at the first period of its flood, and I think that the stronger tidal current being to the south, it would be advisable to remove these rocks so as to allow the equal action of the tide, which is arrested by these rocks at one period, and deflected by them at another period of the tide.

28,011. To what depth would you remove them ?—To the general depth of the adjacent beach.

28,012. On either side ?—Yes.

28,013. (*Chairman.*) After the Commissioners have had time to examine the plans they will probably like to put some questions to you respecting them ?—I am engaged in completing some plans and details, and shall be prepared, in the course of a few days, to appear before the Commissioners again, with those plans and the additional details which have been asked for.

Mr. Michael Scott examined.

Mr. M. Scott.

28,014. (*Chairman.*) What is your occupation, Mr. Scott ?—I am a civil engineer.

28,015. Will you state what is your object in tendering your evidence to the Commissioners ?—My object is to bring under their notice certain new arrangements to be employed in the construction of breakwaters.

28,016. Be good enough to proceed with your statement.—I would ask leave, before proceeding to describe these arrangements, to say one word on a matter that concerns my position with respect to them. It has been said to me that piers have been constructed before of stone and timber combined, and that these plans I now propose to describe are mere modifications of that which has been done before. To some extent that is true. It is simply a different arrangement of the materials. But I conceive that the whole science of construction is involved in difference in the mode of arranging the materials. It is true that the materials I employ are the same that have been used before, and that are still used by others ; but they are arranged differently, and I think by that different arrangement that I attain results which have not been hitherto attained. I merely refer to that, because I think it is essential that I should show that I had some reason for coming here before this Commission. For, if I could not show that there was some novelty in these arrangements, I probably would not have been justified in requesting permission to appear before the Commissioners at all. I wish also to refer to another point. I was present two days ago during part of Mr. Abernethy's examination, and I am desirous of saying a word upon a matter which was then broached as regards the materials of which the works I propose will be composed. First, as to the stone, there cannot be any difficulty about that. No stone of a high class would be required, and that I conceive to be an advantage. But with reference to the timber, there seemed to exist some doubt as to the power of obtaining timber of the requisite length. Now, on this point, I would in the first place observe, that in many cases it is more desirable to combine the timber by building than to employ what is called self-timber. For many strains they are stronger. But there really is no difficulty in obtaining this long timber. It is simply a question of a slight addition to the price ; and if the work generally is such as will enable us to employ with the long timber a large quantity of short timber, we are then enabled to work up good average cargoes. If excessively long timber only was required, even it could be obtained in any quantity. Within a few days' journey of the place where you are now sitting, there are large forests where any quantity of timber might be obtained,—timber of the best quality,—from 150 to 200 feet long, and of good dimensions. The chief difficulty consists in getting ships long enough to bring it to this country. And in the case of mahogany, a friend of mine is felling mahogany at this moment in large quantities, and of the largest and best description. The only difficulty he finds is, that there is no demand for timber of such large dimensions; otherwise logs of 60 feet long by a yard square might be readily obtained and imported into this country, at less than 5*l.* a load. Another point I would wish to explain is as to the Blyth works. Considerable reference was made to the settlement in one of the sections at Blyth. Now the formation of that section is triangular, and the reason why the settlement was felt in that particular instance, is that a very small amount of settlement at the base of the triangle represents a very considerable settlement at the top. In the last section, which is not triangular, after the stones were shaken together, as we call it, at first, we have not even perceived the least indication of any settlement ; and that the settlement does not materially affect the work in that case is proved by the fact that in a length of 2,000 feet I have not yet been able to discover the settlement of a single inch, although the work has been up, the greater part of it, more than two years. If the structure were raised upon an equable substratum it might be supposed, perhaps, that the whole had gone down, and that having gone down equally no settlement was observed. But it so happens that the ground on which it is based varies from the hardest rock to clay, and yet we do not observe any settlement in the work. Coming now to the plans and the arrangements I propose, I wish to say, in the first place, that I consider it desirable in deep water not to employ a form that will break the wave, starting from the principle that the wave will not necessarily break unless the form of the work break it. Therefore I would prefer that the sea face of the breakwater should be, if not vertical, nearly so. I think also it is desirable that the harbour face should be vertical or nearly so, inasmuch as it gives it the advantage of being a quay. Of course it will be understood that the models and designs I exhibit have reference to no particular locality, but were merely brought before you in order to enable me to explain the principle of the construction ; and therefore I should observe that the nature of the bottom and other local considerations would of course require variations of detail in each particular case, although I have employed the same principle in different breakwaters in different places. The ground may be hard, that would require one system of arrangement ; or it might be soft, that would require another, and so forth. One advantage I claim, not for my designs so much, but for the system generally of combining timber and stone is, that you thereby obtain continuity of face. If that can be obtained, then the work resists the action of the sea as a whole ; if that is not obtained, then the measure of the strength of the work would to a considerable extent be the weakest part. A point which I claim for my own design is that the work does not depend, so far as stability is concerned, upon any connexion with the ground ; the stability depends upon the weight of the stone employed. With a hard bottom, piling, of course, is inadmissible. By piling, I mean driven piles. I may here state, in explanation, that we call the timber in these works piles, a term which got into usage at the Blyth works, and we are

obliged to continue the name ; but in speaking of these timbers as "piles," it must be understood that they are not driven piles ; it is driven piles that I object to, and which I think are in all cases more expensive.

28,017. (*Sir F. Smith.*) Then you have adopted the term "pile" for that which, as I understand you, is not really a pile. Do you not think that it would be better to call it by some other name, as it may lead to some confusion if you continue to use the term "pile" when you do not mean a pile. A pile is a thing driven.—With all due deference, I think the term "pile" is generally used and generally understood as denoting these timbers.

28,018. I think it is improperly used in this case, and is not generally used.—I admit the term may lead to some confusion, but it is difficult to find another that will express what they are.

It would be very easy for you to adopt another term that cannot be misunderstood.

(*Mr. Coode.*) Why not call them "standards"?

28,019. (*Chairman.*) You see what the result will be when the report is published if you use a word in one sense which is generally used in a different sense ; that is, if you use a term in your evidence as denoting one thing which in another part of the report is used to denote a different thing.—I may mention, while on this point, that in one of the models here piles are represented ; but they are not driven with the intention of obtaining a hold of the ground, and so assisting to ensure the stability of the work, so much as that of affording a convenient method of filling up the spaces under water. I produce here a model of the section of a breakwater for ten fathoms at high water. (*The model was produced.*)

28,020. (*Sir F. Smith.*) Will you give us the high-water line ?—Here it is (*pointing to it in the model*).

28,021. (*Chairman.*) Will you state the scale of the model ?—Half an inch to a foot. This particular design consists of a series of frames, each consisting of two standards braced and tied together, and united at the foot by a cross-tie. A number of these frames having been prepared, it is proposed to float one to the end of the work, to raise it on end, to load it so as to sink it into its place, and then secure it to the frame previously erected by longitudinal ties. I feel some difficulty in describing the details of this in words, and I was going to suggest that, should the Commissioners desire it, I should be allowed to make drawings of each of these designs and send them in.

28,022. No, I think the description, if you proceed with it, will answer the purpose ?—I should state that the lower tie in this model is peculiar, consisting of pieces of timber ranged in the form and having much the effect of a ship's chain, being flexible to a certain degree. I do not know that in this model, which is one of the first that was made, there is much that is peculiar beyond that tie. Perhaps, therefore, I had better proceed to describe another model, which possesses some other novelties.

28,023. Do you wish to make any further statement with respect to this, or shall we ask you such questions as occur to us upon the model, as you have explained it. Or do you wish to make a general statement as to other plans also to be examined upon them altogether ?—I am entirely in your hands, and am perfectly ready either to be examined now upon this model, or after I have submitted the other plans I wish to bring under the notice of the Commissioners. I should state that I have other models and forms of construction to submit which, perhaps, I had better proceed to describe before I am examined ; but the course which the Commissioners may consider the more convenient is that which I am most anxious should be pursued.

(*Sir F. Smith.*) I think you had better go through this before we go into any of the others.

28,024-5. (*Chairman.*) Then we will take your examination upon this. There is one question I wish to ask. I understand the peculiar principle of this is, that there is nothing driven into the ground, but that it rests entirely by its own weight ?—It rests by the weight of the stone.

28,026. By the weight of the stone ?—Yes, by the weight of stone packing.

28,027. (*Sir F. Smith.*) I think you stated, Mr. Scott, that there had been no perceptible disturbance of the stone at Blyth ?—Not after the first settlement.

28,028. When do you consider the first settlement to have taken place after the first deposit of the whole weight ?—Well that would depend very much upon the weather—after you have had several heavy seas upon the work.

28,029. Is then the settlement a question of time or of the action of the sea ?—I think it is a question of the action of the sea to a considerable extent.

28,030. You say that since the "consolidation," as we may term it, of the works, that no perceptible settlement has taken place ?—I have observed none.

28,031. Have you taken any pains to ascertain for a certainty that there has been none. Have you made it a matter of study, of frequent observation and examination, to see that no settlement has taken place ?—I have, and have not observed any indications of settlement. The effect upon the work would be this :—At Blyth there are cross timbers placed on the stone, and if the stone had settled to any extent it would have been necessary to remove those cross ties, and repack the stone.

28,032. Would you not effect the object by putting in more stone without disturbing the timber ?—The timbers would require to be removed before the stone could be put in ; they are so continuous.

28,033. They are continuous, are they ?—Not exactly continuous, but so close as to form a sort of timber grating.

28,034. And the pieces or bars of that timber grating are so close together that there is no room for the stone to go between ?—No.

28,035. And you are prepared to say, as the result of your observation and actual examination, that there has been no settlement ?—There has been no perceptible settlement after the first settlement. As I have stated, when the stone is first packed there is a considerable settlement. We assume that to be the case; but since then, so far as my experience of the Blyth works is concerned, there seems to have been no settlement.

28,036. And that notwithstanding the foundation is, as you say, an unequal one ?—That refers to the framework ; that affects the settlement of the timbers.

28,037. But would it not affect the settlement of the stone also, if there was an unequal foundation ?—It would certainly affect it to a certain extent.

28,038. Where you found the foundation comparatively soft, you have not observed any settlement ?—No.

28,039. I think you state that you have got at the bottom of your framework in this model a sort of chain bearing ? A timber tie, timber placed, so as to form a sort of chain, something like the links of a chain ; is not that the expression you used ?—Exactly so.

28,040. Is there likely to be any tendency to spread at the base of this vertical timber ?—The chain is placed there to correct that tendency.

28,041. But you state that these timbers have no connexion with the chain except by the weight put on them, and that these are independent pieces ?—Oh no.

28,042. That is your plan ?—It really and practically is a chain, and the same connexion exists between these timbers as exists between the links of a chain.

28,043. Will you explain the mode of construction ?—I will explain the formation of a link, if you will permit me, and that will show the construction of the chain. A link is composed of two side timbers ; at each end between these two side timbers is placed a block of timber, and that constitutes one link.

28,044. But how is one piece of timber connected with another ; for instance, taking the timber in connexion with the upright timbers adjoining, is

LONDON.

Mr. M. Scott.

4 Dec. 1858.

Sir F. Smith.

there any connexion?—This is one link (*pointing it out on the model*). Here are the side timbers; there lie the side timbers, behind which is not seen; there the blocks up to this end, and up to the other small blocks are placed.

28,045. I see they are a sort of clips?—And the side timbers in the second link are the same in dimensions, but reversed in position.

28,046. And this chain is perfectly flexible?—Not perfectly flexible in the sense of an iron chain, but it is sufficiently flexible for the purpose.

28,047. Then it is flexible?—To a certain degree, but if there should be an unequal settlement in the foundation, would not that affect the stability of your uprights in a certain degree if they are kept together by means of this chain?—No, I cannot anticipate any inequality of settlement that could possibly affect the uprights further than this, that it is possible that in the event of a very great settlement,—for the chain will admit of a great variation,—that one chain might be depressed more than the chain next to it; that would tend to draw in the feet of the uprights, and might possibly draw them in to the extent of a few inches, but that would not affect the stability of the work.

28,048. It would draw in the uprights, and the chain would break, or the blocks would give way?—The blocks would not give way.

28,049. Then as the other parts could not be drawn in in consequence of the power of the packing, it must be the reverse?—Perhaps I had better explain the way in which I deposit the stone. The hearting is deposited in the first instance in the centre of the chain; proceeding from the centre, we have the chain covered with stone, and a great weight is therefore put upon it before the stone is allowed to bear laterally against these uprights.

28,050. You keep them off the uprights?—Yes.

28,051. By packing?—Yes, by packing, near the middle of the chain in the first instance.

28,052. I presume that you put in the chain by means of the diving bell?—Oh no, it is all done from the surface. The whole is tied together and floated to the place, raised upright into position, loaded, and let down.

28,053. With the chain?—With the chain complete.

28,054. Then the whole goes down bodily, as we now see it?—Not exactly, Sir Frederic. The flexibility of the chain would be inconvenient, and cross spiked pieces are temporarily introduced to keep it extended.

28,055. Then you have pieces of timber spiked upon the links to keep the chain extended?—And to give it the necessary degree of stiffness.

28,056. And to give it the necessary degree of stiffness, what advantage do you gain by this chain formation over a scarfed piece of timber, not flexible from side to side?—Two important advantages; first, that it is not liable to be broken by the superincumbent weight of the stone, which a single piece would be; and secondly, that it enables us to work up small timber, which otherwise would not be useful.

28,057. Then, as I understand, you do not use the diving bell at all?—Not at all.

28,058. By what process do you propose to join the timbers together, and at the ordinary intervals, as shown in the model?—In a very simple way. In the last frame, before we proceed to erect another, pieces of timber are nailed to each side, representing the space that is to be left between the two frames.

28,059. As guides?—We have also longitudinal timbers projecting out, which act as guides in the opposite direction. The frame being then floated to its place, is raised so as to stand on end, is hauled close against the blocks, and made fast there by means of timbers attached to it temporarily.

28,060. And you think that is not a difficult operation, when exposed to a heavy sea?—I should not select a day when the sea was a heavy sea, for the commencement of the work.

28,061. But would it not be almost continuous when you once commenced?—No; I think not.

28,062. Why, you would not arrest the work for every gale of wind?—There would be no objection to arresting the work in the event of a heavy sea.

28,063. Then suppose there should be inequalities in the surface of the bottom, in the line of construction, either longitudinally or transversely, how would you deal with them; suppose a piece of rock, for instance, should stand up in the middle of the space where the chain-band is, how would you deal with it?—Any ordinary inequality within the space of the work would not affect the chain. We should have some idea beforehand of the nature of the ground and of the work with which we had to proceed, and arrange accordingly.

28,064. Do you mean that you would prepare the bottom?—In the majority of cases there would be no preparation necessary; and if upon examination I was of opinion that any preparation would be necessary, I would abandon this particular form of construction.

28,065. Can you give us the dimensions of these timbers, as they would be the full size of the uprights?—The total length of the uprights?

28,066. Yes. The framing is from the bottom of the platform to the top?—Yes, in this particular instance. It is not necessary that the uprights should be in one piece. We can make them of more than one piece of timber joined together, and these would be as strong as a single piece of the same length; but supposing the uprights to be in one piece, they would be almost 70 feet long.

28,067. In what depth of water do you adopt this mode of construction?—This is proposed for a depth of 10 fathoms; but I do not see any limit, so far as the dimensions of the timbers are concerned, for it can be got to any extent, but of course there is a limit.

28,068. But the greater the depth the greater would be the difficulty with regard to the weight to be moved and the apparatus for it?—Yes.

28,069. Will you give us the size of the timber?—The timbers of the frame below low-water mark are 2 ft. 4 in. by 14 in., and above low-water mark they will be about 14 in. square.

28,070. What would be the cost of that in 10-fathom water per lineal yard.—I mean of the timber work alone, irrespective of the stone, which much depends on local circumstances?—The cost of the timber work alone would be about 54*l.*

28,071. Per lineal yard?—No; per lineal foot.

28,072. I asked what would be the cost by the yard, and I was rather surprised at the answer. Does that include all the cross braces and the suspenders, the platform and all the apparatus for lowering and fixing?—It includes everything.

28,073. Then suppose we were proceeding with the construction of this pier from the end of the pier of stone which gives you your gangway, you would begin, I suppose, by putting in your first frame?—Just so.

28,074. And when the first frame is put in, what is the next process?—We proceed to weight the frame, and then place a second.

28,075. When you say you weight the frame, in what way do you weight it?—A convenient way would be to weight it from this platform (*pointing to it*).

28,076. Is that at the level of low water?—A little above the low-water level.

28,077. We may call it for convenience, I suppose, the low-water platform?—Yes; but it is not exactly at the level of low water, but above it.

28,078. Then say the platform a little above low water. Then having weighted this frame securely as placed, to what extent do you go on with your framing further before you put in any of the hearting?—Perhaps to the extent of three or four frames.

28,079. And then you would begin to put in the hearting?—Yes.

28,080. And that hearting, if I understand you correctly, is not intended to touch the outside uprights, but to be placed in the central portion of the

chain ?—It is intended to touch ultimately, but we tip in the centre first instance.

28,081. I mean in the first instance ?—We tip in, in the first instance, near the middle of the work.

28,082. Therefore you go on with the work of the packing in the exact order in which you go on with the frames ?—Yes, in that order.

28,083. And follow that order up to about low water ?—Yes ; but I do not propose to put in any packing above low water until the packing below low water has been consolidated by the action of the sea.

28,084. Have you any idea of the time it will take to execute each 1,000 yards of such a breakwater, provided the depth were nearly equal ?—Much would depend of course upon the locality and the special circumstances of each individual case ; but of this description of framing, probably I could execute at least 600 feet a year.

28,085. 600 feet a year ?—Yes. In fine weather a great deal more might be done ; but perhaps it would not be safe to calculate upon more.

28,086. Then your rate of progress would be 6,000 feet in ten years ; that is 2,000 yards in ten years ?—Yes, at the 10 fathom depth of water, and of this particular formation.

28,087. Is that the formation to which you give the preference under ordinary circumstances ?—Certainly not, as I have said, this is one of my earliest models, and I have made many alterations and improvements upon it since then.

28,088. (*Capt. Sulivan.*) Do you expect to have for every separate frame to make a model of the ground outside the previously deposited frame before you proceed to deposit the next frame in succession ?—Certainly not.

28,089. Then how would you be sure that the frames corresponded and fitted below water, seeing that the slightest inequality in the ground would throw out the work ?—We should have to sound, of course ; but it would not be necessary to go beyond that. Any slight variation of the bottom would not affect the plan of the upper work.

28,090. Might it not throw it out of the perpendicular, and so prevent it fitting accurately against the previous frame ?—It does not fit against the previous frame ; the only connexion with the previous frame is the longitudinal timber.

28,091. But it is supposed to fit vertically next to the previous frame, is it not ?—Yes.

28,092. And might not any inequality of ground, unless models are made for each successive frame, throw the centre out of the perpendicular ?—Even if that did occur, we could readily bring it into line again.

28,093. Yes, by straining the whole ?—No, without any straining ; by simply detaching the braces and refixing them.

28,094. How far do you think it would be loaded before you moved it to its place ; how high would you require the stones to be loaded to ballast it and take it down to its position ?—We do not load it, there would be no stones, no ballast ; it would sink of itself, by its own weight.

28,095. Then how do you fill in the whole mass of stone when it is in its place without a diver ; you say you do not use the diving bell ?—No.

28,096. Then how do you place the stones so accurately as to pass them through all this trellis work ?—The stone is tipped in so far as the mass below low water is concerned, and left to consolidate.

28,097. Tipped where ?—Over the top.

28,098. Then it has to find its way down through these diagonal timbers ?—No ; we use a shoot for the purpose, suspended from the top externally.

28,099. From the top ?—Yes.

28,100. Still, the stone must find its way through these timbers of the upper frame ?—No, the shoot goes off from the top at an angle away from the framework.

28,101. Then what prevents the stone from falling outside ?—The shoot turns it back at the reverse angle, turning in again under the half stage.

28,102. How do you pack the stone, and how do you shoot it into the upper portion of the framing so as to keep it far enough back ?—The stone packs itself ; and after the lower stone is consolidated, then we run a line of rails out from the shore under the upper platform over the small beams ; along this railway we bring the stone in waggons, and drop it through these spaces in the timber framing.

28,103. Then the stone comes upon some platform beyond the outer frame, and is then tipped over from the waggons and dropped through ?—The stone does not fall by means of a platform, but by means of a shoot.

28,104. Then the railway you spoke of to the upper part does not start directly from the shore between the platform ?—It may or it may not, that is of no consequence.

28,105. But if your railway comes over the platform the course of the stone in its descent will be reversed, and carried through the trellis work ?—The railway on the top of the work is only intended to tip the stone below low-water mark. It is tipped over, and that having been accomplished and the stone consolidated, we bring a line of rails inside the works from the shore, and the stone for the upper part is brought in waggons and dropped in by hand.

28,106. Do you suppose that the shoot underneath would enable you to fill the lower space entirely up with stones ?—Not entirely.

28,107. Then the upper portion of the lower space would have to be filled with stones, dropped through and finding their way down through these crevices ?—Yes, exactly so ; but these crevices, though small in the model, are large enough in the work to allow stones of any size to pass down.

28,108. And do you think by this means, by the stone falling through these crevices, that it would pack itself under water, in the lower frame, sufficiently close to support these ties against the weight of the upper stone bearing upon them ?—I propose to remove the low-water ties, so that when the stone is filled up to the diagonals we shall take care to have the stone projecting through between the diagonals to a considerable distance, and that is done by hand. Then we pack about it. The stones projected through the diagonals will admit of a settlement perhaps of two feet, and no pressure can come upon them. There is very little weight above them.

28,109. (*Capt. Vetch.*) You have been asked about the packing of the stone for the upper part and for the lower, whether you could manage to have it deposited and packed in a proper manner ; now, with regard to the packing, I will ask you whether the surge of the sea does not sufficiently affect that object ?—Yes, the action of the sea consolidates the mass for us. We have no occasion to pack where we have the sea to do it.

28,110. Do you find generally that the surging of the sea does tend to arrange and consolidate these masses of stone ?—No doubt of it.

28,111. You find this tramway on the diagonal braces effectual and convenient ?—Just so ; we have adopted that plan at Blyth.

28,112. And you bring the material upon it in waggons all the way from the shore ?—Yes, we do.

28,113. And you find no difficulty or inconvenience in that arrangement ?—No difficulty at all ; on the contrary, it is found convenient.

28,114. And you experience no difficulty in passing down the material to the lower part of the work by means of funnels, without disturbing the timbers ?—Not the slightest ; that I can say from experience.

28,115. Then in all cases you could by the application of these funnels obviate any danger to which the timber might be exposed, by passing down the materials through the framework ?—Most decidedly.

28,116. The only limit to passing down the stone is the size of the spaces between the timbers ?—Cer-

LONDON.

Mr. M. Scott.

4 Dec. 1858.

Capt. Vetch.

tainly; so long as the space is sufficient for the stone to pass through there is no difficulty.

28,117. And you have no doubt that the surging of the sea upon the stones as they are thus dropped down one upon another arranges them, and by forcing those which may have a bad foundation into a better tends to consolidate the masses?—No doubt that is the effect.

28,118. In fact they are packed in this way better than if they were packed by hand?—Yes; I rather object to hand work, for it not only costs more, but is, I think, unnecessary. I rather prefer to have the interstices between the stones left, and that they should not be entirely filled up.

28,119. How long have you been employed in the direction of the works at Blyth?—About four years.

28,120. Have you ever experienced any difficulty in carrying out the work there?—None at all; I do not remember any difficulty.

28,121. Have you met with any disasters in the course of the work?—No; the works have never been touched; we have erected frames in very bad weather, and they have been exposed when hardly bonded to the action of very heavy seas, and in no instance have the works been touched or injured. We have never had a single frame removed in the whole progress of the Blyth works.

28,122. And in respect to the creosoting, how long have your timbers been creosoted in the works at Blyth harbour?—At Blyth I suppose it is between two and three years since the timbers were creosoted; I cannot give the date exactly, but I know that there was a portion of the creosoted timbers put up there between two and three years ago.

28,123. And has there no action taken place on the face of those timbers?—No action on the creosoted timber, but a very decided action on the uncreosoted timber.

28,124. What is your impression as to the stability of the timber which has been submitted to the creosoting process; how long, in your opinion, is it likely to last?—We have evidence of the creosoting process preserving timber exposed for the last seven years without the slighest action taking place upon it, and as I know cases in which timber has endured for twelve years without being creosoted, I think at the lowest calculation we may assume that creosoted timber will last for twenty years. There is a paper here, which I got from the patentee of the process, Mr. Bethell; if you will allow me, I will hand it in, as you will find therein various statements with respect to the durability of creosoted timber. (*The paper was handed in.*)

28,125. Could you give me any notion, provided all the materials were ready at your hand, of how much of this kind of work you could execute, proceeding from the shore, or a given point, how much you could execute within a period of twelve months?—I have stated that with respect to this particular formation,—but I must again observe that this is one of the earliest formations, and by no means the best or the most rapid of execution,—I could execute 600 feet a year. I shall have to state, with respect to other formations I propose to submit, their advantage over this in respect to rapidity of execution, as well as other matters.

28,126. Then, since you commenced operations, you have made improvements from time to time as you proceeded?—Yes; as we have proceeded improvements naturally suggested themselves. If you will allow me to revert for a moment to the previous evidence in reference to Blyth harbour, I would remark that Mr. Abernethy understated the progress of the work in the last sections we have erected. We erected there 130 feet in five days, and in six days we accomplished 150 lineal feet of the work.

28,127. Then from time to time you have been able to make improvements in the mode of execution?—I have.

28,128. And you expect, I suppose, as you progress in the erection of the same kind of structure, you may be able still further to accelerate and improve the mode of putting the work together?—It is but natural to expect that further experience will produce further improvements.

28,129. All difficult structures, I presume, commence in rude ways, and get improved by the ingenuity of mankind as they go on, until we arrive at comparative perfection?—Certainly.

28,130. (*Mr. Coode.*) The model you produce before us is, I understand, intended to apply to cases where the depth of water is ten fathoms?—It is ten fathoms at high water.

28,131. The works at Blyth are all above low water, I believe?—No; at present it is six feet below the lowest spring tide, that is, a portion of it.

28,132. What length of the work is below the low-water level at spring tides—I mean up to the line—as far as you have progressed?—I should think about 100 feet.

28,133. Then your experience of this construction of work below low water extends to a length of 100 feet in a depth of six feet?—My experience at the Blyth works, and the Blyth works only, amounts to that; but I do not say that the extent of my individual experience consists of that, and of that alone.

28,134. You made reference to Blyth as the place where this mode of construction was in operation?—Yes.

28,135. And at Blyth, as I understand, you have about 100 feet which is under low water?—Yes.

28,136. And that not to any very great depth?—No; I do not suppose it is more than two feet below the low-water level of spring tides.

28,137. I do not exactly understand the manipulation you adopt in regard to the erection of these frames: will you explain it? with respect to the erection?—Yes.

28,138. Are they put together with the horizontal ties and diagonals afloat, or are they put together before they leave the shore?—Yes, before they leave the shore.

28,139. And the chain ties; they are also made complete before you float the frames out?—Yes.

28,140. They are put together in the same way?—Yes.

28,141. And are we to understand that you float them out to their position?—Yes; we float them out.

28,142. What course do you then adopt?—By means of gearing on the top, and not heavy gearing either, for the frame is not heavy, we make fast to the upper part of it, raise it on end, haul it close to the previous frame, and then make it fast with temporary timbers.

28,143. How do you raise it on end? for I understand you to say that you float it out to its position?—By means of cranes projecting over the top.

28,144. How does the lower portion sink then?—We have ropes fastened to the bottom of the lower portion, with which we haul it into its place, and it sinks of its own weight.

28,145. This mass of timber sinks of its own weight?—Yes; the downward pressure per foot run is about $1\frac{1}{4}$ tons.

28,146. How do you obtain that weight, if the structure is made, as you say, of timber only?—Very easily; the creosoting adds about ten pounds a foot to the weight, and then the timber is not all immersed when it is on end. I can give you the exact particulars.

28,147. I should like to know the exact proportion of the timber below the low-water level, and the timber above the high-water level, if you please?—The weight above high water and below low water?

28,148. If you please?—I have the calculation containing the weights, and will give it in. The floating power of the immersed portion is 11 cwt. per foot run; that is the difference between the weight of the timber creosoted and the weight of the bulk of the water displaced. In this particular model, the weight may be taken at 11 cwt. per foot run, that is, of the immersed portion. The weight of the non-

immersed portion is 1 ton 16 cwt. per foot run, giving a downward pressure of 1 ton 5 cwt., that is, at half tide. At high water the floating pressure of the immersed portion is 12 cwt. per foot run ; the weight of the non-immersed portion is 1 ton 8 cwt., and the downward pressure 16 cwt. per foot run.

28,149. Then do I understand you that the floating power of this mass of timber is only 11 cwt. at half tide ?—The floating power is 11 cwt. at half tide.

28,150. At what points do you attach the ropes by which you bind each frame close to the adjoining frame ?—Above low water.

28,151. Then, by merely hauling them together at low water, you assume that you are able to bring them together at the foot in 10 fathoms water ?—They are not in close contact.

28,152. But it is shown in the model that they are in close contact ?—This model has been altered ; it is not perfect.

28,153. Would you adopt this model under any circumstances ?—I think it might be adopted in many.

28,154. Have you any better model to put before us ?—Yes. This model here, which is very bulky, represents the method of constructing the round head for the entrance of a harbour. Here is a model of the end of a breakwater. (*The model was here introduced.*)

28,155. (*Chairman.*) Will you proceed now with any statement you may wish to make with regard to this model ?—I have here to submit a model of the round head of a breakwater, such as is generally required at the entrance of a harbour. This is not so perfect as the section which I shall presently have to refer to, but it is intended only to explain the mode of constructing the round head.

28,156. (*Sir F. Smith.*) But had we not better have the breakwater ? There are some harbours where there is no occasion for the round head ?—If you wish it, I will show the model of the breakwater. This (*producing another model*) is a much more perfect model than the other ; it is the model of a breakwater to be erected on a rubble mound. The first operation is to place frames at a distance of 30 feet apart ; by the longitudinal ties on the top of the cross ties, to connect the two uprights forming the sides of the frame ; and from this stage to tip the rubble in the ordinary manner, so as to form a bank or mound, up to perhaps 15 feet below low water. The bank having been allowed to consolidate for some time, then between the first-mentioned frames I propose to erect intermediate frames six feet apart ; the spaces between these intermediate frames under low water would be filled by upright timbers put in from above, and above low water by longitudinal planking (as shown) ; and above the upper platform, which would also be plank, there would be a parapet of timber placed at the same angle as the face of the work. There are some peculiarities in this model, to which I am anxious to direct the attention of the Commissioners. The first is the means of connecting the feet of the uprights on the mound by employing a sliding tie composed of two beams of timber, one inside and one outside of the external pile, with blocks between them to keep these timbers apart, the distance of the thickness of the pile ; and the two pieces being secured together above water, are slid down to the bottom, and tie the feet of the main uprights together in the direction of the length of the work.

28,157. (*Chairman.*) This system of construction, as it appears to me, is precisely the same as that advocated by Mr. Abernethy ?—The principle is different.

28,158. How different ?—In this respect, Mr. Abernethy employs piles, and I do not ; nor are the arrangements I have been describing any of them Mr. Abernethy's arrangements, but are entirely different. I think they are of some importance ; for upon them will depend the possibility of constructing the work, and its advantages.

28,159. By the difference in the arrangements, you mean in the construction of the timbering of the frame ?—Yes.

28,160. And also that the standards in yours are not driven into the ground, but supported on the mass of rubble ?—Yes, that is the important point.

28,161. (*Sir. F. Smith.*) The former model represented a breakwater in which the frames were placed and contained in the whole mass of rubble ?—Yes, to the bottom.

28,162. If I understand this model, it is so far different that the mass of rubble is first deposited, and upon that a framework is made to contain the rest of the rubble ?—It is.

28,163. Is that when you have got your rubble on to a certain height, say how much ?—15 feet below low water.

28,164. Under all circumstances ?—Certainly not ; you may vary the height as you please ; I merely selected that in this case.

28,165. In this case, which the model of your invention represents ?—Yes.

28,166. You must give us something which may be definite, so that we may test your project. If you will say any dimension you please, we shall be able to form some idea what the mass will be ?—The whole system will be applicable to a greater depth of water than 15 feet, but I do not know that it would be desirable to go beyond.

28,167. We will take the former case of 10 fathoms of water. What mass of rubble would be deposited before you could begin to put up the framework ?—In this case the depth of the rubble deposited in the first instance is 24 feet.

28,168. In what depth ?—Ten fathoms water.

28,169. What is the scale of this model ?—A quarter of an inch to the foot.

28,170. The other being ?—Half an inch.

28,171. This is half the scale of the other ?—Yes ; having the same depth of water.

28,172. Under the same depth of water ?—Yes.

28,173. Then the height above the bed of the sea before you place the upper framework would be how much ?—24 feet.

28,174. Then what would you gain by this system over the other ?—Well, in the first place, the other system might not be applicable to a bottom so soft as that to which you might apply this. Another advantage of this system is that it is cheaper, and a further one is, I think, it may be more rapidly executed.

28,175. I suppose that that is in some degree a question of the cost of stone and the cost of timber, because if you had far to go for the stone, your second plan might not be the cheapest, inasmuch as you use much more rubble in it than in the other ?—Quite so, but of course that must be taken into consideration. If rubble is very scarce, I do not think this would be a desirable section to adopt. I would then attempt the other section, going to the bottom directly.

28,176. What do you claim for your invention ? is it not a great saving of rubble material ? Is that the first claim you make, economy of construction by the diminution of the quantity of rubble ; is it so ?—No doubt the quantity of rubble is diminished in the section first described, but it would not be so in this. I would claim much more than that. I would claim that you have an efficient face work in this particular form, and that it is very difficult to obtain that with stone. I start with the assumption that the form of the face ought to be perpendicular, or nearly so ; and I do not see that that can be readily obtained with stone, except it be at a great cost.

28,177. You do not say that you mean that going to a depth of 10 fathoms you would require an entirely vertical face ?—I only adopt that to 15 feet below low water.

28,178. Exactly. Do you propose in the former plan submitted, as well as in this, to have any stone face work ?—I am prepared to show how this work could be faced.

28,179. I do not ask you how it could be done, but

LONDON.

Mr. M. Scott.

4 Dec. 1858.

Sir F. Smith.

what you propose as a system ?—In this case I would not propose to face it. I would leave it in the position in which it stands finished with timber work, and take advantage of that timber as long as it would last, and if the timber decayed, then I would propose to face it with stone.

28,180. In undertaking a great national work, I suppose you would not recommend the Government to undertake that work unless they contemplated going to a further expense in eventually facing it with ashlar ?—If it is a great national work, I believe it would be better to contemplate facing it subsequently than to renew the timber, although the timber could be renewed, and that very easily.

28,181. The timber could be renewed, and you think that would be less costly than facing with stone ?—No doubt.

28,182. You were so kind as to explain the process by which you have deposited your frames in the last model. Will you be so good as to explain how you propose to deal with them in this case ? How far apart are the frames ?—Thirty feet.

28,183. Then from the end of the breakwater up to any one frame will be thirty feet ; that is, from where the next is to be deposited. By what pressure do you deposit the next frame ?—I would attempt that with the frame complete ; but if I found that that was so difficult that the bad weather interfered with the process of depositing it, I think then I would place the timber standards alone, and then add the frame afterwards above water.

28,184. I perceive the timbers are unconnected except at the top, and by the diagonal bracing. If you were to separate them how would you keep the tops of the timbers at the required interval. I understand you would put in the two uprights and the sill pieces ?—Unless the frame was put in as a frame the sill piece would require to be abandoned. It would not be a matter of much importance in this particular case, because the rubble is tipped outside as well as inside. In fact, the principle upon which this could be done, assuming that there was any insuperable difficulty in dealing with the frames, which I am far from thinking would just amount to the plan which is adopted at Holyhead for placing their staging. The uprights that they employ there are very much larger timber than those in the model ; and they can place a whole row of them readily with very simple means.

28,185. I perceive that in this model you have a continuous sill ?—It is so represented simply to save labour in constructing the model.

28,186. The sill is to be the same sort of tie-chain that you have in the first model ?—Yes, as in the first model ; I should not attempt to make the sill all one piece of timber, because it would be too long.

28,187. What is the spread in 10 fathoms of water? —I think 64 feet.

28,188. You have no difficulty in getting timber of 64 feet in length ?—It is not difficult to get timber of that length ; but if you can employ small timber as advantageously as large, I do not see the advantage of using large timber. If you could save a farthing a foot in your timber I do not see why it should not be saved.

28,189. It is quite desirable if you make it equally effective ?—Therefore there is no reason for employing long timber. I did not say it did not cost more, but not much more.

28,190. In the case of the model before us, there is great economy of timber, is there not ?—There is.

28,191. And a great excess of rubble ?—An excess of rubble.

28,192. You consider that the facility of construction is greater by the plan represented by this model than by that shown in the last, inasmuch as here you have got a great interval between your frames ?—I think so. I think that the execution of this arrangement would be more rapid, but I do not know that it would cost less.

28,193. Do you think that in the case of framing a pier, at Hartlepool for instance, which would be a very long breakwater exposed to north-east or east gales, that you would be able to place those frames without much difficulty or expense ?—Our sea at Blyth is just the same as at Hartlepool as near as may be, and from my experience there I should not hesitate to undertake it.

28,194. I think you attributed the facility in placing the frames in the case of the first model to the proximity to each other ; here you have quite the contrary system to deal with. Would you float those out in this case ?—Yes.

28,195. But with a considerable interval from the last placed frame ?—The advantage of that interval is that the moment the frame is down you may tip rubble stones upon it.

28,196. The moment it is down ?—Yes. In the other case, as I stated, if we pursued that course we might interfere with the ground upon which the succeeding frame is to be placed.

28,197. The frames would require to be placed with considerable accuracy ?—Not the first frames. I do not consider accuracy of much moment. The intermediate frames we can place with great accuracy, with very great accuracy indeed.

28,198. But if the larger frames are not placed with accuracy the other ones would not correspond with them, because they are made to fit precisely ?—There would be no difficulty, supposing there was an inaccuracy in the adjustment of the first frames, in cutting the timbers at low water, and in renewing them; but I do not conceive that such accuracy is at all necessary. There is nothing that I see about the work that involves the necessity of it.

28,199. The frames must all be made of different dimensions ?—As far as depth is concerned.

28,200. Then of course, supposing the first frame placed, the next one going out to sea must either alter its form or must have a wider base?—Yes.

28,201. Then as you proceed every frame would be different ?—Yes, which I consider a decided advantage, because that provides for a difference in the length of the timber.

28,202. It requires much greater nicety of arrangement, every one having to be different so as to correspond with the soundings?—I do not apprehend the slightest difficulty in that respect.

28,203. Can you tell me the difference in the amount of timber employed in the two systems, the difference per lineal 100 yards?—In the plan represented by this model I should employ about 200 feet per foot run, and in that represented by the first or large model, about 270 feet.

28,204. 200 feet against 270?—Yes.

28,205. Under the same circumstances?—Under the same circumstances.

28,206. Can that be accurate looking at the materials here?—You forget that in this case the timbers do not go so far down, there is more stone and less timber.

28,207. Now, as regards economy of time, which is the most expeditious mode?—I think this would be the most expeditious mode.

28,208. Although you have got nearly double the quantity of rubble stone on the lower portion of the work?—The quantity of stone is, I should think, almost double.

28,209. How do you purpose to tip the rubble? —In this case it could be tipped through from the upper platform.

28,210. Working from the upper platform?—Yes.

28,211. Therefore your work must be done with very great nicety, in order that the tipping may follow immediately upon the placing of the frame, and keep the frame in its proper position?—I do not understand how that affects the question of nicety.

28,212. For instance, you would not attempt to place a frame until the material was over the sill of the preceding one. You would place it the moment you had got the rubble up to the previous frame ; or should you wait until the rubble had come nearly up

to where the next frame is to be placed?—It would be desirable to get the rubble upon the frame as soon as it was down.

28,213. In point of fact, you would hardly think it safe to place a second frame until the rubble was close up to it?—I do not see any danger. The surface exposed to the sea is nothing. If the frame is disturbed it would not affect the progress of the work, except as an interference with that particular frame. I should certainly try to place some weight upon that frame as soon as possible; but it is not a matter of great importance or necessity, nor does it involve any risk to the whole of the work.

28,214. You think you could depend entirely upon these comparatively large braces and longitudinals which run along?—It would be a stronger staging than any which has been employed hitherto, so far as I know.

28,215. I merely ask whether it is your opinion that the frame would keep its place in heavy gales of wind?—I do not propose that it should be so tried.

28,216. But suppose a gale of wind come on the moment the frame is placed?—The contractor would lose a small part of his timber.

28,217. And the work would be arrested?—A storm will always arrest sea works, at least any of which I have had experience. There is no staging that has ever been exposed to the sea that has not been most seriously damaged by gales of wind.

28,218. Perhaps your previous plan would not be so liable to be damaged as this, the timber being more continuous, and getting a more rapid lateral support?—I do not know; both have their advantages.

28,219. If you do not get great economy of time and money, perhaps the first plan is as good as this, if not better, as you have then more solidity—I think both have their advantages. I think this would have advantages in some situations, and the other, perhaps, in others.

28,220. You propose to creosote the whole of the timber, and the estimate provides for that?—The whole of the timber.

28,221. Will you tell me the cost per lineal yard?—I think I have stated it.

28,222. And the relative cost of the timber?—The quantity is about 200 feet per foot run in the one case, and in the other about 270 feet; 200 feet as against 270.

28,223. Now, assuming any position you please for the construction of a breakwater of either kind, and putting down the cost of rubble stone at what it would come to at that particular situation, could you tell me what would be the relative cost of the two estimates?—According to this plan as compared with the other?

28,224. Yes, at any locality you choose to select, giving the price of the material at that locality?—Everything will depend upon the cost of the stone.

28,225. Precisely. Take any cost you please at any locality you like, say at Hartlepool or Swansea?—To take a favourable case, so far as the price of stone is concerned, the model first described would probably come to 75*l.* per foot, and this which I am now submitting to the Commissioners would, at the same price of stone, that is, a low price, come to about 76*l.*

28,226. Surely that must be wrong?—In the one case the quantity of stone is increased, and in the other that of timber. They come to very nearly the same price.

28,227. The two systems come to very nearly the same price?—Yes.

28,228. Putting the economy of timber against the excess of stone?—Yes.

28,229. (*Capt. Sulivan.*) Is this estimate for the timber and rubble base and the filling alone, without any facing walls?—Without any facing walls, of course.

28,230. Have you made any estimate of what it would be faced for?—That so entirely depends on the situation. I should be very glad to do so in reference to any situation, but it so entirely depends on situation that it is hardly worth while going into the calculation except for a given place.

28,231. You said in one answer that if the timber decayed there would be camparatively little expense in renewing it?—That it could easily be done.

28,232. If these uprights decayed, or were cut off by the action of the rubble base, how would you easily get fresh frames down to the bottom through the old rubble base?—I should not attempt it. It would not be necessary, the old rubble base being there. All we want this staging for is to deposit the rubble base.

28,233. Do not I understand that if anything occurred that should injure the standards at the top of the rubble base, the internal pressure of the filling would be apt to force the whole thing out, and therefore the standards would require renewing if any accident happened?—This particular plan for frames upon a rubble mound was intended to be faced, and if such an accident occurred, and if the standards or outside frame had decayed and had to be removed, the rubble being a hard bottom, there would be no means of piling, inasmuch as the rubble is consolidated. If, however, you did pile, you would have the staging, and could apply steam power, and do it at a quarter of what it would cost to perform similar work by hand.

28,234. By steam power you would force the piles into the rubble stone?—No; in this case that is not applicable.

28,235. Therefore another system must be adopted?—I would employ something like a cage formed of timber, and loaded with stones, and lower it over the face, filling up with stone. It would constitute a renewal of the external face filled with stone, in fact, making a new face 10 or 12 feet thick along the whole face of the breakwater.

28,236. Then you would add a thick face of a new frame full of stone, as the other decayed?—I would probably. However, the better system in this case would be to face with stone at once.

28,237. Do you call that easily renewing your timber?—Quite easily.

28,238. Do you call adding a new face many feet thick formed of frames filled with stone an easy renewal of the timber of your present system?—I do, and not an expensive one.

28,239. But it is a substitution, and not a renewal?—It is not a renewal of the decayed timber. It is a substitution of fresh timber for the decayed.

28,240. The same thing would be necessary if, by the action of the sea upon the rubble base, your standards were chafed through at the surface of that base?—That is a contingency which I do not contemplate at all, and for this reason, that the rubble is 15 feet below low water, and I do not anticipate that the action of the sea would at that depth at all affect the piles; at the surface of low water and above it the action is extremely destructive. I have seen piles cut off, but at the depth that I have mentioned it will never affect them, so that that is a contingency which I do not contemplate. I may repeat again that this particular model is, when the timber decays, intended to be faced with stone, and I am prepared to show a method to accomplish that work which involves some peculiarities.

28,241. Put on one side the view which you entertain of its being a structure intended to be faced with stone, and looking at it merely as a staging from which to construct masonry walls of the ordinary class, have you made any comparison between the expense and the amount of timber used in a staging like that and that employed according to the present system for depositing a rubble base of the breadth you require, and afterwards erecting masonry on it?—A comparison of quantity or cost.

28,242. Either quantity or cost of that staging, looking at it only as a staging corresponding with the staging now used at other places?—I do not know of any case with which a comparison could be instituted, but I could do it.

LONDON.

Mr. M. Scott.

4 Dec. 1858.

Capt. Suli

28,243. Could you not easily ascertain what amount of ordinary pile staging would be required if you constructed a base of the size you require in the ordinary way, and then compare it with the amount of wood and the cost of your framework, looking at it only as a staging from which to make a rubble mound ?—That I can do with the greatest ease, and will be very glad to send it to the Commissioners.

28,244. Do you think you can show that, irrespective of the stonework, for works of equal dimensions your framework as a stage will be cheaper than the present mode of staging ?—I do not think that the quantity of timber in this model would be less than in the staging which you might have designed for the purpose you name, but it is not only a staging. Suppose that it was required to build a wall, and perpendicular face, as I proposed to have here in this depth of water, no ordinary staging would do ; you must fill up behind that staging, or you would be exposed to the disadvantage they suffer from at Dover, where the works advanced at the rate of about 100 feet per year. If they had had a central mass or backbone to that wall, and then had to face it, that would be a comparatively simple process ; but the fact of having to build continuously from the end makes it exceedingly difficult and exceedingly slow, and therefore I should not say that it was fair to compare this framing with ordinary staging. It not only gives a power of tipping the rubble mound, which is all a common staging will do, after which you have to build from the end of the work, but also a power of, in the first place, forming a central wall, and of then facing, at a dozen different places if you please, along each side not exposed to the current.

28,245. Could not a common staging, fixed for depositing a rubble mound, after it had deposited that rubble mound, be made to answer exactly the purpose you are describing of building the walls on each side, and filling in again between them as you went up ?—The wall would be exposed to the sea without backing.

28,246. I presume that your wall, or stage and wall, as we saw in Mr. Abernethy's plan, would be exposed as it went up, unless it was filled in behind as fast as it rose ?—Yes ; but my wall would be built against the central mass.

28,247. In the same way, could not any containing walls as fast as they went up be filled in with material to back them ?—No doubt you might fill in with rubble, but the ordinary staging would not have the necessary strength. It would require to be much more strong than ordinary staging.

28,248. I want to understand whether there would be any saving in your mode of staging over the ordinary staging that might be strong enough to do the work in the way it is usually done ?—I do not, of course, know what might be constructed ; I can only say what I have seen, and I think, most decidedly, that there would be a very considerable saving both of cost and of time by employing this particular arrangement, and by avoiding the risk of a breach during the progress of the work. I have built a wall such as you have described, with stone-faced work backed with rubble, and I have had that wall swept away again and again.

28,249. Will you describe the particulars of that wall ?—It was not to be compared with a work of this magnitude. It is built with faced stones of considerable weight, and filled in with rubble at the back.

28,250. And that rubble borne solidly by some other containing wall ?—A wall on each side.

28,251. Was that wall constructed with stones of the same weight that you would put on a face like this of which we are now speaking ?—I think not.

28,252. If that objection applied, would it not also apply to the frame staging, such as Mr. Abernethy proposes, in which he speaks of several feet as left between the face and the backing until it is filled in between the wood and the stone ?—I did not see his plan, and therefore cannot speak to it ; but if I were proposing to face this work I would not leave any interval between the face work and the central portion.

28,253. You would build the face work against the timber, would you ?—I will briefly explain the process.

28,254. (*Capt. Vetch.*) We have had two models before us, models of two descriptions of work. The first one I understand to be applied to carrying out a breakwater upon uneven ground, just as the bottom presents itself, and in the one now before us you carry out the timber work, and at the same time go on depositing the material until you bring that material up to 15 feet below low-water mark, and I believe it shows the amount of rubble stones so dropped from the staging ?—Yes, dropped from the staging. The pyramidal part represents the rubble mound.

28,255. That shows the progress of the rubble work going seaward ?—Yes.

28,256. The staging is for the purpose of depositing the rubble stone in the divisions ?—Quite so.

28,257. So that will fill up the staging ?—Quite so.

28,258. I think you said that the staging uprights are 15 feet apart ?—30 feet.

28,259. Then you would have no difficulty in discharging, by tramways or by tipping from the staging, the rubble required to bring up an even bottom, which is your great object ?—I think not.

28,260. Having carried out an uniform pier, if I may call it so, of rubble work up to 15 feet below the low-water mark, you would then have the staging ready made upon which to build the stone structure ?—Well, this model does not quite represent that. According to this, the work is intended to be finished, first, as a timber pier, and to be allowed to remain in that condition until the timber showed symptoms of decay, and then, and not till then, to be faced with stone.

28,261. But if you are so disposed, having brought up the rubble mound to 15 feet below low-water mark, you might if you chose, with the staging already made, carry up the walls on either side and fill in ?—Then we should be exposed to the difficulty I want to avoid, the sea breaching the work in progress. We should be exposed to the difficulty of the sea breaking up that work while in progress ; and it would not be safe, I think, to build, except at one end, and continue, proceeding from that end. By finishing the work in the first instance with timber, I get a rubble heart up to the top, and that consolidates before the timber decays, and then I build the stone facing, removing the timber as it proceeds. There is a great difference between building at the end of the work, with the sea and tide running across, and building along the face, where the current is not much felt.

28,262. (*Mr. Coode.*) Do you apprehend you will be able to construct your work more rapidly on this plan than on that first produced ?—I think so.

28,263. What rate of progress do you assume you could make upon your second plan ?—I think by calculation it came out that we could construct and complete the superstructure of 4,200 feet in three years, about 1,400 feet of finished work per annum.

28,264. If I understand you, you do not drive the uprights or standards at all ?—No.

28,265. I think you objected to that ?—I object to driving on principle, if it can be avoided.

28,266. Wherein does your objection lie ?—There are a great number of objections. First, it is difficult to accomplish in a seaway. Next, it is expensive. It is slow compared with the placing of these frames ; and, so far as my experience has hitherto gone, it is vastly more expensive.

28,267. And liable to interruption by bad weather ?—I think so. Supposing, however, that the timber of this work decayed, then I should have no objection to piles being driven. You would just pile along each face, but then you would have the staging to work from, and no interruption from the sea, and you could apply steam power. My experience of steam driving, as compared with hand driving, is exceed-

ingly favourable to steam; I could give the exact ratio.

28,268. I do not think that is necessary; we will not now enter into that.—It is much more rapid.

28,269. You speak of the floating power of the water, or rather of the ratio between the floating power of the water and the sinking power of the frames which you would adopt in the case of your fresh model. Would you tell us at what rate per foot you have estimated the weight of the timber?—I think it is taken at 50 feet to the ton.

28,270. 50 feet to the ton, creosoted?—No, uncreosoted.

28,271. What sort of timber?—It was Memel timber. I think the calculation is taken from actual weight, but it is a year and half ago since it was made. It is Memel timber, and I have the particulars somewhere.

28,272. I should like to know the claims you advance to peculiarity or novelty in this particular model. You explained them with regard to the first, but not with regard to this?—First, there is the peculiarity of the sliding ties.

28,273. You stated that accuracy was not necessary in the position of the uprights or standards?—That question had reference to the first framing, where extreme accuracy I think is not necessary. I mean that it is not like fitting an ashler face, when you want to be within one sixteenth of an inch in line. Timber work is not of that character.

28,274. Would then these ties require to fit closely at the bottom?—I do not think it is necessary.

28,275. If they do not fit closely, how will they act as ties?—If we can get the two frames brought within an inch or two of the same line it will be quite sufficient. To that extent you require an accurate fit.

28,276. If there is an inch or two difference, there must be an inch or two of play in the uprights which you propose to let down. You propose to let the upright timbers through the openings in the solid ties?—Quite so.

28,277. You say that the fitting to an inch or two is not necessary?—I referred to the fitting of the frame timbers.

28,278. Supposing that these frames spread in a transverse direction—I mean transversely with reference to the centre line of work—how would you then propose to get the sliding ties down?—I do not suppose the small frames will spread large. I do not see why they should. In that case we have the power of making them perfectly parallel above water. With respect to the large ones, if any spread of that nature occurred, it would require to be remedied by cutting the timber, but that would only happen to one individual frame, or 30 feet of the work.

28,279. There would be a certain amount of fitting and cutting?—I do not expect there would be, but it is possible.

28,280. Would that not be necessary in consequence of some want of accuracy in the direction of the uprights?—I do not know. It can only refer in the first instance to the uprights that constitute the first staging for tipping the rubble. Suppose that we found that these uprights were displaced to a considerable extent, having a rubble mass tipped, and having the intermediate frames brought well forward, I could cut off the frame and put down an intermediate one on the top of the rubble mound. It is quite independent of what is below, and I do not apprehend that which is below adds anything to the value of the work.

28,281. How would you prevent the power of the sea lifting that intermediate frame off the top of the rubble mound?—By placing stones upon it. It has no buoyancy itself. The frames have no buoyancy, they have a considerable pressure downwards. We have no difficulty in lowering them temporarily; we have not lost a single frame at Blyth, where the coast is as bad as it would be here. They are immersed in proportion to their height quite as much as these would be.

28,282. You say the system which you first produced was not so applicable to a soft bottom as this. I see that the sills are rigid; if these sills are rigid, how are you to guard against a rupture in the case of a soft bottom?—These are not rigid; they are only so represented on the model to save labour.

28,283. You propose to use the chain tie in this instance, as well as the other?—I should prefer it.

28,284. Should you not apprehend that if a gale of wind were to come on before the frames were weighted, that the whole of that part which was not weighted with rubble would necessarily be carried away?—We should be exposed to that risk, but that is only the risk to which staging used in the erection of this kind of work is always exposed.

28,285. You mentioned Holyhead?—So far as the exposure of timber is concerned, it would be very much the same as at Holyhead, but then if the frames can be put down complete, we have the power of weighting here which they have not got at Holyhead. At Holyhead they can put no weight upon the pile, except perhaps, placing one stone at the bottom, and there is the action of the rubble against the side of the pile that cuts it.

28,286. Is there not a greater amount of horizontal and diagonal surface exposed to the sea in your plan than there is in the plan adopted at Holyhead?—I think not.

28,287. Is there any horizontal surface exposed to the action of the sea at Holyhead below the level of high water, and in your plan are there not both horizontal and diagonal timbers exposed to the action of the sea below that level?—No; I do not think there are.

28,288. Below the level of high water, the framing at Holyhead consists simply of vertical timbers?—I think so, but they are more numerous and a larger surface exposed.

28,289. Are the uprights nearer than 30 feet?—I do not know that they are nearer. I do not know. I do not remember. I cannot say. Our experience with respect to that point at Blyth has been exceedingly favourable. We find that it does not require more than a very little weight upon the frames to hold them comparatively safely.

28,290. You have already said, have you not, that your experience for working below water is confined to a length of about 100 feet in a depth of water not exceeding 6 feet?—I think the framework at Blyth is very much more exposed than this could be, for this reason, that in proportion to the weight of the frame there would be as much immersed; and, in addition to that, we have a very heavy sea running over that space where the work is erected, an exceedingly heavy or broken sea, more than I should expect would occur in a work of this depth. Although the water would be deep, the motion only extends to a certain depth below the surface. We have at Blyth as much of that as you would have in the deepest water on the coast of England.

28,291. Then it is your opinion that this work would not be so much exposed to damage from gales of wind as the work at Blyth?—In proportion to the extent of work. I am speaking of the piles.

28,292. (*Sir F. Smith.*) You propose to tip your rubble in the line of the breakwater from the framework?—From the framework.

28,293. How do you propose to deposit that portion which extends laterally beyond the line?—Either by shoots or by side tipping.

28,294. What will be the distance out to the foot of the slope in deep water?—Sixteen or seventeen feet.

28,295. Not more?—Not more.

28,296. From the line of the top to the foot of the slope?—It would be about so; and by using side tipping waggons, we should have no difficulty in throwing it out there.

28,297. (*Chairman.*) You were going into the question of facing the breakwater with stone, in your

LONDON.

Mr. M. Scott.

4 Dec. 1858.

Chairman.

plan, for which you say there are some peculiarities, were you not?—Yes.

28,298. As you are resident in London, it will not be inconvenient to you that we should postpone your examination on that point, in order that the gentlemen appointed to be examined on this particular day may come before us?—Not at all.

28,299. Probably we may be able to continue your examination at a later period this afternoon, but if not, we shall meet again on Tuesday, and perhaps you will come then?—I will.

28,300. (*Chairman.*) What does the 76*l.* per lineal foot for this work include?—It includes the whole work complete.

28,301. That is, the staging for depositing rubble, the diagonals, and the intermediate frames?—Everything.

28,302. The rubble mound?—The rubble mound.

28,303. Both below low water, and filled up to above high water?—Yes.

28,304. How high above high water do you propose to fill the frame?—Right up to the top.

28,305. At what rate per ton have you assumed the rubble to be deposited?—I take the rate when rubble would be low in price; 4*s.* per yard.

28,306. What are the largest sized stones you propose to employ?—I do not think that that is a matter of much consideration. I would employ a variety both large and small; I think it is desirable they should be mixed.

28,307. Does the model you have produced represent according to scale the exact proportions of the timber scantlings?—As nearly as anything made in that way can; but I can give the exact dimensions. In some cases they are not correctly represented here.

28,308. What weight of trains do you propose to run over the work?—It would perhaps facilitate the work to employ heavy trains, but if we did so we should require to tie the baulks carrying the rails. If we were to employ trains of waggons carrying 8 or 10 tons, I should be disposed to tie those baulks.

28,309. You would add to the strength of the larger bearings?—Yes.

28,310. Would you not add to the strength of the transverse bearings in any way?—I do not think that that would be necessary.

(*Mr. Mather.*) I present a memorial from the seamen of South Shields, adopted at a public meeting.

(*Chairman.*) How many signatures are there to that memorial?

(*Mr. Mather.*) I think 449. There would have been more, but the sailors have been a good deal scattered.

(*Mr. Lindsay.*) Was that memorial left at any particular place, so that the seamen might sign it at their free will?

(*Mr. Mather.*) It was left at a place where they are in the habit of assembling.

(*Mr. Lindsay.*) And it was signed without any canvass?

(*Mr. Mather.*) They were not canvassed. It was signed of their own free will.

(*Mr. Mather.*) The conviction which is expressed in this memorial is one which has gained ground very rapidly among the class of men from whom it emanates, and if we had a little longer time the number of signatures would have been considerably increased. It is the opinion of all classes interested in these ports that they should be enlarged so as to enable ships to have access to them at all times. That opinion is daily gaining strength.

Mr. Edward Killwick Calver, R.N., Admiralty Surveyor of the East Coast of England, examined.

Mr. E. K. Calver.

28,311. (*Chairman.*) Before going into the question of the invention of the Wave Screen, we will take any examination which the Commissioners may wish to pursue with respect to the general question, because, if you recollect, I put no question to you at Hartlepool on the understanding that you would be subsequently examined in town?—I have prepared a general statement on each of the harbours, which I should wisht o read.

28,312. (*Mr. Lindsay.*) Does that statement which you are about to read bear upon the question of the silting up of the bays on the north-east coast of England, and more particularly upon Hartlepool Bay?—It bears upon the general effects which I believe will follow the execution of the works proposed to the Commissioners.

28,313. Will it bear upon the question which I asked you with regard to the supposed silting up of Hartlepool Bay?—No.

28,314. Then, if you have no objection, I would ask you, have you anything to add to the evidence which you gave on that point before the Commissioners at Hartlepool?—None.

28,315. You have nothing to add?—Nothing.

(*Chairman.*) We will now have the statement.

(*Witness.*) Before reading the statement I may mention that I have been employed on the east coast of England and Scotland for the last twenty-two years; during that period I have paid special attention to the movement of materials upon the sea coast, and the causes by which they appear to be governed. I am therefore prepared to give the Commissioners information upon nautical questions; the effects which have followed the construction of works, and those which will probably follow the execution of the various schemes brought before the Commissioners.

I have prepared a general statement of my views on the subject of refuge harbours upon the Eastern coast of Great Britain. The remarks I have to offer upon the question will have reference to the sea-board included between the Pentland Firth and the Humber, with which my experience is more immediately connected, and they will be limited to the application of a few recognized and well-established principles as a test of the merits and claims of each of the suggested sites.

Notes on the Selection of Sites for Refuge Harbours upon the Eastern Coast.

Wick.

The case of Wick will be first considered from a general and not from a local point of view, viz.:—in its bearing upon the question of refuge for the passing trade, and apart from the special wants of the fishery of the district.

Geographical Position.—Wick, the north-eastern extremity of the entrance to Moray Firth, bears from Kinnard Head, the eastern extremity, north 68 miles; an east gale, therefore, blows dead into the Firth. A vessel in a gale, under the proper canvass, makes from four to five points lee-way, according to her quality, and the weight of the wind and sea; and it will be evident, that to any vessel near the above line, or even at some distance to windward of it, and becoming embayed, a harbour at Wick would be useless, as it would be impossible for her to reach it. Vessels often sail within this line, because their common track in westerly winds from Kinnaird Head to Duncansby Head is to the westward, or windward of it, so as to secure the advantage of what is termed a "short Firth," and, consequently, less sea. From such a position, Cromarty Firth offers a safe approach and perfect shelter, should a change of wind render it desirable, and thus, when a vessel becomes embayed in the Moray Firth, the refuge which she could not possibly obtain at Wick, is amply provided at Cromarty. As one of the proofs of the perfection of the latter harbour as a place of refuge, it is entirely free from the symbols indicative of loss in the Wreck chart, although hundreds of vessels annually seek its shelter.

Five-sixths of the cases of wreck and damage to shipping within the limits of the Moray Firth take place upon its southern shore, and probably result either from accidents while entering the imperfect tidal harbours on that side, or from being caught by an on-shore wind, while waiting for entry, and thus being placed upon a lee-shore. A refuge harbour at Wick would do nothing whatever in preventing this loss.

Although it may be proved by returns that two-thirds of the gales within the Moray Firth are from the south-eastward, which blow, consequently, directly upon the coast of Caithness, constituting it the lee-shore, that strand is singularly free from cases of wreck. This is the result of the coast not being a frequented one, being only used in general by small vessels bound to and from the harbours in the neighbourhood of Dornoch Firth, and by those bound by Tarbetness hugging the western land in westerly winds; and secondly, that when such vessels are caught by gales close in-shore, they either find shelter in the small harbours to leeward, in Portmahomack, the Little Ferry, or Cromarty, or they manage to weather the Wick land, and so pass on towards and through the Pentland Firth. If then, notwithstanding the coast of Caithness is the lee-shore in two-thirds of the gales which blow in the Moray Firth, and when a harbour at Wick might be presumed to be most required, scarcely any wrecks take place upon it, how can it be said that refuge for the passing trade is needed, and would be useful at Wick?

Much has been advanced about the dangerous character of the Pentland Firth, as bearing upon the formation of a harbour at Wick. If it is really a dangerous passage, which a vessel in south-easterly gales must necessarily run for at all hazards, and at the imminent risk of being lost, then the necessity for a harbour at Wick is apparent; but the case is entirely altered, if, by the adoption of common precaution, the Firth affords a ready escape under such circumstances.

Upon this point, the Wreck chart is very instructive. It will be observed, that only fifteen cases of wreck and damage are recorded against the Pentland Firth for the years 1852–56 inclusive, which, considering the great amount of the passing traffic, would assuredly have been otherwise, were the passage through the Firth necessarily accompanied by special danger. Too much stress is often laid upon single cases of wreck, as proving the necessity for refuge at a particular spot, whereas, if such cases were strictly analysed, and all the facts were fully brought out, it would be generally found that they resulted from circumstances which had little to do with the character of the coast, and that they had no real bearing upon the point at issue.

As respects the Pentland Firth, however, what is the fact in south-easterly gales? These winds, when opposed by the flood-stream, cause a highly dangerous sea in the Firth from side to side, but directly the tide changes, and the ebb, or lee-going stream, is fairly away, then the sea in the Firth is necessarily less than anywhere else in its neighbourhood; consequently, in the one case, the passage of a vessel could only be accomplished with extreme risk, and in the other, it is attended with no risk at all. This difference is clearly set forth in the North Sea Pilot, Part 2, where on p. 39, it is remarked respecting the Pentland Firth, that "during the "flood-stream in an easterly or south-easterly gale, it is "absolutely necessary to keep an offiing of six or eight "miles abreast the Pentland skerries until the flood-stream "has ceased. Three vessels were observed to founder on "the 18th August 1848, when attempting under these "circumstances to run against the flood, whilst others, "which kept their offing till the ebb made, effected a safe "passage to Scrabster road." This being so, any vessel crossing the Moray Firth in a south-east gale, and bound "north about," would have only to adopt the precaution of heaving to till the tide turned to enable her to pass through the Pentland Firth with safety; and it is not to be imagined that any seamen having the option, would attempt to use a harbour at Wick under such circumstances, with the chance of being locked in, when by heaving to for a few hours, he might pass through the Pentland Firth, and pursue his voyage without risk. It is true, that any vessel bound to the southward caught in a south-east gale, would be driven less out of her course by using a harbour at Wick, but this affords slight grounds for the formation of such a harbour.

Strategic Value.—The existence of Scapa Flow in the Orkneys, only 25 miles from Wick, with the several secure harbours surrounding it, forming collectively the finest rendezvous in Europe for a defensive fleet, entirely does away with the necessity for a station for war purposes on the Caithness shore. Scapa Flow is a secure and land-locked sea, with gentle tidal streams, moderate depths over good anchorage ground, offering with the harbours and anchorages about it every convenience, the most perfect security, and ample space for every class of vessel, and the most numerous fleets. The value and importance of this position in the event of a war with any of the Baltic powers is not to be over-estimated, for the chance of the western mercantile ports being successfully struck at by an expedition sent round the north of Scotland, would be materially lessened by the presence of a defensive squadron stationed in the Flow. The latter would be in connexion by telegraph with all the principal signal stations in Orkney, Zetland, the North of Scotland, and the Western Isles; and as the Flow possesses outlets to the eastward, southward, and westward, upon the first intimation of the presence of a hostile force the squadron could slip and follow it immediately, irrespective of the circumstances of tide, wind, and weather. It would not be easy to find a place possessing more completely all the important requisites for a naval rendezvous in time of war.

Wick bay, on the contrary, has a restricted area, which, except in the winter months, would be always required and occupied by the fishing boats and trading vessels of the district. Besides, everyone who has witnessed the nature of the sea sent home to the bay in easterly and south-easterly gales, must be aware that no vessel in Her Majesty's navy, with her guns and weights on board, could steam against it, let the necessity for quitting the bay under such circumstances be ever so urgent; and thus, while an enemy passing round the north of Scotland could be instantly followed by a squadron in Scapa Flow in any weather, another stationed in Wick bay might be locked in, and unable to move.

This exhausts the nautical aspects of the question, so far as general purposes are concerned.

Its Necessity.—The claims of Wick are really confined to its herring fishery, which is of a most extensive character, employing, as it does, from 1,000 to 1,200 boats, and about 6,000 men. A first requisite for the safe and successful prosecution of such a branch of industry evidently is accessible shelter in the immediate vicinity of the fishing grounds, to which the boats may resort on the first indications of a storm; and this they are nearly destitute of. Wick harbour, from whence the boats principally fish, is nearly dry at low water; the neighbouring creeks and harbours are too small to be available, and Cromarty Firth, at times attained by vessels in on-shore gales, is out of the reach of fishing-boats encumbered by nets and fish, and with their gunwales only a foot above the water. Losses frequently take place from the want of shelter, and they would be of still more common occurrence were it not that the boats remain in harbour in uncertain weather to ensure their safety, often to their serious loss and disadvantage in other respects. The want of shelter must be apparent to all, and it is unnecessary to enlarge upon it here.

The claims of Wick for assistance are as great as its necessity. If the saving of life be of the first importance in a national point of view, it is manifest that in this case it is exposed to special risks; and till a remedy is provided a wholesale loss of life and property must be always impending. It has also been fairly urged in favour of Wick that its fishery, employing men drawn from all parts of Scotland, and even from England, and increasing, as it does, the imports and exports of the country by a large amount, partakes more of a national than of a local character; and if it be right that the wants of every section of the sea-going community should in turn be cared for, then, as the case of the seamen employed in the foreign trade may be said to be provided for by the formation of the Channel refuge harbours, and that of the coasting trade will be met by the proposed harbour on the north-eastern shore of England, so should the fishermen, in like manner, be assisted by the erection of a refuge-harbour in the north of Scotland.

Nature of the required Harbour.—A harbour is required at Wick for the shelter of fishing boats; it should be easy of approach and entrance, and should afford perfect defence for the boats and small vessels using it. As it would not be required as a place of refuge for the passing trade, there would be no need to project it with special reference to such a purpose.

Looking at it from every point of view, I am clearly of opinion that a projection somewhat approximating to the designs furnished by the Messrs. Stevenson, and the late Messrs. Rendel and Bremner, would answer all necessary purposes.

There is much reason to fear, that any attempt to enclose the bay by upright-wall breakwaters from 12 feet below low-water mark, projecting from either shore, with an opening between them 500 feet wide in the centre of the bay, as indicated by the works A B and C D in the lithograph appended to the Minutes of Evidence taken before the Select Committee of the House of Commons, or by those on a more extensive scale, as L M and N O on the same plan, would result in failure. A fair following sea is an absolute necessity for a boat; with broken and confused water her safety is jeopardized every moment, for she no sooner rises to one sea than she runs the risk of being swamped by another topping her gunwale from a different quarter. Now it is to be feared that the heavy sea which sets into Wick bay would, on meeting the transverse solid work "full butt," be reflected from its face, and cause a confused and broken sea; harmless, perhaps, to a vessel of length and burden, but exceedingly dangerous to one of smaller size, and to boats. The

4 Dec. 1858.

width of the proposed opening, ample though it be, would not have the effect of preventing the formation of such an impediment in front of the entrance, and I have no doubt, after fully reconsidering the subject, that the evidence I offered upon it before the Select Committee of the House of Commons was essentially sound.

The work to protect the bay should begin a little within the south head, but be detached from the shore, in order to afford an escape from the destructive batter of the pent sea, and a southerly outlet for the boats in fine weather. From this, its southern terminus, the work, following, as near as may be, the six-fathom low-water depth, should extend with a gradual curve to the north-north-eastward and northward, and then, doubling in more rapidly, should leave a principal entrance into the bay between the northern end of the work and the northern shore. I have marked the suggested work in red on the accompanying lithograph. Among its principal advantages, such a projection would admit of the existence of a fair sea in the entrance, and of the safe passage of boats; it would cover in the whole of the body of the bay, and render it available for refuge; while, owing to the protection afforded by the Head of Wick and Proudfoot, the entrance would be in comparatively smooth water in easterly and north-easterly gales. The sea that would pass round the extremities of the work would run high upon the shores to about the positions marked A and B, but within these points it would be much less than it now is, owing to the comparative quiet that would be established over the body of the bay, and it would occasion but little detriment to properly constructed works along the foreshores for the purposes of the fishery.

Peterhead.

The geographical position of Peterhead has much in common with Wick, and the refuge illustrations already given in connexion with the latter place admit of a nearly common application to both.

The evidence I gave upon the subject of Peterhead before the Select Committee of the House of Commons, and which, after further consideration, I have no wish to alter, was briefly as follows; viz., that Peterhead being at a salient portion of the coast, where vessels with the slighest offing have the Firth of Forth and Cromarty Firth available to them in north-easterly and south-easterly gales, and as a vessel must be very close inshore to constitute the shore a dangerous one, a harbour at Peterhead would be comparatively useless for refuge, and I could not recommend any public expenditure for such a purpose.

This appears to be the broad fact concerning Peterhead, to which all others are greatly subordinate, and it deprives Peterhead of any just claim to be considered a site directly useful for the purpose of saving life and property. In one respect also the necessity for refuge at Peterhead would appear to be even less than at Wick, for whereas the Pentland Firth in south-easterly gales is closed against the passage of vessels during the continuance of the flood stream, and they are consequently obliged to hang out in the offing abreast Wick until the stream turns; no such impediment occurs at Peterhead, for a vessel can round it to the south-westward or westward before a north-easterly or south-easterly gale at any period of tide, and with nearly equal safety.

It has been said that many of the wrecks which take place upon the coasts between the Firth of Forth and Peterhead, and between Cromarty Firth and Peterhead, are those of vessels which could and would have sought refuge at Peterhead had it been provided there. The correctness of this statement can only be determined by a careful analysis of the wreck registers; but even allowing some of these cases to be established, it will be evident on comparing the aggregate loss on the coasts alluded to, with what it is on many sections of the east and west coasts of England, and the east coast of Ireland, that the claims of Peterhead of being indirectly useful are comparatively very small.

It has also been advanced, that the case of Peterhead is not greatly different from that of Holyhead; the harbour at which place is not sought by vessels for the purpose of refuge, so much as to avoid the risks and inconveniences connected with their being kept beating about at sea in adverse winds. The truth, however is, that the cases have little in common, and the comparison fails in one important and essential particular. A vessel neglecting the shelter of Holyhead has, on the occurrence of an on-shore gale, only the dangerous sands about the Dee and Mersey awaiting her on the one hand, or more dangerous embayment in Caernarvon bay on the other; whereas, a vessel may drive or pass to leeward of Peterhead on either side with impunity, having the Firth of Forth or Cromarty Firth under her lee, available at any moment.

The merit of a site for purposes of refuge may be viewed under two aspects; in some instances its value results from the dangerous character of the coast about it, while in others, it follows from its usefulness in preventing the safety of vessels from becoming jeopardized from their being kept at sea, or driven back upon their course by heavy weather. It is clear to my mind, that Peterhead does not possess the shadow of a title under the first head; I also believe that its claims under the second head are not such as to warrant an outlay of public money in the manner proposed.

It may be true that a large harbour at Peterhead would be exceedingly useful as a place of call, it might also be valuable as a place of stoppage in preventing vessels being driven far out of their course; but these are purely mercantile considerations, which have no necessary connexion with the question of refuge for the salving of life and property; and to supply Peterhead with additional accommodation at the public expense on any such pleas, would be, in fact, only to give it a commercial advantage over the neighbouring and competing ports.

The statements I made in evidence respecting the character of the suggested site, "that the water is deep, the "anchorage space small, and that it would require a con-"siderable outlay to form a harbour there," and which I have no doubt will be confirmed by the information acquired by the Commissioners, I need not further allude to here, as the mere fact of adaptibility of site is entirely subordinate to the question of the necessity for such a harbour.

I do not give a separate consideration to Fraserburgh, as its nautical characteristics, in their bearing upon refuge for the eastern coast of Scotland, are practically the same as those of Peterhead.

North-east Coast of England.

Bar Harbours as Places of Refuge.—The decision of the Select Committee of the House of Commons respecting the north-eastern coast of England, viz., that a harbour on a large scale is required to the southward of the principal coal ports, has been followed by a movement of the communities of those ports, having for its object the improvement of the present harbours, as all that is necessary to meet the requirements of refuge upon the coast. It will be well, therefore, to inquire into the soundness of such views, and whether it be possible to supersede the necessity for a single harbour of large size by any such means.

It is important to understand what are the requirements of refuge on such a coast as this. It is evident that the necessity must be measured by the largest description of vessel that frequents the coast; for whether light or loaded, they are as likely to become embayed, and to require refuge as the smaller ones. To stop short of this, and only to provide a retreat for light vessels bound to their ports, when loaded vessels, on quitting the latter, are subjected to a more than double risk, would only partially meet the case, and a large proportion of the vessels would be still exposed to wreckage and loss. A refuge harbour on the north-east coast of England, therefore, should at least be capable of admitting vessels of 20 feet draft at every stage of the tide; indeed many of even a greater draft, proceed to sea at high-water springs from the several harbours.

The harbours on the north-east coast of England are impeded at their entrances by bars of sand or similar material; and without here entering into a detailed explanation of the causes which have produced the feature, it will suffice to say, that on the coast in question, it arises from the action of the sea driving the material of which the shore is composed in the direction of the preponderating sea-stroke, the result of which would be the formation of a continuous beach across the entrance, were it not that the flow and reflow, due to the river, act as an opposing force; there is, in short, a perpetual contest going on between the effort of the sea to shut the entrance up, and a corresponding effort of the passing waters to keep it open. It therefore follows, that as the heaping power of the sea may be considered a fixed quantity, the size of the channel over each bar, as respects width and depth, will be determined by the proportion the power of the river bears to that of the sea. This is exemplified in the cases of the rivers of the district, where, for instance, the channel into the Blyth has a low-water depth of one foot, the Tyne about seven feet, the Wear three to four feet, Hartlepool three feet, the Tees eight feet, and so on; quantities which fairly represent something like the comparative sizes of these rivers, &c. Now, as the necessity for refuge may occur at or about low-water, it will be evident, that unless it be possible by artificial means to very materially increase the depth over the bars of the harbours upon the north-east coast, they never can afford the amount of refuge required, and which it is the object of the Commission to establish. Is it then possible to improve them to such an extent? *for the matter of depth is the vital point as respects refuge.*

The power of the sea to heap up obstructions is not affected by remedial measures; and the use of artificial works is nearly limited to the conservation of the power of the river, in other words, the narrowing of the area of its operation, that so, by increasing its force relatively to that of the sea, it may be more efficient for overcoming obstructions, and the direct result is, consequently, an increase of depth over the bar. All experience proves, however, that the utmost possible extent of improvement is confined to a small increase over the original capacity, and instances might be adduced where, after centuries of exertion and ample expenditure, the result has only afforded examples of the folly of attempting that which, in the nature of things, is impossible. Notwithstanding this experience, however, the expressions "removing the bar," "doing away with the bar," and "getting beyond the bar," are still frequently met with in documents recommending works, although it is clear that a bar is a condition of the existence of the outlet of a river which works can never remove, and can barely modify.

Confining myself to the north-eastern district for examples, Sunderland harbour is a case full of instruction; there the authorities, with a commendable energy, have been engaged in pier-building for upwards of 130 years, and the structures they have reared are alike creditable to constructive skill and to the enterprise of the port, but the gain, as regards depth at the entrance, has been exceedingly little. In Grenville Collins' chart of the port in the middle of the 17th century, a depth of two feet is shown on the bar; in Burleigh and Thompson's map of 1737, the depth is three-fourths of a foot, but as this depth, according to an explanatory note, was that of the "lowest ebb of a high "spring tide," the former quantity, two feet, may be safely accepted as the low-water depth upon the bar of the Wear while it remained in its natural state. Now the depth varies from 3½ to 4 feet, so that 1½ foot to 2 feet additional depth over the bar represents the gain in upwards of a hundred years, and the effect of extensive and costly works, for the great improvement of the port itself has not been due so much to the direct effect of the piers, as to deepening and cleansing operations within, by which the Stell Canch and other obstructions which were dry at low water have been removed, as will be seen by reference to the old plans of the port. It is, however, far from my intention to assert that the erection of the piers has not been followed by benefits commensurate with the outlay, or that additional works are unnecessary at the mouth of the river, but only, that as respects an increase of depth, the works hitherto executed have been nearly fruitless.

Take one more example, that of the Coquet Island. The necessities of the district requiring that some attempt should be made to improve it, works of an extensive character, involving a large outlay, were entered upon, the effect of which, as described by their projectors, would be "to render "the port equal to the Tyne and superior to the Wear, and "to maintain at the entrance a depth of from four to six "feet at low-water springs." I visited the harbour several years after the works had been carried out, and their effect fully developed, when, instead of a free and unincumbered approach as was predicted, an all but dry bar, of a horse-shoe form, extended across the entrance from pier to pier.

That the system will always so fail in materially reducing a bar may be expected when it is remembered that the extension of piers does not destroy the heaping-up power of the sea, but only transfers its operation to a more advanced position, and the extended works become, consequently, progressively charged on their exterior sides by an accumulation of soil, because, like groins, they will intercept the coast drift already alluded to, and thus prove the direct cause of the ultimate obstruction. This heaping-up process is clearly illustrated by the valuable series of plans attached to Mr. Murray's account of the improvement of Sunderland harbour, from which it will be seen that every extension of the north pier (the side from whence the drift arrives) has been followed by a corresponding extension of the flanking sand, and now the sandy low-water margin of spring tide ranges outside the north-pier head, which was built, so recently as 18 years ago, in a low-water depth of four feet and upwards. Every advancement of the piers having thus been steadily followed by the abutting sand, and by the bar, shows that wherever the actual mouth of the river may be established by the protrusion of works, nature will gradually accommodate herself to the new arrangement; the soil which is being constantly moved forward by the direct and oblique strokes of the wave will find a resting place, and be upheld by the works; and in the end, the bar will be formed at their terminations as before, with only the additional capacity to the channel over it, which is due to the extra impact of the coast streams upon it, and to any increase of power which may have been given to the river outset by the extension. Opinions may differ as to matters of detail in the projection of works, and the exact effect to be expected from them, but experience affords no warrant for the proposal to do away with the bar, or to get beyond it. I drew attention to this subject in my Treatise on Tidal Rivers, published upwards of five years ago. I therein remark, p. 96,—"It is "useless to project piers at the mouth of a tidal river with "the view of getting beyond the bar; wherever the outer "ends of such works are placed, the bar will still be found "in front of them. The intention, therefore, can only arise "from the want of a due regard to the cause of the "existence of the feature."

The advocates for extension state that the bar is the result of the pier-heads ranging with the line of beach, or foreshore, and that if the piers were advanced well into the sea, into what is termed a "natural depth," there would be no bar; but the natural depth alluded to is simply due to the unobstructed passage of the tidal streams along the coast, and the absence of a nucleus for the collection of soil in motion, which favourable condition would be done away with by the extension of piers, and there would be no means of preventing the latter being finally skirted by a beach or flat. The evil might, of course, be postponed for a considerable period, as the time necessary for its accomplishment would depend on the amount of moveable material and the extent of the works.

It is also urged by the advocates of extension that the sea has no propelling power at a greater depth than three fathoms at low-water, the depth at which it is proposed to establish the outer ends of the works; but such a supposition appears to be opposed to general experience. It is, for instance, anything but an uncommon occurrence for live shell-fish to be driven on shore in gales of wind round our coasts from greater depths than five fathoms. It was also ascertained during the North Sea survey, conducted by the present Hydrographer of the Navy, that shingle was moved from some offing ridges, through a depth of about twelve fathoms, towards the shore. Vessels sunk in depths of from nine to thirteen fathoms have occasionally broken up in gales of wind, and many other examples of a like character might be adduced to show that experience is against the above assumed limit to the sub-action of the wave upon the eastern coast of England.

I would refer once more, but very briefly, to my Treatise on Tidal Rivers, that the Commissioners may see that what I now advance respecting bar harbours is entirely consistent with my former views upon the subject. At p. 98 of that work I remark, "Each example of a river out-"let must be treated upon its own merits, yet in the appli-"cation of piers for improvement, it will be found in the "majority of cases, that *the first step is to accept the natural "position of the bar.*" I was then, and am still of opinion, that the advance of a bar seaward is objectionable, because, among other reasons, its frontage would then be comparatively steep, for like points upon a seaboard, the impact of the coast streams upon it would be more decided, and the additional sweep to which it would be exposed would give it a more sudden fall, and, as a consequence of this abruptness, the deep-water undulation which had been formerly gradually reduced by an easy slope, would arrive at the bar with its height undiminished, and when opposed by the ebb, would cause a far higher, hollower, and weightier sea than at present.

As the hollow and bursting character of the sea upon a bar during the ebb would be aggravated by improvement works, especially during freshes or floods, it is evident that river outlets are inseparably connected with a drawback which entirely unfits them for havens of refuge. Respecting these freshes or floods, it is worthy of special remark that they generally occur in easterly gales, adding to the dangerous character of the bar harbours at the very time they are required for refuge. Mr. Thomas I. Taylor, in his work on the "Improvement of the River Tyne," remarks, on p. 29, "For the last thirty miles of the course "of the Tyne and its affluents, there is seldom much fall "of rain from the south-west; the very heaviest floods of "the Tyne have, therefore, been accompanied by north-east "winds. Such was the case with the great flood of 1771, "which carried away the old bridge of Newcastle, and also "with many other high floods of the Tyne. The bleak "Scandinavian wind occasions in Northumberland, *in a "given time*, a more general and abundant precipitation of "moisture than any other," . . . . because, "owing to its "low temperature, it condenses the vapour contained in "our milder atmosphere," &c.

In confirmation of the above I may remark, I have been informed that the largest amount of damage done by a fresh in the Wear (when unaccompanied by ice) occurred in an easterly gale about twenty-five years ago, when the whole of the tiers in the lower part of the river broke adrift; the loaded vessels grounded on the flat, and, by forming a complete barrier across the harbour, dammed

LONDON.

Mr. E. K. Calver.

Dec. 1858.

back the waters to the height of several feet. Vessels and keels were also driven out to sea without anyone on board them, and were then cast ashore and wrecked by the gale.

The same fact of an easterly wind, accompanied by much rain, was illustrated so recently as the 25th ult. On that day there was a strong south-easterly gale, with nearly constant rain, and on the following morning a heavy fresh was setting out of the Wear; so that had the wind backed easterly and northerly, as is often the case, a sea would have been created sufficient to endanger any vessel attempting the port for refuge.

The great desire which now prevails for the improvement of the north-eastern harbours is most natural; extensive works have been designed for the mouth of the Wear, and others of still greater magnitude are in progress at the entrance of the Tyne; but experience teaches to little purpose if it cannot be applied in foreshadowing the result in cases like the present. There appears sufficient ground for believing, that whether the entrances to the Tyne and the Wear be attempted to be improved by the extension of one pier, or of both, or by others curving like embracing callipers in front of the ports, the result in either case will disappoint expectation, and the same lesson will be conveyed that has been worked out in other places, that a limit has been placed to the improvement of the depth in the entrances to tidal rivers, beyond which it is impossible to pass.

I mentioned in my evidence before the Select Committee of the House of Commons that considering the increase of the effective scour and the impact of the coast streams which they would occasion, it might be possible to obtain, by improvement works, a low-water depth of 10 feet* over the bar of the Tyne, or about a third more than it has at present. Such a depth, however, would be quite inadequate for the purposes of refuge upon the north-eastern coast of England; for no harbour of the sort, to be adapted for the reception of a vessel of 20 feet draft at every period of the tide, and making due allowance for the send of the sea, should have a less depth than from five to six fathoms at its entrance at low-water springs.

If the opinions I have expressed be sound, it would manifestly be a waste of public money to bestow it for the improvement of the entrances of the north-east tidal harbours, to adapt them to a purpose for which they are altogether unfit. Any alteration in them could only have a local value, and should be carried out by local funds; but whether it might not be a far-seeing policy, and a wise financial measure, to advance money at a low rate of interest for their improvement to the greatest possible extent, is altogether another question, and quite beside my province to discuss.

The North-east Embayment, and a Harbour at Hartlepool.—All that I can offer upon the subject of embayment, and the need of refuge which results from it; that Hartlepool is conveniently situated for the purpose at the head of the north-eastern bight, at an easy tide's sail south of the large coal ports, and possesses a free and unincumbered site, will be found in my evidence before the Select Committee of the House of Commons, and in the Appendix No. 1 to the Minutes; it is therefore unnecessary that I should repeat it here. I observed, however, that in the subsequent examination of witnesses, reference was made by the Committee to what was termed "Mr. Calver's Theory of Embayment," although any practical seaman will be aware that what is termed my "theory" is nothing new; it is, for instance, declared in express terms by Admiral Sir James Ross and Capt. Sheringham. Nothing, I think, can more clearly indicate the merits of the case than the foregoing evidence; and if it were necessary to define the value of a harbour upon a point, as it respects refuge, it could only be characterized as a place which could be used before refuge was wanted, but which could not be reached after it became a necessity; and a mistake in position in such a case would be materially aggravated, when the necessities of trade led the vessels into the bight which caused the danger. I shall not dwell upon this point longer, and I would not have referred to it so frequently in the course of making these notes, were it not that it is to the principle in question that all pleas of necessity for refuge must be brought as to a touchstone.

But although it is needless that I should add to my evidence, pointing to Hartlepool as the most valuable refuge site between the Firth of Forth and the Humber, I would offer a few words in explanation of it, the accuracy of my statements, as well as the consistency of the views I have at different times expressed, having been called in question.

The objects of inquiry before the Select Committee of the House of Commons were, the necessity for refuge for life and property, and the places where to supply it; and my various replies, therefore, bore directly upon and were nearly confined to these two points. I mentioned (Reply 2312) that the greatest loss actually resulting from the want of refuge upon the north-east coast of England, takes place in gales from "east "by north, that being the direct embaying wind;" and also (Nos. 2314, 2240) that in gales from south-east, "refuge is not "required; then there is a fair and free outlet without any "difficulty," because "a south-east gale is not an embaying "wind." It has been objected that this is not correct in fact, inasmuch as the heaviest loss takes place in south-east gales. That a large number of vessels are lost occasionally in south-easterly gales, I am well aware (and I alluded to it in evidence), not because a south-east gale is necessarily a dangerous wind, and refuge from it is required, but as I stated (No. 2263), because "men will sooner risk their ports "when they are dangerous, than pass them," and obtain shelter in Holy Island harbour, or in the Firth of Forth, as it would be in their power to do. The evil, then, of the large coal ports being the "centre of a great crop of wrecks," I go on to state, in so far as it results from vessels seeking shelter in south-easterly gales, would be prevented by the establishment of an efficient harbour at Hartlepool. I am aware that it is denied such a result would follow; but I feel confident that when it became a question between twenty-four hours detention at Hartlepool, and the imminent risk of the loss of the vessel, the recklessness which is now so common would give place to the prudent dictates of self-interest.

The exact line of embayment in the lithographic plan intended to illustrate my evidence, has also been objected to. This line, however, was not projected by me without due care, for its northern termination is at North Sunderland point, where a vessel has Holy Island harbour available, and to the southward it ends at Robin Hood Bay; because I am of opinion that upon the coast south of that point, no necessity for refuge can arise, unless the commonest precautions be neglected, or except in the extreme case of a sudden gale catching a vessel very close inshore. It has been suggested, that to have reference to local traffic "the line should have been drawn from the mouth of the "Tyne to Robin Hood Bay, and to embrace the general "traffic it should extend from the outermost Farn Island to "Flamborough Head;" but, in reality, no such nice distinction can be drawn in practice. For instance, the coal fleets on leaving their ports in moderate weather, but with a foul wind, often stretch to the eastward, or outside the embaying line, while the passing trade in westerly winds are often sailing to and fro for weeks within it. Any attempt of the sort would only lead to a labyrinth of difficulty and probable misdirection in the end, and, evidently, the only safe way of treating the question is to consider the north-east embayment as one great bight bounded by one general and containing line, within which vessels using the coal ports or coasting must or may pass and be exposed to the risk of becoming embayed. An allusion was also made on the same occasion to a statement of mine, that "vessels would "keep an offing and pass on to the Firth of Forth, were it "not for the existence of the coal ports," a statement which had reference to the north-easterly bight in south-easterly gales, and not to vessels forced into it by gales dead on without the means of escape, as was suggested.

One more point in explanation. In reporting to the Admiralty on May 31st, 1855, upon Mr. Rendel's proposal for the mouth of the Tees, I recommended it so far as the north breakwater was concerned, because "it would render "unnecessary a large outlay at a neighbouring site (meaning Hartlepool) to secure a similar advantage, and where "there are physical drawbacks which do not exist in the "present case." There has been some misapprehension with regard to the expressions "large outlays" and "physical drawbacks," which have been understood in a sense they were never intended to bear, for they had reference only to Mr. Rendel's proposed close harbour there, which I had just previously been reporting against; and that they were not used by me to imply any drawbacks as actually pertaining to the site is clear, for in the same report I suggest a covering work for the protection of the bay, that "a permanent harbour of refuge might thus be obtained at "Hartlepool without incurring any of the risks involved "in the scheme reported against." One reason, among others, which led me to believe in the danger of forming a close harbour there, was the accumulation of foreign matter which had taken place in the body of the bay subsequent to the Admiralty survey of 1838, but whether the increase was temporary or otherwise will be learnt with certainty from the periodical examinations made by the haven-master, and from the investigation now being made by order of the Commissioners.

There can be, in my opinion, little doubt that, whether as respects its geographical position, or the character of its

* I may mention that this estimate had reference to Mr. Walker's original projection.

frontage, Hartlepool offers superior advantages to any place between the Forth and the Humber, and I have no hesitation in repeating what I have already stated in evidence, that "nearly all the loss of life and property which now "takes place in the north-eastern bight from actual stress "of weather," might be prevented by the establishment of a large refuge harbour at the head of Tees bay, abreast Hartlepool.

FILEY.

If only one harbour for saving life and property is to be formed upon the north-east coast of England, there are several reasons why a harbour at Filey should not be allowed to enter into competition with one at Hartlepool.

First. As in the majority of cases, on-shore gales find vessels generally distributed along the line of track between the coal ports and Flamborough Head, a harbour of refuge at Filey would be useless to nine-tenths of them, and they would, consequently, be forced into and become wrecked within the line of the north-east embayment, just as they are at present.

By adopting timely precaution, vessels caught in on-shore gales between Whitby and Flamborough Head, would (except under very exceptional circumstances) obtain the shelter of a harbour at Hartlepool.

A harbour at Filey would only (in reality) be a stopping place, whereas a haven at Hartlepool would be one of refuge, and directly useful for the salving of life and property.

Secondly. A harbour at Filey, from being necessarily projected on the principle of a prolongation of the "brig," light vessels caught short of their ports and forced to bear up in north-easterly and northerly gales, could not enter it, and they would be forced to pass on to Bridlington Bay, as at present. It is quite clear, that light colliers under small canvass, which never make less than about four points leeway, would be unable to fetch into the projected harbour in any wind to the northward of east.

From being so projected, conditions would be established eminently favourable to deposition upon a coast where the waters are always highly charged in blustering weather, and there would be a rapid accumulation of matter. The projector of Filey harbour in his report recommending it, remarks "there is no tendency to sand or silt up." This is quite true, and the statement would, no doubt, be applicable for centuries to come, provided the disturbing and transporting power of the wave and tide-stream were not interfered with, but once intercept them, and accretion will follow immediately. It will be apparent on referring to the depths on the plan, that a few feet of deposit would destroy the site for refuge purposes.

Thirdly. When the necessities of the north-east coast were provided for by a harbour at Hartlepool, if it were judged expedient to form another in the neighbourhood of Flamborough Head, Bridlington Bay should be preferred for the purpose, as it would render secure one of the most frequented anchorages upon the eastern coast; which anchorage, if it were defended by a covering work upon the Smithic, would never fill up; which would have the advantages of great space and an inner harbour; and which, while it would be of the greatest service to light vessels, would doubtless be reached by and afford security to many of the loaded ones, which are now occasionally forced to hover under the protection of Flamborough Head in scant south-westerly winds.

The summary of my opinion upon the refuge question, so far as the choice of sites upon the eastern coast is concerned, is, therefore, as follows:—

That a refuge harbour is urgently needed at Wick, as a security for the thousands of lives as well as for property, which are so much exposed in its important fishery, the largest in Scotland.

That a harbour either at Fraserburgh or Peterhead would not be useful for saving life.

That bar harbours are, and must ever continue to be, nearly entirely unfitted for refuge purposes in cases of extremity.

That a harbour at Hartlepool on a proper scale, projected and constructed upon correct principles, would afford refuge from stress of weather to the loaded vessels now commonly embayed and lost, with many of their crews, within the line of the north-east embayment, and even to as far as Flamborough Head. It would also receive light vessels caught short of their harbours, a circumstance of frequent occurrence; while the establishment of such a harbour would render unnecessary the risks which are now run by light vessels in pushing for their several ports in south-easterly gales.

That in no case, so far as the saving of life is concerned, should a harbour at Filey be allowed to enter into competition with one at Hartlepool; and that if it were required to form another harbour in the neighbourhood of Flamborough Head, it should be established in Bridlington Bay, for reasons stated.

Such are my opinions upon the subject now being investigated by the Commissioners. I mentioned in the beginning of these notes that they resulted from the application of a few recognized and well-established principles to the respective cases. They are principles to which I have always submitted every question of a like nature which has been referred to me for my opinion, believing, as I do, that a steady application of them to each instance, unless there be some local peculiarity in a case to constitute it an exception to the general rule, contributes to render a decision easy, as well as sound in character. A brief statement of them may, therefore, perhaps, not inappropriately conclude these remarks.

1. A refuge harbour, for saving life and property, may be defined as one with a free and unincumbered approach; having its position well marked from the offing by the character of the adjoining shores; so projected and constructed that its capacity shall be permanent; and also that vessels of all descriptions, from the largest downwards, that frequent the coast, may be able to enter and ride safely within it, under every possible circumstance of tide, wind, and weather.

2. Refuge is required when a coast is dangerous, which can only be so considered when the shore forms an indenture, and exposes vessels from stress of weather to the risk of becoming embayed without the means of extrication. The need of refuge in such a case is increased in proportion to the number of vessels and men employed upon the coast.

3. The head of a bight is the proper position for a refuge harbour, for the one simple and paramount reason, that vessels can reach it from nearly every part of the bight, when the latter is rendered dangerous by the wind blowing into it either directly or obliquely. An asylum harbour, placed in any other part of the indenture would, on the contrary, be only partially available.

4. A harbour upon a point or salient portion of a coast is not needed for refuge, because a vessel's necessity in on-shore gales begins only when she is actually within the line joining the horns of a bay, or, in other words, to leeward of the point. The fact, therefore, of leading a vessel from the offing down to a point, is to induce her to exchange a position of safety for one of comparative danger, because the operation of closing and entering any harbour must always be attended by circumstances involving a certain amount of risk.

5. A harbour upon a point would be indirectly useful for refuge when it can be clearly proved by *bonâ fide* returns, that vessels passing the point from stress of weather have afterwards become wrecked upon the shores right and left of it, either from the wind backing out and placing them upon a lee-shore, or from obscurity of weather, or from the various mistakes incidental to navigation.

6. As refuge, to be worthy of the name, must always be available, whatever be the circumstances of tide, wind, and weather, bar harbours are not fitted for the purpose, nor can they ever be rendered so. The low-water depth over the bars in this country varies between six and eight feet as a maximum, and two and three feet as a minimum, depths, which experience proves can never be materially increased by artificial works. As the necessity for refuge may occur at low water, it is evident that at such a time these shallow inlets offer no escape for vessels of the smallest class, nor do they afford any to the larger ones, even at high-water. Bar harbours are also subject to another inconvenience peculiar to themselves, namely, the dangerous breaking sea caused by the ebb-outset.

The foregoing observations embrace all I have to offer, and I have to apologize to the Commissioners for the length to which they have been extended.

28,316. (*Chairman.*) There is a question that I should like to ask you with reference to the plan which I have before me, which I find in a report of a committee of the House of Commons, showing the line of embayment. I see that transverse lines, which show the distances between it and the several ports, are drawn from it to a line along the coast. What is that line?—The line of 10 fathoms.

LONDON.

Mr. E. K. Calver.

4 Dec. 1858.

Chairman.

28,317. Why is 10 fathoms selected?—A safe offing abreast each port.

28,318. Because 10 fathoms is a safe offing from the ports. Is that it?—No.

28,319. Why is this 10-fathom line selected and drawn upon this plan?—It is to show the depth of the offing at each of those ports between the line of embayment.

28,320. Because you see that if the line of the Tees, for instance, was drawn home to the shore, it would show that the mouth of the Tees is equally embayed with Hartlepool, but at present the plan shows that Hartlepool is more embayed than the Tees?—That depth of 10 fathoms laid down there is the position in which vessels would be that were hovering, about to enter the several ports. I thought it better to project the transverse lines to some definite line of that sort than to do it in any other way, which perhaps might meet with some objections.

28,321. You thought that was a better mode than projecting the transverse line to a depth of water, say 5 fathoms, or whatever it might be, in which the mouth of the harbour of refuge would be placed?—At the time I projected those lines I had no definite schemes before me, and I thought it was a safe plan to prevent any objections being made.

28,322. With reference to the plan of Wick Bay, upon which I see marked in red your proposed breakwater, I notice that it is curved in a bit to the northern and southern extremities. In your evidence you said, I think, that you were of opinion that the sea between the points B and C would be a cross sea from the shape of the proposed piers?—That was so.

28,323. Will you explain to me, if you consider that the form of your breakwater is more favourable for the prevention of a cross sea?—It is favourable because it offers no direct line of resistance to the action of the reflected or reverse sea. The sea meeting that work at a time when a refuge might be required instead of being reflected from it and run along it, and would be projected a certain distance from the end; but it would cause nothing like a confused sea.

28,324. Then, generally speaking, you would say that a bell mouth is favourable to a fair sea in the opening?—A bell mouth formed by an artificial work on each side I should not recommend there. There are several important reasons why a bell-mouthed entrance, so constituted, should not be attempted at that place.

28,325. I mean with reference to the sea, because this is laid down upon the plan as a bell mouth?—As a broad principle I would say that a bell mouth as therein arranged is the better.

28,326. It was simply with reference to the sea that I was speaking?—A bell mouth is better with one side formed by the shore ledges, from which there can be no reflected sea.

28,327. Your idea is that the sea runs along the pier, and does not interfere with the sea in the opening?—It does not; the practical effect of a bell mouth of an acute angle is to cut off a certain section of the undulation, and to admit of that undulation advancing in an undisturbed course, whereas with an entrance by piers of an opposite character formed by works parallel to the line of undulation, the simple effect is, that it causes a rebound, which rebound causes a confused sea, and, consequently, a dangerous one.

28,328. Therefore you are distinctly of opinion that when the sea strikes the pier, as I see it marked upon this plan, that there would be no rebound?—These works which I have projected could only receive a south-east sea, which would be oblique to the direction of the work, and the result of its being so oblique to the direction of the work is, that it would pass on and cause it to hug the work, and there would be no rebound.

28,329. Is your statement that it could only receive the sea in that direction founded upon observation, because I am under the impression that we were told in evidence, that with the wind from north-east to south-east the sea would be fair into Wick Bay?—The sea is always fair into Wick Bay, and would at the north end of the work be a very regular sea, whereas that same sea would cause a heavy reflected sea from the works I have already specified, marked O and N, and M and L, for the reason that they are directly opposed to the direction of the undulation; but the rebound ceases at a certain angle. I am not prepared to say what that angle is, but at a certain angle it ceases. When the angle between the direction of undulation and the direction of the works is decreased to a certain amount, there is no longer a rebound, and the waves, instead of being reflected, hug the works, and run along them undisturbed.

28,330. That is not a theoretical opinion merely, but one based upon constant observation?—Upon constant observation.

28,331. (*Sir F. Smith.*) You said that one of the elements of a good harbour of refuge is a well defined approach. Was not that the expression which you used?—Yes, it was so.

28,332. Is there a well defined approach to Hartlepool—can you say?—Yes, a very good one.

28,333. Will you tell us what it is?—It is defined by Hartlepool Heugh, a headland of limestone some 40 or 50 feet above high water at one end, and the Cleveland hills, some high eminences, on the other.

28,334. You consider that is well defined?—Yes, well defined.

28,335. (*Mr. Lindsay.*) You recommend the construction of a harbour at Wick, upon one ground and upon one ground alone—the very large fishing trade that exists there, and the saving of life among the fishermen which the harbour would effect?—I do.

28,336. And that so far as the passing trade is concerned, you do not recommend the expenditure of public money at Wick?—No, I do not.

28,337. Is the loss of life in the fishing trade greater than what it is in any other maritime pursuit do you know?—I cannot say from experience.

28,338. Do you know whether the loss of life in the fishing trade, especially about Wick, is greater in proportion than it is in any other maritime pursuit?—I am not aware.

28,339. What is the largest amount of life that has been lost at one time, at Wick?—I am not aware.

28,340. It was stated to us in evidence that in one gale 28 lives were lost in Wick Bay?—From my knowledge of Wick Bay I think that is very possible.

28,341. Are you not aware of the amount of loss of life that has taken place there during 20 years?—I am not aware of the particulars, I only remember the general facts.

28,342. Consequently you are not able to say how many lives a harbour of refuge would have saved if it had been constructed there 20 years ago?—No, I am not.

28,343. Well then, when you recommend the expenditure of public money for the saving of life to one section of the community and of one section alone, do you not think it would have been as well to have examined the proportionate loss of life among the fishermen compared with that in the home trade or any other maritime pursuit. Would it not have been as well for you also to have examined the facts so as to inform us what amount of life the expenditure of the public money there would have saved during the last 20 years?—I did not think it was necessary for me to inquire into that, as an element in forming an opinion. I know the nature of the fishing—that it is carried on in boats, and I know the nature of the coast and the gales of wind which often occur there; and I am aware that the fishing so conducted is exposed to special risks, and without knowing exactly the amount of loss of life which has occurred from year to year, I know that at any moment when there is the absence of the precaution which so generally characterizes the fishermen, there is, from the want of a harbour, the chance of a wholesale loss of life.

28,348. Well then, if you recommend the expenditure of the public money at that particular spot called

Wick, for the saving of life, would you consistently, if it rested with you to decide, refuse to any other port a grant of public money if they could show the expenditure of the money would save life at that particular spot?—If there was a large loss of life, I should be prepared to recommend an expenditure in the same way as here.

28,345. To carry out your principle, and to show you what it would lead to, I will tell you that it was given to us in evidence that at Wick, in one gale about 28 lives were lost, and it was upon that ground as I understood that a claim for Government aid was based. It was also given in evidence before us that at a place called Clovelly, in Barnstaple Bay, in one particular gale 29 fishermen lost their lives upon entering that small harbour, therefore if the public money was to be voted for the saving of 28 lives in one gale at Wick, could the Government consistently refuse to grant the public money for the construction of a harbour of refuge at Clovelly, where it had been shown that a harbour there at one time would have saved 29 lives?—If the amount of the fishing trade there is equal to that at Wick, and the want of a harbour is as great, I should for the same cause recommend an outlay of public money at Clovelly, but if there is not the same amount of fishing, nor the same risk of a wholesale loss of life there, I think Wick should have the preference.

28,346. But it might happen that the dangers of the particular coast were so great, that out of 1,000 lives the risk upon that coast would be much greater than at some other part of the coast where 2,000 men were employed and 2,000 lives were exposed to risk. Therefore you would not vote the public money according to the number employed, so long as it is confined to a particular class of the community, but in accordance with the risks which the persons so employed incurred if you voted it only for the saving of life. Now I have given you an instance where at one time 29 lives were lost, and I ask you upon what ground you could refuse to grant to Clovelly a sum of public money for the saving of life, while you would grant it to Wick for a similar purpose there?—I do not say that I would refuse Clovelly a sum of money, but I do say that in order of importance Wick is the first, because I am not aware that there is the same amount of fishing, or of risk at Clovelly. I recommend distinctly that the money should be spent at Wick, on account of the great number of men that are exposed to any sudden occurrence, whereby at any moment from unforeseen circumstances, a wholesale loss of life may occur, and therefore the practical effect might be that 1,000 men might be lost at Wick, whereas at Clovelly with only a small fishing, no such circumstance could occur.

28,347. Say that you voted 100,000*l.* for the saving of 20 lives per annum at Wick, could you refuse 50,000*l.* for the saving of 10 lives per annum at Fraserburgh, or Peterhead, or Clovelly, or any other place along the coast?—They should each be assisted according to their claims.

28,348. Then you would, wherever it could be proved, or wherever it was supposed that the expenditure of public money would be the means of saving one life per annum, you would vote a sum of money to that place in proportion thereto?—In proportion to that, coupled with the risks incurred.

28,349. Well now, Mr. Calver, do you not think that the claims upon the public purse would be very large indeed in the course of every year, and of every session of Parliament?—I do not say that I would enter upon it all at once. They should be taken in priority, according to their necessities, and as the public funds would admit of. I do not say that I would do all these things immediately. I would observe that there is a pressing necessity, as far as the fishing community is concerned, of immediately doing something at Wick.

28,350. Would it end there? Do you think that the expenditure of the public money for the saving of life would be confined to that?—Could you stop there without reference to other classes of the community?—No, of course not.

28,351. You could not stop there, you think?—No; life is as valuable and as much exposed in a coaster as a fishing vessel.

28,352. Take an extreme case, and suppose that it could be shown, as I have no doubt it could, that a very large amount of loss of life takes place from ships being badly found, from their having bad ground tackle, and various other similar causes, would you recommend that the public money should be applied to the purpose of supplying those ships with better ground tackle and other stores?—No.

28,353. How then could you grant it in the one case and refuse it in the other, if better found ships and better ground tackle would be the means of saving of life?—Those are defects which must be remedied by the owners of the vessels; the risk does not result from the dangerous character of the coast.

28,354. Does it not, then, really all come back to this, that the Government would not be justified in granting the public money, unless it be for purposes in which all classes of the community are interested. Does it not come to that in fact?—That is my opinion. I have said so in my evidence.

28,355. That the Government would not be justified in voting the money unless it can be shown that the whole of the parties to whom the money belongs may derive some benefit from its expenditure?—I have mentioned that I consider the foreign seamen have been provided for by the Channel harbours; the coasting seamen will be provided for by the works upon the north-east coast, and that the fishermen are the next in order.

28,356. If that is the principle, how can you recommend the voting of public money for one particular section of the community, the fishermen of Wick?—On account of the extent of the fishery, and the number of lives that are exposed.

28,357. Would the public, as a whole, derive any benefit from that harbour?—The public would experience damage in the case of a wholesale loss of life to which the Wick fishermen are constantly exposed, and must ever be, while the men have no harbour which they can take at all times.

28,358. Would a harbour at Wick enable the fishing boats to go to sea often, when they are now from going out on account of there being no harbour?—In my opinion, they would.

28,359. Consequently they would derive a considerable pecuniary benefit from the construction of the harbour there?—That is my opinion.

28,360. Consequently they would be able to bear a tax for the construction of such a harbour?—That is my opinion.

28,361. If that be so, why should they come to the public purse and ask for money?—I think the general public might bear a portion of the expense, and those who would derive a direct benefit from the harbour might also bear a portion of it.

28,362. You come now to a different proposal. You recommended the whole grant from the public funds before, but now you say a part only?—I have been misunderstood. Assistance would have been the better term. I do not mean to say that the Government should come forward with the whole amount.

28,363. Your meaning, then, is, that the Government should come forward with a portion of the amount that would be required?—Or perhaps the whole outlay at first, and imposing a small tax upon the community benefited, for the use of, or for the work itself.

28,364. You would not recommend that the whole sum that might be necessary should be given by the Government in the shape of a grant?—I think not. I think the community, who are directly benefited, should to a certain extent assist in defraying the expense.

LONDON.

Mr. E. K. Calver.

4 Dec. 1858.

Mr. Lindsay.

28,365. To what extent would you say ?—I am not prepared to say.

28,366. You do not think that Wick is necessary as a harbour of refuge for the passing trade ?—I do not.

28,367. And you also are of opinion that Peterhead is not necessary for the passing trade ?—I am of that opinion.

28,368. As a port of call, would Peterhead be of much advantage ?—I am not aware of that.

28,369. Would it be of much advantage, do you think, say to ships coming home from the Baltic in the fall of the year, when they often meet with long detentions from adverse winds ?—If it was considered necessary to provide accommodation for a purpose of that sort, I should be inclined to place it further down the coast.

28,370. What port do you consider better fitted for such a purpose as that?—Midway between Peterhead and the Tay, because while it would answer as a place of call for vessels coming home from the Baltic, and going in to obtain supplies, the same harbour would also render the coast secure in case of on shore gales.

28,371. Where would you find a site between the Tay and Peterhead ?—I have not considered the subject, except in a general point of view.

28,372. Are you not prepared to point out any place between these two ports which is suitable for a harbour of refuge ?—No I am not.

28,373. You have offered some very strong opinions as to the improvement or as to the folly of attempting to improve Bar harbour, and it seems that you are decidedly of opinion that the public money should not be voted for that purpose ?—I am.

28,374. Now so far as I could make out, you said that a pier was only another name for a groin. When run out it collected sand and made the land ? —Generally it is so. The general effect is that of a groin.

28,375. And I think I understood you to say, that a bar at the mouth of a river was principally formed of sand which was driven along the coast or washed in from the sea ?—Yes, that is my opinion.

28,376. And you said that if a pier was run out at right angles from the coast, sand would go on collecting behind it until it reached beyond the pier ?—Yes, that is my opinion.

28,377. And that it was a mere question of time, until it gets out sufficiently far to form shallow water outside, at the end of the pier ?—Yes, that is so.

28,378. Let us look at the Tyne, which is now before me ; if these are your opinions, what has the situation of the river Tyne to do with it, because this silting up would take place exactly the same if there was no such river as the Tyne at all here ?—I do not distinctly understand you.

28,379. I will repeat it, as I am asking for information. Looking at this plan, you see the south pier, as it is laid down in the chart. You say the sand drifting along from the south, collected from the south of this pier ; by degrees it creeps out to the end of the pier, and in time gathers at the mouth? —I refer to the drift from the north to the south.

28,380. Take it so then.—The great drift upon the whole of the east coast of England is from north to south. That is the general drift, and when that is not the case, it arises from special circumstances, which are easily explained.

28,381. That being the case, we will take the north pier. If the drift is from the north to the south, then the sand will go on collecting at the back of the north pier, until it creeps out to the pier end ?—Yes, that will be so.

28,382. Well,then, it will go on until it forms a bar right across, from the north pier end to the south pier end ?—I believe that a bar will be eventually re-formed nearly between the pier heads ; perhaps the shallowest ridge of it might be in the horseshoe form a little outside them.

28,383. That is the operation which goes on at all places, is it ?—That depends upon the nature of the case. All rivers are not encumbered with bars.

28,384. The answers which you have been giving to me have had nothing to do with anything coming out of the rivers. All they have had to do with, has been that which comes along the coast.—The movement along the coast line.

28,385. Well, if there was no such thing as the river Tyne at that particular spot, would that gathering of the sand take place then ?—I assume that you mean if it was an open place with no issuing river.

28,386. Suppose the coast to be as it is on the chart, and suppose there was no river Tyne there at all, but that the coast was exactly the same in all respects, only there was no river Tyne, would the gathering of the sand take place behind the backs of these piers if they were run out ?—Yes, just the same.

28,387. Very well, then. What you say affecting the running out to sea of these piers would apply to Hartlepool or to Filey, where there is no river, or to any part of the coast where the sand drifts along ?— Just the same.

28,388. Therefore your opinion did not apply to the site of the river, but to any particular part of the coast wherever you may run out piers at right angles with the coast.—Any part of the coast, whether opposite to the mouth of a tidal river, on the straight coast, or any other part, so long as the work is practically a transverse work to the line of the drift, the practical effect is the same whether at the mouth of a river or in any other part.

28,389. Say that you were to run out piers at Hartlepool, to which you are strongly favourable ?— I am a strong enemy to anything of the sort.

28,390. Then how would you make a harbour at Hartlepool ?—By covering works entirely.

28,391. You would say that if a pier was run out from the Heugh at Hartlepool the effect would be exactly the same as it would be with a pier run out here on the Tyne ?—Just the same.

28,392. It would be the same on any part of the coast?—Just the same where there is a coast drift and the work acts as a groin.

28,393. In fact then the river has nothing whatever to do with the creation of a bar. Your evidence goes to that.—I beg your pardon. Oh dear, no. The river presents an opening in which a bar may be formed.

28,394. You told me that the effect of the gathering of the sand would be exactly the same if there was no river Tyne here at all ?—Just the same. It would be a dead flat bank outside.

28,395. But the river being here has nothing whatever to do with the formation of that collection of sand ?—A bar strictly speaking is an impediment to getting into a river. You cannot have a bar in any other place. A bar is an obstruction on entering a river, and the existence of the river makes it a bar.

28,396. You have been telling me that if you could run out piers at any other part of the coast, sand would collect in the same way as it would do at the mouth of the Tyne ?—Yes, just the same.

28,397. And would form a bank with shallow water right between the two pier heads ?—The difference between the two cases would be that where there is no river it would become in the course of years a sand flat.

28,398. What is the difference between a sand flat and a bar ?—A bar is a stop or obstruction on entering a river.

28,399. Is not a sand flat an obstruction on entering a river ?—The difference is this :—The enclosure of a bay like Hartlepool bay would tend to produce a flat of sand enclosed between the piers, but where there is a river there is a bar.

28,400. But what is the difference between a sand flat and a bar ?—A sand flat would be dry at low water or perhaps at high water. A bar is an obstruction over which there is a certain depth of water at low water, according to circumstances.

28,401. Well, then, the formation of piers at any part of the coast where there is no river would create that which is even worse than a bar?—If there was no issuing river it would be a sand flat.

28,402. Therefore your evidence goes to the effect, that if you run out piers at any part of the coast with a drift of sand on either side, the consequence will be that you gather the sand at the back of the piers and finally close up the mouth or entrance?—Yes; that is so.

28,403. It does not apply to the site of a tidal river any more than it does to any other part of the coast?—Oh yes, but it is somewhat different. If you perceive, a river is not dry near the channel of the river, and this obstruction, which is termed a bar, is at the outer portion of the river, but if it was a mere enclosure by two piers with no issuing river, the difference would be that it would be a solid flat nearly dry up to high-water springs. There would be no bar properly speaking. It would be altogether dry, whereas a bar strictly speaking is a stop or obstruction upon entering a river.

28,404. Therefore, if piers were to be carried out at any particular part of the coast, it would be a greater advantage to carry them out on each side of a river than upon a site where there was no river?—That depends upon circumstances.

28,405. Because if the river would clear the sand away to a certain extent. Is it the case that it would do so?—No; it depends upon the nature of the piers at the mouth of a tidal river, whether they are effective or not. But I do not exactly understand the question.

28,406. If it is the case that these piers run out at right angles to the coast act as groins and collect the sand until it accumulates right at the end of them, right across the entrance; if that be the case as you say, would there not be a greater accumulation of sand within those piers where there was no river than there would be where there was a river to drive it partially away?—Distinctly, when you have river you must always have a channel.

28,407. You said the depth of water on the bar of the Tyne was 7 feet, I think?—About that, as I understand.

28,408. You also said that with the piers now in course of construction, if they were run out to a depth of 14 or 15 feet, you think that the tendency would be to increase the depth of water on the bar from 7 feet to 10 feet?—I think, as an estimate, it would be about that. That by carrying out the piers to 14 feet you would deepen the water on the bar from 7 feet to 10 feet.

28,409. Well then, why, by carrying them out to 30 feet, should you not deepen the water on the bar from 10 feet to 18 or 20 feet?—Because you involve the same amount of obstruction without increasing the force for overcoming it.

28,410. Now then say that these piers were carried out to a depth of 36 feet, would they be able to maintain that depth between them?—Again making an estimate as near as I can, I have no reason to say that you would have more than that. The only difference in depth would be due to the extra amount of tidal water which you admitted. I am not prepared to say it would produce much effect.

28,411. You are not prepared to say that a greater silting would take place then than does now, do I understand that?—No; my estimate is that with Mr. Walker's original projection, there might ultimately be upon the bar a depth of about 10 feet, and with the enlarged plan ultimately about 11 feet.

28,412. And that the bar would remain about the place where it now is or thereabouts?—Distinctly not; it would be between the pier heads, wherever they may be placed.

28,413. Do you mean to tell us that if we carry out the piers to 37 feet at low water, that in course of time it will fill up so as to have only 10 feet or 11 feet water there?—That is my opinion.

28,414. That is your opinion?—That is my opinion distinctly.

28,415. Because I asked this question yesterday of a very eminent engineer, and he looked at me as if I was asking the most extraordinary question it was possible to conceive. Then if we carried out the piers to 60 feet, do you mean to tell me that the bar would be carried out to, and that there would be but 10 feet water where there was 60 feet when the piers were constructed?—I do not like to say 10 feet or 11 feet exactly. The only difference would be due to the amount of the tidal water you admitted in your enlarged works, to produce an increased depth. I am prepared to say that if it were possible to take these piers out to 60 feet water, in the process of years you would have the bar restored there with only 10 feet or 11 feet of water over it.

28,416. You mean to say that if we carry out the piers to 60 feet, in the course of time the bar would also be carried out, so that you would only have ten feet water, where there is now 60 feet?—I think so; ten feet, or a little more, as the case may be.

28,417. If you were to carry them out to 100 feet, what would be the consequence?—If there was a sufficient supply of the coast drift, you would have the same thing restored there with the extra depth due to the extra enclosure of tidal water.

28,418. Then, if you carry them out to the middle of the North Sea, it seems to be a mere question of time. The bar that was at the mouth of the river would be carried right out to these pier-heads?—Yes, as a broad principle, that is the fact.

28,419. That is your opinion?—Yes, that is my opinion. I have also distinctly said that the depth upon the bar is not the only difficulty you have to deal with at the mouth of a tidal river.

28,420. During what winds is there most sea on the north-east coast of England; east or west?—I cannot speak from my own judgment.

28,421. Because you stated, and gave it very strongly that the principal freshets were generally during easterly gales?—I gave that statement from an authority which I quoted.

28,422. Would you be surprised if those who have for a long time resided upon the coast should tell us the heaviest freshets were during westerly gales?—I am not thoroughly informed upon that point. I have quoted a certain authority, which I believe to be reliable.

28,423. Although you have resided for some years upon the north-east coast, you cannot say, of your own knowledge, during what winds the heaviest freshets take place?—If I judged from my own observation, I should rather be inclined to say in westerly winds; but there is no determined rule.

28,424. You said that the most dangerous winds were from east and by north?—That being the wind that renders the north-east embayment the most dangerous.

28,425. And that in south-easterly gales ships would not be embayed between these lines?—No.

28,426. How do you account for the fact that the greater number of ships are lost in south-easterly gales?—Because they run for the ports.

28,427. Then, is there not the greater necessity that the largest amount of improvement should be done to these ports?—No; because the running there is not a necessity, and therefore I should not provide for it. It results from the wilful act of the parties themselves, and not from any stress of weather or from the character of the coast.

28,428. But if the Tyne was deepened to 20 feet at low water at its entrance, would not that be the means of saving a very large amount of the lives and property which are now lost in the bay in south-easterly and easterly gales?—I can only answer that question with respect to my belief in its feasibility. I do not believe it to be possible at all.

28,429. But if it were possible, would the Tyne then become a great harbour of refuge. If it were possible to have 20 feet at low water at spring tides,

LONDON.

Mr. E. K. Calver.

4 Dec. 1858.

Mr. Lindsay.

and to maintain that depth, would that be the means of saving a large amount of life and property ?—Not a harbour of refuge ; for no bar harbour, with an issuing river can, strictly speaking, be called a harbour of refuge.

28,430. What is a harbour of refuge, then ?—It is one with much depth of water, ease of approach, the absence of tide, good ground, and perfect shelter.

28,431. The first point is the depth, so as to allow ships to get in ; is it not ?—Yes ; that is the first point.

28,432. If 20 feet of water could be got and maintained at the entrance of the Tyne, would that admit the usual description of vessels frequenting the coast ?—At low water ?

28,433. Yes.—No.

28,434. If 24 feet could be got and maintained ?—No.

28,435. Then if 36 feet could be got and maintained —for that is the proposal that has been laid before us now—to carry out the piers to 36 feet at low water, would a depth of 36 feet at low water in spring tides admit the ships which usually trade upon this coast ? —As to depth it would.

28,436. At 30 feet would it ?—Yes, it would.

28,437. At 26 feet would it admit the usual description of vessels frequenting the coast?—The vessels which you must provide for are those of the greatest draught, 20 feet, and for them 26 feet would be barely sufficient.

28,438. Then if they had 28 feet at low water in spring tides, and could maintain it, that would admit all vessels at all times of the tide, going along the coast ?—So long as they were not prevented by the dangerous sea caused by the outset, when no small vessel could attempt it.

28,439. And it would consequently be the means of saving a great many lives, would it not?—I do not think so.

28,440. How so ?—I am not aware there is much loss of life in light vessels, which are generally lost there.

28,441. Would you require a depth of 28 feet at low water in spring tides to admit light vessels ?—I have mentioned my idea, that the necessity is measured by the largest vessels frequenting the coast, to call it strictly a harbour of refuge ; and as they go to the extent of 20 feet, and they may be caught in extreme peril, you must provide for them before you call it a harbour of refuge.

28,442. Would a depth of 28 feet admit those vessels ?—Yes.

28,443. If it would admit those vessels, would it be the means of saving lives ?—In proportion to the amount of risk to which such lives were exposed.

28,444. It would be the means of saving life ?—If life in such vessels is lost, it would ; but I am not aware that any large vessels have been lost.

28,445. It would be the means of saving the lives of those who were in danger, in vessels drawing 20 feet or under ?—Provided they could reach it, and did not arrive there at the time of the strong ebb outset.

28,446. And all these vessels of great bulk which are lost on entering the Tyne, might be saved, if there was a harbour with a depth of 28 feet at spring tides ?—The great majority of them would be saved.

28,447. The ships and the lives of those on board of them ?—If lives are lost, then the lives would be saved too.

28,448. You said if there was to be only one harbour made, you should give a decided preference to Hartlepool ?—Yes.

28,449. Why do you prefer it to Redcar ?—Redcar is not a suitable place for a harbour to be made.

28,450. What is your objection to Redcar ?—Because it is encumbered with rocks. There are two natural ledges there. It is not adapted for a harbour, because no harbour, could be formed on the rocks as a basis, except on the principle of a close harbour. It would not do to put a harbour on one side of Redcar, because the fact of having dangerous ledges stretching out seawards near such harbour, would add to the risk in running for it. For these reasons I certainly should not think of forming a harbour at Redcar, and especially not when I had such an eligible site as Hartlepool.

28,451. And you would prefer Hartlepool to Filey? —Yes for the purpose of saving life. Always bearing that in mind.

28,452. I suppose you include the saving of property as a secondary consideration. You also said that if a second harbour were to be made you would give the preference to Bridlington over Filey ?—Yes, I should.

28,453. Is it the case that laden vessels, in the usual track bound south, when they can weather away Flamborough head in gales of wind can generally reach the Humber ?—Yes, that is so.

28,454. Then as far as laden ships are concerned, a harbour at Bridlington would be of little value ?—It would give them the advantage of the better port of the two under the circumstances. Bridlington would be a better stopping place.

28,455. Would it be a better one than the Humber ? —Distinctly so. You could make a better harbour for saving life at Bridlington.

28,456. Than the Humber now is ?—Yes.

28,457. You said very frankly that when a vessel can weather away Flamborough Head to the south, as a general rule she can always reach the Humber ?—The Humber as a general rule is a good shelter in the most dangerous gales.

28,458. A most invaluable place for that purpose ? —I do not recommend the harbour to be made at Bridlington, I merely said that it would be the best of the two.

28,459. Now then as to light ships. When a light ship bound to the north can weather away Flamborough Head, are they generally able to reach down to Hartlepool at the bottom of the bay?—That depends upon the nature of the wind and its continuance.

28,460. I am speaking as a rule, as it applies to vessels that are found in that track ?—I have often seen them running back ; scores of them are caught in north-easterly winds.

28,461. When they cannot weather away Flamborough Head they can find good shelter in Bridlington Bay, is it not so ?—They can, but exposed to risk.

28,462. To what risks ?—Exposed to the risk of the wind chopping in.

28,463. That is the only risk which they are exposed to ?—That is the only risk.

28,464. Is it the case that many vessels bound south cannot weather away Flamborough Head congregate in large numbers there, and when the gale comes on they are obliged to run back to their own harbours, Hartlepool, or the Tyne, or perhaps so far north as the Forth ?—Yes, that is so.

28,465. If that be so, is it also the case that great numbers of those deeply laden ships founder in the winter time in running back from Flamborough Head to seek refuge in the bight of the bay, about Hartlepool, or are lost in attempting to enter bar harbours ?—That may be so.

28,466. Then would not a harbour at Filey be the means of saving a large number of those vessels which are so lost now ? Would it not be something more than a mere stopping place ?—No, not practically, because the vessels which now linger under Flamborough Head stay there until the last possible moment until the gale has freshened rather than give up track, and when they do bear up, the sea has become so heavy that they are lost in running to the north. If there was a harbour established at Hartlepool, vessels would bear up much more quickly and save themselves by it.

28,467. Would this large number of vessels which now congregate about the Head unable to weather it, easterly gales of wind ?—I have never seen that in easterly gales. It is always in south-westerly winds.

28,468. Then you do not think it is a fact that large numbers of vessels do congregate there, unable to weather the Head in easterly gales, about south-south-east?—No; in my experience I have never seen many vessels hovering about there unless the wind was well south.

28,469. When it is south-east?—I have seen them hanging about in very strong southerly gales; but generally in south-easterly gales they run northwards.

28,470. Where do the laden ships come from that are lost in running into Hartlepool, or attempting to get into the Tyne and Sunderland during south-easterly gales? Are not they vessels which have been unable to make a passage south, to weather Flamborough Head, and are obliged to put back?—Yes; they are so.

28,471. Would a harbour at Filey not be of vast advantage to them for saving them from running back?—Distinctly so.

28,472. If it happens that ships and lives are lost in attempting to make bar harbours, and it is the case that they run back from the south; and if it be the case that if a harbour was made at Filey they would be able to find shelter there, would not that harbour be the means of saving a very large amount of property and a great number of lives?—If there is but one harbour to be formed, I would form it at Hartlepool, because it would save life and provide for the contingency you mention; whereas, if there was only one harbour, and that formed at Filey, it would prevent the contingency of running back, but it would be of no use in decreasing the evils of the north-east embayment.

28,473. Would it not save many lives that are now lost, not merely from foundering at sea, but that are lost in attempting to find shelter at Shields, Hartlepool, or the Wear?—That would all be provided for by a harbour at Hartlepool.

28,474. I am speaking now more particularly as between Filey and Bridlington.—I beg your pardon.

28,475. Do you think that a harbour at Bridlington would be the means of saving a larger amount of life and property than one at Filey, taking into consideration the answer you have given to the question which I have just put?—I am not prepared to say, because I am not aware of the exact amount of lives lost in vessels to the east of the Head being pressed by on shore gales, nor of the amount of loss in light vessels anchored in Bridlington Bay being suddenly caught in it. I should say the loss was greater in vessels to the east of the Head, because they are laden vessels, whereas the light vessels, when they go on shore, will beach up, and the lives are saved.

28,476. Consequently a harbour at Filey would do more to save life than one at Bridlington?—As between those two places, I should rather say that it would.

28,477. How does that agree with your giving a preference to an expenditure of public money at Bridlington instead of at Filey, because you set out by laying it down as a great principle that the first object to consider was the saving of life?—A harbour at Bridlington would in one case be useful in saving life, because it would decrease the risk of loaded vessels. I have also said that a harbour at Filey would only save for a short time, whereas one at Bridlington would be a benefit in perpetuity.

28,478. (*Capt. Washington.*) A comparison was put to you between the loss of life at Clovelly and that at Wick. It was stated in evidence at Bideford that from 50 to 60 boats belong to Clovelly, are you aware how many belong to the district of Wick, and fished last year in that district?—I have mentioned it in my evidence, but I cannot as a matter of memory say; I believe 1,100 or 1,200.

28,479. It was given in evidence to us at Wick that 1,100 actually fish out of Wick, and 1,700 out of the district?—From my own observation I should believe that to be the fact.

28,480. About how many men sail in each boat?—I have heard five.

28,481. At that rate how many lives would be exposed to risk during the fishing season?—From 5,000 to 7,000.

28,482. And how many at Clovelly at the same rate?—300.

28,483. The comparison between Wick and Clovelly is as 7,000 to 300?—Yes, as respects lives, but it is also in favour of Wick that they really have no port to run for; practically, no port if the flood tide be running, whereas at Clovelly they are frequently able to get round Morte Point.

28,484. Are you aware that in the parliamentary return it appears that the amount of public money expended for the erection of harbours between the years 1840 and 1854 is 2,544,748*l.* on the coast of England?—I believe that to be the case.

28,485. During the same period and within 15 years 48,500*l.* was expended on the coast of Scotland, and on the coast of Ireland, 241,452*l.* Of that money on the coast of Ireland 90,000*l.* was expended on fishing harbours. Seeing the large amount of money laid out on the coast of England and Ireland, do you think it would be anything unreasonable to ask for an amount in similar proportion to be laid out on the coast of Scotland?—I think they have an undoubted right to claim it.

28,486. Leaving the fishery harbour to return to the refuge on the north-east coast of England. A great deal has been said in evidence about the necessity of a harbour near Flamborough Head to save laden vessels. I think you have stated in your evidence that nine-tenths of the vessels are spread along the coast between the Tyne and Flamborough Head?—On the occurrence of a south-east gale, that is my experience.

28,487. And supposing a refuge harbour was constructed in Tees Bay, how far would those south of Tees Bay and north of Flambourough Head have to run back to get into that harbour?—Taking the chances, as far as I can estimate them, the great body of the vessels would be distributed practically abreast of the harbour.

28,488. Would they have to run 20 miles?—Some of them might have to run 40, if they had advanced to near the head.

28,489. The maximum would be 40 miles?—I should say so, but I cannot say decidedly without having the chart before me.

28,490. Do you consider that there is any very great risk in a laden collier running back 40 miles to a certain refuge harbour under her lee?—If she has waited until the gale is heavy and the sea has made, I should think there was risk. I am quite ready to believe that vessels would founder under those circumstances. I should quite think it possible that such casualties may have occurred, but they would be prevented if a refuge harbour was provided in the north-east bight, because the ships would then bear up in good time.

28,491. (*Capt. Sulivan.*) Can you explain how it was that in one south-east gale 28 vessels allowed themselves to be wrecked between Flamborough Head and Whitby, with great loss of life, if it is so easy in dangerous gales on the east coast to get back to Hartlepool after they have been to Flamborough Head?—Before I can answer the question I must know exactly the special circumstances connected with each vessel. As a general fact, I cannot imagine that any vessel or vessels could be wrecked between Whitby and Flamborough Head without having either neglected common precautions or having been caught under very exceptional circumstances.

28,492. I believe, as a rule, the colliery masters are good seamen, and well accustomed to the coast?—Excellent seamen and thoroughly acquainted with the coast.

28,493. Do you think that in one gale 28 men would have allowed themselves to be wrecked on one short part of the coast by the neglect of the usual precautions, or would not the circumstance of the loss of these ships rather convince you that stress of

LONDON.

Mr. E. K. Calver.

4 Dec. 1858.

Capt. Sulivan.

weather alone drove so many vessels on one part of the shore in one gale of wind ?—I cannot imagine it, unless the gale came on very suddenly, or they had neglected the commonest precautions on the occurrence of a gale, that common precaution being to haul off into a safe position before the sea made.

28,494. We have had it in evidence in many places that large numbers of vessels leave the coal ports together in high tides, and instead of being scattered evenly over the whole of that embayment line, congregate in flocks near Flamborough Head ; that when the wind draws round to the southward and south-east it is a more common thing that vessels are caught in numbers near the Head than that they are spread along the shore. For all that class of vessels, would your remarks about the number that would fetch Hartlepool, founded on their being equally distributed along the coast line, apply ?—My remark about the embayment line and the shelter to be obtained by vessels so driven back, has reference to what I believe to be the common circumstance, and not to exceptional circumstances. I should apprehend, from my own experience, that vessels never collect in strong easterly weather near Flamborough Head.

28,495. South and south-east, I said ?—It could not have been a strong wind, or they would not have closed up, that is clear. It might have been a south-easterly wind, but not a south-easterly gale, because they could not congregate in a south-easterly gale.

28,496. I refer to vessels that have left the ports with a slant or favourable wind, and the wind drawing by south-west and south to south-east as they got under the head, causing them to congregate in large numbers ; that is the fact to which I allude. To vessels congregating in that way when a south-easterly gale comes on, your remarks as to the vessels being distributed over the whole line will not apply ?—Distinctly not ; if such circumstances do exist, they would have to run back the whole distance.

28,497. Will you tell me whether vessels are in the habit of leaving the coal ports at all times of the day and night in the ordinary way in which they leave a harbour that is not a tidal one, so that they are likely to be scattered on their voyage, or do they leave at tides in numbers, and so get in clusters along the coast ?—Quite in knots from the various ports, but separated from each other on account of the distance of the ports.

28,498. Then if vessels leaving with a slant from the Tyne had got half way across Tees Bay, vessels leaving Hartlepool would be more likely to have got down near Flamborough Head ?—They would.

28,499. Even in that case we might take it for granted that the vessels would be in clusters here and there at different parts of the coast instead of being scattered along the lines ?—You cannot exactly call them clusters after leaving the port some time, because the difference of sailing separates the vessels ; but when they first leave the ports they are practically in clusters from each port.

28,500. You were asked by Mr. Lindsay whether, if there were no river Tyne, the piers now being run out there, would be closed up by the sand until the harbour was entirely choked up ?—Choked up, yes.

28,501. Would that merely tend to show that no pier harbour from the shore should be erected where there is that moving sand ?—I do not quite understand that question.

28,502. Would the effect of that merely be to show that no person should think of making a pier harbour from the shore where there is a large amount of travelling sand ?—Distinctly, as a general principle.

28,503. And would you on the other hand think of applying that objection to a point of the coast, if you could find one where a small beach was bounded by such a rocky shore north and south, that there was very little fear of there being any travelling sand at all ?—I should apply it the same there as at any other place, because the movement of the sand is continuous to a considerable depth, wherever the wave has an action ; and, assuming the frontage to be sand, there is a movement, as I have mentioned before ; the preponderating sea strikes in whichever direction that may be.

28,504. Along a rocky shore is the sand moved the same as along a sandy one ?—Yes, below the low-water mark. There is no sand on the rocks because no sand will rest on rocky ledges ; why, I do not pretend to explain. There is some peculiar action, but the undertow of the wave bursting on the ledges will prevent the material lodging upon them, but if you go out beyond the original ledges then the effect is exactly the same as if it was a sandy frontage.

28,505. If nature on any part of the coast has made a distinct wall by a projecting reef, and there is no tendency inside that natural breakwater or in the corner of that bay to deposit increased quantities of sand, would that satisfy you that there is no tendency at that immediate part of the coast for sand to travel into that bay ?—Not at all, because by the erection of works you altogether alter the circumstances.

28,506. I do not ask you about works. I say if nature has herself placed a wall which makes a corner of a bay where no sand is accumulated, would that show you that in the present order of things there is no tendency for sand to accumulate in the corner of that bay ?—No ; in the one case there are forces in action which could not remain after the erection of a solid transverse wall. You now get a tremendous weight of wave and current coming over the ledge, and that is a thing you could not get with a transverse solid wall reaching above high water. You would entirely destroy the motion and make a perfectly still corner in which the débris would lodge. The cases are not parallel.

28,507. You are alluding to Filey ?—No ; as a general principle.

28,508. Taking the case of Filey and knowing the shape of that bay, if there is any sand travelling from Flamborough Head northward along that shore, would not the projecting point of the bay and the Brigg have induced a tendency for the sand to accumulate in the northern corner of the bay ?—Up to a certain point, when the accumulation of the sand would be in equilibrium with the wave stroke and the current. After that, whatever be the amount of sand travelling along the coast, there is no effect shown, because the forces are exactly in equilibrium. Nature has adapted herself to the circumstances, and you get permanency.

28,509. You express the opinion that the erection of a harbour at Filey, might cause an accumulation of sand, although you were perfectly satisfied that one at Hartlepool might be constructed, without causing any accumulation ?—I have in view works of an entirely different character.

28,510. I am not going to ask about the character of the work, but if engineering skill can provide against the accumulation of sand, when there is so much on the shore as at Hartlepool, why should not similar skill provide a harbour at Filey, which should be safe from sand ?—In my experience I never knew anything of the sort to be provided against. Whenever works have been carried out where there has been matter like coast drift, or matter held in suspension, it has always resulted in a loss of depth.

28,511. As you suppose that works can be constructed at Hartlepool, I am right in supposing you consider that ?—Yes.

28,512. Why cannot works be constructed at Filey Bay, where there is much less sand north and south, which shall equally obviate any objection on that score ?—For one simple reason, that to make it a harbour of refuge, the covering must be formed on the principle of a prolongation of the Brigg, or it could not be a harbour of refuge.

28,513. Why could not a detached breakwater, leaving a passage at the Brigg buoy, be constructed for Filey, if necessary, as well as a detached breakwater for the Heugh, leaving a passage between it and the Heugh?—There is a material difference in the cases. I may remark that if you have any work in

view, my replies will be clearer if I have a plan of that work before me.

28,514. I have no work in view. I am only asking, with reference to your knowledge of the present shape of the coast, and the amount of sand in the neighbourhood, why, if a harbour can by engineering skill be designed for a sandy coast like Hartlepool, which shall leave the currents free and prevent silting up, the same precautions guarding against the same evil cannot be adopted at Filey Bay, where there is much less sand?—The circumstances are altogether different. If there is any drift along the margin of Filey Bay from south to north, the presence of any covering work would admit the accumulation of that drift without the possibility of removal. I cannot assume a covering work to be in Hartlepool Bay so that the same effects will follow.

28,515. If the sand were to travel from Tees Bay to Hartlepool, and if you had no covering work to that bay, would not the general appearance of the land, putting the Heugh in the place of the Brigg at Filey, be very much the same, and the effects be likely to be the same?—I do not think the cases are at all similar. In the first place, after increased experience, I at once object to the statement of any sand, as a general thing, travelling from the Tees to Hartlepool.

28,516. Then why should you suppose that sand is travelling northward to Filey Bay, where there is no river whatever, and a rocky shore on both sides; if the water in a sandy bay, including a river in it like the Tees, carries no travelling sand?—Because in Filey Bay the full effect of the sea stroke in moving the sand must be from south to north. The preponderance of the stroke will be from south to north, and therefore if you put out a groin there, I should be prepared to find it bank up upon the south side.

28,517. Is not the natural projection of the point at Filey now a groin, which would have the effect of collecting the sand in the northern corner of the bay, if such a drift existed?—It does, but the collection will be immensely added to if you have a covering work which shall prevent the sea stroke acting, because the sea stroke could then only come in, and not out.

28,518. You really think from your knowledge of the coast that along the two miles of sandy beach at Filey, with a large rocky projection a few miles to the south of it, to cut of all the travelling sand, a larger amount of sand is travelling along the shore there than along such a sandy bay as Tees Bay, with the whole stroke of the south-east sea setting along it, and a very considerable length of shore, and the sand from the ebb of the Tees river added to it?—That is not the way I understood the question. Do you mean to ask if it is possible to form an artificial harbour at Hartlepool Bay without detrimental results, and would not it be possible to form the same at Filey?

28,519. Yes; but in the one case you express your opinion that there would be no danger to silt up from the sand, and in the other you said you feared there would, and I was therefore anxious to know why you should fear there would be travelling sand when there is hardly any on the coast, and a rocky point a little to the south; and should not fear it when there is such an amount of sand as there is in Tees Bay?—In Filey Bay there is an immense sand track.

28,520. For two miles south of it as far as the chalk cliffs?—As far as the Speeton cliffs I should be prepared to find that there is a constant movement going on, but in giving my answers to these questions I can only reply in view of some hypothetical work. If the plan of Hartlepool was put before me, I would sketch the work I mean, and the same in the case of Filey, and would detail the effects.

28,521. Leaving out all works, and coming to the sand as it is at present, why should you suppose there is a greater tendency for sand to travel along the shore of Filey Bay to the northward than you suppose there is along the sandy shore of Tees Bay?—My replies have no bearing on quantity, they really only have a bearing upon the effect. Let the quantity at Hartlepool be large, it is possible to provide a work there which will prevent any detrimental results, whereas let the quantity in Filey Bay be ever so small, I do not see that any work really constituting it a harbour of refuge could be projected without its erection being followed by the prejudical results which I have mentioned—the accumulation in consequence of the drift.

28,522. The present Brigg at Filey answers somewhat to the pier which has been run out from the main point at the Heugh?—There is a parallelism.

28,523. There is, I believe, already an accumulation at the back of that pier at the Heugh?—I do not know it. I should expect to find it at the back, but not outside on the sea side. In the inside, or harbour side, I should expect to find some, but on the sea side I should not expect to find sand until the work advances below low-water mark.

28,524. Will you explain why, if there is a tendency of the sand to move in Filey Bay, the whole of the inside corner of the Brigg and the point has not been filled up by the sand?—For the reasons I have already stated, that in that case you have a sea and current acting over the Brigg at the top of the tide; there is a current and the sea generally throughout the tide, which, with a large solid work like that at Hartlepool, you have not, and therefore in the one case the sand will be washed away in accordance with the conditions that exist, while in the other it will remain and accumulate, because it has a quiet corner in which the sea can only bring the sand, but cannot take it away.

28,525. Would not the effect be, if you were right, that until you came out on the Brigg, when the sea could have an effect in clearing the sand away, the corner would have been filled up by the sand, where the sea has no action over the Brigg; I mean under high-water mark in the corner?—Oh no; because while there is no artificial work you get a far better outlet for the tide and the sea sweeping from south to north.

28,526. If there is a detached breakwater only, should not that outlet remain just the same as well as the outlet you propose round the Heugh?—No, for this reason, because when there is a variety of tide streams you can never exactly prevent an artificial work from, to a certain extent, producing a stoppage, and therefore if you were to put such a detached work at Filey——

28,527. I do not say with a detached work.—You have assumed a detached work, and in general terms I can only say that although in the construction of such a work at Hartlepool the prejudicial results might be avoided, it is also quite consistent that these works at Filey should involve them all. But I have great difficulty in answering: I always have when I have no definite plan before me.

28,528. I am not asking you on any plan. I am asking generally about the present contour of the shore and the movement of the sand?—My anxiety is to give my real opinion, whatever it is worth, but I am very anxious that it should not be mistaken. I have, sometimes, by answering questions before Committees of the Houses of Parliament, without having a plan before me, been led into difficulty.

28,529. To go back to Wick, you were asked whether you thought it just to lay out a sum of money at Wick, say 100,000*l*., on the ground of its being such a large fishing interest, and loss of life, without giving a proportional sum to any point on the coast that had a smaller interest or a smaller loss of life. Now, have you not proposed on national grounds that there should be a large outlay of public money on the east coast of England, because there are very large interests and very great loss of life concerned on that coast?—On account of the large trade and of the character of the coast.

28,530. And yet you do not recommend that on

LONDON.

Mr. E. K. Calver.

4 Dec. 1858.

Capt. Sulivan.

some points on the coast, say between Dungeness or Portsmouth, where a smaller loss of life occurs, that there should be a smaller outlay ?—I do not say that no outlay should take place there, but I would provide for the great risks first.

28,531. You recommend a large outlay in consideration of the amount of danger on the east coast of England, though there might be other parts of the coast where smaller losses of life took place which could not be provided for by the Government, as in that case ?—I should provide first for this coast, where there are great risks to meet, and then, if the public funds admit of it, I would appropriate them in the same direction to provide for other cases, according to their importance.

28,532. Would you not consider it quite just, for the same reason, to provide for an extreme case, having a fishery such as Wick, though you could not do so for the smaller points on the coast ?—Distinctly; because, looking at the character of the coasts generally, I could not say that such a necessity could exactly exist.

28,533. Would not the principle suggested to you on the examination I refer to, if carried out, apply equally against making large harbours of refuge for general shipping, as it would against making a harbour of refuge for the fishing trade ?—It would.

28,534. Therefore, there would be no principle against making a harbour at Wick for the fishing trade more than there would be against making one on a large scale on the east coast of England for the general trade ?—They stand exactly on the same groundwork, as it affects the saving of life.

28,535. (*Capt. Vetch.*) I believe the great object we all have in view is the saving of life and property. You have been asked some questions about Wick. Are you aware that in 1848 no less than 50 lives were lost in that vicinity, of men belonging to Wick and two or three adjoining ports ?—I believe that that was the case.

28,536. Do you think that the life of a fisherman is just as valuable as that of a sailor ?—Just the same.

28,537. Is there not rather more respect due to it, inasmuch as those fishermen generally have wives and families depending upon them ?—In that view the lives of fishermen are more valuable ; I should be prepared to find that sailors generally have not so many persons dependent upon them as fishermen.

28,538. Are you aware that there are generally no less than 1,500 boats fishing in the neighbourhood of Wick ?—I believe that to be the fact.

28,539. Then, if these contained about four men each, that would give about 6,000 fishermen at sea at a time ?—I believe that to be the fact.

28,540. I have received to-day or yesterday a certificate from Wick, stating that about ten days ago a gale came on very unexpectedly, and raged two days, and during that time such heavy seas were thrown into Wick Creek that it was white from one end to the other, and not a boat could have lived in it ?—I have seen it under these circumstances repeatedly, having myself resided at Wick.

28,541. Supposing a storm were to arise suddenly when these 1,500 boats were out at sea, what would be the consequence ?—If the flood tide was running at the same time, I should be prepared to expect that half of them would be lost.

28,542. Is not that a fearful contingency to look in the face, to any man who has a heart in his bosom ?—It has ever been present to my mind.

28,543. Would such a man hesitate one moment to urge the Government, or any other body he could prevail upon, to do all that they could to prevent such a contingency ever arising ?—Distinctly ; during the time the fishing lasts, the men are daily exposed to that wholesale risk.

28,544. So much as regards life ; but I suppose that boats are as much property as vessels. If 1,500 or half of that number were lost in one season, that would be a loss of at least 120*l.* a boat, I presume ?—I think that is about the price of the boats.

28,545. Did you ever happen to hear that the fishermen at Wick are willing to contribute, to the formation of a harbour, 1*l.* or 2*l.* per boat ?—I am not aware of it.

28,546. Then, as regards the saving of life and property, has not Wick as good a claim to Government assistance as if it was a port for common vessels and common sailors ?—As good a claim.

28,547. Particularly, owing to the number employed in that neighbourhood, that is to say, there might be several fishing places along the coast, but if they have only a comparatively small number of men employed about them, that would not reduce the claims of Wick for the protection of the Government, as the most prominent case that could arise ?—It would not affect it in the least.

28,548. I have a question to ask concerning the bar harbours, and the formation of bars. I think you started in the first instance by stating that all river harbours were bar harbours ?—No ; rivers issuing under certain circumstances have bars, but there are some rivers without bars. If a river partake of what is called the estuary character, and the wave and the tide can only act in the exact line of the river inwards and outwards, there could not be a bar ; but, on the other hand, if a river issues at right angles to the line of the coast, that is the most likely position for the formation of the worst bar.

28,549. Speaking of river harbours not of an estuary character, is it not the fact that the bar is caused by the outgoing current, the river water meeting the stroke of the sea, and that the sea bringing the sand in one direction, and the river carrying silt out in another, they meet at some neutral point, and there, where it is comparatively still water, they deposit their contents ?—That is not my belief, because I have always observed in watching narrowly the operation of the ebb-stream from the river that there is no such conflict. You will find that the ebb of any river goes out in a body, without disturbance, right off into the sea for a considerable distance, and beyond the position of the bar, which at once leads to the conclusion that the formation of the bar is not due to any opposition of forces of that character.

28,550. Leaving out river silt altogether, does the river current, meeting the tide current coming in,—one coming out and the other going in,—would not that be apt to create a bar ?—It would not be at all a practical cause. As I view it, it is simply the operation of the sea by a marginal drift endeavouring to shut the river up. Were it not that a river was issuing, it would be a dry beach instead of a channel.

28,551. (*Mr. Coode.*) I believe that one of the principal advantages of Wick as a harbour would arise from the fact that it is the nearest port to fishing grounds occupied by 5,000 or 6,000 men ?—That is so.

28,552. Should you not think that an equal number of men occupied in fishing off the east coast of England would have a claim equal to that of the 5,000 or 6,000 fishing off the north-east coast of Scotland ?—If, like them, they were collected in one spot, and exposed to the same risk, they might ; also bearing in mind that I think Scotland, as a section of the country, has distinct claims.

28,553. You think Scotland has stronger claims to the advance of public money than any other part of the country ?—I think so, especially in view of a certain feeling which I have seen arising of late years. I have lately seen a statement as to a want of fairness in the distribution of the national funds for national purposes. It is a point I do not understand much about, but it enters into my view.

28,554. That being a question of political economy, I would rather not enter into it. The liability to accumulation on any part of the coast would, I presume, depend on the material travelling along that coast, would it not ?—It would.

28,555. Are you aware that close harbours have been made without any accumulation taking place ?—The only case of this sort with which I am ac-

quainted, and about that I received information from others, is Kingstown harbour, but in the other close harbours with which I am acquainted, when matter is held in suspension, I have always observed an accumulation, and the deeper the harbour the more rapid is the accumulation, for certain reasons, which are at once apparent.

28,556. Then Kingstown is a case in which a harbour has been made, and there has not been any accumulation ?—Practically, there is no accumulation. I believe, as a matter of fact, that there is a little accumulation, but nothing of any importance. The water there is uncharged with matter, and there could not be any accumulation of any moment, nor can the waves ever be charged with matter. The water is not charged, except at the time the harbour is emptying itself. The water arrives from an iron-bound clean coast, and is as clean as the Atlantic, as I am told, which results in a freedom from accumulation.

28,557. You say that Bridlington Bay would not fill up, if an artificial work were constructed in front of it ?—If it was properly arranged and constructed.

28,558. You are doubtless aware that there is already a sand bank of very considerable extent in front of Bridlington Bay ?—There is.

28,559. Can you tell whether within the last 40 or 50 years there has been any accumulation within that bank ?—I am not aware. I am told that the bank has a nucleus of chalk. I do not know it of my own knowledge.

28,560. I think you yourself have reported that there has been an accumulation on the south side of the pier, projecting from the Heugh at Hartlepool ?—As a matter of memory, I do not think I have, about the pier at Hartlepool.

28,561. I speak of the work which was commenced there a few years since, extending from the Heugh in a south-easterly direction ?—I think the accumulations which I referred to were in other situations, and arose mostly from suspended, and not driven matter.

28,562. If we have heard in the course of the inquiry that there are a great number of laden vessels attempting to get to the south that cannot get round Flamborough Head, they would not be served by a harbour in Bridlington Bay ?—Distinctly not. It would be of no use to them.

28,563. What is your experience of the direction in which the heaviest gales turn in the North Sea ?—They are rendered dangerous by working easterly. Vessels are enticed by the wind hanging southerly. They stretch to the south and struggle against it. If they hang on too long, and it comes easterly, it places them in difficulty.

28,564. Do not the heaviest gales often wind up by blowing very hard from the north-east ?—I think that is my experience.

28,565. Then, in the case of those vessels of which we hear as running back from Flamborough Head, would not the tendency of the direction of such gales be to prevent them from reaching the northern ports ? Would not the wind be more apt to prevent them than to favour them ?—That I am not prepared to say. If it flew in suddenly from south-east to north-east it would, but if it come in the usual course, gradually backing, a man, if properly cautious, would reach the northern ports.

28,566. Still these gales do occasionally fly round suddenly, do they not ?—I think you can scarcely term it suddenly. Perhaps there would be an interval of a few hours between several points ; gradually backing I think, that is my experience. I have seen it from moderate southerly winds flying suddenly to north-east. At the back end of last month, I was very much attracted by a circumstance which occurred. There was a good number of light vessels bound to the coal ports, and distributed opposite the several ports of Seaham, Sunderland, and so on, apparently bound to the Tyne. They were caught by a north-easterly wind short of their ports, and could not struggle against it, and all bore up to the south. I found out afterwards they went to Hartlepool, and I observed that a few days afterwards they were all towing back to the Tyne with steamers ahead. It is a circumstance I have seen occur before in my experience, and is therefore included as one of the collateral points which would render valuable the establishment of a harbour at Hartlepool.

28,567. You say that sand will not rest on a ridge of rock. Will sand in travelling along the shore be arrested by the existence of shingle upon the shore ?—I have no case at present in my memory.

28,568. As you have given an opinion that sand will in no case rest upon a ledge of rocks, I should wish to know whether you can give an instance where you have found sand arrested by shingle and accumulated in the interstices ?—I am not aware.

28,569. Do you not think that if sand were travelling along any part of the coast, and were to meet with a shingle beach, it would be arrested by the shingle ?—A shingle beach transversly to the shore ?

28,570. No ; a shingle beach along the line of the shore. If sand were travelling along the shore would it not be found mixed with the shingle ?—If I hear the exact case I will tell you immediately.

28,571. I am asking you as a general principle ?—I cannot in this case speak to a general principle, but to special circumstances if I know them.

28,572. You said you would not recommend the formation of a harbour at Redcar. Had your answer reference to the site between the Scars, or had your answer reference to the coast at Redcar generally ?—My reply had reference both to a harbour formed on the principle of a close harbour upon the Scars themselves, and also to any harbour, whether close or open, anywhere about the Scars.

28,573. Either towards the north-west or south-east ?—On either side, or even within a mile, I should consider it objectionable.

28,574. The only objection that I remember you mentioned was the projection of the Scars themselves; that the harbour not being so far in advance as the eastern end of the Scars, or rather the Scar projecting beyond the proposed work, it would pick up vessels attempting to enter ?—The neighbourhood of the Scars to a harbour formed on one side.

28,575. Was your objection on the ground of the eastern end of the Scar being likely to pick up vessels attempting to make or to leave the harbour ?—The Scars, as a whole, without reference to either end, either to the north or south Scars, taking the Scar as a ledge of rock close to a neighbourhood in which a harbour is projected, I should consider that a great disadvantage indeed. It renders that harbour to a certain extent, taking the common chances, a dangerous one.

28,576. Your objection would not be done away with if one of the piers of the harbour was run out upon the Scars ?—Distinctly not, because the groin objection comes in, and I have already explained that along the whole of the east coast of England the movement of the soil is with the preponderating sea stroke, which is from north to south. I have a few practical examples of that. The movement of the soil upon the east coast of England from north to south is determined by the preponderance of the sea stroke ; in other words, that movement is from north to south, because the heaviest gales and the heaviest seas come from the north-east quarter.

28,577. Do you mean both sand and shingle ?—The movement of material. The first case I will give is Holy Island. It is joined to the mainland by a narrow neck of land to the north-west, and not by a ridge to the south-east, which would not be the case unless the soil was moving from north to south. Warkworth pier is charged on its north side by a high sand. Sunderland north pier is charged on its north side as it goes out, and whenever upon this coast a transverse work is run out for protecting the land or other purpose, I have always found them, without an exception, charged upon the north sides. All along the Holderness coast

LONDON.

Mr. E. K. Calver.

4 Dec. 1858.

Mr. Coode.

to the Spurn points, wherever these things are erected, they are charged with sand upon the north side. Upon the Lincolnshire coast the groins are charged upon the north sides, and also all along the Norfolk coast. Yarmouth north pier is exactly the same as Sunderland north pier and the Southwold north pier, and so along the entire sea-coast of Suffolk to Landguard Point. All these piers are charged with sand upon their north sides.

28,578. Have you examined whether, in all states of the wind, the movement is the same?—Under all circumstances the abiding result is, their being charged with sand on the northern side.

28,579. Then, if you found a projecting ledge of rock or artificial work, without any accumulation on the north side, would you take that as an indication that there was but a small amount of material travelling along that part of the coast?—As affording you no clue to the movement of material. The movement of the material is only to be developed by the establishment of works to give you any guide. No common observer of the coast about Lowestoft would ever have supposed that there was very much material moving about there. There was nothing to indicate it; but directly the north pier was put out the movement of material became very apparent, and in a few years it had moved out to the extent of 500 feet of solid land; whereas, to the common observer there was nothing at all before that to indicate that there was any material drift there. I say, as a general thing, that you cannot develope either the presence of any movement or its amount without you commit yourself to the construction of works.

28,580. In the case you have just alluded to, would you tell us the depth of water that existed, before the pier was thrown out, at the point at which you now find the low-water line?—About 17 feet at low-water springs.

28,581. Then is the fact this,—that there has been an accumulation of sand to the extent of 17 feet, since the advancement of that pier?—Yes; within the same harbour, from other causes of decay and deposition, there was in two and a half years an absolute deposit of 10 feet in thickness, of light sand.

28,582. Was it sea sand?—Yes, light sea sand.

28,583. Not mixed up with alluvial matters, or material from the débris of the cliffs?—Not to any appreciable extent.

28,584. (*Chairman.*) Do you think your breakwater at Wick would be outside the rollers where the water breaks?—Not in the height of the gales.

28,585. There would be breakers outside of it?—A topping sea, but not breakers properly so termed, not the breakers of a body of water.

28,586. But breakers that would be dangerous to fishing boats running in?—Oh, yes, when the gale is thoroughly established, no boat could look near it.

28,587. From what you know of Wick Bay could it be possible to put a breakwater far enough out to get rid of that danger from the breaking sea?—I think not.

28,588. How far out should you be prepared to say that you know the water breaks in Wick Bay in heavy gales?—I have seen the sea topping over the whole of it from point to point.

28,589. Right across from point to point?—Yes, in the height of the gale.

28,590. You have no estimate of the breakwater which you propose for Wick?—I have merely projected it to exhibit a principle, without any reference to the expense of it.

28,591. You have formed no estimate of the expense of the breakwater on Smithic Bank, I presume?—I have not.

28,592. Will you explain to us what kind of breakwater you would place in Hartlepool Bay?—The only breakwater, holding the views which I do, that I should think of placing at Hartlepool, keeping in view all the circumstances, would be a work which I have named the Wave Screen, which is described in a pamphlet which I think is now before the Commissioners.

28,593. What would be its position?—I have in the same pamphlet indicated the line which I think such a work ought to occupy, always bearing in mind the modifying effects of the tide and other circumstances, of which I am not at this moment thoroughly in possession.

28,594. I think this pamphlet is not in evidence before us?—It is not.

28,595. Will you be good enough to state, for the information of the Commissioners, where you would put a breakwater. At what part of the bay?—I have already pointed that out in page 59 of the pamphlet.

28,596. The pamphlet is not in evidence before us, and I should prefer your giving it to us in evidence. You can read an extract if you please?—I could not project it without instruments and careful measurements.

28,597. Read the extract which you desire to put in evidence?—Here it is (*witness read from pamphlet*), "The true principle of such a work was "present to the mind of the writer when giving "evidence before the Select Committee upon July 27, "1857, as the following extracts from the replies will "show, viz., It (the harbour) would be open to the "sea, but not to endanger it for refuge purposes. I "have mentioned my idea of a refuge harbour to be "a protected anchorage. The exact projection (of a "breakwater) would be determined upon finding out "the exact set of the tide streams, and one or two "other points of information. Speaking generally, "it (the breakwater) would be curved with the di-"rection of the tidal stream if it could be so pro-"jected. My object being not to interfere with the "set of the tide throughout, and I think that is per-"fectly consistent with affording all the refuge that "is required. The breakwater I have in view would "protect the whole space of the bay." The cut illustrating this is shown upon page 59.

28,598. Would the harbour you propose in Hartlepool Bay be exposed to a line of sand drifting along the coast?—The effect of any accumulation opposite the Hartlepool Heugh, of sand drift would be, if my views are correct, rather to go outside the screen, because the concentrated ebb set would have a tendency combined with the flood set to work the material outside the screen. The general effect would, I think, be that; but it is a point I am not now inclined to speak of very decidedly.

28,599. You said, as I understood, that the drift of the material along the east coast of England is from north to south. Is that clearly established in your mind?—That is the result of my 22 years' experience.

28,600. Because I think we have had it given in evidence, and very strong evidence too, to the contrary; but such is not the result of your experience?—I am perfectly well aware that there is a north drift in special cases. At the mouth of the Tyne for instance. I should be prepared to expect a northern drift over the Herd Sand, and there are one or two other places, such as Scarborough Bay; or where any bay lies recessed within the line of the preponderating stroke, the drift would be in the opposite direction; but taking the coast as a whole, it is an unquestionable fact, that the movement is from north to south. I may also mention, to put the matter in a broad light, the effect of centuries, shown by the present state of Lynn Deeps and the mouth of the river Thames. The material deposited there is not the result of matter arising from the disintegration of the country thereabouts; but it consists of matter which, travelling from north to south, has been deposited at the mouth of the river Thames and in Lynn Deeps.

28,601. Then what is this sea drift? Is it the disintegration of matter from the shores which forms the sea drift, and comes south, or is it swept up from the bottom of the sea?—It is brought from sandstone districts, in a northerly direction.

28,602. The disintegration from the sandstone districts of the north?—Yes.

28,603. Therefore a thorough examination of the

coast, and a comparison of the nature of the drift which is found, with the geological formation of the country, would be a proper test?—It would be a clue, but not an absolute test. Coupling it with the particular facts I have mentioned, it would show the general fact that the drift arrives from the north.

28,604. As to matter which is held in suspension, does the tide from south to north bring most material?—There again it is common over the whole coast. As a general fact you will find the water heavily charged in gales of wind, from the Tweed right to the Thames. I can't say distinctly that there is much difference as respects portions of the coast. There is only a difference as respects the distance from the coast. The closer on shore you have the water highly charged. A little further off it is less highly so, until we get to 15 fathoms, and there, as a rule, you will find the water uncoloured.

28,605. Would you be disposed to attribute much effect in silting to matter held in suspension?—It all arises from matters held in suspension.

28,606. As distinct from the sand drift, from what drifts along the coast I mean, that matter which is still held in suspension?—That is the precise cause of all *silting*; there is a drift of matter which cannot very well be suspended, except for a very short time.

28,607. One more of the nature of a mechanical action?—They are both mechanical actions.

28,608. But one is more of that nature than the other. It is driven along the shore?—The other is also mechanical. It is the motion of the sea that causes the movement of particles, which gives the mechanical power.

28,609. I understand you to say that, supposing the larger plan shown by Mr. Walker for these piers was carried out, the arrival of the sand at the piers and the formation of a sand bank at the pier heads, is only a question of time?—That is my belief. The re-formation of the bar between the pier heads.

28,610. The sand banks of which you speak, where there is no river, would not exist where there is a river?—Oh no.

28,611. Then it will become a bar?—Yes; there would be a channel to a certain extent.

28,612. But that bar, if I understand you rightly, would not necessarily be at the pier head?—It might be some little distance away. It might be a little within or without, but my impression is that it would be a little convexed outward from the line between the pier heads. Ultimately we should have a bar at the pier heads very little different from that which we have now, and, as it affects refuge, practically the same.

28,613. Referring also to a statement that was made to us by Mr. Walker, that in his opinion the depth of water of 39 feet which I see between the pier heads might be reduced to about 30 feet, and that a regimen or normal state would be obtained, you entirely differ from him in that opinion?—Yes; the regimen would, in my opinion, be a ten-feet bar.

28,614. Also with reference to a further statement of his, that there would be what he termed an inclined plane from where the bar now is to the pier head, from ten to thirty feet, that is entirely in conflict with your opinion?—It is entirely contrary to my opinion.

28,615. Why would not the inclined plane exist?—It could not exist if a bar was formed, as I believe it would; the fact of the bar re-forming, of the same character as respects height as at present, would be rather to have a tendency to shallow backward. The heaviest débris and sand from the river would not run up an inclined plane; if even it was dredged to 18 feet, the tendency would be to retain the débris from the river; the heaviest materials would, to a certain extent, go to the inner side of that bar; and therefore, if my views be correct, it would matter very little whether they dredged or deepened within, after the bar was formed. The tendency would always be to restore the depth within to what was consistent with a ten-feet bar.

28,616. How is a bar formed?—To put it in the most simple form, bars upon the coast which is now under review are formed from the sea, assisted by the tides drifting materials from north to south, the practical effect of which would be to shut the rivers up by a beach, if there was not a river issuing, which makes a channel across this obstruction in proportion of its own power to that of the accumulating forces. Perhaps I may be permitted to mention that these views of mine are not new with me, but are all contained in a pamphlet which I wrote some five years ago, since which time I have seen no reason (but the reverse, in fact) to alter the opinions which I then expressed. On the contrary, my convictions have increased by experience, and I am now inclined to put them a little stronger than I did then.

28,617. By the preponderance of the sea-stroke, do I understand you to mean that there are more gales from the one direction than there are from the other?—That is not exactly the reason for the preponderance of the sea-stroke. There may be the heaviest gales from the north-east and the heaviest sea from the north-east. A single gale from the north-east may, by its force, neutralize a good many from the south-east.

28,618. In fact, there is a greater mechanical power exerted by the north-easterly winds than there is by the south-easterly winds?—Distinctly so.

28,619. I think you said something about the iron-bound coast of Ireland as a reason for Kingstown Harbour not being exposed to any sand drift. In another part of your evidence, however, I gathered from you that an iron-bound coast is not necessarily clear from sand-drift, because there may be sand drifting along, of which we know nothing?—There may be, but I am acquainted with the fact that the water in Kingstown Harbour is uncharged; and looking at the coast I saw that the water could not be charged, from the circumstance of there being nothing there to do it, and that the water could only be charged with the light sand in the neighbourhood of Dublin; but at that time Kingstown Harbour would be emptying itself, and when it was filling it could only be filled with clear water.

28,620. Are calliper-shaped piers favourable to a fair sea through the opening?—Very favourable.

28,621. Will you state your reasons for thinking so?—They are favourable to the extent to which they approach to transverse piers, or piers projected right out seaward. The practical effect of such is to cut off a certain amount of the undulation which advances undisturbed through the canal. So far as the calliper-shaped piers approach to this condition, so far do they ensure a favourable sea; and if you were to reverse the shape and let the piers approach each other, pointing inwards, you would have the worst possible condition, because you would have a reflected sea acting exactly across—the most favourable being transverse piers, and the most unfavourable bell-mouthed piers. A bell-mouth is a doubling in instead of out, doubling in landwards, and the effect is to cause a deflected sea from each work, which makes the worst possible sea.

28,622. There was a question asked about vessels bearing up from the Head to Hartlepool. Would you be disposed to say that vessels in the condition in which they ought to be sent to sea, laden colliers in such a condition as respects sea-worthiness, would experience any danger in running from Flamborough Head to Hartlepool, even in a very heavy gale?—Not from my experience. I have been running with them under such circumstances.

28,623. The danger on running from Flamborough Head to Hartlepool arises mainly from the inferior character of the vessels, does it not?—It may arise partly from that, or it may partly result from their hanging on till the last possible moment, and no shelter being provided for them to the north. They are unwilling to give up track, and keep hanging about imprudently, and then they are lost.

28,624. But I put to you this case: If the vessels were in such a state of seaworthiness as they ought

LONDON.

Mr. E. K. Calver.

4 Dec. 1858.

Chairman.

to be, would they be, generally speaking, in any danger while running back in a heavy gale from Flamborough Head to Hartlepool ?—No, in no danger whatever.

28,625. You spoke of the depth at which a wave acts. What is the greatest depth at which you have known a wave to act ?—It was quite clear to my mind at the time of the North survey, that the result of the wave's action was to move shingle towards the mainland through a depth of 12 fathoms.

28,626. Are you satisfied that there is a motion at the bottom of the sea in 12 fathoms depth ?—Distinctly so.

28,627. Uninfluenced by any special form of the bottom ?—Uninfluenced by that, and resulting merely from the undulations of the sea conveying their own impressions to that depth.

28,628. You have stated in your pamphlet, which I have read, that there are three causes for harbour depreciation. You say, " Harbour depreciation pro- " ceeds from three principal causes, which I do not " here specify." What, in your opinion, are those three causes ?—That was written some years ago, and I cannot now, as a matter of memory, exactly say what the causes were which I had then in my mind.

28,629. I am anxious to know what these three causes are ?—I shall have to speak from memory as to the causes which were then present to my mind. I may mention as a primary cause, river encroachment at the upper part of rivers. The second cause would, I think, be, according to what I then had in my mind, the non-projection of works upon right principles ; and the third reason I am not now prepared to specify.

28,630. We shall have you before us again, and if you can by that time recollect the three causes you referred to, and will name them to me, I shall be obliged.—I will read over the pamphlet attentively, and most likely I shall be able to do so.

28,631. Are you acquainted with the Tay ?—I am.

28,632. If we had the good fortune to have the Tay upon the north-east coast of England, should you not consider it to be a very capital harbour of refuge ? —The Tay, under general circumstances, is an excellent harbour of refuge.

28,633. I judge merely from the chart. Are there any circumstances connected with it which prevent it from being a good refuge ?—There is a bar at the mouth of the Tay, and the sand lays a considerable distance off. It is possible that in south-east gales a sea may be caused upon the bar, which to a certain extent would interfere with refuge.

28,634. Have you personal knowledge which enables you to speak as to the eligibility of the Tay as a harbour of refuge ?—Not strictly with a view to refuge ; the result of my experience is contained in the North Sea Directory, whatever that may be.

28,635. With reference to your opinion that upon a straight coast the middle point of the straight coast is the proper place for a harbour of refuge : taking the coast from the Tay to Peterhead, would not Aberdeen pretty well meet that definition ?—Anywhere midway ; midway upon a straight coast, wherever that site would be. I have no special site in view.

28,636. Are you sufficiently acquainted with Aberdeen to speak of it ?—Yes, well.

28,637. (*Capt. Washington.*) As you seem to have made tidal rivers a subject of study, I should like to ask whether you consider that in dealing with a tidal river it would be desirable to deal with it as far up as the tide flows, and not merely with its mouth ?—I think that is of the utmost importance.

28,638. You consider that in the case of the Tyne it would be desirable to remove all obstructions as far as Newcastle Quay, including the old bridge at Newcastle, and to encourage the tide to flow up to its utmost limit ?—Anything within the river Tyne which interrupts the tidal propagation, and the works which you have mentioned do interrupt it, ought to be removed ; in fact the utmost amount of tidal contents should be invited by decreasing the friction.

28,639. Are you aware what is the loss of rise of tide between Shields Bar and Newcastle Quay ?—Speaking from memory, I think about five feet.

28,640. Do you think that that state of things ought to be remedied, and do you apprehend any difficulty in remedying it ?—If all the obstructions upon the sides and in the bed of the Tyne were removed, the evil would be to a certain extent cured, but I am not prepared to say that it would be altogether done away with.

28,641. Might not the bed of the river be lowered, as was done in the case of the Clyde ?—The increase of tidal quantity has that effect.

28,642. Might not the bed of the river be deepened by dredging ?—It ought to be in the first instance, in order to remove all obstructions which the current unassisted cannot carry away.

28,643. Do you consider the free application of the dredge one of our most powerful instruments towards the improvement of harbours and rivers ?—A most valuable aid as a means of getting a river into condition, but not of maintaining it. It is an expensive process to maintain it by dredging.

28,644. Ought not a river once put into what engineers call " train " to maintain itself ?—It ought.

28,645. Is not it fair to think it would do so ?—It ought.

28,646. But if you require to increase the depth it must be done by dredging, as in the Clyde ?—It must.

28,647. (*Capt. Vetch.*) Coming back to the drift along shore, I suppose it would follow from your observations that material coming down from the north would fill up all the quiet nooks round the south side of a headland ? More or less it will so.

28,648. And that in fact the Herd Sand is a case in point : that the Herd Sand is owing to the promontory of Tynemouth Head running out and affording shelter, and that it takes its shape from being interfered with by the river ?—Yes, a triangular sheltered position.

28,649. And the waste of shore proceeds from north to south, where it is in a state of decay ?—The drift is from the north to the south.

28,650. The material which falls down is carried away to the south ?—Yes. There is one memorable instance ; the whole Holderness coast for a distance of thirty miles is being cut away at the rate of a few feet per annum, and the material so carried away is lodged at the head of Lynn Wash, and forms most beautiful land.

28,651. Are you aware that the Holderness coast is cut away year by year, at the rate of seven feet per annum ?—It is so.

28,652. That cliffs 20, 30, and even 40 feet high, are so cut away ?—I should think the average is about 40 feet.

28,653. All the material going along the beach seems to be carried to the south ?—Yes.

28,654. You know from what is going on at Spurn Point that the same thing takes place there ; everything training down to the south ?—It is so.

28,655. In fact, by referring to history we find that many parishes formerly belonging to Holderness have vanished into the sea ?—Yes ; I have myself seen a steeple in the sea.

28,656. The only place to which the material can be transported is the Wash ?—Yes ; it receives the whole of it.

28,657. That drift from the north is perhaps in connection with the northerly winds in some degree, because I understand from all sailors that a northerly wind brings the heaviest swell into the North Sea ?—Perhaps. The heaviest wave undulation is said to have occurred with northerly and north-westerly winds doubling round out of the Atlantic ; the greatest mass, if I may so term it. But the most dangerous and heaviest sea under other circumstances is that from the north-east.

28,658. We hear of what seemed to be a case in point at Wick. It was remarked by some person there that upon one occasion, when there appeared to be a perfect calm at sea, yet in a very short time there were breakers and rollers from Wick Head right up to the upper end of the creek ?—I have seen it so.

28,659. Breaking seas when there was still water outside ?—Yes, on a calm day.

28,660. That I suppose you would attribute to the Atlantic swell running up into the creek and meeting the shoal ground ?—Yes, to a westerly gale in the Atlantic, not reaching, but sending its swell home.

28,661. You would not be surprised if it came with a south-west wind in the Irish Channel ?—No.

28,662. I crossed that channel in the month of October last to Kingstown, with a south-west gale, and found a breaking sea with a driving surf running into Kingstown Harbour ?—I should expect it to do so; looking at the circumstances of the case, I think, I could have predicted such an occurrence.

28,663. With the same westerly gale I saw the sea running up into Dublin Bay; the sea breaking, and the wind off shore, carrying away the surf to sea ?—I should expect it.

28,664. So I fancy the Atlantic wave has, generally speaking, a great deal more to do with our shores than we are aware of ?—It has a good deal.

28,665. (*Mr. Coode.*) You say that in a gale of wind, you have seen the sea discoloured to a depth of 15 fathoms ?—Yes.

28,666. Did you refer to extraordinary gales, or to fair average gales ?—A fair average heavy gale. I am constantly witnessing it from being on the coast.

28,667. Where about ?—Near Sunderland. I have a mark for the depth.

28,668. You are prepared to say that there is a movement of matter in suspension to a depth of fifteen fathoms ? That is my belief.

28,669. In short, you would not agree with the evidence given at Sunderland, that sand and light matter will not move in a greater depth of water than eighteen feet ?—Oh dear no !

28,670. You speak now from actual observation ?—From the observation of twenty-two years directed to all these points; in fact, I have made them a favourite study.

28,671. Have you ever had occasion to direct your attention to the nature of the material forming the bar at the Tyne ?—I have not. It is a prolongation of the Herd Sand. I should be prepared to find in the body of the bar some river debris, masses of stuff, stones, refuse, and so on, but 99-100ths of the bar would be sea-sand.

28,672. Material brought in from seaward ? — Drifted either along the shore or from seaward.

28,673. Material brought by the sea ? — Brought by the sea.

28,674. And you apprehend that the existence of a bar just outside the piers at the Tyne would entirely prevent the existence of an inclined plane such as Mr. Walker spoke of ?—It would immediately destroy anything of the sort if it existed, for the reason already stated. I may also mention that the rearrangement of the entrance of a river by works advanced into the sea, besides involving the serious drawback of abruptness of frontage, to which I have alluded, acts both ways; it increases the force of the flood as well as that of the ebb, and therefore, although the tendency of the increase of the ebb is to send matter out, the effect of the increase of the flood is to send it in.

28,675. So that although there might be an additional quantity of matter carried out, there would also be a greater quantity carried in ?—Yes. I may mention as a broad principle, that the great object is to accept the natural position of the bar, and then to act upon it by artificial works. What you ought to aim at is a concentrated ebb and diffused flood, the bar being really a balance of the power of the river on the one hand, and that of the sea on the other; therefore, if you could concentrate the ebb over the channel of the bar with no perceptible flood, that would be the best possible condition for procuring depth.

28,676. You regard that as the broad principle to be acted upon, in attemping to improve a tidal harbour ?—That is the case. I have heard certain cases referred to, as illustrations in support of artificial works at the mouth of the Tyne and the Wear, but they have really no bearing upon the question. The three cases to which I allude are those of Scrabster Roads, in support of the Wear, and Dover and Yarmouth in support of the Tyne, with which, however, they have nothing in common. You can draw no inference from them as to what would be the result at the Tyne and Wear.

28,677. I fear there may be some little misunderstanding of your description of calliper piers, and I would ask, rather by way of illustration than for any other purpose, whether, when you spoke of calliper piers, you did not mean piers that approach each other as they advance seaward, and by bell-mouth piers, piers that recede from each other as they advance seaward? —I do; calliper piers are those which approach as they advance seaward and curve towards each other, and bell-mouth piers those which recede from each other as they advance. I may also mention in support of the view that I am expressing as to the primary cause of the bar, that you never find a bar at the mouth of a river when the sea and the tide set in the direction of the entrance; there can then be no sea or tide across the entrance, and that being the case, the cause for the formation of bars does not exist: I will instance the Thames. It is in the direction of the tidal influence, and there is no sea, except in the direction of the channel. The Shannon is the same, and the Forth the same. There are also others, in fact you might go round the whole coast, you will see it indicated that where the tide and the sea do not set across the entrance there is no bar, but wherever they do there is. In fact, if you allow your reason to act with these two facts before you, you can be at no loss as to the cause.

28,678. The Humber is another case ?—The Humber is, to certain extent, a case in point. It runs transversely to the tidal set, the sea may act across it, and there is the nucleus of a bar, but it is far seaward. That is an enormous river, and of course it has special features.

28,679. Do you consider the Tay as good a harbour of refuge as the Humber ?—I am not immediately prepared to compare them, but I do not see any broad difference.

28,680. Have you ever heard of the proposition to construct island breakwaters in front of tidal rivers, with a view to the removal of bars, and to prevent their formation ?—I have heard that such an idea has been originated by a Mr. Glover, a clergyman, but I do not at all know the plan.

28,681. It is that to which I allude ?—I only know that the idea has been suggested, but of the mode of application I know nothing. I have never seen a projection, and therefore can form no idea of it.

28,682. Do you imagine that the application of the principle of an island breakwater to the mouth of a river, would have the effect of preventing the formation of a bar ?—I cannot reply to that. I must see a plan of the work, and would then indicate clearly what I believe would be its effect.

28,683. (*Chairman.*) Referring to this plan, in which Mr. Abernethy's proposed pier at Aberdeen is marked in red, what is your opinion of it ?—I do not know the express objects of the work.

28,684. The object of the work is to give thirteen acres of refuge, in which vessels could lie until the tide enabled them to go up the harbour ?—With only the work shown upon the plan.

28,685. With only that work ?—It cannot be done.

28,686. Why ?—Because the sea would find its way into the space, and that heavily.

28,687. It does not follow that because the line in

LONDON.

Mr. E. K. Calver.

4 Dec. 1858.

Chairman.

which the sea runs is cut off by a breakwater it will not come round?—It will double round sufficiently to prevent vessels within being in a safe position. Then it would have to be deepened, and I do not see any power except artificial power for maintaining it.

28,688. For maintaining the depth?—For maintaining the depth.

28,689. It is not proposed to create any depth?—The effect of the work will be to decrease the depth.

28,690. An opening is to be left for the tide to go through?—Practically that would have no effect in preventing the lodgment of matter.

28,691. Your opinion is that that space would fill up?—It would be a sack to receive material. Perhaps upon being informed of the views of the projection, and carefully considering the subject, these opinions of mine might be slightly modified.

28,692. On Tuesday you will be examined as to the wave screen.—In support of that invention I shall only be able to advance principles. As to the mode of construction and so on, I of course know nothing. But since I published my pamphlet upon the subject, the gentleman who has carried out the only work of the kind in this country, Margate pier, has written to me to say that he was perfectly astonished to find that that pamphlet embodied all the experience which he had gained during the construction of that work, and that he was thoroughly convinced not only of the truth of the principle, but also of the practicability of constructing such a work at a very small cost. That is Mr. Bastow, who constructed Margate iron pier.

28,693. Will you write and ask him to be here on Tuesday, at ten?—I will.

Mr. GEORGE GRANT FRANCIS examined.

Mr. G. G. Francis.

28,694. (*Chairman.*) You have a statement to make to us?—I have put what I have to say in the fewest possible words in the form of a written statement, which, perhaps, I had better read.

To the Royal Commissioners on Harbours of Refuge for the United Kingdom.

GENTLEMEN,

PURSUANT to the request of the Commissioners, and the arrangement made at the time I gave evidence at Swansea, I have now the honour to present the following information illustrating my evidence in chief, and confined to the Bristol Channel above Hartland Point, as defined by the Select Committee of the House of Commons at pp. vii and viii of its Report on Harbours of Refuge, 1858.

1st. A table of the Tonnage and Shipping of the Bristol Channel proper, or above Hartland Point, for the year 1857,

By which it will be seen that it has one sixth of the tonnage and one quarter of the shipping of England and Wales; and nearly half a million of sailors engaged on its waters.

2nd, Some account of the Loss of Life and Property which has occurred during the last twenty-five years on the north side of the Bristol Channel, and taking the Mumbles as a centre.

From the absence of registered statistics, I have found great difficulty in obtaining the facts under this head, but from trustworthy sources I have obtained six different lists, which, though unfortunately imperfect, yet exhibit in a marked manner the want of a Harbour of Refuge on this coast, a want which must necessarily increase with the rapid extension of the commerce of the district. I have ventured to present the lists in their original condition for examination by the Commissioners, but they can easily be reduced to any given form for printing, if so desired.

3rd, Photographs of the beaching ground at the Mumbles.

To show the character and value of the flats at the Mumbles for the smaller class of vessels, and the reason why loss of life is not so frequent at the Mumbles itself as upon other parts of the coast. I have obtained the four photographs marked a, b, c, and d.

4th, The stratagetical value of the Mumbles.

I am now able to inform the Commissioners that during the long French war, the Government found that the most convenient place in the Bristol Channel for the convoys to assemble was at the Mumbles. It was the rendezvous for the entire channel, and the gun brigs "Bloodhound," "Intelligent," and "Conquest" were employed for years in convoying the merchantmen westward as far as Plymouth. In the present day it has been determined to erect a powerful Battery on this head, and a well-known Lighthouse has long existed there, so that the naval, military, and civil authorities appear to have been singularly unanimous in selecting this locality as a common gathering ground for this channel.

5th, Touching the question of Ships from other ports than Swansea frequenting the Mumbles roadstead.

I have heard but one universal declaration, that it is, and always has been, used by ships from all the Channel ports, but probably the annexed letter (marked X) from the lighthouse keeper at Swansea will be more satisfactory to the Commissioners than any general statement of mine.

As illustrating the inquiry,—How many vessels have been seen there at a time? I have found a note that when Colonel Vicars and myself visited the site of the proposed Mumbles Battery in 1854, we counted 280 vessels lying in the roadstead. And on the very Tuesday evening after the Royal Commission sat at Swansea, eight vessels only were counted at the Mumbles; on the following morning no less than 104 sail of ships were lying there in safety, driven in by the change of wind, and having reached it without a pilot!

Lastly. Supply of Stores at Lundy Island.

On this subject I have gone into the question with several competent merchants, and looking to the great variety of stores required to be kept, varying indeed from biscuits to masts and sails, and the long and uncertain periods between the times of demand, together with the necessity for the erection of special store-rooms there, they are of opinion that the extra cost of articles of almost every description would have to be set down against the shipowner at from 50 to 100 per cent. over that from localities which possess the ordinary appliances of ports with large populations.

I have, &c.

London, December 4, 1858. GEORGE GRANT FRANCIS.

Mr. Clayton read the following memorial upon the improvement of the Tyne:—

The Memorial of the Tyne Improvement Commissioners

Humbly showeth,

THAT your memorialists observed with much satisfaction the appointment of a Royal Commission to inquire into the best means of preventing the lamentable loss of life and property by shipwreck.

That your memorialists feel the deepest interest in this inquiry, representing as they do the commerce of the river Tyne, in and out of which river pass annually nearly one-half of the shipping frequenting the north-eastern ports, and about one-eleventh of the whole traffic of the ports of the United Kingdom, and they earnestly hope that the result of the present inquiry may be the adoption of adequate measures for the saving of life and property on this dangerous and much frequented coast.

Your memorialists have already laid before you evidence in support of the views which they have formed as to the best means of affording the required protection against shipwreck, reserving their engineering evidence to be given at your meeting in London.

Your memorialists believe that the most effectual means of diminishing the loss of life and property on this coast would be the improvement of the entrances of the existing harbours, and that one or two great refuge harbours would not alone answer the purpose contemplated.

It is found in practice that the masters and crews of ships invariably press on, almost at any risk, to their harbour of destination, and that if compelled to put back, they seek to make their port of departure. This is confirmed by the fact which Mr. Thomas John Taylor's evidence will establish, that almost without an exception the wrecks at the mouth of the Tyne are of vessels bound thereto, or seeking refuge therein, or which, having sailed from the Tyne, have put back from unfavourable weather. In such cases increased depth and greater shelter at the entrance of the Tyne would immensely diminish or wholly remove the risk. The greatest proportion of wrecks at the mouth of the Tyne occur with south-easterly gales, and to light ships caught to the north of Tees Bay and bound for the Tyne, or ports north of the Tyne,—the protection of which, a harbour of refuge in Tees Bay would not secure.

And taking a more general view, one single harbour of refuge, while it would not meet the most frequent and most urgent cases, would not realize all the advantages which have been set forth even on such a possible occasion as

when a sudden gale overtook a fleet to the windward of it; because, of the vessels running for it the earliest arrivals would occupy the deepest anchorage, irrespective of their size; and larger vessels, as they arrived, might find no anchorage space unoccupied, and be obliged to take the beach; and this on account of the impossibility at any practicable cost of constructing a harbour sufficiently large to allow, swinging at their anchors, the numerous and always increasing fleets which necessarily accumulate in the coal trade.

Besides this, the enormous estimated cost of any artificial harbour of refuge in deep water; the consideration that it will almost certainly exceed the estimates of its promoters; and the uncertainty that the intended depth of water will be maintained, or that the nautical advantage expected will be realized, must always induce the utmost caution before the national funds are awarded for such an undertaking.

Your memorialists believe that the application of the public money, as they recommend, to the improvement of the existing harbours, is not liable to these objections, while it would more effectually provide for the safety of life and property.

Your memorialists feel some delicacy in alluding to the schemes put before you by other parties; but they, as well as the rest of Her Majesty's subjects, are interested in preventing the waste of public money which would result from its application to schemes which, if executed at any cost, could not effect the end proposed, though they might improve the financial position of joint stock companies.

Even supposing that a general harbour of refuge could be made at any practicable cost, and of any practicable extent, and that vessels could and would use it—notwithstanding the necessary delay, risk, and expense of doing so—there would remain an urgent necessity still for the improvement of the present trading harbours; for, in any case, vessels must reach their port of destination, and encounter all the risks of entering it.

The attention of your memorialists, from the time of their constitution as Conservators of the River, has been constantly directed to the improvement of the mouth of the Tyne, with a view to the saving of life and property, and they have more than once memorialized the Government for national aid towards the accomplishment of such a truly national object. They have also obtained an Act of Parliament for the erection of piers, taxing the shipowners (who voluntarily consented thereto) in order to raise funds towards the undertaking.

Your memorialists are now accordingly engaged in the construction of piers at the mouth of the river, for the purpose of improving the depth and safety of the entrance. These works are described in Mr. Walker's report and plan of November 1853, and the extent of the present contract and the progress made in its execution have been already detailed in the evidence of Mr. Messent, the resident engineer.

The estimated cost of completing those piers is 400,000*l.*, and your memorialists have power, and do levy a pier due of twopence per register ton on ships arriving from foreign ports, and one penny per ton on all ships arriving coastwise, for the purpose of obtaining the necessary funds. The annual produce of this tax is about 12,000*l.*, and is increasing.

Your memorialists, encouraged by the appointment of a Royal Commission, and the evident intention of Her Majesty's Government to devote a grant of public money to the purpose of refuge on this coast, requested Mr. Walker to report to them his views as to the possibility and cost of converting the Tyne into a harbour of refuge. His report will be laid before you and supported by his evidence.

By his extended plan, the piers are proposed to be advanced into 36 feet at low water, instead of 15 feet. Mr. Walker expects that these works will occupy 10 or 12 years in execution, but that their beneficial effect will be much sooner felt, and that the result will be to secure a passage of 18 feet depth at low water from the sea to Shields Harbour.

To secure this great benefit, however, an outlay of a further sum of 400,000*l.* will be required, making the total sum necessary to complete the extended piers 800,000*l.*, but this cannot be done without the aid of a grant of the sum of 400,000*l.* from Parliament.

Regarding what the Tyne Improvement Commissioners have done, and are doing, for themselves, and the great benefit to the country at large which will result from the Tyne being made a harbour of refuge to the extent which will be effected by the piers now in the course of formation, and their proposed extension, and considering how vastly beyond the sum named will be found any estimate for any one general harbour of refuge, your memorialists submit that a contribution of 400,000*l.* on the part of the Government is reasonable and just, and would, in fact, be a contribution by the nation precisely equal to the sum which the port spends out of its own resources to accomplish this great national object.

There is ample accommodation for ships in Shields Harbour, which has frequently contained more than 700 ships lying afloat at most efficient moorings. Besides this, the moorings in the rest of the Tyne have, at the same time, accommodated other 500 ships. The Northumberland Dock already opened, and the Jarrow Docks nearly completed, will together hold an additional number of 700 ships, making in all nearly 2,000 vessels. Such an extent of mooring accommodation, and facilities for classifying vessels, according to their size, can be found only in a river harbour. And it is to be remembered that when Shields Harbour and the other coal harbours are full of ships, it is because nearly all the vessels are in port, few being at sea exposed to danger.

By Mr. Walker's extended piers the largest vessel frequenting the Tyne could find shelter within the pier heads, if necessary, until there was depth of water to pass up, which there would be for a great part of every tide; while the smaller vessels would go up without waiting, and not remain to crowd the anchorage within the piers.

Your memorialists are aware of the objection that the Tyne is liable to heavy freshes or land floods, which cause a very strong outward current at the bar, and prevent vessels entering. This, no doubt, has happened at rare intervals, but to a much less extent than has been stated. But such freshes or land floods always happen either with westerly winds or in calm weather, and their occurrence is no practical objection to the Tyne as a refuge harbour.

The national aid which your memorialists seek would be repaid, not only in the diminution of the immense sacrifice of life and property connected with the coasting trade (which has ever been the best nursery for the hardy race of seamen who have so ably maintained the honour and power of their country), but also by the port becoming a station for small frigates and gunboats, by which the coast and its commerce would be most effectually protected.

(Signed) Joseph Cowen,
Chairman of the Tyne Improvement Commission.

Tyne Improvement Commissioners' Office,
December 2nd, 1858.

The Commissioners adjourned till Tuesday.

Tuesday, 7th December 1858.

PRESENT:

Admiral Hope (Chairman).

Sir Frederic Smith.	Captain Vetch.
Mr. Lindsay.	Mr. Coode.
Captain Washington.	Mr. Evans, Secretary.

Mr. E. K. Calver, R.N., re-examined.

28,695. (*Chairman.*) Mr. Calver, is the gentleman whom you mentioned on Saturday here?—The gentleman who constructed the pier at Margate?

28,696. Exactly so?—Yes; Mr. Bastow of Hartlepool; he is here.

28,697. The understanding was, that we should

LONDON.

Mr. E. K. Calver.

7 Dec. 1858.

Chairman.

call on you this morning for an explanation of your proposed new principle of the wave screen?—Yes.

28,698. But before doing so there is a question I wish to ask. In your former evidence you stated that a lee-going tide runs down to the sea?—I did.

28,699. By that expression am I to understand that it is the result of your experience that a lee-going tide makes less sea than if there were no tide at all?—It is so.

28,700. That is the result of your experience?—It is.

28,701. And in the same way that a weather-going tide makes a greater sea than the ordinary sea or lee-going tide makes less?—Yes; and exactly for the same reason.

28,702. I was not quite sure whether I correctly understood you?—I will merely add one word. I mentioned that it did for the same reason exactly, because as the wave is the result of the friction of the wind upon the water, the weather-going tide as it takes the water to windward increases the sea by increasing the friction, and so the lee-going tide as it takes the water to leeward reduces the friction and decreases the sea. I may add, that after very close observation extending over a period of 22 years I have never seen the slightest deviation from that broad fact.

28,703. Before going into the subject of the screen, is there anything you wish to add to the remarks you made when last under examination?—Since I was examined on Saturday, I have remembered a few facts which bear upon the information required by the Commissioners, and which I think they ought to be possessed of. In the first place, I explained to the Commissioners that on the east coast of England, on every part of that coast which received the true sea, not interrupted by local causes, I invariably found that the movement of the soil was from north to south; and I explained to the Commissioners that that effect was the result of the preponderance of the sea, without specifying whether that preponderance arose from the sea caused in the north-east gales, or to the sea which we find on the eastern coast of England, and which is merely the residue of the Atlantic Sea, a sea which as a body is perhaps superior in magnitude to the sea of the north-east gales. I also explained that in certain positions on the north-east coast the movement of soil was from south to north; but that that movement proceeded from exactly the same causes; that was, the preponderance of sea acting exceptionally from the general rule from south to north. I now wish to produce a more minute example, to show that if even you take it down to the smallest practical example you will see the same law constantly operative. Before the Commissioners arrived in Sunderland, I walked round the works, for the purpose of refreshing my memory, in case they should require any information from me about that port. Amongst the other places I visited there was the south dock; the seaward face of the south dock. The Commissioners are perhaps aware that that is an artificial work, formed and protected on its seaward side by a series of transverse groins, formed of stone, and running in a direction transverse to the line of beach. While walking along there I observed that up to a certain point the groins were charged upon the north side, and as I walked southward I found that they were charged upon the south side also. Now, whenever I observe a fact of that sort I immediately make a note of it, and endeavour to ascertain the cause. I looked seaward, and reflected a little, and I at once saw the cause. In the centre, or rather opposite the centre of these groins, is a ledge of rocks, marked by a beacon called the South Beacon, and the consequence of the proximity of those rocks in that position is, as it affects these works, to destroy the sea in its progress to the northern works. Therefore the only effective sea that can arrive at the northern works is from the north-east, and hence the movement of the soil has choked up this northern side. On the northern division of the works, these south rocks, which have the effect of cutting off the sea from the north works in the same way have the effect of destroying the north-east sea in its progress to the south works, and the consequence is, that the most effective sea is from the south, and therefore these groins are charged on the south side as well as the north. The Commissioners will therefore observe, that whether as respects the whole line of coast, the results of modification, or minute examples, that the same law is constantly operative.

28,704. The chart shows a groin which I see is charged on both sides; is that consistent with the fact?—Is the chart correct? The groin is in a central position. But this plan was made a number of years ago. If I had now to make a survey, I could better illustrate the effect. There are documents and plans in the possession of the dock company which would be very instructive upon this point, if they exhibit the effect.

28,705. Did you observe whether the central groin was charged upon both sides?—I did not particularly look for that, but I apprehend it would be so.

28,706. Do you wish to add anything further to your statement?—Only in general terms.

28,707. Then before you proceed may I request that on your return to Sunderland you will examine that portion of the beach, and send us an exact plan of it?—I will do so.

I mean particularly with reference to this central groin, that we may be sure of the fact that there is one groin in respect to which the deposit is shown to be on both sides.

28,708. (*Mr. Coode.*) What number of soundings did you take? Can you give us anything like a contour line of the rocks?—It is merely a large mass of rocks, lying out like a groin, upon which the sea bursts, and so becomes destroyed. It is a ledge of rocks upon which the sea breaks up.

28,709. (*Chairman.*) In effect these works form a prolongation of the groin in fact it is a groin in itself?—Yes, virtually a groin in itself.

28,710. (*Mr. Coode.*) It is in fact as if it were two bays, the central groin forming a headland which divides the water into two small bays?—It is so.

28,711. And that is precisely the effect, is it not?—That is really and practically the effect.

28,712. (*Chairman.*) Will you proceed, Mr. Calver?—The next point to which I would desire to add a little illustration is that of the depth to which the wave extends. I mentioned to the Commissioners on Saturday that the result of some of my observations, taken by me during the progress of the north sea survey under the command of the present hydrographer, led to the inevitable conclusion that there was a movement of the soil or material — that material being shingle—to a depth of twelve fathoms towards the shore. We observed the different beaches along the coast of Suffolk: but in studying the character of that coast, both in respect to its structure and general formation, we saw distinctly that the shingle could not have arrived from the north across Lynn deeps, because Lynn deeps form, as it were, a sack to receive the material that may pass that way. It is quite clear that anything attempting to cross the mouth of the Lynn deeps, any material of that kind, would lodged in the deeps, as a general receptacle. This led to inquiry. Capt. Stanley being then in temporary command of the *Blazer* during the absence of Capt. Washington, and his father, the Bishop of Norwich, being a very scientific man, he was induced to direct his attention to the point. He was pleased to consult me in reference to it, and I recommended dredging operations in the offing. I had studied the character of the coast a little, and to a certain extent indicated the region to dredge in. We went accordingly, and dredged in the offing there at a certain number of miles away from the shore,—I cannot now exactly specify the distances, and we found ridges of shingle lying parallel to the main exactly of the same cha-

racter as that upon the beach, but a little more angular. Another fact we discovered was, that in sounding the spaces between these ridges and the main,—in the great majority of cases, in nine out of ten, or I may say in 99 out of 100, the bottom was plain sand, but occasionally there was a pebble. Now putting the two things together, the character of the shingle in this, which I may term its primal bed, or the source of supply, with the fact that we found the single pebble, the traveller, as it were, between the bed and the beach, led us to the conclusion that the shingle was supplied from these ridges ; and therefore I said, on Saturday, that I was prepared to state distinctly that we had obtained proof that the wave possessed a power which had a propelling effect at a depth of 12 fathoms.

28,713. (*Sir F. Smith.*) Were the travellers from the beds to the main in great numbers ?—No ; it is true that the travellers were not in great numbers ; but I believe, if you could uncover the bottom of the sea, you would find a large sandy waste dotted over here and there with pebbles travelling towards the main.

28,714. (*Chairman.*) Does that conclude your observations upon this point ?—I would ask permission to continue my remarks upon the depth of the wave. In the report of the voyage of the *Samarang*, which is the result of Sir Edward Belcher's experience, we find that the effect of waves have been known to reach to a depth of 200 feet below the surface ; and the harbour master of Holy Island mentioned to me that the *Pegasus* steamer, which sunk in his district of coast, and lay there for a long time, at last broke up in a heavy north-east gale, with a depth of 13 fathoms over her. Sir Henry De la Beche, a most careful observer, in his evidence given before a former commission in reference to the harbour of Dover, says, that he has observed the water discoloured to the depth of 15 fathoms, as showing the result of heavy gales of wind ; and the same authority tells us that molluscs, making bivalve and invalve shells, are uncovered and driven on shore during heavy gales, from a depth of even seven fathoms water ; and he remarks, that the late Professor Forbes mentioned to him that the venus cassina, a large shell, which is not known to exist alive at a less depth than seven fathoms, is often thrown up during heavy gales, and cast upon the coasts of Ireland, the Isle of Man, and the coast of Scotland. Sir Henry de la Beche further goes on to observe, that in such cases as these, not only is the power of the wave equal to the uncovering of those animals which live beneath the surface of the mud, the silt, or the sand, but also to drive them ashore, against the exertions they may make to avoid it. The sizes of these animals are, moreover, such as to show that if they can be driven and moved about in this manner, the silt and the sand may be readily moved and driven also. It was likewise mentioned to me by a commander in the navy, an officer of very close observation—I will mention his name, in order to give the Commissioners an opportunity of calling him before them, if they wish—I refer to Captain Ward, now, I believe, connected with the Humane Society.

28,715. (*Sir F. Smith.*) The Life Boat Society ?—The Life Boat Society. Captain Ward, in a note he addressed to me, mentioned what I consider a very interesting fact. He says, "You will see that the "depth of our anchorage at high water, that is at "Santandar on the north coast of Spain, was 40 feet. "I do not think that the height of the wave from the "crest to the lowest part of the bottom could have "been more than five feet, as the wind was off shore "on that coast ;" and the fact he alludes to was this, that looking down through the water, which in that locality is uncharged with matter, he found at the depth of 40 feet that the wind of the previous day had left ridges on the bottom and ridges in a direction transversely to the wind, showing that it was due to some other cause than the mere action of the current. That, I submit, is a very interesting fact, for here we have evidence of a wave of five feet sending its impression to a depth of eight times its own column. This, probably, may be sufficient upon this particular point, as I am anxious to avoid overloading the subject. The only thing I would state, in addition, on this subject of depth, is the fact that opposite Sunderland Harbour, one of the ports proposed to be operated upon by means of certain works which have been brought before the Commission, are a number of ballast buoys, in ten fathoms water, within which no keel, vessel, or other craft is allowed to drop one single bit of material of any sort, under very heavy penalties, which are inflicted by the magistrates with great rigour in every case where the law in this respect is infringed. This shows at all events that the appreciation of the inhabitants of that district is against the assumption which has been produced before the Commissioners.

The next point to which I would refer, and I will do so very briefly, is respecting bars. I mentioned in general terms on Saturday, that the primary cause of the formation of bars on our coasts was, the transverse motion of the wave and current crossing the debouching river ; and if the Commissioners will take that as a doctrine—and while there are many facts which tend to bear it out, none have been adduced to the contrary—it will at once recommend itself to their minds as the cause. Looking at the matter in a broad light, I said, that where the wave goes transversely across the entrance there would always be the worst bar formed, and that when there is no such cause in operation there can be no bar ; and you will find that to be the case universally. But there was one particular example that occupied my attention at the time, and that is the case of Lowestoft on the coast of Suffolk, where there is an aggravated movement of the material which commonly causes the bar. In 1832 a harbour was formed there, by connecting a lake, which was close at the back of the beach, with the sea, duly defended with piers and gates. If the parties who were called upon to project that work had kept this law in view to which I am referring, they would have instructed those who wanted the work that the harbour could not remain open, inasmuch as there would necessarily be a most aggravated bar ; but, not recognizing this law, the parties promoting the work gave in their report the most elaborate reasons why there should be no bar. In consequence of this, the work was carried out, and the result was that the entrance to the harbour was soon choked up by a bar.

28,716. (*Chairman.*) Will you state what that report is, and where it is to be found ? I should like to see it ?—I believe it is the report of the Tidal Harbours Commission, but I am not quite sure. I merely state the fact, about which I have no doubt. Well, as I have said, the harbour became eventually choked by a bar, and that was one of the causes of its abandonment. They have now carried out a different harbour altogether. The case of Lowestoft is additionally instructive ; and I felt it my duty on Saturday, just sketchingly, to revert to it, because I thought that those who contended that the origin of a bar was due to matter projected out from a river were not exactly correct. It is very true that the materials projected out from the river into the main ocean may add to those which go to form a bar ; but I mentioned previously my distinct view, that in bars like that of the Tyne the river outset was conveyed in an unbroken body far beyond the region of the bar ; and the only thing it does is to add a certain amount of material to the bar. Now upon this point Lowestoft is very instructive ; for when the lake was opened it filled up, clearly showing that the bar at any rate was not due to the matter projected out of the lake, because it filled up as rapidly as the bar formed. And it may be also of interest to the Commissioners to know, that even in the outlet of the south dock at Sunderland, a work that I had the honour to recommend myself, as a broad departure from the original conception, that in that work, although it is pointed in a direction somewhat parallel to the coast, that even there,

LONDON.

Mr. E. K. Calver.

7 Dec. 1858.

Chairman.

as I have every reason to believe, there is a little tendency to form a bar. That concludes all I have to offer upon this particular point.

28,717. Before you leave Lowestoft will you tell us whether the system since adopted there furnishes any further illustration of the theory you have put forward? Is it more parallel?—It does not; it does not throw any additional illustration on the subject of bars; but it is, as I submit, very instructive as to the filling up of close harbours. In that respect it is full of instruction; but upon the subject of bars it throws no new light. The next point I will briefly allude to is that of the Tyne. In a broad way I stated my opinion on Saturday, that the bar there would re-form if these works were carried out. I mean either those large works which have been proposed to the Commissioners, or if the works they are now prosecuting are completed. And here is one point to which I would invite the special attention of the Commissioners. I have explained that the origin of these bars is really the drift of the material along the shore tending to shut the river up. It has been stated in evidence in my hearing that the bar at the Tyne is deepening. I do not know if that is so or not, but I should expect it would deepen. The very protrusion of the north pier to such an extent would have the effect of shutting off the material; and I am prepared to state that during the progress of these works the bar will get deeper and deeper; in fact, that the summit of the bar at various periods will practically form an inclined plane to the very termination of the works themselves, up to the time of their completion. But after their completion then will follow another process. If I am right with respect to the origin of the bar, nature will gradually accommodate herself to the altered circumstances: the north side of the works will bank up, while the effect of the addition of soil will be to shallow the frontage, the shallowing of the frontage will raise the bar, and reverse the incline; so that from the time that the works are completed, the shallowing will commence, and the formation of the new bar will be in progress. There is another matter which I think is extremely interesting, in the consideration of this subject. Taking the east coast of England, I know of no case of a point with anything like the assumed depth in front of 30 feet. There is no point along the eastern coast of England with the tidal streams, acting with perfect impact upon it, that has not a shallow frontage. It is true that the shallow frontage may be formed partly by the rock or by the foundation that formerly existed; but the fact of sand lying upon it shows clearly, that if you produce an artificial point it will in the end be fronted by such an incline as we find opposite every such point on the coast.

28,718. (*Capt. Vetch.*) That will hardly hold good, I think, at St. Abb's Head or Flamborough Head?—There we must judge by analogy. I would take the coast within a certain district. I do not put this forward as a universal law; I merely confine its particular bearing to the coast upon which these works are proposed to be carried out. The works proposed are not at St. Abb's Head nor at Flamborough Head. And then, again, the coast you allude to is a different one, and requires to be studied specially in reference to the locality, applying to the special circumstances of each locality certain ascertained laws; but on that part of the coast where these large works are proposed to be erected, at the Wear and at the Tyne, I know of no such circumstances as would take it out of the operation of that general law.

28,719. Will you explain the difference there is between the circumstances of St. Abb's and Flamborough Heads and the Tyne and Wear?—I cannot off hand. Before giving an opinion, I should prefer to study the subject, lest I might be held to an opinion given without due consideration. In my evidence on Saturday the Commissioners will remember that I quoted the case of Warkworth as being very instructive respecting the bar; but I also want to bring it in now in illustration of another point. I mentioned that at Warkworth the movement of the sand was from north to south, and I may add that it is in its physical characteristics very much like the Tyne, but reversed, having a point out to the south and a flat to the north, while at Tynemouth we have the flat to the south and the point to the north. After I made the Admiralty survey in 1848, extensive works were carried out; a north breakwater, as represented in the plan. When those works were completed the first effect was to deepen this flat. The effect was to deepen the flat within directly; and it proceeded from this simple cause, that while in a state of nature the constant drift kept the flat high and deflected the river to the southward, but the moment they erected the works across the flat the source of supply was interrupted, and the river began to cut out from the north-west, forsaking the place when they wanted deep water, and then they had to build a solid quay to deflect the river to the southward. Now, applying this to the Tyne, and making use of this experience, I should expect the effect of these works would be to lower the Herd Sand, and that the tendency will be exactly in the same way to bring the river to the southward. I believe it has been stated in evidence,—indeed I heard Mr. Walker state it,—that the whole body of the sand was lowered. I should expect that, and that the general effect of the works would be to lower the Herd Sand. I expect that the whole tendency will be to lower the sand, and that the effect of the south work will involve the necessity of constructing another work.

28,720. (*Chairman.*) As at Warkworth?—As at Warkworth. Looking at the Tyne works as a whole, I am prepared to predicate three effects: the re-formation of the bar at the pier heads; the deepening of the Herd Sand; and the banking up of the sand to the southward of the south pier. I have only one or two more remarks to make, in conclusion. In the evidence I have given, and in the support I have endeavoured now to give to it, I have brought under the notice of the Commissioners ascertained facts, as an index of the probable result of what the effect of these works that are being promoted before the Commissioners would be. I have done this for one special reason; because in the course of my study of these subjects I have found that the operation of nature is always uniform. A similar cause invariably produces similar effects. When I observe the state of knowledge in such matters is so defective, the impression of my own mind is, that in an important case like that of providing refuge harbours, involving the expenditure of an enormous amount of money, it would be a very unsafe course to sanction works, if we find them only backed up by theories opposed to common observation. A concluding remark I would offer is this:—If I am not mistaken, it is possible that a witness or witnesses in connexion with the parties who promote these works may appear before the Commissioners, and if anything should be offered by them which might appear to the Commissioners to take away from the value of my evidence, I trust I shall be permitted an opportunity of explaining it. That completes all I have to offer.

28,721. In your evidence on Saturday the case was put to you by Mr. Lindsay, as to what would be the results at the mouth of the proposed works at the Tyne, supposing the Tyne not to exist; do you recollect that?—I do.

28,722. Then, to a certain extent, or in some degree, does not this case of Warkworth afford us a proof of that, inasmuch as the river Coquet is comparatively of small amount?—It does certainly, to that extent.

28,723. There is a certain analogy between the case supposed by Mr. Lindsay and Warkworth, inasmuch as the river there is very small as compared with the whole area included?—It is so.

28,724. And here I find at the mouth of the works a circular bar, a horse-shoe bar, with only one foot upon it?—It is so; and in connexion with that bar I

may mention, that it occupies a position within which we could carry five feet or six feet when in a state of nature ; that is a bar due to the works, and that is a very interesting fact.

28,725. If the Commissioners could obtain the original survey of Warkworth by the Admiralty it would be very valuable indeed ?—It would be a very instructive document to study.

28,726. (*Sir F. Smith.*) Have you any idea of the breadth of the bar, taking the corner of the river ?—I have not examined it since I made the survey in 1849. I do not know its existing state at all.

28,727. Do you know what it was at that time ?—Oh yes ; at that time it was about 800 feet from 6 feet on each side.

28,728. Is not that the length ? I want to know the width ?—The bar then measured from 12 feet on the river side to 12 feet on the sea side for about 1,500 feet or a quarter of a mile.

28,729. And do you suppose that if the works projected by Mr. Walker should be carried into effect that the existing bar would be removed, and that another bar of similar proportions would be placed beyond the works ?—Yes. The bar would no longer exist as an obstruction in its present position, but it would be removed outwards with the execution of these works. It will eventually exist as a bar, but not exactly of the same character, as I explained on Saturday. It will have a steep frontage, and therefore be a more dangerous bar than it it now.

28,730. What was the external or seaward slope of the bar when you made the survey ; what was the slope it presented to the wave ?—At the period of the Tyne survey there was a slope of 18 feet in a distance of 1,100 feet of horizontal distance.

28,731. That is a rise of 18 feet with a base of 1,100 feet ?—Yes, a rise of 18 feet with a base of 1,100 feet.

28,732. And you believe when the works are completed, and the new bar is formed, that the external slope will be steeper ?—Yes.

28,733. The vertical rise will be greater ?—Exactly. It takes the place of a point at sea. In that case you get a steep slope, and with a bar you get a gentle slope.

28,734. And to what height do you suppose that the bar will rise, or rather what depth of water do you suppose there will be over the bar when the worst shall have happened ?—I mentioned on Saturday that that was a point I dared not speak to very decidedly ; but I stated in a general way my opinion that if the works were carried out it might be possible, on account of the scour, the prevention of the dispersion of the ebb by the projection of the north pier, that a depth of two or three feet might be produced, in addition to what the depth was in the unprotected and natural state, but that I thought not more. I said, in considering the subject, you might take it that the state of any bar is the balance of power between the river to keep it down and the sea to keep it up, and in carrying out that idea in the present case you have merely to consider what additional force you give to the river outset, and in exactly that proportion you increase the depth.

28,735. Do you imagine it possible so to construct the works within the harbour as to deflect the ebb tide between the breakwater and the breakers, so as to prevent the meeting of these two forces ?—I think I have already explained that there is no opposition of forces.

28,736. I thought you said that the flood tide from the ocean met the ebb tide or freshes from the river, and causes the bar, where the power of the two forces concur ?—No ; that is the view I contest. I say that the bar is not due to any opposition of currents, except to the extent I have stated,—that the river does lend a certain amount of débris, perhaps to the extent of 1-100th of the whole accumulation.

28,737. If that be so, is the heaving-up force of the sea at the entrance of the river greater than at the shore north and south of it ? If there is a heaving-up force sufficient to produce the bar at the entrance, there will be a corresponding force north and south of it, will there not ?—By artificial works you form a nucleus for the power of the sea to develope itself. If works do not exist the incline remains unaffected for centuries ; but if you put up artificial works you give the sea the means of showing its heaving-up power, and it would be as great towards the south, and the effect would be that any additional power that you give to the river would be so far to prevent such heaving-up from developing itself.

28,738. Then you think the question of projecting the piers further to seaward does not affect the general result ?—That is my belief.

28,739. It is merely a question of degree ?—Yes, it is merely a question of degree.

28,740. In fact, if you get into very deep water you will still have a bar, but it will be less injurious because it will be on a lower level ?—Yes ; but you have another and steeper bar, which has a most important bearing on the question of refuge. The steeper the bar, the more dangerous it is. On a natural incline the undulations are gradually reduced, and when you come to a bar in a natural state that bar has a sea upon it not half so dangerous as the sea produced upon a slope which is the effect of artificial works.

28,741. What examples have you to illustrate that ?—The commonest observation.

28,742. As to steepness ?—Every part of the coast, where the frontage is steep or shallow : the undulations are always carried with enormous force against a steep incline, and on the other hand they are greatly reduced. In every part of the coast, without exception, you will find that effect produced.

28,743. On the whole, you think the public money would be injudiciously expended if it were expended on the improvement of the Tyne ?—Yes ; considered as a matter of depth, you would find little gain, and the providing a refuge at the mouth of tidal rivers involves that which is dangerous. That is not a place where refuge should be supplied.

28,744. (*Capt. Vetch.*) Supposing that the river Tyne was not a great trading place, you would not select that as a place for a harbour of refuge proper for passing vessels ?—No. In considering the question of refuge, I leave out the mercantile character of the port ; but I object to it because it is the outlet of a river possessing an ebb which is increased by the freshets, and hence causes a dangerous sea.

28,745. I am leaving out of sight the question of trade. You would not recommend that site as a harbour of refuge for the passing trade ?—No ; on no consideration whatever.

28,746. (*Mr. Coode.*) Then the sum and substance of your evidence with regard to the river Tyne is shortly this, that the proposed works, if carried out, will simply postpone the time at which a new bar will be formed ; that the new bar will have a steeper slope in consequence of the works being projected further seaward ; and that the effect of the deeper slope will be to concentrate the power of the breaking sea into a single wave, instead of distributing it over a great number of waves ?—That is so.

28,747. And that the entrance to the Tyne will, in fact, be more dangerous than it is at the present moment ?—That is my belief.

28,748. You made reference to the fact, that on the north-east coast, in every case where there is a projecting work or point, there was an accumulation of sand either on one side or the other ?—Yes.

28,749. Then how do you explain the fact of the absence of sand either on one side or the other at Filey Brigg ?—I endeavoured to explain that on Saturday. There is no absence of sand within Filey Brigg.

28,750. But immediately on either side, and at the point above high water, there is no sand whatever ; there is a quarter of a mile of the Brigg above high water, on either side of which there is no sand ?—The cause is easily explained.

LONDON.

Mr. E. K. Calver.

7 Dec. 1858.

Mr. Coode.

28,751. Will you be good enough to explain it?—Filey Brigg is a narrow ledge, and at the top of high water there is a heavy bursting sea upon it. If you consider the ledge simply with respect to the sea, I would say there ought to be more material within it than without it, because in bursting over that ledge, which it does, the principal effect would be on the outside, where the first strike of the wave is. But you must also consider the effect of the ledge with respect to the current. On the inside of the ledge there is a rotatory tide or eddy tide constantly operating on the inner part of the brigg, but not the outer part. And therefore the result is this, that although there ought to be more soil within the brigg, if you consider it simply with respect to the sea, still, if you consider it in connexion with the concentration and action of the current within the inner part, you would then expect to find it exactly as it appears.

28,752. You mean that there is a considerable quantity of sand carried along by the water on that part of the coast, but that it is prevented from being deposited by the motion of the water?—By the natural power, whether of the wave or the current, being uninterrupted.

28,753. If this quantity of sand is carried along, how does it happen that the ledges of rock there are not filled up with sand along the shore to the north of the brigg, and on the brigg itself?—I think I explained that on Saturday. Where there is a heavy bursting sea you never can get sand to lie about a little narrow ledge. I think I drew your attention to that as an important point. Many persons believe that because sand is not seen lodging on ridges it is not moving, but that is never the case, for where there is a rocky foreshore, and the wave is large in proportion, there is the action of the undertow, which prevents any material resting. It is the same with shingle as with sand.

28,754. That is within the reach of the wave, and when the undertow comes into play?—Yes.

28,755. But assuming that large quantities of sand are carried up, should you not expect a deposit of sand in the hollows of the ledges?—That is a point to which I dare not reply. I can give any reply with respect to Filey, inasmuch as it is a place recommended to the Commissioners. I object to speak of broad principles in connexion with a small local example, but give you my opinion in connexion with the great feature of the briggs.

28,756. My question had reference not merely to the brigg proper, but the rocks north of it. There, in the cavities of the rocks inclined from the shore, the water is deposited in large quantities, and remains in a state of rest, and there is no accumulation of sand. Is not that the case?—Yes; directly the water is in a state of unquiet the sand is taken away. Around Hartlepool you will find cavities with plenty of sand, but directly the sea comes its action is brought into play, and takes away the accumulation. In all bays, although not uncovered, the light material which is suspended in unquiet times is deposited in still water.

28,757. This allusion would hold good below the level where the action of the pure wave would come into play. But my question has reference to the higher levels of rock, only just reached by the broken water during gales of wind, and where the action of the unbroken water does not come into operation?—As I have already said, I cannot give any reply to a question of that kind. There are certain ascertained facts of which I can speak, but in my view of the case these minute matters are not material to the question.

28,758. You conceive they are not indications of the quantity of matter which may be contained in suspension in the water?—No. In the case of Lowestoft no person, let him have watched ever so intently, would ever have supposed there was such an amount of marginal matter in motion. But the moment the transverse work is put out it is charged to the extent of several hundred feet.

28,759. If you have two bays, with respect to one of which there is no indication of a tendency to deposit, and with respect to the other there is a decided evidence that there has been, or is, a tendency to deposit, should you not think it safer to construct the artificial work in front of the bay which showed no tendency rather than in front of that which did show a tendency to deposit?—I trust the Commissioners will allow me to decline giving answers to hypothetical questions. If you mention any place I will give you distinct replies, but I dare not give a reply in connexion with certain principles which may be misconstrued.

28,760. Then I will take the case of the two bays of Filey and Hartlepool, and suppose works of a similar character designed for the front of each bay?—Works of a similar character cannot be designed to produce the same effect in these bays.

28,761. Generally speaking, I suppose it is possible to construct artificial works in these bays?—But they are of a different character; they are examples of a different order altogether. There is no connexion between the two; and I say that you cannot project a work of the same character to produce the same effects in these two bays.

28,762. In order to prevent the tendency to deposit, I presume you consider it desirable to keep up a certain amount of motion within any bay?—It is desirable to preserve the whole motion, if possible, because permanency is the result of the motion. But as that cannot be so with regard to refuge harbours, you must destroy the motion. The great point in projecting a harbour of refuge is this, how little can you interfere with the motion so as to render it consistent with refuge. The object is, as I have said, to preserve all the motion if possible.

28,763. Granting the accuracy of the broad principle you lay down, do you mean to say that it is impossible to construct any work in front of Filey Bay which shall be without a tendency to deposit, but that it is possible to construct one in front of Hartlepool which shall be free from a tendency to deposit?—I do not think it quite impossible; but I say that whatever the work may be, and of whatever character it may be, the work in Filey Bay will have a greater tendency to decrease the depth within that bay than a work at Hartlepool will have a tendency to decrease the depth in that bay.

28,764. Do you think there will be as great a tendency to silt up in Filey Bay as in Hartlepool Bay?—There can be no tendency to silt up in Filey Bay while in a state of nature.

28,765. Has there been a tendency to silt up at Hartlepool?—Decidedly. Up to the year 1846 I have shown in evidence that it did silt up considerably.

28,766. (*Sir F. Smith.*) Am I to gather from what you have just said that all harbours of refuge should be disconnected with the shore on both sides, in order to disturb as little as possible the natural action of the sweep of the sea?—That is the simple point to be aimed at. The object should be to disturb as little as possible the motion of the wave and the current. I may also observe, that the current is not to be undervalued. It is of course the usual agent of depth in rivers. If you are to preserve a large current through a harbour, or if you are able to increase the current, while you cut off the wave, you will still preserve the means for keeping your depth.

28,767. Your answer to my question is in the affirmative?—Yes.

28,768. You would disconnect the piers in harbours of refuge from the shore?—Yes.

28,769. Applying that principle to the neighbourhood of the Tyne, I gather from your observations that you do not recommend anything being done at the Tyne for the purpose of forming a harbour of refuge. But supposing it should be thought desirable to expend public money for refuge purposes in that district, should you be disinclined to make any application of that money to the formation of a harbour of refuge south of the mouth of the Tyne, though unconnected with the Tyne, by projecting piers from the

shore, and giving deep-water refuge within those piers ?—In no case opposite that coast. I am clearly of opinion that upon that coast, whether at the mouth of a tidal river or in a bay, no refuge should be supplied by a space contained within piers projecting from the shore, because by that means you will insure the loss of your harbour.

28,770. I clearly understand your meaning. That is a repetition of your former answer, that piers should be unconnected with the shore. But supposing that the piers might curve, much or little, or be in a straight line, would there be any objection to forming a harbour of refuge to the south of the Tyne, unconnected with the shore, and by piers either parallel to or coming from the deep-water line towards the shore, as shown on Mr. Walker's plan ? —I think that nothing on the plan of Mr. Walker's projection should be permitted on the coast.

28,771. That is, in connexion with a tidal harbour. But my supposition is, that it might be desirable to form a harbour of refuge unconnected with the Tyne, but to the south of it, by the construction of some breakwater to afford shelter in storms ?—I can only say this, that if works projected are transverse to the current they should not be permitted.

28,772. Supposing them to be parallel to the current, would that be an objection ?—Not at all.

28,773. So that it would be possible to construct a harbour to the south of the Tyne, which would answer the general purposes of a harbour of refuge ? —It would be quite possible, so long as these principles are kept in view.

28,774. Would it be injudicious to form a harbour of refuge by means of a breakwater in front of the shore to the south of the Tyne, and quite unconnected with the Tyne ?—I have strongly recommended a work of that character at Hartlepool.

28,775. Would you see any objection to having something of the same kind to the south of the Tyne, but unconnected with the Tyne River ?—Not considered as a work ; but if you consider it as a site, from its geographical position, I am opposed to anything about the Tyne for the purpose of saving life.

28,776. Will you tell me why ?—Because you could not reach it, in many cases. You can always get towards the head of a bight, and I consider the head of a bay the proper place.

28,777. Might it not happen that the Tyne or the neighbourhood would be as good for a refuge ?—As the exception, but not the rule.

28,778. Supposing a harbour of refuge on your system to be constructed at Hartlepool, do you not think that a harbour on the same principle might be constructed to the south of the Tyne, although it would not give so much shelter or security as that at Hartlepool ?—A harbour of that character might be constructed opposite to the Tyne. It might be constructed in the neigbourhood of the Tyne. But, all things considered, I should not recommend a harbour to be formed there for the purpose of saving life.

28,779. Do you not think that immediately in the vicinity of a great port of commerce there should be some refuge unconnected with the port, but near to it ?—I think it is very desirable for the locality for their own purposes to supply that refuge ; and just in the same way as it is possible to screen a frontage like that at Hartlepool, which will afford a large amount of protected space at a small outlay, it might be supplied at the mouth of the Tyne, and it would be for the interest of the locality to do it.

28,780. Would not that screen be better placed at the south of the Tyne than at the mouth of the Tyne ?—No, I think not. I presume that the mouths of tidal rivers may be screened, allowing the principle to be correct, in such a way as to put them in a comparatively better state, and deepen the bars.

28,781. (*Capt. Vetch.*) You have adverted to the Tyne again, and to the great arms proposed by Mr. Walker to increase the depth of the channel. Have you taken into consideration the amount of backwater to be received and returned in consequence of the space enclosed by those arms ?—I have.

28,782. And do you think that the 600 acres of flux and reflux of the sea would not materially help to preserve the depth of the mouth ?—There will not be 600 additional acres of water.

28,783. How many acres would the pier enclose ? —I am not sure.

28,784. Supposing it to be 400 acres, would not those 400 acres, receiving the tide, and discharging it through the narrow entrance, keep the channel open ?—The principal part of the water on these 400 acres is now discharged over the bar. The effect of the piers would be to direct the current, but they would not direct down much more than passes at present.

28,785. But at present the water escapes over the Herd Sand ?—Yes, up to a certain portion of the ebb.

28,786. Up to half ebb ?—I am not prepared to say that.

28,787. But it would be confined to that period ?— Yes.

28,788. The entrance would be confined to a much narrower space ?—Which is prejudicial.

28,789. In what manner ?—It would be beneficial not to have any flood set over it at all, because as the ebb rolls the material out the flood rolls it in. It is not desirable to have any flood set.

28,790. Do you consider that it is the sea stream at flood tide, or the stroke of the wave, that brings in the flood sand ?—I think it is principally the stroke of the wave.

28,791. Then, if it were calm weather, the flood tide would have its effect at the entrance ?—It would have an effect, but not much. As a general rule it is not advisable to add to a flood current, considering the depth over the bar.

28,792. I think we have always been in the habit of considering that the greater the amount of water going into and returning from tidal harbours the better ?—That is a broad principle, and it is correct.

28,793. Supposing these piers were carried into a much greater depth, say, for the sake of argument, 10 fathoms, would you consider the scheme subject to the same evils that you expect from the present ? —Precisely the same.

28,794. If the piers were extended to a depth of 10 fathoms into the North Sea, would not the flood ebb tide be the means of carrying away any sediment at the harbour mouth ?—I think not. The flood sea stream would not act directly between the piers ; it is transversely across them. The only stream between the piers is that which is due to the demand of the river as a receiver.

28,795. Supposing these piers to run out so as to become a little Flamborough Head, and the tide to run across at the rate of four knots, would you not keep deep water in front ?—Yes ; but still you would have a bar much steeper, as I have endeavoured to explain.

28,796. Upon that principle, then, any extent to which these piers might be carried would have no beneficial effect in improving the river ?—The effect of the prolongation would be merely to retard the ultimate result. When they were carried out, nature would adjust herself to the altered condition of things, and you would have the restitution of the features which I have endeavoured to describe.

28,797. Then why has not the south side of Flamborough Head and the whole of Bridlington Bay been filled up with sand long ago ?—The case of Flamborough Head has no connexion with that of the Tyne, so far as I can see. You have a concentrated flow from the south. You have a deep channel within the Smithic. But there is no instruction to be gathered from that case. In such cases you will never find any accumulation, nor would you in the frontage of the Tyne, so long as no artificial works of this character are put there.

28,798. But if this would occur at the Tyne, would

LONDON.

Mr. E. K. Calver.

7 Dec. 1858.

Capt. Vetch.

not the same effect take place at Bridlington and to the south ?—I will put the parallel in this way : if you were to put a river through at Flamborough Head you would have a bar before it.

28,799. Do you consider that a material deposit would take place in such a tideway as that at Flamborough Head ?—Yes. There are two tides, that which is due to the coast, and that which is accelerated by the works ; that is the sea side ; but it has no effect in stopping the formation of a bar within. The increase on the ingoing current is due to the extra space you supply within.

28,800. If you consider Flamborough Head an artificial work, running out a certain number of fathoms, it produces a strong tide across it ?—It does.

28,801. The run of the whole tide is cut off ; the part cut off becomes aggravated as the point proceeds into the sea ; a large volume of water must pass through a smaller space, and therefore a great tide stream occurs at Flamborough Head. Now, if you project a pier out from Tynemouth into the North Sea, ought it not to have the same effect ?—Yes. But in the one case there is an opening, and in the other there is none. Flamborough Head gives you no information beyond that of having a steep frontage.

28,802. But the current that would come into such an artificial harbour would be so insignificantly small, compared with the great tidal current, that it would really amount to nothing ?—Yes. It would be very small ; but within the region of that tidal current there is a wave stroke setting the sand in motion, and the opening forms an aperture into which the sand falls.

28,803. Coming to another point. I believe you have seen a great deal of the North Sea ?—I have known it for 22 years.

28,804. If a favourable wind arises for vessels to proceed to London from the Forth, the Tyne, Sunderland, Hartlepool, and other places along the coast, can you tell me any good reason why these vessels, from so many different ports, and of such different speed of sailing, should accumulate in such very large numbers at Flamborough Head when the wind comes on from the south-east unexpectedly ?—No. In my experience I have never seen vessels congregated there except in south-west winds. If the south-west winds are of a certain strength and continuance, vessels proceeding to the south collect there, but beyond that point they dare not go. But in all cases I have observed that directly the wind backs to the west, which it always does in heavy gales, there is a loose, and away they go. In all my experience I have never seen vessels crowded there except in strong south-west gales. When Flamborough Head acts as a sort of breakwater they are able to hold their own, and wait till a change of circumstances takes place. During the 22 years that I have known the North Sea I have never seen such a congregation off Flamborough Head, except under these circumstances.

28,805. There are certain times when a stream of vessels is anticipated ; those which get south of the head pursue their voyage, while those which are prevented by the wind are detained at various places after sailing from their ports of departure ; is not this owing a good deal to the inequality of sailing ?—Yes.

28,806. They would be secure in a storm from Flamborough Head to the Firth of Forth ?—That is my experience. Whenever a collection takes place off Flamborough Head it has arisen from a continuance of south-west winds, which allowed them to congregate up to the head, but did not permit them to proceed beyond it.

28,807. (*Mr. Coode.*) Which is the prevailing wind on the east coast ?—From my experience it is the south-west.

28,808. The congregation of the vessels at the head depends on these winds ?—Yes ; and if the wind is strong they dare not go beyond the head.

28,809. Is it or is it not the case that vessels do frequently congregate in large numbers to the north of the head ?—I think I have seen from 200 to 300 sail. That is a mere guess.

28,810. Then you concur in the evidence which has been given, that this is a matter of common occurrence ?—Not common.

28,811. Do I understand you to deny that this is a matter of common occurrence ?—I merely speak from my own observation. I do not deny anything.

28,812. As far as your own experience goes, you are not prepared to say that it is a matter of common occurrence ?—I have observed it, but not so frequently as to call it common.

28,813. Still is it a matter of fact that vessels oftener congregate there than at any other part of the coast, and in larger numbers ?—I think so.

28,814. And if so caught, and the wind backs round suddenly to the east, would it not be most desirable to have a harbour of refuge close under their lee ?—I think so ; a harbour of stoppage. But supposing the vessels were so congregated, and the wind did back out, the sea does not rise so immediately as to prevent their making an offing.

28,815. Supposing it has been given in evidence before a Committee of the House of Commons that many vessels have been driven back two or three times from Flamborough Head, incurring great danger, do you not think it desirable that the risk should be avoided or diminished by this construction of a harbour of refuge ?—If a harbour is to be supplied to prevent detention, a harbour at Filey would be very useful ; but if you distinguish between detention and life-saving purpose, Filey is not the place for the harbour. It would be useful where vessels are congregated, because those vessels so congregated, and forced to stretch off to the north, would at once go into the harbour at Filey. It would be extremely useful in that way.

28,816. Would not a harbour there prevent those wrecks which occur from vessels being driven back, and being unable to get into Whitby or into Tees Bay ?—If the case is as you have stated, then it would be useful.

28,817. Would it not tend to diminish the chances of wreck and the foundering of vessels in heavy weather ?—It would, so long as no other harbour were supplied to the northward.

28,818. (*Chairman.*) Will you now proceed with your statement as to the wave screen ?—I appear before the Commissioners as the advocate of the wave screen. I am no longer in the independent position I have hitherto occupied. I have hitherto spoken as a public servant, making use of my experience for public aims and objects, and having no connexion whatever with the works before the Commission, and therefore, so far as position is concerned, favourably placed for judging dispassionately ; but instead of occupying a position somewhat analogous to that of a judge, I now appear as an advocate. The effect of this may be to influence my judgment ; but the only thing I can promise the Commissioners is, that, so far as I can guard against such an effect, I will endeavour to do so, and will only state certain things which I conscientiously believe to be facts.

The invention, of which the object on the table is a model, I have named the Wave Screen. The name is descriptive of its purpose. It is to screen the place enclosed by it from the effect of the waves, either wholly or in part, and its general aim and object is to supersede the necessity for breakwaters in forming harbours of refuge, for two special reasons, which are highly desirable to accomplish ; on account of their being projected generally in opposition to natural laws, and also on account of their enormous expense. It is a point to which considerable attention is directed at the present day, how to supply refuge for saving life and property without causing such an enormous exhaustion of the public funds, in too many instances being a mere exhaustion without any benefit. This invention is the result of three facts, open to the commonest observation, connected with

waves, with breakwaters, and with harbours formed by breakwaters. First, as respects the wave. I think I have mentioned to the Commissioners that since I have been employed in my present civil employment I have adopted one course. Whenever I have observed a fact I have noted it, and the consequence has been that I have a considerable body of facts. The ultimate result of that is, that I collect the facts, I reflect upon them, and then I analyse them. Now respecting the wave I have observed, as every observer ought to notice, that the deep-water wave is an undulation as respects its main mass; that is to say, the highest formation of that wave, as respects substance, has only a vertical motion. The substance oscillates vertically, and every seaman will have observed that his vessel in a calm remains motionless in the water, horizontally concerned. This deep-water undulation comes to the vessel, raises her up, passes from under, advances to the main, and is broken, showing very clearly that the substance of the water is horizontally motionless. We also observe that the same law holds good in gales of wind as in calms. Any seaman will often have observed these enormous undulations advancing towards a ship hanging to windward, and an instant afterwards she rises to the top, falls into the trough, and the undulation passes to leeward, just the same as it does in a calm, showing that, with the exception of its crest or summit, the same law is operative, that the main motion of the wave is simply an oscillation. The same thing holds with comparatively very shallow water. If I am advancing with my ship towards a bar harbour, my vessel keeps sailing through the water, the undulation comes astern of me, passes me, and breaks eventually upon the bar, but I can keep sailing through the water, showing that the same oscillatory movement of the water is continued even into shoal water. I may remark, before I go on, that the various illustrations in connexion with the views I am now advancing will be found in the pamphlet illustrative of this invention which I now put in, between pages 1 and 17.

Secondly, as respects breakwaters. Those in common use are of two kinds. I have called them, for purposes of my own, the long slope, as at Plymouth, Kingstown, and numerous other places; and the upright wall, as that now being formed at Dover. The Commissioners, in perusing the pamphlet to which I have just alluded, will have observed that according to my view the long slope breakwater is projected upon incorrect principles, and in total disregard of the character of the wave. I always find that success is certain if the application of observation is correct. So that in any one case it is only necessary to apprehend a law of nature, and the adaptation of means to meet that law is extremely simple; and inversely, if your means fail, it is to a certain extent a proof that you have not apprehended the law. Now the history of long slopes presents one uniform series of disasters, and I may state that generally a long slope cannot be finished. It is, in the first place, utterly incorrect in principle, and, in the second place, it is a permanent source of expenditure. When a mistake of the sort is made the penalty for making that mistake is continually levied; and as the power of the sea is continually operative, so the powerlessness of a long slope to resist that sea, is continually displayed. The upright wall breakwater happily has resulted from a clearer appreciation of the law. But it is a singular fact, that up to 1844, when a commission, with objects similar to the present one, was issued by the Crown, of which the present Hydrographer of the Navy was a member,—that absolutely up to that recent date amongst the scientific men of this country there was a most singular conflict of opinions about the nature of a wave; and any one who will go to the study of the events that then occurred, and of the various opinions which were then offered, will feel considerably surprised that such ignorance could have existed, because if they had been less scientific, but more practical, there were things under their very eyes, which, applied to the commonest powers of reasoning, must have led to one inevitable conclusion. Though the upright wall breakwater is, to a certain extent, correct in principle, it has elements properly belonging to it which are most unfavourable. The various illustrations of these points connected with breakwaters will be found in the same pamphlet, between pages 18 and 30.

In my remarks hitherto about breakwaters I have considered them simply as structures, without respect to the harbours to be formed by them. These breakwaters, or moles of the sea, as commonly used are projected transversely into the sea, enclosing a certain amount of still water, as they interfere with, intercept, or destroy the wave itself, and therefore that protected space which was originally exposed to the fury of the wave is rendered comparatively still. I have on several occasions while giving evidence mentioned to the Commissioners that the only reason why matter is held in suspension around the coast is on account of the mechanical power imparted to the water; that is the case whether as respects coast drift or the lighter particles held in suspension. The one simple cause is, that the particles of water have a movement imparted to them, and therefore we perceive that the motion of the water which existed before the space was so enclosed no longer exists, and therefore the power which caused the suspension is entirely destroyed, and as the matter obeys the law of gravitation it immediately falls. The water on the coast of the country is generally charged with matter, and in all the close harbours that I have examined I have found that they fill with suspended matter in a degree proportionate to the amount of quiet obtained and the amount of matter suspended. I have met with no exceptions, in my experience. Last year I had an opportunity of examining the harbour lately formed at Holyhead, and there I saw that the same thing holds good. I found that in the course of that survey that there was something like from 15 to 18 inches of earthy matter in the deeper portions of the harbour. The parties who were prosecuting the works,—interested parties, I may observe,—suggested to me that this might be due to the debris from the works themselves. But during the course of my stay at Holyhead there was a strong north-west breeze. Then I looked about, and I saw that the water was highly charged with matter, and that supplied me at once with the cause of the accumulation.

28,819. (*Chairman.*) Therefore, in your opinion, Holyhead is silting up?—It is.

(*Capt. Washington.*) That is a strong remark to appear upon the minutes, without there is some authority for it, or that question is gone into.

28,820-1. (*Chairman.*) In your opinion?—I state it as a fact. So far as I connect it with a cause, it is my opinion that it will continue to fill. I state so because that is in harmony with all my experience. Wherever you have a little matter your harbour fills in proportion to the matter. I shall be most careful not to advance anything which I am not quite prepared to support. Respecting deposition, there is no difference between the long slope and the upright wall, because they produce similar degrees of quiet, and the effect upon suspended matter is exactly the same. For various illustrations in support of these points, I would refer the Commissioners to the pamphlet already quoted from, pages 31 to 34.

And now I come to the wave screen, which is a work of a different order, but intended to supply refuge. The model is an approximate representation of the invention. It is not complete in its details. It is only sufficiently so to develope the principles. But I also produce a drawing, which I put in, and which will supply the details in a greater degree, but not details which I pledge myself to adhere to. But they are so far useful as showing one mode in which this invention, if correct, may be brought into practical

LONDON.

Mr. E. K. Calver.

7 Dec. 1858.

operation. The invention, to describe it in simple terms, is practically a line of piles, cylinders, or tubes driven vertically into the bed of the sea, and a leading principle of its projection is, that it should be formed in the core of the tidal streams, as nearly as that is consistent with supplying refuge. What I mean by the core of the tidal streams is, the medium or central point between the maximum strength of the flood and the maximum strength of the ebb. The structure or screen is supported on the landward side by inclined stays, and it is held together by longitudinal ties and link bars, and is intended to have a gangway or other walk along its summit, and to be lighted at night. The model is constructed according to the usual scale of a quarter of an inch to the foot, and the drawing is to the same scale. In the pamphlet which I have written in illustration of this invention I have generally endeavoured to confine myself to principles, and illustrations in support of them ; but in describing the structure, I have indicated, to some extent, the materials of which it might be composed. The main structure or screen, driven vertically into the bed of the sea, consists of two divisions. The lowest line of nails in front represents the low-water level, and the little nails above represent the high-water level. According to this scale, there will be a low-water depth of 36 feet, and a vertical rise of the tide of 15 feet. I have mentioned that the main structure or screen is divided into two portions, the junction being some distance above the lower stays. The lowermost portion is the lower course, and the upper portion the upper course. And I mentioned, under the head of materials, that the screen might be composed of pine-scupper nailed, pine cased in greenheart, or wrought-iron cylinders for the lower course, and either cast-iron or wrought-iron cylinders for the upper course, and for the upper half of the larger stays, the ties, flanges, link bars, or shoes, could also be of wrought iron. But as I mentioned on Saturday, respecting matters of construction, and the material of which it is to be composed, the sizes and so on, they are really matters of which I know nothing, and therefore I shall pass them over. The Commissioners will learn from others all that they may desire to know upon this subject. Here the question arises, (which is the sum and substance of the whole), Is that structure adapted to a law of nature, and if so, to what force will it be exposed ? I have explained in this pamphlet, and for reasons which the Commissioners will be able to read for themselves, that I arrive by the simplest inference at the fact, that each cylinder in the main structure will be exposed to a force representing a pressure of less than a ton, plus the effect of the surface stroke, whatever that may be. If that be correct, the next question is, what amount of resistance is that structure calculated to afford ? But first, as respects the force to which it will be exposed, it is not percussive, for if it be correct that the deep-sea wave, or the wave of undulation, where this is to be placed, is oscillating, then the movement of the mass of the wave cannot be percussive, in the true sense of the term, for to strike a vertical object with percussive force it must have a horizontal motion, and all observation and analogy lead to the fact that the great mass of the wave is not percussive : nor is it, strictly speaking, hydrostatic pressure, that is, a pressure imposed by water on any vertical object, so arranged as to have the water at a higher level on one side than on the other,—for instance, like dock gates. It is not that, because the line of the wave is not a horizontal one. A wave is angular, and therefore, strictly speaking, it is not hydrostatic pressure. Then what is it ? If my views are correct, it is the pressure arising from the weight of the body, and it is just the same as if it arose from the weight of a solid resting against a wall. There is no difference whether it be water or whether it be a solid ; and therefore, in my opinion, the principal force to which this structure would be exposed would be the weight of the wave, whatever that might be; and I have explained, therefore, in accordance with these principles, what I believe that weight would be. The next point is, what is this structure calculated to resist ? I am sorry to say that I have not sufficient mechanical knowledge to determine such a point with precision. I could not do it, and therefore the plan I adopted was this :—After the idea struck me,—for really it was an idea,—it was after that loss in the winter before last, when I was pondering very intently upon the probability of the head of the bight being furnished with refuge, and having a very clear insight into the character of waves, my thoughts ran thus,—if it be true that the main motion of the wave is an oscillation, why provide such enormous works when other means will suffice, because it is very beautiful to observe that by simple attention to the laws of nature it is possible to produce very large results with very small means. You will see that beautifully displayed in the works of the Dutch engineers. They observe the laws of nature, and produce most singular results by the most trifling means. I did not presume to determine what the screen is calculated to resist. The plan I adopted was this :—I have scientific friends in different parts of the country, and to them I proposed the question, giving them certain elements. I found from the testimony of practical men, such as engineers, and so on, that to extract one of these cylinders out of the clay, assuming it to be 18 inches in diameter, and driven 10 feet down into the clay, it is no uncommon thing to break an inch and a quarter chain. In fact, I believe that chains of greater magnitude have frequently been broken in the endeavour to extract piles of this description. Therefore I supplied the problem, and sent it to Portsmouth and Yarmouth, to Oxford and Cambridge, and Edinburgh and Glasgow, and Newcastle, and to various other places. Some of the replies I have got here. The elements of the problem I gave were these :—If it takes so many tons to extract a pile out of clay, and if this structure be supported by inclined stays, the feet of which are fulcrums or points of rest, tell me what pressure will that structure bear, or rather a single section of that structure, supported by its two stays,—what pressure or push will that bear at 51 feet from the ground, my question having reference to the structure or model which the Commissioners have before them ? When I mentioned the distance, I said 51 feet, because that in this particular breakwater represents the high-water level of spring tides, when the greatest stress would arise, and I wished to have the maximum. The replies which I have received are not entirely satisfactory to my own mind, but as an average they are far beyond what I could have expected. The most satisfactory reply which has been given to the various questions has been given by an engineer of considerable eminence ; but I trust the Commissioners will not, unless it is necessary, require me to mention names, as that might perhaps be a breach of confidence. The party who has given me the reply most satisfactory to my own mind is an engineer of considerable eminence, who has carried out most important works, and is in constructive talent, only second to Robert Stephenson. I will call him A. He treats in a very simple way, which at once comes home to my mind ; whereas the formulæ supplied to me from Cambridge and elsewhere I certainly do not profess to understand so thoroughly ; but the way he has treated it seems to be very beautiful, and is illustrated by this sketch marked S, which I hand in. These solutions have reference to one section of the screen, and one cylinder driven into the ground supported by its own stays. The sketch practically represents the screen in section. The dotted line represents that driven below the bed of the sea. My question was to this effect :—What resistance will that structure afford at the height of 51 feet from the bed of the sea ? The engineer has treated it in this way :—He has considered the bed of the sea a wall, with the wave screen occupying the place of what he terms a cantilever ; and he says it is to be treated thus :—

LONDON.

Mr. E. K. Calver.

7 Dec. 1858.

"You tell me as the result of your investigation, that it will take a tension of 50 tons to extract such a structure driven so many feet into the clay, therefore it is to be arrived at in this way:—You want to know what weight must be suspended to produce a tension of 50 tons upon that cantilever;" and he tells me that it would require at 51 feet a weight of 39 tons, and that represents what I want. My reply to him was this:—If you give me one ton, that is all that I require, which is immediately apparent. For if a section of this screen is equal to one ton, when standing by itself, and only supported by its two stays, it is apparent to the commonest sense that when it forms part of the structure receiving the combined support of the whole, its resisting force is enormously increased,—20-fold, 30-fold, or what may be the point I dare not predict. But it is self evident that there will be a large increase of resistance. The average power of resistance given in the replies was something like 20 tons. If this be true, and if my inferences, founded upon the facts which are contained in the pamphlets, are true, then it is clear that this structure will have an enormous surplus of strength over and above what it requires to resist the force brought to bear against it. In conceiving this structure, and in writing the pamphlet, I had to depend entirely upon my own observation and reasoning power, and therefore, as a mechanical structure, it is the result of my own unaided reflection; but not being practically acquainted with mechanics, and with the carrying out of works of this kind, I had a certain amount of diffidence about the structure; and therefore, when brought into contact with engineers, it became a very interesting point of discussion as to the mechanical character and force of the structure, and I was not certain that I had hit the exact means for bringing into operation that which I believe to be the law. One engineer, B, who has carried out a considerable number of works, and who has been something like 30 years a member of the Institution of Civil Engineers, when I produced this structure before him, suggested an alteration, but it was a radical departure from the principle. He did not contest the law, but he took exception to the means. He said that instead of having a screen supported by inclined stays it would be better to have another line of cylinders inside supported by a platform, and secured above by certain oblique ties, I think he termed them, crossing each other transversely. I told him that I had considerable diffidence in differing from him, but at first sight several objections presented themselves to my mind. I said one of the great things to arrive at is cheapness, and I observe that his plan involved double the amount of materials. I also saw that there was another disadvantage, because it gave a great amount of resisting force within the region of the stroke of the surface wave,—the topping wave. The late Mr. Rendel gives a beautiful illustration of the danger of putting any surface not required within the region of the surface stroke, arising out of circumstances connected with certain works he was carrying on in Mill Bay. It struck my mind at the time, and agreed exactly with what I had observed. He stated as a broad fact, that they endeavoured to support some upright structure with inclined stays, and they found that it would not stand. But directly they took away the inclined struts and ties from the surface it stood. The reason was apparent, and very instructive. Therefore, when this friend suggested this to me, I immediately started this objection:—Now, I said, I have a third objection to make, but I am not very confident about that. I am afraid that there would not be the same amount of mechanical resistance, and that while your suggestion involves a greatly increased expense,—while it involves its own destruction by the constant stroke of the surface wave and the constant working,—you also have not the same amount of mechanical resistance; but on that point I dare not be very certain. A post or two after I received a letter from him, in which he went into the subject, and in the most candid way he said that on analysing the matter he found that my plan had double the mechanical force of that which he had suggested. The only other suggestion I received was from the celebrated engineer whom I have termed A, and whom I first mentioned. He kindly asked me to visit him, and said that my plan had had a considerable effect on his mind, but he durst not say whether it was correct; but he said, "I will tell you what, if it be correct, I will show you the means of constructing it at half the expense." The sketch No. 2, which I produce, embodies the ideas suggested by him. It represents cylinders driven at certain intervals into the bottom of the sea. But he said, "If the points which you advance are true, there is no necessity for driving all the cylinders to the bottom;" and therefore he suggested that only every third or fourth cylinder should go into the bottom of the sea. I thanked him for the idea, and saw that it would reduce the price 50 per cent. I said I dared not form an opinion about it until I had reflected upon it; but directly I had got home I found that it was a departure from what I believe to be correct principles. The leverage of the upper part would be enormous. Then if my views are correct, it is a necessity that as the wave has an undulation which extends from the surface to the bottom the cylinders themselves should in every case be extended to the bottom of the sea. Therefore, for these two reasons, I am prepared to say that the mode suggested by this eminent engineer is not that in which the screen should be carried out.

I have only, in conclusion, to indicate one or two principal effects of such a structure, assuming it to be constructed. The one great result would be, that it would not interfere with the mechanical motion of the water, and therefore the harbour formed by it would be permanent as to depth. From being adapted, I believe, to the law of the wave, these waves would be dealt with by the structure most simply, and most economically. The crest of the wave, the principal cause of vessels parting from their anchors, would be entirely destroyed. A portion of the undulation would be admitted to assist in maintaining the depth; and I have explained that the object would be so to arrange the cylinders as only to admit 50 per cent. of the undulation, and 50 per cent. would not be prejudicial to the vessels anchored there, so long as the waves were void of topping. Practically a harbour so formed would be a protected roadstead, but it would be a roadstead of far superior character to those with which we are commonly acquainted, such as those of Yarmouth and Lowestoft. I have been riding there in my little surveying ship when there has been a heavy sea, and vessels have parted from their chains, and the vessel which I have been in has been in peril; but in the roadstead formed by this screen there will be no such peril. A nautical advantage is this, that on account of the character of the structure the entrance would be so designed as to admit vessels into it dead before the sea, when such a harbour was necessary for refuge. The nature of the screen would render it independent of faults of construction, and it also admits of being shifted to meet local changes. I mean, suppose at the original construction the proper projection had not been duly considered, and a mistake had been made, you have a power of remedying it. All the details in illustration of these several points will be found in the latter part of the pamphlet alluded to.

The next and last point is the price. In the same pamphlet I have given a rough approximation of what would be the cost. Those which I now produce are of a more accurate character. The first has been very kindly supplied to me by Mr. David Stevenson of Edinburgh, an engineer of considerable eminence and experience, the general result of which is, that the wave screen formed of piles scupper-nailed for the lower course, and cast iron for the upper course, would amount to 285,176*l.*

LONDON.

Mr. E. K. Calver.

7 Dec. 1858.

per statute mile. This estimate is calculated for statute miles, and would therefore be less than for nautical. Since I have received these various replies, I am quite clear upon one point, that I have supplied far too much resistance, and therefore I am quite prepared to say that the structure only requires alternately a longer and a shorter stay; that is, one stay alternately long and short for each cylinder. These estimates embrace two stays for each cylinder. With this alteration, the estimate just given in represents a sum of 256,250*l.* per statute mile. Before I pass on, I think it right to mention to the Commissioners that Mr. Stevenson, in supplying that estimate to me, said, "The estimate is necessarily very general, as in estimating such a work it is impossible to foresee so as to put a money value upon the difficulties to be overcome. I do not think, however, that the work would cost materially less; it might be more." The next estimate I put in is one of a very important character. It is that supplied to me by the only person in this country who has carried out a work in the sea of a somewhat similar character, and therefore it invests his opinion with a particular value. This estimate is from Mr. Bastow, the contractor for the new pier at Margate, which I am informed is a structure and work of a somewhat similar order to my proposed wave screen. I put in that estimate, and appended to it is a testimonial from the parties for whom he constructed that pier, bearing witness to his energy and ability. His estimate, reduced to the same terms as those of Mr. Stevenson, is 211,872*l.* per nautical mile, the structure to be of pine scuppernailed for the lower course, and cast iron for the upper. The third estimate has been prepared by Mr. Casebourne, of West Hartlepool, who has been continually building works in the sea since the time that harbour first commenced, and therefore has considerable experience. That is for a structure of a similar order as respects materials, and his estimate for a nautical mile is 218,846*l.* I have also three other estimates from Mr. Casebourne, one for a screen of wrought iron entirely, another for a screen with a lower course of greenheart and an upper course of wrought iron, and a third for a screen with a lower course of greenheart and an upper course of cast iron. In a letter, however, which I have received this morning, Mr. Casebourne tells me that these estimates are incorrect, owing to his having made a mistake in the number of yards in a mile, and he supplies the correction in this paper, which I will put in with the estimates, not having had time to make the necessary corrections.

I will now bring my remarks very briefly to a conclusion. I mentioned that in promoting the scheme before the Commissioners I should confine myself to broad principles, and would not presume to interfere with mechanical details and matters of construction, of which I really literally know nothing. One of the parties who has supplied an estimate, Mr. Bastow, the builder of Margate pier, I had not the pleasure of his personal acquaintance until last week; but last week, the very day before I came up to London, I received a letter from him, to say that since the publication of my pamphlet he had considered the means of construction, and although he had supplied me with the estimates according to my own views, he had prepared an estimate according to his own. I thought I could not extract sufficient information from him by post, so I telegraphed to Mr. Bastow to come over and meet me. He did so, and on Thursday last I had the pleasure of making his acquaintance. The day before I came up to London, Mr. Bastow showed me the drawing which I hold in my hand, and which he had named the plan of a breakwater; but as I perceived that it was a wave screen to all intents and purposes, even as to materials, I suggested to him that he had better call it Calver's Wave Screen, designed by himself, which he has done. I am not prepared to say that this structure embraces all that I should be prepared to recommend, for there are one or two points on which my views would not harmonize with Mr. Bastow's. They are principally these:—I should have two stays, alternately an upper and a lower one, the foot of the inclined stays to form a fulcrum. I should prefer to adhere to my original plan of upright fulcrums perpendicular to the plane of the ground, to be sunk by their own gravity. The other details I know nothing about, or whether it is possible to construct a cylinder according to this form or not. Mr. Bastow also with that drawing kindly supplied an estimate, which I will put in with it.

28,822. (*Capt. Washington.*) Different from the first you gave?—Differing entirely. Entirely confined to this drawing.

28,823. (*Sir F. Smith.*) The amount is 289,297*l.* 4*s.*; but it does not say whether for a nautical or a statute mile?—In receiving the assistance of Mr. Bastow's testimony I should not like the Commissioners to be misinformed. Just in the same way that I do not occupy the same position that I did on former occasions, so, to a certain extent, I may say that Mr. Bastow is not a disinterested witness. He is a worker in iron, and therefore, to a certain extent, the interest he would undoubtedly have in carrying out works of this character might influence his judgment. I think it my duty to mention that; but in Mr. Bastow you have the great advantage of a person who has carried out a work of the sort, and therefore the Commissioners will have the benefit of the experience gained in that work.

Lastly, my object in promoting the scheme is for saving life. That which I seek at the hands of the Commissioners is not a decision as to its truth or untruth. That I cannot expect; for when the idea came into my own mind it startled me, and it was not until I had elaborated it carefully, as I mention in the pamphlet, that I perceived it to be the truth. But what I seek is this, that if, on going into the subject, the Commissioners entertain the possibility that, after all, it may be correct, that they will recommend a test of the principle. Happily the structure is of such an order that a test involves very little outlay. A test would be extremely useful, in whichever way it resulted, for at the present day scientific men are divided into two parties. One party contends for the oscillation of the wave, and the other for its percussive effect. And I may draw the attention of the Commissioners to a remark of one of the most scientific men, and one of the deepest thinkers in this country, Professor Airey. In reference to this principle of the oscillation of the wave, he said, in his evidence given before the Harbour of Refuge Commission of 1844, that "he did not think that professional men were aware of the vast importance of this peculiarity in reference to such questions as that before the Harbour Commission." Its vast importance, in my mind, is indicated by this invention; therefore a test would be useful in this way, that it would clear up the point. If it failed there would not be much loss; but if it succeeded, I need not point out to the Commissioners that it would be a boon of the most enormous public value. I have only advanced the wave screen as a means for saving life; but if the principle be correct, the saving of life is only half its use. For, in consequence of its being suggested to me by engineer C, that such a structure would labour under a difficulty in times of war, it occurred to me that, if the principle be correct, it is possible so to adapt it for purposes of war that it might be made a most effective means for the general defence of the country. If the principle be correct it carries that in its wake. I think I have now mentioned all the points which are of importance; but I shall be most happy to communicate any further information which the Commissioners may desire.

28,824. (*Chairman.*) In your comparative estimate of the expense, do you consider that description of breakwater would be so permanent that the necessity of renewing it, say at the expiration of 50 or 100 years, is not to be taken into account?—It is to be

taken into account, but to be weighed with the enormous advantages of it. I give in the pamphlet certain facts, obtained from parties who are authorities, to show the Commissioners the probable duration of such a structure. Of course duration is one of the elements for consideration, but that is to be considered in connexion with its simplicity, its cheapness, its universal adaptability, and also in connexion with the fallacy of the system at present pursued.

28,825. With reference to the first sketch which you handed in (that marked No. 1), will you be good enough also to put in the original demonstration, because I do not think the sketch is sufficiently explanatory. I want the original paper of the engineer, or a copy of it ?—I can hardly at present supply that.

28,826. You cannot put it in ?—Yes ; but I think the Commissioners will permit me to consult the party, or it would be a breach of confidence. It was a confidential communication between myself and him, and it becomes a question whether he would like it to be made public.

28,827. It is a mathematical demonstration, I understand ?—But it is a point upon which the Commissioners themselves may obtain any amount of information they desire. The question may be proposed to any man of science or practice ; but I feel I have no warrant to produce anything of this sort. These solutions were given to me as confidential communications, and without permission I could not hand them to the Commissioners.

28,828. (*Chairman.*) I think you misunderstand me. I did not want the name of the engineer, but only a copy of his paper, because I do not think your representation of it is sufficiently explanatory. I do not want the name, and therefore I should think you can have no difficulty in giving me what I desire ? —Oh, distinctly I beg your pardon. Without the name there will be no breach of confidence at all.

28,829. I presume he would rather have his own demonstration sent in than an explanation ?—I am not aware.

28,830. (*Sir F. Smith.*) You have produced a drawing prepared by Mr. Bastow, the contractor for the improvements at Margate ?—I have.

28,831. Have you seen his work, which you say is in some degree an illustration of your principle ?—I saw a representation of it in the *Builder* some years ago, but not since.

28,832. Therefore you know nothing of the work as constructed by him ?—Not at all.

28,833. Have you seen anywhere any work of piles submitted to the direct action of the sea which would give you any idea of the force of the sea upon them, and their resistance ?—The question brings into my memory a very valuable example. In the Solway Firth there is a newly-formed place called Silloth. Opposite this port of Silloth is a transverse jetty of open piling. It is generally dry at low water, but at high water, on account of the great rise in the Solway, it has a considerable depth of water. In the spring of last year I had occasion, in the course of my duty, to visit Silloth. The vessel which I have for surveying purposes is a cutter of 120 tons. She was lying opposite this work, with two anchors a-head, one of the chains being calculated for a vessel of 200 tons instead of 120 tons. In the height of the gale the *Seaflower* parted both chains, and drove ashore, the very time when a long steamer, named the *Silloth*, lying under the protection of the jetty, and absolutely transverse to the wave, was only held by warps.

28,834. Do you know the saluting platform at Portsmouth ?—I do not.

28,835. For the protection of the front of the saluting platform at Portsmouth, about 1821 or 1822, owing to the escarp wall having been considerably acted upon by the waves, a line of piles of from fifteen to eighteen inches diameter were placed a few feet from the foot of the wall. Would you be surprised if you were told that between 1821 and 1855 a great proportion of those piles were destroyed by the action of the sea, so as to be obliged to be renewed ?—I should not be at all surprised that the piles so placed were destroyed.

28,836. Will you state why you are not in any similar apprehension as to your structure ?—Because my piles are situated entirely differently. The great portion of my piles, or the structure which I have designed, is situated, if my views be correct, in a region horizontally motionless, and the only percussion which such a structure would be forced to resist would be that of the stroke of the surface wave, Entirely a different case from that of piles on a beach, with the friction of a constant batter acting upon them, and constantly exposed to a percussive force through the whole depth.

28,837. Would not the action of the wave be the same in the one case as in the other ?—Entirely different.

28,838. Why ?—Because in one case it is a breaker and in the other an undulation.

28,839. The lower part of the piles at Portsmouth are acted upon considerably below the level of the breaking wave ?—I am not aware of their position.

28,840. I merely mention the fact to you to see if you account for the difference ?—In this case, to give a sound opinion, I should require to see the platform battery, and the position of the piles, and to calculate the forces acting upon them. I could not give a sound opinion without seing the exact situation.

28,841. With regard to the duration of this structure, would there be any great difference as regards the material of which it is formed in the one case over the other ?—In the estimates I have called for I have had provided for pine scupper-nailed for the lower course, and cast iron for the upper. To a certain extent that is indicative of my opinion, the object of scupper-nailing being to resist the action of the worm.

28,842. The same thing was done at Portsmouth. —The piles at Southwold Harbour, driven in forty years ago, and defended by scupper nails, are perfectly sound; and the late Captain Ellis, when I made inquiries about them, said that they would apparently last half a century more. They were within the region of breakers, and not placed in the position which would be occupied by a structure of this sort.

28,843. Is that the reason why you propose to make the upper portion of the wave screen of a different material from the lower ?—I do that. I adopt metal for the upper course, because you can constantly get at it, and apply preserving coats, the same as you can to a steamer's bottom, a pier, or any other thing formed of iron, and therefore I adopt a different material. But I mentioned that the lower portion of the structure also may be formed of malleable iron, because Mr. Mallett, who is a great authority for all facts about the endurance of iron in sea water, states very decidedly that such a material may be employed for such a structure as this.

28,844. Do you propose to put in the lower piles by screwing or driving ?—I do not know.

28,845. That is undetermined, it seems. In what mode do you propose to join the upper portion to the lower ; by what mechanical process?—Beyond showing an upper and a lower course, I prefer not saying.

28,846. You have not quite determined your mode of construction ?—I have, in my own mind, but whether that is at all the best one I am not fitted to say, because I am not practised in mechanical construction

28,847. To what extent do you suppose you reduce the force of the breaking wave against anything behind it by your mode of construction ; by this open work ?—It destroys the breaking wave altogether There is no breaker, properly so called, in water of a certain depth. There is a surface crest, which is entirely different in character and in effect from that which we term the breaker, which is the wave doubling over in a body, and bursting on the shore or any other object. In the region where this structure is intended or calculated to be placed, there is no such

LONDON.

Mr. E. K. Calver.

7 Dec. 1858.

Sir F. Smith.

force. There is a doubling over and tumbling of the surface crest, and a running down the front incline of the undulation, but nothing analogous to a solid percussive breaker as on the shore.

28,848. You expect an almost still-water basin beyond ?—Still water, in so far as the surface crest is concerned, but with half the undulation preserved within. My object would be to preserve as much of the undulation as is consistent with the security of vessels.

28,849. I suppose the intervals are equal to the size of the piles ?—I cannot predicate. I might find out the passage of water through pipes or bridges, and to a certain extent form some conclusion as to the passage which would be left to pass a certain amount of water in a given time. But in the estimates, I have assumed the intervals to be equal to the diameter, and so on, without venturing to say how much interval should be left to produce the effect which I should like to arrive at.

28,850. Your structure would not give the same stillness of water which would be produced by a continuous breakwater made of stone, would it ?—Still water ; as far as the surface crest, just the same. Only in a harbour formed in this way there would be an undulation, which is not the case with a harbour formed by a stone breakwater, and it would also have a perfect current action.

28,851. Then you get nearly all the advantages you require, except protection against wind ?—Perfect protection against wind.

28,852. In gales of wind would vessels lie as easily at anchor as they do under a stone breakwater ?—Nearly the same.

28,853. There would be no tendency to drive them from their anchors, so far as wind is concerned ?—Not any, so far as the wind is concerned. Of course every undulation to a certain extent would bring a little strain ; but I should take care that the undulation was not of such a character as at all to give a tendency to trip.

28,854. Have you at all made up your mind as to the mode of placing your screens in the ocean ?—Yes.

28,855. Could you describe that process, commencing with the first pile ?—My views, perhaps, are not very reliable on this point. I should drive 20 or 30 single uprights by means of a floating driver, with a corresponding number of temporary piles abreast, and then have a platform between them with the pile-driver traversing upon it.

28,856. Of what material do you propose to make the stays ?—The lower stays of the same material as the lower course of the screen, and the upper part of the longer stay of the same material as the upper course.

28,857. As the ground at the bottom of the sea would naturally not be perfectly level, how do you propose to arrange about the stays, which in all probability will every one require to be of a different length ?—They find their own position. They have a swivel connexion with the structure, and are sunk into the bed of the sea by gravitation.

28,858. By gravitation only ?—By gravitation. I do not drive. I do not attempt that.

28,859. They take their bed first of all ?—They take their bed, and sink below the surface, being defended at the lower end by a heavy iron-palm perpendicular to the surface of the ground, which provides a fulcrum.

28,860. You think that is applicable to all soils ?—Not all soils.

28,861. To what is it applicable ?—To sands, clays, or materials of a similar order.

28,862. In a rocky soil it would not be applicable ?—I am not prepared to say. I cannot now suggest the best means for securing it on rock.

28,863. You might secure vertical piles, but not the stays ?—Not on rock. If I could secure the vertical piles there would be no difficulty about the stays.

28,864. You might, I suppose, screw into moderately hard rock ?—I am not practically informed upon this point. I cannot say. I have an idea about it, but it would not be of much value if I gave it.

28,865. Then, assuming that the stay is placed on the ground by gravitation, it is to be fixed, I suppose, to some horizontal ribband, and you would be obliged to cut the end if it did not correspond ?—I have provided for that. The stay or strut is loaded at its lower end with a shoe of a certain amount of weight and a certain form, to sink it down to the bottom ; and the reason I adopted that is on this ground :—I have often observed that the effect of the current on the bottom of the sea is to sink heavy materials below the surface of the ground, and therefore, when I wanted to support this structure against the force to be brought against it, it came immediately into my mind that you must provide something which will sink below the surface. Now, whether it sinks much or little, it matters not, when it has got to its permanent position. Then I connect the chain, which will not prevent its sinking lower, but will prevent its coming out.

28,866. I do not clearly understand your mode of fixing the stay at the upper end. Have you determined upon that ?—In a general way.

28,867. How do you regulate them ?—The upper stay is represented on that model, and a chain in connexion with it, which the lower stay or strut has not, and that is because the surface crest of the wave may act upon the upper stay, and might trip it.

28,868. Are the upper ends of the stays in any way halved into the material, or how are they connected ? You would have to regulate the length of every strut as it came up to the bearings ?—No ; I can make them all of one length, and let them go to their own depth.

28,869. Then if a strut should be rather too short for a particular spot, it would draw upon the upright ?—Yes ; then I supply a longer strut.

28,870. Then they must be regulated according to the position ?—Yes. Suppose this structure were, for instance, to be placed on a frontage like that of Hartlepool, part of it would be in 30 feet at low water, and the other parts in only 24 feet.

28,871. The stays must differ throughout ?—Differ throughout ; and it is very easy, if they are too long, to saw off a little.

28,872. Do you imagine that there would be any tendency in your upright portion to yield and give over a little ?—Not at all, on account of the small force brought to bear against it, compared to the mechanical resistance supplied. I may say, if these views are correct, it is impossible ; but by the inclined stays I provide for that.

28,873. The tendency will be to incline the screen inwards ?—It would be, if the screen was unsupported, and therefore a support is provided, which, if I am correctly informed, supplies an enormous surplus of power over the force to be brought against it.

28,874. Will you explain in what manner it is to be applied to defensive purposes ?—I should not venture to give a definite opinion about that without having consulted a military engineer and an artillerest ; but I am quite convinced that if the principle is correct such a use might be made of it. The upper part I should treat like a vessel's broadside. Assuming this screen as a mile in length, I should defend it by a certain number of guns put at various positions along that screen. To do this, at the position of each gun, on the seaward side, I should adapt a plate of iron exactly like that now applied to the mortar batteries, with this difference, that in applying it to the screen I should have some elastic backing, or give it an inclination from the perpendicular, so as to prevent a solid stroke. I should put along the screen single guns at certain intervals. These guns would be on small platforms sufficient to receive them. And if my views are correct, I believe it is very possible to be done ; and the advantage would be this, that it would be a structure which you

could scarcely assail without the party assailing it getting more damage than he would give, seeing the upper part would be of malleable iron instead of cast. Also it would not involve the employment of a large public force. If I put a screen of this sort opposite any district, I should give it to that district to defend it. In other words, it should be defended by the locality.

28,875. (*Sir F. Smith.*) They would rather defend the shore by being on shore, would they not?—I should think each port would find plenty to act as local volunteers, in the same way as local fencibles in former wars; that is my idea.

28,876. Do not you think it would be very easily destroyed by the fire of the enemy's cruisers coming in?—I think not, for reasons which I could specify. I may mention that I have not gone thoroughly into it, but only partially.

28,877. You mean to case it with iron?—Case it seaward with iron; that is, opposite each gun.

28,878. Is it not found that that casing of iron is not shot-proof?—That is correct, when it is a casing to a solid body which opposes an effectual resistance; but I think it possible, that if you put a plate of iron, with an india-rubber or other elastic backing, or slope it well, that shot would not penetrate it: that is my idea; I do not know whether it is sound. It is an idea which might be elaborated, but having come into my mind, and as it is connected with this subject, I thought it right to mention it.

28,879. (*Capt. Washington.*) I think you said the screen would be placed broadside to the stroke of the sea?—It will.

28,880. In all cases you would propose it should be so placed?—It will be broadside to the sea, advancing from abreast, but it might often have an oblique sea, wherever it was placed.

28,881. Taking the case of the east coast of England, the exposure would be nearly east. Supposing it to resist that, would it equally resist a north-east and south-east stroke, which would take the line of piles in flank?—It would resist it the more effectually the more oblique it was, though, as far as the direct sea is concerned there is no question as to its resisting it.

28,882. I am not speaking now as to the quieting effect on the water inside, but as to the structure itself?—It possesses ample power of resistance to every stroke of the sea.

28,883. Both the direct and the oblique stroke?—Its power of resistance is quite apparent. The engineer conducting the work at Portland mentions, and it is a very important point, that piles resist the sea even above the submass of tipped matter on which a breaker is generated. If that be the case, and the piles there resist the breaker, and admit of locomotives and other things working upon them in the heaviest gales, it is quite clear that in the region of comparatively motionless sea the success of this is certain.

28,884. According to your scale, how far apart would the piles be?—This model is arranged for equal spaces, but I do not tie myself to that space as the one to be adopted in practice. I might go from equal spaces down to one half.

28,885. In any staging or structure of piles are the piles placed so closely as that?—The engineer at Portland mentioned certain piles, and I observed certain piles at Holyhead. I am not aware of any other. But about the power of resistance I propose this case:—If a wooden pile standing upon a rock without any support resists a 12 or 15 feet breaker, then if a pile is put in water nearly altogether motionless, possessing 10 or 12 times the force of resistance of the other pile, it is quite undoubted that if the first pile stands the other will do so infinitely better.

28,886. I think I understood you to say, in your evidence, that all the present breakwater harbours have been more or less unsuccessful?—I do not say all are; but as a system it has been an eminently unsuccessful one. The practical examples of this I give in the pamphlet which I put in.

28,887. Do you consider Kingstown as being unsuccessful?—I do not say so, as a harbour, for the simple reason that happily the party constructing that put it in a very good position. It is uncharged because the water is uncharged. But considering Kingstown as a structure, and that it was necessary to have a close harbour, then I should have said, without knowing the district, except by plan, that an upright wall would be better than the form of breakwater adopted. To that extent, I think Kingstown is constructed on erroneous principles.

28,888. But it does stand, I believe, without requiring any very great repairs, and proves to be very useful?—The returns will show whether there is much expense for repairs. I am not aware, but I should, as a general thing, expect expense. With the long slope breakwaters you can never practically finish them, if you get an oblique sea upon them.

28,889. Do you contemplate that if your wave screen were erected, there never would be any repairs required?—No.

28,890. Then is it fair to apply a different reasoning to stone harbours than to timber?—Yes, for this reason, that in the stone projection the evil results from a fault of principle, and here it results from a want of duration, and the practical effects are enormously different. This screen would involve a very different outlay to that of the stone breakwater, even supposing you had to restore the lower portion of it at the end of a century.

28,891. You contemplate that no repairs would be required within a century?—Not as far as the action of the sea, the worm, and matters of that sort are concerned; certainly not. The reasons for forming that opinion are embraced in the pamphlet, where I have given sufficient details to show that my opinions are founded upon facts.

28,892. To come to another refuge harbour, that of Portland; do you consider that that has been unsuccessful?—I have not been at Portland since 1844, when the Commissioners visited the place; but if the case of Portland was put before me, with my present experience, assuming that experience to be sound, I should not perhaps be prepared to recommend it precisely as it is; certainly not the work as it is.

28,893. You have made a very bold statement, that the system as at present pursued is faulty and wrong, and should not be followed?—That I believe.

28,894. We, the Commissioners, are endeavouring to arrive at what is the right thing to do?—Truly.

28,895. I adduce to you two harbours which appear to be successful, which have proved very useful, and are maintained at a very small annual cost. As far as we know, Portland, when finished, will be maintained at no annual expense, will require no repairs?—The cases to which you have alluded are not faultless in character, as I have said; but what is true at Portland and Kingstown is certainly not true of other parts of the coast where there is much matter in suspension. A harbour which is perfectly allowable at one part of the coast might not be so at another. As you have no absolute principle of projection, you must study each site; and, as a general rule, if you want to put a harbour upon a coast where the water is charged with matter you must not form it as a close harbour.

28,896. Then you do not mean to say that the stone breakwaters, placed where they are, faulty; but that if it was attempted to apply them to spots where there was a great deal of stuff in suspension, that then they would be faulty?—Then they would be faulty.

28,897. That was all you intended to imply by saying that the system was faulty?—Yes. To Portland and Kingstown as works you can take very little exception, except as to their expense.

28,898. Should you have recommended the wave screen at Alderney?—I do not know Alderney. I should not recommend a work there at all; not the expenditure of a penny.

LONDON.

Mr. E. K. Calver.

7 Dec. 1858.

Capt. Washington.

28,899. I do not ask that question?—I do not know Alderney. I only know its geographical position, and I should not have been prepared to recommend any work there with a view to national defence.

28,900. Is it quite judicious of you to decry all these harbours, when, upon two of the principal ones being mentioned to you, you say that you have not visited them, and really know nothing about them?—I know them by plan, distinctly and thoroughly, just the same as if I was to visit them. I do not require to visit the place to ascertain the character of the coast, when I have a chart.

28,901. In these two cases of Portland and Alderney, would you, supposing that harbours were to be constructed at those places, have recommended the adoption of the wave screen, instead of stone breakwaters?—I should always recommend the wave screen where applicable. If the soil of the frontage is of such a character as to admit of the application of the wave screen, I should always recommend its adoption merely as a measure of economy.

28,902. Should you have recommended it at Dover?—Distinctly so; so much so, that if it rested with myself as a dictator, I would now stop the work there, and finish it with a wave screen. In these cases I speak very decidedly. I give my distinct opinion, in order that I may not be mistaken.

28,903. At Holyhead, upon a notoriously rocky coast, should you have recommended the wave screen in preference to a stone breakwater?—If the wave screen could have been formed, decidedly so; but whether I could or could not I should not have recommended the harbour as at present projected; I should not even have dreamed of it. Holyhead Harbour involves several radical errors in principle.

28,904. My question was, as to the material and mode of construction; not as to the plan?—Distinctly, if it had been possible to put the wave screen at the Holyhead site, I should have recommended its adoption, because the wave screen would have supplied you with everything which you required at one tenth of the expense which is now being incurred.

28,905. Would it have been possible to have placed it there?—Distinctly.

28,906. It would?—I am not aware whether you could drive it, but if that be possible then it might be placed. I cannot speak to these points, but the contractor of Margate Pier will be able to do so.

28,907. You stated that Holyhead Harbour is silting up, will you give your reason for saying so?—Finding silt in it, and the greatest quantity of silt in the deepest portions.

28,908. That some silt will be found in it?—Silt varying in thickness from between 15 and 18 inches in the deeper portions. When I discovered the fact, certain parties suggested that it might arise from the débris from the works in progress. I could not form an opinion until a gale of wind came on, and I saw that the water was charged with matter; then I had no doubt as to the cause.

28,909. Where do you think the stuff with which the water was charged came from?—I have not studied the matter enough to give a reply. I can only state the fact of the water being so charged.

28,910. But you do not think that the tumbling down of the large mass of stone which has been tipped there is sufficient to account for a slight silting up in the different places in which you might have found it?—Distinctly not. It is a matter of easy solution. Take a portion of the silt and analyse it, and you will find out whether or not it comes from that source.

28,911. Have you done so?—No. I am not a chemist. There is the material there; and when I state that fact the Commissioners have the guarantee that it can be tested. All these matters are perfectly susceptible of proof.

28,912. Did not I understand you to say that the silting up could not arise from the tipping of the stone?—I do not say that it could not; but I say that when the charged state of the water supplied me with a reason for it, I at once formed my conclusion that at any rate that supplies a means of silting, and it being the case that the water is charged to a very great extent, I can distinctly say that Holyhead Harbour will gradually decrease in depth. I may mention that Holyhead Harbour as you now see it has only been carried out by degrees, but even though that has been the case, the silt has formed to the extent which I have named.

28,913. As you have insisted a good deal upon the faulty nature of the Holyhead plan, will you point to any instance in this or any other country in which a plan for a refuge harbour has been dashed off at once, without alteration, and has proved complete and successful?—Speaking in general terms, the cause of faulty projection, so far as my experience goes, is ignorance of principles, and the result of failure in every case with which I am acquainted can be traced to the disregard of natural laws. The present system of carrying out works is essentially faulty. The formation of a harbour is not a mere matter of construction. I should employ a man qualified in constructive art to build the work; but that is a very different thing from the higher science, which deals with laws, and their application. If I wanted to build a harbour for the saving of life, I should adopt a very simple course; I should employ a man who was thoroughly acquainted with the natural laws of the movements of the waves, and their results; I should employ an engineer, a man who was in the habit of constructing works; and I should also employ a nautical man: the projection of a harbour, in short, should be the result of a combined opinion. What, however, is the system now pursued? Of course I do not wish to speak offensively. The Commissioners have asked for my opinion, and I am giving it. The system at present pursued is this:—Parties at the ports want works, and they are at no loss in finding an engineer to carry out those works. The engineer goes down. He may or may not be acquainted with the subject with which he has to deal. In forming the works a great number of things are to be taken into consideration. Not only must you be acquainted with the natural law, but also with the special circumstances under which that law is to be brought into operation. The engineer goes down to where the works are wanted, and will carry them out. He may or may not have had a nautical opinion, or he may have had the best of nautical opinions; but the practical result is, that he has to select that by which he shall be guided; in other words, the value of the nautical opinion is determined by the engineer. Another thing which I consider to be essentially faulty is this:—The persons who carry out the works have a beneficial interest in them; and, allowing them to be men of the most unsullied honour, I would apply to them the same law that I would apply to myself. If you connect my self-interest with a subject you supply me with a ready means of acting with a faulty judgment. What is the system in the case to which I am now referring? The works are carried out, and the engineer is paid according to the amount of the outlay.

28,914. I think you are speaking of private harbours. I was confining myself entirely to public government harbours, in which case the engineer is paid by salary?—It applies equally.

28,915. The government engineer is paid by a salary, and therefore the observation as to having an interest in the expenditure cannot apply to him. The contractor may have, and naturally ought to have, an interest?—I am now speaking of the supreme authority, if I am not misinformed.

28,916. The government engineers are paid by salary; that is an undoubted fact?—Then, speaking of private harbours, taking that of the Tyne for instance, if there is no objection.

28,917. I would rather keep to the public harbours that I have mentioned?—Then, whether they are paid by salary or by a per-centage for overlooking, there is a natural tendency to extensive works,

because the pay depends upon the work. Now there is also another point.

28,918. I should like you to keep to the plan of the harbour at Holyhead, with which you have found fault?—The sum and substance is, that the general system is essentially faulty.

28,919. You admit, I think, that Portland has been as successful as any other harbour?—I have not inspected it.

28,920. But from the plan?—I should require to examine it for myself, and to have the facts ascertained. I have not been acquainted with that district since 1844.

28,921. You are aware that the same engineer who planned Portland Harbour planned that at Holyhead?—I believe he did.

28,922. You are also probably aware that he would have planned a much larger harbour, but he was crippled in funds, and obliged to limit his design?—I am not acquainted with that fact. I simply take things as they appear before me.

28,923. That certainly was the case. Can you have any doubt that the late Mr. Rendel obtained the best nautical opinions he could get before he decided upon his plan?—I have no doubt of it; but Mr. Rendel had the determination of the value of those nautical opinions.

28,924. Ought not the person who is charged with the work to have that?—Distinctly not, because it is a nautical question. It would be like my dabbling in construction. A judge is learned in the law, a cobbler in making shoes, and you do not put one in the place of the other. Every man ought to be educated for that with which he has to deal.

28,925. All I wish is to show that the late Mr. Rendel is not responsible for the altered plan of Holyhead Harbour; that as an engineer he is not responsible for the plan of that harbour as it at present stand?—I am very glad to hear it. I was not at all aware of the circumstances. I merely took the harbour as it is, and then tested it by laws. I limit myself to that.

28,926. To return to the wave screen; the places for which you consider it most applicable would be on a sandy coast, or where there is silt held in suspension?—Sand, clays, and so on, but particularly adapted to, in fact it is a necessity for, those places where matter is held in suspension.

28,927. (*Capt. Vetch.*) Have you examined Holyhead lately?—Not since the summer before last.

28,928. Did you observe on the outward face most exposed to the sea that the stones which were originally very angular are now converted into round boulders and shingle?—I did not. I went outside the work to see whether the original state of bottom was still preserved, and found that it was, while that of the inner part was thickly covered with silt.

28,929. I thought perhaps that that circumstance had had some influence upon the description of the work?—No.

28,930. Coming to the question immediately before us, the wave screen; of course if only one of these piles or cylinders was erected, when the sea beat upon its outward face the level of the work inside would almost instantaneously rise to the same point, therefore upon a single pile there would be no pressure?—Not much.

28,931. But if you put them very close together you would have a great pressure upon the side from which the wave came, and considerable want of support on the inner side?—By putting other cylinders on each side of it you approach in a degree to a long line of resistance, and add to the force acting upon it in a like degree.

28,932. We will suppose, for instance, that the cylinders were put very close together, say within an inch of each other, in that case the pressure on the coming wave side would be felt long before support would be given to the inner side?—I hope I have not been misapprehended. I do not imagine that the intervals will require to be anything like so small as an inch or anything of that sort. On the contrary, I am rather inclined to believe that in practice equal intervals will be found to be that which is desirable.

28,933. My object is to get at the principle of the thing. Clearly, if a single pile is erected in the sea, the pressure would occur so instantaneously upon all sides that there would be no effectual preponderance, or only very little?—That is so.

28,934. But if you put three or four piles close together, the pressure of the sea on the side from which it comes would be for a while considerably more than that on the other side?—That would be so.

28,935. And therefore it is important to have the distance between the cylinders so regulated that it shall not induce that heavy pressure on either side?—Yes.

28,936. I want to ask you whether you have arrived at the conclusion that equal intervals, intervals equal to the diameter of the cylinders, is the best arrangement?—So far as I can determine, I should think that equal intervals would be sufficient, because with so curved a structure as I propose it is only at one portion that the undulation would advance from abreast of the work. At the other portions the direction of the undulation would be oblique.

28,937. It is quite clear that if cylinders were put very close together the pressure on the outside would be considerably more than that on the inside?—Much more; in proportion to the mass, whatever that might be.

28,938. Therefore you have placed the stays on the inside?—Yes; in fact it is to resist that. Take the extreme case. To a certain extent the screen occupies the position of the broadside and bulwarks of a vessel that are exposed to the surface stroke. There you have a continuous line, and the bulwarks and boats are washed away. In the case of this structure it becomes a question of mechanical resistance. Is or is not this screen stronger than a ship's bulwarks and boats?

28,939. You have placed the cylinders nearly upright?—I adopt the upright form as a matter of principle, in accordance with the character of the wave; and I should also adopt it because I perceive that from its capacity to bear weight it is available for purposes of war.

28,940. In adopting that I presume that you intend that a wave striking the column should run up, and by its own gravity have a tendency to fall back?—In answering the question I must take exception to the word "striking." The great mass of the wave does not strke; it only undulates. It is only the crest which strikes.

28,941. Yes; but if it is impeded, and cannot go on, it must go upwards?—The surface crest would strike the work, and partly go through it, and be altogether destroyed; but the undulation merely meets the screen; it has no stroke; no momentum like the surface.

28,942. Still if it cannot undulate onwards it will go upwards?—It will, and rebound backwards.

28,943. And by its own pressure bring it back?—Yes; in fact it will run back to the extent I have mentioned in the pamphlet.

28,944. It is much better to send it upwards than onwards?—Distinctly.

28,945. I put these questions in order to see exactly the principles on which you propose to adopt that form of breakwater?—Although half the undulation would go through, still there is another half or portion of it which would be reflected backwards, just the same as is the case from a perpendicular cliff with a profound depth of water in front. There you find no breaker; there the undulation meets a resistance, and returns exactly upon its own track. It would in a degree be the same here. The only difference would be, that this screen would not present a continuous line of resistance, as the cliff or other object does.

28,946. (*Mr. Coode.*) I believe you very strongly entertain the opinion that a current moving in opposition to the direction of the wave causes a breaking

LONDON.

Mr. E. K. Calver.

7 Dec. 1858.

Mr. Coode.

sea, which sea is attended with a considerable amount of percussive force ?—Yes.

28,947. Then in the case of a wave rising against the outer portion of this structure, the water would become elevated within, to a less degree than it is outside ?—That is so.

28,948. The water without the structure is free to recoil, unimpeded by any obstruction from the screen itself ?—That is so.

28,949. Whereas the water within the screen would be momentarily retained at a higher level than that without ? The water within the screen not being able to fall so rapidly and freely would for a short period of time be retained at a greater elevation than that without ?—No. The water through the intervals would occupy the place of a cascade running into the harbour.

28,950. Would not the effect of the falling of the wave be, that for a short time the water within would be heaped up at a greater elevation than that without ? —No.

28,951. You think not ?—Oh dear, no.

28,952. Then you think that the water within the screen would be free to fall to the same level and within the same time as that without it, and that there would never be any difference between the level of the water within and without the screen ?—Distinctly, for reasons explained in the pamphlet. The water will be much higher without than within. The elevation will be outside the screen, not within it.

28,953. But in the same way that the elevation is caused without, will there not occasionally be an elevation within ?—No.

28,954. I should like you to explain why there will not, because, seeing that the wave without the screen is free to recoil unimpeded and unobstructed by the screen itself, I should like to see how it is that the water within will resume its level as rapidly as the water without ?—Because, while the superior undulation which is outside the screen is retiring in height, the inferior undulation within the screen will also be retiring in height.

28,955. Will the water within the screen recede as rapidly or will it fall in as short a time as that without ?—Distinctly ; practically it will.

28,956. You are prepared to say that at no time will there be any elevation of the water within to a greater height than the level of the water without ? —So as to apply pressure from the inward outwards ?

28,957. I am not speaking so much of pressure. Will there be a difference of level ?—None whatever, in practice, except in favour of the outside.

28,958. There will never at any moment be a greater elevation within the screen than without ?— There will not.

28,959. Then assuming that there is a greater elevation outside, would not the tendency be to create what we may call a cascade on a small scale, within ?—There will be ; in fact the inferior undulation will be to a certain extent caused by each cascade.

28,960. Then the pressure on either side of the screen will be constantly varying ?—No ; it will always be in favour of the outside. I cannot see anything else.

28,961. At any rate the pressure will vary, because at one moment the levels inside and out will be equalized, and at another you admit that the water will be heaped up on the outside ?—Distinctly. At one time there will be a force exerted, and at others there will not.

28,962. You adduced just now a parallelism between the pressure on this screen and that upon a cantilever, with which I quite agree. Would not the resistance of these cylinders depend upon the resistance of the foot of the inclined stay ?—The power of resistance would depend upon the operation of the fulcrum.

28,963. I see you state in your pamphlet that " the foot of each stay is furnished with a heavy shoe," and so on, " to be buried beneath the tidal current." I would ask, if the soil be so soft and so yielding as to allow of the shoe being buried by the action of the tidal current, do you think that it would offer sufficient resistance to the strains which these inclined stays will have to undergo ?—Distinctly. If the force is great and the soil soft you must increase the resisting surface of the shoe, the surface being below the general bottom of the sea.

28,964. Will the strain vary according to the state of the weather ?—Yes.

28,965. Then you would make your shoe of such an area as you assume would be sufficient to resist the greatest amount of strain which it would have to undergo ?—That is so.

28,966. Then if you put them down, and it ultimately turns out that their area is not sufficient to resist the strain, will not the effect be that the stays must drag over the uprights with them ; that the upright cylinders will follow the inclined stays as they settle into the bottom ?—That would be the tendency ; but in practice you would see what surface you required, and increase it as was necessary. It is only a question of supplying sufficient resistance to meet the force which will be exercised.

28,967. How are you to do that if you have no idea of the strains ?—I do not venture to predict what surface you may require for certain soils. I merely say that I know these flat palms will sink below the surface, and will supply a fulcrum, a perfect fulcrum, even in soft soil, by increasing the surface. It is matter of practice for an engineer to know what surface is required to withstand a push ; that I do not go into.

28,968. You imagine that a soil which would readily admit of the palms or shoes sinking below the surface, would offer a resistance sufficient to encounter all the strains to which the uprights would be subjected ?—Ample, with an ample surface ; there is not the slightest doubt of it.

28,969. And that there would not at any time be any fear that the upright cylinders would be strained by the yielding of the shoes ?—No ; especially if you consider the character of the wave, and the nature of the structure. A wave is not altogether to be considered as acting in one uniform line with an uniform force. It is true that upon three or four or even a dozen of the cylinders there may be the strain to which you refer, but you must remember that while there is a considerable amount of force pressing upon one part of the structure there will be very little upon another, and then you bring into play its character as a whole. The amount of resistance required in extreme cases is supplied by the cylinders not so acted upon, and that brings in the principle of structural continuity.

28,970. Would not each upright cylinder in turn have to undergo a considerable amount of strain from the force of the sea heaped up outside ?—No ; for the reasons stated in the pamphlet. I may also mention here, that I designed this structure upon certain principles out of my own mind. I do not at all tie myself to the mode of bringing those principles into operation as represented by the model. I should rather expect that a practical engineer, in the habit of constructing works, might suggest some means far superior to these inclined stays. I have only constructed this model to show one mode in which the principle may be made practically useful.

28,971. Still as you profess that by this new system of yours we shall get greater economy than has yet been reached, I ask whether the cost will not depend upon the means employed ?—Yes.

28,972. Therefore, before we attempt to form an estimate, we should be satisfied that the means for which it is calculated are sufficient to attain the object which we have in view ?—Always bearing in mind the first cost, because the increase of expense in a thing costing a farthing is very different from the failure of that which costs a sovereign. That is a very important principle to keep in view.

28,973. A great deal has been said about the work at Holyhead. Are you aware that when the late

Mr. Rendel designed the harbour at that place, he was charged with having made it too large for the wants of that particular part of the coast, and that in consequence either a commission or a committee of inquiry was nominated by the Admiralty to examine into the whole question ?—I believe that that was so.

28,974. If that be so, I presume you do not mean in any way to charge the engineer in that case, at least, with having treated the subject improperly ?—I dare not venture to sit in judgment upon the conduct of Mr. Rendel; far from that. I can only say this, that if there had been a distinct grasp of principles, Mr. Rendel or any other party who had projected the harbour would not have recommended it, whatever the circumstances might have been.

28,975. I understand your views to be that the harbour at Holyhead is designed in opposition to what you believe to be correct principles ?—That is the fact.

28,976. And that the error of principle consisted rather in the line of the proposed work than in the mode of construction ?—As you have put that question, I may indicate what I consider to be the errors properly belonging to it. It is possible to form a work at Holyhead of such a character as to insure permanency of depth within it, and it is also possible, with a work somewhat shorter than the present work, to have inclosed double the present space. Those are the two points I would specially connect with the opinions I give; and it is also nautically defective.

28,977. With regard to the inclosure of a given amount of space by a given amount of work, would not the result depend upon the views that were entertained of what might be a sufficient area, when these works were commenced ?—The matter of the necessity of the district I know nothing about. I can only say, whatever the necessity may be or might have been, that necessity should have been met by works projected according to correct principles; beyond that I do not go. I do not know what the necessity of the district was, or the exact history of the projection of these works. I know nothing about them. I merely speak of the works as a matter of principle. With respect to the party who carried them out, I say nothing.

28,978. Still, as you have made reference to the amount of area that might have been enclosed by the same amount of work as now constructed, I ask you whether the amount enclosed must not depend on the position at which the works had arrived when it was decided that an extension was necessary?—It is quite correct, and it may account for the form in which the harbour at present appears. I do not know anything about the history of it. I really do not know anything about the persons or the necessities. I am merely dealing with principles. I do not know the exact history of the transactions by which such a harbour was determined upon, or the mode in which it was carried out. I only take it as I find it.

28,979. As you have offered some very strong remarks upon the mode pursued, in case of a determination to undertake any public work, and as those objections have rested mainly on the fact that nautical authorities have been disregarded———?—I beg your pardon. There is a mistake. I merely so far questioned the wisdom of allowing any engineer a supreme authority in carrying out such a work to analyse and determine upon the value of the nautical evidence; that is all.

28,980. Is it not the fact that in the case of all our large refuge harbours, nautical authorities have been consulted, and that their views have been allowed to carry a very considerable amount of weight, if not the paramount weight, in the determination of the plans adopted ?—I believe it may be said, in general terms, that the system pursued is to give the work into the hands of some party celebrated for his position as an engineer. The system pursued, taken as a whole, is essentially faulty. The practical effect is, as I tell you, as respects nautical evidence. It is a wrong system.

28,981. You have just admitted, I think, that nautical evidence is taken in every case ?—It is.

28,982. And is allowed to have considerable weight? —It is taken, but the party who designs the work, and analyses the value of that evidence, is not a nautical man. That is, I think, wrong; very wrong. In fact, as I said, these sort of things should be the result of three distinct opinions, and one party should never have the designing of works intended for nautical purposes.

28,983. Are you not aware that if nautical evidence be not taken after the design is finally completed, that the design is in most cases based upon nautical evidence bearing upon it ?—Quite correct; perfectly correct; but the value of it is generally determined by the party who designs the works. I only take exception to the system. It is no new thing with me; for many years I have held the same opinion, and increasing experience confirms me in the general soundness of my views.

28,984. With regard to this silting at Holyhead, you have said that it is earthy matter ?—Apparently earthy matter.

28,985. Are you aware of the source from which that earthy matter is derived ? Do you know of any earthy matter travelling along the coast generally ?— I merely mention a fact which is easy to prove, that is, that the waters in Holyhead Bay are charged with matter. I do not tell you where it comes from. I take the simple fact, and then I say you get a cause of ultimate loss.

28,986. When you say Holyhead Bay, do you mean the bay without the works, as well as within ?— Oh no; the water without the harbour.

28,987. Then if the bay generally were charged, would not this discoloured water be found to extend on either side of the proposed work to a considerable distance ?—The whole bay for a long distance out, from what I observed on that occasion. That embraces the whole of the refuge harbour.

28,988. Might it not be possible, if there was some little disturbance within, that the silting matter might be raised and brought into suspension, and that a great portion of it would be carried away by the ebb tide ?—Silt is formed. The balance is silt.

28,989. That is as regards the soil in the bottom of the harbour; but I ask if the discoloured state of the water may not be due to the matter being raised and held in suspension, and carried away by the ebb tide ? —Distinctly not; where is the wave to suspend it ?

28,990. Is there no disturbance within any portion of the new harbour ?—Disturbance, but not to suspend matter within the refuge harbour.

28,991. You are prepared to say that there is no such disturbance as would raise this matter into suspension ?—Over the deeper portion there is not.

28,992. Over the shallower portions ?—There there is very little soil, for the reasons which are given in my pamphlet.

28,993. Are you aware that a considerable extent of beaching ground has been formed on the shore of the new harbour at Holyhead ?—I am.

28,994. Do you know from whence the material was obtained to form it ?—I think I was informed that it was the débris of the quarries.

28,995. Have you ever heard that the material forming that beaching ground consisted of material taken from the crevices in the rock forming Holyhead Mountain, and that it consisted mainly of broken quartz, in sizes of about road metal, down to small chippings, intermixed with a small portion of soil ?— I know it is generally the débris of quarries, but of what character I do not know. I know it is small.

28,996. You are not aware that the material forming that beaching ground has been taken from the source I speak of ?—I should think it had.

28,997. Might not that prove to be the source of a considerable amount, if not all, of the earthy matter which you describe as in the bottom of Holyhead Bay ? —A little might be given to it; but, again, that is a thing easily susceptible of proof. What is the amount

LONDON.

Mr. E. K. Calver.

7 Dec. 1858.

Mr. Coode.

you tipped in, and what is the loss; or, rather, what is the amount within the harbour?

28,998. Do you not think that if the water in Holyhead Bay had generally been charged in the way you speak of, some indication of this earthy matter would have been found in portions of the bay, before the commencement of the works?—No, not while the bay was in a state of nature.

28,999. Do you say that no portion of that bay within Soldier's Point would have been sufficiently quiet to allow a deposit of matter?—Not of matter of this sort; not a particle.

29,000. Are you aware that it was objected to Holyhead as a site, that the bottom was very unequal?—I fully remember that.

29,001. If the bottom were so unequal, do not you think it likely that matter of this kind would have lodged in the inequalities, if the water of the bay had been charged in the manner of which you speak?—The inequalities of a rocky bottom, with a wave and current acting upon it; distinctly not. I should not expect a grain to be found under such circumstances.

29,002. That is always supposing that the whole of the bay was exposed to the action of the wave; but was there not some portion of the bay which was comparatively sheltered within Soldier's Point?—No.

29,003. You have spoken of piles at Portland and Holyhead resisting breakers upon rubble?—Yes.

29,004. Are those piles to be compared to the piles in the wave screen as shown in the model now before us? Are the circumstances parallel?—If you confine the question to the matter of the force to which they are exposed, I should say that the effects in the one case are very instructive as to what would be the effects in the other.

29,005. You adduce the circumstance of the piles at Portland and Holyhead not being broken as a matter in favour of the wave screen; and the inference which I understood you to wish to draw from the circumstance is, that because the piles stood at Portland and Holyhead they would stand in the wave screen. Was that the inference you wished to draw from your answer?—Yes; the facts at Holyhead and Portland, with respect to the standing of piles, are eminently suggestive as to what would be the result with a structure of this order.

29,006. What is the distance between the piles at Portland and at Holyhead?—A considerable distance; I should think 10 or 12 feet.

29,007. Should you be prepared to find it is 30 feet?—I should not be at all surprised.

29,008. Such is the fact. The piles are 30 feet apart, longitudinally and transversely, therefore the amount of resistance offered by them is hardly to be compared with that which would be offered by piles only 20 inches apart?—Not without you take into consideration the difference of circumstances, certainly not.

29,009. Is it not the fact that the piles at Portland and Holyhead now subject to the breaking sea are supported in the midst of an enormous mass of rubble?—That is so.

29,010. That they are supported up to above the level of the water?—I believe that is the case.

29,011. Therefore but a very small portion of the length is exposed to the action of the sea?—That is the case; but the fact cuts two ways. While you support them by the sub-mass, you add to the battering power of the sea.

29,012. Therefore the circumstances are not analogous?—No; and I merely say that they are eminently suggestive. It occurs very much to my mind that if piles stand, although so supported, in the midst of a breaker, then those which are not in the region of breakers, but in still water, and have very little force opposed to them, would, as a matter of the simplest inference, stand too.

29,013. In the one case the pile derives support from being supported by a mass of stone, and in the other it does not?—But the latter has not a tithe or a hundredth part of the force acting upon it which the former has.

29,014. As to the means you propose of resisting impact, which is somewhat uncertain, to say the best of it, it depends upon a shoe or palm resting upon a bottom sufficiently soft to allow that shoe or palm to sink by the action of gravity and of the tide?—In answer to that, I may say that I do not pledge myself as to the means even in a case of that sort, though I believe them to be all that is required. I have already mentioned that these are the mere means that I have devised as a support; but I do not advance them as perfect. I should rather say that a person who has been in the habit of carrying out works would be more calculated to give a structure of this sort support than I should be. I merely confine myself to broad principles, and do not dabble with things I have had nothing to do with.

29,015. Still, coming to the question of cost, that must depend on the means employed and the mode of structure which is adopted?—Truly.

29,016. If the mode of structure is altered, the cost would be altered too?—In the same proportion, but the difference would be trifling.

29,017. You have some objection to the works at Portland. Would you be good enough to say in what respect they are improperly arranged?—Do you mean considered as a structure?

29,018. To whatever your objection applied?—Considering the work at Portland as a structure, I object to the principle of it. It is tipped. This forms a submass, and so far supplies an agent for its own destruction and for constant future expense. I object to it on account of its defective principle as a structure. Then as to projection, I also object to it on account of the comparative close character of the harbour formed by it. You could have supplied all the covering to shipping without involving the risk of its filling up if there is any matter in suspension about Portland. If there is not, then that latter remark about projection does not apply. Then also I object to it on the score of expense. The lives of our men are suffering, and it is necessary to devise means for giving them security. Now it will not do to go and exhaust the public funds upon these things, which really are a sink-hole for money, when it is possible to devise means which will produce all the necessary results without any such drawbacks.

29,019. Are you aware of the cost per lineal foot of the works at Portland?—I am not.

29,020. Are you aware that it is the cheapest deep-water breakwater which has ever been constructed in this country, and probably in any other?—I have heard it so stated.

29,021. If that be so, is Portland open to the objection arising from want of economy in construction?—In the degree to which Portland involves a useless expense, to that degree, whatever it may be, it is faulty; the degree I do not specify. Whether it costs 1,000*l.* per foot or 100*l.*, I do not know.

29,022. Are you in a position to prove satisfactorily at this moment that any portion of the expenditure at Portland has been useless?—I do not know the work, except the broad principle of it, and the position in which it is placed.

29,023. Then do not you think you should have acquainted yourself a little more with the circumstances, before you bring forward Portland, or any other case, as an illustration of a general principle?—No. I am sufficiently acquainted with the circumstances to form a sound opinion. Beyond that I do not require information. I am quite content to take the character of the work as I know it to be, and the principles. The general statement is that it costs 130*l.* per foot run.

29,024. The cost of that work as a breakwater, irrespective of the superstructure, which has been adopted solely for harbour purposes, is 85*l.* per lineal foot, in a depth of water averaging something like eight or nine fathoms. I have told you that I should like to know if you can give some idea of the proportion of useless

expenditure which you think has been incurred at Portland ?—Even if it were only two thirds of that amount, or even a half, I should not be prepared to put a work of that principle into the sea, because the principle is faulty, and involves future expense, and you must take the future expense into the estimate.

29,025. What future expense do you apprehend the work at Portland involves ?—I am not aware ; but I believe it is a tipped breakwater, and as that is exposed to the direct and oblique strokes of the wave it must be always subject to wreckage.

29,026. What will that arise from ?—Either from the under tow of the wave, or the oblique stroke, driving material as on the beach.

29,027. What will be the effect ?—To undermine any structure you may have put upon it, or if there is no structure to be undermined, then, allowing the materials to be moved, you will have the constant expense of lifting these from the extremity of the work.

29,028. That will depend upon the materials being moved to any extent during gales of wind ?—Yes.

29,029. If you were told there is no material disturbance, and no superstructure of masonry, which really is the fact, what, I ask, will be the future expense ?—Then I say that if there is no sea so acting upon it, and no matter so to be deposited, then the structure is perfect in these two points, and then, as compared with the wave screen, the only question is one of expense.

29,030. But in connexion with the wave screen, you admit that after a certain time there may, and probably will be, a necessity for the renewal of some portion ?—Oh, nothing is everlasting ; iron will not last for ever.

29,031. Of what material should you propose to construct the wave screen ?—The conclusions I have come to are contained in this pamphlet. I can add nothing to what is in it.

29,032. As you allude to the pamphlet, upon the wave screen, I see that in it you propose wood, you propose cast iron, and you propose wrought iron ?—Yes ; cast iron below ; below the surface of the water. For that portion which cannot be got at I propose several materials as the result of information which I have received. These are pine scupper-nailed, pine cased in greenheart, or solid greenheart, or wrought iron. I do not mention any other.

29,033. As you propose pine scupper-nailed, I should wish to ask whether it is not the fact that the use of pine scupper-nailed has been almost entirely abandoned by engineers ?—That is a point I am not acquainted with. I have judged from the information brought before me by reliable persons, amongst others, Captain Ellis of Southwold, Captain Smythe of Yarmouth, and from information supplied by Mr. Walker.

29,034. Can you adduce any instance in which piles scupper-nailed have been used on any large scale within the last five or six years ?—No ; but as a very useful example I will mention the instance of Southwold. Sir Samuel Brown, who was a very talented and observant man, recommends the use of pine scupper-nailed.

29,035. But still, as the modern experience of engineers has been against the use of scupper nails, I ask if you think you would be safe in adopting them ?—I do not adopt them ; I merely suggested it.

29,036. If some other course is to be pursued, that would affect the question of expense also ?—Truly if the substitution could not be made for the same price I am not tied to materials.

29,037. You will produce some one who will speak more particularly as to the cost of the proposed work ?—Yes; I will produce the contractor for Margate pier, who, I am informed, is remarkably skilled in matters of this sort.

29,038. You spoke of the depth at which silt, sand, and shells had been moved, in the course of some of your observations. Am I to understand that there is any material movement, in a depth of twelve fathoms, which you quoted, or that what there is at that depth is only a minor action, which would not affect works exposed to the force of the sea ?—The exact nature of the action I cannot describe. I can only say that there is an action, and what the balance or effect of the action is. Just in the same way as sound is conveyed by certain impressions from an original impulse, so is the movement of the particles of the surface wave conveyed down to the bottom ; but of the exact way in which this effect is produced I know nothing.

29,039. Are you prepared with any examples which would give an idea of the depth at which the wave action would be found to exist, to any great extent ?—I have mentioned one or two examples, which may be trusted in, in this wave-screen pamphlet, and also in my evidence.

29,040. You have no others you could offer ?—I might. On this subject I have a body of facts ; but I am not prepared to say that there are any especially useful which occur to me at this time.

29,041. (*Mr. Lindsay.*) In the case of this wave-screen, do you propose to drive the piles into the ground ?—I do not mark out the mode of construction; that I would leave to persons practically acquainted with the subject. So far as I am fitted to form an opinion, I should think there would be no difficulty in doing so. I should have no hesitation in undertaking it.

29,042. You mean the wave screen to be a breakwater ?—Distinctly not ; I consider breakwaters very faulty ; we want effects and not works, and to produce those effects which are endeavoured to be produced by breakwaters.

29,043. You mean this to be in lieu of a breakwater ?—Yes ; to supersede them.

29,044. Therefore you must fasten the piles some way or the other to the bottom ?—I put them ten feet into the bed of the sea ; that is, the main structure or vertical position of the screen.

29,045. At what distance apart ?—At that distance apart which is calculated to produce the effect desired, the effect being to admit half the undulation into the harbour ; or if that half undulation was found prejudicial in practice, then to adopt other means to reduce it.

29,046. About what distance would that be, as a general rule ?—That is a question of hydraulics, and I have not gone into it ; but you could arrive at a fair inference before establishing the structure. You would only have to form a few sections before it would become apparent immediately whether you had adopted the proper intervals.

29,047. As a rule, would they be two or three feet apart ?—The model I have arranged has vacancies equal to the diameters of the cylinders ; equal spaces.

29,048. That is only a foot apart ?—A foot and a half, in this model.

29,049. I think you said, in reply to Captain Washington, that the wave does not strike ; that it is merely the crest which does ?—The crest of the wave in deep water, until you come into shoal water, when it is converted into a breaker on the beach, moving forward horizontally. It strikes with the same force as a solid. There is no difference between a fluid and a solid in that respect. The force with which a solid strikes is the result of the velocity and the quantity of matter, and it is the same with a fluid.

29,050. Therefore as the wave, in your opinion, would not strike in the position in which this screen would, as a general rule, be located, you think the force of the wave would not destroy it ?—Distinctly not. The structure is of that mechanical form and power which would render it independent of anything in the way of wave-force. A wave which easily destroys a vessel's bulwarks and boats, would be thoroughly destroyed beating against a structure of this sort, with one long line of continuity uniting all its parts.

29,051. You must often have seen, when the deep

LONDON.

Mr. E. K. Calver.

7 Dec. 1858.

Mr. Lindsay.

water comes up to the base of a mountainous cliff, the force or roll of the sea, or the stroke of the wave you would call it, has in the course of time hollowed out that rock. Now if the roll of the wave, or, I would call it, the stroke of the wave, makes such an impression on this hard rock as to hollow it out in the course of time,—makes caverns in them,—do you not think a structure such as this would very soon be destroyed ?—No, because the caverns you refer to are not in the region of simple undulations, but are cliffs with a certain amount of sub-mass, over which a breaker to a certain extent is formed. The two cases are not at all parallel. In this instance the structure is perfectly perpendicular, and possesses nothing in its character to create a percussive effect. The consequence is, it would not be subject to percussion; but in the case of the cliff it is entirely different.

29,052. I have seen cliffs at the base of which there was a depth of six or seven fathoms water, and I have seen the rocks there, against which the sea rolled or struck, completely hollowed out. If that is the effect in that depth, with the wave acting upon these hard rocks, do you really now, speaking to you as a sailor,—do you think that that structure of yours would resist the enormous force that would constantly be playing upon it ?—I do ; I have not the slightest doubt about it.

29,053. (*Sir F. Smith.*) In a strong gale of wind, blowing against the inside of your work, might not there be a tendency to lift out your struts ?—No ; because the little wave or lipper which could be formed over a refuge harbour would have no effect whatever, because in that case it is altogether in still water up to the screen itself.

29,054. In point of fact you think that in no case will there be any tendency to loosen the piles from their sockets ?—Not the slightest.

29,055. (*Mr. Coode.*) I see in your work you state that you apprehend that it will not be possible to form this wave screen entirely from a floating platform, but you will have to resort to staging ?—It would be possible, but not desirable, on the score of expense and detention.

29,056. You propose, in the event of having resort to staging, to adopt "common staging, as at Portland ?" —I merely sketch it out to show the possibility. I do not say whether it should be adopted. That should be left to a person in the habit of making these works.

29,057. Have you taken into account the cost of any kind of staging (in such a depth of water) that would enable you to construct the work at all times ? —I am not acquainted with such matters, but parties who will follow will give all the information.

29,058. Do you not apprehend that this wave screen will offer some resistance to the passage of the tidal water in and out, during the greatest strength of the ebb ?—A little it will, when not in the core of the tide. To that extent it would ; but when in the core of the tide it would be like a long vessel in a tide-way.

29,059. The effect will be to cause the water to heap up slightly within as compared to the water without ?—Not at all.

29,060. What would be the effect upon the ebb tide ?—You observe that one of the principles of projection is its being formed in the core of the tide, and no such thing, as you suggested, could happen there. It is one of the principles that it should be in the core of the tide.

29,061. Then if you had a wheeling tide you would construct the wave screen in the form of a wheel ?—Give me a case, and I shall be happy to give you a reply.

29,062. I will give you the case of Hartlepool, mentioned in the pamphlet ? — Then I have something definite to go upon.

29,063. Will you look at the Admiralty Chart of Hartlepool Bay, No. 1628, and tell me if the line of the wave screen you have laid down in the engraving in your pamphlet, corresponds with the direction of the tidal streams as shown upon that chart ?—Possibly it does not. I should think most likely it does not.

29,064. That being so, can it be said that the screen you propose to construct will be in the line of the tide in the case of Hartlepool ?—My evidence on Saturday plainly went to this, that in the wood engraving in this illustrated pamphlet, to which the attention of the Commissioners has been drawn, I propose it as a means of showing the application of the principle ; but I distinctly stated that that is not to be taken as the exact line of the structure. Before I should venture to project anything in front of Hartlepool, I should get the whole of the tide streams, and find out what was the core or mid-direction of the strength, and so project it. Before I should venture to draw upon paper a single line representing the work to be carried out, I should supply myself with all the information that was necessary to be known. For instance, this wave screen, in the pamphlet, is projected, as nearly as my knowledge would admit of its being done, in the core of the tide streams. It is also projected over what is a clean bottom of clay ; but beyond that it indicates nothing. I do not say that is the work to be carried out, but it indicates the principle and the approximate position of the work to be carried out in Hartlepool Bay.

29,065. Do you think that in bays generally, in this country at least, you will find a suitable line of bottom, and a favourable direction of tide, so that you could insure all the conditions which you require for the successful carrying out of your scheme ?—I think that when you could not find a site upon the east coast adapted for a work of that sort, would, so far as I am acquainted with the matter, be the exception, and not the rule.

29,066. Then you think that on the east coast you will find the direction of the flood and ebb so to harmonize and correspond with each other that you would have no difficulty in laying down your work on the line of the tide, and at the same time taking that line which should afford the best protection to the bay within ?—It depends entirely upon the locality. I have to apply the principle to a locality, which is Hartlepool ; and I have shown in the woodcut how the principle has to be applied to that place. But if you wish it to be projected in any other locality, mention it, and I will apply it.

29,067. I would rather confine myself to Hartlepool, and ask how you would apply it there ?—As I have indicated in my pamphlet, assuming that that is the direction of the core of the streams, and assuming also it is over a clear bottom. Until I found that these two things were clearly established, I should not commit myself to a single portion of the work.

29,068. Have you not assumed that which the Admiralty chart before us shows not to exist ?—Distinctly not. The marks upon the Admiralty chart shows facts. It may or may not be the fact about that special direction which I have sketched out ; but I think I should not be far wrong, and that that would really be the core of the tide streams.

29,069. Is that so in the case of the tide stream indicated by the Admiralty chart before us ?—Sufficient for the application of the principle ; but those on the chart are absolute facts.

29,070. Undoubtedly the facts, as I see them exhibited on the chart, do not correspond with the facts or assumptions on the woodcut ?—But on the Admiralty chart there are only flood arrows, and in projecting a work you must take into consideration the ebb also. The core of the tide is the result of the mean between the two. What you see on the chart gives no clue as to the position in which a work of that description ought to be placed.

29,071. As you have taken the mean, at certain periods of the tide the set must necessarily be across or oblique to the line of work ?—I have stated that it is in the core of the tide streams ; but I told you I would not presume to put a stroke upon paper, so far as that stroke indicated future works, without being

fully in possession of every item of information which ought to be known.

29,072. Seeing that in very few places the lines of the ebb and flood would be found strictly to correspond, would you take the line of the ebb or that of the flood ?—I should take a line between the two. I most distinctly and respectfully decline to give any reply which would be connected with hypothetical plans or places. I must have something definite to go upon. I must know the whole of the facts and circumstances, otherwise I have nothing upon which to give a reply.

29,073. Do you believe you could find any one place upon the east coast of England where the ebb and flood tide were so truly in any given line, that, in regard to any work which you might lay down, you could ensure that the line of ebb or flood should not, at some period, set across that work ?—I can find plenty of sites where the wave screen can be applied to perfect refuge harbours, keeping in view all the principles to which it is necessary to adhere. Beyond that I cannot reply, but of that I am quite clear, because I am acquainted with the whole east coast, and I perceive many sites where it could be brought into play. To show that it involves no practical difficulty, such as you suggested, I should have no objection to put the wave screen opposite a tidal harbour at a certain distance, although to a certain extent the ebb of the river would be transverse to the work ; but so far as the prejudicial effects were concerned, they would be nil.

29,074. Then I understand your evidence to be to the effect that you will have no difficulty in so placing the wave screen opposite any bay on the east coast of England that you shall have no material velocity of tide setting out through the piles or cylinders ?—I do not reply to that, beyond the extent to which I have already answered it.

Mr. Samuel Bastow examined.

29,075. (*Chairman.*) Will you state your occupation to the Commissioners ?—I am an engineer and contractor.

29,076. I understand the object of your appearing here is to give us some further information respecting this wave screen, drawn from a work which you have actually constructed ?—I may state that I am here at the request of Mr. Calver, to give the Commissioners any information which I can possibly do upon the construction of the wave screen, and more particularly with regard to a plan and estimates which I have furnished to Mr. Calver, and which differs very much in its details from his structure. From Margate Pier, to which reference has been made, I believe that in some respects inferences may possibly be drawn as to facts, and I would speak more especially with regard to the head of that pier. During the progress of that work I had frequent opportunity of observing its effects in stilling the water, which were very manifest. A vessel, such, for instance, as a steamboat which plies there from London, and to receive which the pier was constructed, could lie very comfortably on the lee side, when she could not approach from the other side. That was when the wind was in certain directions. Having noted these observations, and having seen Mr. Calver's pamphlet about the wave screen, I believe that the principle advocated by Mr. Calver might be found to be exceedingly useful in providing shelter for ships in stress of weather, as applicable to harbours of refuge ; and having been applied to by Mr. Calver to furnish him with an estimate for his particular description of screen, it gave me an interest to look more carefully into the nature of the structure itself, and the result of these observations was to produce this plan, which differs very much from Mr. Calver's proposed structure. I am now speaking, not of the principle, but of the material adopted, and of the method of construction.

29,077. (*Sir F. Smith.*) You are the contractor for the improvements now making at Margate ?—The improvements have been completed some time.

29,078. They have been completed some time, and the work is no longer in progress ?—They are quite complete.

29,079. What were those works ?—I might perhaps show the plan.

(*Sir F. Smith.*) Yes ; but you had better give a description also, that it might appear upon the minutes.

(*The witness produced a plan of Margate Pier, and then proceeded with the following explanation.*) The structure at the head is supported upon wrought-iron piles screwed into the chalk. These vertical piles are 10 feet apart in the direction of the length, and nearly the same transversely. There are 57 of them, which support the structure above. The low-water line is about three feet below the top of the screw piles. Upon the top of them is a cast-iron cap, keyed on to a head bored out conically. On the top of these caps are four logs of timber bolted together, making what are called sleepers, and on the top of that is raised the framework of timber.

29,080. This structure is not exposed to much action of the sea ?—Very considerably so.

29,081. In what depth of water is the extreme end ?—Nine or 10 feet at low water, with a rise of tide of from 10 to 12 feet.

29,082. About 3½ fathoms altogether ?—Perhaps about that.

29,083. It is not subject to great exposure. Did you find any great difficulty in getting the piles into the ground ?—Not any.

29,084. All screwed in ?—All the piles at the head are screwed in. The others are cast-iron, which are driven in. I may also mention, while on that subject, that although it is a chalk formation into which we screwed the piles, we met with beds of flint, which made it very considerably more difficult ; but still we did get the piles down through the flint, with a little extra labour.

29,085. You did not make this pier with reference to affording shelter behind ?—No.

29,086. Simply as a means for landing passengers ?—Exactly so.

29,087. What was the cost per yard run ?—It is about 400 yards in length, and the cost was 15,000*l.*

29,088. You have how many piles in the head of the pier ?—At the head, 57.

29,089. What was the mode of construction for the intermediate piers ; the same ?—No ; very different. The piles are of cast iron, and in three lengths. We cannot drive cast-iron piles into the solid chalk without previously boring a hole, in the same way as you would bore with brace and bit into a piece of wood, taking out a core, making a hole two inches in diameter less than the outside of the pile, and then driving it into the chalk.

29,090. The object of your appearance here is twofold, I imagine ; one to give your opinion of the value of this sort of screen, as a protection against the action of the wave, and the other to show us the facility of construction, coupled with the probable cost ?—Chiefly the facility of construction.

29,091. Your plan differs from Mr. Calver's, and I presume you think it the best of the two ?—Certainly.

29,092. Will you explain how it differs ?—It differs first with regard to the placing of these tubes. He calls them piles ; I call them tubes. I propose to screw these wrought-iron tubes down into the clay or mud, or soil of any description, by means, in the first instance, when I commence, of a barge, and small steam engine and machinery, so adapted to that object, that they could be put down very readily. Mr. Calver proposes to construct the bottom portion of his screen of wood, and I think it would far better be of iron.

29,093. Would wood be more perishable ?—Yes ; and for other reasons. My tubes are two feet six inches in diameter, and the spaces, say the same. That may be determined hereafter. I am not now prepared

LONDON.

Mr. S. Bastow.

7 Dec. 1858.

Sir F. Smith.

to say that that should be the exact space. The mode of proceeding would be as is imperfectly represented upon this drawing, which, together with the plan, I will put in. I should commence about midway with the proposed shelter or screen, and secure some 40 or 50 tubes, and then on the top of the first course should raise my platform, by putting transversely half baulks of timber, and strapping them together at the top with a leg, every four or five or six tubes, and stiffening them transversely on the top, and so keep removing that as I proceeded, continuing to stay them as I went on by other gangs of men finishing that which I had passed over.

29,094. Do you propose to stay, as recommended by Mr. Calver, or by some other process ?—My plan for that somewhat differs from Mr. Calver's. There is only one set, instead of two, attached at the top by a joint and pin, which will be continuous along the inner part of the tubes, and would be made of wrought iron.

29,095. Do you give any definite depth under the surface line ?—Decidedly.

29,096. Does it depend upon the tidal height, or the soil in which it is fixed ?—Do you mean the length to be inserted in the ground ?

29,097. Yes ?—I propose 10 feet. I believe that will be quite sufficient.

29,098. It has no reference to the length above ground ?—It has. But I think that the back stay, with an insertion of 10 feet, is sufficient to make it safe and strong to resist any force which might be brought against it.

29,099. Mr. Calver told us that the stay would take its bed by means of its gravity. That, I presume, is your plan also ?—Yes.

29,100. How will that be in chalk ?—In chalk you would require a different method. It is not proposed for chalk.

29,101. Then it is not of general application ?—If you wish to have a screen erected on a chalky bottom, I would offer something different in the way of a stay.

29,102. This is not of general application ?—It is of general application in clay, sand, or muddy bottom. With regard to the process of insertion, you will observe that the cast-iron screw is not placed at the bottom of the tube, but 18 inches from the bottom, so that that portion would sink into the clay, and form its position at once, before you began to screw, and hold there until you got so far down. The core, of course, would not be disturbed in the action of screwing it down, but it would be inclosed within the boiler plate, which is proposed to be half an inch thick.

29,103. I perceive that your estimate is for a larger amount than Mr. Calver's ?—Yes ; it is in a different material ; more costly.

29,104. For what reason do you prefer a different system ? If economy is to be the object, why do you adopt a system which is to be more costly ?—It may be a question with me whether his is an economical system.

29,105. You doubt the estimate ?—I do not doubt his estimate. I doubt the material of which he proposes to construct the screen.

29,106. You think it is not a judicious material ?—I think not.

29,107. Do you imagine that the proximity of Mr. Calver's piles has nothing to do with the great question of the screen ? Your intervals are much larger ?—I think that the principle is right ; but it is not possible for me, without some practice, to determine the exact distance at which the cylinders should be placed from each other. I am satisfied that the distance proposed by me would produce comparatively still water on the inner side ; but of course the degree of stillness would vary according to the size of the openings.

29,108. Your chief reason for departing from Mr. Calver's plan is, that you get a different material to work with ?—Yes ; and I think at the same time a stronger structure, without increased or corresponding expense by using larger tubes.

29,109. You heard Mr. Calver's evidence, in which he stated that by his mode of construction he should obtain a strength far beyond the requirements of the case ?—Yes.

29,110. You do not doubt that, I suppose ?—Not at all.

29,111. Then why should you, at a greater cost, provide a still stronger structure ?—It is simply stronger on account of my using a different material, and I should say would be more economical in the long run, because it would be more durable.

29,112. You have, I suppose, had considerable experience of iron tubes exposed to the action of sea water ?—I have.

29,113. Under such circumstances does any considerable oxydation go on ?—None, that I can discover ; not when they are in the first instance coated with two coats of purified gas tar. I cannot find any oxidation in that part which has been coated. I cannot tell how long it may take to remove that coating by abrasion or otherwise.

29,114. Did you say that your tubes were to be of cast iron ?—Wrought iron ; made of malleable boiler plates, rivetted together in the same manner as a steamer's funnel.

29,115. Your experience goes to show that in the case of wrought iron exposed to the action of sea water there is no oxydation ?—I should not say that exactly, but I think it is inappreciable.

29,116. Of what are your stays to be ?—Wrought iron.

29,117. They will, I presume, have to be made to particular lengths, according to the depths of the soundings ?—If the bottom varies very much, of course it would be necessary to regulate the length of the stays ; but if the difference of level was not great, that would be unnecessary, because the joint which connects the stay with the tube would accommodate itself to a little difference in the bottom.

29,118. Suppose that, as a general rule, you had a soft soil to deal with, but accidentally came upon a part which was of a rocky character ; that would altogether arrest your progress with this work, would it not ?—No, decidedly not. I am of opinion that I could screw the tubes through the solid rock, or rather into it.

29,119. In point of fact you think, that although it might be more difficult, it would be no impossibility ?—No impossibility whatever. The screws on the end of the piles which I screwed into the solid chalk at Margate are 30 inches in diameter, and I have frequently screwed three of these down in one tide with 35 men and a common capstan head.

29,120. Was not something of the same kind done at Rochester Pier ?—I am not aware.

29,121. (*Mr. Lindsay.*) What is the thickness of the plates in the plan before you ?—Half an inch.

29,122. Are you aware that sometimes corrosion takes place in a ship's bottom to such an extent that plates an inch thick are eaten through ?—I am not aware that up to the present time any appreciable amount of corrosion has taken place in ship's bottoms.

29,123. Shall you be surprised when I tell you that I have seen an inch plate in a ship's bottom eaten completely away in eight years ?—It seems strange.

29,124. Do you mean to say that corrosion would not take place under the water line in these wrought-iron tubes which you intend to screw down ?—I believe not, if they were coated as I have previously mentioned.

29,125. Would not the friction of the water in time wear off the coating ?—In time it might, but I cannot tell how long it would take to do so.

29,126. Would it not wear off in a very short time? —I believe not.

29,127. How long do you give it ?—From my experience, I should give it 60 years.

29,128. When it was worn off corrosion would commence ?—I do not know that.

29,129. Is it not the case that when water plays upon uncoated iron corrosion does takes place ?—I believe that corrosion would go on much quicker if there was no water playing upon it.

29,130. Do you think, now, that after you had screwed down your tubes in a depth of seven fathoms they would be able effectually to resist the roll and stroke of the wave ?—I do believe that, in the position in which it is proposed to place this, in six fathoms at low water, they would be able to resist any sea which could come against them.

29,131. In your experience you must at times have seen the force of the sea so great that it has carried away immense piers and hollowed the very rocks ?—Yes.

29,132. And that being so, do you, as an engineer, think that you could so fasten these tubes in a depth of six fathoms at low water that no sea would injure them or tend to throw them out of their places ?—I do, because the two cases are very different.

29,133. What is the difference ?—In the case of this screen, I do not present any solid surface to the sea.

29,134. You present a surface that offers resistance to the wave ?—To a certain extent.

29,135. You fasten the tubes into the ground ?—Yes, and also to each other.

29,136. Consequently they offer resistance to the wave ?—To a certain extent they do.

29,137. The extent depends upon the amount of surface which is exposed to the wave ?—Just so, and also the shape of that surface ; its configuration.

29,138. (*Capt. Vetch.*) You saw the old pier at Margate ?—I did.

29,139. Did you observe that there was a considerable force of sea occasionally striking one side or the other, generally the west side, I think ; that there was a good smash of sea running through ?—On both sides, I think.

29,140. And now that you have put up your structure you have found that the wave is to a considerable extent prevented passing through ?—I have spoken of that being its effect.

29,141. You are prepared to expect that if a screen like this was put up, with intervals equal to the width of the tubes, you would to a great extent keep out the sea ?—I think it would be comparatively smooth water on the lee side.

29,142. When the sea might be dangerous on the weather side it would be safe on the sheltered one ? Yes, decidedly.

29,143. That is what you expect would arise from such a proposition as this ?—It is.

29,144. Do you think that equal intervals would be a good proportion of open space to solid material ?—My present experience would lead me to say that that would be a good proportion.

29,145. You could not propose any better proportion ?—I would not suggest anything different, just now.

29,146. Until you had tried the effect ?—Just so.

29,147. With respect to the coating of the iron tubes, you have no doubt at all about their endurance? —I have not.

29,148. You are aware that there are lighthouses on the east coast, two between the Thames and Harwich, which are coated with that material, or something like it ?—I do not know of any.

29,149. You are aware that we have been in the habit of building swivel bridges upon iron cylinders in navigable rivers where there is sea water ?—Quite so.

29,150. And that these are very extensive structures. Are you aware that any of them have been corroded or decayed ?—It is possible that they may have ; but I am not aware that such has been the case to such an extent as to prevent iron being still used for the same description of structure.

29,151. You are aware that they are still building iron swivel bridges in tidal water ?—Quite so.

29,152. And that engineers are not afraid of trusting them ?—I believe not.

29,153. Coated with that substance to which you have alluded ?—I should say that the bridges to which you allude would be painted with a paint of a peculiar kind called oxide of iron, or something of that sort.

29,154. I am speaking of those, the supports of which are to be sunk deeply into the beds of the rivers ?—I beg your pardon. In that case I should suppose they would use what I have mentioned, or something like it.

29,155. You have no doubt about the durability of iron under those circumstances ?—None at all.

29,156. (*Mr. Coode.*) You have just been asked some questions respecting bridges. I would ask you whether it is not the case that the tendency to oxydation is much greater from the action of sea water, than it is in the case of a river bridge ?—I do not think it would be.

29,157. Do you not think the sea water has a greater tendency to create oxydation than the river water has ?—I have not observed it.

29,158. The tubes you have shown in this drawing are adapted to six-fathom water, I think ?—Yes.

29,159. Do you purpose to make them of half-inch plate ?—Of half-inch boiler plate.

29,160. Have you read Mr. Calver's pamphlet upon the wave screen ?—I have.

29,161. Do you remember a passage in which he quotes Mr. Mallett, whom he, justly, says is a great authority upon these matters, in which Mr. Mallett reports that from three tenths to four tenths of an inch in depth of cast iron, and about six tenths in depth of wrought iron, will be destroyed in a century in clear sea water ?—Yes, I have read that.

29,162. Six tenths of an inch is one tenth greater than the thickness which you propose to adopt ?—Yes ; but Mr. Mallett may have been wrong in what he has advanced.

29,163. Still is not Mr. Mallett held to be an authority ?—I do not know. It depends upon what his practical knowledge and experience was at the time he wrote that article.

29,164. You know that he was considered to be a sufficient authority to be intrusted by the British Association for the Advancement of Science to report upon this matter?—Very possible. I may here observe, that when Mr. Mallett wrote that, it was a matter of theory, and not the result of observation.

29,165. I see it stated here, in Mr. Calver's book, that it was mentioned in his Second Report of 1840, and that the deduction from his various experiments indicated the result I have just stated?—It would be very difficult, as you are aware, very difficult, to reduce it to anything like that quantity from the very small and inappreciable quantity he could observe during the time he speaks of.

29,166. Those were the deductions at which he arrived from his experiments ?—Very possibly so ; but a very small variation would make a considerable alteration in the deductions.

29,167. I presume you would consider that Mr. Mallett, being intrusted by a body like the British Association to report upon such a subject, would be careful not to report so strongly as that, unless he had believed that he had good reasons for so doing ?—I should not question Mr. Mallett upon this subject, generally ; I have no hesitation in admitting that he would do it to the best of his ability, and be very careful about it ; but it is very possible that he may have got a very bad case, or that he received the information from some one who had observed this under peculiar circumstances. If it had been the result of the experience of a larger number of individuals than himself, I would have placed more reliance upon it.

29,168. Still that was the result of the experiments

LONDON.

Mr. S. Bastow.

7 Dec. 1858.

Mr. Coode.

which he made expressly for the purpose, was it not?—That was so.

29,169. You said that the stays would require no alteration, unless the bottom varied very much indeed. Will you tell us the amount of alteration in the bottom which your tubes will admit of?—From two to three feet.

29,170. Does not that imply that there would be a play of something like two to three feet in the joints?—Oh dear, no.

29,171. How do you propose to get over that difficulty?—The top joint will always allow it to be lifted up and dropped down, and if there is a variation in the bottom it forms a little different angle with the tubes to which it is attached. Supposing there was a hole in one place, which was not the case with the preceding stay, and the stay was dropped there it would approach the tube nearer than the preceding one, and form a little different angle to the tube.

29,172. Then the feet which rest upon the bottom are at varying distances from the tubes, according to the depth?—Exactly.

29,173. What steps do you take to ensure the feet having a firm hold on the bottom, and forming perfect resisting points?—We should put a diver down to examine and to fix it.

29,174. A diver then is to fix it?—Yes.

29,175. Then is he to fix the shoe alone, or the shoe and stay attached?—The shoe will be connected to the stay by a pin and joint. The stay is to fix itself with a little working of the party at the top.

29,176. The diver would have to deal with the stay of something like 55 or 60 feet in length?—He would not deal with it; he would have simply to guide the shoe to the foot. The party on the barge would lower it into its place, and he would place it, and a little working at the top would fix it. If the shoe is three feet square, with four prongs or teeth, it takes hold of the clay.

29,177. You feel certain that a thickness of half an inch of wrought iron would be sufficient and durable enough to last for something like 50 or 100 years?—Considerably more than that.

29,178. (*Chairman.*) The estimates which you have sent in through Mr. Calver were of course complete in themselves?—Yes.

29,179. You will put in that plan, and the estimate for it?—Yes.

29,180. (*Sir F. Smith.*) These estimates, do they provide for the diver?—Yes. There is a certain amount allowed for pile fixing and everything complete, separate from all other matters.

29,181. (*Mr. Coode.*) What amount have you put down in this estimate for the plant?—5,000*l.*

29,182. To what extent will that provide plant for the works?—A barge, a little steam-engine, and the machinery attached to it, which the plan shows, and the small amount of staging which may be required.

29,183. Within what time do you anticipate that you could construct a mile of that work in the manner shown in the plan?—In two years.

29,184. With one barge and a steam engine?—Oh, I beg pardon; that is the commencement only. I should commence, as I stated before, in the middle, and secure 40 or 50 yards, and then put the little steam engine on a travelling platform, and commence at each end simultaneously.

29,185. How will that platform be arranged?—It moves on friction rollers, as projected.

29,186. Would you place it as a permanent platform?—No; it would be at the top of the lower tubes.

29,187. The height of the travelling platform would be about five feet above the level of low water spring tides; rather below the half-tide level?—Yes.

29,188. How would you prevent it being washed away in gales of wind?—I see no difficulty whatever about that.

29,189. At high water, according to your drawings, your platform would be immersed something like 10 feet?—Yes.

The witness put in the plans and estimate.

Mr. Thomas John Taylor examined.

Mr. T. J. Taylor.

29,190. (*Chairman.*) Will you state what has induced you to take an interest in the works at the mouth of the Tyne?—I have an interest in them on account of being resident upon the banks of the Tyne, and also because I have an interest in collieries and shipping. Although I am not a river engineer, but a mining engineer, it has been my duty to pay great attention to the river works which have been constructed on the Tyne for the purpose of shipping coals. For many years past I have given a good deal of attention to the subject, and in 1852 I published a work on the Tyne Improvements.

29,191. We have a printed statement which has been supplied to us. Will you proceed, after that has been read, to add anything that you may have to offer?—You probably allude to the report which I sent in to the Tyne Commissioners?

29,192. Yes; Mr. Clayton furnished us on Saturday with the report.—Of that report the proper appendix is the summary of wrecks,—the analysis of wrecks within the bay extending from the Fern Islands to Robin Hood's Bay, which I had the honour of laying before the Commissioners, through Mr. Mather at Tynemouth, and which I believe is now your possession. I have a copy here of the appendix to my report, my expectation being that the Commissioners would examine me as to the facts and circumstances recited in that report.

Earsdon, November 26th, 1858.

The Chairman of the Tyne Commissioners.

Dear Sir,

I HAVE perused the report, and examined and considered the plan for extension of Tyne piers, prepared by Mr. Walker, the cost of the proposed extension being estimated by Mr. Walker at 400,000*l.*, and of the entire project at 800,000*l.*

The contemplated extension of the piers into 35 feet at low water possesses the advantage of rendering available the workalready constructed under the original plan; otherwise the suggestion naturally occurs, that a line of direction from the shore, without a bend inwards to the proposed pier-heads, would have been preferable, as constituting a more effective stilling basin.

Regarding the depth of water to be obtained at the entrance by the proposed pier extension, it would be rash to give a definite opinion, especially as the result will be greatly influenced by the future measures adopted for the improvement generally of the extensive tidal basin of the Tyne, so as to bring the operation of the flood and ebb currents, and also the land freshes, to their maximum of beneficial effect. At present, as the Commissioners are aware, there is eight feet rise at the bar (spring tides) before the flood tide begins to lift at Newcastle; and in the extreme western section of the tidal basin it is high water at the bar before the tide is felt at all, the current continuing in fact to flow upwards in this section when the tide is ebbing at the bar. This impounding of the ebb tide, and corresponding retardation of the flood, obviously preclude the greatest attainable amount of benefit being derived from the scour of the tidal water; and it is also manifest that the extension of the piers so much the more requires the adjustment of the river bed generally, inasmuch as a greater depth of water than before is required to be maintained at the entrance.

Keeping these remarks in view, we are not without examples in the Tyne itself which at least furnish analogous data for estimating the depth of water that will be obtained between the piers. Thus we find, in a channel of nearly similar width, opposite the new quay, North Shields, a depth of 18 and 19 feet at low-water spring tides.

As regards the general question of a harbour of refuge on this part of the coast, a great bay is formed by a line drawn from Robin Hood's Bay to the east side of the Fern Islands, the sea length of which is 80 miles, and the extreme depth to the shore at low-water mark 13 miles.

The trade of this bay is very great, representing, in fact, a larger amount of shipping traffic than that of any equal length of coast in Great Britain. The following statistics

are from the Board of Trade and Admiralty Returns, being the average of years from 1852 to 1586 inclusive :—

Ports.	Annual Traffic Ships.	Annual Wrecks.	Proportion of Wrecks to Traffic, One in
Blyth - -	2,370	4⅖	538
Tyne - -	45,000	24	1,875
Sunderland -	18,794	19⅗	959
Seaham - -	4,019	3⅖	1,181
Hartlepool -	19,066	20⅗	925
Tees - -	6,355	2⅖	2,648
	95,604	74⅖	1,285, Average of the whole.

Whitby is excluded, as beyond the local limits.

Outside of the line drawn, as before mentioned, is the track or fair-way of passing vessels which do not in fact enter the bay. The "Wreck Registers" for 1852, 1853, and 1854 (not continued in detail after 1854) record only one vessel, not *belonging or trading to the Tyne*, as being wrecked at our port during those three years. This single vessel was timber laden, bound from Stettin to Dundee.

The obvious conclusion to be drawn from this circumstance is, that protection is required, not for the general passing traffic, but for the special purposes of our local maritime trade, referring to the traffic of the bay as carried on at the several ports enumerated.

To the fact, that very nearly the whole of the vessels wrecked either *belong or trade to the ports within the bay*, it may be added, that the great majority are wrecked at or near the entrance of the ports. Thus, of 273 vessels stranded or wrecked in the years mentioned, 229 casualties took place at or adjacent to those ports.

It would be invidious to make comparisons between one suggested locality and another, as regards the most suitable situation for a harbour of refuge. So large a shipping traffic requires multiplied points of safety. And it may be considered the most proper course for the parties interested in the respective ports to assert their claims upon Government for aid in improving those ports, as a more effective means of protection, under the circumstances described, than any single harbour could afford. The following remarks on the subject are, however, submitted to the Tyne Commissioners :—

1st. Though the heaviest gales and seas on this coast are from the north-east to east-north-east, yet the largest proportion of wrecks takes place in gales from east by south and east-south-east.* With a wind a point or two to the southward of east, vessels from the south, where the great traffic lies, are enabled to reach the bay. Now, with the wind from east by south, or east-south-east, vessels rounding Flamborough Head can make the Tyne, except in extreme circumstances, so that a harbour of refuge southward of the Tyne is in such case unnecessary for vessels bound to the Tyne.

2d. If a fleet left the Tyne, which has nearly half the traffic of the entire bay, and were suddenly met by a gale of wind from the south-east, which frequently happens, none of those vessels would be able to reach Hartlepool, but must either return to the Tyne or make their way to Leith Roads.

3d. With a wind from east-north-east, vessels could leave the Tyne and proceed southward two points free, which cannot be so surely said of vessels in the southern portions of the bay. This point is of importance. The trade requires not only access to but also convenient egress from port, especially where an article of such constant consumption as coal is needed for the London and coasting markets, the saving of delay being a prominent consideration as regards both cheapness of transit and regular supply, and consequent cost to the consumer. To the case of less bulky and more valuable cargoes than coal this argument does not apply with the same force.

4th. The Tyne is very nearly in the centre of the bay. On the contrary, there are, south of Hartlepool, only 24 miles of sea-line and 166 square miles of area; and north of it there are 56 miles of sea-line and 486 square miles of area. So that three-fourths of the entire bay are situated north of Hartlepool.

5th. The Tyne has the advantage of deep water very close to its entrance; while, it may be remarked, that one of the drawbacks of ports in the bottom of the bay, which have not the backwater of river to scour out a channel, is, that they are approached over shoal ground. Such is the natural character of the most receding parts of a coast: it being obvious that the silt, which travels along it in more prominent situations, is sheltered and deposited within the innermost portions.

6th. It is difficult to understand how a harbour, which consists of an extension seaward of the actual line of coast, without backwater to maintain an open channel, can be otherwise than a constant source of expense in freeing it from depositions.

7th. Redcar has been proposed for a harbour of refuge, and is free from the objection of a shoal-water approach, but, in other respects, it is in the same category with Hartlepool; viz., as regards its comparative inutility to the Tyne, and the hindrance of vessels from getting to sea so as to make their passage with an east-north-east wind. Neither is Redcar a place of trade, nor, therefore, possessed of those facilities for repair which may be required by vessels in distress; and as a special harbour of refuge, unless constructed and kept up by Government or by a passing toll, it must be made and maintained at a cost which would entail much greater expense upon vessels frequenting it than would a port where a large trade and available revenues are already in existence. The coal trade, it may be added, is extremely sensitive of expense, and will not bear extra charges in the same degree as more costly products, especially since railway competition has been sanctioned and established by the legislature, a circumstance which of itself constitutes a strong claim upon Government.

Influenced by the foregoing reasons and circumstances, I have come to the conclusion that the local improvement of the ports within the bay is preferable to the construction of a general harbour of refuge. Assuming this position to be a tenable one, the claim for the aid of Government in improving the ports does not appear less strong than for a general harbour, inasmuch as the same object is attempted to be attained in a more generally useful and comprehensive manner; and it may be added, that as the question is not one simply of trade, but which concerns the saving of life, it is to be hoped that such claim will be met by Government in a liberal and adequate manner.

I am, dear sir,
Your very faithful servant,
T. JOHN TAYLOR.

It appears from this statement that the greatest proportion, not only of light vessels, but also of laden vessels, have been wrecked in south-east winds during the three years.

In point of fact, few vessels bound to or from the Tyne are wrecked in the southern portion of the bay. The wrecks of vessels trading to the Tyne out and in during the three years, are by the returns 105, of which there were four light vessels and eight laden vessels wrecked at at or near Hartlepool, Seaton, and Redcar; the proportion thus wrecked being, therefore, about one-ninth of the whole.

29,193. (*Sir F. Smith.*) You have, perhaps, heard or seen the evidence which was given by Mr. Walker in reference to the Tyne improvements ?—I have.

29,194. Do you concur entirely in his views ?—I may say I do concur entirely in the views of Mr. Walker. I concur with Mr. Walker especially as to the depth of water which will be obtained at the entrance of the proposed piers. I mean the proposed extension of the piers.

29,195. Do you believe and put faith in the statement which has been made to us, that there will always be a bar at the mouth of the Tyne, however far you may project your piers ?—I think there is some confusion of terms as to a bar. If a bar was established outside the piers, it would be a bar having

LONDON.

Mr. T. J. Taylor.

7 Dec. 1858.

Sir F. Smith.

deep water upon it. I do not mean to say that the entire 36 feet, to which the piers are intended to be carried out, would be realized, but something short of it; something practically so deep as not to bring it within the ordinary signification of a bar. It might, for example, be 26 or 27 feet, but not anything like the present shallowness of water on the bar of the Tyne.

29,196. Do you imagine that the present bar of the Tyne would be removed by the projection of the piers?—I think so.

29,197. What reasons have you for believing that?—I think the current will be brought to operate directly upon the space between the outer piers.

29,198. Do you imagine that any improvement in the river itself would tend to the object?—I think so. I think the improvement of the tidal basin generally of the river would tend most directly to that object.

29,199. You are not the engineer of the river, are you?—No.

29,200. Is it intended at all to improve the river?—It is intended.

29,201. Do you expect from that very happy results?—I think it would be attended with very happy results. Already there have been certain works executed, and more are in progress; but a great deal still remains to be done; for example, nothing has been done in Shields Harbour, which is one of the most important points for improvement. Nothing whatever has been done, with very trifling exceptions, in the upper part of the tidal basin, extending west of Newcastle Bridge for a distance of 10 miles. That is a very important part of the tidal basin.

29,202. Are you prepared, as an engineer, to recommend the outlay of the whole 800,000*l.*, with a view to the carrying out of Mr. Walker's larger plan.—I am.

29,203. Do you think that anything short of that would effect any decided improvement?—I think not. I think, if you will allow me to go a little into detail, that I can show you that the piers projected out 15 feet water would not answer any very efficient purpose. I think it is very possible that, being situated upon the actual sand bank that is formed at the mouth of the river Tyne, those piers would not answer any good purpose; and it is necessary to extend them beyond that sand bank to get into deeper and better water, because if these inner piers, as projected, had even a depth of 18 or 19 feet between them, it is possible that, they being upon a sand bank, the bar might be found outside; whereas, with the piers in 36 feet water, I apprehend that if a bar was formed at all, it would be a bar that practically is not entitled to be considered as such, or to be regarded as an impediment to the navigation.

29,204. Merely a shoaling of the water, you mean?—Merely a shoaling of the water.

29,205. Have you at all gone into the calculations upon which Mr. Walker has based his estimate?—I have not. I left him to sustain his own estimate.

29,206. Then, in recommending the larger improvment, are you fully satisfied that it will not exceed a cost of 800,000*l.*?—I would not undertake to say so, because, as I have already stated, I have not gone into the estimates.

29,207. Is there any amount of money that would justify the Government in not being parties to the increased outlay?—I think the matter is so serious a one, that I hope the Government would be liberal in regard to it.

29,208. Are you inclined to think upon the whole that the improvement of the Tyne, and the piers projected by Mr. Walker, would do more to save life and property, but especially life, than any harbour made at any other part of the coast would do?—I think so. I prepared with a great deal of care the analysis of the wrecks and casualties that have taken place within the bay. By the bay, I mean from Robin Hood's bay to the Farn Islands. That statement is in the possession of the Commissioners; and the conclusion I came to from that statement, which I drew with great care, and which was revised several times, because it appeared to me to be a statement calculated to settle the question, was that the Tyne was the most eligible place for a harbour of refuge.

29,209. Is not the Tyne very much crowded at certain times of the wind?—Yes; but there is great space in the Tyne. A very considerable number of vessels can lie in Shields Harbour, and there are two docks now in the Tyne; one is finished, the Northumberland Dock, and the Jarrow Dock will be opened next spring. An Act has also been procured for a third dock, if sufficient accommodation is not to be found; but in the harbour and the two docks mentioned there will be accommodation for about 2,000 ships.

29,210. You think the dock accommodation will be such as to clear the river sufficiently to take in vessels for refuge to any required amount?—Yes.

29,211. There has been a good deal of evidence given against the formation of a harbour of refuge in a tidal harbour. Do you think there would be any difficulty in constructing a breakwater to seaward of Mr. Walker's piers, at such a distance as to allow the passage of the tide between the breakwater and the shore, that would have nothing to do with the formation of bars, and would be useful as a place of refuge?—A breakwater being liable to admit on one side the action of the north-east sea, which is the heaviest sea on our part of the coast, could hardly be constructed in such a way as to shelter vessels sufficiently, at all events in comparison with piers.

29,212. You are aware that it has been contemplated to form a breakwater in advance of Hartlepool, to form a refuge for vessels?—I have heard so.

29,213. Is there anything in the configuration of the coast, or in the geographical position of the mouth of the Tyne, which prevents a similar construction from being made there in advance of the mouth of the Tyne?—I think it will not be so effectual as the projection of the piers would be. With the projection of piers, vessels would have the opportunity of getting into safe moorings and berthings in the harbour and in the docks, but the assumed construction of a breakwater outside does not seem to me to promise the same amount of shelter.

29,214. That is a question of degree. Your reply goes to the degree of shelter. My question is a positive one. I wish to know whether, in your opinion, it would be practically useful or not; I am not saying, in the same degree as the making of the improvement of the Tyne, but whether it would be practically useful to make a breakwater of the description I have mentioned?—By incurring a very enormous expense a breakwater might be constructed outside the Tyne; but the idea always has been—the plan of projecting piers was for the Tyne the right one. A breakwater to be constructed there would be very expensive.

29,215. More expensive than one at Hartlepool?—No; I do not mean more expensive than one at Hartlepool. I believe there has been no specific plan or estimate made for a breakwater at the mouth of the Tyne; so it is very difficult upon the spur of the moment to give an answer to your question as regards the expense.

29,216. There have been estimates made for Hartlepool, so that I believe you may know exactly what the cost is estimated at of the schemes proposed for the improvement of Hartlepool; keeping the amount in view, which is very considerable—I think nearly a million and a half of money—do you not think that, for the same amount, a breakwater might be constructed sufficiently in advance of the Tyne to afford a considerable refuge for passing vessels without disturbing the traffic of the port?—I think it might.

29,217. But upon the whole you are disposed to give the preference to the improvement of the mouth of the Tyne by Mr. Walker's piers?—To Mr. Walker's extended project I certainly should, on

the ground that such extenson is preferable to a breakwater.

29,218. You think, as an engineer, you would thereby get sufficient water to take in all the ordinary trade of the Tyne at low-water spring tides ?—I think so. I have said in my report that I calculate on getting 18 or 19 feet water at low-water springs, which means at low water neap tides about 22 feet, and with an hour's flood at spring tides 21 or 22 feet water.

29,219. (*Mr. Lindsay.*) The principal objections which have been urged before us against the Tyne have been want of depth, the freshets, and the want of space. I want to examine you somewhat minutely upon those points. There have been most conflicting opinions expressed before us in regard to the piers being able to maintain the required depth. One eminent engineer tells us we may be able, if the piers are carried out to the depth of 35 feet at low water, we may be able nearly to maintain that depth. Another engineer tells us that to whatever extent you carry out the piers you will also carry out the bar with them. Now, as you have lived, I believe, all your life upon the banks of the Tyne, and have watched the effects of the tide, will you give us your opinion upon these important points ?—As so much has been said upon these points, I will first lay this chart before you, which shows the river Tyne and the works proposed to be carried out. (*The chart is handed in.*)

29,220. Be so kind as to explain this so that the reporter may be able to take it down, and so that disinterested persons may, upon reading it, be able to understand it?—The inner line of piers as proposed to be carried out in 15 feet water, does not, it will be observed, cover the extremely irregular shore current which passes along that line ; the water deepens gradually to 16 feet, 17 feet, and so on ; that is to say, that outside the inner piers the sand bank would continue, and therefore the probability is that there must be shallow water formed outside of these piers ; not anything so shallow as the present bar, but perhaps 12 or 13 feet water, where there is now a depth of from 14 to 16 feet. It is pretty well admitted that within the piers there will be a depth of 18 feet of water, or perhaps 19 feet ; the argument for which is, that there is a similar depth at the New Quay, in very similar circumstances, and the analogy is so strong that it would be difficult to get over it. But these inner piers being upon the sand bank, it follows, that although there might be 18 or 19 feet water between them, we may have only 12 or 13 feet outside. On the contrary, if we carry the piers out to 36 feet water, still having 18 or 20 feet within the piers, we should have a right to assume that there will be no greater proportional reduction in the depth of the external water than there would be without the inner piers—that is, that in the case of the inner piers it would be from 14 or 16 feet to 12 feet ; with the larger piers it would be from 36 feet to 27 feet ; so that the river bar formed beyond those piers—if you call it a bar—would be navigable for the largest vessels which frequent that part of the coast. The piers being advanced fairly beyond the coast line into a free sea current, I apprehend, if any shallow water is established, there will be still so great a depth that, practically, it may be considered as not a bar at all ; or at least, if it can be called a bar, one which will really have a sufficient depth of water over it for the purposes of navigation.

29,221. From what you have said, I gather that you think there is a chance if the larger scheme is carried out of the water shoaling for about eight feet ? —It is possible, judging from the similar proportion which would arise at the other piers.

29,222. You think it is probable that the depth of water could be reduced by eight feet ?—I think so, upon the ground which I have stated.

29,223. I do not clearly understand why it should stop when it gets to only 28 or 30 feet ?—Upon the principle which I have explained, that the current along the shore at that part is a free current sufficient to carry away the silt which is held in suspension. That such is the fact at the present time is apparent, because 36 feet of water is now maintained.

29,224. That is caused by the ebb flow of the Tyne, the tide running along parallel with the coast ?—Yes.

29,225. Therefore, if you carry out your piers as is proposed to the outside of that line, the bulk of the sediment which is brought down the river will be caught by the ocean tide, and scattered ?—Not only that which is brought down the river, but that which is transmitted along the coast, which is a larger quantity.

29,226. It will, at the particular point, be met by the ocean tide, and will be distributed ?—Yes.

29,227. What is the cause, in your opinion, of the present bar of the Tyne ? Is it caused by the sediment from the river, or by the sand which is washed up from the sea, or is it partly from both ?—My own opinion of the formation of a bar is one that I may express in very simple terms : it is a sand bank. That of the Tyne I take to be a continuation of the Herd Sand. If we should suppose there was no river there, that sand would extend over to the Tynemouth Rocks ; but there being a river, that river cuts its way through, and so you have a bar at the entrance.

29,228. Then, from what you have said, I suppose that if any engineer, or any man who had really studied this question, was to tell you that the effect of carrying out these piers would only be to carry out the seven feet bar so as only to make seven feet of water where there is now 38 feet, you would perhaps be inclined to say that the man who stated that, knew nothing of the question ?—No ; but I should say that he was wrong.

29,229. Or would you deal more generously with him, and say, that probably he had not studied the question sufficiently ?—I do not know about that. I do not know the circumstances, and therefore I can't speak of them. The gentleman of whom you speak may be right in saying that a bar would be formed outside —in a qualified sense. I explained that a bar may be so formed, but not, however, a bar with only seven feet of water on it, but one with 27 feet.

29,230. That was a point which struck me forcibly, and I put the question on two different occasions distinctly, and the answer I received was, that it was a mere question of time, and that where there is now 38 feet of water you would only have in the course of time, resulting from the construction of these piers, only about seven or eight feet of water there ?—I think, if the gentleman to whom you allude had studied the subject of the along-shore current more closely, he would have been of a different opinion.

29,231. Your opinion is, having watched the effects of the current here for a long course of time, that if any silting does take place it will not silt up to a greater extent than eight feet, but that it will leave a depth at the proposed entrance for all time to come of from 28 to 30 feet at low-water spring tides ?—Not within the piers.

29,232. Where then ?—Outside the piers. We are talking of the bar being formed outside, and the depth of water between the piers is in my report assumed to be about 19 feet.

29,233. At what part within the piers ?—Immediately between them.

29,234. That is between the two outer piers ; in a straight line between those piers where there is now a depth of about 38 feet, do I understand you to say that in the course of time there may not be more than 19 feet water ?—There may be more, but if there should be more than 19 feet it would be owing to other circumstances. There will be the addition to the tidal water of the river, caused by these piers. The Tyne Commissioners also contemplate making great improvements in the river by training and conducting its current, which will lead to a freer discharge and ingress of the tidal water. This circumstance will have a material effect, I do not

LONDON.

Mr. T. J. Taylor.

7 Dec. 1858.

Mr. Lindsay.

doubt, so as to add to the depth of 19 feet, but to what extent remains as yet to be proved. It may be up to 24 feet or 25 feet, but I will not undertake to say that just now. What I alluded to was the formation of a bar beyond the piers.

29,235. Tell me more particularly what would be the effect of extending these piers out to a depth of 38 feet water ?—I have already said that the depth of the channel which the river is capable of keeping clear is, so far as we can judge by analogy from the New Quay, is a depth of 19 feet, and which will be the depth at low water between the piers ; but outside the piers no bar would be formed, or if one was formed it would only be such a bar, as practically speaking, could be no impediment to the navigation of the river. I also said that there might be an addition made to the 19 feet depth, partly by reason of the additional amount of tidal water that would be gained by the construction of these piers themselves, and partly by the improvement which the Tyne Commissioners contemplate making in the river. These may possibly make an addition of five or six feet to the depth between the piers.

29,236. Upon the chart which you have put in the depth within the proposed piers is marked at 36 feet. Is it not so ?—Yes.

29,237. And you tell me that, in the course of time, there may only be about 19 feet water within those piers; is that so ?—Yes.

29,238. Where there is now 36 feet ?—Yes, where there is now 36 feet of water.

29,239. Then the fact is that the existence of those piers will be to make the water a good deal shallower than what it is at present within the piers ?—Within the piers themselves it may be so, but it will be a great deal better upon the present bar, which it is our object to improve.

29,240. Then the substance of your evidence upon that point is, that outside of the pier you think that you will be able to maintain a depth of 28 feet or 30 feet of water, but that within the piers you do not expect to be able to maintain a greater depth than 19 feet or 20 feet ?—With such addition as may be made hereafter from any improvement, such as I have before alluded to.

29,241. Then you think that you would be able to maintain that depth of water up to Shields ?—Certainly I do.

29,242. How will you maintain it—by dredging, or by the scour of the river ?—I think, probably, it may be found necessary to construct inner works within these piers, for the purpose of conducting the current. It is very possible that such may be the case. Dredging is a very expensive process, which is to be avoided if possible, more particularly because the currents of the river are capable, if properly directed, of transferring their own material.

29,243. I want to know what life and property would be saved, in all human probability, if these piers were carried out to the extent proposed, and we can only judge of what would be the probable effect in that respect from what has gone before. Now you give in your report the number of wrecks which have taken place in the Tyne ; would all those ships which have been lost in entering the Tyne have been able to find shelter at any time of the tide, if these piers had been there then ?—I cannot say that all the vessels which have been wrecked there would, but a very large proportion certainly.

29,244. What proportion do you think ?—Five-sixths.

29,245. Three-fourths, perhaps ?—It would be very difficult to say what proportion, but a very considerable proportion would have been able to come in.

29,246. A very considerable proportion, perhaps about three-fourths of the vessels that have been wrecked in the Tyne would in all human probability have been saved with the lives on board of them, if these piers had been constructed ?—Yes.

29,247. That is your opinion ?—Yes, that is my opinion.

29,248. Consequently, if these piers were carried out to the proposed extent, the Tyne would become, considering the description of vessels that frequent the coast, a harbour of refuge in the strict sense of the word ?—I think so.

29,249. Then you are of opinion, after calm consideration, that the Tyne would, if these improvements were carried out, be the means of saving a large amount of property and life, and therefore you, in your report to the Tyne Commissioners recommend that they should ask the Government for a grant of money to carry out the works to the extent proposed by Mr. Walker ?—Yes, I have distinctly stated that in my report.

29,250. You have done so, because you believe it to be the means of saving lives and property to a very large extent ?—Yes.

29,251. One word about these wrecks. I see that the loss of vessels in the Tyne is stated at 1 in 1875, and the loss at Hartlepool is 1 in 975 ; therefore it appears, by that statement, that the loss of vessels at Hartlepool is about two to one of that which occurs in the Tyne. But is it the case, that of the number of those vessels a larger portion of those which are lost at Hartlepool are got off, than are wrecked in the Tyne ?—That is so.

29,252. The number of vessels which are lost at Hartlepool are vessels run on shore because it is a sandy beach, for the purpose of saving life ?—It is understood to be so. That is my opinion. I speak from information ; not being a nautical man, I cannot give a positive answer. But speaking from information, I should say it is so. I may also remark, that a small proportion only of vessels from the Tyne are wrecked in the neighbourhood of Hartlepool, not more than one-ninth part, perhaps.

29,253. Now as you have cleared up some knotty points in my mind, as to the depth and the maintenance of the depth, I want to ask you about the freshets. Are they most frequent in easterly or westerly gales ?—In both.

29,254. Are they more frequent in easterly gales ?—Not more frequent. There have been some heavy ones with easterly winds, especially with north-east gales, but the greatest number are in westerly winds ; the westerly part of the basin of the Tyne is a remarkably rainy district. The easterly portion about Tynemouth is one of the driest districts in the kingdom, while the western portion in the neighbourhood of Scotland, near to the Keilder, is one of the wettest. At Keilder there is a very heavy rainfall, with westerly winds, often when none falls in the eastern part of the basin at all, and then the floods come down without our having any rain in our district at all.

29,255. Have you ever measured the rate at which the freshets run out ?—At what part of the river ?

29,256. More particularly at what rate do they run out across the bar, meeting the ships running in an easterly gale ?—During the ebb, from $2\frac{3}{4}$ to $5\frac{1}{2}$ miles. The first part of the ebb not so rapidly, but the latter more rapidly.

29,257. At what part of the river is that ?—In Shields harbour.

29,258. That is the narrowest part of the river ?—Not the narrowest ; the narrowest is further down in what are called the Narrows. I am speaking now of very heavy freshets ; but the greatest velocity which I have mentioned does not last longer than during the latter portion of the ebb—during a very short period of the ebb.

29,259. That is a freshet running at the rate of about five miles an hour ?—About five miles an hour.

29,260. How often in the course of the year is there such a freshet ?—Four or five times.

29,261. Should you consider it dangerous for a ship to run in with such a freshet as that running out ?—Not if she has a wind strong enough to bring her in. It is not dangerous, it lasts for a very short time. There are, say, five floods during the year, which seldom last more than a day, or perhaps 36 hours ; thus the velocity is only at the later period of ebb

tide, so that, say, five times two hours, 10 hours or something like that, would represent the dangerous period during a twelvemonth, if we are to consider that there is danger at all.

29,262. Then, if there is the danger which has been alleged, the danger only extends over 12 hours in the 365 days ?—It appears about that, from the calculation.

29,263. Then, as you have stated, these freshets generally happen during a westerly wind ?—During westerly winds. There are exceptions ; some very heavy ones occur with north-east winds.

29,264. They generally happen during westerly winds ?—Yes, generally ; because the greatest quantity of rain falls in the western part of the basin.

29,265. They will sometimes happen during calms ?—Not generally. Generally speaking, when there is a good deal of rain in the west, we have rather a heavy westerly wind blowing down the valley of the Tyne.

29,266. Then, in fact, it must be a matter of very rare occurrence when ships would be obliged to run for shelter to the Tyne, with an easterly gale, which are the dangerous gales on that part of the coast ?—It would be a matter of very unfrequent occurrence to meet with freshets in such a case.

29,267. If we take the number of floods at five in the year, and put one of them as being with an easterly or north-east wind, that would be the measure of the danger that you speak of ?—Yes.

29,268. Now as to the next point. What number of vessels have you known to be moored in the Tyne at one time ?—1,250 vessels in the river ; but including the Jarrow and Northumberland Docks, it is calculated there will be accommodation for 2,000 vessels.

29,269. I want to know how many you had in the river ?—One thousand two hundred and fifty moored in the river at one time.

29,270. When your dock accommodation is complete, what number of vessels will they be able to hold altogether ?—Seven hundred or eight hundred in the two docks, making about 2,000 vessels in all.

29,271. You will be able to 2,000 vessels in all, including the docks and the river ?—Including the docks and the river.

29,272. Where vessels could lie afloat at all times of the tide ?—Yes.

29,273. Now say that there is no grant to be given to the Tyne, and there was only one great harbour to be made on the north-east coast of England, how many vessels ought that harbour, in your opinion, to be able to contain ?—It must be very large, very considerable. I think that its required magnitude constitutes one of the strongest reasons for multiplying the points of safety with such an enormous traffic as that of 90,000 vessels a year.

29,274. Do you think if only one harbour was to be made, that that harbour would be sufficient if it was only able to contain 500 vessels riding at anchor ?—I think not ; and that would require a very immense space.

29,275. Have you seen the plan proposed for Hartlepool Harbour ?—I have seen two or three designs, but I do not know whether I have seen the one you allude to.

29,276. Can you state the largest number of vessels either of these designs which you have seen would be able to hold at anchor ?—I made a calculation of, and one was about 150, or scarcely so many as that.

29,277. What was the estimate for that particular harbour ?—I have not seen any estimate. I do not know that any has been made.

29,278. Then such an estimate as that, from what you have stated, would be quite insufficient for the wants of the coast ?—Yes.

29,279. And therefore that is one reason why you think that the public money ought to be voted to assist in improving the existing harbours ?—Yes, to assist in improving the existing harbours. I have come to that conclusion after mature consideration.

29,280. Do you think that a harbour at Filey, and the proposed improvement of the Tyne to the extent which you have just named, would be sufficient to meet the wants of the trade along the coast ?—I have already stated my opinion very fully in my report, that all the harbours should be improved with a view to increase the aggregate amount of safety to vessels frequenting our coast.

29,281. Then do I understand your opinion is, that, to meet the present wants of that coast, all the three harbours, the Tyne, the Wear, and the Tees, should be improved, so as to admit the usual vessels at all times of the tide, and that there should also be a harbour further south, somewhere in the neighbourhood of Filey ?—I do not see the necessity of a harbour further south, provided all the local ports are improved.

29,282. You think that if the local ports were improved in the way which you have just named, that that would be quite sufficient to meet all the wants of the coast ?—I think so. It is a mere truism to say that a harbour of refuge constructed anywhere would do some good ; but I think the preferable plan is to improve the local ports, and that there would be a greater increase of aggregate safety by improving them than by constructing such a harbour of refuge.

29,283. (*Capt. Washington.*) To follow up the last question. By improving the local ports you mean that you would recommend the improvement of the Wear and the Tees, as well as the Tyne ?—Certainly, and I might even go beyond that. I do not see why Blyth should not have a share of improvement.

29,284. Blyth has been a good deal improved ?—Blyth has been a good deal improved. It is naturally very favourably situated, and the engineer has availed himself with considerable skill of the position of the place to construct works, which answer the purpose for which they are intended very well.

29,285. Has any great depth of water been gained by the works ?—About two feet is gained by the works. That has been gained by dredging, because the bottom is hard clay and stones, but it has maintained itself without silting up again.

29,286. You think there is a probability it will be maintained ?—I think it will.

29,287. You have made the subject of the improvement of tidal rivers very much your study ?—Yes.

29,288. I think you are the author of a work published in 1851 on the improvement of tidal rivers, but especially applied to the Tyne ?—Yes.

29,289. I think you have expressed the opinion to-day that it is desirable with a view to the improvement of a bar, also to improve the upper parts of the river ?—Certainly.

29,290. It is your opinion that rivers should be treated as a whole, and not as a part ?—Undoubtedly, most strongly my opinion.

29,291. Then you would not be in favour of engineering solely for the piers independently of the other ports of a river. You would not apply engineering skill solely to the piers without extending it to other ports ?—I should like to see it extended to every part of the river that is capable of being improved, and I may add that the Tyne is capable of very great improvement indeed. For example, the first part of the tidal wave, the first of flood, travels up to Newburn at the rate of only three miles an hour. It is $5\frac{1}{2}$ hours getting there, about 18 miles from the bar.

29,292. In what time does it reach Newcastle ?—At high water in an hour, but I am speaking of the first of flood, which is the best criterion, because when the tidal basin gets filled there is a different velocity of the tidal wave.

29,293. That will be three hours, will it not ?—Yes.

LONDON.

Mr. T. J. Taylor.

7 Dec. 1858.

Capt. Washington.

29,294. If I remember right the tide has risen eight feet at Shields before it is felt at Newcastle quay ?—Yes.

29,295. Does not that show an extremely bad state of the river ?—Yes, when it is coupled with the great improvement which might be made, and for which I have always argued.

29,296. I have heard that the tide ranges 10 feet at Newcastle quay ?—I believe it does.

29,297. And 15 feet at Shields bar ?—It does.

29,298. Consequently there is a loss of five feet there ?—Yes.

29,299. No tide reaches Newcastle quay until it has risen eight feet at the bar ?—It does not.

29,300. Then there must be a hill somewhere between. Is there such a thing ?—There is a mountain of sand between Newcastle and Shields bar.

29,301. So I imagined, and, in fact, the tide goes so far, heaps up against that, and as soon as carried over it rushes down, not up to Newcastle bridge ?—Yes. Another consequence is that the ebb tide is impounded to the extent of about 3½ hours. When the tide begins to flow at Shields bar there is still 3½ hours ebb left in the river.

29,302. There is another obstruction—the old Newcastle bridge; should that be removed ?—I think it should. I believe that the Tyne Commissioners contemplate removing that bridge. I think, from what the chairman has informed me, that they have it in serious contemplation to remove the bridge and replace it by another, the piers of which shall be on a line with those of the high-level bridge.

29,303. The tide flows a long distance above Newcastle ?—About 10 miles.

29,304. Is it desirable it should be encouraged to do so ?—Unquestionably. At present only one seventh of the tidal water reaches that 10 miles of the tidal basin.

29,305. Do you think that it has any beneficial effect upon the bar that the stream should reach it nearly on a level instead of with a rapid descent ?—I think that, as a general question of river training, the more nearly on a level the stream reaches the bar the better. I do not conceive that a river can be in a proper state unless that is so. You cannot have a free ingress and egress of the tidal water, and a consequently maximum effect upon a bar, unless the river is in that proper training.

29,306. I think you said you attributed the bar principally to the drift along the beach; or, in fact, that the bar was a part of the beach which had been cut through ?—Exactly; that is my opinion. I consider it a sandbank which, like any other, might be laid down in a sheltered situation; and without the river it would constitute, in the case of the Tyne, a continuous sand from the Herd Sand to Tynemouth rocks.

29,307. You do not consider that the deposit of the bar is caused by the meeting of the river water and the sea ?—No, I do not, as I have explained.

29,308. That being the case, if the river were placed in train, and a passage once dredged through that bar, is it not possible that the opening might be kept without carrying out very extensive piers into deep water ?—I think not. If the current had space to diffuse itself, the maintenance of a deep channel could not be depended upon.

29,309. In the case of the extended piers, I do not quite understand how you propose to carry the current out so as to keep the depth at the entrance ?—I mentioned that some inner works would be necessary to conduct the current; but the exact nature of those works I should not at present like to state.

29,310. You do not think it would be worth while to try a first experiment by carrying the piers to a certain extent, and improving the river to the utmost, and seeing what effect that would have, rather than going to the more extended works ?—I should still be afraid of a bar forming outside of the first projected piers, because they do not pass sufficiently into the line of unentangled sea current to carry away the silt.

29,311. Do you think that a bar would be formed by the drift going round the north pier and along the south, or how ?—I apprehend your question to imply that the drift in the North Sea is principally from the north.

29,312. Do you contemplate that that drift would travel along the north pier, and form a bar along the outside ?—Yes; and that the wave action, still referring to the short piers upon the ground external to the piers, would throw up a sandbank there, not to the same extent as at present, but still sufficient to constitute a bar which would be injurious to the navigation.

29,313. Do you think that any shelter, enclosed between the extended piers, could be made available for refuge, or would it silt up ?—I do not place any dependence upon the shelter that could be obtained in the shape of a harbour within the pier basin. I think, in all probability, it would silt up, excepting a space that would be excavated by the current. But it would still answer the purpose of a beaching ground. The security for vessels would be found in the harbour and docks.

29,314. That, in fact, there is ample space ?—That there is ample space.

29,315. You spoke of the depth of the river opposite the new quay at Shields, and that that depth might, in your opinion, be obtained at the pier heads ?—Yes.

29,316. You reasoned from that as to the depth which might be obtained there ?—Yes, I reason from that, as the section at the new quay is nearly the same as that at the piers.

29,317. Then, in truth, it would be desirable that the sides of the enclosure within the piers should silt up to maintain the same section nearly ?—If they do not it would be necessary to construct some internal works for the purpose of guiding the current.

29,318. And in reducing the river into train, you would use the dredger freely ?—I would use the dredger. It would be indispensable to use it in many cases, but I should feel disposed to dispense with it as much as possible.

29,319. You would use it wherever there is gravel or hard material ?—Yes, I would take care to direct the current so that it should be made the instrument for keeping the bed clear, on the principle that it is sufficiently powerful in that part of the river to carry away the silt.

29,320. Is it not often the case, that when you remove a course of gravel several feet of sand are carried away ?—Yes, it is.

29,321. Are you acquainted with the Clyde at all ?—I know it generally.

29,322. You are aware of the works that have been carried out there ?—Yes.

29,323. Do you see any reason to suppose that the same results would not follow in the Tyne if the same engineering were applied to it as to the Clyde ?—I do not see any reason to the contrary; but I confess I should prefer not adopting precisely the same plan adopted in the case of the Clyde.

29,324. I do not refer to that, but applying such engineering skill as is considered applicable to the Tyne ?—Certainly; I should be quite of that opinion, speaking more particularly of removing points and projections, diminishing the radii of the curves, and constructing works for straightening and regulating the stream.

29,325. The free admission of the tidal water ?—The object of the whole would be to admit tidal water freely, and also to pass it out again freely, but these objects are to be obtained by what really constitutes the science of river engineering the lowering of the bed of the river. That principle I would extend through the whole of the tidal basin. I think the velocity of the tidal wave might first be increased to double what it is now, which would cause double the amount to flow in the upper part of the tidal basin.

29,326. Considering the importance of the experiment to be tried upon the improvement of the Tyne,

do you consider that the public funds might fairly be applied in trying that experiment?—I do; the experiment is a very great one, and would set many contested principles at rest. An experiment upon so large a scale has never been tried yet. It would quite justify the application of the public funds to the purpose.

29,327. If it were successful, might it not be very advantageous to other rivers around the coast?—As an example, it might be very advantageous. Reference having been made to the Clyde, I may state that the engineer of the Clyde has been engaged to be the engineer of the Tyne Commissioners.

(*Capt. Washington.*) The Tyne Commissioners could not do better than engage the best engineering skill in the kingdom, and apply it to the river. I am glad to hear of the appointment.

29,328-9. (*Capt. Vetch.*) I think I understand that your opinion is, that the north shore of the Tyne mouth is the weather shore?—Yes.

29,330. And that the south side is the lee shore?—Yes.

29,331. Consequently you are of opinion that the drift of sand or other small material comes from the north to the south?—I think so; the set is from the north to the south. The entire drift of the North Sea tends in the direction from the north to the south.

29,332. Acting upon these natural laws, then, the Herd Sand has been the effect of a constant motion of material travelling down to the south, and finding a quiet place?—Travelling from the north, and finding shelter upon that spot.

29,333. Had there been no river Tyne in existence, that would, in fact, have covered the whole extent of the bay abutting against Tynemouth?—Yes.

29,334. And that it is owing to the river Tyne that we have any entrance at all?—Yes.

29,335. That, at a certain depth, a pier head being carried out would anticipate the travelling of that sand, and that the sand, still continuing to travel, would fill up under the lee of the new promontory?—Yes.

29,336. And that, if carried out to the extent first proposed, there would be additional shelter given for the sand to deposit, and that it would continue to grow out further?—It is very posssble that it might.

29,337. Now I presume that the bar at the Tyne as elsewhere, is partly constructed by the force of the sea wave of the North Sea running in upon the land?—Yes.

29,338. In a storm from an easterly gale it will drive the sand, will it not?—Yes; there is a double action: first, the current action, bringing the silt along the coast; and then the wave action, throwing it up upon sheltered portions of the coast.

29,339. Then the river coming down and meeting the stroke of the sea, they will meet upon neutral ground, and then a bar will be formed?—The point where the action of the sea is determined is the point where the bar is formed.

29,340. You have already said that the river scoops out a passage to the sea, and the wave of the sea drives the sand in easterly gales; then these two are conflicting powers?—Yes.

29,341. And the place where their powers are neutral will be the place where the bar will be deposited?—I do not know I could exactly say that. I conclude that the sand is thrown up by the sea, and that it is thrown up in a situation where the river has only a partial power to remove it; it is of sea origin, absolutely of sea origin, and not of river origin.

29,342. Then what is wanted, in your opinion, is more power from the land to drive a passage through?—Clearly more power to drive a passage through.

29,343. Considering the immense number of ages it has taken to deposit the sand to the south of the river on the Herd, I suppose the progress seaward would be still slower?—I do not know that it takes a long period of time. A great quantity of silt travels along the coast, especially when it is disturbed and thereby in a state of suspension. The sand has been laid down very rapidly in some cases.

29,344. We may suppose that the Herd Sand and the sand out into two fathoms water has been the consequence of a certain natural action going on for 4,000 years; you would not expect that the progress of throwing out a new headland would be very great in 100 or 400 years?—That would depend on the extent of drift upon the coast, and the amount of shelter that the sand found in that particular locality.

29,345. But that amount of drift is comparatively measured if we admit the premises by the knowledge that the Herd Sand has accumulated from time immemorial?—Yes; all parts of it have been removed, and new portions laid down again.

29,346. By what?—By being taken into the river, and sent back out of the river current, as well as by sea action.

29,347. Would not the case be that the river carries it out and the sea beats it in nearly in a circuit?—No doubt there is a circulation, but at the same time it does not follow that all the sand which goes into the river from the Herd and out again finds its way to the Herd. On the contrary, it may be carried away, and deposited in other situations.

29,348. Still you would admit that the farther the promontory went out to sea the greater time would be spent in any further accumulation along shore?—Yes.

29,349. And that if the entrance went a great distance out into deep water the process of silting up would be very slow?—I think so; so slow that it would never take place, practically speaking, so as to be injurious to the navigation.

29,350. Looking to the expense of these two new calliper piers, as laid down in Mr. Walker's plan, could not some other means be devised that would rather limit the outlay and the extent of the works?—Suppose this north pier was carried out by itself so as in some measure to overlap the other.

29,351. With a south pier?—Not going to the same length with a south pier, but so that the extension of the north pier would act as a shelter to the south pier.

29,352. And the stream travelling from the north to the south, any matter travelling would shoot across?—The north pier would be a great advantage in the manner you describe; but my own opinion is, that the south pier should be carried out quite as far as the north. I think the proper river action cannot be maintained without that; also that shortening the south pier would tend to bring the sand more into the river.

29,353. From what you have mentioned a short time ago, do not you expect that when the river gets into the train you want to put it in the deep channel will be found to be of a pretty regular width?—Yes; but to get it into train I must have the two piers carried out with a pretty regular width.

29,354. Do not you uncover the river entirely to the action of the sea by presenting the opening directly upon the sea?—I provide a stilling basin in the interior, which I think meets that objection.

29,355. Would not that position meet the heaviest wave that could come in?—Not the heaviest; the heaviest would be the north-east.

29,356. Does it not follow that any wave, say the Atlantic wave, or any other wave running in parallel lines, would run in through this opening?—Yes; but I should feel satisfied that the large extent of stilling basin provided would prevent any mischievous effect as regards the security of the space that vessels had to lie in.

29,357. The overlapping of the south pier to some extent by the north would prevent the wave coming in, would it not?—To some extent.

29,358. (*Mr. Coode.*) I think you say you consider that some inner works would be necessary to maintain the depth over the bar, but you are not prepared to say to what extent. Could you give your

LONDON.

Mr. T. J. Taylor.

7 Dec. 1858.

Mr. Coode.

idea of the direction which they should take, and their general character?—Without pledging myself to its being my ultimate opinion, I should leave the north side as it is, and should construct works along the south side, for the purpose of training and guiding the current. Probably these might be half-tidal walls, with an open structure or platform resting upon them to assist vessels coming in, and to act as a wave trap, thus allowing the inner part of the pier basin still.

29,359. So as to encourage the production of a nearly parallel channel all the way to the mouth of the piers?—Exactly; without that I should be apprehensive that the channel would become tortuous in the pier basin.

29,360. You would do that with the view of maintaining the channel permanently in one direction, and as nearly as possible in one uniform depth?—Yes.

29,361. I gather, too, from the answers you gave to Captain Vetch, that you consider it an essential feature in any scheme for the improvement of the Tyne, that both piers should be carried out to about the same depth of water?—I think so.

29,362. The hill in the bed of the Tyne you describe as being a mass of sand, do you think it is not a nucleus of clay, or is it only a great accumulation of sand?—It is sand to a very considerable depth.

29,363. It has been tried, has it?—Yes. I may add that on the bar the deposit of sand is considerable. There have been borings on the bar to a depth of 13 or 14 feet, and still sand is found. There is an alluvial deposition westward of Shields, a thick alluvial deposition through which the river flows, but it is masked and covered by a very thick bed of sand. I calculate that above the bar level in the part of the Tyne you speak of, from Shields to Newcastle, there are about 14 million cubic yards of sand lying in the bed of the river.

29,364. Which would necessarily have to be removed in order to bring the bed of the Tyne to one uniform inclination?—Yes.

29,365. That quantity is derived from actual sections?—Yes.

29,366. Not a speculative quantity?—Not by any means. The right arm of the undertaking would be the lowering of the bar in the first instance, thus giving the river power to scour out the sand.

29,367. The character of the works within should be in the nature of training walls?—Yes.

29,368. May I ask, if your observation of the Tyne has induced you to think that groins are right in principle in attempting the improvement of such a river, I mean jetties projecting at right angles from the line of the shore?—They are not sufficient. My own opinion is, that full-tide walls trained in a parallel course are necessary.

29,369. What are ordinarily called training walls would be the treatment you would like?—Exactly.

29,370. The velocity of the tidal wave from Tynemouth to Newcastle you stated at about six miles an hour?—To Newburn, 10 miles beyond Newcastle. The first of the flood is about three miles an hour; the high-water velocity is a good deal greater, about 10 or 11. The first of the flood, which is the real test of the state of a river, is only three miles an hour.

29,371. You would improve the river so as to produce as nearly as possible an equal rate of something like 10 miles an hour over the whole bed subject to tidal flow?—Yes, or higher than this.

29,372. And that would be no unusual rate?—Not at all.

29,373. With regard to the freshets, you said that very heavy freshets occurred in easterly winds. Do the heaviest occur in easterly winds?—There is one notable instance of a very heavy freshet in the Tyne having happened with a north-east wind, called the great flood. It was a rain which extended over the whole basin of the Tyne; but with that exception, and perhaps a very few others, the great floods occur in the westerly winds.

29,374. You mean it is a rule that the heaviest floods do occur with westerly winds, and not with easterly winds?—Yes. I may add also, that besides the river floods the melting of the snow sometimes causes a heavy flood, which generally takes place with a westerly or south-westerly wind.

29,375. Can you give any statistics of the loss of life at the mouth of the Tyne? Your statement has reference simply to the loss of vessels?—No; I have prepared a statement of the loss of ships, which I have already handed in, but I have no statement as to the loss of life.

29,376. (*Chairman.*) Supposing those larger piers to be carried out, could you draw upon this chart for me what you would suppose would be the form of the sandbank outside the piers, when the depth of the entrance is reduced to 19 or 20 feet?—It would be difficult to do so, but it might extend in the manner which I have now marked upon the plan. [*The witness sketched upon the plan presented to him by the Chairman the limits to which he referred.*] I have drawn this as a sort of indication, without pretending that it would be absolutely as sketched.

29,377. My question alluded to the formation of a bank at the back of the piers?—I have no doubt it would go a great way out, but the ebb would still be powerful enough to determine a current which would keep it back. Something like what I have sketched would take place on the south side.

29,378. At the north?—The sand would be disturbed on the north side, and raised into a state of suspension. It might occasionally accumulate against the north pier, but I think it would not rest there; the south side is the sheltered one.

29,379. (*Mr. Lindsay.*) I see in your report to the Tyne Commissioners you say that, although the heaviest gales are from the north-east and east-north-east, yet the largest proportion of wrecks takes place in gales from east and by south and east-south-east?—Yes.

29,380. And I see in the return which you give that all the vessels stranded or wrecked during this year were in east and by south or east-south-east winds. There were 63 vessels, with their cargoes?—Yes.

29,381. Were these vessels which had left the coal ports—the Tyne and other coal ports—and were obliged to put back?—You are now speaking, not of the Tyne, but of the entire number of vessels wrecked at the ports within the bay.

29,382. Does this tabular statement in the report, page 2, refer to vessels wrecked in the entire bay?—Yes; that refers to the whole of the vessels lost in the bay.

29,383. Then these 63 vessels, with cargoes, are not vessels which were all lost in entering the Tyne?—No; they were vessels wrecked within the bay.

29,384. Those, I suppose, have been vessels that have come out from the coal ports and been obliged to put back?—Yes; coal laden, and obliged to come back.

29,385. With the wind at east-south-east it might so happen that even if there was a harbour at Hartlepool, that would not save many of these vessels?—It would not be reachable by these vessels.

29,386. They would, in fact, require to be south?—They would either run to the Tyne or some place further north; perhaps Leith Roads.

29,387. Is there a large trade from the Tyne?—No, not a very large trade. There is a certain amount of coals sent to Scotland; but the principal trade is to the southward.

29,388. Is there not a large trade between the Tyne and the Baltic ports?—Yes, very large. I thought you referred more particularly to Scotland. There is a very large trade with the Baltic.

29,389. I am speaking of places to the north of the Tyne. What proportion of the vessels which leave the Tyne go south-about, and what proportion go north?—The coal trade takes so many vessels that the majority go south. The coal trade principally lies in that direction. I do not recollect any state-

ment of the kind you refer to. I do not think any analysis has been made of the trade in that way, but it could be got.

29,390. I want to know what proportion of vessels loading in the Tyne go north; because a harbour south of the Tyne would be of no value to any of those vessels. I should like to know about the proportion?—I think your question, so far as it bears upon the subject of wrecks, might be partly answered by the return which I have put in. The general result of the vessels wrecked is:—Of vessels trading with the Tyne wrecked on the Herd Sand, Tynemouth rocks, and Souter Point, all close to the Tyne, 28 in ballast, 33 in cargo; total, 61. North of the Tyne, 5 in ballast, 21 in cargo; total, 26. Hartlepool and south, 4 in ballast, 8 in cargo; total, 12. Other places, 5 in ballast, 1 in cargo; total, 6. So that south of Hartlepool there are 12 vessels out of 105—between a one-eighth and a one-ninth part.

29,391. Could you furnish to the Commissioners a return showing the number of vessels loading in the Tyne which go south and the number which go north—the relative proportions of each?—For one year?

(*Mr. Lindsay.*) For three years, if you please.

29,392. (*Capt. Washington.*) You made a reference to the great flood in the Tyne?—Yes.

29,393. That was with a north-east gale?—Yes, in the year 1771.

29,394. I think that gale knocked down the old Newcastle bridge?—Yes, I believe it cleared the Tyne of nearly all the bridges.

29,395. Perhaps the recurrence of such a flood might not be the greatest misfortune that could happen to the Tyne. You spoke of the desirability of encouraging the tidal water; would you carry it so far as to stop any encroachment upon the river—encroachments by which compensation was not made in depth?—I should not consider these encroachments. I should not consider training walls for conducting the current to be an encroachment. I conceive I should gain depth, gain a useful dimension of section instead of one comparatively useless.

29,396. If I remember rightly, part of Jarrow Slake has been enclosed?—Yes.

29,397. Is it desirable that it should continue to be so?—I think so. I think it would have a very beneficial effect upon the western part of the tidal basin, the portions west of that point. The mountain of sand we have been talking of begins there.

29,398. By forcing the tide to flow further up?—Yes; it is a recess which stops the tide. There are one or two other recesses, such as Coble Dean and Wellington Gut.

29,399. I think you said the rate of the tidal wave was about 10 miles?—The tidal wave at high water is.

29,400. Are you aware what it is in the river Thames?—I think it is about 22 or 23 miles.

29,401. Twenty or 21. Do you happen to know what it is in the Humber?—I think 16 or 18.

29,402. Not exceeding 20?—Not exceeding.

29,403. In the Orwell?—No, I do not recollect.

29,404. That is 30 miles. Perhaps that is the best state we know from Harwich to Ipswich. Along the open coast of Northumberland it is 60 miles. The progress of the tidal wave may be considered a very fair test of the state of the river?—No doubt it is.

29,405. (*Mr. Coode.*) I believe you have made some observations on the discharge of the Tyne during freshets?—I have.

29,406. What is the proportionate discharge of water during freshets, as compared with the ordinary summer condition of the Tyne?—The quantity discharged in heavy floods is at the rate of about 110 or 112 millions of tons in 24 hours. The quantity discharged in the ordinary summer condition of the river is only about the 1-120th part of that. The freshet proportion is therefore about as 120 to 1. The difference is very remarkable. In large rivers, such as the Nile, it is only 5 to 1, and in the Ganges 5 to 1.

29,407. (*Chairman.*) Supposing we had these piers run out to 20 feet at low water, where will the sea break? Will it in a heavy gale of wind on shore break outside the pier heads?—The sea will come in between the pier heads to a certain extent, and expand itself upon the stilling basin inside.

29,408. But say we have only 20 feet of water outside the pier heads, shall we in that depth have a breaking sea outside the pier heads?—Not unless the sea is very heavy indeed—extremely heavy. The north-east sea will be broken by the protection of the north pier.

29,409. And therefore, except in very heavy gales of wind, there will not be a breaking sea outside the pier heads?—There will not be.

29,410. That is your explanation?—I may also remark, with regard to the depth of 19 or 20 feet water, that this is an extremely low point—dead low water at spring tide. In one hour from that in spring tides the water rises about four feet, so that in one hour from low water spring tides there will be 24 feet, and in neap tides we shall never have less than 24 feet at low water.

29,411. Do you consider five fathoms to be perfectly safe from a breaking sea under all ordinary circumstances of gales of wind?—Under all ordinary circumstances.

29,412. (*Mr. Lindsay.*) To maintain the depth of 20 feet, will it be necessary to go on improving the river up above Shields?—No, I take credit above the 20 feet for the improvements to be effected in the river.

29,413. Therefore while they are going on expending money on the construction of the piers it will be necessary to go on expending a considerable sum upon the improvement of the river?—The Commissioners must, and I believe are, quite prepared to expend a very considerable sum of money, I believe to the extent of somewhere about 200,000*l.* or 250,000*l.*, in the improvement of the river, including the removal of Newcastle old bridge; in the construction of training walls, and all other works necessary for the improvement of the river, quite irrespective of the piers or docks. In the application of their ordinary means they intend to spend that large sum on the improvement of the river.

29,414. Then to make the Tyne what we desire to see it, a harbour of refuge for the saving of life at all times of the tide, will it be necessary for the Commissioners, so as to be able to maintain the depth of the channel all the way, to go on expending so large a sum as 200,000*l.*?—No doubt it will.

29,415. They must go on with that simultaneously with the improvement of the piers?—Yes, with the view of maintaining the proper depth of the river, and increasing it.

29,416. (*Chairman.*) And therefore if the Government spend a large sum of money at the mouth of the Tyne, for the purpose of making it a harbour of refuge, it would in your opinion be fair to demand that the River Commissioners should spend a proportionate amount upon their part of the river, pari passu?—I think so.

29,417. (*Mr. Lindsay.*) Do you mean that if the Government was going to vote any money to assist in the construction of these piers you would make it a condition that the Commissioners should spend somewhere about a similar amount in improving and deepening the river?—That would be rather hard upon the Commissioners.

29,418. I should like an answer. Do you think that that would be a fair condition?—I do not know that the Commissioners should be exactly bound to do so. I think that there is a special claim upon the Government, irrespective of what may be done by the Commissioners.

29,419. If the people of the Tyne come to ask the Government for money for the purpose of making and maintaining it as a harbour of refuge, would you or

LONDON.

Mr. T. J. Taylor.

7 Dec. 1858.

would you not, before voting the money, make it a condition that the Tyne Commissioners should go on spending the amount necessary to maintain the depth ?—I do not see that there could be any objection to that condition. The Commissioners mean fully to carry it out. I do not know that they would object to it.

29,420. (*Chairman.*) I will put the question a little more generally. Supposing that the Government desired to make a harbour of refuge at the mouth of any river, would you consider it right and proper that the money which was to be devoted to that purpose, whether drawn from public or private sources, should be divided in proper proportions between the improvement of the river and the improvement of its mouth ?—I think that that would be a fair principle.

29,421. In order to obtain the greatest engineering effect from the money spent ?—Yes, for the double objects you mention, both being, in fact, parts of the same question.

Mr. Joseph Cowen examined.

Mr. J. Cowen.

29,422. (*Mr. Lindsay.*) You have heard the evidence which has just been given by Mr. Taylor ; you have heard him state that in his opinion it will be necessary to spend 200,000*l.* in deepening and improving the River Tyne, in order to maintain the proposed depth of channel at the end of the piers, and to render the Tyne a harbour of refuge, in the strict sense of the word ?—Yes.

29,423. Say that the Government arrived at the conclusion that something should be done to make the Tyne a harbour of refuge, and that the Government was disposed to vote a certain sum of money towards the construction of these piers which Mr. Walker has proposed, are you, on the part of the River Tyne Commissioners, prepared to say that they would spend the necessary amount of money in the improvement of the river, so as to maintain the desired depth ?—Certainly they would. They are in course of spending it now, and must, during the construction of the piers, with their present income, spend 200,000*l.* on the improvement of the river.

29,424. But would they be prepared to enter into a bargain with the Government, whereby they should be bound to spend that sum of money ?—I do not know. I am not prepared on the part of the Tyne Commissioners to say that we would enter into a bargain to do it. We have the revenue, and must spend it in the river. Over and above that, be it remembered that the people of the Tyne have already agreed to tax themselves to the extent of 400,000*l.* for the construction of the piers. The revenue of the river people is about 14,000*l.*, and is increasing. It would this year have been increased by 5,000*l.* if the Government had not prevented a matter being carried into effect. But for that interference we should this year have had 20,000*l.*, which in ten years would give 200,000*l.* that we must spend upon the river ; we cannot do anything else with it, therefore it required no bargain. We cannot apply the revenues of the river to any purpose but the improvement of the Tyne, and, therefore, we must maintain the depth so far as our revenue will enable us.

29,425. From what you state, the River Commissioners would spend about the sum named ?—No doubt of it ; from 200,000*l.* to 300,000*l.* would be spent by the River Commissioners during the time of the construction of these piers, and the principal part of that would be expended in directing the current so as to maintain the depth over the bar.

29,426. (*Mr. Coode.*) When you say that the Tyne Commissioners must spend that sum of money, are they under any positive engagement to spend it ?—Only that is the revenue of the river, and we have nothing else to do with it.

29,427. Can they devote it to any other purpose ?—Most certainly not.

29,428. They have no power to appropriate the funds in any way whatever, other than to the improvement of the river ?—Certainly not.

Tuesday, 14th December 1858.

PRESENT :

Admiral Hope (Chairman).

Sir Frederic Smith.
Captain Washington.
Captain Sulivan.
Captain Vetch.
Mr. Coode.
Mr. Evans, Secretary.

Mr. James Abernethy, Civil Engineer, re-examined.

Mr. J. Abernethy.

14 Dec. 1858.

29,429. (*Chairman.*) You have a statement to make, Mr. Abernethy ?—I have prepared a statement which I have here ; shall I read it ?

29,430. That will be the most desirable mode of proceeding ?—I have also prepared a model, which you will observe is made in accordance with the drawings, and shows elevations of the work in various stages of progress.

29,431. (*Capt. Vetch.*) Upon what scale is this model ?—The same scale as the drawings, 6 feet to the inch.

29,432. (*Chairman.*) You will now proceed with your statement.—This is a statement regarding a proposed mode of constructing breakwaters, and its assumed advantages as contrasted with that pursued at existing works of a similar description.

Drawings.

The relative Drawings marked Nos. 1, 2, 3, and 4, show in detail the proposed mode of construction and form of breakwaters.

Mode of Construction.

First. (Figure No. 1, Drawing No. 1.)—Piles, two in number, A A, are driven to a depth of 10 feet or thereby below the bed of the sea, the top of the piles being 5 feet above the level of low water ; these are to be connected together transversely by tie pieces (B B), four in number on each side of the piles, to which they are to be bolted by screwed bolts.

In the line of the proposed breakwater, and 10 feet from the centre of these piles, similar piles are to be driven, and connected in the same manner, the various sets of piles being connected longitudinally by inner wales, C C.

A certain continuous length of these sets of piles being driven, a mound of rubble stone or " Pierre perdu " is deposited within and around the piles, as shown by (Figure No. 2, Drawing No. 1,) the top of this mound being 15 feet below the level of low-water spring tides.

A certain continuous length of these piles and rubble mound being completed, a timber framework, D, (Figure No. 3, Drawing No. 1,) previously framed and constructed on shore, is lowered down over the top of the piles, and bolted and secured to the ends of the cross ties (B B,) similar frames being lowered over the adjacent sets of piles, and the whole connected longitudinally by wale pieces (E E, Figure 3, Drawing No. 1.)

A certain length of these frames being thus fixed in their places, balks of timber 12 in. by 6 in. and six inches apart, or panels framed together as shown by (Figure 7, Drawing No. 1,) are bolted on behind the piles up to the level of low

water (F F, Figure 3,) and the space within these panels may be then filled in, to a certain extent, with dry rubble stone packing; an additional framework (G, Figure 4,) is then constructed within and above the previous framework, the uprights of which are to be securely bolted to the cross and diagonal ties, the foot of the uprights resting on the top or head of the lower piles, which are cut off to the level of low-water mark.

A certain length of these frames being constructed, and further connected longitudinally by additional wale pieces, (H H, Figure 4, Drawing No. 1,) half balks of timber six inches apart are bolted on to the inner side of both sides of the framework, and carried up "pari passu" as the rubble filling progresses.

The rubble being tipped from wagons from the top of the framework, or filled in from barges, as circumstances may render expedient.

Lastly. The framework being completed, and its interior packed with rubble, as shewn by Figure 5, timber bearers and rails for carrying powerful hydraulic cranes (I I I., Figure 5,) are to be laid on the top of the framework with outside bearers for two roadways K K, for lines of railway to carry the stone trucks; these may be dispensed with in certain cases, the stones or masses of masonry being brought alongside the breakwater in lighters, and deposited "in situ" by the hydraulic cranes, as shewn on Drawings Nos. 2 and 3. Thus will be formed a loaded timber breakwater, possessing a continuity of structure, in addition to its weight or inertia, which renders the breaching of any of its parts by the action of the sea extremely improbable, and the timber of which it is composed, being thoroughly creosoted under pressure, which renders it, from my experience, impervious to the ravages of the worm, it may reasonably be expected to last a long period of time. The design shewn on the drawings I propose to apply to sites such as the Mumbles Roadstead in the British Channel or Hartlepool Bay, where it is assumed that the nature of the ground for foundation is of a character that renders any material subsidence of the rubble masonry at least improbable; but even supposing a subsidence did take place to such an extent as to injure the cross ties in certain cases, it would not affect the stability of the structure; the first and principal object of these ties, being to fix and secure in their places the piles (A A, Figure 1.) previous to, and during the deposition of, the rubble mound. In ground of a nature which renders subsidence probable, the rubble mound may be allowed to consolidate for a given period of time, and the details in the arrangement of the timber work, can be arranged to meet such a contingency; one mode of effecting this is shown by Figure 6, Drawing No. 1.

Rate of Progress.

The general arrangement to be observed in the construction of such a work, and its rate of progress, selecting as an example the Mumbles or Hartlepool Bay as sites, and dealing with the loaded timber breakwater as the nucleus or means of forming a permanent structure of masonry of an enduring character I should propose to be as follows:—

1st. To provide all the necessary creosoted timber, and to build for the facework large and uniform masses of masonry on shore, allowing sufficient time for these to become hard and compact before being deposited in the work. These masses of masonry to be not less than 20 tons weight, ranging to 30, or even more; and composed, in the case of the Mumbles, of the hard sandstone of the coal measures, set in best hydraulic mortar; at Hartlepool, substituting the magnesian limestone, for the foundation courses up to the level of six feet below low-water level; for the superstructure from that level, to the height of 10 feet above high water, I should construct similar masses of rubble masonry, faced with hard stone ashlar, toothed or bonded into the rubble, as shown by Figure No. 8, Drawing No. 1.

A sufficient quantity of material being thus prepared, which I presume would occupy a period of 12 months, I should proceed during the last half of this period to drive the lower piles for a continuous length of 1,500 feet or thereby, and to form the rubble mound which I estimate could be executed in a period of six months.

In the formation of this mound at the Mumbles I should use copper slag for its outer portion, beyond the toe of the facework; using the mountain limestone for the interior. The slag being heavy and angular would be less liable to disturbance, and like most vitrified substances it is very durable; moreover, its great specific gravity would tend to prevent any lateral spreading of the central mass of limestone, and cause any subsidence to be in a vertical direction.

After a portion of the mound had been deposited for a period of three months, I should proceed to form the framework, completing it at the rate of 500 feet in three months; and as soon as the first 500 feet of this work was constructed I should proceed with the face masonry at the same rate, observing, as a rule, four stages of the work "pari passu" with each other:—

1st. The masonry in progress.
2d. The timber breakwater formed.
3d. The same in progress.
4th. The formation of the rubble mound.

The whole time occupied in the construction of such a work as that proposed at the Mumbles, a total length of 6,600 feet of breakwater, would be as follows:—

1st. Preparation of material, say 12 months.
2d. Construction at the rate of 500 feet in three months, being a total period of four years and a half, or thereby. On the Drawing No. 1. I have shown an elevation, explanatory of the various stages of the work in progress.

I propose to lay the facework in alternate courses of headers and stretchers, connected together by cast-iron dowels, and cemented above low-water level with the best hydraulic mortar.

As the masonry proceeds, a certain portion of the timber only is proposed to be enclosed or absorbed within it. This is tinted green on Figure No. 6, Drawing No. 1.

Timber and Rubble Stone Structure treated as a Breakwater, &c.

In this description I have treated the loaded timber breakwater in connexion with the stone structure, but it may be used as a breakwater "per se," for a long period of time. Taken in connexion with the stone structure it affords a firm basis for setting great masses of masonry, which, from their weight and abutment on the timber framework within, cannot be breached by the action of the sea; thus enabling the work to be carried on with safety in sections of considerable length, instead of being carried on, as in the case of existing works, in progress from the end merely. The loaded timber breakwater affording, moreover, in a very short period of time, a considerable amount of shelter. Structures of such a character might be applied as an economical and effective protective work for ports possessing but limited financial resources.

The great cost generally of stone piers, and their liability to breaching by the action of the sea, more particularly during progress of construction, is well known, and has been felt by every engineer practically conversant with marine works; and I am aware that these causes have rendered, in a great measure, nugatory the means at the disposal of the authorities of various harbours on the coast of the United Kingdom, especially on the east coast of Scotland; so that, as a general rule, the works actually executed are limited in extent, and inadequate for the protection and safety of the shipping. If a mode of construction had been followed, comparatively safe and economical, in the first instance, works of greater magnitude might eventually have been carried out, from results of the additional revenue thus afforded, whereas, in many instances, the attempts at harbour improvement, to meet the demands and encourage the growth of trade, have only ended in disappointment and financial difficulty.

Comparison with present Works and Modes of Construction.

I shall now proceed to compare the proposed system of constructing breakwaters with that followed at existing works, selecting the case of the breakwater at Holyhead as an example.

For the purposes of this comparison I have furnished the accompanying Drawing, (No. 4,) showing sections of the two systems adapted to the same site, and a careful consideration of both leads me to the following conclusions:—

1st. That the proposed new method admits of more rapid completion, and is less liable to risk during progress of construction;
2d. That a considerable saving is effected in the quantity of material used, and, consequently, in cost of construction;
3d. That greater durability is insured, arising from general form and the nature or quality of the material.

With regard to the first of these.—By the present system the rate of progress is defined by the number of waggons which can be discharged from the termination of a given number of roads, and, in the case of Holyhead, the proportion between the required rubble mound and that now proposed being as 5 to 1, it is manifest that a much greater

LONDON.

Mr. J. Abernethy.

14 Dec. 1858.

length of time must be required to form it; while the superstructure cannot be carried on "pari passu" with the formation of the embankment or mound, as in the latter case.

Moreover, the timber-staging at present in use is constantly liable to be carried away in storms, whereas the staging proposed being connected together as a continuous work, and loaded with a mass of rubble, is independent of its use as a breakwater, "per se" of greater strength, and more capable of resisting the action of the sea.

As regards the saving in material and cost, the estimated quantities in one lineal yard of a breakwater on the Holyhead system applied to the Mumbles site, as compared with the proposed structure, is as follows, excluding the parapet in both cases.

Holyhead.		Proposed system.	
Cubic yards, 2,472	-	Rubble stone - -	500
Cubic feet, 1,201	-	Ashlar facework -	1,118
Cubic yards, 48	-	Rubble backing in mortar - -	94
Cubic feet, 396	-	Pitching - -	219

As regards the cost of each, as I have not the means of instituting any other comparison, I have simply computed the quantities of material required in each case, applying the same scale of prices. And I find the result as follows in the case of the proposed Mumbles breakwater:—

By the Holyhead system	- £1,742,620
By the proposed system	- £895,400

I believe this is a comparison in favour of the former, because the risk and cost of such a mode of construction, on a site subject to a great rise and fall of tide, is increased by the exposure of the staging, and the long slope of the rubble mound, to the prolonged and violent action of the sea. To these must be added, the difficulty of transporting under these circumstances, to the site a vast quantity of material.

With regard to durability, I have to remark, that the system of depositing a rubble mound, up to the level of high-water mark, as a basis for a solid and vertical superstructure of masonry, has always appeared to me a costly and injudicious mode of construction in deep water, as the long slope, thus necessarily formed seaward, converts the undulating ocean wave, into the shoal water, progressive, or percussive breaker, and the consequence is, a violent disturbance on the seaward face of the rubble mass, which by the constant action of the sea, must ultimately be reduced to a mass of boulder stones, while the vertical portion is subjected to incessant percussive action. In the case of Holyhead, I am convinced, that for the preservation of the superstructure, it will ultimately be found necessary to pitch the outer slope with massive ashlar, at great expense, at least between the levels of high and low water. I consider the breakwater at Plymouth, a much more consistent example of this mode of construction, denuded as it is of any vertical superstructure.

A breakwater of the form proposed, will not be exposed in any material degree to the action of a percussive force, but merely to what may be termed the hydraulic action arising from the rise and fall of the undulating deep water wave.

In conclusion, I have to express my firm conviction, that by means of powerful staging, and machinery capable of depositing with rapidity and ease, large masses of masonry, breakwakers, with vertical face walls carried up even from the bed of the ocean, may be executed in a much shorter period of time, and at considerably less cost, than has hitherto been attained.

The practicability of meeting these requirements admits of no doubt. As regards the necessary machinery and power to deposit masses of great magnitude, my practical experience of the facilities afforded by the application of hydraulic power, in various and numerous forms and appliances by Mr. Armstrong, of Newcastle, convinces me, that as regards labour, time, or facility, a mass of twenty tons may be deposited at the same cost as a stone one-tenth part of that weight by the ordinary means in use. For sites exposed to the action of the Atlantic or ocean wave, or where it is not expedient to form a base mound of rubble stone, I have shown a mode of construction (Drawing No. 5,) bringing up the face walls from the bed of the sea in a depth of seven fathoms.

I apply what I term the vertical system to deep water breakwaters; in shoal water, and under certain circumstances, the long slope system I am aware, from experience, may be applied with advantage.

29,433. (*Chairman.*) Then you propose to deposit the rubble by tipping from the stage or by means of barges, either one or the other?—If the breakwater had been constructed a considerable distance out from the land, it might, perhaps, be the best method of carrying out the work, to deposit the rubble from barges.

29,434. In fact, it would be the only mode, would it not, because the expense of the staging under those circumstances would be so great as to render that mode in effect impracticable?—Yes, it would be the only mode; it is the mode that was adopted at the Plymouth breakwater necessarily.

29,435. But could you in any case, by means of the staging you propose to use, dispense with the use of barges?—Yes, I could; supposing the breakwater were carried out from the shore. In that case, as the framework was completed, the waggon road might be carried along the top, and the whole of the packing might be completed before the facework was commenced.

29,436. Yes; but I apprehend that the whole of the rubble mound which is deposited in the first instance must necessarily be deposited by tipping from barges?—Yes; by being tipped in from barges.

29,437. And it can only be done from barges?—Yes; it can only be tipped in from barges by this mode of construction, but it might be done otherwise, by adopting a somewhat different mode of dealing with the staging, that is, by constructing these frames and tying them together, and carrying on the deposit of rubble from the frame below.

29,438. But would that give you that portion of the rubble mound that is outside the piles?—By the aid of side waggons I think it would, tipped over outside from the side of the frame.

29,439. By the aid of side waggons you think it might be done?—Yes, I think it might.

29,440. Therefore you think that it would be possible to deposit the whole of the rubble mound by tipping from the stage?—I do.

29,441. And you propose in that way to put in the heart or core of the work?—I do.

29,442. Could you not gain a little in breadth by throwing out a temporary platform from the side to tip from?—Yes; that could also be done.

29,443. That would be practicable?—Yes, quite practicable; for the weight of the waggons which would be used for the purpose of depositing the rubble is not very great.

29,444. Have you, Mr. Abernethy, considered the subject of using iron for the piling in lieu of wood?—I have; and my objections to the use of iron for that purpose is the great cost of iron piles, and their liability—cast-iron piles especially—to be broken in the process of driving.

29,445. Therefore you consider that the greater cost which they would occasion renders iron piles unfit for your object in cases where ultimately the work is to be built in?—It does, in my opinion.

29,446. In filling up the core or rubble under your stage, do I understand that the barges would have to be brought in under the framing for that purpose?—They would get along by the side of the piles, and cast the rubble over from both sides.

29,447. From both sides?—Yes; from both sides.

29,448. But you do not contemplate the barges coming in under the staging?—I do not; and for this reason I carry the piles 5 feet above low-water mark.

29,449. Your hydraulic cranes will necessarily be made to carry a very great weight?—Yes.

29,450. How do you propose to fix them for the purpose of lowering these immense blocks of 100 tons each?—Not 100; I said 20 to 30 tons each.

29,451. Well, 20 to 30 tons each. What mode do you propose for securing your crane? Do you propose that your hydraulic crane should be a travelling crane?—It is a travelling crane; there are two modes of lifting the blocks of masonry, one being to build into them iron rods of sufficient strength with eyes,—that would be one mode; and another would be to put in small square masses of hard stone into the face of the rubble mass, and carry them down, say to half their depth. There are a variety of other modes that might be adopted according to circumstances.

29,452. But all of which would increase the expense of the work in proportion to the weight of the blocks used?—To some extent certainly, but it would be but a very trifling per-centage on the whole cost.

29,453. If the breakwater is to be faced immediately with stone, would there be any necessity for resorting to the creosoting process?—Upon the whole I think it would be advisable to do so, because certaid portions of the timber framing will be built in or absorbed within the stone breakwater when completed; and I think it would be desirable that that should be made durable; therefore I think it would be better that it should be creosoted, that it may be made the more permanent.

29,454. But if it were not creosoted, would it affect the permanency of the structure?—It would not in the least degree affect the facework, but it might cause a slight subsidence in other parts of the work.

29,455. What is the expense of creosoting timber?—Thoroughly well done, it would cost about *5d.* per cubic foot.

29,456. And what per-centage would that be on the cost of the piles?—In this case I have put down the cost of the timber piles at *3s. 6d.*, and I would add another *6d.* for creosoting,—that would be *4s.* per cubic foot; but, as I have said, the creosoting might be done for *5d.* per cubic foot.

29,457. That is one eighth?—Yes, one eighth.

29,458. I gather that it is your opinion that all breakwaters which are constructed with the long slope must ultimately, in order to ensure their permanency, be faced between high and low water?—Yes, that is my opinion; and from explanations I have heard this morning in reference to the action of the sea upon the slope, I am convinced that opinion is correct, and that unless the slope is faced, the stone will in process of time be rounded by attrition, and worn into boulders.

29,459. And, therefore, it will be necessary to pave or face the seaward slope with square ashlar?—That will, no doubt, tend to preserve the slope, but it would have one bad effect, it would give the sea greater percussive force on the vertical wall.

29,460. If there be a vertical wall to the breakwater?—Yes.

29,461. But when the facing of the entire slope is completed, shall we not be free from occasional repairs?—Yes, I think so, to some extent; but in the long slope system any subsidence in the rubble tending to disturb the facework might, by the action of a heavy sea, cause it to be broken up and moved. In Scotland we are in many cases obliged, in order to guard against this, to connect the stones with iron bars.

29,462. Therefore it is almost impossible to construct the long slope so perfect as to obviate the probability of repairs being occasionally required?—I think so.

29,463. And very heavy repairs sometimes?—Yes; sometimes heavy repairs.

29,464. You propose, I think, a new system of base building up from the bottom; have you considered that for any length of time?—I have; and I have for some time been of opinion that there would be no difficulty in dispensing with the rubble mound, commencing at once from the base by depositing large masses.

29,465. And have you considered the subject sufficiently to be enabled to give us an idea of the comparative advantages of the two systems; I mean of this system of building from the bottom as opposed to the system of the rubble mound?—I think that in certain localities, where the quality of the stone available for forming the rubble mound is of an inferior class and liable to decay, it would then be advisable to resort to the other system, and commence by building from the foundation.

29,466. But where you can procure a good class of materials, the rubble mound system is the most economic, is it not; the more especially as the fact is now practically ascertained that below the depth of 15 feet from the surface there is no disturbance from the action of the sea?—I think it advisable, on the score of economy, where a proper description of material for the purpose can be procured, to have the rubble mound; but where a suitable kind of stone cannot be obtained, I would recommend the carrying out of the vertical system from the bottom. As, for instance, in the case of Table Bay at the Cape of Good Hope, I should say it would be advisable there to adopt the vertical system entirely.

29,467. Why do you think so?—Because of the great distance you would have to transport vast quantities of material.

29,468. (*Sir F. Smith.*) Upon the whole, then, I think I understand that you are of opinion that the long slope system should be altogether abandoned as a general rule?—As a general rule I am so.

29,469. Is there any exception to that general rule?—Yes, in shallow water, where there are breakers or a strong percussive sea; in such cases I think the long slope might be used with advantage. I can give you an instance in point, showing the advantage of the long slope. The head of the pier at Aberdeen was built as a vertical wall, and it was twice thrown down by the action of the sea, because the whole mass of masonry had not sufficient weight to stand the heavy shocks of the percussive sea. The class of material used, the masses of masonry were too small. The blocks of stone themselves were too small. Hence, where you have a strong percussive sea, and cannot have any sufficient weight of masonry, the best way is to avoid its shock by forming a long slope. The vertical wall at Aberdeen, as I have said, was twice thrown down and twice built up, and then they resorted to the long slope, which has stood, I believe, for the last 25 years or more, without injury.

29,470. Then do you mean to say that if this wall had been sufficiently thick it would have been better vertical than sloped; that it wanted mass?—Yes; it wanted mass, and the foundation is somewhat insecure, being sand for a considerable depth.

29,471. And by adopting the long slope the difficulty consequent thereon is obviated?—Yes.

29,472. But is there no remedy for the evil if you have a vertical wall?—The remedy in that case would be very expensive, and also difficult to carry out.

29,473. Then you think, as a matter of economy, that the alteration at Aberdeen from the vertical to the long slope wall was judicious?—Yes, in that case.

29,474. Were you ever at Haslar, on the Gosport side of Portsmouth? Do you know the wall there?—I have not examined the works at Haslar.

29,475. Are you aware that the wall at Haslar was in 1821 a vertical wall of great massiveness, and that in successive gales of wind it was completely washed down; and that instead of being restored as a vertical wall, it was restored as a long slope wall? are you aware of that?—I am aware that it is a long slope wall now.

29,476. Yes; and the long slope is kept in repair at a very little cost. May I ask what is the depth of water in that case?—The wall is sometimes dry at low water. That is then the case of a percussive sea, and I have no doubt under those circumstances that, as at Aberdeen, the long slope wall is preferable to a vertical wall.

29,477. Then, where there is a percussive sea you think the long slope the better of the two?—I think it is the better of the two.

29,478. Do you think that the long slope might be very much diminished in its length without injury to the construction. I see here you have a long slope in the comparative wall; do you think the long slope is required here?—Yes, with the class of material used. It is simply rubble.

29,479. As I understand from you, the sea will form the slope, there being no disturbing action in the water below 15 feet from the surface line; if so, are

LONDON.

Mr. J. Abernethy.

14 Dec. 1858.

Sir F. Smith.

we not open to have a less steep slope under the water line ?—I have shown it at 1¼ to 1.

29,480. But do you require that ?—With such material as copper slag, 1 to 1, or an angle of 45°, would be sufficient.

29,481. But your comparative estimate is, as I understand you, with the long slope ?—Yes, for the long slope.

29,482. You say that the quantity of timber used in your system of staging is not greater than would be used for tipping rubble into breakwaters constructed upon the ordinary principle ?—I think not.

29,483. Have you gone very minutely into that point ?—Not very minutely ; I have assumed a certain quantity of timber to be used, and in this way. Supposing a section to be carried out in the Holyhead form, according to this drawing. The base of the mound is marked at 520 feet. I should suppose, in order to tip the necessary quantity of material for such a mound, there would be staging 100 feet in width, and that it would be composed of piles transversely 20 feet apart, and longitudinally 30 feet apart. The piles would require to be connected by cross ties at the top and by diagonal ties below ; and seeing the great length these piles would require to be for carrying the stage 10 feet above high-water mark, and being driven 10 feet into the ground at bottom, 86 feet long, they would require to be scarfed, and I should think 4 balks would be requisite to carry the stage. I mean, if you placed them 30 feet apart longitudinally, so that there would be no economy whatever in the matter of timber. I think in that case there would be 575,080 feet of timber absorbed or buried in the work.

29,484. In what way ?—I mean the total quantity that would be absorbed in a breakwater like the Mumbles, 6,600 feet long.

29,485. In constructing a breakwater with a vertical face to the bottom, would you use the same sort of hearting as when you adopt the rubble mound construction ?—I should be inclined probably to vary it to some extent. I should adopt the rubble hearting in the usual way, but carefully packed, using large masses of masonry for the facework; but in certain sites, where the quality of the material required it, I should connect the facework by rubble walls in mortar, 10 to 15 feet apart.

29,486. In estimating your rate of progress, what have you taken as your data ? have you taken the rubble construction or the timber formation ?—I have taken the whole construction of the timber and the stone combined. I propose to prepare a large quantity of the material on shore and carry the work on in sections. There would be 500 feet of masonry in progress, 500 feet of the completed timber breakwater, and 500 feet in progress of the rubble mound beyond that again.

29,487. What is the interval between the frames ?—Ten feet from centre to centre.

29,488. Could you not place the frames more rapidly if you had no rubble to fill in ?—No doubt of it.

29,489. Consequently the rate of progress would be defined by the rubble mound ?—Yes ; the rubble mound defines the first stage of progress.

29,490. But that mode of construction would not be more rapid than any other ?—It would not ; but as the quantity is less, the time occupied would not be so great.

29,491. In the case of Swansea, it would depend upon the number of barges you employed. You might drive a great number of those piles, say extending over a length of 1,000 feet at the same time, employing a large number of lighters for the purpose ?—Yes ; it would depend entirely on the appliances.

29,492. Would you contemplate filling in the heart or rubble up to the level of the first horizontal piles, and then placing the upper framework, or would you go on filling in the rubble before you placed any portion of the second part of the framework ?—I should in all cases fill in the rubble mound to the level of 15 feet below low water before I constructed the upper framework.

29,493. What does this line on the drawing represent ?—Low-water mark.

29,494. Then should you carry the rubble up to low water before proceeding further or not ?—When the rubble mound is completed to a point 15 feet below low-water mark, seeing that the piles are driven 10 feet into the bed, the lower part of the framework will be sufficiently firm to admit of the superstructure being put on.

29,495. But if that were done the second portion, the superstructure of the second framework would be exposed to the action of the sea externally without protection ?—It would for a short period of time.

29,496. And a great mass of the timber would be exposed to the oblique stroke of the sea ?—Not more than is usually the case in respect to open pile piers, which are common on various parts of the coast.

29,497. Not more so than usual ?—No, not more so.

29,498. Would there not be in the case of Swansea, by your plan, a much larger quantity of timber exposed than in any pier you are aware of that is exposed to a similar sea ?—No ; I think not. I think in the upper part of the pier at Boulogne there is as large and as dense a mass of timber exposed.

29,499. But it is not equally exposed, I think ?—It is exposed to a very heavy percussive sea.

29,500. Have you stated in your report the rate of progress which you calculate upon ?—I have.

29,501. (*Capt. Sulivan.*) Have you made any comparison between your plan and the proposed upright wall plan, setting aside the large bases of rubble ?—I have not.

29,502. You are aware that the upright wall plan upon a small base is not a novelty ?—I am quite aware of that.

29,503. Then, to make the comparison, suppose your view, which agrees with others that have been put forward, to be right in regard to the advantage of an upright wall on a small base in deep water, would not the comparison, to enable us to judge of the relative expense, have to be made with the small base and upright wall, and not with the large base and the upright wall ?—I have in this case selected sites for comparison,—Holyhead with Swansea ; and have dealt with the plan accordingly, having reference to the circumstances of both, and I have simply made a drawing showing the upright wall system as carried out from the base.

29,504. But with regard to the saving of material, to enable us to judge of the saving in the construction of the one form of upright wall with the other, should it not be taken with the large rubble base ?—I think the comparison of the rubble base to a given height is sufficient, that is, to 12 or 15 feet above low-water mark. That is a fair comparison as against the system now carried out ; but another and a still further comparison might be made with an upright wall, if you take the other form of the upright wall on a small base. In that case I apprehend there would be but very little difference in the cost of the material as between yours and the other ?—No, there would not.

29,505. It would show the different mode of construction and the question of the superiority of the slag to a great extent, would it not, and also the supposed comparative rapidity with which the stage in your system could be carried out ?—It would show the difference in time ; and in addition, by my plan the advantage of using each of the stages as a breakwater for the time being, and also as a stage for conveying machinery of much greater weight than has hitherto been used in the construction of breakwaters, and depositing by means of the machinery larger masses of material than have been hitherto used in such works.

29,506. Then the result is, that the comparison now brought out is not the comparison of a new mode of construction as to material with an old mode of construction, but merely of a new mode of carrying

out and depositing the material, and building the enclosing walls with the ordinary mode?—Quite so. There is nothing novel in the plan of the walls themselves.

29,507. (*Capt. Vetch.*) Mr. Abernethy, have you made any comparison between the cost of your work and the cost of that adopted at Dover by Mr. Walker?—I have not.

29,508. I am presuming that he has carried the end of his breakwater now out into 7 fathoms water, and we understand that the cost of his work averages about 1,000*l.* a yard run. What would be the difference—the comparative difference—between these two plans, yours and Mr. Walker's?—Of course the cost of the Dover pier is far beyond any estimate I have made of this work; and I think the large cost of the pier may, probably, arise from the fact that it is carried on solely from the end, and that the class of material used is small, comparatively speaking, consequently a great deal of time is consumed in the construction of the work.

29,509. Well, you are aware that at Dover the building takes place entirely by means of the diving-bell under low-water mark?—I believe it does.

29,510. And that every stone is laid with the same precision under the diving-bell below water as it would be above?—Yes; and I believe the diver has as much labour in setting a small stone in that way as he would have in setting a gigantic mass of masonry.

29,511. But upon the whole, taking the pier at Dover as compared with any other breakwater pier, and supposing it was finished, which do you consider the best work being made?—I should prefer the Dover pier.

29,512. Then you would object to it chiefly on the score of expense?—Yes; the expense appears to be great. But I think when the work is finished it will be, as a breakwater, a perfect work.

29,513. You have spoken of using large blocks of stone for the under courses of an upright pier?—Yes.

29,514. Do you consider that that would tend to diminish the cost of the upright wall?—It certainly would do so, for the large blocks might be deposited as easily as blocks of a much smaller size.

29,515. And by using there large masses of masonry much time would be saved in the construction of the work, and you would be out of danger sooner?—Yes; three or four courses of blocks, such as I contemplate, would, in 5 fathoms, bring you up above low-water mark.

29,516. And if carried on barges, would they not in transport have about half their weight?—They would.

29,517. Would you look at this section of a breakwater at St. Ives, and tell me if it agrees pretty nearly with your views?—Yes; this is a breakwater of similar construction to that I propose. It shows large masses of masonry below low-water mark; but I should continue that system further, and face it with large masses of masonry up to high-water mark.

29,518. But when you get above low-water mark there is no difficulty in laying the courses?—There is not.

29,519. What do I understand to be the difference of cost between this model plan before us and that which is involved in the construction of the breakwater at Holyhead?—The comparison which I have made is made upon the supposition that I adopt the Holyhead system, and that that system is adopted in the Bristol Channel, where the rise of the tide is very great. Using that data, I estimate the cost of the Holyhead system adapted to a breakwater at Swansea at 1,742,620*l.*, and of a breakwater constructed upon the system shown on the model at 895,400*l.*; that is, for a breakwater 6,600 feet, or 2,200 yards in length.

29,520. Suppose this system had been substituted at the breakwater at Holyhead for that we now find there, that would be the comparative rate of difference in the cost between the two?—It would; for I have taken the quantities and calculated the material at the same prices in both cases.

29,521. I suppose you consider the Plymouth breakwater to have arrived at a state of repose?—No; I believe that occasionally now the facework may be liable to disturbance in very heavy gales.

19,522. I mean the outward sea face?—Yes, I should suppose so; I used to visit it very frequently while it was in process of construction.

29,523. Do you consider that the rubble work outside the Holyhead breakwater has come to a state of absolute repose?—No, I think not; I think the sea face of the sea slope will never come to a state of absolute repose until it is pitched with substantial masonry.

29,524. I think you said that many of the blocks at Holyhead, that is, of the outward face, had been converted into boulders; have you yourself observed that to be the case?—Yes; I suppose it will be the case unavoidably.

29,525. But you have not observed it as a fact?—No; I have not observed it, but it appears to me unavoidable.

29,526. But looking at the time it has been up, if it is unavoidable, as you say, would it not before this have become apparent?—I should think so; and I have no doubt, if an examination were made, that the mass of stone on the sea face will be found to be rounded.

29,527. If that should be proved to be the case, it would be a great detriment to that particular mode of construction, would it not?—It would; the stones forming the slope seaward must be disturbed and rolled about by the action of a heavy sea, and that being the case, I cannot see how they can avoid being rounded by attrition.

29,528. Can you say from your own observation that that is the case. Have you yourself observed it?—No, I have not; but I suppose it is so, and I have heard it stated that such is the case to a certain extent.

29,529. Then one of your objects, I suppose, is to prevent this change—this reduction of the rough stones into boulders?—It is.

29,530. (*Mr. Coode.*) The rate of progress, in this proposed plan of yours, would depend upon the rate at which the piles could be driven, would it not?—It would.

29,531. The first set of piles?—Yes; the first set of piles.

29,532. And these would necessarily have to be driven from barges, I think I understood you to say?—They might be driven from barges, or they might also be driven from staging for a limited period of time. Suppose a few of the piles driven and connected together by the tie pieces above and below, for a short period, above low-water mark, they might be driven from the staging; but as a general rule, I should say they would have to be driven from barges.

29,533. And at a level of 5 feet above low-water mark?—Yes.

29,534. Do you think that the Mumbles, where the tide runs at the rate of 2 or 3 knots an hour, the piles could be pitched at any other time than at slack tide?—Yes, I think so; and when we spoke of the tide running there at 2 or 3 knots an hour, it must be recollected that that is only round the Mumbles Head.

29,535. Do you think that as the work progresses, the rate of tide will diminish, or do you not think that it would carry that rate of tide with it?—I think that a wide opening being left between the Mumbles Head and the end of the breakwater near the land, there would be no fear of a very strong tide passing round the head of the breakwater.

29,536. But if the tide runs at the rate you speak of opposite the Mumbles Head, do you think that the projection of these works would reduce it?—It would not.

29,537. But you would carry at least the same rate of tide with you?—There would be no difficulty in the matter. I have often myself driven piles from barges in a stronger current.

29,538. Do you think you could pitch these piles accurately, in so great a depth of water, and with a current running at least 2 knots an hour?—I do.

LONDON.

Mr. J. Abernethy.

14 Dec. 1858.

Mr. Coode.

29,539. That you would not have any difficulty either in pitching or driving ?—None at all.

29,540. Could you pitch them at high water ?—No, of course not, in that case, because the top of the pile is only 5 feet above low-water mark ; therefore I could not pitch them at high water.

29,541. The top of the pile would not be bare until about half tide ?—No, not till about half tide.

29,542. Then you must necessarily pitch the pile sometime between half-ebb and half-flood ?—Just so ; but I think by using steam hammers placed in barges we might drive these piles with great rapidity.

29,543. My question had not reference to the rapidity of driving, so much as to the possibility of pitching them accurately, in deep water, with a stream running 2 or 3 knots an hour ?—In a stream running 2 or 3 knots an hour there could be no difficulty in pitching them. I have myself driven piles in a river current quite as strong.

29,544. May I ask in what depth of water ?—In 10 or 15, or 20 feet water.

29,545. Where was that ?—I have done it at Aberdeen, in the river Towey, and at Swansea ; and I have constructed a pier at Solway Firth, 1,000 feet from the shore, where the tide runs at more than 3 knots an hour, and the piles for that work I have pitched with the greatest accuracy, although they were 60 feet in length.

29,546. And what depth of water ?—The depth of water at the termination of the pier is, at low water spring tides, about 13 feet.

29,547. Then you have no case analogous to this proposed work, where the piles would be driven in a depth of 40 or 50 feet at low water ?—Not in all respects analogous ; but I should say that to drive piles of 60 feet long in a current of 3 to 4 knots, and 18 feet below low-water mark, was a more difficult thing than to drive piles in a current of 2 knots 40 or 50 feet long.

29,548. Would not these piles require to be driven with great accuracy ?—No ; supposing a little deviation took place in the driving, it would not affect the stability of the structure, because the panels behind the piles from low-water mark to the level of the top of the rubble mound, and also the framing above, can be adapted to the piles when driven. And, supposing the distance in one case to be 10 feet and in another 12, that would not at all affect the structure.

29,549. I refer to the accuracy in distance between the two piles transversely ?—The distance between the piles transversely would be regulated to a great extent by the cross ties at the head. They would form the gauge.

29,550. Could these cross ties be fixed until the piles are driven ?—They could not.

29,551. Then how could they be used as a gauge until the piles were actually down, for they would have no support ?—Yes ; we could use them as a gauge even then. After the piles had been pitched and driven, these cross pieces might be put in, and a piece fixed across each as a guide to keep them in their places ; but I cannot conceive any practical difficulty in driving piles at that angle into clay without the aid of the cross ties, and keeping them accurate as to distance. I am constantly in the habit of driving piles in deep water, and find no difficulty in keeping the distances apart from each other accurate.

29,552. Suppose there were only the variation of an inch in that part of the pile which is in the ground, would it not cause five times as much deviation in the upper part ?—No doubt it would ; and it would after all amount to this,—that we should have to adapt the framework above to the altered width.

29,553. That is what I was coming to. The upper frame could not be put together until the piles were driven and their exact gauge ascertained ?—Just so ; and I should recommend the piles to be all driven (that is the mode we pursue at Blyth), and then when the work is gauged and the exact width ascertained, it is an easy matter to construct the framework to suit the piles.

29,554. You say that this system of constructing the staging would be less liable to damage than the system pursued at Holyhead ?—Yes, I think it would.

29,555. Take this model as it stands at present. I see there is a length of about 200 feet exposed to the action of the sea ?—Yes.

29,556. Do you not think that it would be liable to breaching during a gale of wind ?—I think not. But I should state, that in making this model my chief object was to show the work in different stages of progress, without exhibiting in the model the precise way in which I would carry out the work. I might, for instance, find it advisable to expose a less amount of timber than is here shown until the rubble mound had been formed and the whole frame secured.

29,557. You consider one of the advantages of this staging is, that it is connected longitudinally and transversely ?—Yes.

29,558. Do you know that at the breakwater at Portland they find it necessary to resort to just the opposite mode of proceeding ; that is to say, they always allow the last bay outer part of the staging to be merely temporarily connected with the inner stage, in order that if a heavy gale comes on, and any pile should be moved, they may only lose the small portion outside, instead of having long lengths of the staging carried away ?—I should think it would be necessary ; in that case the staging depends entirely on itself, but in this case the base of the staging is at once secured by the rubble mound, and forms a firm base for the superstructure.

29,559. In your case you are obliged to depend upon the staging itself for a time, until you have deposited the rubble mound in it ; but in the case of the staging at Holyhead and Portland there are no horizontal timbers exposed to the action of the sea ; whereas in your plan you have a considerable mass both of horizontal and diagonal timbers necessarily exposed to the action of the sea in a gale of wind ?—In the cases both of Holyhead and Portland, seeing that the stage is dependent upon itself, it would be unadvisable to connect the timbers by horizontal ties, but in this case the rubble forming a firm basis, the staging above is able to resist the action of the sea.

29,560. Then you do not apprehend any liability to damage from the sea lifting any portion of these horizontal and diagonal timbers ?—I do not. The buoyant power of the timber there—the creosoted timber—is much less than the power required to draw these piles out of the soil.

39,561. My question had reference not so much to tearing piles out of the ground, but rather to lifting the horizontal and diagonal timbers, and the breaking of the connexion of the framework ?—They are not put on until the rubble mass is brought up, and the pressure on the timber is then much less.

29,562. You propose to cut off the heads of the piles at the level of low water spring tides ?—Yes.

29,563. That operation can only be performed at spring tides ?—Of course.

29,564. Supposing a case of bad weather during the time of spring tides, that operation must be postponed for a fortnight ?—Yes ; but that is an operation that can be done almost at any time. Supposing the top of the pile to be 5 feet above low-water mark, the framework can be put over it ; and it is only when that is on, that the pile need be cut, and that is a question of 5 minutes with a cross-cut saw.

29,565. I do not exactly understand the extent to which you adopt packing. Something was said about packing at the last examination, but I do not see any now shown on the drawing. Will you explain to what extent you adopt hand packing ?—Above low-water mark I propose to carry on the work in lengths of 500 feet each. I should tip

certain portions along that 500 feet, and place men within the framework to level the ruble mass and see that it is properly packed against the outer planking, and then carry on another layer.

29,566. Do you not apprehend that the packing would be liable to be disturbed by the action of the sea in heavy gales of wind ?—If you carry the packing at the sides a little above the level of the top of the packing the action of the sea will not materially affect it.

29,567. That is, a broadside sea ; but in the case of Swansea, would there not be a considerable fetch from the south-east, to which the end of the frame would be open ?—A south-east sea would take the end of the breakwater at an acute angle, and we have never a very heavy sea from that quarter.

29,568. Is there not a fetch of 6 or 7 miles from the south-east ?—There is a fetch from the Skerweather Sands, but I have never seen a heavy sea.

29,569. Of what materials would you propose to construct the artificial blocks ?—Of sandstone and Aberthaw lime.

29,570. What period of time would be necessary for the blocks to consolidate ?—I should say about six months.

29,571. Do you know any case where large blocks have been built with lias lime mortar in that way ?—Not for that purpose. I have seen large masses built, but not for that purpose. I may give you an instance of the use of that sort of lime. About six months ago I had occasion to put down a mooring post for a temporary purpose, and this was done by bedding the lower part in a mass of rubble 8 feet square and 6 feet thick. At the end of six months the contractor undermined the mass, and the post and the rubble tumbled down some 20 or 30 feet unbroken, and he was obliged to blow the rubble mass to pieces with gunpowder before he could remove it.

29,572. What is your estimated cost of the large rubble blocks ?—Sixteen shillings per cubic yard.

29,573. That includes the cost of building, plant, and setting ?—It includes the cost of materials and of setting. The price I pay for common rubble at Swansea is from 8*s.* to 10*s.* per cubic yard.

29,574. These blocks would have to be built in moulds, would they not ?—Not necessarily ; I should not use moulds in building them ; that is to say, a mould in the proper sense of the term.

29,575. What plan would you adopt to insure their accuracy of form ?—Building them from a level base with a common square ; it is easy to keep the sides vertical, sufficiently so for the purpose for which they are required, without building them in a mould.

29,576. Do you consider that a diver could manipulate blocks of such a size, in a tideway, as easily as blocks of a smaller size ?—I think he could. All that the diver has to do is to transmit signals. Everything can be done by the hydraulic machine ; the blocks can be moved in any direction and set with great nicety.

29,577. You think the diver would have nothing to do but to transmit the signals ?—Yes, I think so.

29,578. Have you ever constructed any work in such a tideway by means of divers ?—No, I have not ; but divers do much more difficult work. The work here at Westminster Bridge is much more difficult.

29,579. You imagine the whole work can be done by divers signalling from below ?—I think so.

29,580. What is the specific gravity of the copper slag you mentioned ?—It varies from 10 to 12 cubic feet per ton ; some is heavier still. It varies at different works.

29,581. Will you give us the rate of progress of the work according to your system,—the rate per annum at which you would construct the work ?—About 2,000 lineal feet per annum.

29,582. That would be an uniform rate ?—Yes ; that would be an uniform rate.

29,583. About 40 lineal feet per week ?—Yes.

29,584. In comparing the cost of the work at Holyhead and the cost of the work which you propose at Swansea, you take the prices according to your own estimate and not the actual cost of the work at Holyhead ?—Yes ; I had no means of ascertaining the actual cost of the work at Holyhead, and the only method I could adopt was to apply the same prices in both cases.

29,585. Will you give us the number of cubic feet of timber in your stage, per yard forward ?—I will prepare a statement.

29,586. And send it to our secretary, if you please ?—I will do so.

29,587. You said the work at Plymouth had been quite successful, and you recommended pitching in front of the rubble wall at Holyhead. Are you aware that the difficulty at Plymouth has been in retaining the pitching ?—I don't think I stated that the work had been successful, but that it afforded a good example. I am aware that the pitching has been disturbed at Plymouth. That is one reason why I think that even the Plymouth breakwater is objectionable, because the long slope is liable to disturbance. If there is the least subsidence in the rubble mass below, that will follow.

29,588. You stated, as I understood, but perhaps not erroneously, that the Plymouth breakwater was successful ?—I do not think that I exactly used that term. I say that I consider it a more consistent example than any other on the long slope system.

29,589. There is one portion of your evidence to which I am alluding, in which you spoke of the Plymouth breakwater. I was about to ask whether you are aware that they are adopting courses of masonry set on horizontal beds, to protect the foot of the pitching, and that the pitching which you recommend at Holyhead has failed at Plymouth. At Plymouth they are abandoning pitching, or rather have been compelled to set masonry on horizontal beds to protect the foot of the pitching. When you said pitching, perhaps you did not mean pitching in the ordinary sense of the word ?—I may, perhaps, use the word facing, and say facing of ashlar.

29,590. I think you estimated the piles at 4*s.* per foot, including creosoting ?—Yes ; I have taken the whole of the timber at that price throughout. That would include planking and everything else.

29,591. In reply to a question, I think you said that in the Holyhead form of stage it would be necessary to have the piles 20 feet apart transversely, and 30 feet longitudinally ?—Yes.

29,592. Are you aware that at Holyhead the piles are 30 feet apart both longitudinally and transversely ?—Yes.

29,593. Then would not that tend to reduce the cost ?—Yes. But in this case I do not think it advisable to have piles for staging more than 20 feet apart. Here you have a 30 feet rise of tide, and I think, under such circumstances, it would not be advisable to have the timbers more than 20 feet apart transversely, considering the great length of the piles, 86 feet.

29,594. Are you aware that a great portion of the piles at Portland are upwards of 80 feet in length, and have only two balks in section ?—Yes ; but at Portland you have comparatively a small rise of tide. A rise of 30 feet makes a material difference with regard to staging.

29,595. But supposing the length of the piles to be the same, how can a pile of 86 feet require four balks at Swansea, when two are sufficient at Portland ?—The rise of the tide renders it necessary.

29,596. In what respect should you require a stronger form of staging ?—Because you have a much greater height of pile out of the water, and it is exposed to the constant lashing of the sea. You have at Portland, comparatively speaking, a smaller portion of pile out of the water than at Swansea.

29,597. But with the system of upright walls there is no lashing of the sea ; the wave is not converted into a percussive wave ?—No, it is not.

29,598. Then the rise of the tide would not make

LONDON.

Mr. J. Abernethy.

14 Dec. 1858.

Mr. Coode.

any difference ?—No. In the one case the work is not equally exposed to the action of the sea as in the other. As soon as you get the rubble to a certain height you have the percussive sea acting on the staging.

29,599. But if the piles at Holyhead, formed of two timbers, are sufficient to resist the stroke of the percussive sea, surely piles of 86 feet, having a simple undulation to contend with, would suffice ?—The staging at Holyhead has been over and over again washed away, and many lives have been lost, and locomotive engines and waggons have been dropped into the sea. I do not think the staging sufficient at Holyhead.

29,600. May that not be owing to the want of attention in the construction ?—I think it is owing to the want of strength.

29,601. Seeing that it is of the same description at Portland, and has been successful there, may there not be some defect in the construction, or want of proper precaution on the part of the contractor to whom the stage belongs at Holyhead ?—There may ; but is not the rise of tide different at Holyhead, and is it not more exposed to gales of wind ?

29,602. But when on shore gales of wind arise, they are as heavy at one place as at another. I think you made an estimate for a breakwater at Wick 18 months ago ?—Yes ; I did.

29,603. In that case you proposed to adopt the simple rubble mound confined within timber framework ?—If I recollect right, it was a rubble mound within timber framework of a different construction from the present plan.

29,604. The timber framing went to the bottom ? —Yes ; it went to the bottom.

29,605. And the rubble was confined entirely within the framing ?—It was.

29,606. Your estimate for that work was 178,000*l.* ? —I think it was. If I recollect rightly, it was 70*l.* per foot.

29,607. I believe, when you were examined before a Committee of the House of Commons in March 1858, you proposed a different plan for the Mumbles than that now produced ?—I did. I proposed to have the rubble made to the level of low-water mark, but on reflection as to the effect of constructing the work, and seeing the destruction which had taken place at Holyhead, and taking into consideration the information which I derived from your evidence as to the effect of the sea, I thought it advisable to confine the rubble mound to the height shown in my design.

29,608. In answer to question 2037, you say, " The present mode of constructing a breakwater is " by the formation of a large rubble mound to a " depth of 12 feet or thereabouts below low-water " mark, and upon that to build a superstructure " of masonry. That mode of construction in- " volves a great expenditure of material and time, " and consequently of money." Now is not that essentially, if not identically, the same plan as the one you now produce ?—I have observed that passage in the evidence, and think I did not make myself sufficiently clear. What I meant to say was, a superstructure placed on a rubble mound 12 feet below low-water mark.

29,609. As the passage now stands, the plan therein described is identically the same as that which you now produce ?—Yes, with 15 feet instead of 12 feet.

29,610. The only difference is that you have in this case a greater quantity of the more expensive material, and a smaller quantity of the less expensive material, a greater quantity of masonry, and a less quantity of rubble ?—That is so.

29,611. Then the plan you propose is the same as that which appears here to be objected to ?—I don't know how that was reported, but I don't think that was my meaning. The rubble mound was carried higher up ; but I was under the impression that you had based your superstructure at Portland 12 feet below low-water mark, and that in that respect you differed from the mode of construction at Holyhead. But that is not the case. The section you recommended to the Committee in 1857 certainly contemplated going below low-water mark. You furnished a section, and then I observed your mound was below low-water mark.

29,612. Do you not think that a section of the kind shown with upright walls upon plan No. 3 in the Appendix to the Report of the Select Committee of the House of Commons in 1857, might be constructed from a stage similar in principle to that adopted at Holyhead ? Do you see any practical difficulty in constructing such a work from a frame similar to that at Holyhead ?—No, I see no practical difficulty, but it is not the mode I would adopt.

29,613. But there is no practical difficulty ?—No ; but I do not think it the best mode.

29,614. The section on that plan, and the section produced by you, are essentially the same ?—Yes.

29,615. As regards all their prominent features ?— Yes.

29,616. The only difference is in the mode of constructing the stage ?—Yes, that is the difference. The material used and the modus operandi of carrying out the work are the same.

29,617. The novelty consists only in the stage itself ?—In the stage, and in using large masses of masonry, and setting them by hydraulic power. The use of staging of a more powerful class, of machinery of a more powerful class, and of greater masses of masonry than have been before employed.

29,618. Has it not been proposed before to use large masses of masonry ?—The late Mr. Rendel, in his report on Hartlepool, suggested the use of large masses of rubble masonry, and in that case to build from the foundation of the sea a vertical wall. That was a great departure from the system he had adopted at Holyhead, and it would seem as if he had changed his mind.

29,619. Do you not think that he, like most judicious engineers, would vary his mode of construction according to the circumstances of the locality ?—I do not think there is such a difference between the two localities as to render it necessary to vary the plans so much.

29,620. With respect to the introduction of hydraulic machinery, is it necessary to employ such machinery, seeing that the blocks have only to be lowered, and not to be raised ?—I think it is necessary ; I think you ought to have the power of raising a block as well as of lowering it. A block might be deposited on a site which was found objectionable. It might not have a level bed, or there might be other reasons for raising it.

29,621. But would it be necessary to raise it out of the water ? Would it not be easily lifted in the water when its weight was so much reduced ?—Of course it would have to be lifted in the water. It would be submerged. It would not be necessary to raise it to any great height.

29,622. Practically the weight would not be very great ?—No, it would not.

29,623. Would the use of hydraulic machinery introduce a complication into the apparatus ?—No ; I think it exceedingly simple, and prefer it to the ordinary mode of working cranes.

29,624. You consider it more expeditious ?—Much more so.

29,625. Are you aware of the mode in which the stone is set at Portland, where a chain is used with two free ends, and the lowering of one block raises the " lewis" ready for the next ?—I am not. I have not visited Portland.

29,626. But if you were informed that that mode was adopted, should you not think it as simple and expeditious as any that could be devised ?—Probably for such masses of masonry as you use there it might be so ; but, in dealing with large masses, it is necessary to have the power of lifting them. Large masses must be brought on a truck, and raised and lowered over the side.

29,627. Still, the raising of an inch would suffice ?

—Yes, that would be sufficient. I prefer the hydraulic power on account of its great speed.

29,628. (*Chairman.*) You mentioned a pier in the Solway Firth; where is it, exactly?—It is at a place called Silloth, about 21 miles below Carlisle.

29,629. Is it exposed to any considerable action of the sea?—In westerly gales it is exposed to a considerable action of the sea.

29,630. What lift of sea would you say at a guess?—Not the North Sea wave, 10 or 12 feet in height at the extreme.

29,631. Ten or twelve feet from the crest to the trough of the sea?—Yes; not more than that.

29,632. You have heard of the wave screen?—Yes.

29,633. If there is a considerable length of pier, would it enable us to form any estimate of the probable effect of a wave screen in stopping the wave and diminishing the undulation?—To a certain extent it would; but there we have a percussive wave; and in Mr. Calver's case he deals with the deep-water undulatory wave; at Silloth we find the water on the lee side much smoother than on the weather side.

29,634. Would it be possible to institute any series of experiments there to test the amount to which the undulatory wave is reduced by passing through the pier?—It would so far as there is a percussive sea, but not an undulatory wave.

29,635. But the percussive sea is the most difficult to deal with, is it not; and if the wave screen is effectual for that, it would *à fortiori* be as good for the undulatory sea?—I think that scarcely follows. The piers at the Solway are at a slight angle to the sea, and the breaker has to pass through all the piles before getting to the lee side, and the consequence is that we have comparatively smooth water on the lee side, but there is a certain amount of undulation. In deep water, I think the effect of an open screen would be that you would have a swell on the opposite side, because it would pass through the openings.

29,636. So that the swell inside would be as high as on the outside?—It would, to some extent, be diminished. The crest would not be found so high on the lee side, but you would still have a ground swell.

29,637. You think the ground swell would be very little diminished?—Yes; I think so.

29,638. And therefore the breakwater would be of comparatively little use?—I think, as a breakwater, it would not be of much use. I think the only way in which you can break the deep-water wave is by arresting its progress, and throwing it back.

29,639. Is there any other construction that you are acquainted with that would enable us to form an idea of the probable effects of a wave screen?—There is not.

29,640. There is none that has occurred in your experience?—A good many in shallow smooth water, but not in deep water.

29,641. You know of no such work in deep water?—No; not in deep water.

29,642. Now with respect to the machinery for handling these large blocks below water, have you considered that matter in any detail?—Only to a certain extent. I have been in communication with Mr. Armstrong, of Newcastle, one of our most ingenious mechanics, and he sees no difficulty in the way.

29,643. Would you move the blocks laterally by machinery under water?—I contemplate moving them entirely from above. I think that would be a less complex plan. I am aware that there is a plan for having a supplemental cylinder below water, but I think there will be great difficulty in supplying it with the necessary water power. We work our hydraulic machines 800 or 1,000 lbs. to the square inch, and I think it is impossible to get any flexible pipe to bear anything like that pressure to begin with. I think every thing should be done from above.

29,644. Of course you have contemplated the action of frost on hydraulic machinery. Would not that cause a certain amount of delay in winter?—No; for there is a steam-engine attached to such machinery.

29,645. (*Capt. Sulivan.*) You propose to work in lengths of 500 feet?—Yes.

29,646. What do you mean by that?—I mean that I should have cranes setting the facework along that 500 feet, course after course.

29,647. That refers to finishing, not to the first construction?—I should extend the timber staging in such a way that as soon as one 500 feet was up to high water, I should be ready to go on with another 500 feet.

29,648. Do you mean us to understand that the facework is an after consideration; that the original construction was a timber framework and rubble?—No. I have always contemplated the formation of a permanent work in connexion with breakwaters; but what I have stated is, that the timber breakwater would last for a long time, provided it should not be considered desirable to proceed with stone.

29,649. Then your working of 500 feet has only reference to that which would be faced at once?—Yes.

29,650. You talk of working in layers, what depth would they be?—Probably three feet at a time, inside of the framework.

29,651. If you only worked three feet layers, would you not be a long time before you got the next set of frames in?—No; the rubble would be distributed equally over the whole space.

29,652. Do you mean to say that 500 feet of timber would be left unprotected?—I should have 500 feet in process of construction.

29,653. I think you said in answer to Mr. Coode, that your breakwater would be exposed to an acute-angle sea from the south-east, but that it would not be a heavy sea?—Not at Swansea.

29,654. Then your great exposure would be——?—West and south-west would be the heaviest exposure.

29,655. (*Capt. Vetch.*) I think you said that these breakwaters would eventually require to be cased in masonry to protect them?—As works of duration.

29,656. You mentioned the breakwater at Plymouth as a case in point?—I did.

29,657. To that it is objected that the stones did get disturbed there. I wish to ask whether you know the fact that the seaward pavement of the Plymouth breakwater has stood remarkably well, except the mere toe, where the outer stones had begun to be disturbed, and that it was found necessary to excavate the rubble beyond, and to build in three courses of upright stones, to which the remaining inclined mass of the pavement or pitching is now attached, and that, with the exception of the mere toe, that the pitching has stood remarkably well?—Yes. I think the main disturbing action of the pitching would be that of the back tow. I was on the breakwater four months ago, and minutely inspected it from one end to the other, and it was perfectly clear to me that it was the back tow that disturbed the sea slope.

29,658. Are you aware that previous to the construction of this masonry work at the toe, blocks of from 10 to 15 tons weight were thrown up upon the pitching?—Yes; so I heard.

29,659. And actually over it?—Yes; so I have repeatedly heard the fact stated. In fact the man who keeps the lighthouse mentioned several instances to me.

29,660. But in fact the toe work now prevents these great blocks from coming up?—I have no doubt it will.

29,661. (*Mr. Coode.*) At what price per ton have you estimated the rubble that has to be barged?—5*s.* a yard deposited.

29,662. Five shillings per cubic yard for that which is barged?—Yes. We have about two miles to convey it.

29,663. I think I understood you to propose to

LONDON.

Mr. J. Abernethy.

14 Dec. 1858.

Mr. Coode.

construct some portions of the work in isolated sections, did you not?—Necessarily there would be, one portion of the breakwater; but it is quite practicable to stage the intervals between one breakwater and the other.

29,664. In the price of 5*s.* per yard, have you allowed for lifting the material that is above the level of high water?—I have applied the price of 5*s.* to both sections. In the case of the packing above the rubble mound I have estimated it at 6*s.*, in my own case, because there is some extra labour in depositing the material within the framework.

29,665. Then, if I understand rightly, the material below the level of high water is estimated at 5*s.* per cubic yard, and that above the level of high water at 6*s.* per cubic yard?—Yes.

29,666. You have assumed that in all cases it would be necessary to adopt a masonry structure. Do you not think that there are a great many cases where a simple rough rubble mound would answer the purpose of a breakwater, if that mound is formed of stones from six tons weight down to fine chippings?—No, I think not; I think that in the case of such a mode of construction the sea slope would in the course of time become very much disturbed, and wear away; and, under any circumstances, that it is a very rude mode of constructing a breakwater, and must necessarily be expensive from the quantity of material used in it. There is another thing I should add. I think it would be a great commercial advantage in the construction of breakwaters to have a vertical wall in the internal face, particularly one connected with the mainland, so that you might use the breakwater as a wharf.

29,667. That rather touches the question of piers, and harbours of commerce; but having reference merely to the refuge question, and to the breakwater simply as such, I ask whether you think it is not possible to construct a breakwater with rough material alone, more economically than with a rough rubble base and masonry above?—I think not. I think the quantity of material that you would require would be so much increased by that mode of construction that you could not construct it at a less cost; and unless the material was of a permanent character, such as granite, greenstone, or sienite, the sea slope would in process of time become a mass of boulder stone, would wear away, and you would require to renew the rough rubble mound constantly, to keep it up to the required height, because it will become depressed in process of time.

29,668. Even supposing the sea were allowed to form its own slope, before the tipping process was stopped?—I think so.

29,669. I think you said, in your evidence before the Select Committee of the House of Commons, that by the system you propose to introduce, you would only occupy in the construction of the breakwater about one fifth of the time which is now required?—I forget the exact time I mentioned; but I think that would be almost consistent with what I have said in the report which I have presented to the Commissioners. In that I speak of $4\frac{1}{2}$ years for executing 2,200 lineal yards of breakwater. If I recollect right, the Holyhead breakwater was commenced about 1844 or 1845, and is not yet complete, nor is it of that length.

29,670. The Holyhead breakwater is somewhere about 8,000 feet long?—Of course the greater portion of that is the rough breakwater. The superstructure may be said only to have commenced, and it cannot be regarded as a completed work.

29,671. Still it answers the purpose of shelter in the meantime?—No doubt it does.

29,672. Which is all you could hope to obtain by your timber staging with rough rubble between?—Quite so.

29,673. As yet it is but an estimate that you could construct 2,000 feet per annum?—Of course it is an estimate. I have taken into consideration the facility of procuring material, and the fact that the greater part of it is previously prepared on shore. Taking 12 months to make the necessary preparations, that no delay should occur when once the works are commenced, from the small experience I have had in constructing the work at Blyth, I think if I could do 130 feet of that in the week I could do 40 feet in this.

29,674. Is the work at Blyth below the level of low-water spring tides?—It is not.

29,675. Then are the circumstances parallel?—The circumstances are so far not parallel; and of course allowance must be made for the greater difficulty of executing the work now proposed; but the means and appliances at Blyth were small in comparison with those I should apply in this case.

29,676. Your estimated progress is at the rate of 2,000 feet per annum, and you stated before the Select Committee of the House of Commons that you could construct a work about five times as fast as by the present system?—Yes.

29,677. Then by that statement you would make the present rate of progress about 400 feet per annum?—I think that is considerably beyond the progress made at Dover. I do not know whether it is beyond that made at Holyhead.

29,678. Will you be surprised if I tell you that the rate of progress made at Portland only last week, during the very short days, amounted to a rate of 1,250 feet per annum?—No, I should not; for I have no doubt you have very much improved upon Holyhead at Portland in the mode of carrying out the work.

29,679. Does not that show that the present system is capable of very rapid progress, more especially when you take into account the fact that the rate of progress at Portland is limited by the comparatively small quantity of material supplied by the convicts?—I think that at sites such as Portland or Holyhead, where you have an immense mountain of material close adjacent to the site of the breakwater, by proper means and appliances you can carry on a work with great rapidity; but in the case of a breakwater, in the open ocean, where you have not that facility, the circumstances are materially changed, and in that case I think you would not be able to construct a breakwater on the Portland system at anything like the rate you have done there. In both the cases I have mentioned you have a large mountain of material at hand, and it is only the question of the means of excavating that material and depositing it in the sea.

29,680. I think you have already stated that the rate of progress in your proposed system would depend upon the speed at which you could put in the piles?—A good deal would depend upon putting in the piles.

The Rev. FREDERICK GLOVER examined.

Rev. F. Glover

29,681. (*Chairman.*) Where do you reside?—At Cologne.

29,682. Will you now proceed with any statement you may wish to make to the Commissioners on the general subject of breakwaters?—What I wish to propose to the Commissioners is twofold; first, as to the mode of building a sea wall; and, secondly, a method of treatment of rivers by which bars may be avoided, and the area of a river may be made available as anchorage.

29,683. Will you proceed with the last-named subject first? We will take the question of construction afterwards?—If an island is put before the mouth of a river it will prevent the assault of the ocean's power against the debouching stream, and when a bar is formed by the opposition of two forces, the attack that the river experiences from the ocean stream will be diverted either to the right or left of the island; and when the influence of the ocean comes in one direction, the river will take the opportunity of escaping in the

other; because the river will not run out against the power which opposes it. In answer to your first query, contained in your letter to me, and to show the reasons for alleging that the forming of island breakwaters at the mouths of tidal rivers would have the effect of preventing the formation of bars, I will read the following statement:—

Before this question is answered, it is proper to observe, that the bar which is formed by the opposition of forces is that formed by the ebb only, at the time that it is hindered in its progress outward sea wise, by the wind being against it, and producing a sea which opposes it; that is, when there is an on-shore wind of some sort.

The flood tide without the aid of the wind, *i.e.* the wind-excited sea, promotes no bar; and unless the ebb is hindered by the sea roll, it ordinarily removes the deposit made by the sea-borne drift during the hours preceding the turn of the tide. Hence it is desirable to protect the power of the ebb.

When the ocean opposes the ebb, the alluvium, with which the ebb is charged, and the detritus sea borne, are, in consequence of the eddy which takes place in the opposition of the two forces at the junction of the waters, dropped at the point of contention, and go to increase the matter already brought up under the influence of the wind-excited sea, and to consolidate it. Hence the desirableness of defending the power of the ebb, undiminished by any adverse action of the water of the sea by the interposition of an island breakwater. This is what occurs at the mouth of the river.

What takes place in and up the river, under the influence of the flood, is, a gradual deterioration and diminishing of the depth of the river by a double depositum of the detritus, which is borne along and held in suspension by the inpouring flood, until the power of sustaining is lost by the action or opposition of the stream of the river.

This is a process which I explain by saying that the river stream, which is the same as the checked ebb, sustains a running fight with the flowing flood; since it is, at each succeeding instant, and ever at a different spot, overpowered by its aggressing and irresistible adversary; the struggle is unintermitting, but the point of contention is, each spot in succession, between the river's mouth and the highest point influenced by the tide. The opposition produces eddy, and the spot where it takes place is shoaled to the extent of the amount of deposit dropped by the charged waters.

Now, if a river were a regular canal, and the bottom of it an inclined plane, and that it were possible to see the bottom of it after the action of one tide, the appearance presented would be as if a coat of distemper of mud or sand colour had been exquisitely laid on with a brush; excepting that the coat of distemper would be thickest at the mouth of the river, and would gradually taper up to nothing at the top of the tide.

Now every tidal river, as it must be subject to this action twice daily, will suffer deterioration yearly to the amount of 730 laminæ of deposit, and this will be greater or less according as the sea water is more or less charged with sand, and the fresh water with alluvium. But, more or less, during the flood, every year and day by day this reduction of depth takes place and must; and all rivers whatever are suffering under this inevitable consequence of a flood water coming in dirty and returning clean, or cleaner than it came in, by reason of the contention carried on between two forces; the eddy and the deposit being the consequence. Hence that universal complaint against river engineers for the asserted deterioration of rivers under their scientific hands and schemes is unjust, whatever the particular inefficiency or the weakness of the efforts they make to improve the navigation. For this disease, namely, the flood tide's daily damage of a tidal river, nothing is a remedy but dredging; and for the facilitating of this operation, it is very fortunate that the deposit does not take place evenly, as it would in a straight canal, especially by a tide stream unaffected by gusts of wind, but is driven about by currents and bends of the rivers, thus causing it to deposit in shoals and spits. For, these accretions are, as to the river dirt, what the scraper's process is to the scavenger's dirt, which is collected in heaps for the purpose of being more easily shoveled away, and they are, in reality, in this sense, a great advantage. Hence we may judge of the fitness of an engineer for his position as an engineer to a conservancy, when he complains that 50,000 tons of sand have been dredged away in a year from a sand in a river, and that not a bit of good has been done by it. If he stop his dredging machine, he will soon discover what good has been done, that he little knew of.

The question then being, "the use of an island breakwater to prevent the formation of bar," the answer is, "in the defence of the ebb stream from the assault of the "ocean during on-shore winds." For, if the matter which constitutes bar be brought up by the sea on the flood, it is the power of the ebb alone which operates to dislodge and dissipate it. Hence, by the interposition of an island between the river and the sea, the direct action of the sea in on-shore winds to oppose the ebb stream is prevented; and the ebb is, therefore, allowed full power to range, with best effort, through the channel formed between the shore and the island, so as that it may sweep out, in its course to the sea, all that has been previously deposited, and be aided to carry on its own contention with the ocean in an *oblique* instead of by a direct action; by the latter of which processes, viz., direct action, bad bar is created, which is what would be created at the river's mouth without the island; by the former, viz., oblique action, spit merely, which is all that would now form at the flood-tide end of the island, when the wind concurred with the direction of the ebb, and be, perhaps, wholly dissipated at the ebb-tide end of the island, when the wind was in the direction of the flood.

This is capable of illustration by a series of five double diagrams, showing the difference of the action of the roll of the sea against the ebb, when its motion is—1, directly opposed to the débouche of the river; 2, when it is oblique with the stream; 3, when it is oblique against it; 4, when it is coast-wise with the ebb; and, 5, when it is coast-wise against it.

When the expression "preventing the formation of bar" is used, there ought to be coupled with it, with reference to the defended power of the ebb by the interposition of the island between it and the sea's roll, "and the facilitating the removal of bar."

If a bar is formed only at a certain time of the tide, it very much simplifies the operation of meeting it. I believe that the bar, by the opposition of the two forces, only forms at one particular spot. That opposition is when the ebb tide is going out, and is met, not by the opposing flood, but by the sea affected, by the wind, and not by the tide. If the two forces meet each other directly, that is, when the ocean comes in directly facing the river, there is a sand formed, such as at Southwold, which is exactly right across the mouth of the river, as shown on the plan which I put in. My proposition is to raise that sand into an island, by promoting its formation; because, as nature has already shown a power of half forming an island there, I should suppose she would form a whole one if you provided her with favourable circumstances. It is evident that, when an island was raised on that sand, you would have, realised, a roadstead with two entrances; and if you could in any way realise that you would have the very great advantage of being able to get in and out with all winds.

28,684. Does that conclude what you wish to state under the first head?—No. I think that shows the effect that would be produced when the prevailing wind is in direct opposition to the outfall of water. But if the prevailing wind is in an oblique direction to the outfall of water, then the formation takes rather the form of a spit, but still it lies across the mouth of the river, and becomes equally a bar; and, in all cases, whether the entrance of the prevailing wind is oblique or direct, an island will have the effect of making still water in the river; and, by giving a double exit to the river, will prevent the position of the bar being direct, so as to lie across the mouth; it will rather form a spit at the end of the island; but, in any case, there would be no danger of any bar being formed by which ships should be prevented getting into the river, as they are by the very large bars which now exist.

If you have finished your statement on the first head, we will ask some questions on that, before we go to the next.

29,685. (*Sir F. Smith.*) When was your attention first directed towards this important subject?—When I lived at Dover in the years 1842–3, when I lived on the beach, there.

29,686. I believe that in front of the mouth of Dover Harbour there was always a considerable bar, with a wind in certain directions?—Yes.

29,687. How do you suppose that bar was formed?

LONDON.

Rev. F. Glover.

14 Dec. 1858.

Sir F. Smith.

—The shingle is brought up, by the sea, raised by the wind.

29,688. By the flood tide or the wind ?—During flood tide, when acted upon by certain winds.

29,689. And what opposing force is there to cause the formation of that bar ?—There, it dropped in, round the front, where there was a place for it.

29,690. If I understand what you said a short time back, it was, that a bar was formed by the meeting of the ebb tide and the sea raised up by the wind ?—Yes.

29,691. Now there was nothing to meet that sea raised up by the wind at Dover, was there, and so cause a bar ?—When the wind sets into a basin it always makes the water inside higher than that outside. Nature is always endeavouring to recover its level, and so, at every opportunity, there would be a tendency of the water to go out.

29,692. But there is no mass of water within Dover piers to be at all equivalent to the ebb of a river such as the Tyne ?—But there is a very heavy return. If the water is always blowing into a space, it becomes higher inside than outside, and that higher water is always acting like a return rapid.

29,693. But there is no great amount of back-water ?—No, not as a quantity, but there is great power in it.

29,694. Therefore your precise theory did not, I imagine arise solely from a consideration of the state of things at Dover ?—No ; I do not suppose it did. I have not affirmed that; but I was first of all led to consider the case by its being proposed to make a great work at Dover. There they proposed to build a work out in six fathoms water, and at a great cost. I proposed a plan of building which would make it much more easy to be done, and at a much less cost. It was afterwards, in consequence of the model being made for the erection of that work, that I was led to see that the principle of building would be applicable in all places where sand is formed. I saw, amongst others, this case of Southwold, which suggested the Island theory to myself. I found subsequently that wherever there was an island that there was a good entrance and exit both ways, and no bar, and therefore I concluded that my reasoning on the Southwold case was just.

29,695. When did you first observe Southwold ?—When the Tidal Harbours Commissioners First Report was printed.

29,696. Have you seen it of late years ?—I went down once, and Lieutenant Ellis was good enough to show me over the place. He was surveyor to the port.

29,697. What interval was there between your first and last seeing it ?—I have only seen it once ; but I saw the report of the Tidal Harbours Commissioners, and read all that was written in the engineers' reports upon that subject, and went there subsequently.

29,698. That bar is made naturally; by no artificial work ?—There are piers there, and there has been a great difficulty about them. They have been first in one direction and then in another, and have been lengthened, and it has been suggested to widen and to narrow them.

29,699. I think on the chart you have put in you show the bar at some distance from the pier heads ?—Yes. That is not my chart; it is a copy of the chart which appeared in the report of the Tidal Harbours Commissioners.

29,700. You have shown the bar extending nearly half a mile along the front of the river ?—That is the Hayle Sand, I think. That has been formed at various times. The inner bar which is formed at Southwold is spit. It forms the corner of the sand, as is indicated there, I think.

29,701. Hayle Sand extends far to the north-east or north-west of the harbour's mouth, I think ?—Yes.

29,702. How do you presume that sand has been formed ?—I conclude it has been formed from time immemorial by the action of the sea-water against the out-pouring ebb in on-shore winds.

29,703. Do you know how far it extends in both directions beyond the harbour's mouth ?—I conclude that that chart is correct.

29,704. And nature, therefore, has formed a mode of access to the harbour's mouth ?—Nature has formed that bank. If it were worked up into an island it would be a defence to anything behind it.

29,705. Is it not a defence now ?—Yes ; at very low water.

29,706. You think that if that was raised to a higher level it would produce beneficial effects ?—Yes ; it would make a safe anchorage behind it.

29,707. What depth of water is there between the Hayle Sand and the harbour's mouth ?—There are soundings in feet upon the chart. I think the depth is 16 or 17 feet.

29,708. You are disposed to think that that mode of treating all tidal harbour mouths will be beneficial ?—Yes, with certain modifications ; but certainly as a general principle : whether the island should be placed more or less obliquely, would depend on the experience of the neighbourhood.

29,709. Is your object to prevent the bar at the harbour's mouth, or, to form a roadstead in which vessels might take refuge behind the island, between that and the harbour's mouth?—Both. I suppose that when the island is formed at the mouth of the river, it will so alter the conditions, that the force of the river will be sufficient to carry itself out either way, without depositing.

29,710. Are there any other situations in which you have considered that this system might be adopted with advantage ?—Smithic Sand and Yarmouth Roads. But with regard to an island at the mouth of a river, I propose it for the Tyne.

29,711. Have you, on the spot, considered that you could place an island so as to be useful to the Tyne ?—I went there, having seen the Duke of Northumberland, when he was First Lord of the Admiralty. His Grace was so good as to ask what I proposed. He saw the reasonableness of it, and said he saw at once it was just what the Tyne wanted, and that good might come, if I addressed myself to the Conservancy on the spot, which I did.

(The witness was shown a plan of the Tyne, representing the works proposed to be carried out by Mr. Walker.)

29,712. You are aware of what is intended to be done at the Tyne ?—I gather it from the chart which shows Mr. Walker's system.

29,713. It goes out to the Herd Sand on the south side, and nearly to the same depth of water on the north. Do you imagine that that would be an efficient mode of dealing with the Tyne ?—I am quite sure it would not.

29,714. What do you suppose would be the result ?—The bar would form exactly as it does now, only farther out. They may go as far they like ; they may go 100 miles, and they will still have a bar. Nature's supplies are inexhaustible, and she will keep on filling up, filling up, filling up, as at Lowestoft. There they have carried out works seaward, and it is all filling up behind the pier; and after that is done, the sand will double round and form a bar as before. Sunderland is a case in point, on the north-east coast. There they ran out piers into water they supposed to be so deep, that no bar would be formed ; but after a short time, they looked out one morning, and saw a bigger bar than ever; a yellow line right across the harbour, which they had to dredge away by a dredging machine.

29,715. You have no doubt that at the mouth of all tidal rivers a bar will be formed with any projecting piers ?—I am quite certain of it ; and I think from the evidence which Sir J. Burgoyne gave the other day, he is quite sure of it too.

29,716. Have you observed other harbours, in reference to this great problem ?—I have not observed them all ; but I have read through the whole of the

Blue Books and the Tidal Harbours Commissioners' Report, which gives this experience of them all; that however far they run out, the remedy is only quite temporary.

29,717. You know of no case where the contrary has happened?—I am not aware of any, and I do not believe that any has happened.

29,718. Supposing an island were to be formed at the Tyne, would you carry out any part of Mr. Walker's system, or leave things as they now are, and form an island?—I proposed years ago to do something, but nothing of the kind that is now proposed by Mr. Walker. I think all that is mischievous, unless the opening be now defended by an island. I should say, whatever is done let it remain, and do not spend any more money about it. The extension of the piers which has taken place might cause the necessity of placing the island farther out; but I do not know how far the works have gone out. This, which I produce, is a plan showing the original proposition I made to the Duke of Northumberland in 1852 or 1853.

29,719. If an island were formed on your principle to the seaward of the Tyne mouth, are you of opinion that the present Tyne bar would be removed by the action of the river, or only that if it were dredged away it would not be formed again?—Ebb-bar would not form again. I do not mean to say that there would be no trifling formation, but nothing to what it is now. The effect of an island would be to prevent all the mass of water at the mouth of the Tyne being affected by the violence of the ocean; and the consequence of that would be, that you would gain all that space as anchorage,—all the outer part of the Tyne which is now useless, as well as up the river. There is a small space occupied by the men-of-war which they call their mooring ground. All other vessels may go to wreck, but the men-of-war must have a mooring ground. But when an island is placed there, the river will be all available; the space from behind the break-water, up as far as Peggy's Hole, would be available as anchorage. Spit Bar only would form, at the point south of the island, when the wind is in a northerly direction.

29,720. Then you admit that there will be a bar formed somewhere?—There will be a trifling spit; but now it is an absolute hindrance. It will only form in one direction.

29,721. There is a bar now at the mouth of the river, and you propose to construct an island beyond that?—Yes; an island seaward.

29,722. And then you admit that there might be a bar formed between the northern portion of that island and the north side of the Tyne?—No; I do not admit that. I admit that there might be a small spit formed along the north end under Tynemouth Castle, but a spit of no magnitude at all compared to what is formed at present, because, at present, all the power of the ocean acts there unobstructedly, and checks the drift power of the coast stream.

29,723. Would it obstruct the passage at the north end?—No, not at all. They would get down and lie under the lee of the island, at any rate.

29,724. What would be the effect at the southern extremity of the island, because if there is any detritus coming down the river it must go somewhere?—That will form a small spit at the south end of the island.

29,725. And go on increasing the length of the island continually?—Yes; which would be rather an advantage than otherwise.

29,726. Why should you imagine it would go across the channel between the main and the island, to the island side of that channel? Why should it not remain upon the mainland side of the channel?—As the stream could not go out to the north when the sea was pouring in from the northward, it would go out the way it could, which would be southward. There would still be opposition of two powers at the south of the island, and where they met, there would be a deposit of spit, which would be deposited in the direction of the line of opposition of the forces.

29,727. And what would be the effect if, when the ebb tide was running out, bringing with it a deposit, it were met by a south-east wind?—Then it would not go south; it would run north, as it ought to do.

29,728. You think, whichever way the wind is blowing, it will force the ebb tide in the opposite direction?—Yes; it would compel the ebb tide to obey its influence.

29,729. Would that be the case? Would the influence be obeyed? Would not the tide endeavour to escape in both directions, and form a bar on that side on which it is met by the wind?—It would go in the direction in which it would receive the least opposition, and it would have the least opposition at the end of the island furthest from the wind; so that the ebb would go where it might be assisted by the wind as it went out.

29,730. You have a tide coming from the south, have you not?—But that, the ebb, does not hurt us. The river ebb and the south tide will help each other.

29,731. Still you will have some portion of tidal water running from both directions?—That would not be quite the case; the tidal water would not run in both directions.

29,732. Would not a proportion of the ebb try to escape in both directions, in the case of the Tyne?—If the wind is from the south, as the ebb is to the north, there is no opposition.

29,733. Then the whole runs out to the north?—Yes; and the material is carried away entirely. There is no deposit.

29,734. But supposing an ebb tide and a northerly wind?—That is the time mischief will occur.

29,735. Where will the mischief occur?—There will be a spit formed under Tynemouth north head, and also at the south end of the island.

29,736. Will the mischief which arises at one tide not be increased at another, and so go on accumulating?—The whole conditions of the place will be so favourable when the island is made, that there will be a constant stream of water through. You will have a much greater advantage of the stream, whatever it might be, both ways, whenever it can go out unobstructed by the weather; so that the mischief which occurs to-day may be remedied to-morrow by the natural action of the water when all the conditions of the wind are more favourable.

29,737. Suppose the wind continues for a series of days?—Then the formation will be greater; but afterwards, when the conditions become reversed, then there will be a continual wasting away of the formation. Nature will have a tendency to restore herself.

29,738. Will there be any tendency to form a similar bar on the opposite side, with a total change of conditions?—No; it can only occur on one side, and that is when the ebb is met by the opposing wind.

29,739. (*Capt. Washington.*) You were asked how long you had resided at any port having a bar harbour?—I have never resided at any port having a bar harbour, except Dover, and that is hardly in the condition of a river harbour.

29,740. Dover cannot be considered a river harbour?—No.

29,741. The bar there is due to the shingle that was washed from the east, I believe?—Yes.

29,742. You are aware that since the groin or pier has been run out the shingle has entirely ceased to travel, and it is no longer a bar?—No; I do not know that; but I do not think that alters the state of the case. There has not been time for the bay, formed by the pier, to fill up with shingle. By what is called the Admiralty Pier (the ground that lies in the bight between the Admiralty Pier and Shakspere's Cliff), must be entirely filled up with shingle before we can judge of the effect.

29,743. The portion of ground?—The portion of sea ground or foreshore which lies between the Admi-

LONDON.

Rev. F. Glover.

14 Dec. 1858.

Capt. Washington.

ralty Pier and the Shakspere's Cliff will have to be filled up entirely by shingle ; so that, so to speak, the Admiralty Pier may become another Dungeness.

29,744. Do you contemplate the possibility of that place ever being filled up with shingle ?—Yes ; I have seen as much filled up myself opposite to East Cliff.

29,745. Where is that ?—At the other end of the bay, by the Jetty.

29,746. Do you know any instance of shingle travelling below the low water of spring tides ?—No. I do not think that affects the case, because the ground will keep shoaling. The whole ground will keep shoaling, so you will alter the character of the beach. There was a remarkable instance of that, when the land-slip took place at Dover, under Abbot's Cliff. There was a projection there of 19 acres made in an instant into the sea. For a time that stood out like a promontory ; but now, the angle has been almost entirely filled up, on one side, by shingle; and so, the ground has shoaled.

29,747. It has entirely stopped the travelling of the shingle from there to the eastward ?—I believe it has, as yet.

29,748. So much so that you cannot get shingle enough at Dover to carry on the works, and are obliged to bring it from a distance ; are you aware of that ?—No.

29,749. Such is the case ?—I conclude that there will be plenty coming up in time.

29,750. You said you had a proposition for Dover differing from that carried out by the present engineer, and which could have been executed at a very much less cost ?—I will explain what that was. It was proposed to lay down a work a mile and seven eighths in length, but I never meddled with the plans which the engineer proposed. What I proposed to do was, to lay down that work upon a cheaper system of building. I did not in the least alter the plan of the engineer. I did not express any opinion against it, and I do not now. I dare say it was very good. I said it was a grand plan. I say so still.

29,751. Can you state what the construction of such a work shall be ?—At that time I printed an estimate, which is, I believe, amongst the papers that have been sent in to the Commissioners. It is accordant with a model now in existence, and which may be seen at the United Service Institution.

29,752. Referring to your papers which have been sent in to the Commissioners, I see that Table No. 4. of the estimate gives the total cost of the whole work at 411,000*l.* ?—Yes; I said 500,000*l.*, but then I had to amend that—thereabouts.

29,753. I wish you to state the sort of work which is to cost 500,000*l.* at Dover, and to be a substitute for the work now going on ?—That work would be a wooden case, filled with concrete of shingle and chalk.

29,754. Do you know of any similar work elsewhere that will stand the action of the sea ?—No ; I do not know of any similar work elsewhere, but I am certain that this would stand the action of the sea, because it would make a new foreshore. That foreshore would be of chalk, and it is found at all the adjacent places wherever there is a chalky shore that it becomes covered with a bearded sea-weed, which protects it from the action of the sea ; so I conclude, if you put chalk in Dover Bay, Nature will produce the same effect upon the chalk face there that she does on that in the neighbourhood adjacent.

29,755. Would not the timber decay ? — That would be of no consequence, seawise, because the chalk would take its place, and be defended from the action of the sea by the bearded sea-weed : the land side face could be renewed with ease from time to time.

29,756. We understand the plan to be a timber frame filled in with concrete and chalk, or both ?—Yes ; the model of which is producible, if desired.

29,757. Did you ever place a plan and estimate before a contractor, and get his opinion as to whether the work could be carried out for the price you have named ?—No. I spoke to Mr. Peto, and he admired it so much that he recommended me to speak to an engineer, to get him to propose it. He said, "We are "not engineers ; we are contractors ; but we are quite "ready to carry out that work if an engineer proposes "it to us ;" and he referred me to Mr. Cubitt. But Mr. Cubitt had a plan of his own. I do not mean to say he opposed mine on that account ; but, instead of answering my suggestions, he said, "Gentlemen "theorists were very useful men, and practical men "were very much obliged to them ;" but he gave me to understand that they were not much to be depended upon. I made him a low bow, and came away. He did not take any serious notice of the plan. But that was what Mr. Peto suggested that I should do, and he was so obliging as to give me his card, that I might introduce myself to Mr. Cubitt, as presented by him. Mr. Peto further said, "Your plan com- "mends itself to me for its extreme simplicity, and "for the entire absence of all ground fastening. You "depend altogether upon natural gravitation for your "work."

29,758. Did you propose that work should be connected from the shore, or detached ?—I did not make any alteration in the plans proposed. The Commissioners were to have two moles going out from the north and south ends of the proposed harbour, and a long island intermediately between them, with an opening at the east and another at the west.

29,759. Then you did not object to that plan ?—Not at all.

29,760. Only to the mode of construction ?—I did not object to the *mode* of construction. I only said that the manner in which I proposed to construct it was easier, for I supposed the other was impracticable, on account of the great depth of water, and that it could not be done under ten millions.

29,761. Have you not stated that you considered the works going on at Dover to be a useless expenditure of public money ?—Yes, carried on in the present manner ; because they could have been done at a much less cost. If 650,000*l.*, as has been affirmed, has been expended in the works there, which are not anything like approaching completion, and the whole could have been done for 500,000*l.*, it must be evident that that is a waste of public money.

29,762. Are not these hypotheses ? You have never carried out a work yourself ?—No.

29,763. You state you have never put your mode of construction into the hands of a contractor or engineer, to see whether it could be carried out ?—I know it can be carried out, because Colonel Jackson, who is an engineer, confirmed my view of it.

29,764. Has he carried out works himself ?—He has.

29,765. Where ? — In the River St. Lawrence. He was in the Staff Corps, and very much employed in making under-water constructions in the River St. Lawrence. I did not move in the matter at all until I had got his guarantee that the thing was practicable. He was ready to undertake it, if necessary :—not that he *desired* it at all, but he was ready, and attended with me at the Admiralty when the model was viewed by the then Lords of the Admiralty.

29,766. I think you said in the evidence, that where there was an island formed at the mouth of a river there was no bar. Will you state any cases that you are aware of in which that occurs ?—I cannot mention the cases off hand, but they are contained in the report of the Tidal Harbours Commissioners. To recur to your former question : I said the work at Dover could have been done for much less than 650,000*l.*, because at the time the work was to be commenced, Mr. Walker, or the contractor, had the command of an excavation of 18 acres of chalk and shingle conglomerated, to a depth of 40 feet, upon trams. The Duke of Wellington saw the model at my house of the work into which this mass of excavation could have been thrown. I called upon his Grace to come, at the time they were throwing it into the bay of Dover. I think Captain Washington

was aware what was being thrown into the bay, because when I was before the Commissioners, he put certain questions to me that necessitated certain answers, to the effect that the excavation was, at that time, being hoven into the bay. At that very time, some of the Commissioners had objected to Dover being selected as a harbour of refuge at all, from the tendency which there was to silting up. I think Captain Washington himself had obtained an order from the Admiralty that the throwing in of this stuff should be discontinued; and on one occasion, when I was going into Suffolk, and he to Harwich, and we met at the station, and he asked me what was going on at Dover, I told him that they were renewing the process. Afterwards, because it did not seem to be discontinued, I reported this to the Duke of Wellington. I called upon him to come to my house, before he went to a certain Harbour Sessions, to satisfy himself of what I had stated. He saw that what I said was practical; a plan greatly reducing the cost of the work, by turning all this material, which was being hoven into the bay, into the great cradle which I proposed to let down. If that had been done it would have reduced the cost from 500,000*l.* to 250,000*l.*, by taking advantage of the material which was already on the trams. Instead of that, it still continued to be hoven into the sea, and there it now is in the bay, and some day it will all have to be pulled up again by the dredging machine.

29,767. Did you ever lay your plan before the engineer for the works at Dover?—No. I might have known that there *was* an engineer, but I did not find any very great encouragement to do so. The Duke of Wellington went away from my house to the Harbour Sessions very much impressed with what he had seen. It was a great deal spoken of, and, in consequence, Sir George Back came and examined the model. After he had spent four hours in looking at it, he said, "You have not a moment to lose; "you had better go and speak to Lord Haddington "to-morrow." I did so, in consequence of his opinion, for he had been employed by the Government to give an opinion on some other cases. He had been told that this plan of mine was a copy of another man's plan, upon which he had been called upon to report; but such was the result of his investigation of my plan. If that stuff had been hoven into that large case, at the time I have alluded to, it would have saved 300,000*l.*; for, the excavation is made; it has been on the trams, and is absolutely wasted by being thrown into the sea and made to do mischief.

29,768. If you have finished your statement I should like to come to the bar harbour. Will you name any river harbour that has an island off its mouth, and has no bar?—Oban in the Hebrides is a case, where there is no bar.

29,769. There is no river at Oban, that I remember. It is an arm of the sea, with an island lying before it?—In the documents which I sent to Admiral Walcott, and which he has forwarded to the Commissioners, there is a statement of all of these cases which I have extracted from the Tidal Harbour Commissioners' Report.

29,770. Perhaps it may assist you if I enumerate the rivers without bars in the United Kingdom. They are the Thames, the Medway, the Humber, the Orwell, the Severn, the Forth, the Tay, and the Shannon. Perhaps, not strictly speaking, but, in the general acceptation of the term, these rivers have no bars at their entrances. Has any one of them got an island entrance?—I should think all of them had, if you consider under-water islands. Great shoals are islands, in a certain sense. The Thames is full of large islands, only they are not visible.

29,771. By islands we are to understand that you mean shoals as well?—I do not mean to say that. I say they can hardly be said to be rivers without islands, because these great shoals to a certain extent act the part of islands, particularly at low water; and such rivers are all, more properly, 'Arms of the Sea' than rivers. All these can hardly be called 'Rivers,' in the sense of a narrow-mouthed river. The Shannon is an arm of the sea, and the Thames and the Forth are also both arms of the sea.

29,772. Then your plan for the improvement of rivers would not apply to those?—Well, I think there *should* be a great work upon the Thames somewhere, not only from the depth of channel which may come of it, but as a refuge. The Galloper Sand, or some of those, might be worked into islands; but I do not think that any of these that you have mentioned are to be considered as rivers, in the sense in which I use the word river, when I propose to put an island before a small river.

29,773. But they are rivers and some of the principal rivers of this country; there cannot be a doubt of that. But they are not suitable for your particular purpose?—I do not know. I consider these rivers as being arms of the sea rather than rivers. The power of the sea, for instance, in the River Thames is hardly felt while you are lying behind shallow water; but, at the same time, I am quite sure that there is a great improvement to be made in the Thames by islanding it, perhaps in more places than one. It would have a great effect in improving the course of the river and the fair-ways of the river.

29,774. Will you name any river besides that at Southwold to which your plan is applicable?—I do not name any, because I say it is applicable to all. There is no river that debouches to the sea to which it would not be applicable. I do not say the Humber, because that is also an arm of the sea; but opposite to any small river where it could be laid down at all, I say it is applicable; and it could be laid down anywhere, whatever might be the foundation, whether mud or sand, in any depth. Whatever the bottom may be, you can lay down this work. That that bottom is a bad foundation, does not affect the case; it will stand equally well upon a bad foundation as upon a good one.

29,775. Do you know any instance of an island having been created or recommended to be created at the mouth of a river?—When I met you at Cologne, two years ago, you told me that there was some idea of putting an island in front of the Liffey, I think; but up to that time I do not think that I had heard of such a case. I said I was glad to hear that that the idea had at last been entertained.

29,776. In 1800 Sir Thomas Page proposed an island at the entrance of the Liffey?—I am very glad to hear it; it makes another authority in favour of laying islands in front of rivers.

29,777. I suppose if it had been thought a good thing it would have been acted upon?—It is fair to suppose so. Some time ago I proposed to make an island in the case of Wexford, *i.e.* to convert sands into an island; that was two years ago.

29,778. Could you lay before the Commissioners a plan for the improvement of Wexford Harbour by means of an island?—Yes; I have it here. That arose in this manner:—I applied to Mr. Walpole, the member for my University, to use his influence that this thing should be brought before the Government in such a way that they should take it up; and I wanted to be examined before the late committee. But owing to some informality, or the wrong time of applying, it could not be brought forward. Mr. Walpole, however, went to Sir John Pakington, and it was agreed that if I would give my ideas upon the state of Wexford they should be appended to the report. That was in the month of June or thereabouts. It was too late; I had not time to do it. But I have now sent to the Commissioners three plans referring to Wexford, and have prepared a manuscript which explains them.

29,779. Which of the three plans you have sent in represents the work you propose to carry out at Wexford?—No. 1. is what might have been done before the work was begun at all; before Wexford Harbour was touched at all.

29,780. You cannot undo what has been done?—

LONDON.

Rev. F. Glover.

14 Dec. 1858.

Capt. Washington.

If that be impossible, No. 2. represents the present state of things, according to Captain Frazer's plan; and No. 3. represents what now remains to be done, *i.e.* what it would, under the circumstances, be best to do. The manuscript which I have prepared is, in fact, a report upon it.

29,781. Can you describe that plan in any way?—Yes. No. 2. represents the river embankment according to the present state. Upon the third plan, the line of embankment on the south side of the harbour would take an S form (ʃ), instead of the curve represented, for the purpose of taking in more of the slob.

29,782. You think it is desirable to embank more of the slob inside the harbour?—Yes, because the evil is that you have too much back water, and the more you diminish that, the more you diminish the evil under which you suffer; and, seeing that you *are* embanking, it is as easy to embank in one direction as in another, and the more the ground you enclose, the more money you have to help to pay the expense of doing it.

29,783. Externally you propose to place the island breakwater somewhat in the shape of the letter S?—Yes; upon the Dogger Sands, which lay outside of Wexford Harbour.

29,784. What is the length of the work, do you know?—About a mile and a half, I think.

29,785. How do you propose to construct it?—By wooden cradles, so as to allow the sandy water to come in; the water to come in dirty, eddy, and then to go out clean. As the sand is so rapidly formed, I conclude there would be plenty of sand to rapidly form an island.

29,786. You would propose a north and south opening?—Yes.

29,787. Do you consider that the tide would keep both those openings?—Yes; I conceive the drift of water running through would keep them open, assisted by the stream. Sometimes the weather would be bad, and sometimes it would be favourable; but I suppose, that on a balance of conditions, the ultimate result would be very favourable.

29,788. If the strength of the present tide streams cannot keep the channel open, why do you suppose that it will keep open two?—The present tide stream closes up the channel. It is the tide stream which does all the mischief. The outpouring of tidal water from the lagoon *plus* the river water is so enormous, it comes out like an undersea waterfall. An extraordinary phenomenon in water engineering is that which is caused by the outpouring ebb at Wexford. That it is not an accident, nor anything dependent upon the particular locality, is evident, because the same thing occurs twice in the same river; once at Enniscorthy Bridge and once at Wexford, where holes are scoured out by the violence with which the pent-up backwater forces itself through narrow spaces: it drives through, and makes frightful pits.

29,789. Is not that the case in every harbour of the world where there is a narrow entrance, and the stream forces its way through?—That may be; but that it is not entirely local is clear from the fact that it occurs at three different places. It is a great evil, and an evil that has not been considered sufficiently, I think, by water engineers, who are always talking about the necessity of backwater. Now, as Sir John Burgoyne has said, if the effect of an excessive force of backwater is to form bars instead of removing them (and this is a most favourable instance), if that be so, then it becomes necessary here to reduce the backwater as much as possible: my plan would have that effect. The Admiralty, I believe, consented to the erection of these Lines because there *was* too much backwater; and that being the case, it would have been better still more to have reduced the evil, by making the Lines such as would, at the same time, have given more return.

29,790. You are aware that it was the Astronomer Royal who first pointed out the effect of the scouring action of the Slaney at Wexford?—Yes; I have read it in his report, and very interesting it is.

29,791. Have you formed any estimate of the cost of the breakwater which you propose to place at the entrance of Wexford Harbour?—Yes; I think it will be 150,000*l.*, but I cannot exactly say as to that. I will take the liberty of correcting that statement afterwards, if it should be necessary. It may have been less; perhaps it was.

29,792. I think you said your plan would be applicable to the Tyne?—Yes, I did.

29,793. And you went to Newcastle with the view of laying it before the River Commissioners?—Yes, I did.

29,794. Did they give any opinion upon it?—The River Commissioners, I suppose, like all River Commissioners in other places, did not know much about the matter. They had a plan prepared by their own engineer, and it was natural that they should back up their own engineer. They could not do otherwise, as the case was. If a stranger came, and proposed an alteration and a change, it was not very likely that they should take up with his suggestions, not being able to go into the matter very scientifically themselves. They backed up their own man, and, the consequence was that, I had my journey for nothing.

29,795. Had you ever been to the Tyne before?—No.

29,796. Have you ever been at Wexford?—No; but I say, as Mr. Airey said, that it is not necessary to go to a place, if you have soundings and experience of the place reported. Of course, afterwards, if any works are proposed to be done, then it might be very desirable, before everything is finally adopted, that a person should go and examine the locality. With the knowledge of Wexford, as acquired from reading, the Lines in my plans are given as a rough outline of what may be done there.

29,797. Then we are to understand that your proposal is an entire hypothesis; that it has not the support of any engineer, except Col. Jackson, whom you mentioned, and that it has never yet been tried in any place?—Well, I cannot admit all that, because there are a great many other engineers who have seen it. Col. Sykes took a great interest in it, and he had it examined by Mr. George Rennie and Captain Brandreth, whose opinions were favourable.

29,798. When I spoke of engineers, I spoke of those who had actually carried out such works?—Mr. George Rennie, I believe, has. His father was engineer of the Great Plymouth Breakwater, and the son was acting under the father.

29,799. Can you give any reason why, if engineers suppose that these low-priced works would answer the purpose, they do not adopt them, instead of erecting such costly structures?—I think, if I may be allowed to say so, that the Harbour of Refuge Commissioners made a mistake when they laid it down as a principle in their report that works only of a *permanent* character should be constructed. I have no objection to the use of the word "permanent"; but, when they said that permanent works should mean stone works, then I think they made a mistake; because there are hundreds of places that require treatment which cannot carry stone work: and, when they lay it down as an absolute rule, that, unless stone be used they will sanction nothing, they preclude themselves from the execution of many works which are much required. I think myself, that stone works, which are of a frightful cost, are very uncertain. If stone work come on a bad foundation, it is all done for; but if you have a wooden work it does not cost so much at the beginning, and you can renew it; and, it is not so likely to suffer from a bad foundation.

29,800. If you say you know of no works of the sort you recommend to be found in England, do you know whether foreign engineers have ever countenanced the idea?—No.

29,801. Are you aware that the large structures at Cherbourg,—that all that is of stone?—Yes.

29,802. That apparently shows the opinion of the French engineers?—Yes ; I think that is very likely; but I do not see that it is absolutely necessary that we should follow them, because I think, that, when wooden works can be constructed for one tenth of the amount which would be expended on stone works, that that would enable you to do many more works for the benefit of the present generation. Let the future generations look after themselves. In many places you cannot put stone work, if you would. Now, Wexford is a place that requires to be treated ; but if you lay it down as a rule, that you will have nothing but Stone Work, why then, Wexford must go to the wall.

29,803. When you mention the Harbour of Refuge Commissioners recommending permanent works of stone, are you aware that that was only as applied to Dover and Portland?—*I* did not so read the report. I am glad to hear that.

29,804. The Refuge Harbour Commissioners had nothing to do with tidal rivers. It was only Portland, Dover, and Seaford which they recommended should be done in stone?—When I came before the Commissioners, Sir Byam Martin seemed to think it was strange that after they had given a report in favour of stone works, a man should come forward and propose to erect a work of wood. He considered it was a kind of reflection upon their judgment. I had nothing to do with that. I said you are going to build a great work, which is to cost, so much. *You* say, two millions ; but *I* should say rather 10 millions. And what I said has been justified by the outlay that has taken place at Dover. There, there has been 650,000*l.* expended, for about one-tenth part of the work to be done, even *less* than that. That, too, is the most favourable portion: all the rest of the work that is to be done there, is infinitely harder than anything which has been yet attempted. Yet, this part has cost 650,000*l.*, and Col. Sykes said in the House of Commons that the whole thing would cost six millions ; but in that I think he is mistaken, for it will cost 10 millions if it be carried out in stone work ; and I say, to throw away 10 millions, to expend that sum, upon works that could be done for 500,000*l.*, is a frightful waste of money. I was prepared to show, and can show, and I maintain still, that if the work had been put down as I proposed, it would have answered all purposes, and have been finished in two years.

29,805. You would recommend the Government to expend the public money in putting down timber cases filled in with concrete as a shelter or refuge harbour in Dover Bay or elsewhere?—Yes, certainly, everywhere.

29,806. (*Capt. Sulivan.*) I suppose I may consider that the success of a work of this kind would depend upon the stream outside acting with the stream of the harbour to keep the entrance open?—I think that would be the case.

29,807. If it was perfectly still water, and there was no tide outside, the effect of such a work would be to divide the stream into two, and to have two entrances into the river instead of one, would it not?—Yes.

29,808. And consequently there would be less power in the stream to overcome any tendency in the sea to form a bar at this entrance than if there was but a single one?—That is possible.

29,809. Therefore the success of your plan, if it be carried out, would depend upon the coast stream being added to by the force of the river stream to keep each end open better than one stream at present keeps the bar open?—Will you allow me to say the sea has a tendency always to draw one way or the other, so that the conditions you propose will never take place in our seas.

29,810. That is what I want to come to. Can you tell me, when the tide turns to the north, how does the ebb tide from the river go? Can you tell me whether the turn of the tide on the coast occurs at the same time as the turn of the tide of the river stream?—Not instantaneously.

29,811. But about?—Yes, about.

29,812. Then the ebb tide would commence to run to the north about the time that the ebb stream would commence to run out of the Tyne?—Allow me to say that the ebb stream will not run out of the Tyne until the ocean makes room for it. The ocean makes room for it, and then the river stream flows into the ocean.

29,813. Exactly. Then the two streams very nearly coincide?—Yes, about.

29,814. What do you depend upon, then, to prevent a bar from forming at the end of your island, because if you have nothing of that kind to keep these ends clear, can you explain why a bar will not form by the action of the sea meeting the action of the stream at the ends, just the same as a bar is formed now at the entrance of the river?—If the ocean ebb comes from the south, as it does, and the ebb comes from the river, the two will go out together. There will be no opposition. A bar is formed by the wind blowing in from the north. That is the time the bar is formed.

29,815. Are you satisfied that southerly gales of wind bring no accumulation of sand in the south part of the River Tyne?—They may do so. I dare say they do so.

29,816. Are you aware that the sand is accumulating from the south at the back of the south pier at present?—Of course, wherever the water comes up dirty and eddies, by being obstructed, it does.

29,817. And by the action of the sea along the shore apparently the sand is heaped up now at the south end of the south pier?—Yes, and for this reason ; they made a bay for it. It cannot get on, and so it will fill in there.

29,818. How will an island in any way alter or prevent the sand coming from the south, and travelling with south-east or south gales along the shore, from accumulating at the entrance of the river and inside your island?—It will not, so long as the south side is not filled up, south of the pier which has been now run out ; but when that is close filled up, the sand will not stop at the mouth of the river on the ebb.

29,819. You stated before that the north-east wind would dam up the ebb tide, and change the current. Do you know that for a fact, that the wind would alter the tide so much as to stop the current which now runs to the north?—The wind will not alter the tide at all.

29,820. I may have misunderstood you, but I certainly did understand you to say the north-east gales,—the wind from the north and north-east,—would check the stream of the ebb tide running to the north going out, and would drive it back?—When the wind comes from the north it heaves the sea up to some height, and it meets the river. To the north it is higher, so to speak, than at the south, and therefore there is less opposition to the south, to the ebb of the river, than there is to the north. I say that when the wind is from the north, the ebb of the river will not take place through the north entrance, but through the south.

29,821. Then you consider that the wind wave travelling to the south will overcome the tidal wave travelling to the north in the North Sea?—Quite so at that spot.

29,822. Do you know that as a fact? Do you believe that the natural ebb flow of the tidal wave running to the north is actually stopped and overcome by a northerly gale?—I am certain of it, because it makes the water higher. People are very little aware of the enormous power of the wind upon the waves. Memel is often completely under water, so to speak, when the water at the other end of the Haf is quite low.

29,823. That is going into a bay or an estuary with no escape ; but can you tell me a case in which a gale along an open shore has had this effect of overcoming the tide upon this coast, because I have never known such a case. You often find the tide causing a heavy sea running against the gale, but it

LONDON.

Rev. F. Glover.

14 Dec. 1858.

Capt. Sulivan.

is not often that you find the tide actually overcome by a gale setting in an opposite direction in an open sea like the North Sea ?—If the gale raises the water so high as to make a hill then the sea will find its own level, and return, not against the power that raises it, but under-about.

29,824. The tendency of a gale would be to make it high where it runs in an estuary or against the land, as in Lynn Deeps; but what I want to know is, would the actual tide without, upon the open part of a coast like the east coast of Yorkshire, be overcome by a wind blowing from the north ?—I am certain of it.

29,825. But its doing so would make your plan less valuable, would it not ? If the tide would always flow north and south with the river stream it would keep the ends more clear than would be the case if the tide was dammed back by the wind, would it not ? —I cannot say. As the water comes up from the north-east it becomes higher then than the ordinary level; and, as it rises higher than the ordinary level, so it rises higher than the outgoing ebb.

29,826. Do you think that the gales along the coast can make such a difference of level in a short length like your breakwater as to have a higher wave to the north than at the south, and so turn back the current there ?—No ; but if it is only an atom it is sufficient to make its influence felt.

29,827. And would not the effect of the ebb tide being checked back be more likely to form a bar than if the natural flow of the tide from the north and south went on unchanged ?—No : the *channel* would aid the stream of the natural flow.

29,828. Is it not making your case more difficult by supposing the wind checks the action of the tide, so as to cause it to flow in a different direction ?—I am not contending that there is no difficulty in the case. It is a case of great difficulty. I am only saying these are more favourable conditions for a harbour than those which now exist ; and at the same time I answer the direct question by saying the water will be higher at the north than at the south, if only an atom, and if so then it will be felt in giving the river a tendency to make the easiest debouchment instead of the most difficult. If the sea is only one atom higher to the north than to the south, the river will go the lowest part.

29,829. Do you believe that in easterly gales along the shore there is an increased height of water in the direction in which the wind is blowing ?—On the contrary, sometimes it will be the reverse ; but in such an open sea, where there is no absolute end, it will be higher nearest to the quarter from which the wind blows than further down the coast.

29,830. I think you are mistaken in that view, and I think you are raising a difficulty against your own plan; for if the tide remain sflowing from the north to the south, and changing with the current of the river, would not that be more likely to keep the ends open than any other condition ?—I hardly understand your question.

29,831. If the coast tide changed from north to south at the same time as the river ebb and flow changed, so that you had always the tidal strength, the stream due to the coast tide and the river tide, running out to the north, would not that be the most favourable state of things which you could have for keeping the passage open ?—With a north wind it would be the most unfavourable.

29,832. Do you not believe that the tide to the south would be stronger if the ebb tide to the north is checked by the wind ?—Yes ; there would be no ebb tide to the south unless it were checked by a wind. It is not the flood tide we are speaking of, but the ebb only.

29,833. But, if the effect of the wind is to check the tide running to the north, it would have the effect of making the tide to the south stronger, would it not ? Where is your water to go to if there is no tide running to the north, while it is blowing hard with the flood tide which has accumulated ? Where is the water to go to ; ocean I mean ? If the ocean tide is dammed back by the north wind, how can this go on without filling the north sea up to the south entirely, and throwing back the whole of the ebb tide ?—It returns under-about.

29,834. Do you think that there is no reflux to the north while it is blowing from the north ?—The thing is, that it goes backward, that is, returns, under the surface of the sea.

29,835. A counter-current underneath ?—Yes, the tide goes underneath.

29,836. Can you tell then how it is that even in the heaviest weather it is a common thing, when the tide sets along the coast, for ships to make their passages with the tide, and get up against the wind. That is a common thing, continually done upon the north-east coast, and we have it in evidence that ships can even work round Flamborough Head, against the strongest gales of wind, with the tide ?—That is quite possible. Running water is a very queer thing indeed, and is capable of sustaining two or three counter-movements at the same time and place.

29,837. If that be so, would not it appear that the run of the tide upon this coast remains unchecked by northerly gales ?—The wave of the sea which comes from the north has full power to raise itself against the tide stream ; and if there were an opportunity for the stream to go to the south under-about, it would rather take that, the way that it *could* take, and go the easiest way, than run against the ocean wave.

29,838. If the tide is running to the north, if it be an ebb tide to the north, there will be a steady current through your passage inside, whichever way the wind is blowing ?—I doubt that, against the wind when sufficiently powerful to raise a sea.

29,839. There is the point. It all hinges upon that. I think that upon that point you are entirely mistaken. The tides may be checked comparatively ; but that the ebb tide should be altered and changed into a completely opposite direction by any gale, except just in the case of water being heaped up in an estuary, is a thing which I think will not be found to occur really ?—Then if what you say be true it only makes this plan better.

29,840. I think so too ; but I wanted to understand upon what evidence you ground your statement that the tide along the coast is altered by a change of the wind ?—Upon the coast of Yarmouth it is found that when the wind blows hard on shore all the manor is taken away : what is the cause of that ? the level of the water is raised, and it cannot run back against the wind, which is blowing it up ; so it is obliged to go underneath. The same would be the case here.

29,841. In that case there is no opening ; but in the case of your entrances there is an opening for the water to flow through ?—I am speaking of the power of the ocean ; not of the tide.

29,842. I think you are mistaking the power of the waves on shore altogether ?—Now that I understand what the difficulty is, I will reconsider this matter, and communicate further with the Commissioners upon it.

29,843. I do not think that is against your plan ; but perhaps it was rather a difficulty you were raising against it. But the difficulty I want you to explain is this :—What is to prevent the gradual accumulation of the sand, both from the north and the south, travelling along the shore, as it does now, still accumulating off the mouth of that river inside your breakwater, so as at last to fill up the entrance between the island and the shore, and make a double bar, as it were, at the entrance of the river ?—At what time of tide will you have that travelling sand ?

29,844. I am speaking of that travelling along the shore, which appears to be caused by the prevailing gales from either quarter, heaping up the sand, as we now see it heaped up at the back of the pier at Tyne? —When the sand is travelling from the south, the ebb of the river will also travel south.

29,845. As long as you keep these matters so that the two exactly agree ?—At other times, when it is

travelling from the south, it will be flood tide, and it will all go up the river together.

29,846. When the sand is travelling with a gale on either side, and is brought inside your island, along the shore, as it now is, towards the mouth of the Tyne, what will arise from that sand heaping up at the mouth of the river, as it appears it must do?—You have made a barrier by running out a pier, as I understand.

29,847. I am speaking of this, if your island is put here, instead of these works?—But the thing is done as it is shown upon the plan.

29,848. Yes; and it accumulates the sand?—Yes. This pier which has been run out stops it, because it has been made for it to form against outside.

29,849. You think the stream of the tide north and south would keep the channel open to a certain breadth inside the island at all times?—Yes.

29,850. And that the current of the river would be sufficient, with the tide there, to prevent any bar from forming at the end of your island?—When the current of the river concurred with the ebb there would be no bar at all, or at least a less bar than there is now. The formation that would take place would be a small spit; but no bar, so to speak, would form there at any time; it would be a spit. Under adverse circumstances the tendency to form a bar would be at the south end and at the north of the island.

29,851. That was the point which I was now coming to. At the south end of your island you would have no current to prevent the formation of a bar, except the coastal tide to the south, would you? The stream of the river would not act to overcome it in any way. It would only be the coast tide to the south that would tend to prevent the formation of a bar at your south entrance?—The flood of the ocean would help the stream. As the stream comes out, the three streams would concur: the Ocean stream, the Roads stream, and the River stream would all come out together.

29,852. If the ebb tide from the river runs to the north with the ebb coast tide?—The ebb tide of the river runs to the north.

29,853. With the ebb coast tide?—There would be no bar.

29,854. None to the north; but as the flood of the river would be running in, and you would have no river tide to help the coast tide in the south entrance, how will that coast stream alone be sufficient to prevent the formation of a bar at your southern entrance?—The flood tide as it comes in from the north will check the flowing of the river, and also, when the flood tide comes up, to turn the southern end of the breakwater running up there, you will have the two streams, which will concur and run up together, until you have high water.

29,855. You will have two powers, but you will not have more in reality than you had before?—The utmost is, what will run through the river entrance.

29,856. Then the tide which runs from the south will be much slighter than that which runs from the north?—I should think it would be exactly the same.

29,857. How will that tend to keep the south side of the river open, and prevent the formation of a bar?—First, I lay down as a general proposition that a bar is not formed by the flood tide. I deny that altogether. It is only *formed* by the ebb tide. The flood will come in at a north entrance: a minute or half a minute later it will come in at the south, and they will go to the centre, where they will join, and run up the river together.

29,858. Then upon what grounds do you suppose that the ebb tide will not split in the same way, and run out from the two entrances?—Because I say that there is always a draw in the sea, one way or the other; and whichever way the sea draws, in that direction will the river go, and the only difficulty will be, when the sea is dead or right on against the shore.

29,859. I am speaking not of the sea, but of the tide. If the coast tide to the north is strong enough to overcome the ebb of the river in a southerly direction and make it all go in a northerly direction, then surely the flood tide towards the south will be sufficient to overcome the flood at the south entrance, and if it flows in at both entrances will it not also ebb through both?—No; it will go out at the end where the water is lowest and there is least resistance.

29,860. Then in the same way at the flood would it not flow in at one end?—No, because the conditions are quite altered. It depends on the rise of the water outside.

29,861. At present where a river has three entrances formed by sandbanks, such as in the case of the Thames, or the river at Wexford, the tide ebbs and flows through all those, does it not?—At different times, with little variation.

29,862. Then if you form, as it were, a bank or island, and say that the tide will flow in at two entrances, will it not equally ebb through two entrances, and if it does so will you not be dividing the strength of the stream, and so much increase the action of the sea, which forms a bar, by weakening the force of the stream?—I wish I could, because I think people are wrong in thinking that it is all to be done with backwater. I do not think so.

29,863. Take the case of Wexford. We have had it in evidence from engineers, that, by blocking up the centre of the three channels, making an island or sandbank, the other two channels would be deepened?—I have not seen that. There is only one entrance, is there?

29,864. There are two entrances, one at each end of the bank, and a third, a shallow one, formed by the current issuing through the bank, which it is proposed to close, and make it an island, and so divide the river into two channels?—Well, I never have heard of that before. It is, however, what I recommended to be done two years since. My plan was sent in. I received for answer that it was submitted to the Harbour Board, and that I should be informed of the decision. It would seem, from Captain Sulivan's observation, that my plan was approved and acted upon, *without* informing me of it.

29,865. If the river has three entrances, and the stream forms a shallow bar off each, would you not suppose that by closing one you would carry a stronger current through the other two channels, and so deepen them?—First of all, you must allow me to doubt whether they would have a bar at each entrance, because if you keep a river open in that way, I think you will get rid of them.

29,866. But if you have a bar at each of them, and you close one of them, would you not hope that by the extra strength of the tide thus obtained the other two channels would become deeper, and further, if you close two of them out of the three, would you not have a still stronger current, and perhaps deeper water in the remaining one?—Very likely, if you throw all into one, you would have a bigger bar than ever.

29,867. If the Tyne ebbed through two openings you would not fear that its power would have less influence in keeping them clear than if it ran only through one channel?—No; I am sure the conditions would be favourably altered. I cannot suppose that a bar would be formed at both entrances. It would only form before one of them. The ebb would go in any direction that it could take. You will not find Nature running against a stone wall.

29,868. If by any means the action of the sea to heap up sand at the entrance of the Tyne is met by a less current from the river than is now the case, will you not have in this position, in all probability, a shallower bar than we now have there?—I suppose the whole conditions externally to be altered, and when that is so you will not have the bar which you expect. You cannot have it. Supposing that all the power is advancing from the stream that comes from the river, it

Rev. F. Glover.

14 Dec. 1858.

Capt. Sulivan.

will not act in opposition to the sea, but it will go in an direction that it *can* go; and when it comes towards the north it will be reinforced by the stream inside the island, and you will have a greater power through the north entrance than you ever had before.

29,869. That is supposing that the ebb only runs out from the river in one way round your island, and not by both ends. But as you conclude that the flood will come in both ways, I cannot understand why the ebb is to be confined to one only. The whole of your plan appears to me to rest upon that. If you divide the ebb into two streams you are weakening its power to keep the river clear. If you have the flood coming in at both entrances it seems to me that the ebb must go out at both?—When the ebb is coming from the south, and the river ebb comes down, the tendency of the water is to draw up north, and there will be three streams going north, instead of one: the ebb of the river, the main ebb of the tide running coastwise through the channel, and the outer stream of the ebb, from which the channel stream divided, when it entered the channel.

29,870. You think that the ebb from the south is sufficient to turn the whole ebb of that river out to the north. Why will not the same strength of the tide from the north coming round your island at the time of flood prevent the flowing of any of that flood round the south end of it?—Because the water outside is higher, and it must come in.

29,871. Well then the water will be lower at the ebb, and so it must run out both ways?—I have no objection to its going out both ways at all. When there is a quiet condition it may have that effect, but when there is a quiet condition no mischief will be done. When an unquiet condition comes, a greater height of water would be raised, which would be advantageous to the proposed alteration of the river.

29,872. You think that dividing the strength of the River Tyne through two openings instead of one will not reduce the power of each to prevent a bar from forming?—I have no doubt, if you say that the power is to be directed equally on both sides, it makes it evident there is less power than when it goes in one direction. What I meant was this, that except when the sea outside is perfectly quiet, the sea will draw in either one direction or the other; and that, in whichever direction is the drift or tendency of the sea, in that direction will the sea go, and carry with it the ebb from the river, so that there will be a coalition of power with the streams within, and then draw the water without, to assist each other.

29,873. That is supposing that the wind on this coast causes the flow of the tide along the coast always to be with the wind?—Not in the flow of the tide, but in the raising of the water.

29,874. It is the same thing. If it causes the raising of the water, and it flows along the coast, is it not the same thing as causing the tide?—Not what we should call tides.

29,875. I should like to ask you about Dover. How do you propose to make this wooden structure which you are to fill up with chalk; with piles?—By horizontal layers.

29,876. I mean the wooden structure?—By horizontal layers of wood to raise it foot by foot. There is a model of it in the United Service Museum.

29,877. I want to know whether you make the wooden structure that is to hold the chalk by piles or by box forms?—By box forms. I propose to lay on the bottom of the sea a long framework of a width suited to the height to which the work was to be erected. When that was laid at the bottom of the ocean perfectly flat,—the whole thing ought to be laid horizontally,—I should have capsized masses of concrete out of a particular box; a tumbling box. When the first layer was completely filled in, another layer of wood should be added, and upon that again another layer, and so on, filling in each with concrete, until the whole thing were completed, to a height of 70 feet from the bottom of the sea; *i.e.*, 7 fathoms soundings + 20 + 8.

29,878. You would have staging in order to tumble it in?—Yes; that is a matter of engineering. There is no difficulty about it. If I was going to lay the work on sand, I should build a frame, making it like a ship, and launch it. It was intended in the first instance at Dover to have laid a frame, and to have had divers to place the concrete in the proper places.

29,879. The tumbling boxes must be carried by vessels or stages?—Oh yes; lighters and vessels.

29,880. Have you in your calculation estimated the cost of this staging?—Yes.

29,881. (*Capt. Vetch.*) Have you a general opinion that islands at the mouths of harbours are very necessary and useful, or merely that at particular places an island at the mouth of the river will make a good harbour?—I believe both to be the case.

29,882. As a general rule?—As a general rule.

29,883. Then coming to a practical view of the subject, are you aware of any harbour in Great Britain that has that advantage of a natural island?—In the report of the Harbour of Refuge Commission several places are mentioned where there are islands. I will send in a list of them to you.

29,884. You cannot recollect them at present?—No.

29,885. But if this were so important a matter, one would think that the cases would be easily recognized and remembered?—There is one very important instance, which we all know, that I can mention, viz. the Isle of Wight.

29,886. That is a large island, of what harbour does it subserve the purpose?—Southampton Water.

29,887. Southampton Water, I think, is a sea estuary, with two little streams at its head?—Yes; but at the Needles it rushes through a very small channel.

29,888. Do you consider the Isle of Wight a case in point?—I think it is a very strong case in point.

29,889. It is a very large island, and a very small river, and the estuary lying between the river and the island is so large and extensive that it becomes effectually a firth or arm of the sea?—Yes; no doubt it does.

29,890. And Southampton Water discharges itself into this arm of the sea?—Yes.

29,891. You would not allow the Thames to be properly speaking a river, because it discharged itself into a large estuary?—If you will take away the Isle of Wight you will soon have a bar in Southampton Water.

29,892. I hope you will not try the experiment?—No; but I have no doubt that would be the result.

29,893. I have been casting my eye along the the coast of Great Britain as laid down upon the charts, and I can hardly find an instance of a river which has the benefit of an island at its mouth. Are you acquainted with the River Avon at Bristol?—Yes. I was born upon it.

29,894. There is a tide runs up and down that river strong enough to clear a channel anywhere. We have there an island, called Dumb Ball Island, on which several works are erected; tell me whether you think that that is of any great advantage to the river?—I have not considered that case; but perhaps if the island was further out it would do more good. It is now upon the low-water line.

29,895. There it is exactly at the mouth of the river?—Yes; but if you put the island further out you would have a different state of things.

29,896. Then that does not answer the purpose you have in view?—No, of course not, because I say that if you put an island at the mouth of a river it is for the purpose of getting an entrance at all times of the tide and in all states of the wind. What you must do in the case of the Avon would be to run the banks out into deep water, and then put the island off the new mouth. But the case of the Avon is a very peculiar one, and shows the enormous mischief which may be done by the rising tide. The man at

Rownhan Ferry is constantly employed sweeping away the deposit which is laid there every tide. If he did not do so, people could not use his ferry, for the mud through which they would have to walk when the tide was not at full.

29,897. That great tide ought to carry everything before it?—I do not give in to that doctrine of scours. I am a great heretic on that point.

29,898. You do not admit the doctrine that running water will scour away obstacles?—I think that bars are often rather formed by backwater than removed.

29,899. Are you acquainted with the River Wye, with two rocky islands at the mouth; a river that rises and falls more than any other in the kingdom, and has a bad entrance?—That is a peculiar case. Perhaps if you made the two islands into one that might alter the case.

29,900. Could you point out any place in Great Britain or Ireland where an island at the mouth of a river shows itself to be of great advantage?—I do not know. There is Lamlash Island.

29,901. That is not at the mouth of a river. That is off the island of Arran?—There is a good entrance there.

29,902. There is no river there. One half of the circumstances do not exist. The island is there, but there is no river. Do you know of any other place?—I will tell you to-morrow, when I have looked at the report of the Tidal Harbours Commission, which I have at home.

29,903. The Orwell at Harwich is a good navigation, and there is no island there. At the mouth of the river called the Colne, which passes Colchester, there is an island, and it is a very bad mouth, and a bar mouth. Except the Isle of Wight, I do not know of any other example which could serve as a proof of the correctness of your doctrine. Now, there is the River Mississippi, which is a large river 600 feet deep at New Orleans, and the mouth of that river is beset with islands; there is a great number of them; but it is not more than nine feet water at low water at the mouth, although up at New Orleans it is 600 feet deep. According to your theory there should be a good entrance to that river?—That Gulf of Florida is a very exceptional case. One hardly knows how it is. When you speak about tides, there is not much tide in the Mississippi.

29,904. What do you say about the Island of Anticosti in the River St. Lawrence?—I have not examined it, and cannot say anything at all of it.

29,905. But as you have had this theory of yours so long in hand, I should have expected you would have had a great many examples to bear out your doctrine. We have a number of good harbours; but I am not aware of one, except that of Southampton Water, which is an illustration of your system. The Shannon, for instance, has no island at its mouth?—That is an arm of the sea, and there are plenty of islands up the middle; that is, shoals.

29,906. (*Mr. Coode.*) You adduce the case of Southwold as favourable to your theory of the formation of island breakwaters. Are you aware, or not, whether any changes are going on there at this time?—I have not known anything of it for the last three or four years. The other day I happened to see the curate of Southwold, who came to Cologne, but he did not say that any change had taken place; but I dare say there has.

29,907. Are you at all aware in what direction that change is likely to be? Will it be in the nature of an accumulation of sand, or of a deepening of the water?—I cannot say.

29,908. Then in quoting Southwold it will be necessary to ascertain whether it is improved or not, because it is possible that the channels may be shoaling?—I dare say they are.

29,909. If so, would not that be an argument against the correctness of your theory; that is, if the channels are shoaling after the island has been formed?—No. The sea acts with great violence upon that place, because the sand is not raised up into an island. If there were smooth water within the shoal, and things were getting worse, then it would be an argument against what I have been asserting.

29,910. If that be so, is Southwold to be adduced as an argument in favour of your theory?—What I say is, that nature has formed an half island there, and if you raise that into a whole island you will get a safe and quiet anchorage behind, to which you will have access and egress; and those are two good conditions. I say, in addition to that, that the bar would not form where it forms now. It may form further out, but not in the same shape as it now forms. It will only make an increased spit at each end of the island.

29,911. You imagine that you will still be liable to a bar, even if your plan is carried out?—You will have very much improved conditions. You will never have the same bars or hindrances that you have at present.

29,912. Do I understand you that the bar which you anticipate will be a bar in the nature of a large spit, rather than of a transverse accumulation?—Yes.

29,913. You were asked some questions by Captain Sulivan as to the effect of the wind from the north meeting the ebb tide coming out of the Tyne, and in answer to those questions you stated that the effect would be to drive the ebb tide through what would be your south entrance?—Yes.

29,914. Assuming that to be so, would not the effect be to cause two currents to meet in opposition; that is to say, the ebb tide running out of the Tyne to the south, would meet the main ebb tide along the coast running to the north. This must happen if your view be correct, when you say that the effect would be that in northerly winds the ebb tide would be driven through the southerly entrance?—I will explain that. Under ordinary circumstances the returning tide runs coastwise.

29,915. By returning tide, do you mean the ebb?—Yes; under ordinary circumstances it runs coastwise.

29,916. Which way?—To the north. But when the water is very much accumulated against the east coast by a north wind, then it compels the ebb to run farther out from the coast. It does not hug the coast in the manner it does when there is no wind.

29,917. Do you mean to say that in northerly winds the ebb tide in the North Sea runs to the southward immediately along the coast?—No. I say that when the wind is very much on shore, that is from the north and north-east, the sea raises the water against the coast, and that under these circumstances the ebb will find its way parallel to the shore at some distance rather than close along it.

29,918. The effect of the north and north-east wind is to drive along the shore to the southward, meeting the ebb tide?—Yes, I say it will; and the run of the ebb tide will be forced to run parallel to the coast outside rather than go as at other times. For that reason, when the water goes out from the south entrance of the breakwater it will be drawn rather underwards and outwards, instead of remaining there to oppose the surface stream coming up from the north.

29,919. I understand your view to be, that with the wind from the north or north-east, the ebb tide out of the Tyne would be driven through the southern entrance?—Yes.

29,920. Then if that be so, with the main ebb tide running from south to north, would it not necessarily be the case that the ebb tide out of the Tyne would come directly in opposition to the ebb tide running along the coast?—No; when there is that action of the wind against the coast it raises the water, and makes it very much higher. The water at the edge of the coast is higher than the level of the sea, and returns to its level always under-about, as is proved by its sweeping away the beach or manor with it.

BIBLIOTECA DEL C.O.A.M.

LONDON.

Rev. F. Glover.

14 Dec. 1858.

Mr. Coode.

29,921. That is in the case of an on-shore wind ?—Yes.

29,922. Then, assuming that the wind is directly along the shore, I ask, as you say the effect of such a wind would be to drive the ebb tide out of the Tyne to the southward, whether it would not necessarily meet the main ebb tide coming along the coast ?—It would, to a certain degree.

29,923. Meet it in opposition ?—Yes.

29,924. And would not the effect be to cause an accumulation where the two tides met ?—If it would, you would have the north entrance open; and though there would be a tendency to leave an accumulation, it would not be near so excessive as at present.

29,925. Without going into the question of the relative depth obtained in the channel by your plan and any other plan, I should like to know whether, if this method of yours were adopted, you would not have a greater liability to variation in the position of your channels, seeing that, according to your view, in some instances the ebb tide would run out through the north channel, and under other circumstances through the south channel ?—When the wind was blowing from the north a formation would take place to the south; but when the wind was blowing from the south there would be no accumulation at all, because I always premise that a bar always forms at the ebb. When the wind is from the south you would have no opposition, because the wind, the ebb coming along the coast, and the ebb from the river, would all concur in all going out together in three streams, the river ebb, the outside ebb, and the wind ebb, so to speak, or the wind current. They would all concur in going out together, and therefore there would be nothing to make a bar. At the same time, if there had been anything gathered there, before this great concurrent power of the three streams occurred, it would scour all that out. Whatever might have been deposited there by some accident or the other would be cleared out by them.

29,926. That would be your view so far as regards the north channel ?—Yes.

29,927. But as regards the south channel, would not that be liable to great fluctuations, both in position and depth, depending upon the direction of the wind ?—When the wind was blowing right on shore there might be a formation at both sides, but with any other condition of wind you will not have any other formation.

29,928. I should like as direct an answer as you could give to the question, whether with a long prevalence of northerly and north-easterly winds there would not be a tendency to an accumulation, at any rate at the south entrance ?—That is the only time an accumulation or formation would take place.

29,929. And the condition of that channel would fluctuate very greatly ; it would be dependant upon the direction of the wind ?—Yes ; I suppose it would fluctuate, but I should say not so very greatly ; but it *would* fluctuate. It would be better and worse at one time than at another ; but at no time would you have the conditions so bad as they exist at present.

29,930. The conditions as to depth might be different, but would not the conditions as to fluctuation and the variable direction of the channel be worse than under present circumstances ?—No. There is no variation now. It is *always* bad. But when this had been done it would be usually good. It might occasionally be impaired, but you would always be able to recover it. Now it is manifest that they have only six feet, or at most nine feet, over the bar.

29,931. Still, bad as the state of things may be now, they are more constant than they would be under your system ?—The north entrance would always be good.

29,932. You apprehend that in the case of the Tyne, if your system were adopted, you would always get a good entrance to the north ?—Yes.

29,933. Have you considered the depth of water which you could permanently maintain there ?—I assume that whatever depth was made, would abide, and would not alter. It might, by dredging, be increased. I maintain, whatever depth you have, you may, with the exception of places where rocks occur, realise all the way up the river. You would have smooth and still water within the whole of it, which would be made available for anchorage. At the time I first proposed it, this island could have been placed off the Tyne for 75,000*l*. Another thing is, that the ballast which is now a dreadful nuisance in the river, as they do not know what to do with it, might have been thrown into this cradle, which would have become a receptacle for it.

29,934. Do you apprehend that you could make your cradle so tight that the ballast would not wash away ?—I am certain of it.

29,935. Of what is ballast generally composed ?—Sand, shingle, or rubbish of any kind. It would go into this thing, which would be a great wooden structure, close at the back and open in the front. They might go on for centuries depositing the ballast in front, and it would keep increasing the island.

29,936. You would have no fear that the sand and finer particles would wash out and accumulate within any portion of the entrance ?—I should not care if they did ; they would only be washed out again.

29,937. You stated, I think, that you objected to backwater. Is it not a fact, that the maintenance, and even the existence of channels, is due to backwater?—I do not mean to say that I object to backwater altogether, but I think the importance of it is exaggerated, and in many instances it does absolute mischief. You may take the case of Wexford for example. Wexford would be greatly better off if they had only one tenth part of the backwater. The River Slaney is enough, without the enormous quantity that returns from the lagoon.

29,938. In what manner does the amount of backwater operate prejudicially at Wexford ?—At Wexford it makes a kind of underground waterfall, such as you see before a wear. The water goes down, and scoops out everything, and makes a little kind of circular embankment. That is what takes place at Wexford.

29,939. That is just within the Dogger Bank ?—Yes ; in fact the Dogger Bank is a portion of that kind of crater formation ; that kind of half crater.

29,940. You seem to have no doubt upon the subject of the shingle accumulating and filling up at the back of the Admiralty Pier at Dover. Have you formed any idea of the time it will occupy, assuming it to do so ?—That is impossible to say.

29,941. You have no idea ?—No. Dungeness is an example ; within the memory of man it has increased from being a little point of sand, as its name implies, the Nose of Sand, to above seven or eight miles in length.

29,942. Referring to your peculiar mode of construction, you said, I think, that Sir M. Peto decidedly approved of it ?—When I spoke to him he did.

29,943. When was that ?—In the year 1844 or 1845.

29,944. That was prior to the construction of the works at Lowestoft ?—Yes.

29,945. If he approved of that system, can you tell us why he did not adopt it at Lowestoft ?—That I cannot say. He may have been satisfied, that for his particular purpose, piles were better ; because wherever my construction is put down there is no passage of water through it; and he may have thought that at Lowestoft it is necessary to have an open work.

29,946. Could you furnish us with a section, or at any rate with a description rather more in detail than you have given in, of the mode in which you propose to construct the timber frame and the concrete ?—I can give a written account, if you choose, about half a page in length.

29,947. Something to give an idea of the process and mode of construction, and the manner in which you would proceed. I see amongst your documents a printed table containing a great many calculations as to quantities and estimates. I presume that the section or description with which you will furnish us will be applicable to these calculations, or would you prefer to send in a fresh estimate for the section which you will supply to us?—Those calculations are quite true, so far as they go, and, according to that date. But since then, things have changed. Timber, which used to be 1*s.* a foot, is now, I believe, 13*d.*, 14*d.*, 15*d.*, or 16*d.* These calculations are upon the supposition that timber is 1*s.* a foot, cubic.

29,948. Then we should have to deal with these calculations, simply substituting the present price of timber for the then price?—Yes, that is all.

29,949. In all other respects the estimate would apply to the section or description which you will furnish?—Yes; that is with respect to Dover; but in the case of a sand bank I should not prefer to have any filling in. The caisson or carcase would be loaded and kept in its place until Nature had filled it in; by which, you would save 200 per cent. upon the cost of the work nearly.

29,950. You assume that the bottom would be level on which you place your frames?—Yes.

29,951. How would you proceed in the case of a rocky bottom with a rapid fall, or great irregularities?—I do not think that in rocky places you could follow that system of sand construction. In rocky bottoms you might have to fill in. Still it would be more convenient to make it horizontal. If I had to carry out a work in such places I should first fill in the inequalities of the bottom so as to make it a tabula rasa; realise a flat, and then lay down the work upon that.

29,952. Of course the cost of that would form an element in the estimate, when such a plan had to be resorted to?—That would be extra; but at Dover there is no necessity for anticipating that case. The bottom is supposed to be quite nearly enough flat. The inequalities would have been trifling, and would have been hardly worth mentioning.

29,953. (*Chairman.*) You have a chart of the Tyne before you?—Yes.

29,954. What is the precise object of putting an island in front of the Tyne, in your view of the subject? Is it for the protection of shipping, to enable ships to run in in bad weather, or simply to improve the river?—The object is twofold. Supposing that there was no river to improve, it would be a very desirable thing to have an island there; but there is also the object of so improving the river as to give to ships, egress and access, at all times of the tide.

29,955. The primary object of all breakwaters is to supply safe harbours for shipping, is it not?—Yes.

29,956. At what distance from the mouth of the Tyne, and in what depth of water, would you place your island breakwater, in order to give the necessary safety for shipping?—That would be for the consideration of others rather than of myself. I can only give an opinion. It might be half a mile or three quarters of a mile from the mouth, or more or less; but it does not signify where it is to be placed. You can put it down equally well in deep or in shallow water; it is only a question of cost.

29,957. Of course the further out you put it the more expensive it becomes?—Yes, and the more exposed you are to the north.

29,958. To the north and south?—I do not suppose that the south is of so much consequence as the north at the Tyne.

29,959. The object would be to keep the breakwater as close to the shore as possible, consistently with furnishing sufficient refuge area for shipping?—Quite so.

29,960. Have you formed any idea at what distance from the mouth of the Tyne your breakwater would require to be placed for that purpose?—About half a mile out from Tynemouth Castle.

29,961. What depth of water does that give you?—32 feet, ranging from 25 feet to 32 at the entrance, and on the land side 28, 22, and 18.

29,962. In what water would the breakwater itself be?—In 31 feet, 32, 36; and at the south end 41 feet.

29,963. To what length on each side of the middle line of the river do you propose that the breakwater should extend?—A mile to the south, and half a mile to the north.

29,964. Are you aware that the time at which protection is required for shipping is when it is blowing hard on shore in easterly gales?—I am.

29,965. And that large numbers of vessels which would run in for shelter are so light that they make four and six points leeway? You understand what leeway is?—I have a general idea of it.

29,966. Because these are very important points; they are at the root of the matter. Perhaps you are also aware that the object is to find shelter for these vessels when the water over the bar is so low that they cannot get into the river?—Yes.

29,967. Therefore that vessels would have to anchor under your breakwater in heavy easterly gales, to find shelter?—Quite so.

29,968. Are you at all aware of the number of vessels that run into the Tyne in one tide under such circumstances?—On one occasion, when my son was there, 32 vessels, went ashore in one gale.

29,969. Are you aware of the number that run in in one tide?—No, I am not.

29,970. I think we have it in evidence that the number amounts to 50, 60, 70, and 80. Suppose these vessels came in round the ends of your breakwater, were could they possibly anchor so as to get shelter in a heavy easterly gale?—When the breakwater is once made the whole space behind it will be available as anchorage. It will deepen very considerably.

29,971. You do not understand the drift of my question. Vessels making so much leeway as those mentioned would not be able to get there. They would all be obliged to anchor in clusters near the entrances, because they could not, under sail, fetch in further. Has it ever occurred to you to consider that?—No; I was not aware of the fact.

29,972. Granting that to be the case, does not the position which you have selected entirely defeat the object of your breakwater, which is to afford shelter to ships, because they could not make use of it under the circumstances in which they most need refuge?—If you thought there was any difficulty about that there might be an entrance or two entrances lower down in the work.

29,973. How would it affect the work to make an entrance for running in just opposite the mouth of the river?—That would tend to prevent your making the river, quiet anchorage.

29,974. No; but a small entrance; how would that affect it?—Persons like yourself, who are competent to give an opinion, would have to consider that; probably it would be an improvement.

29,975. Have you formed an estimate of the quantity of sea that would come in at each end, with northerly and southerly winds, because it appears to me that with a gale from north-east or south-east, all the shelter would be destroyed?—I do not think you want shelter from the south-east. It is with a sea from the north-east that you require shelter.

29,976. With a gale from south-east a heavy sea runs on the whole of that coast, and I observe that with the wind from north-east or south-east your breakwater gives no shelter at all?—Even in that case, if a ship came in with a wind from south-east the water inside would be smoother than it is now without this work, and she would be able to get into the river very well, go up, and cast anchor in safety. She would be safe as soon as she got round the Herd Sand.

29,977. With the wind from south-east and north-

LONDON.

Rev. F. Glover.

14 Dec. 1858.

Chairman.

east vessels could run in behind your breakwater perfectly well ?—Yes.

29,978. But at low water they could not get into the river, and would be obliged to anchor in the roadstead in about 26 or 30 feet, in order to be in safety, on account of the lift of the sea ?—As soon as this work was constructed the condition of the river all the way up would change. All the stuff would be dredged out, and would not re-form. They would have deep water where they now have shoals. A vast deal of space is now indicated on the chart by the sand mark. All that would be taken away, and they would have deep and smooth water up into the river.

29,979. And be able to enter the river at any time of the tide ?—Yes. The question of having an entrance in the middle of the breakwater is a matter of great consequence about which I cannot speak.

29,980. Even supposing that the river was so much improved that vessels could enter it at all times of the tide, we should have a sea running from the north and south, and the sea would still break at the entrance of the river, and render it dangerous for ships to run in. It would still be a breaking sea, which is what renders the mouth of the Tyne so dangerous for ships to run into ?—The sea would never be so violent then as it is now.

29,981. In your opinion the sea would never be so violent then as it is now ?—No.

29,982. The second head in our memorandum, Mr. Glover, was "the application of the theory "to particular instances with a view to its illus- "tration." We have had the application of the theory to Wexford and Southwold, and also to a certain extent, indeed to a very considerable extent, its application to the mouth of the Tyne. Do you wish to adduce any other instance ?—No.

29,983. I think there was something said about Wismar ?—Since I had the honour of receiving your communication, I went to Bonn, where Professor Ardt, who informed me of that case, and Professor Dahlmann, the brother of the burgomaster, reside. When I went to Professor Ardt he confirmed all that he had said. When I went to Professor Dahlmann, it seemed rather offensive to him that Wismar should be adduced as an instance of a bad harbour ; rather insulting to his country. I should have been very much taken aback by what he said as to the goodness of the harbour, had it not occurred that when I mentioned Wismar to a member of the Tyne Conservancy, he said that it was the very worst harbour in the world, that he had had a ship there three months, and she could not get out, and that they always avoid that port as much as possible. He imagined and still believes that I wanted to assimilate the Tyne to Wismar, and would not hear anything to the contrary. From that circumstance I should have gathered that Wismar was a very bad harbour, even if the fact had not been well known in Germany. I cannot obtain a chart of the harbour as it was before the Danes and Russians destroyed it, but its present condition will appear from the Admiralty charts.

29,984. We have also asked for "such natural "instances as exist or may have existed as will tend "to prove the correctness or otherwise of the island "breakwater theory." If you have anything more to say about Wismar it will come under that head ; any circumstances to detail. We have also asked for charts of the harbour, showing its state before and after the change alluded to ?—It is not possible to obtain a chart of the harbour before the change. The destruction of the harbour took place in the year 1715, and the charts of that time are not to be relied upon, even if they exist. The chart showing its present state can of course be obtained at the Admiralty.

29,985. How can we authenticate the changes which are said to have taken place ?—All you can do is to take the history of the country, viz., that at one time the harbour was used by the admiral's ship going in and out at pleasure, and that when the Danes and Russians took it, and wished to destroy it, they sunk ships between one end of the barrier and the main-land, and from that time the place has not been accessible to the same extent.

29,986. Is there such a chart amongst the papers which you have sent in ?—No, there is not.

29,987. Does it occur to you to state anything further under these three heads ?—No, not at present.

29,988. As respects construction, would you like to add anything ?—I think it is desirable that the model exhibiting the mode of construction, which is in the United Service Institution, should be seen by the Commissioners. It is too large to be brought here.

29,989. (*Mr. Coode.*) Will the description which you have promised us, apply to that model ?—It will.

29,990. (*Chairman.*) When shall we receive that description ?—To-morrow, if you please.

29,991. (*Mr. Coode.*) An examination of the model with that description will enable us fully to understand your views as to the mode of construction which should be adopted ?—Yes.

29,992. (*Chairman.*) In constructing this work, what would be the size of the boxes ?—It would be like a great ladder laid along the bottom of the sea. There would be a fore balk and a hinder balk, and these would be tied together by other balks of similar diameter, and 100, 150, or 200 feet long, according to the height of the work : the width of the base being to the height of the work as two to one. The breadth of the frame would be diminished, as you ascended, two feet each layer, which would leave an opening to the sea like steps, except that the balks would be set to the angle of inclination of the whole slope.

29,993. It would be successive layers ?—Yes.

29,994. (*Sir F. Smith.*) Do I understand that your work is not to be solid from top to bottom ? —That would depend upon circumstances. If it was to be used in a place where there was no sand formation, or that you did not choose to wait for its being filled from that source of supply, you must put it down solid ; but if you thought that Nature would do the work, or if you had the means of filling it afterwards, as in the case of the Tyne, by means of ballast, then you would make it hollow.

29,995. Hollow, in what sense ? In putting it down, what is the first operation that you perform ? —If the work is to be put down solid, it would have to be raised layer-wise ; but, if hollow, I should build it like a ship, and launch in convenient masses.

29,996. Say that you were going to erect it in the solid form at a distance of a mile from the shore, what is the process of the work ?—I should make the framework, and sink it.

29,997. Describe the framework ?—It would be a balk, say of a foot section, and of any length you please, so as to suit the convenience of sinking. If the weather was favourable, I should sink it in long pieces ; if unfavourable, in short ones.

29,998. When you talk of a balk, do you mean a single log laid down by itself ?—The framework, looked at from above, would appear like a great ladder.

29,999. In fact it would be two balks with cross pieces at certain intervals ?—Yes.

30,000. Not boxes, but merely these cross pieces acting as sides ?—Yes.

30,001. Then these boxes are a foot high ?—Yes.

30,002. And you fill them in with what ?—Concrete.

30,003. How do you pass the concrete from the surface to the bed of the ocean ?—It should be dropped in capsizing boxes.

30,004. Might not some of it be taken up and held in suspension by the water ?—I should take care that it was not let out, until the box was in the proper place.

30,005. You would let the box sink to the level of the ladder ?—Yes.

30,006. Then you would capsize it, and part of the materials would go in, and part, not ?—No ; none

would be lost; because they should be so concreted as to remain whole until they were deposited.

30,007. Then they must correspond with the spaces between the balks?—Yes; near about. The masses would be (say) four feet square, and one foot in depth. The concrete need not be as hard as mason's work. It would only be necessary that it should hold together and fill in.

30,008. Then it fills in the space between the two balks, which are a foot apart?—They may be any distance; only you must fill in between them.

30,009. Give me a dimension that we can deal with. How far apart would the cross-pieces be?—Say 40 feet.

30,010. A space 40 feet wide?—From tie to tie, 40 feet; but the length would be sometimes 100 feet.

30,011. What length will your balks be?—As an average length, 40 feet throughout.

30,012. Two timbers, 40 feet long, with cross-pieces, are laid down first?—Yes.

30,013. Is that in the sense of the width or the length of the mass?—In the sense of the width of the mass.

30,014. The length of the balks will be equal to the transverse width of the mass?—Yes. I call the transverse balks "ties," and the balks that lie up and down the length of the work "balks."

30,015. I understand, that along the outer and inner edge of your work there is a continuous line of balks?—Yes.

30,016. And that the width of the structure is represented by cross-pieces tying together these longitudinal balks?—That is right.

30,017. The balks which go from end to end are a foot square?—Yes.

30,018. What is the height of the cross-pieces?—The same.

30,019. A foot square also?—Yes: nearly square. I should make their section a trapezium.

30,020. Then you have intervals which are the whole width of the work in one direction, and how far in the other, from cross-piece to cross-piece?—40 feet.

30,021. If the width of the structure is to be 40 feet, and there is to be 40 feet between the cross-pieces, the interval which you have to fill up would be a rectangular space 40 feet square?—That is what I was afraid you misunderstood.

30,022. What will be the width of the base?—We will call it 100 feet.

30,023. If that be so, each of the compartments will be 100 feet long by 40 feet wide?—Just so.

30,024. Do you propose to frame these together before you put them down?—If the weather was favourable I should do so; if not, it would be possible to do it under water by means of a diving bell.

30,025. You propose that they should be put together by divers?—When necessary.

30,026. How should you get the timbers down?—By loading them with iron chain cable, for example.

30,027. And then frame them together when down?—Yes, when necessary.

30,028. That being the case, you next have to fill in these rectangular spaces?—Quite so.

30,029. You propose to fill them in with concrete?—Yes.

30,030. Tipped in?—Tipped in by tumbling boxes.

30,031. And then I suppose spread equally?—It would spread itself because it would be made just square.

30,032. So that a certain number of boxes shall fill each compartment?—Yes; it would look like a great chessboard, only, of course, not coloured.

30,033. We will suppose that you have completed the whole of the first layer; your next process, I apprehend, would be to put down the framework for the succeeding layer?—Just so, of less dimensions in width, but of the same length.

30,034. By that means you have the whole thing rising in steps until you come to the surface?—Yes; and upon the surface you will have a space for any purpose to which you may please to devote it.

30,035. In the event of your not adopting the solid form of construction, what other should you propose?—Then the work would be built according to the model which you will perhaps have the goodness to look at, at the United Service Institution, as the foundation for a lighthouse on a sand-bank.

30,036. Then that would be launched?—Launched, either altogether, or in parts.

30,037. Launched and sunk?—Yes.

30,038. In that case there is no filling in at all?—That would depend upon circumstances. If the work had been laid down at Dover for the purpose of being filled in with the material which Mr. Walker had at his disposal, then it would have been necessary to have made the case ship-wise, and to have launched and sunk it; and *then* to have run the rubble into it.

30,039. What steps do you take to preserve the timber from decay?—I do not care about that, because as soon as the work is solid, it may decay the next week; and it will make no difference, because all the fore part is to be chalk, which generates that weed that I have mentioned, that saves the surface from being injured by the sea. Sir Gordon Bremmer (I believe) objected to chalk being used, on the ground that it would be washed away, and gave as an instance that the land-slip at Dover had all been washed away. So far was that from being the case that not a bit of it had gone. On one side there was the great formation of shingle, and the other was covered with green weed. But the proposition was not, at any time, to put down the chalk loose, but to be defended from the wearing action of sea, in swell or current, by the means of the framework.

30,040. Has not a great portion of the cliff, blown down at Seaford, washed away?—I cannot say.

30,041. It is the same chalk, and has in a great degree washed away?—Well, at Dover it remains, or did, five years ago, at the site I have spoken of.

30,042. (*Mr. Coode.*) Do I understand that the first layer of concrete comes simply to the level of the top of the balks?—Yes.

30,043. The layers of concrete correspond in thickness with the balks?—Quite coincident.

30,044. How is that concrete brought to a level surface? Are the blocks of the same thickness as the depth of the balks?—Yes.

30,045. Then you raise your work in layers of a foot or 15 inches, as the balks may be?—Yes.

30,046. Would not these blocks of concrete require to be placed by divers?—Oh yes.

30,047. You did not contemplate that you could drop them into their places, without the aid of divers?—No.

30,048. Is that the system for which you have estimated, in the printed sheet before us?—Yes.

30,049. (*Chairman.*) Do you wish to add anything before we part with you?—No; but I should like to be present when you inspect my model at the United Service Institution.

30,050. (*Chairman.*) When shall we have your description?—To-morrow.

30,050*a*. We shall be happy to receive any statement which you may think proper to send upon the subject?—Thank you.

Friday, 14th January 1859.

PRESENT :

Sir Frederic Smith.
Mr. Lindsay.

Mr. Coode.
Mr. Evans, Secretary.

Mr. John Gibson examined.

LONDON.

Mr. J. Gibson.

14 Jan. 1859.

30,051. (*Sir F. Smith.*) Where do you reside ?—At Gateshead. I am superintending some works for my master, Mr. Johnson.

30,052. You are now conducting works for Mr. Johnson ?—Yes.

30,053. What is the nature of the works which you are now conducting ?—They are on the screw pile principle.

30,054. What is the precise nature of the work ? How is the screw pile principle applied ?—The nature of it is, to run a pier out into deep water to 25 or from that to 30 feet of water.

30,055. And is it a very extensive work ?—Yes, it is a very extensive work, 1,000 feet long and 40 feet wide.

30,056. What is the length of the screw piles ?—Various lengths ; we shape the pile according to the position.

30,057. They differ in length ?—Yes, they differ in length.

30,058. What is the soil in which they are fixed ?—Sand on the top and clay on the bottom.

30,059. What is the deepest pile which you put in ?—Forty-five feet into the ground.

30,060. Screw piles ?—Yes, screw piles.

30,061. Do you mean that the screw itself is that depth ?—Yes.

30,062. And what is the length of the pile which you screw into that shoe ? Am I to understand that you screw the pile into a shoe ?—No ; the pile takes the column down.

30,063. Then the whole pile is screwed into the soil ?—Yes, screwed in together.

30,064. Because there are some instances where there is a shoe, and the pile is fixed into the shoe ?—I never put in such a pile as that, and I never heard of such a pile ; we secure the screw properly to the pile before we put it into the earth, and that screw takes the pile down behind it.

30,065. Do I understand that you are now constructing such a work at Gateshead ?—Yes ; we are having a large work got up there, in which there will be nearly 8,000 tons of iron. I am not screwing the piles down at Gateshead; I am getting it up to go to Madras.

30,066. Then you are doing no work at Gateshead ?—No, not for Gateshead, it is to go to Madras, to erect a pier there.

30,067. Can you tell us any instance where you have practically carried out such a work in England ?—Yes, many instances ; the Gunfleet lighthouse and the Chapman's Head lighthouse.

30,068. Where is the Gunfleet lighthouse ?—The Gunfleet lighthouse is 15 miles from Harwich, on the face of the Gunfleet sand.

30,069. And is that in sand entirely, or in clay ?—There are two small beds of lime clay, with nine inches fall and nine feet deep.

30,070. How have you constructed that work ? What sort of piles have you used ?—The screw pile, four feet diameter the screw, the column 15 inches diameter, with the best wrought boiler plates.

30,071. What is the thickness of the boiler plates ?—Bent up to two and a half inches thick.

30,072. And 15 inches diameter ?—Outside diameter.

30,073. Do you find that thickness necessary ?—It it extraordinarily strong ; it is stronger than is necessary for the place.

30,074. It is not exposed to anything but the breach of the sea ; there is no great pressure on it ?—The sea has no effect at all on it ; I believe that it is quite capable of resisting any vessel.

30,075. How close are the piles ?—The base is somewhere about 53 feet from corner to corner, on sand.

30,076. Do you mean to say that there are 53 feet between pile and pile ?—No.

30,077. I asked what is the interval between the piles ?—I cannot possibly say ; the first bracing is about 15 feet long each brace.

30,078. Are there horizontal bearings from pile head to pile head ?—Both horizontal and diagonal.

30,079. Still the weight, I suppose, is taken on the horizontal beams ?—It has a regular bearing all over.

30,080. Is it perfectly rigid ?—It is perfectly rigid. I have sat there in a heavy gale with the plumb bob suspended 30 feet and the plumb bob has not moved.

30,081. What was the depth of water ?—When we commenced, five feet at low water.

30,082. What is the rise of tide,—12 feet ?—That is the average, or 12 feet two.

30,083. Then it would be 17 feet at high water of spring tides ?—I have had 21 feet at high water of spring tides.

30,084. Did you do the work from a staging or from barges ?—We had both a raft and staging ; the principal part of the work was done from staging.

30,085. Would it be easy to do it from barges ?—It could not be done so there, there is too much sea ; we could not have a barge ; we had to have the raft out sometimes at 10 minutes' notice.

30,086. Then you think that if the structure be exposed to a very heavy sea, it is very difficult to screw piles without staging ?—It is very difficult to make the first start, commencing out at sea, but commencing at the land it is very different ; out at sea is such a bad place to establish a beginning in the middle of the water.

30,087. Assuming that a work of that kind had to be done in the open sea, unconnected with the land, would it be a difficult operation ?—It would be difficult, but I am quite satisfied it can be done ; I did it there.

30,088. But you worked partly from a staging ?—I had the staging to fix.

30,089. Supposing you had a line of piles a mile in length to screw into the ground, what course would you adopt ?—I would adopt a steam-engine to screw them down.

30,090. But you must place the steam-engines on something ?—I would put it on the top of the finished work to travel out behind it.

30,091. But supposing it was a simple line of piles, with spaces equal to the diameter of the pile itself, such as in the model which you see before you, would you in that case be able to establish a steam-engine for work of the kind ?—If there were a great continuation of the work I should be able to establish a steam-engine to travel as it proceeded.

30,092. Would you risk it in the open sea, with the chance of a gale of wind coming on?—I would rest the engine in the open sea on the top of the screw piles. Such a structure would have to be sufficient to carry it; but I should not be afraid of the risk on such a work as that at Gunfleet sand.

30,093. But before the piles are braced there is vibration ?—The piles have to be braced. There must be space between for men to put on the bracing.

30,094. Supposing the model to represent a structure which you had to make, should you feel it safe, before the struts were placed, to run out an engine on the pile heads without the bracings ?—It could be

done more simply, so that if there was a break-up you would not have so serious a loss; an engine is only necessary for very large, enormous works. There would then be a great saving of manual labour. That is what we use the engine for. I have not really used an engine myself, but there is one in Peru, at Pisco I think, now in work, and it answers the purpose very well indeed. Wherever there are large works an engine is necessary, but I have not used an engine myself.

30,095. Do you mean by large works, works of solidity and breadth, or works of length?—As to length, it would be no matter how long the work was if your engine were secured properly. It would not pay to have an engine for small piers, that is what I mean.

30,096. Supposing it were a work a mile or a mile and a half long, of single piles at intervals, would it answer to use an engine there?—No, I would never attempt it, because there must then be a temporary stage for the engine to travel on; it could not travel on a single row of piles.

30,097. That being the case, by what process would you screw down piles 60 feet long?—To carry out a line of piles like that in the model, I should fix a frame somewhere about the point of half ebb and half flood.

30,098. At the half-tide line?—Yes; from that I should either hang or strut it up, to carry the men right along.

30,099. In the space between the stays and upright piles?—I do not know what is the supposed diameter.

30,100. The space being about 40 inches, would you have room?—No; but there is a remedy by putting the staging across at half-ebb line, and putting a cap on the top of the piles to level the pile with, to fetch it down to the level of the capstan.

30,101. Supposing you had to screw piles of that kind 10 feet into the ground, in ordinary soils, either clay or hard sand, what time would it take to screw a pile of that diameter?—I have screwed a pile at Chapman's Head or Chapman's Sand lighthouse 21 feet in 8 hours, 4 feet diameter screw at the bottom, and an 8-inch pile.

30,102. If you had two piles to screw, each 10 feet 6, you could not do that in the same time as one pile of 21 feet, because you would have to place the piles in position?—In that instance when I screwed a pile 21 feet in 8 hours, the time of pitching the piles is not calculated at all; it is reckoned from the capstan head being fixed and everything ready for screwing.

30,103. The pitching the piles takes time in rough weather?—I consider the mere screwing a pile 21 feet in 8 hours very quick work indeed.

30,104. But the pitching of the pile independent of the screwing takes time, does it not?—In a heavy sea it does. It depends greatly on the staging; if you work from a staging above the water, and are independent of the sea, the pitching a pile is not much. It depends on getting the frame fixed.

30,105. How would you pitch piles in a rough sea?—I would steady the frame.

30,106. The frame above water?—Yes.

30,107. To be a good frame it must be above water?—Yes.

30,108. Then the fixing of the stays, such as those in the model, would also be an operation which would occupy time?—I have examined this model before.

30,109. Do you think the shoe shown in it enough to hold the pile under ordinary circumstances?—I do not. I could put a pile down in half the time it would take to fix it to the shoe.

30,110. In fact you would be disposed, if I understand you rightly, to screw the raking piles at the back rather than trust to the shoe?—Yes, I feel certain that I could put a pile down easily. I cannot see how that shoe is to be got into the sand.

30,111. You would put down a pile and have a strut or screw diagonal pile—an oblique pile. Do you mean to say that the whole stay would be screwed in?—Yes, the whole stay, and fixed at the top afterwards.

30,112. That being the case, the oblique pile, which would act as a stay, would require as much screwing as the vertical pile. Would it be more difficult to screw than the vertical pile?—It would be a little more difficult in screwing, but it would go down quite as fast as the other. You would put them down as easy, but there would be more danger of breaking the capstan bars.

30,113. To make allowance for the inequality of the bottom of the sea, it would require that the screw piles should be prepared the exact length necessary?—Oh yes, though I have cut them off at the top, but not at sea.

30,114. It is an awkward thing to do that?—I could do it very fast.

30,115. I suppose, assuming that to be the process, that one pile and one screw stay would occupy you at least a day?—Oh yes.

30,116. A period of twenty-four hours?—It would occupy twenty-four hours at the least.

30,117. That would be about the rate of progress in the whole work?—In the whole work.

30,118. So that the progress would be at the rate of a pile with its interval *per diem* in the length of the work?—Yes.

30,119. (*Mr. Coode.*) You have put down screw piles at the Gunfleet sand and Chapman's Head?—Yes.

30,120. Can you name any other places?—Yes, many. I have put them down at Newport, Cardiff, and the Victoria Docks.

30,121. Those are moorings?—With shanks on the top. I have put them into the ground 15 feet.

30,122. Please to confine yourself to places where you have put down screw piles in the sea?—I have put them in at Spit Bank in the Cove of Cork.

30,123. Did you put down the piles on the Maplin sand?—No, but I have examined them since.

30,124. How many piles are there in the foundation of the Gunfleet lighthouse?—Seven.

30,125. How long were you from the commencement, until you had completed the whole seven?—We could only work in the summer season. It would not pay to carry on the work in winter. I was 48 months there altogether.

30,126. That included the completion of the light house itself?—Yes, everything connected with it, preparing the materials at Harwich.

30,127. Our object is to ascertain the result of your experience as to the time necessary for putting down screw piles under different circumstances. Be good enough to confine your answers to that particular point. With regard to the piles only;—from the time you commenced putting down the first till you completed the last, what period had elapsed?—Well, I think, as near as I can tell you, about 24 months—about half the time.

30,128. And how many piles altogether did you put down?—Seven piles of two lengths each.

30,129. Were the whole put down from a raft or after you had got a stage?—They were all put down from the stage. The raft was used to take them out. It was very substantial, and we would cut it adrift and pick it up with a steam-boat.

30,130. Are we to understand that you constructed the stage before you commenced to screw in the piles, so that the whole of the piles were put in solely from the stage?—They were finished from the stage. The stage was erected with temporary screw piles.

30,131. At Chapman's Head how many piles were there?—The same number—seven with two lengths each.

30,132. Were they put in from a stage?—They were put in from a raft. It was not so much exposed. I could clear myself of the raft.

30,133. How long were you occupied putting in the piles there?—I finished all the bracing in five months—the whole of it. I was there five months

LONDON.

Mr. J. Gibson.

14 Jan. 1859.

Mr. Coode.

altogether. That is the difference between Chapman's Head and Gunfleet lighthouse.

30,134. Is there any other exposed situation where you have put down piles from a stage ?—Nothing but the Cove of Cork lighthouse.

30,135. Is that very much exposed ?—It is very much exposed when the wind is blowing into the harbour's mouth, because it stands right in the centre to guide vessels coming in.

30,136. How many piles did you put in there ?—The same number.

30,137. Were they put in from a raft or a stage ?—From a lighter.

30,138. How long were you occupied in putting them down ?—They were 17 feet each into the clay in about three weeks. It was much more simple still than Chapman's Head.

30,139. What was the diameter ?—Seven at the centre, tapering to six.

30,140. And solid ?—Yes, solid.

30,141. I think you have stated that at the Gunfleet lighthouse the piles were 15 inches in diameter, and the iron two and a half inches thick ?—Yes.

30,142. Of how many thicknesses of plates was that made up ?—Three thicknesses.

30,143. Look at that drawing, which represents a wave screen as suggested by Mr. Calver ; the piles are formed of wrought-iron boiler plates, and are from 20 to 30 inches diameter, screwed 10 feet into the ground. It is proposed to construct this screen in front of a bay, and totally unconnected with the shore, and we should like to have your opinion as to the rate at which you think you could screw down one of these piles to a depth of 10 feet, under ordinary circumstances ?—I never could put down the piles at Gunfleet so fast as I might here, because they had to be so accurately put down.

30,144. It is simply the principle shown in the model ?—At Gunfleet I had to scrape the paint off, and the piles had to go down to the 37th part of an inch, but in a single row of piles, like the model, there would be no necessity for such accuracy.

30,145. That extreme accuracy is not required in this case ?—Extreme accuracy is not required. In putting down the Gunfleet piles I had to keep them from going too fast down. I was afraid of them going too fast, and often stopped the men to get the measurements, to see that the piles were correct. I put them down 13 feet 6 at Gunfleet.

30,146. Give us an idea of the time which would be required to put down piles as in the model ?—I would put one of them down 10 feet in two hours in sand.

30,147. After you commence screwing ?—Yes.

30,148. Supposing you had to put them in six fathoms water at low water, in an open seaway, should you apprehend any loss of time in pitching the piles and getting them into their situation ?—It might be weather that you would not be able to go out.

30,149. That is what we wish to know ?—There are days and weeks when you could not go out, but I should not be afraid of the pile standing. A pile 10 feet diameter screwed in would never come out of the ground again.

30,150. That is not the question at this moment. We want to know the facility with which you could get these piles down, the time it would occupy ?—You cannot calculate more than six months in the year to work in the sea.

30,151. Then it is the result of your experience that works of this kind in the open sea can only be prosecuted during six months in the year ?—Not more, taken on the average.

30,152. Do you think it more economical to stop the works for the winter months, or would you progress just as you could ?—I would secure the works as much as I possibly could, but not exactly for the winter months. My experience proves that from March up to May is the worst of all the season round.

30,153. Would you stop the works entirely for any period of the year ?—Yes.

30,154. For how many months ?—For at least three months—February, March, and April—at any rate.

30,155. During those months you think it would be useless to attempt to accomplish anything of the sort ?—Quite useless.

30,156. Is that on the assumption that the piles are put down from a stage ?—It would be impossible to get backwards and forwards. At Gunfleet I left the stage all the winter, but it was impossible to land upon it.

30,157. It would be difficult to get the workmen to the stage without a connection with the land ?—I think it would be impossible to get men landed on it.

30,158. Then it is your opinion that nine months in the year may be calculated as reasonable working time ?—Yes.

30,159. Of those nine months what deduction should you make for lost days ?—For gales and bad weather I should say three months more. You may always calculate a broken time being three months, and that would leave only six months.

30,160. Then that comes to 26 working weeks throughout the year ?—Yes.

30,161. And in that case, assuming that the men work six days in each week, you have 156 days in the year on which to calculate, for carrying on your operations ?—Carrying on operations out at sea.

30,162. Then taking these 156 days as the working season, how many sets of piles and stays (reckoning one pile and two stays as a set) could you get down in the same day ?—This pile can be put down in two hours if it is pitched.

30,163. But taking into consideration the carrying out the piles, the pitching them, and making a temporary stage ?—What is the distance from the land ?

30,164. The distance being from one to two miles, could you complete one pile and two stays in each working day ?—No.

30,165. What should you allow to be done during the six working days of the week ?—Three columns and stays.

30,166. And you think that would be a reasonable allowance ?—That would be a very reasonable allowance. The time is taken up in running to and fro by steamb oats ; it is in carrying the material out. Supposing the pile could be put down in one hour, still you would require nearly the same time for the work.

30,167. After your long experience in such matters, you think that if you could get down three of those sets in the six days, you would have every reason to be satisfied with your progress ?—I should be quite satisfied with it.

30,168. (*Sir F. Smith.*) If you were to make an estimate to save yourself from loss, you would not calculate more than that ?—It would require the place to be looked at and examined. If it were a simple place and smooth water you might do more.

30,169. You know that Hartlepool is much exposed, that the sea breaks a great distance from the shore, and that a great sea rolls in when the wind is south-east ?—Yes.

30,170. In a position of that wind it would not be safe to make an estimate of driving more than three piles in six days ?—Three piles for six days.

30,171. You allow 26 weeks in the year and calculate three sets a week ?—Yes.

30,172. Of course you would take out more than one pile in a steamer at a time—more than one pile and the stays ?—I would take only one at a time and the braces connected with it.

30,173. You would not think it advisable to take out more than one set at a time ?—No.

30,174. And why not ?—I have been often caught going out from Harwich to Gunfleet. I have made the attempt seven times with one column, and did not get there until the seventh time.

LONDON.

Mr. J. Gibson.

14 Jan. 1859.

30,175. Did you start in unfavourable weather ?—No, but it sometimes comes on bad weather suddenly.

30,176. How far off was it ?—Fifteen miles.

30,177. It is an extreme case. Here the distance is only a mile or a mile and a half ?—With a mile or a mile and a half you might venture two piles.

30,178. Then if you had two piles and the braces connected with each, and you were able to do more than one in the course of 24 hours, you might commence the other ?—You would pitch them ; they must be finished before you leave them.

30,179. You would not attempt two at the same time ?—No, I would finish off one first.

30,180. If the length were a mile, would it be advisable to commence in the middle, and work both ways ?—In this case there would be no obstacle at all.

30,181. That might be done ?—Yes.

30,182. That would put you then in possession of twelve months' work in the year ?—Yes, by having a double set of men.

30,183. And there would be no increase of cost ?—No, not in that case.

30,184. You would just want double the amount of plant ?—Yes ; one superintendent could act on four set of men if necessary.

30,185. (*Mr. Coode.*) Assuming that the diagonal stays were screwed down, instead of being fixed in a shoe, should you not require much smoother water than if they were fixed in a vertical position ?—No. The only objection I have to screw down obliquely is the breaking of the bars. You must stop to shift the blocks, or you would break all the gear. That is the only difficulty.

30,186. (*Sir F. Smith.*) Is it not more difficult to form the guide to give the proper direction to those struts than to the vertical piles ?—When you have to put in those piles correct to the half-inch it is difficult. It requires you should work very gently and slowly to keep them to their position.

30,187. You mean the stays ?—Yes, because they are to be fixed in the manner shown in the model.

30,188. Does it occur to you to make any observation yourself ?—No. I have examined this model before, and I have no observation to make about it. I have spent some hours over it, and I cannot see how the shoes are to be got down.

30,189. (*Mr. Coode.*) You think that if the shoe could be put down in ordinary ground, it would form a sufficiently rigid resisting point to the piles, when struck by a sea ?—Yes. The weakest point is at the top of the struts, and that is where the effect of a sea would tell.

30,190. Do you think there would be any tendency in the shoe to work in the ground ?—It would work, but would set again almost momentarily.

30,191. (*Sir F. Smith.*) Do you mean in sand ?—Yes.

30,192. How would it work in clay ?—It would make a great hole.

30,193. (*Mr. Coode.*) What would be the consequence ?—The whole structure would vibrate, and the consequence would be to harden the iron in the water, and in time the piles would break off.

30,194. That is your view with regard to this particular mode of construction ?—Yes. It would be like working a bit of wire to and fro in your hand. After a certain time it breaks.

30,195. You think you could secure the stays by screwing ?—Yes, by putting in screw piles. In my opinion nothing else will do it.

30,196. Would it be braced and tied in both directions—both sea and land ?—No, that is not necessary. The back stay is sufficient. If put in with a screw it holds as much one way as the other.

30,197. What weight of screw do you think would be required to secure a pile such as is shown in the drawing ?—The screw would weigh six cwt. or seven cwt.

30,198. I am not making reference to the exact form of screw shown in the drawing, but to a screw such as would be fixed to a pile of twenty inches diameter, to be screwed ten feet into the ground ?—The weight of that would be about five cwt., as near as we can come to it.

(*Sir F. Smith.*) We are very much obliged to you for the information which you have given us.

Friday, 18th February 1859.

PRESENT :

Admiral HOPE (Chairman).

Sir FREDERIC SMITH.
Captain VETCH.

Mr. COODE.
Mr. EVANS, Secretary.

Mr. MICHAEL SCOTT re-examined.

Mr. M. Scott.

18 Feb. 1859.

30,199. (*Chairman.*) Be good enough to proceed, Mr. Scott, with your evidence, from that point at which you left off when last under examination ?—I described the erection of a timber and rubble breakwater upon a rubble bank, and I will now describe the mode of facing, so as to form a permanent stone structure. I propose to employ large blocks of concrete for both faces, and I conceive the advantages of using blocks of large dimensions to be, that they are less liable to be disturbed, being of great weight, and in a very few courses, probably three, the work would be brought above low water, and that these masses are cheaper than stone. Of course in handling such great weights very strong staging is required, and very powerful machinery, and I submit that I have obtained, by the plan proposed, a very strong staging, and I will now describe the machinery which I propose to employ for setting these blocks. There are two drawings handed in, Nos. 3 and 4, which represent the hydraulic machinery for setting the face. It consists first of an accumulator, patented by me in 1851, placed on a traversing frame, which frame moves on four lines of rail.

30,200. (*Sir F. Smith.*) Do you mean four rails, or four lines of rail ?—Four lines of rail.

30,201. Then you mean eight rails ?—No, four rails. I was perhaps wrong in my expression. On the fore end of this main frame there is placed a cross frame, and on this cross frame there is a crab. This crab being brought over a block conveyed on a waggon below, instead of the chain being attached direct to the block, a cylinder containing a piston is interposed between the chain and the block; the cylinder hangs from the chain, and the piston rod is

LONDON.

Mr. M. Scott.

18 Feb. 1859.

Chairman.

attached to the block. A communication is made between the accumulator, which contains water under pressure, and the lower end of the cylinder by a flexible tube. A stop-cock being opened, the water passes into the cylinder, forces up the piston, and lifts the block. The men at the crab then move the crab out to the end of the frame, and by means of a break they lower the block : the divers then proceed to set it in its place, but to do this they require the power to move the block in different directions, and this is accomplished as follows :—First, suppose the block requires to be raised, the stop-cock is opened as before, and the water entering the cylinder forces up the piston and raises the block : the block may then be suspended by shutting this cock ; and suppose the block requires to be lowered, a second cock is opened, situated between the cylinder and the first-named cock, which allows the water in the cylinder to flow out ; the piston descends, and the block is lowered. To move the block laterally a small cylinder is attached to the framing above. A chain from the piston rod passes over a pulley at the opposite end of the crab, and is attached to the crab. A flexible tube from the accumulator passes down to the divers, just within the men's reach, and up again to the cylinder ; and the stop-cock in that tube being opened, the water presses upon the piston in the small cylinder, which pulls the chain, and the crab is moved to one side. For the purpose of moving the crab in the opposite direction, another and a still smaller cylinder is fixed at the other end of the frame, the piston in which is connected with the crab by means of a chain as before. This smaller cylinder is always in communication with the accumulator, and the piston in the cylinder is always acting in opposition to the piston in the cylinder previously mentioned, so that when the water is allowed to flow out of the first cylinder the piston in the second cylinder moves the crab to the opposite side. The motion forwards and backwards is accomplished by similar means, and thus the divers have the power of moving the block in every direction and in every degree without communicating above water. The great traversing frame is moved by two long cylinders of small diameter, one at each side, the piston rods of which are hooked on to chains made fast to the forward end of the work, and the water being admitted into these cylinders the frame is moved forward. When the pistons have reached the end of their stroke they are drawn out and rehooked further forward on the chains. I think this concludes the description of the machinery for facing.

I will now proceed with a description of the Round Ends of the timber breakwater. The structure end is composed of frames formed of two uprights tied together, and these frames vary in width according to the exposure ; that is, the frames on the seaward side of the round end are wider than those on the harbour side. The exterior planking is interwoven with the uprights, on the principle of basket-work, and the result is that the work, as a whole, is strong, and, being slightly elastic, vessels which might touch on entering the harbour are not so liable to injury. I do not know that I have anything further to say with respect to the Round Ends.

30,202. (*Sir F. Smith.*) What is the thickness of the planking which interlaces with the uprights ?—It varies from top to bottom. The thinnest at the top where the uprights are close, and thicker as you descend.

30,203. What is its greatest thickness ?—Six inches.

30,204. Six inches the planking, and how far apart are the uprights from each other into which it interlaces ?—I think the distance is about ten feet apart.

30,205. And do you think that you will be able to interlace at the round end six-inch planking, with uprights ten feet apart ?—We are doing so at Blyth.

30,206. How are you able to continue that in the round ? In a straight line one can understand it ?—The planks will be twenty feet long, passing in front of one upright, behind the next, and in front of the next.

30,207. Like basket-work precisely. There can be no difficulty in getting pieces to pass in in the straight. What is the diameter of the circular end ?—At Blyth it is about 45 feet.

30,208. Forty-five feet diameter ?—Yes.

30,208*a*. How much are the planks removed from the straight line in interlacing ?—I cannot answer that without referring to the model or drawing.

30,209. What pressure do you use ?—The angles are removed from the uprights, which diminishes the amount of deflection.

30,210. Give me the deflection, and what force you use to obtain that deflection. They alternate, do they not ? The planks are not wholly in the inside or the outside. They alternate, do they not ?—Yes, they alternate. There would be very little difficulty indeed.

30,211. No ; I perceive now that each plank deals with only three uprights ?—Exactly so.

30,212. (*Mr. Coode.*) Are the planks bent in any degree, or do they remain straight ?—They are bent to some extent ; not to any great extent.

30,213. Were they bent in the model which was produced ?—The model was made to a correct scale, both as to the dimensions of the work generally and the thickness of the planking, and therefore the amount of bending was shown accurately.

30,214. As far as I recollect the model, there was no necessity for bending the planking ?—They were bent, but not much.

30,215. Not enough to injure the timber ?—No.

30,216. The greatest thickness you say would be six inches. What would be the least ?—At Blyth, at the top of the rail it would be about $3\frac{1}{2}$ inches.

30,217. Have you begun the circular work at Blyth ?—No ; it has been tested to see that the thing can be done, but they have not begun it.

30,218. Was it tested on a large scale, or in a model ?—It was tested on a large scale.

30,219. What we may call the full size ?—Yes.

30,220. At what rate have you estimated these concrete blocks per cubic yard,—the cost as made without the cost of setting ?—Below low water the cost is 27*s*.

30,221. That is per cubic yard ?—Yes.

30,222. Is that the cost when set ?—Yes, set.

30,223. What is the cost of the concrete block complete on shore before it is taken out to the work ?—I can hardly say.

30,224. Do I understand you to say that the frame of the traveller is moved by hydraulic machinery or by hand ?—By hydraulic machinery.

30,225. With reference to the pressure of the water within the cylinders, have you given us the number of pounds per square inch?—The pressure might vary very considerably. It depends on the dimensions of the cylinder, but I think in the drawings it is about 700 lbs.

30,226. Per superficial inch ?—Per square inch.

30,227. Of what material do you propose to form the flexible tube ?—It is made of canvass ; a woven tube. I think that gutta-percha is used.

30,228. Have you known a flexible tube tried with that pressure ?—Oh yes. The small hose which is generally made for general purposes will bear that amount.

30,229. What is the object of passing the flexible tube down to the diver ? Is it that the cock may be placed within reach of the diver ?—Exactly.

30,230. That is your object ?—Yes, to enable the

diver to produce the motion himself, without signalling to those above.

30,231. Will the cylinder and the piston rod pass down below the water level ?—The cylinder which lifts vertically will pass down.

30,232. Do you not fear that the piston rod will be liable to corrosion in coming in contact with salt water ?—I think not, as it will be a piece of machinery in motion ; but if it is found to do so, it can be cased the same as are the pumps of marine engines.

30,233. I do not think you stated the weight of the blocks which you would propose to employ ?—The weight would vary with the dimensions, and the dimensions with the particular work ; but the machinery which I propose will be competent to deal with blocks of 30 or 40 tons.

30,234. How would you suspend those blocks,—by slings or lewises ?—By rods of wrought iron passing through them.

30,235. How would those rods be attached to the block ?—They would be passed through the block together.

30,236. And how fastened at the bottom ?—With a washer.

30,237. How would they be disengaged ?—They would not be disengaged ; I should leave them in.

30,238. How would you provide for setting the succeeding block if the first had a projecting eye left in ?—Those eyes which you see in the drawing are detached ; the rods are left in the block. The eyes represented there in the upper block are really detached.

30,239. So that you leave the upper block fair to receive the next ?—Just so.

30,240. (*Sir F. Smith.*) What amount of durability do you expect in these masses ; equal to stone nearly ? —I should say equal to many stones. I would not say they would be equal to granite of the best quality, nor equal to some other of the hard stones, but still we have instances of the great durability of such blocks.

30,241. With what stone would you compare it as being nearly as strong ?—I do not know the life of any of the better stones. I do not know that it has been ever ascertained, because it must be very great. I can hardly conceive any limit to the durability of some of the stones which we use for harbour works—for example, the Carlingnoze stone.

30,242. Is there any peculiarity in the concrete blocks which you propose—any special mixture ; or are they ordinary, such as are being used at Dover now ?—One peculiarity I was about to mention. Suppose the stone of the neighbourhood in which the work was to be erected was not of very good quality, I think the block might be faced with a superior stone by laying on their face a series of stones rudely jointed and with the ends projecting upwards, first employing cement ; then filling in with the more ordinary material. The bottom of the block would thus become the face of the block.

30,243. The external face ? — Yes, the external face; and we should have that face of a better quality.

30,244. Do you mean that you would use stone of the neighbourhood in fragments or in pieces that could be peeled off generally, or as a sort of ashlar ? —Not ashlar, but as rubble.

30,245. As rubble,—broken fragments ?—Yes, broken fragments.

30,246. And intermixing with cement ?—With cement or lime, as the case may be. Of course a great deal must depend on the locality.

30,247. Then you imagine your external surface would be of much better quality than the mass behind it ?—I think not only of better quality, but a better face, seeing that the joints would be smaller.

30,248. With equal hardness and resistance as you propose both in the external and internal portions ?—I think that, made in that way there would be no liability to fracture. I do not propose this face for the purpose of better resisting any superincumbent pressure. I assume that the whole materials of the block would be equal to that, but that you would have a better material exposed to the action of the sea.

30,249. You have, I suppose, manufactured some blocks in that form ?—I have just been trying the experiment.

30,250. You have not applied any pressure ?—I have not tested it on any large scale.

30,251. You have not tested it ; at present it is a theory, in fact ?—I do not know that it is a theory exactly, because I have said nothing of this peculiar method in describing the concrete blocks. There is a great variety of ways of making them. We know that a mass of block concrete has stood for 2,000 years exposed to the sea. I will adopt the best method. It is no part of my plan making the concrete blocks. I merely employ them in large masses on a large scale.

30,252. (*Mr. Coode.*) Following up Sir F. Smith's question,—the only reason why you employ the concrete block is to obtain a larger mass than you can get in the shape of stone ?—Certainly.

30,253. You do not contemplate that you can get stones of from 40 to 50 tons ?—No ; except at an enormous cost.

30,254. By means of concrete you will effect greater economy ?—Quite so.

30,255. Are you aware that some experiments were tried six or eight years ago in building artificial blocks with a granite face, and softer material at the back ?—I am not aware of that, but I should not expect a good result.

30,256. Why not, if in the way you have described ?—In the first place, from an ashlar face with rubble backing I should hardly expect a good result, there being such a great difference between the two materials, if there was a great superincumbent weight.

30,257. Is that your opinion, assuming that you have in the face small pitchers ?—In my process the object is to blend the two qualities into each other as gradually as possible, and I think that anything which makes a strong line of demarcation between the back and face would be disadvantageous.

30,258. Undoubtedly your object is to obtain a durable material on the face ?—Quite so.

30,259. Is that the object in the process which you have explained to us ?—Yes.

30,260. (*Chairman.*) Is there anything else, Mr. Scott ?—I was going to describe the Wave Screen. This drawing illustrates the principle of the Wave Screen. It is composed mainly of a timber grating resting on piles and inclined towards the sea, and when in action the waves will run up the slope, part of the water dropping through the transverse openings. The lower edge of the grating is not carried to the ground, but remains some feet above the surface of the ground.

30,261. (*Sir F. Smith.*) In your drawing it is marked low-water mark ?—Quite so. I said the edge does not reach the ground. The advantages which I think this Screen presents over a stone slope will be, first, that stone slopes are more generally injured at the toe, and in this case there is no toe, as the grating does not reach to the ground ; and secondly, that it permits to a considerable extent the uninterrupted flow of the tidal current through it. The water which runs up the slope, dropping through the grating, neutralizes the undulation seeking to pass underneath. As the planks are arranged, they oppose but little surface to the blow of the wave, whilst at the same time they will intercept any water returning down the slope. The peculiar form of the cross section of the planking has also the advantage of being easily secured ; and the Screen, as a whole, is cheaply erected and easily repaired or replaced. I do

LONDON.

Mr. M. Scott.

18 Feb. 1859.

Sir F. Smith.

not know that there is anything further which I can say on that point.

30,262. (*Sir F. Smith.*) Have you made any experiment to ascertain what probability of success you have in this plan of yours?—Yes, I have tried it.

30,263. Where?—At Blyth.

30,264. In what depth of water?—It would be eight feet at high water, but the action of the screen was not observed then; it was when the water was four or five feet deep.

30,265. And you imagine that the great mass of the wave will not return down the inclined plane again, but pass through the planks?—I think part of the wave will return probably. I do not think it any disadvantage if it does. Of course the quantity which would return would be determined by the openings.

30,266. Have you made experiments as to what the openings ought to be?—I do not think any individual experiment would determine that for any given situation.

30,267. Except for a given situation?—Yes.

30,268. Have you made any estimate of the cost per lineal yard in any situation where there was a considerable depth of water?—It is only intended for shallow water.

30,269. You did not say so?—It is wholly inapplicable in deep water. If there were great depth of water under the toe of the screen, the undulations would pass under. It is only where the water is shallow and the wave necessarily breaks.

30,270. I asked you a question as regards the cost?—It is about 12*l.* per foot run as drawn.

30,271. There is no scale on the drawing?—It is drawn to the scale ordered by the Commissioners,—four feet to the inch.

30,272. What is the rise of water supposed to be shown on the plan?—About 15 feet.

30,273. What is the angle of inclination which you would give the screen towards the horizon?—That is not a matter subject to calculation. I think we require to be guided by experience.

30,274. By circumstances and experiment?—To a considerable extent. If the slope of the screen be very steep, it will oppose more resistance to the blow of the wave. On the other hand, if it be too flat, then the wave will be apt to overrun it.

30,275. Then you think it is quite inapplicable to deep water?—Quite inapplicable.

30,276. What is the extreme depth in which you think it would be applicable?—I am not prepared to answer that without considerable deliberation; but, at all events, at a depth where the low water would be anything like three or four fathoms I should think it would be inapplicable.

30,277. You would not go so deep as that?—No.

30,278. (*Capt. Vetch.*) Where do you propose to apply this screen?—In cases of shallow water only.

30,279. For the protection of piers?—To form a breakwater itself.

30,280. It would only be applicable in shoal water?—Only in shoal water.

30,281. How much water at low water would you place it in?—Nothing above three fathoms.

30,282. And do you think it would be applicable to depths of three fathoms?—As I have stated, it would require serious consideration before I could answer. It might be very useful in a number of smaller harbours.

30,283. What would you expect to be the action of the wave?—I suppose the wave would run up the slope. As it would run up, a considerable portion of the water would drop through; then on returning it would wholly drop through. The blow is less than on a solid stone slope.

30,284. You think that between the toe and the higher end the whole wave would be absorbed?—I do.

30,285. That it would not then come with any force on the platform?—I think not; and in case it should be found to do so, it would show that the slope ought to have been made longer.

30,286. How high would you have it above high water?—No definite point; the higher the better. That would be a question of expense.

30,287. You would not make it less than 10 feet?—I think not.

30,288. (*Mr. Coode.*) In your estimate do you contemplate that the timbers would be creosoted?—Yes, creosoted.

30,289. Have you any fears that the piles would get chafed in case of any shingle rolling upon the surface of the ground? Shingle would be disturbed in water of that depth, if there were any?—If there was any probability of that, the piles would require to be cased with iron at that point.

30,290. You have not taken that into account in forming your idea of the cost?—No; but it is a very liberal estimate, and I believe would include that.

30,291. Of what material would you form the Screen—of what kind of timber?—It would depend on the situation. On the east coast I would apply Baltic and on the west coast American.

30,292. (*Chairman.*) Is there anything else which you wish to add?—I would now propose to say some few words on the principles which have guided me in determining the best form of breakwater. I have stated that this Screen, for example, is applicable to shallow water, and that the other forms of breakwater which I described were applicable to deep water. This Screen is applicable to shallow water, because waves must necessarily break in shallow water if of any magnitude, but not in deep water. I believe that the wave will not break against a vertical face; and I think in the case of Dover we have an example of that. At Dover, partly from the absence of material, the work has been expensive, and the rate of progress is slow. I believe that it is the form only of the wave which travels rapidly in deep water; that the motion of the individual particles is small; that though the motion of each particle is small, the number moving or the bulk of water agitated is great, and that it is with the momentum of this mass of water that we have to deal. I also believe that a wave passing along a uniform channel remains of the same form and dimensions; that if the channel enlarges, the wave spreads and agitates a greater bulk, and the agitation of the particles is less; that if the channel contracts, the wave is concentrated, the bulk agitated is less, but the degree of agitation is greater, and that if the bottom rises the effect is even greater than with converging sides.

30,293. (*Sir F. Smith.*) The principles which you appear to be supporting are so well recognised, that, unless you have any particular object, the Commissioners deem it unnecessary to trouble you to go into further details?—Having stated my belief in those principles, I will not occupy the time of the Commissioners further in that matter.

30,294. (*Mr. Coode.*) Should you be an advocate for the adoption of the vertical wall under all circumstances, and in all cases, without exception?—No.

30,295. (*Chairman.*) Is there anything else, Mr. Scott?—I wish to say a few words on two very important points—the rate of progress, and the cost.

30,296. Will you proceed to do so?—I described the erection of a breakwater upon a rubble bank in my previous evidence, and I now propose to compare two breakwaters constructed under similar circumstances, the same in form and external dimensions, in materials, and in prices. I have constructed tables to show the rate of progress and the cost of these works upon the two systems. The one I call the old system, to distinguish it; and I will proceed to explain the following table in very few words:—

OLD SYSTEM.—RATE OF PROGRESS.

—	—	Amount expended each Year.	Total Amount expended.	Length
1st Year:	£	£	£	Feet.
600 ft. rubble bank, 21*l.* 12*s.* -	12,960			
600 ft. staging, 18*l.* - -	10,800			
		23,760		
2d Year:				
Interest at 4 per cent. on previous amount - - - -	950			
Repairs of staging, 6 per cent. -	648			
300 ft. wall at 69*l.* 12*s.* - -	20,880			
300 ft. staging and rubble mound	11,880			
		34,358	58,118	300
3d Year:				
Interest on previous amount -	2,325			
Repairs 600 ft. staging - -	648			
300 ft. wall - - - -	20,880			
300 ft. staging and mound - -	11,880			
		35,733	93,851	600
4th Year:				
Interest - - - -	3,754			
300 ft. mound, staging, wall, and repairs of 600 ft. staging, &c. -	33,408			
		37,162	131,013	900
5th Year:				
Interest - - - -	5,240			
300 ft. mound, staging, wall, &c. -	33,408			
		38,648	169,661	1,200
6th Year:				
Interest - - - -	6,786			
300 ft. mound, &c. - - -	33,408			
		40,194	209,855	1,500
7th Year:				
Interest - - - -	8,394			
300 ft. mound, &c. - - -	33,408			
		41,802	251,657	1,800
8th Year:				
Interest - - - -	10,066			
300 ft. mound, &c. - - -	33,408			
		43,474	295,131	2,100
9th Year:				
Interest - - - -	11,805			
300 ft. mound, &c. - - -	33,408			
		44,213	339,344	2,400
10th Year:				
Interest - - - -	13,574			
300 ft. mound, &c. - - -	33,408			
		46,982	386,326	2,700
11th Year:				
Interest - - - -	15,453			
300 ft. mound, &c. - - -	33,408			
		48,861	435,187	3,000
Three thousand feet being now complete and effective in affording protection, no interest is for the future charged upon this amount, 435,187*l.*				
12th Year:				
300 ft. mound, &c., as before -	33,408			
		33,408	468,595	3,300
13th Year:				
Interest on 33,408*l.* - -	1,336			
300 ft. mound, &c. - - -	33,408			
		34,744	503,339	3,600
14th Year:				
Interest on 68,152*l.* - -	2,726			
300 ft. mound, &c. - - -	33,408			
		36,134	539,473	3,900
15th Year:				
Interest on 104,286*l.* - -	4,171			
300 ft. mound, &c. - - -	33,408			
		37,579	577,052	4,200
16th Year:				
Interest - - - -	5,675			
300 ft. mound, &c. - - -	33,408			
		39,083	616,135	4,500
17th Year:				
Interest - - - -	7,238			
300 ft. mound, &c. - - -	33,408			
		40,646	656,781	4,800
18th Year:				
Interest - - - -	8,864			
300 ft. mound, &c. - -	33,408			
		42,272	699,053	5,100
19th Year:				
Interest - - - -	10,555			
300 ft. mound, &c. - - -	33,408			
		43,963	743,016	5,400
20th Year:				
Interest - - - -	12,313			
300 ft. mound, &c. - - -	33,408			
		45,721	788,737	5,700
21st Year:				
Interest - - - -	14,142			
300 ft. mound, &c. - - -	33,408			
		47,550	836,287	6,000
Thus twenty-one years elapse before complete protection is afforded, and the cost is 836,287*l.*				

During the first year, it will be seen by reference to the table, I suppose that 600 feet of staging will be erected, and 600 feet of rubble bank will be deposited. In the second year the expenditure consists, first, of the interest on amount already expended, because unproductive; second, of repairs of staging; third, of 300 feet of finished wall; and, fourth, of extending rubble bank 300 feet. The same amount of work will be done during each succeeding year, interest being charged until the eleventh year, by which time half of the work will be finished; and as it will afford shelter to a considerable extent, the amount expended up to that date will then be called productive, and therefore interest is no longer charged. But other ten years are necessary to complete the work, which is assumed to be 6,000 feet in length. The rate of progress remains the same, and interest is charged as during the former period. The result is, that the work constructed on this system will cost 836,287*l.*, equal to 139*l.* 7*s.* 6*d.* per foot run.

30,297. Do you consider the rate of progress which is indicated in this table as that which is most favourable to economy of construction?—I think so. The second table represents the progress and cost on my new system, and is as follows:—

NEW SYSTEM.—RATE OF PROGRESS.

—	—	Amount expended each Year.	Total Amount expended.	Length complete.
1st Year:	£		£	Feet.
3,000 ft. of staging, at 9*l.* 9*s.* -	28,350			
3,000 ft. rubble bank, at 21*l.* 12*s.* -	64,800			
		93,150		
2d Year:				
Interest at 4 per cent. on previous amount - - - -	3,726			
Repairs of staging, 6 per cent. -	1,699			
2,000 lin. ft. timber work - -	79,200			
		84,625	177,775	2,000
2½ Years:				
Interest for ½ year - - -	3,555			
Repairs of staging (1,000 ft.) -	284			
1,000 lin. ft. timber work - -	39,600			
		43,439	221,214	3,000
Three thousand feet being now complete and effective in affording protection, no interest is charged for the future on this amount, 221,214*l.*				
3 Years:				
1,500 ft. staging - - -	14,175			
1,500 ft. rubble mound - -	32,400			
		46,575	267,789	
4 Years:				
Interest on 46,575*l.* - -	1,863			
750 ft. rubble bank and staging -	23,287			
1,500 ft. timber work - -	59,400			
Repairs of staging (750 ft.) - -	567			
		85,117	352,906	4,500
5 Years:				
Interest - - - - -	5,267			
750 ft. staging and rubble bank -	23,287			
1,500 ft. timber work - -	59,400			
Repairs of staging (750 ft.) -	567			
		88,521	441,427	6,000
Thus complete protection is afforded in five years at a cost of 441,427*l.*				

But the structure has ultimately to be faced with stone, and this will cost 323,400*l.* There are three different modes by which it is proposed to meet this expenditure. The facing can be finished in four years, and four sums of 80,850*l.* are therefore required. As the timber work is assumed to begin to decay in 20 years after its erection, the work of building the stone facing will commence in 20 years, or in 15 years after the completion of the timber breakwater. In order to raise the above amount it is proposed—

First, To lay aside 12,407*l.* a year for 19 years, which at four per cent. compound interest will raise a sum sufficient to meet the instalments of 80,850*l.* each when required.

	£
19 years at 12,407*l.* each year - -	235,733
To which add - - -	441,427
This would make the total cost of the breakwater - - -	677,160
As compared with the cost on the old system - - - -	836,287

Second, To assume nothing paid for 15 years; but then such a sum would be required as, accumulated at four per cent. compound interest, would pay the instalments of 80,850*l.*

	£
This amount is - - -	305,220
To which add, as before - -	441,427
This would make the total cost of the breakwater - - -	746,647
As compared with the cost on the old system - - - -	836,287

Third, To take a sum sufficient, when accumulated at four per cent., to yield 323,400*l.*, in sums of 80,850*l.* per annum for four years, the first payment being required in 15 years.

	£
This amount is - - -	169,480
To which add, as before - -	441,427
This would make the total cost of the breakwater - - -	610,907
As compared with the cost on the old system - - - -	836,287

But even supposing it should be found that the timber began to decay in 10 years, it would be necessary then to commence the building of the stone facing in 10 years, or

LONDON.

Mr. M. Scott.

18 Feb. 1859.

Chairman.

in five years after the completion of the timber breakwater. It would be necessary then to take a sum sufficient, when accumulated at four per cent., to yield 323,400*l.*, in sums of 80,850*l.* per annum for four years, the first payment being required in five years.

	£
This amount is - - -	250,868
To which add, as before - -	441,427
This would make the total cost of the breakwater - - -	692,295
As compared with the cost on the old system - - - -	836,287

Referring to the table, it will be observed that on my new system, during the first year 3,000 feet of staging and 3,000 feet of rubble bank will be deposited. In the second year the expenditure consists, first, of the interest on amount already expended, because unproductive; second, of repairs of staging; third, of 2,000 lineal feet of timber work erected and filled in. In the first half of the third year the expenditure consists, first, of interest for the half year; second, of repairs of staging; and third, of 1,000 feet of timber work erected and filled in. 3,000 feet, or half of the whole work, is now complete, and as it affords shelter, no interest is hereafter charged. In other two and a half years the timber breakwater is completed, and the result is that in five years shelter is obtained for the whole harbour at a cost of 441,427*l.*, or 73*l.* 12*s.* per foot. But the work has to be faced with stone, and this must be done before the timber decays. Timber will last 20 years. You may therefore take the benefit of the delay to allow such a sum to accumulate at interest as when required will pay for the stone facing. The sum required at 4 per cent. is 169,480*l.*, which added to the previous expenditure makes the total cost 610,907*l.*, or 101*l.* 16*s.* 8*d.* per foot, being a saving in money of 225,380*l.* In other words, the old system costs 37 per cent. more than the new, and under the old system 21 years are required to afford the same extent of shelter as is afforded by the new system in five years. I have taken the price of the facing the same in both systems, but there being little or no interruption from the current in the new system, and no danger of breaching, I think the prices may be less under the new system. As the Commissioners requested me, I have made a drawing of the staging required under the old system as compared with the new. The facing requires to be formed of heavy blocks, especially under the old system, because the open end will be exposed to the sea during the progress of the work, and this involves a very strong staging, which is obtained under the new system for less money.

For the purpose of comparison in the matter of cost, I have taken that case in the paper handed in; and in order that the comparison may be fully understood, I give the details of the quantities and prices, as follows:—

STATEMENT of the Details of the Quantities and Prices at which the preceding Tables have been calculated.

OLD SYSTEM.

Quantities in One Running Foot of the Breakwater.

	£	s.	d.	£	s.	d.
Rubble mound, 108 cubic yards, at 4*s.* - -				21	12	0
Staging:						
Timber and iron work equivalent to 103 cubic feet, at 3*s.* 6*d.* - - - -				18	0	0
**Facing:*	£	s.	d.			
Concrete blocks below low water, 20 cubic yards, at 27*s.* - -	27	0	0			
Concrete blocks above low water, 25 cubic yards, at 20*s.* - -	25	0	0			
Pitching, 36 cubic feet, at 2*s.* -	3	12	0			
Coping, 8 cubic feet, at 4*s.* -	1	12	0			
„ 8 „ at 2*s.* -	0	16	0			
Rubble filling, 58 cubic yards, at 4*s.*	11	12	0			
				69	12	0

	Feet.	in.
*The average thickness of the wall on the sea face - - - -	12	6
The average thickness of the wall on the harbour face - - - -	10	0

These thicknesses being greater than in the new system, because the walls have to bear the thrust of the newly filled rubble, whereas the facing in the new system has a backing already consolidated.

The rubble bank can be deposited rapidly. It is the superstructure which limits the rate of progress. At Alderney, where the superstructure is nearly similar, the rate of progress has been under 300 feet a year. I therefore take 300 feet a year.

The *same prices* are assumed in both cases, although the facilities for the construction of the face are much greater on the new system.

Repairs of Staging.—The necessity for this item is obvious; but it may be mentioned that at Holyhead, Portland, and Dover the staging has been repeatedly damaged. Only last season 250 feet at Holyhead, and a few years ago at Portland 330 feet, were carried away at one time.

NEW SYSTEM.

Quantities in One Running Foot of the Breakwater.

	£	s.	d.	£	s.	d.

Total cost of facing 6,000 cubic feet, at 53*l.* 18*s.*, 323,400*l.*

† The average thickness of wall on seaface - 10 feet.
The average thickness of wall on harbour face - 8 „

To prove that 2,000 lineal feet of superstructure can easily be erected in a year, it may be observed that this is only at the rate of 12 feet per day for 167 days out of 365; and to erect in a year 3,000 lineal feet of staging, it is only required that one frame should be erected per day for 100 days. In like manner to complete 3,000 lineal feet of rubble mound in a year, only requires that 2,000 tons should be tipped per day for 250 days. And at Holyhead, where there are five lines of rails, 4,000 tons per day have been deposited.

As these tables depend very much on the question of charging interest, I wish to explain the principle upon which interest is charged on capital until the capital becomes productive, there being no other way of representing the money value of time. As an illustration, we have the case of Blyth, where Parliament enacted that no dues should be chargeable on shipping using the harbour until the completion of the breakwater, nearly a mile long. Supposing a capitalist to have advanced the money for that work, he would certainly consider that if 20 years elapsed before the work was completed, and before he received any return, instead of five years, that in the former case the work would cost him a great deal more.

It may be said that a breakwater on the Holyhead system gives shelter as soon as the rubble bank is deposited, and therefore the tables which I have given in will not apply to a work of that kind. Now, in the first place, that system is only applicable where stone is exceedingly cheap and very plentiful; but even then I have prepared a comparison without reference to this question of interest at all, in which, assuming the stone at a very low price, we get the following results: In the case of a breakwater in 60 feet

water, if constructed on the Holyhead system at the prices named, it would cost 140*l.* per foot; whereas taking the same prices, a work in the same depth of water on the new system would cost 113*l.* 15*s.*, or for a length of 6,000 feet the cost on the Holyhead system would be 840,000*l.*, and on the new system 682,500*l.*, showing a difference in favour of the new system of 157,500*l.* The following is the detailed statement from which I get that result:—

Cost of a Breakwater on Holyhead System.

Depth of water 10 fathoms; rise 21 feet.

	Price per foot run. £	s.	d.
Rubble, 626 cubic yards, at 2*s.* 9*d.* -	86	1	0
Staging, 100 cubic feet, at 3*s.* 6*d.* - -	17	10	0
Wall, 26 cubic yards, at 1*l.* - -	26	0	0
Excavation, 26 cubic yards, at 1*s.* - -	1	6	0
Cordon, coping, and plinth, 61½ cubic feet, at 2*s.* - - -	6	3	0
Pitching on slope, 90 cubic feet, at 8*d.* -	3	0	0
	140	0	0

Cost of a Breakwater on New System.

	£	s.	d.
Rubble bank, 108 cubic yards, at 2*s.* 9*d.* -	14	17	0
Staging:			
Timber and iron work equivalent to 54 cubic feet, at 3*s.* 6*d.* - - -	9	9	0
Intermediate frames, &c., 152 cubic feet, at 3*s.* 6*d.* - - - -	26	12	0
Rubble hearting, 65 cubic yards, at 2*s.* 9*d.*	8	18	9
Facing:			
Concrete blocks below low water, 16 cubic yards, at 27*s.* - - -	21	12	0
Concrete blocks above low water, 20 cubic yards, at 20*s.* - - -	20	0	0
Pitching, 36 cubic feet, at 2*s.* - -	3	12	0
Coping, 8 cubic feet, at 4*s.* - -	1	12	0
„ 8 „ at 2*s.* - -	0	16	0
Filling in behind blocks, 126 cubic feet, at 1*s.* - - - -	6	6	0
	113	14	9

As to the times in which shelter is obtained, they would be very much the same.

As works of a similar character, I take the case of Alderney, which appears by the parliamentary returns to cost 170*l.* per foot, exclusive of preliminary expenses, and of Portland, which I think has cost 150*l.* per foot, exclusive of preliminary expenses.

30,298. (*Chairman.*) With reference to the comparative cost of construction per foot, the table shows an advantage of 26*l.* on the new system over the old. How does the assumption of a depth of water of 10 fathoms affect the question? Does the consideration that a breakwater is not likely to be carried its whole length in 10 fathoms water alter the comparison? If it were in two fathoms, for example, would the advantage still be 26*l.*?—Not so much as 26*l.*, because that figure is in relation to the total cost.

30,299. And to the depth?—And to the depth. I have taken 10 fathoms,—1st, because I am dealing with a breakwater intended for great harbours; 2ndly, because that figure was adopted before, and I did not like to introduce confusion by adopting another; and, 3rd, because it is nearly the actual depth of existing great works. The 26*l.* must only be taken in relation to the magnitude of the work.

30,300. In 10 fathoms water the advantage per cent. is rather more than a fifth of the whole cost; would it be a fifth of the whole cost at lower depths?—I should think so; but, with the permission of the Commissioners, I will go into the question, and send them the result.

30,301. (*Mr. Coode.*) I see, Mr. Scott, that in your estimate of what you call the old system, you put down the rate of progress at 600 feet a year, and under the new system you put it down at 3,000 feet a year. On what have you based the relative rate of progress?—The rate of progress on the old system is based on the experience at Alderney, which is the only parallel case I can get.

30,302. Are you aware that at Holyhead the rate of progress has been 1,200 feet a year?—I acknowledge that as to Holyhead it does not apply.

30,303. I see in the table of the relative cost you put down on the new system for staging timber and timberwork 9*l.* 9*s.* per foot. In your previous evidence you gave the estimated cost at 54*l.* per yard, which would be 18*l.* per foot. The question which was put to you in your former examination was, what would be the cost of that per lineal yard, and your answer is 54*l.*?—That is the breakwater, not the staging.

30,304. You say in your former examination the cost of the timber work alone would be about 54*l.* per yard?—That is quite right. I referred to the timber work of the breakwater; that is not the staging. I distinguish between them.

30,305. By the staging you mean only the bays, which are 30 feet apart?—And what is necessary to deposit the rubble bank.

30,306. In the 9*l.* 9*s.* per foot you contemplate the bays 30 feet apart, but it does not include the intermediate timber work?—No; that is the breakwater.

30,307. Your answer of 54*l.* per yard had reference to the timber work filled in with rough stone?—Perhaps superstructure would be the better word.

30,308. Then 9*l.* 9*s.* per foot is simply for the skeleton stage, without the intermediate filling and intermediate framing?—Quite so.

30,309. You have put in a drawing of the old system of staging; from what particular work is it taken?—It is not taken from any work. I have made the best I can of it. There was no existing work to take it from, but I made the best drawing I could.

30,310. Then it is rather an assumption than a fact?—It is the best I can give. There is no example to give as a fact.

30,311. You state that Portland breakwater has cost 150*l.* per lineal foot; whence do you derive your information?—From the parliamentary returns.

30,312. For what year? I merely wish to know for what year; I do not wish to go into unnecessary details?—I think the return is dated 6th May 1858, and is made up to March 1858.

30,313. Are you aware that there is a parliamentary return of the same description made up to March 1857?—I believe there is.

30,314. Are you aware that in that return the total quantity of rubble in Portland breakwater is made to cost 634,875*l.*?—The gross estimated expenditure for rough stone work is 634,875*l.*

30,315. You will find at page 18 of the return up to March 1857, "The estimated expenditure for the "rough stone work, both in the small and great "breakwaters, calculated according to the prices at "which the same work has hitherto been executed, "is 634,875*l.*" Are you aware that that applies to the whole length of the rubble, exclusive of the heads and passages?—I am not aware of that.

30,316. Will you turn to the plan of the breakwaters at Portland, and tell me what is the total length, exclusive of the heads and passages?—It would be about 7,500 feet.

30,317. Be good enough to divide 634,875*l.* by 7,500 feet, and tell us the result per foot run?—It is between 84*l.* and 85*l.*

30,318. At what rate per annum do you assume the facing in stone to proceed?—In what work; in Portland?

30,319. In your new works?—Four years.

30,320. For what length?—6,000 feet. It is just the same rate per annum under both systems, if working at only one spot; but there is this distinction, that under the new system you can work at five or six different places at once, or a dozen if you like.

30,321. If you begin in several places at once, must not the materials be put afloat in some places?—No, I think not.

LONDON.

Mr. M. Scott.

18 Feb. 1859.

Mr. Coode.

30,322. Do you mean that the work is done entirely from the stage ?—Yes.

30,323. Is it not possible according to the old system to work at several places at once ?—It is quite impossible ; with a gap, and the sea running in, and with open ends.

30,324. Would that not be the case in the system you propose ?—Certainly not ; you would be building against an existing work ; but in the other case there is no work until you have put the facing,—the facing is the work.

30,325. Then you assume you would complete 3,000 feet of timber and rubble filling within the first year ?—Yes ; but 2,000 feet is the length which is completed of the superstructure in one year.

30,326. Then I understand you complete 3,000 feet of skeleton staging the first year, but you contemplate that at the end of the second year you would have completed 2,000 feet of timber work with the rubble filling within it ?—Quite so.

30,327. That would be, in short, a complete work of timber framing and rubble, at the rate of 1,000 feet per annum for the first two years ?—Quite so ; and then the progress, if you observe, is 1,500 feet per year after that.

30,328. I find between the end of the second year and the end of the fifth year a difference of 4,000 feet ?—Yes.

30,329. That is 4,000 feet in three years ?—Exactly.

30,330. That is not quite 1,500 feet a year ?—One year, you see, 1,500 feet is done ; but take the average, and it will come to the same thing—about 1,250 feet a year.

30,331. (*Chairman.*) Is there anything further which you wish to add ?—I wish to call attention to the statement which I have made with regard to the cost of the Portland works, for a few minutes, to show that I do not make that statement rashly. I made the statement on the basis of the parliamentary returns, and if those returns are incorrect, of necessity my statement is incorrect also. I do not wish it to be supposed that I have made a statement without reasonable grounds. If those grounds are wrong, my statement falls with the grounds on which it is based. I have been asked questions with respect to 634,875*l.* which appears in the parliamentary return of 1857 as "estimated gross expenditure for rough "stone work in small and great breakwaters, calculated "according to the prices at which the work has been "hitherto executed." I find that in the return, but that I beg to observe is an estimated amount ; and when I tried to arrive at the cost, I tried one method which gave me these results : I thought that if I could obtain the quantity of stone, and the cost of that stone, I should get some indication of the cost per foot of the work. By a return dated 16th April 1855, up to 31st March 1855, I find the expenditure, exclusive of land, stock, plant, and convict earnings, is 354,680*l.*, and the quantity of stone deposited at the same date was 1,743,437 tons. The length of staging is stated to be 3,860 feet from the shore, and I also find that a considerable part of one round head was done, and a small part of another, and I must be very near the truth, therefore, to assume that one round head was finished. These round heads are stated to cost 38,000*l.* each, so that from the expenditure of 354,680*l.* I deduct one head, 38,000*l.*, and 3,860 feet of staging, at 20*l.* per foot, 77,200*l.*, making a total of 115,200*l.*, and that amount deducted from 354,680*l.* leaves 239,480*l.* Then, dividing this amount by the number of tons deposited, I find the cost to be 2*s.* 9*d.* per ton, or 4*s.* 1½*d.* per cubic yard, exclusive of staging.

30,332. (*Mr. Coode.*) There is the cost of the staging ?—It is deducted ; 77,200*l.*

30,333. Where do you get that amount ?—At 20*l.* per foot. Further, taking the amount of stone per foot run in the work, where it is 60 feet deep, at 511 cubic yards, I find that the cost of the rubble bank alone is 105*l.* 8*s.* per foot run, exclusive of the quarrying of the stone and exclusive of the preliminary expenses. That is one of the series of proofs worked out of the parliamentary paper. My statement wholly depends on those figures. If the figures are wrong, I am wrong ; but if they are correct, I take it that I must be correct also.

30,334. Without going into any detail, have you any drawing of the stage at Portland ?—I examined the stage at Portland very minutely, and I think, from some experience, I could estimate the quantity of timber and iron within a mere trifle. I took out the quantities very carefully.

30,335. Did you take out the quantities from a drawing ?—Certainly ; from a drawing made from what I had seen as to the depth that is stated on the particular section.

30,336. Have you the particulars of the cost of the moorings, the pile shoes, and the iron work, in connection with that stage ?—It was not necessary to have them.

30,337. Would it not be necessary to form a correct estimate of the cost of the staging ?—I allow for the iron work ; I think I can give the particulars.

30,338. I do not want the particulars, only to know how you dealt with the question. You have stated and assumed a depth of water of 60 feet. Do you mean at low water ?—No, at high water. I produce the section from which the quantities were taken out. The slopes are the slopes which you stated yourself.

30,339. The depth of 60 feet is at high water ?—Yes.

30,340. (*Chairman.*) Does that conclude your evidence ?—I do not know that I have anything more to add to it.

The sitting then terminated.
